Part I Understanding Oracle WebCenter

1 Introduction to Oracle WebCenter Administration

1.1	Introducing Oracle WebCenter	1-1
1.2	Oracle WebCenter Architecture	1-2
1.2.1	Oracle WebCenter Framework	1-2
1.2.2	Oracle Application Development Framework	1-3
1.2.3	Oracle Composer	1-3
1.2.4	WebCenter Services	1-3
1.2.5	WebCenter Spaces	1-4
1.2.6	Portals	1-4
1.2.7	Composite Applications	1-4
1.3	Oracle WebCenter Topology	1-5
1.3.1	Oracle WebCenter Topology Out-of-the-Box	1-5
1.3.2	Oracle WebCenter Managed Servers	1-6
1.3.3	Oracle WebCenter Startup Order	1-7
1.3.4	Oracle WebCenter External Dependencies	1-7
1.3.5	Oracle WebCenter Configuration Considerations	1-8
1.3.6	Oracle WebCenter State and Configuration Persistence	1-10
1.3.7	Oracle WebCenter Log File Locations	1-10
1.4	Oracle WebCenter Spaces	1-10
1.5	Custom WebCenter Applications	1-11
1.6	Planning WebCenter Installations	1-11
1.7	Understanding the WebCenter 11g Installation	1-11
1.8	Understanding Administrative Operations, Roles, and Tools	1-11
1.9	Performance Monitoring and Diagnostics	1-13
1.10	WebCenter Application Deployment	1-13
1.11	Data Migration, Backup, and Recovery	1-13
1.12	Oracle WebCenter Administration Tools	1-14

1.12.1	Oracle Enterprise Manager Fusion Middleware Control Console.....	1-14
1.12.1.1	Displaying Fusion Middleware Control Console.....	1-14
1.12.2	Oracle WebLogic Server Administration Console.....	1-15
1.12.3	Oracle WebLogic Scripting Tool (WLST).....	1-15
1.12.3.1	Running Oracle WebLogic Scripting Tool (WLST) Commands.....	1-16
1.12.4	System MBean Browser	1-17
1.12.5	WebCenter Spaces Administration Pages.....	1-18

Part II Getting Started With Oracle WebCenter Administration

2 Getting WebCenter Spaces Up and Running

2.1	Role of the Fusion Middleware Administrator	2-1
2.2	Role of the WebCenter Spaces Administrator	2-2
2.3	Installing WebCenter Spaces.....	2-2
2.4	Setting Up WebCenter Spaces for the First Time (Roadmap).....	2-3
2.5	Customizing WebCenter Spaces for the First Time (Roadmap).....	2-4

3 Maintaining WebCenter Spaces

3.1	Role of the Fusion Middleware Administrator	3-1
3.2	Role of the WebCenter Spaces Administrator	3-2
3.3	System Administration for WebCenter Spaces (Roadmap).....	3-2
3.4	Application Administration for WebCenter Spaces (Roadmap).....	3-5

4 Getting Custom WebCenter Applications Up and Running

4.1	Installing Oracle WebCenter and Oracle WebCenter Framework Libraries	4-1
4.2	Deploying Custom WebCenter Applications for the First Time (Roadmap).....	4-2

5 Maintaining Custom WebCenter Applications

5.1	System Administration for Custom WebCenter Applications (Roadmap).....	5-1
-----	--	-----

Part III Basic Systems Administration for Oracle WebCenter

6 Starting Enterprise Manager Fusion Middleware Control

6.1	Displaying Fusion Middleware Control Console	6-1
6.2	Navigating to the Home Page for WebCenter Spaces	6-2
6.3	Navigating to the Home Page for Custom WebCenter Applications	6-5
6.4	Navigating to Dependent Components.....	6-7

7 Deploying WebCenter Applications

7.1	Deploying Custom WebCenter Applications	7-1
7.1.1	Deployment Prerequisites	7-2
7.1.2	Preparing the Application EAR File	7-2
7.1.2.1	EAR File Contents	7-2
7.1.3	Preparing the Target Environment	7-3
7.1.3.1	Creating and Provisioning a WebLogic Managed Server Instance.....	7-3

7.1.3.1.1	Creating and Provisioning a WebLogic Managed Server Using a Jython Script.	7-3
7.1.3.1.2	Creating and Provisioning a WebLogic Managed Server Using the WLS Administration Console	7-5
7.1.3.1.3	Creating a WebLogic Managed Server Using Fusion Middleware Control.....	7-10
7.1.3.2	Creating and Registering the Metadata Service Repository	7-12
7.1.3.2.1	Creating an MDS Schema Using the Repository Creation Utility	7-12
7.1.3.2.2	Registering an MDS Schema Using Fusion Middleware Control.....	7-16
7.1.3.2.3	Registering an MDS Schema Using WLST	7-18
7.1.3.3	Configuring the Target Environment.....	7-19
7.1.3.3.1	Configuring the JDBC Data Source	7-19
7.1.4	Deploying the Application to a WebLogic Managed Server Instance.....	7-19
7.1.4.1	Deploying Applications Using Oracle JDeveloper.....	7-20
7.1.4.2	Deploying Applications Using Fusion Middleware Control.....	7-20
7.1.4.3	Deploying Applications Using WLST	7-25
7.1.4.4	Deploying Applications Using the WLS Administration Console	7-27
7.1.4.5	Saving and Reusing the Deployment Plan	7-30
7.1.5	Transporting Customizations Between Environments.....	7-30
7.1.6	Configuring Applications to Run in a Distributed Environment.....	7-31
7.2	Undeploying Custom WebCenter Applications	7-31
7.2.1	Undeploying WebCenter Applications Using Fusion Middleware Control	7-31
7.2.2	Undeploying WebCenter Applications Using WLST.....	7-31
7.2.3	Removing an Application's Credential Map	7-32
7.3	Redeploying Custom WebCenter Applications	7-33
7.3.1	Redeployment Considerations	7-33
7.3.1.1	Preserving Application Configuration.....	7-34
7.3.1.1.1	Preserving Configuration Across Deployment Using WLST	7-34
7.3.1.2	Preserving Application Metadata	7-35
7.3.1.3	Preserving Portlet Customizations and Personalizations	7-35
7.3.2	Redeploying WebCenter Applications Using Fusion Middleware Control	7-35
7.3.3	Redeploying WebCenter Applications Using WLST	7-40
7.4	Post-Deployment Configuration	7-40
7.4.1	Configuring Security	7-41
7.4.2	Configuring Connections	7-41
7.4.3	Configuring Data Sources	7-41
7.4.4	Tuning the Application.....	7-41

8 Starting and Stopping WebCenter Applications

8.1	Starting Node Manager.....	8-1
8.2	Starting and Stopping Managed Servers for WebCenter Application Deployments	8-2
8.3	Starting and Stopping WebCenter Spaces.....	8-3
8.3.1	Starting WebCenter Spaces Using Fusion Middleware Control	8-3
8.3.2	Starting WebCenter Spaces Using WLST.....	8-4
8.3.3	Stopping WebCenter Spaces Using Fusion Middleware Control	8-4
8.3.4	Stopping WebCenter Spaces Using WLST.....	8-4
8.4	Starting and Stopping Custom WebCenter Applications.....	8-4

8.4.1	Starting Custom WebCenter Applications Using Fusion Middleware Control.....	8-5
8.4.2	Starting Custom WebCenter Applications Using WLST	8-5
8.4.3	Stopping Custom WebCenter Applications Using Fusion Middleware Control.....	8-5
8.4.4	Stopping Custom WebCenter Applications Using WLST	8-6

9 Setting Application Properties

9.1	Setting Application Properties for WebCenter Spaces	9-1
9.1.1	Specifying the BPEL Server Hosting WebCenter Spaces Workflows	9-1
9.1.2	Enabling Oracle SES Crawlers in WebCenter Spaces.....	9-2
9.2	Setting Additional Properties for Custom WebCenter Applications.....	9-2

Part IV Managing Services, Portlet Producers, and External Applications

10 Managing Services

10.1	Introduction to Managing Services	10-1
10.2	Setting Up the WebCenter Repository	10-2
10.3	Setting Up the MDS Repository	10-3

11 Managing Content Repositories

11.1	What You Should Know About Content Repository Connections	11-2
11.2	Content Repository Prerequisites	11-3
11.2.1	Oracle Content Server Prerequisites	11-3
11.2.1.1	Oracle Content Server - Installation.....	11-3
11.2.1.2	Oracle Content Server - Configuration.....	11-4
11.2.1.2.1	Configuring the Identity Store	11-4
11.2.1.2.2	Enabling Full-Text Searching and Indexing.....	11-6
11.2.1.2.3	Configuring Secure Sockets Layer (SSL).....	11-7
11.2.1.3	Oracle Content Server - Security Considerations	11-10
11.2.1.4	Oracle Content Server - Limitations in WebCenter	11-10
11.2.2	Oracle Portal Prerequisites	11-10
11.2.2.1	Oracle Portal - Installation.....	11-10
11.2.2.2	Oracle Portal - Configuration	11-10
11.2.2.3	Oracle Portal - Security Considerations	11-10
11.2.2.4	Oracle Portal - Limitations in WebCenter.....	11-10
11.2.3	File System Prerequisites	11-11
11.2.3.1	File System - Security Considerations	11-11
11.2.3.2	File System - Limitations in WebCenter	11-11
11.3	Registering Content Repositories	11-11
11.3.1	What You Should Know About Registering Content Repositories for WebCenter Spaces	11-12
11.3.2	Registering Content Repositories Using Fusion Middleware Control	11-12
11.3.3	Registering Content Repositories Using WLST	11-18
11.4	Changing the Active (or Default) Content Repository Connection	11-19
11.4.1	Changing the Active (or Default) Content Repository Connection Using Fusion Middleware Control	11-19
11.4.2	Changing the Active (or Default) Content Repository Connection Using WLST.	11-20

11.5	Modifying Content Repository Connection Details	11-20
11.5.1	Modifying Content Repository Connection Details Using Fusion Middleware Control . 11-20	
11.5.2	Modifying Content Repository Connection Details Using WLST.....	11-21
11.5.3	Modifying Cache Settings of Virtual Content Repository (VCR).....	11-21
11.6	Deleting Content Repository Connections.....	11-23
11.6.1	Deleting Content Repository Connections Using Fusion Middleware Control....	11-23
11.6.2	Deleting Content Repository Connections Using WLST	11-24
11.7	Setting Connection Properties for the WebCenter Spaces Content Repository.....	11-24
11.7.1	Setting Connection Properties for the WebCenter Spaces Content Repository Using Fusion Middleware Control	11-24
11.7.2	Setting Connection Properties for the WebCenter Spaces Content Repository Using WLST	11-25
11.8	Testing Content Repository Connections.....	11-25
11.8.1	Testing Oracle Content Server Connections	11-25
11.8.2	Testing Oracle Portal Connections	11-27
11.9	Changing the Maximum File Upload Size	11-28

12 Managing the Announcements and Discussions Services

12.1	What You Should Know About Discussions Server Connections.....	12-2
12.2	Discussions Server Prerequisites	12-2
12.2.1	Discussions Server - Security Considerations	12-2
12.2.2	Discussions Server - Limitations	12-4
12.3	Registering Discussions Servers	12-4
12.3.1	Registering Discussions Servers Using Fusion Middleware Control	12-4
12.3.2	Registering Discussions Servers Using WLST.....	12-7
12.4	Choosing the Active Connection for Discussions and Announcements	12-8
12.4.1	Choosing the Active Connection for Discussions and Announcements Using Fusion Middleware Control	12-8
12.4.2	Choosing the Active Discussion for Discussions and Announcements Using WLST.....	12-9
12.5	Modifying Discussions Server Connection Details.....	12-9
12.5.1	Modifying Discussions Server Connection Details Using Fusion Middleware Control... 12-9	
12.5.2	Modifying Discussions Server Connection Details Using WLST	12-10
12.6	Deleting Discussions Server Connections	12-10
12.6.1	Deleting a Discussions Server Connection Using Fusion Middleware Control....	12-11
12.6.2	Deleting a Discussions Server Connection Using WLST	12-11
12.7	Setting Up Discussions Service Defaults	12-12
12.8	Setting Up Announcements Service Defaults.....	12-12
12.9	Testing Discussions Server Connections	12-13
12.10	Setting Discussion Forum Options.....	12-13
12.10.1	Specifying Where Discussions and Announcements are Stored on the Discussions Server	12-14
12.10.2	Setting Up a Default Group Space Discussion Forum	12-15
12.10.3	Enabling Discussion Forums to Publish Group Space Mail.....	12-15
12.11	Granting Administrator Role for Oracle WebCenter Discussions Server	12-17
12.11.1	Granting the Administrator Role	12-17

12.11.2	Revoking the Administrator Role	12-18
12.12	Troubleshooting Issues with Announcements and Discussions	12-19
12.12.1	Discussions Cannot Be Enabled in Group Spaces	12-19
12.12.2	Login Does Not Function Properly After Configuring Oracle Access Manager...	12-20
12.12.3	Category Not Found Exceptions	12-20

13 Managing the Events Service

13.1	What You Should Know About Events Connections	13-1
13.2	Events Service Prerequisites	13-2
13.2.1	Microsoft Exchange Server 2007 Prerequisites	13-2
13.2.1.1	Microsoft Exchange Server 2007 - Installation	13-2
13.2.1.2	Microsoft Exchange Server 2007 - Configuration	13-2
13.2.1.3	Microsoft Exchange Server 2007 - Security Considerations	13-3
13.2.1.4	Microsoft Exchange Server 2007 - Limitations	13-3
13.2.2	Microsoft Exchange Server 2003 Prerequisites	13-3
13.2.2.1	Microsoft Exchange Server 2003 - Installation	13-4
13.2.2.2	Microsoft Exchange Server 2003 - Configuration	13-4
13.2.2.3	Microsoft Exchange Server 2003 - Security Considerations	13-5
13.2.2.4	Microsoft Exchange Server 2003 - Limitations	13-5
13.3	Registering Events Servers	13-5
13.3.1	Registering Events Servers Using Fusion Middleware Control	13-5
13.3.2	Registering Event Servers Using WLST	13-6
13.4	Choosing the Active Events Server Connection	13-7
13.4.1	Choosing the Active Events Server Using Fusion Middleware Control	13-7
13.4.2	Choosing the Active Events Server Connection Using WLST	13-7
13.5	Modifying Events Server Connection Details	13-8
13.5.1	Modifying Events Server Connection Details Using Fusion Middleware Control.	13-8
13.5.2	Modifying Events Server Connection Details Using WLST	13-8
13.6	Deleting Event Server Connections	13-9
13.6.1	Deleting Event Server Connections Using Fusion Middleware Control	13-9
13.6.2	Deleting Event Server Connections Using WLST	13-9
13.7	Testing Event Server Connections	13-9
13.8	Troubleshooting Issues with Events	13-10

14 Managing the Instant Messaging and Presence Service

14.1	What You Should Know About Instant Messaging and Presence Connections	14-2
14.2	Instant Messaging and Presence Server Prerequisites	14-2
14.2.1	Microsoft Live Communications Server (LCS) Prerequisites	14-2
14.2.1.1	LCS - Installation	14-2
14.2.1.2	LCS - Configuration	14-2
14.2.1.3	LCS - Security Considerations	14-5
14.2.1.4	LCS - Limitations	14-5
14.2.2	Oracle WebLogic Communications Server (OWLCS) Prerequisites	14-6
14.2.2.1	OWLCS - Installation	14-6
14.2.2.2	OWLCS - Configuration	14-6
14.2.2.3	OWLCS - Security Considerations	14-6
14.2.2.4	OWLCS - Limitations	14-6

14.3	Registering Instant Messaging and Presence Servers.....	14-7
14.3.1	Registering Instant Messaging and Presence Servers Using Fusion Middleware Control 14-7	
14.3.2	Registering Instant Messaging and Presence Servers Using WLST.....	14-11
14.4	Choosing the Active Connection for Instant Messaging and Presence	14-11
14.4.1	Choosing the Active Connection for Instant Messaging and Presence Using Fusion Middleware Control 14-11	
14.4.2	Choosing the Active Connection for Instant Messaging and Presence Using WLST.....	14-12
14.5	Modifying Instant Messaging and Presence Connection Details	14-13
14.5.1	Modifying Instant Messaging and Presence Connections Details Using Fusion Middleware Control 14-13	
14.5.2	Modifying Instant Messaging and Presence Connections Details Using WLST...	14-13
14.6	Deleting Instant Messaging and Presence Connections.....	14-14
14.6.1	Deleting Instant Messaging and Presence Connections Using Fusion Middleware Control 14-14	
14.6.2	Deleting Instant Messaging and Presence Connections Using WLST.....	14-15
14.7	Setting Up Instant Messaging and Presence Service Defaults	14-15
14.8	Testing Instant Messaging and Presence Connections.....	14-15
14.9	Troubleshooting Issues with Instance Messaging and Presence	14-16

15 Managing the Mail Service

15.1	What You Should Know About Mail Server Connections	15-2
15.2	Mail Server Prerequisites	15-2
15.2.1	Mail Server - Installation	15-2
15.2.2	Mail Server - Configuration	15-2
15.2.2.1	Configuring Microsoft Exchange Server 2007 for WebCenter.....	15-3
15.2.2.1.1	Obtain the Certificate from the Microsoft Exchange Server 2007	15-3
15.2.2.1.2	Add the Certificate to the WebCenter Keystore	15-3
15.2.2.1.3	Microsoft Exchange Server Considerations.....	15-3
15.2.3	Mail Server - Security Considerations	15-4
15.2.4	Mail Server - Limitations	15-4
15.3	Registering Mail Servers	15-4
15.3.1	Registering Mail Servers Using Fusion Middleware Control	15-5
15.3.2	Registering Mail Servers Using WLST	15-8
15.4	Choosing the Active (or Default) Mail Server Connection.....	15-9
15.4.1	Choosing the Active (or Default) Mail Server Connection Using Fusion Middleware Control 15-9	
15.4.2	Choosing the Active (or Default) Mail Server Connection Using WLST	15-10
15.5	Modifying Mail Server Connection Details	15-10
15.5.1	Modifying Mail Server Connection Details Using Fusion Middleware Control ..	15-10
15.5.2	Modifying Mail Server Connection Details Using WLST.....	15-11
15.6	Deleting Mail Server Connections.....	15-11
15.6.1	Deleting a Mail Connection Using Fusion Middleware Control.....	15-12
15.6.2	Deleting a Mail Connection Using WLST	15-12
15.7	Setting Up Mail Service Defaults.....	15-12
15.8	Testing Mail Server Connections.....	15-13

15.9	Setting Send Mail Notifications	15-13
15.10	Troubleshooting Issues with Mail	15-14
15.10.1	Mail Service is Not Accessible in Secure Mode.....	15-14
15.10.2	Mail Service is Not Accessible in Non-Secure Mode.....	15-15
15.10.3	Unable to Create Distribution Lists in the Non-Secure Mode	15-15
15.10.4	Unable to Create Distribution Lists in the Secure Mode.....	15-15
15.10.5	Unable to Configure the Number of Mails Downloaded	15-16
15.10.6	Unable to Publish and Archive Group Space Mail.....	15-16
15.10.7	Changing Passwords on Microsoft Exchange	15-17

16 Managing the People Connections Service

16.1	What You Should Know About Administering the People Connections Service.....	16-1
16.2	People Connections Prerequisites	16-2
16.3	Configuring the People Connections Service in WebCenter Spaces.....	16-2
16.3.1	Accessing People Connections Administrative Settings.....	16-2
16.3.2	Configuring Activity Stream.....	16-3
16.3.3	Configuring Connections	16-8
16.3.4	Configuring Profile.....	16-9
16.3.5	Configuring Message Board.....	16-12
16.3.6	Configuring Feedback.....	16-13
16.4	Troubleshooting Issues with the People Connections Service	16-15
16.4.1	Troubleshooting Activity Stream	16-15
16.4.2	Troubleshooting Connections	16-15
16.4.3	Troubleshooting Profile	16-16
16.4.4	Troubleshooting Message Board	16-17
16.4.5	Troubleshooting Feedback	16-17

17 Managing the RSS Service

17.1	What You Should Know About the RSS Service.....	17-1
17.2	RSS Prerequisites.....	17-1
17.3	Specifying the RSS Feed Proxy	17-1
17.4	Testing RSS News Feed Connections.....	17-2

18 Managing the Search Service

18.1	What You Should Know About WebCenter Search with Oracle SES.....	18-2
18.2	WebCenter Search Prerequisites for using Oracle SES.....	18-2
18.2.1	Oracle SES - Installation.....	18-2
18.2.2	Oracle SES - Configuration.....	18-2
18.2.3	Oracle SES - Security	18-3
18.2.4	Oracle SES - Limitations	18-4
18.3	Setting Up Oracle SES Connections	18-4
18.3.1	Registering Oracle SES Services	18-4
18.3.1.1	Registering Oracle SES Search Services Using Fusion Middleware Control....	18-4
18.3.1.2	Registering and Modifying Oracle SES Services Using WLST	18-6
18.3.2	Choosing the Active Oracle SES Connection.....	18-7

18.3.2.1	Choosing the Active Oracle SES Connection Using Fusion Middleware Control.....	18-7
18.3.2.2	Choosing the Active Oracle SES Connection Using WLST	18-8
18.3.3	Modifying Oracle SES Connection Details.....	18-8
18.3.3.1	Modifying Oracle SES Connection Details Using Fusion Middleware Control	18-9
18.3.3.2	Modifying Oracle SES Connection Details Using WLST	18-9
18.3.4	Deleting Oracle SES Connections	18-9
18.3.4.1	Deleting Search Connections Using Fusion Middleware Control	18-10
18.3.4.2	Deleting Search Connections Using WLST.....	18-10
18.3.5	Testing Oracle SES Connections.....	18-10
18.4	Configuring Oracle SES to Search WebCenter Spaces	18-11
18.4.1	Setting Up Oracle SES for WebCenter Spaces	18-12
18.4.2	Setting Up WebCenter Spaces for Oracle SES Search	18-15
18.4.2.1	Enabling Oracle SES Crawlers Using Fusion Middleware Control	18-19
18.4.3	Setting Up Oracle Content Server for Oracle SES Search	18-20
18.4.4	Setting Up Oracle WebCenter Discussions for Oracle SES Search	18-21
18.4.5	Setting Up Oracle SES to Search WebCenter Spaces	18-23
18.4.5.1	Logging on to the Oracle SES Administration Tool	18-23
18.4.5.2	Setting up Oracle SES to Search Documents	18-23
18.4.5.3	Setting Up Oracle SES to Search Discussions and Announcements	18-26
18.4.5.4	Setting Up Oracle SES to Search Group Spaces, Lists, Pages, People, Wikis and Blogs	18-28
18.4.5.5	Additional Oracle SES Configuration	18-30
18.5	Troubleshooting Issues with Search.....	18-30
18.5.1	Cannot Grant View Permissions to WebCenter Spaces	18-30
18.5.2	Oracle SES Cannot Search WebCenter Objects	18-31
18.5.3	"Results Not Currently Available" with Oracle SES Results	18-31

19 Managing the Wiki and Blog Services

19.1	What You Should Know About the Wiki and Blog Server Connections.....	19-2
19.2	Oracle WebCenter Wiki and Blog Server Prerequisites	19-2
19.2.1	Oracle WebCenter Wiki and Blog Server - Installation.....	19-2
19.2.2	Oracle WebCenter Wiki and Blog Server - Configuration.....	19-2
19.2.2.1	What You Should Know About Oracle WebCenter Wiki and Blog Server	19-3
19.2.2.1.1	About the General Menu.....	19-4
19.2.2.1.2	About Administration Mode	19-4
19.2.2.2	Accessing the Oracle WebCenter Wiki and Blog Server.....	19-7
19.2.2.3	Setting Up Domains and Menus	19-8
19.2.2.3.1	Adding a Domain.....	19-8
19.2.2.3.2	Editing a Domain Menu	19-9
19.2.2.3.3	Managing Domain Members	19-12
19.2.2.3.4	Managing Blog Authors	19-13
19.2.2.4	Changing the Theme	19-14
19.2.2.5	Creating a User Interface Template	19-14
19.2.2.6	Unlocking a Page	19-15
19.2.2.7	Managing Users and Roles.....	19-16

19.2.2.7.1	Managing Users.....	19-16
19.2.2.7.2	Managing Permissions for a Role	19-17
19.2.2.8	Blocking an IP Address.....	19-18
19.2.2.9	Deleting Wiki Pages and Blog Entries.....	19-19
19.2.2.9.1	Deleting a Wiki Page.....	19-19
19.2.2.9.2	Deleting a Blog Entry	19-20
19.2.2.10	Specifying Configuration Parameters	19-20
19.2.2.11	Importing Templates and Attachments	19-21
19.2.2.12	Specifying Features Supported on Oracle WebCenter Wiki and Blog Server	19-21
19.2.2.13	Configuring application_config_script	19-22
19.2.2.14	Generating the Passcode.....	19-23
19.2.2.15	Backing Up and Restoring Wiki Content.....	19-25
19.2.3	Oracle WebCenter Wiki and Blog Server - Security Considerations	19-25
19.2.4	Oracle WebCenter Wiki and Blog Server - Limitations	19-25
19.3	Registering Oracle WebCenter Wiki and Blog Server.....	19-25
19.3.1	Registering Oracle WebCenter Wiki and Blog Server Using Fusion Middleware Control	19-25
19.3.2	Registering Oracle WebCenter Wiki and Blog Server Using WLST	19-27
19.4	Choosing the Active Wiki and Blog Server Connection	19-27
19.4.1	Choosing the Active Wiki and Blog Server Connection Using Fusion Middleware Control	19-28
19.4.2	Choosing the Active Wiki and Blog Server Connection Using WLST.....	19-28
19.5	Modifying the Wiki and Blog Server Connection Details.....	19-28
19.5.1	Modifying Wiki and Blog Server Connection Details Using Fusion Middleware Control	19-29
19.5.2	Modifying Wiki and Blog Server Connection Details Using WLST.....	19-29
19.6	Deleting Wiki and Blog Server Connections.....	19-30
19.6.1	Deleting a Wiki and Blog Server Connection Using Fusion Middleware Control	19-30
19.6.2	Deleting a Wiki and Blog Server Connection Using WLST.....	19-30
19.7	Testing Wiki and Blog Server Connections.....	19-31
19.8	Monitoring Oracle WebCenter Wiki and Blog Server	19-31
19.9	Troubleshooting Issues with Wiki and Blogs	19-31

20 Managing the Worklist Service

20.1	What You Should Know About BPEL Connections	20-1
20.2	BPEL Server Prerequisites	20-2
20.2.1	BPEL Server - Installation and Configuration	20-2
20.2.2	BPEL Server - Security Considerations.....	20-3
20.2.3	BPEL Server - Limitations in WebCenter	20-3
20.3	Setting Up Worklist Connections	20-3
20.3.1	What You Should Know About Worklist Connections	20-3
20.3.2	Registering Worklist Connections.....	20-4
20.3.2.1	Registering Worklist Connections Using Fusion Middleware Control.....	20-4
20.3.2.2	Registering Worklist Connections Using WLST	20-6
20.3.3	Activating a Worklist Connection	20-7
20.3.3.1	Activating a Worklist Connections Using Fusion Middleware Control	20-7
20.3.3.2	Activating a Worklist Connections Using WLST.....	20-8

20.3.4	Modifying Worklist Connection Details	20-8
20.3.4.1	Modifying Worklist Connection Details Using Fusion Middleware Control ..	20-8
20.3.4.2	Modifying Worklist Connection Details Using WLST.....	20-9
20.3.5	Deleting Worklist Connections.....	20-9
20.3.5.1	Deleting Worklist Connections Using Fusion Middleware Control.....	20-9
20.3.5.2	Deleting Worklist Connections Using WLST	20-10
20.3.6	Testing Worklist Connections.....	20-10
20.4	Troubleshooting Issues with Worklists	20-11
20.4.1	Unavailability of the Worklist Service Due to Application Configuration Issues	20-11
20.4.1.1	adf-config.xml Refers to a Non-Existent BPEL Connection	20-11
20.4.1.2	adf-config.xml Has No Reference to a BPEL Connection.....	20-12
20.4.1.3	No Rows Yet Message Displays	20-12
20.4.2	Unavailability of the Worklist Service Due to Server Failure	20-13
20.4.2.1	Users Mismatch in Identity Stores	20-13
20.4.2.2	Shared User Directory Does Not Include the weblogic User.....	20-15
20.4.2.3	Issues with the wsm-pm Application.....	20-16
20.4.2.4	Clocks are Out of Sync for More Than Five Minutes	20-16
20.4.2.5	Worklist Service Timed Out or is Disabled	20-16

21 Managing Portlet Producers

21.1	What You Should Know About Portlet Producers	21-1
21.2	Registering WSRP Producers	21-2
21.2.1	Registering a WSRP Producer Using Fusion Middleware Control.....	21-2
21.2.2	Registering a WSRP Producer Using WLST	21-8
21.3	Testing WSRP Producer Connections.....	21-8
21.4	Registering Oracle PDK-Java Producers	21-9
21.4.1	Registering an Oracle PDK-Java Producer Using Fusion Middleware Control.....	21-9
21.4.2	Registering an Oracle PDK-Java Producer Using WLST	21-11
21.5	Testing Oracle PDK-Java Producer Connections	21-12
21.6	Editing Producer Registration Details	21-12
21.6.1	Editing Producer Registration Details Using Fusion Middleware Control	21-12
21.6.2	Editing Producer Registration Details Using WLST	21-13
21.6.3	Migrating WSRP Producer Metadata to a New WSDL URL	21-13
21.7	Deregistering Producers	21-14
21.7.1	Deregistering Producers Using Fusion Middleware Control	21-14
21.7.2	Deregister Producers Using WLST	21-15
21.8	Deploying Portlet Producer Applications	21-15
21.8.1	Understanding Portlet Producer Application Deployment	21-15
21.8.2	Converting a JSR 168 Portlet Producer EAR File into a WSRP EAR File	21-16
21.8.3	Deploying Portlet Producer Applications Using Oracle JDeveloper	21-17
21.8.4	Deploying Portlet Producer Applications Using Fusion Middleware Control.....	21-17
21.8.5	Deploying Portlet Producer Applications Using Oracle WebLogic Server Administration Console	21-17
21.8.6	Deploying Portlet Applications Using WLST	21-17
21.9	Troubleshooting Portlet Producer Issues	21-17
21.9.1	Producer Registration Fails for a Custom WebCenter Application	21-17
21.9.2	Portlet Unavailable: WSM-00101 Exception	21-18

22 Managing External Applications

22.1	What You Should Know About External Applications	22-1
22.2	Registering External Applications.....	22-3
22.2.1	Registering External Applications Using Fusion Middleware Control.....	22-3
22.2.2	Registering External Applications Using WLST	22-7
22.3	Modifying External Application Connection Details	22-7
22.3.1	Modifying External Application Connection Using Fusion Middleware Control .	22-8
22.3.2	Modifying External Application Connection Using WLST	22-8
22.4	Testing External Application Connections.....	22-8
22.5	Deleting External Application Connections.....	22-9
22.5.1	Deleting External Application Connections Using Fusion Middleware Control ...	22-9
22.5.2	Deleting External Application Connections Using WLST	22-9

Part V Advanced Systems Administration for Oracle WebCenter

23 Managing Security

23.1	Introduction to WebCenter Application Security	23-1
23.2	Default Security Configuration.....	23-4
23.2.1	Administrator Accounts	23-4
23.2.2	Application Roles and Enterprise Roles in WebCenter Spaces.....	23-4
23.2.3	Default Identity and Policy Stores.....	23-5
23.2.3.1	File-based Credential Store	23-5
23.2.4	Default Policy Store Permissions and Grants	23-5
23.2.4.1	Permission-based Authorization.....	23-6
23.2.4.2	Role-mapping Based Authorization	23-6
23.2.4.3	Default Policy Store Permissions for WebCenter Spaces	23-6
23.2.4.4	Default Code-based Grants	23-8
23.2.5	Post-deployment Security Configuration Tasks	23-8
23.3	Configuring the Identity Store	23-10
23.3.1	Reassociating the Identity Store with an External LDAP	23-10
23.3.2	Tuning the Identity Store for Performance	23-17
23.3.3	Adding Users to the Identity Store	23-17
23.3.3.1	Adding Users Using the WebLogic Server Administration Console	23-17
23.3.3.2	Adding Users to the Embedded LDAP Using an LDIF File	23-21
23.3.4	Moving the Administrator Account to an External LDAP Server	23-25
23.3.4.1	Migrating the WebCenter Discussions Server to use an External LDAP.....	23-26
23.3.4.2	Changing the Administrator Group Name	23-31
23.3.5	Granting the WebCenter Spaces Administrator Role to a WebCenter Spaces User	23-36
23.3.5.1	Granting the WebCenter Spaces Administrator Role Using Fusion Middleware Control	23-36
23.3.5.2	Granting the WebCenter Spaces Administrator Role Using WLST.....	23-39
23.3.6	Configuring the Oracle Content Server to Share the Identity Store LDAP Server	23-39
23.4	Configuring the Policy and Credential Store.....	23-40
23.4.1	Creating a root Node.....	23-40
23.4.2	Reassociating the Credential and Policy Store Using Fusion Middleware Control	23-41

23.4.3	Reassociating the Credential and Policy Store Using WLST.....	23-42
23.4.4	Managing Credentials.....	23-43
23.4.5	Configuring Self-Registration By Invitation in WebCenter Spaces.....	23-43
23.5	Managing Users and Roles	23-44
23.6	Configuring WebCenter Applications and Components to Use SSL.....	23-44
23.6.1	Securing the Browser Connection to WebCenter Spaces with SSL	23-45
23.6.1.1	Creating the Custom Keystore	23-45
23.6.1.2	Configuring the Custom Identity and Java Trust Keystores.....	23-47
23.6.1.3	Configuring the SSL Connection.....	23-49
23.6.2	Securing the Browser Connection to a Custom WebCenter Application with SSL.....	23-52
23.6.3	Securing the Connection from Oracle HTTP Server to WebCenter Spaces with SSL	23-52
23.6.4	Securing the Browser Connection to the Wiki Service with SSL	23-56
23.6.5	Securing the WebCenter Spaces Connection to Portlet Producers with SSL.....	23-62
23.6.6	Securing the WebCenter Spaces Connection to the LDAP Identity Store.....	23-70
23.6.6.1	Exporting the OID Certificate Authority (CA).....	23-71
23.6.6.2	Setting Up the WebLogic Server	23-71
23.6.7	Securing the WebCenter Spaces Connection to OCS with SSL.....	23-71
23.6.8	Securing the WebCenter Spaces Connection to IMAP and SMTP with SSL.....	23-71
23.6.9	Securing the WebCenter Spaces Connection to Oracle SES with SSL	23-72
23.6.10	Securing the WebCenter Spaces Connection to OWLCS with SSL	23-72
23.6.11	Securing the WebCenter Spaces Connection to Microsoft Live Communication Server with SSL	23-73
23.7	Configuring a WebCenter Application to Use Single Sign-On.....	23-74
23.7.1	Configuring Oracle Access Manager (OAM)	23-74
23.7.1.1	OAM Components and Topology.....	23-75
23.7.1.2	Configuring OAM Using Scripts.....	23-76
23.7.1.3	Configuring the Webtier Components.....	23-78
23.7.1.3.1	Configure mod_weblogic (mod_wl_ohs.conf).....	23-78
23.7.1.3.2	Create an AccessGate Entry	23-78
23.7.1.3.3	Install WebGate on the WebTier	23-80
23.7.1.4	Manually Configuring the Access System.....	23-80
23.7.1.5	Manually Defining the WebCenter Policy Domain.....	23-81
23.7.1.6	Configuring the Policy Manager	23-89
23.7.1.6.1	Configuring the Oracle Internet Directory Authenticator	23-89
23.7.1.6.2	Configuring the OAM Identity Asserter.....	23-94
23.7.1.6.3	Configuring the Default Authenticator and Setting the Provider Order.	23-97
23.7.1.6.4	Configuring the Application for Oracle Access Manager SSO.....	23-98
23.7.1.7	Additional Configurations	23-98
23.7.1.7.1	Configuring the WebLogic Server Administration Console and Enterprise Manager	23-99
23.7.1.7.2	Configuring the Discussions Server for SSO.....	23-101
23.7.1.7.3	Creating a Discussions Server Connection for WebCenter Spaces.....	23-101
23.7.1.7.4	Configuring the Wiki Server.....	23-101
23.7.1.7.5	Restricting Access with Connection Filters	23-102
23.7.2	Configuring Oracle Single Sign-On (OSSO)	23-103
23.7.2.1	OSSO Components and Topology	23-104

23.7.2.2	Configuring the Oracle HTTP Server and Associated mods	23-104
23.7.2.3	Configuring the OSSOIdentityAsserter	23-105
23.7.2.4	Registering OHS with Oracle SSO	23-107
23.7.2.5	Configuring the Discussions Server for SSO	23-110
23.7.3	Configuring SAML-based Single Sign-on	23-110
23.7.3.1	SAML Components and Topology	23-111
23.7.3.2	Configuring SAML-based Single Sign-on	23-114
23.7.3.2.1	Preparing WebCenter Spaces and Services for SAML SSO	23-114
23.7.3.2.2	Generating and Registering Certificates	23-116
23.7.3.2.3	Creating the SAML Credential Mapping Provider Instance	23-121
23.7.3.2.4	Configuring a Relying Party	23-126
23.7.3.2.5	Configuring Source Site Federation Services	23-135
23.7.3.2.6	Configuring the SAML Identity Assertion Provider	23-137
23.7.3.2.7	Configuring Destination Site Federation Services	23-156
23.7.3.2.8	Checking Your Configuration	23-161
23.7.4	Configuring SSO with Microsoft Clients	23-161
23.7.4.1	Microsoft Client SSO Concepts	23-162
23.7.4.2	System Requirements	23-163
23.7.4.3	Configuring SSO with Microsoft Clients	23-164
23.7.4.3.1	Configuring the Negotiate Identity Assertion Provider	23-165
23.7.4.3.2	Configuring an Active Directory Authentication Provider	23-167
23.7.4.3.3	Configuring WebCenter Spaces	23-173
23.7.4.3.4	Configuring the Discussions Server for SSO	23-174
23.8	Configuring WS-Security	23-174
23.8.1	Configuring WS-Security for a Simple Topology	23-175
23.8.1.1	Setting Up the WebCenter Domain Keystore	23-176
23.8.1.1.1	Creating the WebCenter Domain Keystore	23-176
23.8.1.1.2	Configuring the Keystore with WLST	23-177
23.8.1.1.3	Configuring the Keystore Using Fusion Middleware Control	23-178
23.8.1.1.4	Unconfiguring a Keystore Provider Using Fusion Middleware Control	23-180
23.8.1.2	Configuring the Discussions Server for a Simple Topology	23-182
23.8.1.2.1	Importing the WebCenter Domain Certificate	23-182
23.8.1.2.2	Creating the Keystore Certificate Properties File	23-183
23.8.1.2.3	Specifying the Properties File for ClassLoader	23-183
23.8.1.2.4	Updating the System Properties for WS-Security	23-184
23.8.1.2.5	Configuring the Discussions Server Connection Settings	23-184
23.8.1.3	Configuring the BPEL Server for a Simple Topology	23-185
23.8.2	Configuring WS-Security for a Typical Topology	23-186
23.8.2.1	Setting Up the WebCenter Domain Keystore	23-187
23.8.2.1.1	Creating the WebCenter Domain Keystore	23-188
23.8.2.1.2	Configuring the Keystore Using WLST	23-189
23.8.2.1.3	Configuring the Keystore Using Fusion Middleware Control	23-190
23.8.2.1.4	Unconfiguring a Keystore Provider	23-192
23.8.2.2	Configuring the Discussions Server for a Typical Topology	23-194
23.8.2.2.1	Importing the WebCenter Domain Certificate	23-194
23.8.2.2.2	Creating the Keystore Certificate Properties File	23-194
23.8.2.2.3	Specifying the Properties File for ClassLoader	23-195

23.8.2.2.4	Updating the System Properties for WS-Security	23-196
23.8.2.2.5	Configuring the Discussions Server Connection Settings	23-196
23.8.2.3	Setting Up the SOA Domain	23-197
23.8.2.3.1	Creating the SOA Domain Keystore.....	23-197
23.8.2.3.2	Configuring the Keystore Using WLST	23-199
23.8.2.3.3	Configuring the Keystore Using Fusion Middleware Control.....	23-199
23.8.2.3.4	Unconfiguring a Keystore Provider	23-200
23.8.2.4	Configuring the BPEL Server for a Typical Topology	23-201
23.8.3	Configuring WS-Security for a Complex Topology	23-202
23.8.3.1	Setting Up the WebCenter Domain Keystore.....	23-203
23.8.3.1.1	Creating the WebCenter Domain Keystore	23-203
23.8.3.1.2	Configuring the Keystore Using WLST	23-205
23.8.3.1.3	Configuring the Keystore Using Fusion Middleware Control.....	23-205
23.8.3.1.4	Unconfiguring a Keystore Provider	23-207
23.8.3.2	Configuring the Discussions Server for a Complex Topology	23-209
23.8.3.2.1	Importing the WebCenter Domain Certificate.....	23-209
23.8.3.2.2	Creating the Keystore Certificate Properties File	23-209
23.8.3.2.3	Specifying the Properties File for ClassLoader	23-210
23.8.3.2.4	Updating the System Properties for WS-Security	23-211
23.8.3.2.5	Configuring the Discussions Server Connection Settings	23-211
23.8.3.3	Setting Up the First SOA Domain	23-212
23.8.3.3.1	Creating the SOA Domain Keystore.....	23-212
23.8.3.3.2	Configuring the Keystore Using WLST	23-214
23.8.3.3.3	Configuring the Keystore Using Fusion Middleware Control.....	23-214
23.8.3.3.4	Unconfiguring a Keystore Provider	23-215
23.8.3.4	Setting Up the Second SOA Domain	23-216
23.8.3.4.1	Creating the SOA Domain Keystore.....	23-216
23.8.3.4.2	Configuring the Keystore Using WLST	23-218
23.8.3.4.3	Configuring the Keystore Using Fusion Middleware Control.....	23-218
23.8.3.4.4	Unconfiguring a Keystore Provider	23-219
23.8.3.5	Configuring the BPEL Server for a Complex Topology	23-220
23.8.3.6	Setting Up the External Portlet Domain Keystore	23-222
23.8.3.6.1	Creating the External Portlet Domain Keystore	23-223
23.8.3.6.2	Configuring the Keystore Using WLST	23-224
23.8.3.6.3	Configuring the Keystore Using Fusion Middleware Control.....	23-224
23.8.3.6.4	Unconfiguring a Keystore Provider	23-225
23.8.3.7	Setting Up the External WebCenter Domain Keystore.....	23-227
23.8.3.7.1	Creating the External WebCenter Domain Keystore	23-227
23.8.3.7.2	Configuring the Keystore Using WLST	23-229
23.8.3.7.3	Configuring the Keystore Using Fusion Middleware Control.....	23-229
23.8.3.7.4	Unconfiguring a Keystore Provider	23-230
23.8.3.7.5	Calling WebCenter Spaces WebServices.....	23-231
23.8.4	Securing Oracle WebLogic Communication Services (OWLCS) with WS-Security	23-231
23.8.5	Securing a WSRP Producer with WS-Security	23-233
23.8.5.1	Deploying the Producer	23-233
23.8.5.2	Attaching a Policy to the Producer Endpoint.....	23-233

23.8.5.3	Setting Up the Keystores	23-238
23.8.6	Securing WebCenter Spaces for Applications Consuming Spaces Client APIs with WS-Security	23-238
23.8.6.1	Generating the Keystores	23-239
23.8.6.2	Providing the Keystores and Keystore Information to the Application Developer ...	23-241
23.8.6.3	Registering the Keystores	23-241
23.8.6.4	Updating the Credential Stores	23-243
23.8.6.4.1	Updating the Credential Store Using WLST	23-243
23.8.6.4.2	Updating the Credential Store Using Fusion Middleware Control.....	23-244
23.9	Securing a PDK-Java Producer	23-245
23.9.1	Defining a Shared Key as a Password Credential	23-245
23.9.1.1	Defining a Shared Key Using Fusion Middleware Control	23-245
23.9.1.2	Defining a Shared Key Using WLST.....	23-246
23.10	Troubleshooting Security Configuration Issues.....	23-247
23.10.1	Webcenter Spaces Does Not Find Users in LDAP Provider	23-248
23.10.2	Group Space Gets Created with Errors When Logged in as OID User	23-248
23.10.3	Users Cannot Do Self-Registration with WebCenter Spaces Configured with Active Directory	23-248
23.10.4	User Made Administrator Doesn't Have Administrator Privileges.....	23-249
23.10.5	OmniPortlet Producer Authorization Exception in SSO Environment.....	23-249

24 Monitoring Oracle WebCenter Performance

24.1	Understanding WebCenter Performance Metrics.....	24-1
24.1.1	WebCenter Metric Collection: Recent History and Since Startup	24-2
24.1.2	Common WebCenter Metrics	24-3
24.1.3	Common WebCenter Performance Issues and Actions	24-7
24.1.4	WebCenter Service-Specific Metrics	24-8
24.1.4.1	Announcements Metrics.....	24-9
24.1.4.2	BPEL Worklist Metrics.....	24-10
24.1.4.3	Content Repository (Documents Service) Metrics.....	24-10
24.1.4.4	Discussions Metrics	24-15
24.1.4.5	Events Metrics.....	24-17
24.1.4.6	External Application Metrics	24-19
24.1.4.7	Instant Messaging and Presence (IMP) Metrics	24-21
24.1.4.8	Import and Export Metrics.....	24-22
24.1.4.9	List Metrics	24-22
24.1.4.10	Mail Metrics.....	24-24
24.1.4.11	Note Metrics	24-26
24.1.4.12	Page Metrics	24-27
24.1.4.13	Portlet Producer Metrics.....	24-28
24.1.4.14	Portlet Metrics.....	24-30
24.1.4.15	RSS News Feed Metrics	24-34
24.1.4.16	Recent Activity Metrics.....	24-34
24.1.4.17	Search Metrics	24-35
24.1.5	WebCenter Service-Specific Performance Issues and Actions.....	24-36
24.1.5.1	Announcements Service	24-37

24.1.5.2	BPEL Worklist Service	24-37
24.1.5.3	Content Repository (Documents) Service	24-37
24.1.5.4	Discussions Service	24-37
24.1.5.5	External Applications Service	24-38
24.1.5.6	Events Service	24-38
24.1.5.7	Instant Messaging and Presence (IMP) Service	24-38
24.1.5.8	Import and Export	24-38
24.1.5.9	Lists Service	24-38
24.1.5.10	Mail Service	24-38
24.1.5.11	Notes Service	24-39
24.1.5.12	Page Service	24-39
24.1.5.13	Portlets and Producers	24-39
24.1.5.14	RSS Service	24-39
24.1.5.15	Recent Activities Service	24-40
24.1.5.16	Search Service	24-40
24.1.6	Group Space Metrics	24-40
24.2	Viewing Performance Information	24-42
24.2.1	Monitoring WebCenter Spaces	24-42
24.2.2	Monitoring Custom WebCenter Applications	24-43
24.3	Viewing and Configuring Log Information	24-45
24.3.1	WebCenter Spaces Logs	24-45
24.3.2	Custom WebCenter Application Logs	24-46

25 Managing Export, Import, Backup, and Recovery of WebCenter

25.1	Exporting and Importing WebCenter Spaces for Data Migration	25-1
25.1.1	Understanding WebCenter Spaces Export and Import	25-2
25.1.2	Prerequisites for WebCenter Spaces Export and Import	25-4
25.1.3	Migrating Back-end Components for an Entire WebCenter Spaces Application ...	25-4
25.1.3.1	Exporting the LDAP Identity Store	25-5
25.1.3.2	Importing the LDAP Identity Store	25-6
25.1.3.3	Exporting and Importing the LDAP Credential Store	25-6
25.1.3.4	Exporting and Importing the LDAP Policy Store	25-8
25.1.3.5	Exporting and Importing a File-based Credential Store	25-11
25.1.3.6	Exporting and Importing a File-based Policy Store	25-12
25.1.3.7	Exporting Oracle WebCenter Discussions Server	25-13
25.1.3.8	Importing Oracle WebCenter Discussions Server	25-13
25.1.3.9	Exporting Oracle WebCenter Wiki Server	25-14
25.1.3.10	Importing Oracle WebCenter Wiki Server	25-15
25.1.3.11	Exporting Oracle Content Server	25-16
25.1.3.12	Importing Oracle Content Server	25-17
25.1.3.13	Exporting Oracle WebLogic Communications Server	25-18
25.1.3.14	Importing Oracle WebLogic Communications Server	25-18
25.1.3.15	Exporting Portlet Producers	25-18
25.1.3.16	Importing Portlet Producers	25-18
25.1.4	Exporting an Entire WebCenter Spaces Application	25-18
25.1.4.1	Exporting WebCenter Spaces Using Oracle Enterprise Manager Fusion Middleware Control	25-19

25.1.4.2	Exporting WebCenter Spaces Using WLST	25-22
25.1.5	Importing an Entire WebCenter Spaces Application	25-22
25.1.5.1	Importing WebCenter Spaces Using Oracle Enterprise Manager Fusion Middleware Control	25-23
25.1.5.2	Importing WebCenter Spaces Using WLST.....	25-24
25.1.6	Prerequisites for Group Space Export and Import	25-24
25.1.7	Migrating Back-end Components for Individual Group Spaces	25-25
25.1.7.1	Exporting Discussions for a Group Space.....	25-25
25.1.7.2	Importing Discussions for a Group Space	25-27
25.1.7.3	Exporting Wikis and Blogs for a Group Space.....	25-29
25.1.7.4	Importing Wikis and Blogs for a Group Space	25-30
25.1.7.5	Exporting Documents for a Group Space	25-31
25.1.7.6	Importing Documents for a Group Space.....	25-32
25.1.8	Exporting Group Spaces	25-32
25.1.8.1	Exporting Group Spaces Using WebCenter Spaces	25-33
25.1.8.2	Exporting Group Spaces Using WLST	25-33
25.1.9	Importing Group Spaces.....	25-33
25.1.9.1	Importing Group Spaces Using WebCenter Spaces	25-34
25.1.9.2	Importing Group Spaces Using WLST.....	25-34
25.1.10	Migrating Back-end Components for Group Space Templates	25-34
25.1.11	Exporting Group Space Templates	25-35
25.1.11.1	Exporting Group Space Templates Using WebCenter Spaces.....	25-35
25.1.11.2	Exporting Group Space Templates Using WLST.....	25-35
25.1.12	Importing Group Space Templates.....	25-35
25.1.12.1	Importing Group Space Templates Using WebCenter Spaces	25-36
25.1.12.2	Importing Group Space Templates Using WLST	25-36
25.2	Exporting and Importing Custom WebCenter Applications for Data Migration	25-36
25.2.1	Understanding Custom WebCenter Application Export and Import	25-36
25.2.2	Prerequisites for Custom WebCenter Application Export and Import	25-37
25.2.3	Exporting Portlet Client Metadata (Custom WebCenter Applications).....	25-38
25.2.4	Importing Portlet Client Metadata (Custom WebCenter Applications).....	25-38
25.2.5	Exporting WebCenter Services Metadata and Data (Custom WebCenter Applications). 25-39	
25.2.6	Importing WebCenter Services Metadata and Data (Custom WebCenter Applications). 25-41	
25.2.7	Migrating Security for Custom WebCenter Applications	25-42
25.2.8	Migrating Data (Custom WebCenter Applications).....	25-42
25.2.8.1	Exporting Data (Custom WebCenter Applications).....	25-43
25.2.8.2	Importing Data (Custom WebCenter Applications)	25-43
25.3	Backing Up and Recovering WebCenter Applications	25-43
25.4	Troubleshooting Import and Export Issues for WebCenter Spaces	25-44
25.4.1	ResourceLimitException Issue.....	25-44
25.4.2	Exporting and Importing Group Spaces in Multibyte Languages	25-44
25.4.3	Page or Group Space Not Found Messages After Import	25-45
25.4.4	Group Space Import Archive Exceeds Maximum Upload File Size	25-45
25.4.5	Lists Not Imported Properly	25-45
25.4.6	Exporting WebCenter Spaces Customizations	25-45

Part VI Application Administration for Oracle WebCenter Spaces

26 Accessing WebCenter Spaces Administration Pages

26.1	Logging into WebCenter Spaces as an Administrator	26-1
26.2	WebCenter Spaces Administration Pages	26-2

27 Customizing WebCenter Spaces

27.1	Naming Your WebCenter	27-1
27.2	Customizing the Online Help Link	27-2
27.3	Customizing the Sidebar	27-3
27.3.1	Hiding and Showing Task Flows in the Sidebar	27-4
27.3.2	Locking Sidebar Content	27-4
27.4	Changing the WebCenter Logo	27-5
27.5	Applying Look and Feel Using Skins	27-6
27.5.1	What You Should Know About Application Skins	27-6
27.5.2	Selecting a Skin.....	27-7
27.5.3	Making New Skins Available to WebCenter Spaces	27-7
27.6	Applying Site Templates.....	27-7
27.6.1	Choosing the Default Site Templates for Personal Spaces and Group Spaces	27-9
27.6.2	Making New Site Templates Available to WebCenter Spaces.....	27-9
27.7	Customizing Copyright and Privacy Statements.....	27-9
27.8	Choosing the Default Display Language	27-10
27.9	Enabling and Disabling WebCenter Services	27-12
27.10	Enabling and Disabling Personal Spaces.....	27-13
27.11	Publishing the WebDAV URL	27-14
27.12	Making New Page Styles Available	27-14
27.13	Customizing the Oracle Composer Catalog and Deploying New Task Flows	27-15

28 Managing Users and Roles for WebCenter Spaces

28.1	Understanding Users, Roles, and Permissions.....	28-1
28.1.1	Understanding Users	28-1
28.1.2	Understanding Application Roles.....	28-2
28.1.2.1	Default Application Roles	28-2
28.1.2.2	Custom Application Roles	28-3
28.1.3	Understanding Application Permissions	28-3
28.1.4	Understanding Discussions Server Role and Permission Mapping	28-5
28.1.5	Understanding Group Space Roles and Permissions.....	28-7
28.2	Managing Users	28-7
28.2.1	What You Need to Know About Managing Users	28-7
28.2.2	Assigning Users (and Groups) to Roles	28-8
28.2.3	Assigning a User to a Different Role.....	28-10
28.2.4	Giving a User Administrative Privileges	28-11
28.2.5	Revoking Application Roles.....	28-12
28.2.6	Adding or Removing Users.....	28-13
28.3	Managing Application Roles and Permissions.....	28-13
28.3.1	What You Need to Know About Application Roles and Permissions.....	28-13

28.3.2	Defining Application Roles	28-14
28.3.3	Modifying Application Role Permissions	28-15
28.3.4	Granting Permissions to the Public-User	28-16
28.3.5	Granting Permissions to the Spaces-User	28-16
28.3.6	Deleting Application Roles.....	28-16
28.4	Allowing Self-Registration	28-17
28.4.1	Enabling Self-Registration By Invitation-Only.....	28-18
28.4.2	Enabling Anyone to Self-Register.....	28-19
28.5	Troubleshooting Issues with Users and Roles.....	28-21

29 Managing Pages in WebCenter Spaces

29.1	Managing Business Role Pages.....	29-1
29.1.1	What You Should Know About Business Role Pages	29-1
29.1.2	Creating a Business Role Page	29-3
29.1.3	Specifying the Target Audience for Business Role Pages.....	29-4
29.1.4	Choosing a Default Display Order for Business Role Pages.....	29-7
29.1.5	Editing a Business Role Page	29-9
29.1.6	Copying a Business Role Page	29-10
29.1.7	Deleting a Business Role Page	29-12
29.2	Managing Personal Pages.....	29-13
29.2.1	What You Should Know About Personal Page Management.....	29-13
29.2.2	Setting Up a Default Look and Feel for Personal Pages.....	29-14
29.2.3	Editing Personal Pages with Administrative Privileges	29-15
29.2.4	Changing Access Permissions for a Personal Page.....	29-17
29.2.5	Copying a Personal Page	29-20
29.2.6	Deleting a Personal Page	29-22
29.3	Setting Up the Public User Experience	29-23
29.3.1	Customizing the Public Welcome Page.....	29-24
29.3.2	Customizing the Login Page.....	29-25
29.3.3	Customizing the Self-Registration Page.....	29-26
29.3.4	Preventing Public Users From Seeing Personal or Business Role Pages.....	29-28

30 Making Applications Available in WebCenter Spaces

30.1	What You Should Know About the Applications Pane	30-1
30.2	Making an Application Available to WebCenter Users.....	30-2
30.3	Editing Links in the Applications Pane	30-5
30.4	Arranging the Applications List	30-6
30.5	Locking Applications Displayed in the Applications Pane.....	30-7
30.6	Removing Links from the Applications Pane.....	30-8

31 Managing Group Spaces in WebCenter Spaces

31.1	What You Should Know About Group Space Management.....	31-1
31.2	Viewing Group Space Information	31-2
31.3	Changing the Status of a Group Space	31-2
31.3.1	Taking Any Group Space Offline	31-3
31.3.2	Bringing Any Group Space Back Online.....	31-3

31.3.3	Closing Any Group Space	31-4
31.3.4	Reactivating Any Group Space.....	31-5
31.3.5	Deleting a Group Space	31-5
31.4	Enabling and Disabling Services	31-6
31.5	Managing Group Space Templates	31-6
31.5.1	What You Should Know About Managing Group Space Templates	31-7
31.5.2	Viewing Group Space Templates.....	31-7
31.5.3	Publishing and Hiding Group Space Templates.....	31-8
31.5.4	Deleting a Group Space Template.....	31-8
31.6	Troubleshooting	31-9
31.6.1	Troubleshooting WebCenter Spaces Workflows	31-9
31.6.1.1	Validating the WebCenter Workflow Configuration.....	31-9
31.6.1.2	Troubleshooting Issues with WebCenter Spaces Workflows	31-10
31.6.2	Troubleshooting Service Provisioning Issues.....	31-11

32 Exporting and Importing Group Spaces

32.1	Exporting Group Spaces	32-1
32.2	Importing Group Spaces.....	32-5
32.3	Exporting Group Space Templates.....	32-6
32.4	Importing Group Space Templates	32-8
32.5	Troubleshooting Group Space Import and Export Issues	32-9
32.5.1	ResourceLimitException Issue.....	32-10
32.5.2	Group Space Blocked After Unsuccessful Export or Import.....	32-10
32.5.3	Page or Group Space Not Found Message After Import.....	32-10
32.5.4	Group Space Import Archive Exceeds Maximum Upload File Size	32-10
32.5.5	Maximum Number of Group Spaces Exceeded on Export	32-10
32.5.6	Lists Not Imported Properly	32-11

A WebCenter Configuration

A.1	Configuration Files	A-1
A.1.1	adf-config.xml and connections.xml.....	A-1
A.1.2	web.xml	A-4
A.2	Cluster Configuration.....	A-5
A.3	Configuration Tools.....	A-5
A.3.1	Configuration Through Fusion Middleware Control, WLST Commands, and System MBeans Browser A-5	
A.3.2	Editing Configuration Files Manually.....	A-6
A.4	Tuning Environment Configuration	A-6
A.4.1	Setting System Limit.....	A-7
A.4.2	Setting JDBC Data Source	A-7
A.4.3	Setting JRockit Virtual Machine (JVM) Arguments.....	A-7
A.5	Tuning WebCenter Application Configuration.....	A-8
A.5.1	Setting HTTP Session Timeout	A-8
A.5.2	Setting JSP Page Timeout.....	A-9
A.5.3	Setting ADF Client State Token	A-9
A.5.4	Setting MDS Cache Size and Purge Rate.....	A-9

A.5.5	Configuring Concurrency Management	A-10
A.5.6	Configuring CRUD APIs (Create, Read, Update and Delete).....	A-11
A.6	Tuning Back-End Component Configuration.....	A-11
A.6.1	Tuning Performance of the Announcements Service	A-12
A.6.2	Tuning Performance of the Discussions Service	A-12
A.6.3	Tuning Performance of the Instant Messaging and Presence (IMP) Service	A-13
A.6.4	Tuning Performance of the Mail Service.....	A-13
A.6.5	Tuning Performance of the RSS News Feed Service	A-14
A.6.6	Tuning Performance of the Search Service	A-14
A.6.7	Tuning Performance of WSRP Producers	A-15
A.6.8	Tuning Performance of Oracle PDK-Java Producers	A-15
A.6.9	Tuning Performance of OmniPortlet	A-15
A.6.10	Tuning Performance of the Portlet Service	A-16
A.6.11	Configuring Portlet Cache Size	A-17
A.6.12	Configuring Portlet Timeout	A-17
A.7	Troubleshooting WebCenter Application Configuration Issues	A-17
A.7.1	WebCenter Does Not Display in the Application Deployment Menu in Fusion Middleware Control	A-18
A.7.2	Configuration Options Unavailable.....	A-19
A.7.3	Configuration Performed in One Application Reflects in Another	A-20
A.7.4	WebCenter Spaces Logs Indicate Too Many Open Files	A-20
A.8	Troubleshooting WLST Command Issues.....	A-20
A.8.1	None of the WLST Commands Work.....	A-21
A.8.2	WLST Commands Do Not Work for a Particular Service	A-21
A.8.3	A Connection with the Name Connection_Name Already Exists	A-22
A.8.4	WLST Shell is Not Connected to the Oracle WebLogic Managed Server Instance.	A-22
A.8.5	Application with the Same Name Already Exists in a Domain.....	A-22
A.8.6	Application with the Same Name Already Exists on a Managed Server	A-23
A.8.7	Already in Domain Runtime Tree Message Displays	A-23

Index

List of Examples

11-1	serviceInstanceEntry in Oracle Content Server's jps-config.xml	11-5
11-2	Sample Output Generated by the Keytool	11-8
11-3	Sample sslconfig.hda File.....	11-10
23-1	Generating the Keypair	23-176
23-2	Exporting the Certificate Containing the Public Key	23-177
23-3	Importing the Certificate.....	23-177
23-4	Updating the Credential Store	23-178
23-5	Importing the WebCenter Domain Certificate	23-182
23-6	Generating the Keypair	23-188
23-7	Exporting the Certificate Containing the Public Key	23-189
23-8	Updating the Credential Store	23-190
23-9	Importing the WebCenter Domain Certificate	23-194
23-10	Importing the Public Certificate	23-198
23-11	Generating the Keypair	23-198
23-12	Exporting the Certificate Containing the Public Key	23-198
23-13	Importing the Certificate.....	23-199
23-14	Generating the Keypair	23-204
23-15	Exporting the Certificate Containing the Public Key	23-204
23-16	Importing the WebCenter Domain Certificate	23-209
23-17	Importing the Public Certificate	23-213
23-18	Generating the Keypair	23-213
23-19	Exporting the Certificate Containing the Public Key	23-213
23-20	Importing the Certificate.....	23-214
23-21	Generating the Keypair	23-217
23-22	Exporting the Certificate Containing the Public Key	23-217
23-23	Importing the Certificate.....	23-217
23-24	Importing the Certificate.....	23-223
23-25	Generating the Keypair	23-223
23-26	Exporting the Certificate Containing the Public Key	23-224
23-27	Importing the Certificate.....	23-224
23-28	Importing the Certificate.....	23-227
23-29	Generating the Keypair	23-228
23-30	Exporting the Certificate Containing the Public Key	23-228
23-31	Importing the Certificate.....	23-228
23-32	keystore-csf-key.....	23-243
23-33	enc-csf-key.....	23-244
23-34	sign-csf-key	23-244
25-1	ldapsearch Command to Export LDAP Identity Store.....	25-5
25-2	ldapaddmt Utility to Import the Idif File	25-6
25-3	migrateSecurityStore - Credential Store	25-8
25-4	migrateSecurityStore - Policy Store.....	25-10
25-5	migrateSecurityStore - Credential Store	25-11
25-6	migrateSecurityStore - Credential Store	25-12
25-7	Export Database Utility	25-13
25-8	Database Import Utility	25-14
25-9	Data Pump Export Utility	25-15
25-10	Database Import Utility	25-15
25-11	Data Pump Utility (Export)	25-16
25-12	Data Pump Utility (Import).....	25-17
25-13	Data Pump Utility (Export)	25-43
25-14	Data Pump Utility (Import).....	25-43

Preface

Welcome to the Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter! This guide describes how to administer Oracle WebCenter, WebCenter Spaces, and custom WebCenter application deployments. It describes how to start and stop WebCenter applications, how to configure WebCenter components, back-end services, and security, and also how to back up, recover, and migrate WebCenter applications and WebCenter Services.

This guide also contains a section for WebCenter Spaces administrators that describes how to customize WebCenter Spaces out-of-the-box, and how to manage user roles and responsibilities for this application.

Audience

This document is intended for:

- Fusion Middleware administrators responsible for Oracle WebCenter installations, and WebCenter application deployments (including WebCenter Spaces).
- WebCenter Spaces administrators (users granted the Administrator role through WebCenter Spaces Administration).

This guide assumes that the audience is familiar with the concepts and content described in *Oracle Fusion Middleware Administrator's Guide*.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible to all users, including users that are disabled. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at <http://www.oracle.com/accessibility/>.

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/support/contact.html> or visit <http://www.oracle.com/accessibility/support.html> if you are hearing impaired.

Related Documents

For more information, see the following documents in the Oracle Fusion Middleware 11g Release 1 (11.1.1) documentation set:

- *Oracle Fusion Middleware Administrator's Guide*
- *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*
- *Oracle Fusion Middleware User's Guide for Oracle WebCenter*
- *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*
- *Oracle Fusion Middleware Tutorial for Oracle WebCenter Developers*

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Part I

Understanding Oracle WebCenter

This part of the Administrator's Guide introduces you to Oracle WebCenter and its administration tools.

Part I contains the following chapters:

- [Chapter 1, "Introduction to Oracle WebCenter Administration"](#)

Introduction to Oracle WebCenter Administration

Welcome to Oracle WebCenter!

This chapter provides a high-level overview of Oracle WebCenter and its administrative tools. It includes the following sections:

- [Section 1.1, "Introducing Oracle WebCenter"](#)
- [Section 1.2, "Oracle WebCenter Architecture"](#)
- [Section 1.3, "Oracle WebCenter Topology"](#)
- [Section 1.4, "Oracle WebCenter Spaces"](#)
- [Section 1.5, "Custom WebCenter Applications"](#)
- [Section 1.6, "Planning WebCenter Installations"](#)
- [Section 1.7, "Understanding the WebCenter 11g Installation"](#)
- [Section 1.8, "Understanding Administrative Operations, Roles, and Tools"](#)
- [Section 1.9, "Performance Monitoring and Diagnostics"](#)
- [Section 1.10, "WebCenter Application Deployment"](#)
- [Section 1.11, "Data Migration, Backup, and Recovery"](#)
- [Section 1.12, "Oracle WebCenter Administration Tools"](#)

1.1 Introducing Oracle WebCenter

Oracle WebCenter is an integrated set of components with which you can create social applications, enterprise portals, collaborative communities, and composite applications, built on a standards-based, service-oriented architecture. Oracle WebCenter combines dynamic user interface technologies with which to develop rich internet applications, the flexibility and power of an integrated, multi-channel portal framework, and a set of horizontal Enterprise 2.0 capabilities delivered as services that provide content, collaboration, presence and social networking capabilities. Based on these components, Oracle WebCenter also provides an out-of-the-box enterprise-ready customizable application, WebCenter Spaces, with a configurable work environment that enables individuals and groups to work and collaborate more effectively.

Oracle WebCenter provides an open and extensible solution that allows users to interact directly with services like instant messaging, documents, content management, discussion forums, wikis and tagging directly from within the context of

a portal or an application. These tools and services empower end users and IT to build and deploy next-generation collaborative applications and portals.

This section describes Oracle WebCenter components and architecture in the following sections:

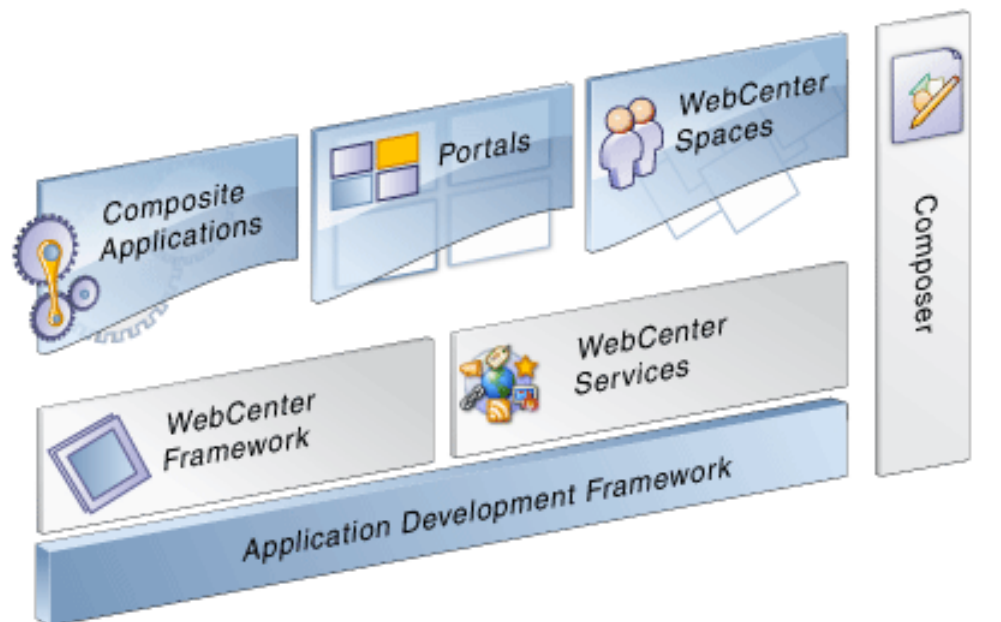

- [Section 1.2, "Oracle WebCenter Architecture"](#)
- [Section 1.3, "Oracle WebCenter Topology"](#)
- [Section 1.4, "Oracle WebCenter Spaces"](#)
- [Section 1.5, "Custom WebCenter Applications"](#)

1.2 Oracle WebCenter Architecture

Oracle WebCenter comprises the following components (shown in [Figure 1-1](#)):

- [Oracle WebCenter Framework](#)
- [Oracle Application Development Framework](#)
- [Oracle Composer](#)
- [WebCenter Services](#)
- [WebCenter Spaces](#)
- [Portals](#)
- [Composite Applications](#)

Figure 1-1 Oracle WebCenter Architecture

1.2.1 Oracle WebCenter Framework

Injects portal capabilities into ADF, including:

- Run-time customization (you can make in-place changes to the application without re-deploying it)
- Support for JSR-168 standards-based WSRP portlets, and PDK-Java portlets
- Content integration through JCR (JSR170), including Oracle Content Server (OCS), file system, and Oracle Portal
- Oracle JSF Portlet Bridge, which lets you expose JSF pages and ADF task flows as standards-based portlets

1.2.2 Oracle Application Development Framework

Application Development Framework (ADF) is a productivity layer that sits on top of JSF and provides:

- Unified access to back ends such as databases, Web services, XML, CSV, and BPEL
- Data binding (JSR 227) connecting the user interface with back-end data controls
- Over 100 data-aware JSF view components
- Native component model that includes task flows
- Fine grained JAAS security model

1.2.3 Oracle Composer

Oracle Composer provides:

- Ability to perform run-time customization in-place in your browser
- A rich, intuitive user experience where you can:
 - Browse and add resources to pages
 - Re-arrange page layout
 - Set page and component properties
 - Contextually wire components

1.2.4 WebCenter Services

[Table 1–1](#) lists the services available to WebCenter application—both WebCenter Spaces and custom WebCenter applications.

Table 1–1 WebCenter Services

Services A Through M	Services N Through W
Announcements	Notes ¹
Blog	Page
Discussions	People Connections
Documents	RSS ²
Events ¹	Recent Activities
Instant Messaging and Presence (IMP)	Search
Links	Tags

Table 1–1 (Cont.) WebCenter Services

Services A Through M	Services N Through W
Lists ¹	Wiki
Mail	Worklist

¹ WebCenter Spaces only.

² RSS news feeds are available from WebCenter Spaces only. The RSS Viewer task flow is available in both WebCenter Spaces and custom WebCenter applications.

WebCenter services include provides:

- Seamless integration with enterprise-level services
- Thin adapter layer to abstract back-end services. For example:
 - Content adapter: Oracle Content Server and Oracle Portal
 - Presence adapter: Oracle WebLogic Communication Server (OWLCS), Microsoft Live Communication Server
- Back-end systems represented by a unified connection architecture
- User interface to services presented through rich task flow components

1.2.5 WebCenter Spaces

Built using JSF, ADF, Oracle WebCenter Framework, WebCenter services, and Oracle Composer, WebCenter Spaces provides:

- A browser-based, community-focused portal framework targeting the business user.
- A personal space for each user, providing a private work area for storing personal content, keeping notes, viewing and responding to business process assignments, maintaining a list of online buddies, emailing, and so on. The focus of a personal space is personal productivity.
- Group spaces, a rich team collaboration platform.
- Threaded discussions, blogs, wikis, worklists, announcements, RSS, recent activities, search, and more.

1.2.6 Portals

Portals provide a common interface (a Web page) to a personalized, single point of interaction with Web-based applications and information relevant to individual users or class of users. For information about creating portals, see *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

1.2.7 Composite Applications

A composite application is an assembly of services, service components, wires, and references designed and deployed as a single application. For more information about composite applications, see the *Oracle Fusion Middleware Administrator's Guide for Oracle SOA Suite*.

1.3 Oracle WebCenter Topology

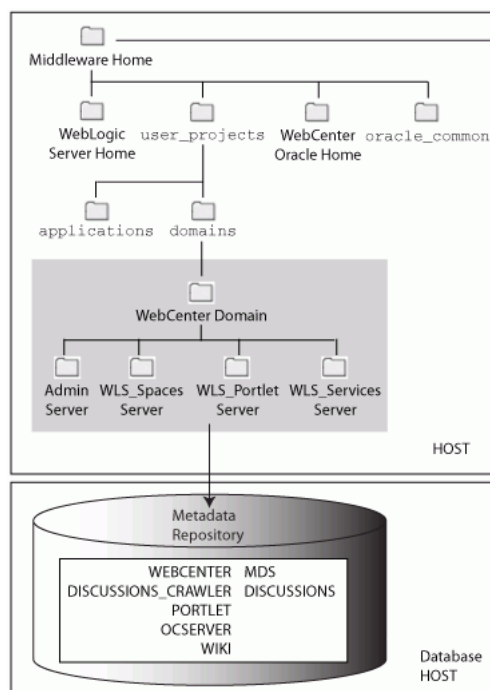

This section describes Oracle WebCenter topology and configuration in the following sections:

- [Section 1.3.1, "Oracle WebCenter Topology Out-of-the-Box"](#)
- [Section 1.3.2, "Oracle WebCenter Managed Servers"](#)
- [Section 1.3.3, "Oracle WebCenter Startup Order"](#)
- [Section 1.3.4, "Oracle WebCenter External Dependencies"](#)
- [Section 1.3.5, "Oracle WebCenter Configuration Considerations"](#)
- [Section 1.3.6, "Oracle WebCenter State and Configuration Persistence"](#)
- [Section 1.3.7, "Oracle WebCenter Log File Locations"](#)

1.3.1 Oracle WebCenter Topology Out-of-the-Box

Oracle WebCenter installation creates a **WebCenter Oracle home** under the Oracle Middleware home directory and the **oracle_common** home directory, which contains WebCenter binaries and supporting files ([Figure 1–2](#)).

Figure 1–2 Directory Structure of an Oracle WebCenter Installation

The installation also creates a WebCenter domain (`wc_domain`), containing the administration server and several managed servers to host various WebCenter components. In [Figure 1–3](#), applications are shown in yellow, while the managed servers they run on are shown in brown.

Figure 1–3 Oracle WebCenter Topology Out-of-the-Box

Out-of-the-box managed servers host the following components:

- WLS_Spaces - Hosts Oracle WebCenter Spaces
- WLS_Portlet - Hosts Oracle WebCenter Portlets
- WLS_Services - Hosts Oracle WebCenter Discussions and Oracle WebCenter Wiki and Blog Server, and any additional WebCenter services that you choose to integrate

An optional fourth managed server (an applications server) can be used to run custom WebCenter applications. When you create additional managed servers, they are provisioned with the appropriate libraries to enable them to draw upon the same external resources as Oracle WebCenter Spaces. For more information about managed servers, see "Understanding Oracle Fusion Middleware Concepts" in the *Oracle Fusion Middleware Administrator's Guide*.

1.3.2 Oracle WebCenter Managed Servers

During Oracle WebCenter installation, the managed servers are provisioned with system libraries and ADF libraries. [Table 1–2](#) lists the managed servers and the applications that run on them.

Table 1–2 Oracle WebCenter Managed Servers and Applications

Managed Server	Application(s)
WLS_Spaces	webcenter webcenter-help
WLS_Portlets	portalTools wsrp-tools
WLS_Services	owc_discussions Oracle WebCenter Discussions Server owc_wiki Oracle WebCenter Wiki and Blog Server

1.3.3 Oracle WebCenter Startup Order

When a managed server starts up, applications and libraries are started in the following order:

1. Oracle system libraries, known as the JRF libraries.
2. ADF libraries.
3. Instrumentation applications, such as Oracle DMS.
4. Oracle Web Services Manager (wsm-pm) application.
5. WebCenter applications, shown in [Table 1–2](#).

The startup order is also the order of dependency. If a dependent component does not deploy successfully, a later component may not function correctly.

WebCenter application startup is not dependent on the availability of external services such as the Discussions server, or other back-end servers. For details, see [Section 1.3.4, "Oracle WebCenter External Dependencies"](#).

1.3.4 Oracle WebCenter External Dependencies

WebCenter applications have several external dependencies, as listed in [Table 1–3](#). The Configuration column lists the type of information provided to Oracle WebCenter to configure or initialize the connection. The Access column lists the protocol used in run-time access of the service.

Server/service unavailability does not prevent WebCenter applications from starting up, although errors may display while the application is running. The only exception is the Oracle Metadata Repository (MDS), as WebCenter applications do not work without it. WebCenter Spaces partially works without the WebCenter repository, but only if it is a different physical database from the MDS repository.

Table 1–3 External Resources - Access Types

External Server/ Service	Configuration	Access
Discussions server	HTTP access to discussions server administration	SOAP/HTTP
Oracle Content Server (Documents)	Socket connection to the Administration Server. HTTP access is required only if the Oracle Content Server must be accessed outside WebCenter.	JCR 1.0 over socket or HTTP
Instant Messaging and Presence server	HTTP access to instant messaging and presence server administration	SOAP/HTTP
Mail server	IMAP/SMTP server	IMAP/SMTP
Personal Events server	HTTP access to calendar services	SOAP/HTTP
Portlets	HTTP location of provider WSDLs	SOAP/HTTP
Search server	HTTP access to search server	HTTP
Wiki and Blog server	HTTP access to wiki server administration	SOAP/HTTP
Worklist	HTTP access to BPEL server	SOAP/HTTP
MDS and Schemas	JDBC	JDBC

Configure each of the external services independently for high availability. Oracle WebCenter provides a single point of access for external services.

- For HTTP services, direct the access URL to a load balancer, which provides access to multiple service providers on the back-end.
- For the MDS and schemas, Oracle recommends an Oracle Real Application Clusters (Oracle RAC) database as the back-end database.

1.3.5 Oracle WebCenter Configuration Considerations

The main configuration files for WebCenter applications are listed and described in [Table 1–4](#). Both these files are supplied within the WebCenter application deployment .EAR file.

Table 1–4 Oracle WebCenter Configuration Files

Artifact	Purpose
<code>adf-config.xml</code>	Stores basic configuration for Application Development Framework (ADF) and WebCenter application settings, such as which discussions server or mail server the WebCenter application is currently using.
<code>connections.xml</code>	Stores basic configuration for connections to external services.

WebCenter applications and portlet producers both use the Oracle Metadata Services (MDS) repository to store their configuration data; both access the MDS repository as a JDBC data source within the Oracle WebLogic framework.

The MDS repository stores post deployment configuration changes for WebCenter applications and portlet producers as customizations. MDS uses the original deployed

versions of `adfconfig.xml` and `connection.xml` as base documents and stores all subsequent customizations separately into MDS using a single customization layer.

When a WebCenter application starts up, customizations stored in MDS are applied to the appropriate base documents and the WebCenter application uses the merged documents (base documents with customizations) as the final set of configuration properties.

For WebCenter applications that are deployed to a server cluster, all members of a cluster read from the same location in the MDS repository.

Typically, there is no need for administrators to examine or manually change the content of base documents (or MDS customization data) for files such as `adfconfig.xml` and `connection.xml`, as Oracle provides several administration tools for post deployment configuration. If you must locate the base documents or review the information in MDS, read [Appendix A, "WebCenter Configuration"](#).

To find out more about WebCenter application configuration tools available, see [Section 1.12, "Oracle WebCenter Administration Tools"](#).

Note: Oracle does not recommend that you edit `adfconfig.xml` or `connection.xml` by hand (unless specifically instructed to do so) as this can lead to misconfiguration.

While WebCenter applications store post-deployment configuration information in MDS, configuration information for portlet producers, Oracle WebCenter Discussions Server and Oracle WebCenter Wiki and Blog Server is stored in the file system or the database (see [Table 1-5](#)).

Table 1-5 Oracle WebCenter Configuration Location

Application	Configuration Stored in MDS	Configuration Stored in File System	Configuration Stored in Database
WebCenter Spaces	Yes	No	No
Custom WebCenter applications	Yes	No	No
Portlet producers	No	Yes	No
Discussions server	No	Yes	Yes
Wiki and Blog server	No	Yes	No

The Oracle WebCenter Discussions Server stores configuration information in its database. Additionally, it stores startup configuration information in `$DOMAIN_HOME/config/fmwconfig/servers/SERVER_NAME/owc_discussions_11.1.1.2.0`. This directory contains the `jive_startup.xml` file, `jive.license` files, and a `\logs` directory containing log files for the discussions server instance.

The Oracle WebCenter Wiki and Blog Server stores configuration information in the server's deployment directory. For example, `$DOMAIN_HOME/servers/SERVER_NAME`. Its configuration file, `application_config.script`, is located in `$APPLICATIONS_DIRECTORY/owc_wiki/WEB-INF/classes`. For example, `DOMAIN_HOME/servers/WLS_Services/stage/owc_wiki/11.1.1.1.0/owc_wiki/WEB-INF/classes`.

1.3.6 Oracle WebCenter State and Configuration Persistence

WebCenter applications run as J2EE applications with application state and configuration persisted to the MDS repository. User session information within the application is held locally in memory. In a cluster environment, this state is replicated to other members of the cluster.

Customizations within a portlet or service environment are persisted by that service. Out-of-the-box, Oracle portlets, any custom portlets you build, Oracle WebCenter Discussions Server, and Oracle WebCenter Wiki and Blog Server all have their own database persistence mechanisms.

1.3.7 Oracle WebCenter Log File Locations

Operations performed by WebCenter applications, portlet producers, discussion servers, wiki and blog servers, and so on, are logged directly to the WebLogic managed server where the application is running:

```
wls_domain_directory/servers/WLS_ServerName/logs/WLS_ServerName.log
```

You can view the log files for each WebLogic managed server from the Oracle WebLogic Server Administration Console. To view the logs, access the Oracle WebLogic Server Administration Console

`http://<admin_server_host>:<port>/console`, and click **Diagnostics-Log Files**.

You can also view and configure diagnostic logs through Fusion Middleware Control, see [Section 24.3, "Viewing and Configuring Log Information"](#).

1.4 Oracle WebCenter Spaces

Oracle WebCenter Spaces is a Web-based application, built using the Oracle WebCenter Framework, that offers the very latest technology for social networking, communication, collaboration, and personal productivity. Through a robust set of services and applications, WebCenter Spaces brings together everything you need to exchange ideas with others, keep track of your personal and work-related tasks, interact with your critical applications, and zero in on your own projects and interests—all within a single, integrated environment.

To help you get started, see:

- [Chapter 2, "Getting WebCenter Spaces Up and Running"](#)

For information about administering WebCenter Spaces, see:

- [Chapter 26, "Accessing WebCenter Spaces Administration Pages"](#)
- [Chapter 27, "Customizing WebCenter Spaces"](#)
- [Chapter 28, "Managing Users and Roles for WebCenter Spaces"](#)
- [Chapter 29, "Managing Pages in WebCenter Spaces"](#)
- [Chapter 30, "Making Applications Available in WebCenter Spaces"](#)
- [Chapter 31, "Managing Group Spaces in WebCenter Spaces"](#)
- [Chapter 32, "Exporting and Importing Group Spaces"](#)

1.5 Custom WebCenter Applications

You can develop custom WebCenter applications using JDeveloper and deploy them to a custom WebLogic Managed Server. For information about developing custom WebCenter applications, see the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

To help you get started, see:

- [Chapter 4, "Getting Custom WebCenter Applications Up and Running"](#)
- [Chapter 5, "Maintaining Custom WebCenter Applications"](#)
- [Chapter 7, "Deploying WebCenter Applications"](#)

1.6 Planning WebCenter Installations

Installing your WebCenter application requires a little bit of planning. Some of the questions to consider are:

- What WebCenter components will be used?
- How many users will access this deployment?
- How can I provide high availability for my WebCenter enterprise deployment?
- How can I secure WebCenter?

For more information about planning a WebCenter installation, see the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*, the *Oracle Fusion Middleware Enterprise Deployment Guide for Oracle WebCenter*, and the *Oracle Fusion Middleware High Availability Guide*.

1.7 Understanding the WebCenter 11g Installation

The out-of-the-box WebCenter topology is briefly described in [Section 1.3, "Oracle WebCenter Topology"](#). Specific areas of the WebCenter topology are described in the corresponding chapters, for example, security-related aspects of the WebCenter topology are described in [Chapter 23, "Managing Security"](#).

For more information about Oracle WebCenter installation and post-installation administration tasks, see the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

For post-installation enterprise configuration, see the *Oracle Fusion Middleware Enterprise Deployment Guide for Oracle WebCenter*.

For post-installation high availability configuration, see the *Oracle Fusion Middleware High Availability Guide*.

For post-installation security configuration, see [Chapter 23, "Managing Security"](#).

1.8 Understanding Administrative Operations, Roles, and Tools

Oracle WebCenter provides several different tools with which to deploy, configure, start and stop, and maintain Oracle WebCenter applications. All these tools are described in [Section 1.12, "Oracle WebCenter Administration Tools"](#).

Your ability to perform WebCenter administration tasks depends on which Oracle WebLogic Server role you are assigned—Admin, Operator, or Monitor. [Table 1–6](#) lists the Oracle WebLogic Server roles needed for common operations. These roles

apply whether the operations are performed through Fusion Middleware Control, WLST commands, or the WebLogic Server Administration Console.

Table 1–6 WebCenter Operations and Oracle WebLogic Server Roles

Operation	Admin Role	Operator Role	Monitor Role
All WebCenter applications			
Start and stop	Yes	Yes	No
View performance metrics	Yes	Yes	Yes
View log information	Yes	Yes	Yes
Configure log files	Yes	Yes	Yes
View configuration	Yes	Yes	Yes
Configure new connections	Yes	Yes	No
Edit connections	Yes	Yes	No
Delete connections	Yes	Yes	No
Deploy applications	Yes	No	No
Configure security	Yes	No	No
View security (application roles/policies)	Yes	Yes	Yes
WebCenter Spaces only			
Export WebCenter Spaces	Yes	No	No
Import WebCenter Spaces	Yes	No	No

Table 1–7 summarizes which tools you can use to perform various administrative operations relating to WebCenter applications.

Table 1–7 WebCenter Operations and Administration Tools

Operation	Fusion Middleware Control	WLST Commands	WebLogic Server Admin Console	WebCenter Spaces Admin
All WebCenter applications				
Start and stop	Yes	Yes	Yes	No
View performance metrics	Yes	No	No	No
View log information	Yes	No	No	No
Configure log files	Yes	No	No	No
View configuration	Yes	Yes	No	No
Configure new connections	Yes	Yes	No	No
Edit connections	Yes	Yes	No	No
Delete connections	Yes	Yes	No	No
Deploy applications	Yes	Yes	Yes	No
Configure security	Yes	Yes	Yes	No
WebCenter Spaces only				
Configure workflows	Yes	Yes	No	No

Table 1–7 (Cont.) WebCenter Operations and Administration Tools

Operation	Fusion Middleware Control	WLST Commands	WebLogic Server Admin Console	WebCenter Spaces Admin
Export WebCenter Spaces	Yes	Yes	No	No
Import WebCenter Spaces	Yes	Yes	No	No
Customize WebCenter Spaces	No	No	No	Yes
Manage application users and roles	No	No	No	Yes
Manage pages	No	No	No	Yes
Manage group spaces	No	No	No	Yes
Export group spaces	No	No	No	Yes
Import group spaces	No	No	No	Yes

1.9 Performance Monitoring and Diagnostics

Performance monitoring helps administrators identify issues and performance bottlenecks in their environment. [Chapter 24, "Monitoring Oracle WebCenter Performance"](#) describes the range of performance metrics available for WebCenter applications and how to monitor them using Fusion Middleware Control. It also describes how to troubleshoot issues by analyzing information that is recorded in WebCenter diagnostic log files.

1.10 WebCenter Application Deployment

[Chapter 7, "Deploying WebCenter Applications"](#) provides instructions for deploying, redeploying, and undeploying custom WebCenter applications from an .EAR file created with Oracle JDeveloper.

[Section 21.8, "Deploying Portlet Producer Applications"](#) provides instructions for deploying WSRP and PDK-Java portlet producer applications.

Note: Oracle WebCenter Spaces is deployed during installation (it cannot be deployed as an .EAR file). See "Installing Oracle WebCenter" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

1.11 Data Migration, Backup, and Recovery

Oracle WebCenter stores data related to its configuration and content for the various feature areas in a several locations. To facilitate disaster recovery and the full production lifecycle from development through staging and production, WebCenter provides a set of utilities that enable you to back up this data, and move the data between WebCenter applications in staging and production environments.

[Chapter 25, "Managing Export, Import, Backup, and Recovery of WebCenter"](#) describes the backup, import, and export capabilities and tools available for these tasks.

1.12 Oracle WebCenter Administration Tools

Oracle offers the following tools for managing Oracle WebCenter:

- [Oracle Enterprise Manager Fusion Middleware Control Console](#)
- [Oracle WebLogic Server Administration Console](#)
- [Oracle WebLogic Scripting Tool \(WLST\)](#)
- [System MBean Browser](#)

All of these administration tools apply to all WebCenter applications. For managing WebCenter Spaces specifically, you can also use:

- [WebCenter Spaces Administration Pages](#)

Administrators should use these tools, rather than edit configuration files, to perform administrative tasks, unless a specific procedure requires you to edit a file. Editing a file may cause the settings to be inconsistent and generate problems. See also, [Appendix A, "WebCenter Configuration"](#).

1.12.1 Oracle Enterprise Manager Fusion Middleware Control Console

Oracle Enterprise Manager Fusion Middleware Control Console is a browser-based management application that is deployed when you install Oracle WebCenter. From Fusion Middleware Control Console, you can monitor and administer a *farm* (such as one containing Oracle WebCenter and WebCenter applications).

Fusion Middleware Control organizes a wide variety of performance data and administrative functions into distinct, web-based home pages. These home pages make it easy to locate the most important monitoring data and the most commonly used administrative functions for any WebCenter component—all from your web browser. For general information about the Fusion Middleware Control Console, see "Getting Started Using Oracle Enterprise Manager Fusion Middleware Control" in the *Oracle Fusion Middleware Administrator's Guide*.

Fusion Middleware Control is the primary management tool for Oracle WebCenter and can be used to:

- Deploy, undeploy, and re-deploy WebCenter applications
- Configure back-end services
- Configure security management
- Control process lifecycle
- Access log files and manage log configuration
- Manage data migration
- Monitor performance
- Diagnose run-time problems
- Manage related components, such as the parent Managed Server, MDS, portlet producers, and so on

1.12.1.1 Displaying Fusion Middleware Control Console

For information about starting Fusion Middleware Control, see [Section 6.1, "Displaying Fusion Middleware Control Console"](#).

1.12.2 Oracle WebLogic Server Administration Console

The Oracle WebLogic Server Administration Console is a browser-based, graphical user interface that you use to manage a WebLogic Server domain.

The Administration Server hosts the Administration Console, which is a Web application accessible from any supported Web browser with network access to the Administration Server Managed Servers host applications.

Use the Administration Console to:

- Configure, start, and stop WebLogic Server instances
- Configure WebLogic Server clusters
- Configure WebLogic Server services, such as database connectivity (JDBC) and messaging (JMS)
- Configure security parameters, including creating and managing users, groups, and roles
- Configure and deploy your applications
- Monitor server and application performance
- View server and domain log files
- View application deployment descriptors
- Edit selected run-time application deployment descriptor elements

For more information about the Oracle WebLogic Server Administration Console, see "Displaying the Oracle WebLogic Server Administration Console" in the *Oracle Fusion Middleware Administrator's Guide*.

Locking Domain Configuration

In a production environment, you must lock configuration settings for a domain before making any configuration changes. Navigate to the Administration Console's Change Center (Figure 1-4), and click **Lock & Edit**.

Once configuration updates are complete, release the changes by clicking **Release Configuration**.

Figure 1-4 Change Center in Oracle WebLogic Server Administration Console

1.12.3 Oracle WebLogic Scripting Tool (WLST)

Oracle provides the WebLogic Scripting Tool (WLST) to manage Oracle Fusion Middleware components, such as Oracle WebCenter, from the command line.

WLST is a complete, command-line scripting environment for managing Oracle WebLogic Server domains, based on the Java scripting interpreter, Jython. In addition

to supporting standard Jython features such as local variables, conditional variables, and flow control statements, WLST provides a set of scripting functions (commands) that are specific to Oracle WebLogic Server. You can extend the WebLogic scripting language to suit your needs by following the Jython language syntax.

Oracle WebCenter offers WLST commands for managing WebCenter application connections (to content repositories, portlet producers, external applications, and other back-end services), and also for exporting and importing the WebCenter Spaces application. All Oracle WebCenter WLST commands are described in "Oracle WebCenter Custom WLST Commands" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

1.12.3.1 Running Oracle WebLogic Scripting Tool (WLST) Commands

To run WLST from the command line:

1. Navigate to the directory `WC_ORACLE_HOME/common/bin`.
2. From the command line, enter the command:

```
wlst.sh
```

For example:

```
WC_ORACLE_HOME/common/bin/wlst.sh
```

3. At the WLST command prompt, enter the following command to connect to the Administration Server for Oracle WebCenter:

```
wls:/offline>connect('<user_name>', '<password>', '<host_name>:<port_number>')
```

where

- `<user_name>` is the username of the operator who is connecting to the Administration Server
- `<password>` is the password of the operator who is connecting to the Administration Server
- `<host_name>` is the host name of the Administration Server
- `<port_number>` is the port number of the Administration Server

For example:

```
connect('weblogic', 'weblogic', 'myhost.example.com:7001')
```

For help for this command, type `help('connect')` at the WLST command prompt.

Note: If SSL is enabled, you must edit the `wlst.sh` file and append the following to `JVM_ARGS`:

```
-Dweblogic.security.SSL.ignoreHostnameVerification=true  
-Dweblogic.security.TrustKeyStore=DemoTrust
```

or `setenv CONFIG_JVM_ARGS`

```
-Dweblogic.security.SSL.ignoreHostnameVerification=true  
-Dweblogic.security.TrustKeyStore=DemoTrust
```

4. Once connected to the Administration Server you can run WebCenter WLST commands, and any generic WLST command.

To list WebCenter WLST commands, type: `help('webcenter')` at the WLST command prompt.

For help on a particular command, type: `help('<WLST_command_name>')` at the WLST command prompt.

See also, "Oracle WebCenter Custom WLST Commands" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

1.12.4 System MBean Browser

Fusion Middleware Control provides a set of MBean browsers that allow you to browse the MBeans for an Oracle WebLogic Server or for a selected application.

Note: While you can monitor and configure WebCenter application MBeans from the System MBean browser, it is not the preferred tool for configuration. Oracle recommends that you configure WebCenter applications using WLST commands or through the WebCenter Settings menu options in Fusion Middleware Control (available from the application's home page).

To access application MBeans for WebCenter applications:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **System MBean Browser**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **System MBean Browser**.
3. Expand **Application Defined MBeans**, then **oracle.adf.share.config**, then **Server: name**, then **Application: name**, then **ADFConfig**, then **ADFConfig**, and **ADFConfig**.
4. To view an MBean's attributes, select the **Attributes** tab. Some attributes allow you to change their values. To do so, enter the value in the **Value** column.
5. Click **Apply** to update attribute values.
6. Navigate to the parent MBean (**ADFConfig**), select the **Operations** tab, and click **save** to save the changes.
7. Restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

1.12.5 WebCenter Spaces Administration Pages

WebCenter Spaces provides several administration pages of its own. WebCenter Spaces Administration appears only to users who have logged in to the application using an administrator user name and password. See also, [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).

WebCenter Spaces administration pages allow you to:

- Customize WebCenter Spaces
- Manage users and roles
- Manage services settings for WebCenter Spaces
- Manage group spaces and group space templates
- Create and manage business role pages
- Manage personal pages
- Export and import group spaces

For more details, see [Section 26, "Accessing WebCenter Spaces Administration Pages"](#).

Part II

Getting Started With Oracle WebCenter Administration

This part of the Administrator's Guide provides checklists to help you get started with Oracle WebCenter administration.

Part II contains the following chapters:

- [Chapter 2, "Getting WebCenter Spaces Up and Running"](#)
- [Chapter 3, "Maintaining WebCenter Spaces"](#)
- [Chapter 4, "Getting Custom WebCenter Applications Up and Running"](#)
- [Chapter 5, "Maintaining Custom WebCenter Applications"](#)

Getting WebCenter Spaces Up and Running

Getting WebCenter Spaces up and running and ready for use requires input from both the *Fusion Middleware administrator* and the *WebCenter Spaces administrator*. This chapter outlines the roles and responsibilities of each administrator who may, in some cases, be the same person.

The chapter also outlines what must be done, after installation, to get WebCenter Spaces up and running. Some roadmaps are provided to guide you through this process.

This chapter includes the following sections:

- [Section 2.1, "Role of the Fusion Middleware Administrator"](#)
- [Section 2.2, "Role of the WebCenter Spaces Administrator"](#)
- [Section 2.3, "Installing WebCenter Spaces"](#)
- [Section 2.4, "Setting Up WebCenter Spaces for the First Time \(Roadmap\)"](#)
- [Section 2.5, "Customizing WebCenter Spaces for the First Time \(Roadmap\)"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators responsible for WebCenter Spaces (users granted the `Admin` role through the Oracle WebLogic Server Administration Console) and WebCenter Spaces administrators (users granted the `Administrator` role through WebCenter Spaces Administration).

Note: Administrators working with custom WebCenter applications developed using Oracle WebCenter Framework, should refer to [Chapter 4, "Getting Custom WebCenter Applications Up and Running"](#).

2.1 Role of the Fusion Middleware Administrator

Oracle Fusion Middleware provides a single administrative role with *complete* administrative capabilities—the `Admin` role. Fusion Middleware administrators with this role can perform the complete range of security-sensitive administrative duties, and all installation, configuration, and audit tasks. This administrator is also responsible for setting up and configuring WebCenter Spaces immediately after installation, and performing on-going administrative tasks for WebCenter Spaces and other Oracle WebCenter components. Throughout this document we refer to this administrator as the *Fusion Middleware administrator*.

During installation, a single Fusion Middleware administrator account is created named `weblogic`. The password is the one provided during installation.

Use this administrator account to log in to the Fusion Middleware Control Console and WebCenter Spaces, and assign administrative privileges to other users:

- **Fusion Middleware Control** - Add one more users to the `Administrator` group using the Oracle WebLogic Administration Console or Oracle WebLogic Scripting Tool (WLST). For details, see "Administrative Users and Roles" in *Oracle Fusion Middleware Security Guide*.

Oracle WebLogic Server provides two other roles, in addition to the `Admin` role, namely `Operator` and `Monitor`. To find out more about these role, see [Table 1–6, "WebCenter Operations and Oracle WebLogic Server Roles"](#) in [Section 1.8, "Understanding Administrative Operations, Roles, and Tools"](#).

- **WebCenter Spaces** - Assign one more users the `Administrator` role through WebCenter Spaces Administration. For details, see [Section 28.2.4, "Giving a User Administrative Privileges"](#).

To find out what other tasks a Fusion Middleware administrator must do to get WebCenter Spaces up and running, follow the [Roadmap - Customizing WebCenter Spaces for the First Time](#).

Note: The Fusion Middleware administrator is also responsible for all on-going administrative tasks, for details see [Section 3.3, "System Administration for WebCenter Spaces \(Roadmap\)"](#).

2.2 Role of the WebCenter Spaces Administrator

WebCenter Spaces administrators have the highest application privileges within the WebCenter Spaces application itself. This administrator can view and customize every aspect of the WebCenter Spaces application and is responsible for customizing WebCenter Spaces out-of-the-box and maintaining the application after it is in use.

Out-of-the-box, the default Fusion Middleware administrator (`weblogic`) is the only user assigned to the WebCenter Spaces `Administrator` role. The password is the one provided during installation. Use this administrator account to log in to WebCenter Spaces, and assign additional users the `Administrator` role. For details, see [Section 28.2.4, "Giving a User Administrative Privileges"](#).

To find out what a WebCenter Spaces administrator must do to customize WebCenter Spaces out-of-the-box, follow the [Roadmap - Customizing WebCenter Spaces for the First Time](#).

Note: The WebCenter Spaces administrator is also responsible for all on-going administrative tasks, for details see [Section 3.4, "Application Administration for WebCenter Spaces \(Roadmap\)"](#).

2.3 Installing WebCenter Spaces

WebCenter Spaces installation is described in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

2.4 Setting Up WebCenter Spaces for the First Time (Roadmap)

The roadmap in [Table 2–1](#) outlines the tasks that a Fusion Middleware administrator must perform to get a WebCenter Spaces up and running.

Table 2–1 Roadmap - Setting Up WebCenter Spaces for the First Time

Step	Documentation	Role
Step 1 - Verify your Oracle WebCenter Spaces installation	<p>Install WebCenter Spaces, start the managed server, log in to the application with default credentials, and assign administration privileges to one or more users:</p> <ul style="list-style-type: none"> ▪ Installing WebCenter Spaces ▪ Starting Node Manager ▪ Starting and Stopping Managed Servers for WebCenter Application Deployments ▪ Logging into WebCenter Spaces as an Administrator ▪ Giving a User Administrative Privileges <p>Tip: WebCenter Spaces URL is <a href="http://<host>:<port>/webcenter/spaces">http://<host>:<port>/webcenter/spaces</p> <p>If the default administrator was changed at install time, you must grant that user WebCenter Spaces administrative privileges before logging in to WebCenter Spaces. See "Granting the WebCenter Spaces Administrator Role to a WebCenter Spaces User".</p>	Fusion Middleware Admin
Step 2 - Launch Fusion Middleware Control	<p>Launch Fusion Middleware Control Console, a Web-based management tool for WebCenter Spaces:</p> <ul style="list-style-type: none"> ▪ Displaying Fusion Middleware Control Console ▪ Navigating to the Home Page for WebCenter Spaces <p>Tip: Fusion Middleware Control Console URL is <a href="http://<host>:<port>/em">http://<host>:<port>/em</p> <p>Learn about the command-line administration tool WLST. See "Oracle WebLogic Scripting Tool (WLST)".</p>	Fusion Middleware Admin
Step 3 - Configure WebCenter Spaces workflows	<p>Connect the application to the BPEL server where WebCenter Spaces workflows are installed:</p> <ul style="list-style-type: none"> ▪ Back-End Requirements for WebCenter Spaces Workflows ▪ Specifying the BPEL Server Hosting WebCenter Spaces Workflows 	Fusion Middleware Admin
Step 4 - Connect back-end services	<p>Configure back-end services for WebCenter Spaces through Fusion Middleware Control Console. See:</p> <ul style="list-style-type: none"> ▪ Content Repositories <ul style="list-style-type: none"> ▪ Managing Content Repositories ▪ Mail Servers <ul style="list-style-type: none"> ▪ Managing the Mail Service ▪ BPEL Servers <ul style="list-style-type: none"> ▪ Managing the Worklist Service ▪ Collaboration Services <ul style="list-style-type: none"> ▪ Managing the Announcements and Discussions Services ▪ Managing the Instant Messaging and Presence Service ▪ Managing the Wiki and Blog Services ▪ Calendar Services <ul style="list-style-type: none"> ▪ Managing the Events Service 	Fusion Middleware Admin

Table 2–1 (Cont.) Roadmap - Setting Up WebCenter Spaces for the First Time

Step	Documentation	Role
<ul style="list-style-type: none"> Secure Enterprise Search Group Space Events, Links, Lists, Notes, and Tags 	<ul style="list-style-type: none"> Managing the Search Service No additional set up required. The WebCenter repository and MDS repository required for these services are configured out-of-the-box. 	
Step 5 - Connect external applications and portlet producers	Configure external applications and portlet producers for WebCenter Spaces. See:	Fusion Middleware Admin
<ul style="list-style-type: none"> External Applications Portlet Producers 	<ul style="list-style-type: none"> Managing External Applications Registering WSRP Producers Registering Oracle PDK-Java Producers 	
Step 6 - Connect back-end servers to the same identity store as WebCenter Spaces	Ensure that back-end servers, supporting Wikis and Blogs, Discussions and Announcements, Presence, and Oracle Content Server, share the same identity store as WebCenter Spaces: <ul style="list-style-type: none"> Configuring the Identity Store See also <i>Oracle Fusion Middleware Security Guide</i> .	Fusion Middleware Admin
Step 7 - Secure communication with WebCenter Spaces	Configure secure communication: <ul style="list-style-type: none"> Configuring WebCenter Applications and Components to Use SSL Configuring WS-Security Configuring a WebCenter Application to Use Single Sign-On See also <i>Oracle Fusion Middleware Security Guide</i> .	Fusion Middleware Admin
Step 8 - Restart the managed server and WebCenter Spaces	Restart the managed server on which WebCenter Spaces is deployed to effect configuration changes, and then login to WebCenter Spaces with administrative privileges: <ul style="list-style-type: none"> Starting and Stopping Managed Servers for WebCenter Application Deployments Logging into WebCenter Spaces as an Administrator 	Fusion Middleware Admin
Step 9 - Verify your WebCenter Spaces configuration	Verify WebCenter Spaces configuration: identity store, services, applications, and so on. <ul style="list-style-type: none"> Logging into WebCenter Spaces as an Administrator Tip: WebCenter Spaces URL is <code>http://<host>:<port>/webcenter/spaces</code>	Fusion Middleware Admin
Step 10 - Customize WebCenter Spaces and grant application roles	The WebCenter Spaces administrator is responsible for WebCenter Spaces customizations and user role assignments: <ul style="list-style-type: none"> Customizing WebCenter Spaces for the First Time (Roadmap) 	WebCenter Spaces Admin

2.5 Customizing WebCenter Spaces for the First Time (Roadmap)

The roadmap in [Table 2–2](#) outlines the tasks that a WebCenter Spaces administrator might perform to customize WebCenter Spaces for a new target audience.

Table 2–2 Roadmap - Customizing WebCenter Spaces for the First Time

Step	Documentation	Role
Step 1 - Log in to WebCenter Spaces	<p>Login to WebCenter Spaces with administrative privileges and access the administration pages:</p> <ul style="list-style-type: none"> ■ Logging into WebCenter Spaces as an Administrator <p>Tip: WebCenter Spaces URL is <a href="http://<host>:<port>/webcenter/spaces">http://<host>:<port>/webcenter/spaces</p>	WebCenter Spaces Admin
Step 2 - Customize WebCenter Spaces	<p>Customize WebCenter Spaces to suit your audience. Choose a name and logo for your application, apply a corporate brand, set language options, and more:</p> <ul style="list-style-type: none"> ■ Naming Your WebCenter ■ Customizing the Online Help Link ■ Choosing the Default Display Language ■ Applying Look and Feel Using Skins ■ Customizing Copyright and Privacy Statements ■ ... for more options, see Chapter 27, "Customizing WebCenter Spaces". 	WebCenter Spaces Admin
Step 3 - Determine self-registration policy	<p>Establish your policy regarding new user registration. Allow users outside of the WebCenter Spaces community to self-register on an invitation-only basis or extend self-registration to the public:</p> <ul style="list-style-type: none"> ■ Enabling Self-Registration By Invitation-Only ■ Enabling Anyone to Self-Register 	WebCenter Spaces Admin
Step 4 - Plan the public user experience	<p>First impressions are extremely important. Determine the content displayed on your Welcome page and the appearance of WebCenter Spaces before users login:</p> <ul style="list-style-type: none"> ■ Customizing the Public Welcome Page ■ Customizing the Login Page ■ Customizing the Self-Registration Page ■ Choosing the Default Display Language ■ Granting Permissions to the Public-User 	WebCenter Spaces Admin
Step 5 - Create roles and delegate responsibilities to other users	<p>Create roles to characterize groups of WebCenter users and determine what they can see and do in WebCenter Spaces. Manage and assign roles for any user in the identity store:</p> <ul style="list-style-type: none"> ■ Understanding Users, Roles, and Permissions ■ Assigning Users (and Groups) to Roles ■ Defining Application Roles ■ Giving a User Administrative Privileges ■ Modifying Application Role Permissions 	WebCenter Spaces Admin

Table 2–2 (Cont.) Roadmap - Customizing WebCenter Spaces for the First Time

Step	Documentation	Role
Step 6 - Customize personal spaces	<p>Design a default personal space for your WebCenter users. Give them instant access to important information and applications relevant to their roles:</p> <ul style="list-style-type: none"> ▪ Setting Up a Default Look and Feel for Personal Pages ▪ Creating a Business Role Page <p>Encourage or enforce a consistent look and feel through default page schemes and default page templates:</p> <ul style="list-style-type: none"> ▪ Setting Up a Default Look and Feel for Personal Pages 	WebCenter Spaces Admin
Step 7 - Set up discussion forums and announcements	<p>Configure default options for discussion forums and announcements:</p> <ul style="list-style-type: none"> ▪ Setting Discussion Forum Options 	WebCenter Spaces Admin
Step 8 - Set up people connection components	<p>Configure defaults for activity streams, personal profiles, connections, messages boards, and feedback:</p> <ul style="list-style-type: none"> ▪ Configuring the People Connections Service in WebCenter Spaces 	WebCenter Spaces Admin
Step 9 - Set up mail	<p>Configure default options for everyone's mail:</p> <ul style="list-style-type: none"> ▪ Setting Mail Options 	WebCenter Spaces Admin
Step 10 - Provide group spaces and group space templates	<p>In WebCenter, users can create and manage group spaces without centralized administration. Give them a head-start by creating templates for the types of group spaces they are likely to build:</p> <ul style="list-style-type: none"> ▪ Building Group Spaces ▪ Creating Group Space Templates 	WebCenter Spaces Admin
Step 11 - Customize the Sidebar	<p>Give users quick access to frequently used applications and collaboration services such as mail, worklist assignments, and personal contacts. Display, hide, reorganize, and lock the content of everyone's Personal Sidebar:</p> <ul style="list-style-type: none"> ▪ Hiding and Showing Task Flows in the Sidebar ▪ Locking Sidebar Content 	WebCenter Spaces Admin
Step 12 - Organize the applications pane	<p>Make WebCenter the single place a user needs to go. Allow users direct access to applications outside WebCenter Spaces that require an HTML form-based login. Expose key external applications in everyone's Personal Sidebar:</p> <ul style="list-style-type: none"> ▪ Making an Application Available to WebCenter Users ▪ Arranging the Applications List ▪ Locking Applications Displayed in the Applications Pane 	WebCenter Spaces Admin

Maintaining WebCenter Spaces

Keeping the WebCenter Spaces application up and running requires input from both the *Fusion Middleware administrator* and the *WebCenter Spaces administrator*. This chapter outlines the roles and responsibilities of each administrator who may, in some cases, be the same person.

Some roadmaps are also provided to help guide you through the process.

This chapter includes the following sections:

- [Section 3.1, "Role of the Fusion Middleware Administrator"](#)
- [Section 3.2, "Role of the WebCenter Spaces Administrator"](#)
- [Section 3.3, "System Administration for WebCenter Spaces \(Roadmap\)"](#)
- [Section 3.4, "Application Administration for WebCenter Spaces \(Roadmap\)"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators responsible for WebCenter Spaces (users granted the `Admin` role through the Oracle WebLogic Server Administration Console) and WebCenter Spaces administrators (users granted the `Administrator` role through WebCenter Spaces Administration).

Note: Administrators maintaining custom WebCenter applications should refer to [Chapter 5, "Maintaining Custom WebCenter Applications"](#).

3.1 Role of the Fusion Middleware Administrator

Oracle Fusion Middleware provides a single administrative role with complete administrative capabilities—the `Admin` role. Fusion Middleware administrator can perform the complete range of security-sensitive administrative duties, and all installation, configuration, and audit tasks. This administrator is also responsible for setting up and configuring WebCenter Spaces immediately after installation, and performing on-going administrative tasks for WebCenter Spaces and other Oracle WebCenter components. Throughout this document we refer to this administrator as the *Fusion Middleware administrator*.

A single Fusion Middleware administrator account (`weblogic` by default) is set up when Fusion Middleware is installed. The password is the one you provided during installation.

To find out what on-going administrative tasks a Fusion Middleware administrator is expected to perform in relation to WebCenter Spaces, follow the [Roadmap - Administering and Monitoring WebCenter Spaces](#).

Note: The Fusion Middleware administrator is also responsible for getting WebCenter Spaces up and running out-of-the-box, for details see [Section 2.4, "Setting Up WebCenter Spaces for the First Time \(Roadmap\)"](#).

3.2 Role of the WebCenter Spaces Administrator

WebCenter Spaces administrators have the highest application privileges within the WebCenter Spaces application itself. This administrator can view and customize every aspect of the WebCenter Spaces application and is responsible for customizing WebCenter Spaces out-of-the-box and maintaining the application after it is in use.

Out-of-the-box, the default Fusion Middleware administrator (`weblogic`) is the only user assigned to the WebCenter Spaces Administrator role. The password is the one provided during installation.

To find out what on-going administrative tasks a WebCenter Spaces administrator is expected to perform in relation to WebCenter Spaces, follow the [Roadmap - Keeping WebCenter Spaces Up and Running](#).

Note: The WebCenter Spaces administrator is also responsible for customizing WebCenter Spaces out-of-the-box, for details see [Section 2.5, "Customizing WebCenter Spaces for the First Time \(Roadmap\)"](#).

3.3 System Administration for WebCenter Spaces (Roadmap)

The roadmap in [Table 3–1](#) outlines typical tasks that a Fusion Middleware administrator might perform to keep WebCenter Spaces up and running.

Table 3–1 Roadmap - Administering and Monitoring WebCenter Spaces

Step	Documentation	Role
Step 1 - Stop and start the managed server	Restart the managed server on which WebCenter Spaces is deployed to effect configuration changes or for routine maintenance: <ul style="list-style-type: none"> ▪ Starting and Stopping Managed Servers for WebCenter Application Deployments Tip: The managed server for WebCenter Spaces is named <code>WLS_Spaces</code> .	Fusion Middleware Admin
Step 2 - View and manage log files	Identify and diagnose problems through log files. WebCenter Spaces logs record all types of events, including startup and shutdown information, errors, warnings, and other information: <ul style="list-style-type: none"> ▪ Viewing and Configuring Log Information 	Fusion Middleware Admin

Table 3–1 (Cont.) Roadmap - Administering and Monitoring WebCenter Spaces

Step	Documentation	Role
Step 3 - Monitor performance	Analyze the performance of WebCenter Spaces and monitor its current status through Fusion Middleware Control Console: <ul style="list-style-type: none"> Viewing Performance Information Monitoring WebCenter Spaces <p>Fusion Middleware administrators granted one of these roles can view metrics: Admin, Operator, Monitor. To find out more, see in "Understanding Administrative Operations, Roles, and Tools".</p>	Fusion Middleware Admin
Step 4 - Tune application properties	Reconfigure application properties: <ul style="list-style-type: none"> Tuning Environment Configuration Tuning WebCenter Application Configuration Tuning Back-End Component Configuration 	Fusion Middleware Admin
Step 3 - Stop and start WebCenter Spaces	Fusion Middleware administrators may shut down WebCenter Spaces for maintenance purposes and then restart the application: <ul style="list-style-type: none"> Starting WebCenter Spaces Using Fusion Middleware Control Stopping WebCenter Spaces Using Fusion Middleware Control 	Fusion Middleware Admin
Step 4 - Modify back-end services	Add, modify, and delete connections through Fusion Middleware Control Console. See: <ul style="list-style-type: none"> Content Repositories <ul style="list-style-type: none"> Managing Content Repositories Mail Servers <ul style="list-style-type: none"> Managing the Mail Service BPEL Servers <ul style="list-style-type: none"> Managing the Worklist Service Collaboration Services <ul style="list-style-type: none"> Managing the Announcements and Discussions Services Managing the Instant Messaging and Presence Service Managing the Wiki and Blog Services Calendar Services <ul style="list-style-type: none"> Managing the Events Service Secure Enterprise Search <ul style="list-style-type: none"> Managing the Search Service Group Space Events, Links, Lists, Notes, and Tags <ul style="list-style-type: none"> Setting Up the WebCenter Repository Setting Up the MDS Repository 	Fusion Middleware Admin

Step	Documentation	Role
Step 13 - Monitor performance	Analyze the performance of WebCenter Spaces and monitor its current status through Fusion Middleware Control Console: <ul style="list-style-type: none"> ▪ Viewing Performance Information ▪ Monitoring WebCenter Spaces 	Fusion Middleware Admin

3.4 Application Administration for WebCenter Spaces (Roadmap)

The roadmap in [Table 3–2](#) outlines typical tasks that a WebCenter Spaces administrator might perform while WebCenter Spaces is up and running.

If WebCenter Spaces must be taken offline for maintenance, ensure that a suitable message displays to any users who attempt to access the application while it is offline.

Table 3–2 Roadmap - Keeping WebCenter Spaces Up and Running

Step	Documentation	Role
Step 1 - Modify Application Settings	Modify application-wide settings as required: <ul style="list-style-type: none"> ▪ Naming Your WebCenter ▪ Customizing the Online Help Link ▪ Choosing the Default Display Language ▪ Applying Look and Feel Using Skins ▪ Customizing Copyright and Privacy Statements ▪ ... for more options, see Chapter 27, "Customizing WebCenter Spaces". 	WebCenter Spaces Admin
Step 2 - Manage Personal Spaces	Manage personal pages and business role pages. Push content to personal spaces: <ul style="list-style-type: none"> ▪ Managing Business Role Pages ▪ Managing Personal Pages 	WebCenter Spaces Admin
Step 3 - Manage Group Spaces	Take any group space temporarily offline and close down any group spaces that is inactive. Manage anyone's group space: <ul style="list-style-type: none"> ▪ Viewing Group Space Information ▪ Changing the Status of a Group Space 	WebCenter Spaces Admin
Step 4 - Manage Group Space Templates	Manage group space templates. Review and delete any template: <ul style="list-style-type: none"> ▪ Managing Group Space Templates 	WebCenter Spaces Admin
Step 5 - Maintain Users and Roles	Maintain security. Modify user role permissions and assign new roles: <ul style="list-style-type: none"> ▪ Modifying Application Role Permissions ▪ Assigning a User to a Different Role 	WebCenter Spaces Admin
Step 6 - Manage the Applications List	Maintain external application links. Add, modify, and delete entries: <ul style="list-style-type: none"> ▪ Making an Application Available to WebCenter Users ▪ Editing Links in the Applications Pane ▪ Removing Links from the Applications Pane 	WebCenter Spaces Admin

Table 3–2 (Cont.) Roadmap - Keeping WebCenter Spaces Up and Running

Step	Documentation	Role
Step 7- Maintain the Sidebar	Hide Sidebar content when services temporarily unavailable. Expose new services when available: <ul style="list-style-type: none">▪ Hiding and Showing Task Flows in the Sidebar	WebCenter Spaces Admin

Getting Custom WebCenter Applications Up and Running

The chapter outlines what Fusion Middleware administrators must do, after installation, to get custom WebCenter applications up and running. A roadmap is provided to help guide you through the process.

The chapter includes the following sections:

- [Section 4.1, "Installing Oracle WebCenter and Oracle WebCenter Framework Libraries"](#)
- [Section 4.2, "Deploying Custom WebCenter Applications for the First Time \(Roadmap\)"](#)

Although WebCenter Spaces is itself a WebCenter application, it does require some special administration tasks that other custom WebCenter applications do not. To see a comprehensive list of these tasks, refer to [Chapter 2, "Getting WebCenter Spaces Up and Running"](#).

Audience

The content of this chapter is intended for Fusion Middleware administrators responsible for custom WebCenter application administration (users granted the `Admin` role through the Oracle WebLogic Server Administration Console).

4.1 Installing Oracle WebCenter and Oracle WebCenter Framework Libraries

Oracle WebCenter installation is described in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

Oracle JDeveloper installation, required for building custom WebCenter applications, is described in *Oracle Fusion Middleware Installation Guide for Oracle JDeveloper*.

Custom WebCenter applications can be deployed to any WebLogic Server instance that is provisioned with the Oracle WebCenter Framework shared library files. For details, see, [Section 7.1.3.1, "Creating and Provisioning a WebLogic Managed Server Instance"](#).

4.2 Deploying Custom WebCenter Applications for the First Time (Roadmap)

The roadmap in [Table 4–1](#) outlines the tasks that a Fusion Middleware administrator must perform to deploy a custom WebCenter application, developed with Oracle WebCenter Framework, and get it up and running.

Note: WebCenter Spaces requires additional administration tasks that custom WebCenter applications do not. To see a comprehensive list of these tasks, refer to [Chapter 2, "Getting WebCenter Spaces Up and Running"](#).

Table 4–1 Roadmap - Getting Custom WebCenter Applications Up and Running for the First Time

Step	Documentation	Role
Step 1 - Verify your Oracle WebCenter installation	Verify your Oracle WebCenter installation and settings. See: <ul style="list-style-type: none"> ▪ Installing Oracle WebCenter and Oracle WebCenter Framework Libraries ▪ Starting Node Manager Installation is described in the <i>Oracle Fusion Middleware Installation Guide for Oracle WebCenter</i> .	Fusion Middleware Admin
Step 2 - Launch Fusion Middleware Control	Launch the Fusion Middleware Control Console, a Web-based management tool for WebCenter applications. See: <ul style="list-style-type: none"> ▪ Displaying Fusion Middleware Control Console ▪ Navigating to the Home Page for Custom WebCenter Applications Learn about the command-line administration tool WLST. See " Oracle WebLogic Scripting Tool (WLST) ".	Fusion Middleware Admin
Step 3 - Deploy the custom WebCenter application	Create a suitable container in which to deploy the custom WebCenter application archive: <ul style="list-style-type: none"> ▪ Creating and Provisioning a WebLogic Managed Server Instance ▪ Creating and Registering the Metadata Service Repository ▪ Deploying the Application to a WebLogic Managed Server Instance See also, " Deploying WebCenter Applications ".	Fusion Middleware Admin
Step 4 - Connect back-end services	Configure back-end services for the custom WebCenter application through Fusion Middleware Control. <ul style="list-style-type: none"> ▪ Content Repositories <ul style="list-style-type: none"> ▪ Managing Content Repositories ▪ Mail Servers <ul style="list-style-type: none"> ▪ Managing the Mail Service ▪ BPEL Servers <ul style="list-style-type: none"> ▪ Managing the Worklist Service ▪ Collaboration Services <ul style="list-style-type: none"> ▪ Managing the Announcements and Discussions Services ▪ Managing the Instant Messaging and Presence Service 	Fusion Middleware Admin

Maintaining Custom WebCenter Applications

The chapter outlines what Fusion Middleware administrators might do to keep custom WebCenter applications up and running. The following roadmap will help guide you through the process:

- [Section 5.1, "System Administration for Custom WebCenter Applications \(Roadmap\)"](#)

Although WebCenter Spaces is itself a WebCenter application, it does require some special maintenance tasks that custom WebCenter applications do not. To see a comprehensive list of these tasks, refer to [Chapter 3, "Maintaining WebCenter Spaces"](#).

Audience

The content of this chapter is intended for Fusion Middleware administrators responsible for custom WebCenter application administration (users granted the `Admin` role through the Oracle WebLogic Server Administration Console).

5.1 System Administration for Custom WebCenter Applications (Roadmap)

The roadmap in [Table 5–1](#) outlines typical tasks that a Fusion Middleware administrator might perform to keep a custom WebCenter application up and running.

If the custom WebCenter application must temporarily shut down for maintenance, ensure that a suitable message displays to any users who attempt to access the application while it is offline.

Table 5–1 Roadmap - Maintaining Custom WebCenter Applications

Step	Documentation	Role
Step 1 - Stop and start the managed server	Restart the managed server on which the custom WebCenter application is deployed to effect configuration changes or for routine maintenance: <ul style="list-style-type: none"> ■ Starting and Stopping Managed Servers for WebCenter Application Deployments 	Fusion Middleware Admin
Step 2 - Stop and start the custom WebCenter application	Shut down the application for maintenance purposes and then restart the application: <ul style="list-style-type: none"> ■ Starting and Stopping Custom WebCenter Applications 	Fusion Middleware Admin
Step 3 Maintain back-end services	Add, modify, and delete connections through the Fusion Middleware Control Console:	Fusion Middleware Admin

Part III

Basic Systems Administration for Oracle WebCenter

This part of the Administrator's Guide presents system administration tasks for Oracle WebCenter and WebCenter applications, such as, WebCenter Spaces and any custom WebCenter applications that you deploy.

Part III contains the following chapters:

- [Chapter 6, "Starting Enterprise Manager Fusion Middleware Control"](#)
- [Chapter 7, "Deploying WebCenter Applications"](#)
- [Chapter 8, "Starting and Stopping WebCenter Applications"](#)
- [Chapter 9, "Setting Application Properties"](#)

Starting Enterprise Manager Fusion Middleware Control

This chapter describes how to access Oracle Enterprise Manager Fusion Middleware Control Console, and display WebCenter-related pages from where you can perform all necessary configuration, monitoring, and management tasks.

This chapter includes the following sections:

- [Section 6.1, "Displaying Fusion Middleware Control Console"](#)
- [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
- [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
- [Section 6.4, "Navigating to Dependent Components"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin`, `Operator`, or `Monitor` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools"](#).

6.1 Displaying Fusion Middleware Control Console

Fusion Middleware administrators can login to Fusion Middleware Control Console and access Oracle WebCenter pages. Your role determines what you can see and do after logging in. To find out more, see [Table 1–6, "WebCenter Operations and Oracle WebLogic Server Roles"](#).

To access the Fusion Middleware Control Console:

1. Start Fusion Middleware Control.

Fusion Middleware Control is configured for a domain, and it is automatically started when you start the Oracle WebLogic Server Administration Server. See "Starting and Stopping Fusion Middleware Control" in *Oracle Fusion Middleware Administrator's Guide*.

2. Navigate to the following URL:

`http://host_name.domain_name:port_number/em`

For example: `http://myhost.mycompany.com:7001/em`

You can find the exact URL, including the administration port number, in `config.xml`:

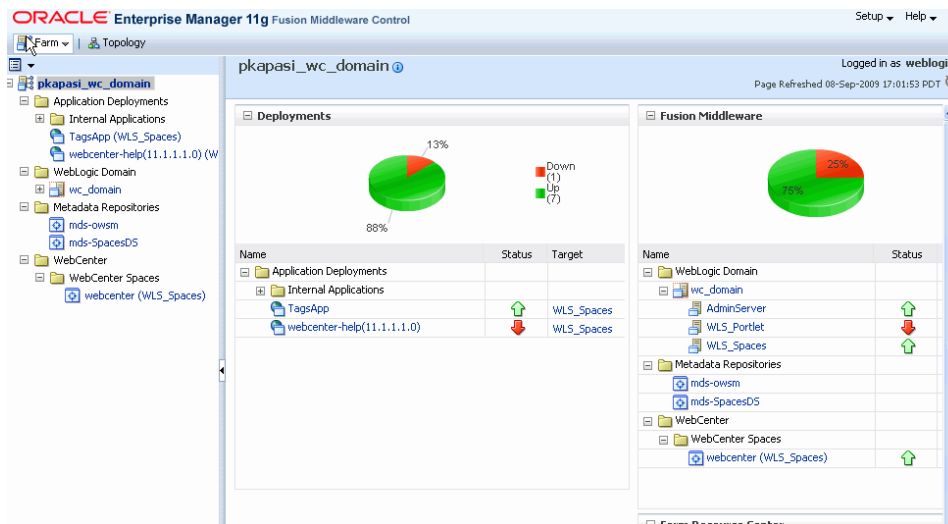

- On Windows: `DOMAIN_HOME\config\config.xml`

- On UNIX: DOMAIN_HOME/config/config.xml
- See also, "Managing Ports" in *Oracle Fusion Middleware Administrator's Guide*.
3. Enter a valid administrator **User Name** and **Password** details for the farm.

The default user name for the administrator user is `weblogic`. This is the account you can use to log in to Fusion Middleware Control for the first time.
 4. Click **Login**.

The first page you see is the Farm home page. You can also view this page at any time by selecting the name of the farm in the navigation pane ([Figure 6-1](#)).

Figure 6-1 Farm Home Page

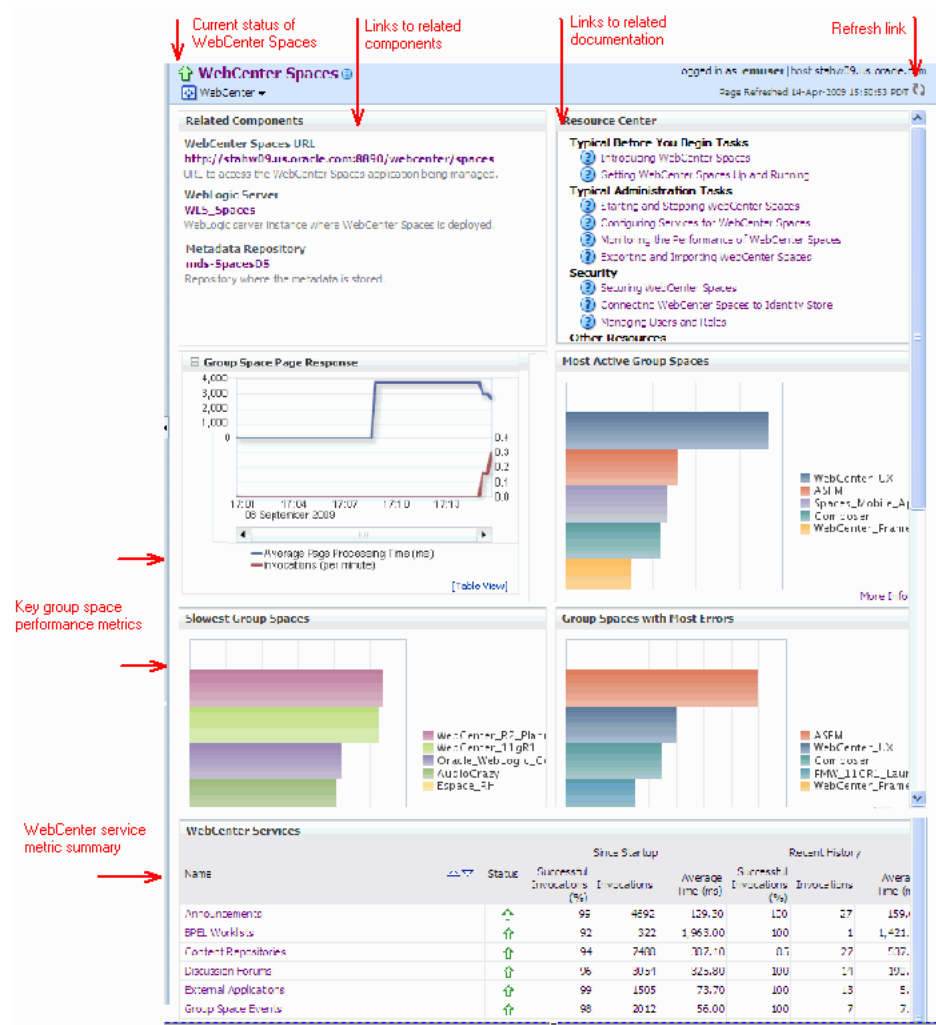

From the navigation pane, you can drill down to view and manage all components in your farm, including WebCenter Spaces and any custom WebCenter applications that you may have deployed. For detailed instructions, see

- [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).
- [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

6.2 Navigating to the Home Page for WebCenter Spaces

The WebCenter Spaces home page is your starting place for managing WebCenter Spaces. The page displays status, performance and availability of all the components and services that make up WebCenter Spaces.

Figure 6–2 WebCenter Spaces Home Page

From here you can:

- Check the status of WebCenter Spaces.
- View key group space performance data. Track overall response time compared with the user access rate to see how the application performs under different loads and to diagnose machine resource issues. Quickly see which group spaces are used the most, the slowest performers, and determine which group spaces are recording the most errors.
- Navigate to key WebCenter Spaces components, including the application itself, the WebLogic Server installation, and the MDS repository.
- View status and key performance metrics for WebCenter services used in the application.
- Drill down to detailed performance information for individual group spaces, services, external applications, portlets, and producers.

The WebCenter Spaces home page also displays a **WebCenter menu** (Figure 6–3).

Figure 6–3 WebCenter Menu for WebCenter Spaces

From the WebCenter menu, you can:

- Start and stop WebCenter Spaces
- Configure application settings
- Manage back-end services
- Manage external applications
- Register and manage portlet producers
- Monitor detailed performance metrics for all components
- Select and chart live metrics
- Analyze diagnostic information and configure logs
- Export and import WebCenter Spaces
- Configure security policies and roles.
- Configure ADF and MDS options.
- View Web Services-related information.

To navigate to the main home page for WebCenter Spaces:

1. Login to Fusion Middleware Control.
See [Section 6.1, "Displaying Fusion Middleware Control Console"](#).
2. In the Navigator ([Figure 6–4](#)), expand **WebCenter**.
3. Expand **WebCenter Spaces**.
4. Select **webcenter** to navigate to the home page for your WebCenter Spaces installation.

Figure 6–4 Navigating to the WebCenter Spaces Home Page

Notice how the Navigator menu changes to *WebCenter* (Figure 6–5).

Figure 6–5 Displaying the WebCenter Spaces Home Page and Menu

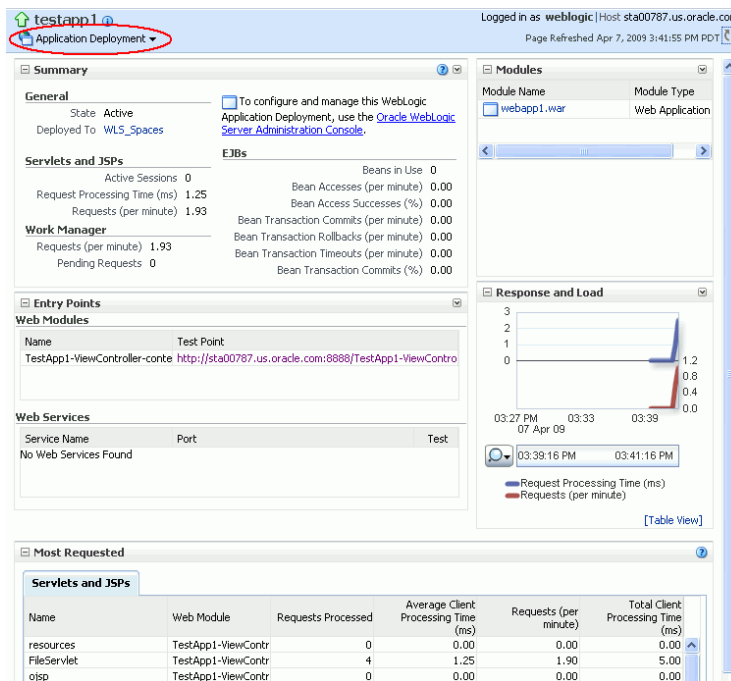

6.3 Navigating to the Home Page for Custom WebCenter Applications

The J2EE Application Deployment home page (Figure 6–6) is your starting place for managing custom WebCenter application deployments developed with Oracle WebCenter Framework. The page displays status, performance and availability of all the components and services that make up the custom WebCenter application.

Note: WebCenter Spaces has a different home page, see [Navigating to the Home Page for WebCenter Spaces](#).

Figure 6–6 Custom WebCenter Application Home Page

From here you can:

- Check custom WebCenter application status.
- Navigate to the Oracle WebLogic Server Administration Console.
- Access various Application Deployment menu options:
 - Start, restart, and shutdown the application
 - View and configure log files.
 - Undeploy and redeploy the application.
 - Configure security policies and roles.
 - Configure ADF and MDS options.
- View a performance summary, entry points to the application, Web Services and modules associated with the application, and the response and load data which shows the requests per second and the request processing time.
- Navigate to key components of the custom WebCenter application.
- Drill down to detailed performance information for individual modules and services.

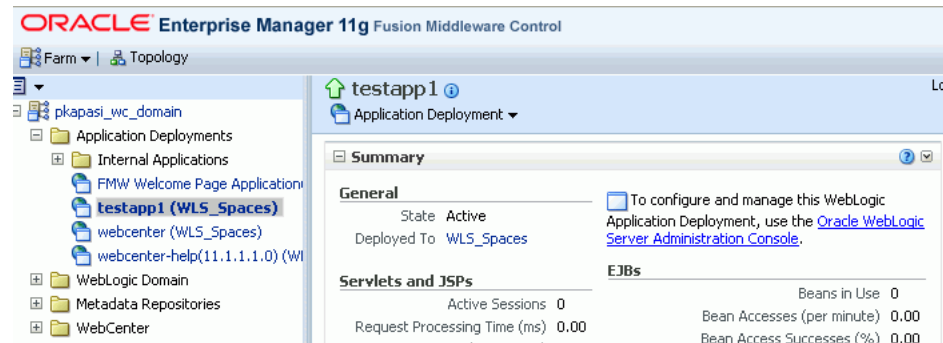

For custom WebCenter applications, the Application Deployment menu displays an additional menu option—*WebCenter*. From the WebCenter menu, you can perform WebCenter-specific tasks such as:

- Manage external applications (see [Chapter 22, "Managing External Applications"](#)).
- Manage back-end services (see [Chapter 10, "Managing Services"](#)).
- Manage portlet producers (see [Chapter 21, "Managing Portlet Producers"](#)).
- Monitor detailed performance metrics for WebCenter services (see [Chapter 24, "Monitoring Oracle WebCenter Performance"](#)).

To navigate to the main home page for your custom WebCenter application:

1. Login to Fusion Middleware Control.
See [Section 6.1, "Displaying Fusion Middleware Control Console"](#).
2. In the Navigator ([Figure 6-7](#)), expand **Application Deployments**.

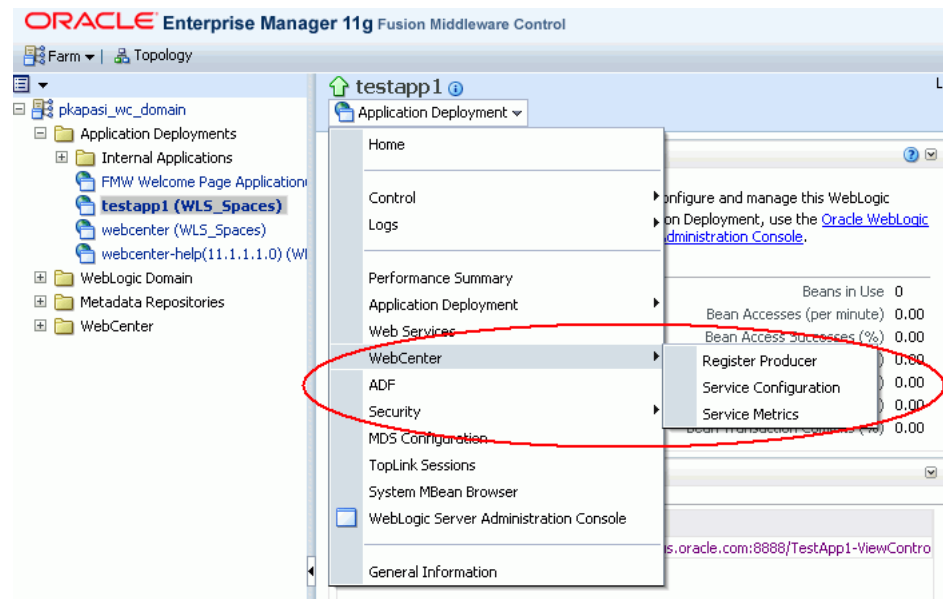

Figure 6-7 Navigating to a Custom WebCenter Application Home Page

3. Select the name of your custom WebCenter application to display the application's home page.

Notice WebCenter menu options display on the **Application Deployment** menu ([Figure 6-8](#)).

Figure 6-8 Displaying the Custom WebCenter Application Home Page and Menu

6.4 Navigating to Dependent Components

From WebCenter application pages it is easy to navigate to pages belonging to related components, such as, WebLogic Server domains, servers, Java components, MDS repository, and so on.

- **WebCenter Spaces** - From the home page, click links in "Related Components" to navigate to the WebCenter Spaces application itself, WebLogic Server installation

pages, and MDS repository pages in Fusion Middleware Control. See also, [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).

- **Custom WebCenter applications** - The Application Deployment menu on the J2EE application home page offers direct navigation to the Oracle WebLogic Server Administration Console, and pages relating to ADF, MDS repository, and security. See also, [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

Deploying WebCenter Applications

This chapter provides instructions for deploying, undeploying, and redeploying custom WebCenter applications from an Enterprise Archive, or EAR file, created with Oracle JDeveloper (for information on how to create an EAR file, see "How to Create Deployment Profiles in Oracle JDeveloper" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*). It does not contain instructions for deploying or installing Oracle WebCenter Spaces. For information about installing Oracle WebCenter Spaces and other WebCenter components, see "Installing Oracle WebCenter" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*. For information about deploying WSRP and PDK-Java portlet producer applications, see [Section 21.8, "Deploying Portlet Producer Applications."](#)

This chapter includes the following sections:

- [Section 7.1, "Deploying Custom WebCenter Applications"](#)
- [Section 7.2, "Undeploying Custom WebCenter Applications"](#)
- [Section 7.3, "Redeploying Custom WebCenter Applications"](#)
- [Section 7.4, "Post-Deployment Configuration"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Deployer` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

7.1 Deploying Custom WebCenter Applications

This section describes the steps required to deploy a custom WebCenter application, which has been created in JDeveloper, to a production domain. The deployment steps in this section assume that you are deploying an EAR file, know its location, and that the domain to which you want to deploy exists.

For information on how to create a WebLogic Server domain, see "Creating a New Domain" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*. For more information about deploying applications, see *Oracle Fusion Middleware Deploying Applications to Oracle WebLogic Server*.

This section includes the following topics:

- [Section 7.1.1, "Deployment Prerequisites"](#)
- [Section 7.1.2, "Preparing the Application EAR File"](#)
- [Section 7.1.3, "Preparing the Target Environment"](#)

- [Section 7.1.4, "Deploying the Application to a WebLogic Managed Server Instance"](#)
- [Section 7.1.5, "Transporting Customizations Between Environments"](#)
- [Section 7.1.6, "Configuring Applications to Run in a Distributed Environment"](#)

7.1.1 Deployment Prerequisites

You can deploy custom WebCenter applications to any WebLogic Managed Server instance that is provisioned with the Oracle WebCenter libraries.

Note: Oracle does not recommend deploying custom WebCenter applications to any of the three preconfigured Managed Servers created during the installation, or to the Administration Server. For WebCenter applications created in JDeveloper, follow the process described in [Section 7.1.3.2, "Creating and Registering the Metadata Service Repository"](#) and [Section 7.1.3.1, "Creating and Provisioning a WebLogic Managed Server Instance"](#) to create and provision a new WLS Managed Server before deploying.

Before deploying, you must:

- Prepare the application EAR file, as described in [Section 7.1.2, "Preparing the Application EAR File."](#)
- Prepare the target environment, as described in [Section 7.1.3, "Preparing the Target Environment."](#)

After preparing the EAR file and the target environment, continue by deploying the application as described in [Section 7.1.4, "Deploying the Application to a WebLogic Managed Server Instance."](#)

7.1.2 Preparing the Application EAR File

Before you deploy an application, you must first create a deployment profile. The deployment profile packages or archives the custom WebCenter application and its associated files so that the application can be deployed to an Oracle WebLogic Managed Server as an EAR file.

For information on how to create a deployment profile (and the resulting EAR file) for an application, see "Packaging and Deploying a Custom WebCenter Application to a WebLogic Managed Server" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

7.1.2.1 EAR File Contents

The EAR file packages multiple information artifacts, which include:

- The application itself: the physical pieces of the application such as `.jsp`, `.jar`, and `.class` files.
- Application Configuration – which contains the URL endpoints and properties of connections to services and producers that are configured for this application.
- Application Metadata – which is an export of the application metadata created during the design time of the application.
- Portlet Customizations – which contain customization settings and data for portlets. This information is maintained within the producer, but is exported when

an application with registered producers is packaged. This customization data is packaged with the rest of the metadata of a custom WebCenter application.

7.1.3 Preparing the Target Environment

Before deploying a custom WebCenter application, you must create a WebLogic Managed Server instance and provision it with a required set of shared libraries. You must also create and register a Metadata Service (MDS) repository to store application metadata such as page personalizations and customizations. Finally, you must prepare the target environment so that it can host the deployed application.

Note: Oracle does not recommend deploying custom WebCenter applications to any of the three preconfigured Managed Servers created during the installation, or to the Administration Server. For custom WebCenter applications, follow the process described in [Section 7.1.3.2, "Creating and Registering the Metadata Service Repository"](#) and [Section 7.1.3.1, "Creating and Provisioning a WebLogic Managed Server Instance"](#) to create and provision a new WLS Managed Server before deploying.

This section includes the following topics:

- [Section 7.1.3.1, "Creating and Provisioning a WebLogic Managed Server Instance"](#)
- [Section 7.1.3.2, "Creating and Registering the Metadata Service Repository"](#)
- [Section 7.1.3.3, "Configuring the Target Environment"](#)

7.1.3.1 Creating and Provisioning a WebLogic Managed Server Instance

You can create a WebLogic Managed Server instance using the WLS Administration Console, or using Fusion Middleware Control. You can also create a WebLogic Managed Server instance and provision it using WLST commands in a Jython script. A sample Jython script that you can modify to suit the needs of your local environment is available for download from the Oracle Technology Network (OTN). Using a script is a good approach in circumstances where new Managed Servers must be created on an on-going basis.

These three options are described in the following sections:

- [Creating and Provisioning a WebLogic Managed Server Using a Jython Script](#)
- [Creating and Provisioning a WebLogic Managed Server Using the WLS Administration Console](#)
- [Creating a WebLogic Managed Server Using Fusion Middleware Control](#)

7.1.3.1.1 Creating and Provisioning a WebLogic Managed Server Using a Jython Script

You can use a Jython script to automate the process of creating a new Managed Server instance. An example script that you can modify for your local environment is available for download from the Oracle WebCenter Suite 11g Demonstrations and Samples page on OTN at:

http://www.oracle.com/technology/products/webcenter/release11_demos.html

under Administration Samples. The example script creates a new WebLogic Managed Server instance, deploys the shared libraries required to run a WebCenter application, and checks that the new Managed Server is ready for deployment.

To create and provision WebLogic Managed Server using a Jython script:

1. Download the example script from OTN.
2. Copy the following two files into your `MW_HOME/as11r1wc/common/bin` folder:

```
createManagedServer.py
targetServer.properties
```

3. Check `createManagedServer.py` and modify it for your local environment, if necessary.
4. Modify `targetServer.properties` to supply your WLS installation path and other required information as shown in the following example:

```
## DomainHome chosen for the installation ##
domainHome=/scratch/workdir/mwhome/user_projects/domains/wc_domain/
## OracleHome of the installation location ##
WC_ORACLE_HOME=/scratch/workdir/Feb241515/mwhome/as11r1wc
## Set CONFIG_JVM_ARGS if using adminServerUrl with SSL t3
setenv CONFIG_JVM_ARGS
-Dweblogic.security.SSL.ignoreHostnameVerification=true
-Dweblogic.security.TrustKeyStore=DemoTrust
## AdminServer URL
adminServerUrl=t3://myserver.example.com:7001
## Name of the Managed Server you want to create
mgdServerName=CustomAppServer3
## Username to access the server
user=weblogic
## Password to access the server
password=weblogic
## Port number to be assigned to the new Managed Server
port=9996
#####
## Use serverType "WebCenter" for generic WebCenter custom apps ##
## or serverType "Portlet" for Portlet producer and bridge custom apps##
#####
serverType=WebCenter
#####
## If you don't want to create a custom schema for the new managed ##
## server, choose NONE, to use the default WebCenter schema. ##
## Otherwise, specify the name of the schema you created with the RCU ##
## prior to running the script (creating a new schema is recommended).##
#####
customDS=NONE
```

5. Run the script from your `MW_HOME/as11r1wc/common/bin` folder:

```
./wlst.sh createManagedServer.py
```

6. Start the newly created WebLogic Managed Server using the following command:

```
nohup ./startManagedWebLogic.sh custom_server_id http://server_ip_addr:server_
port_num
-Dweblogic.management.username=user_name
-Dweblogic.management.password=password customServer.out &
```

Where:

- *custom_server_id* is the name of the new Managed Server you created (for example, CustomAppServer3).
 - *server_ip_addr* is the IP address of the administration server.
 - *server_port_num* is the port number of the administration server.
 - *user_name* is the user name to access the server (for example, *weblogic*).
 - *password* is the password to access the server (for example, *weblogic*).
7. Once the Managed Server is started, check that the schema is registered (the registered MDS schema should appear when you click your WLS domain in Fusion Middleware Control).

You can now continue to deploy your custom WebCenter application as described in [Section 7.1.4, "Deploying the Application to a WebLogic Managed Server Instance,"](#) or portlet producer application as described in [Section 21.8, "Deploying Portlet Producer Applications."](#)

7.1.3.1.2 Creating and Provisioning a WebLogic Managed Server Using the WLS Administration Console

You can create a WebLogic Managed Server on an existing domain using the WLS Administration Console to create the server instance and provision the shared libraries required to run a custom WebCenter application.

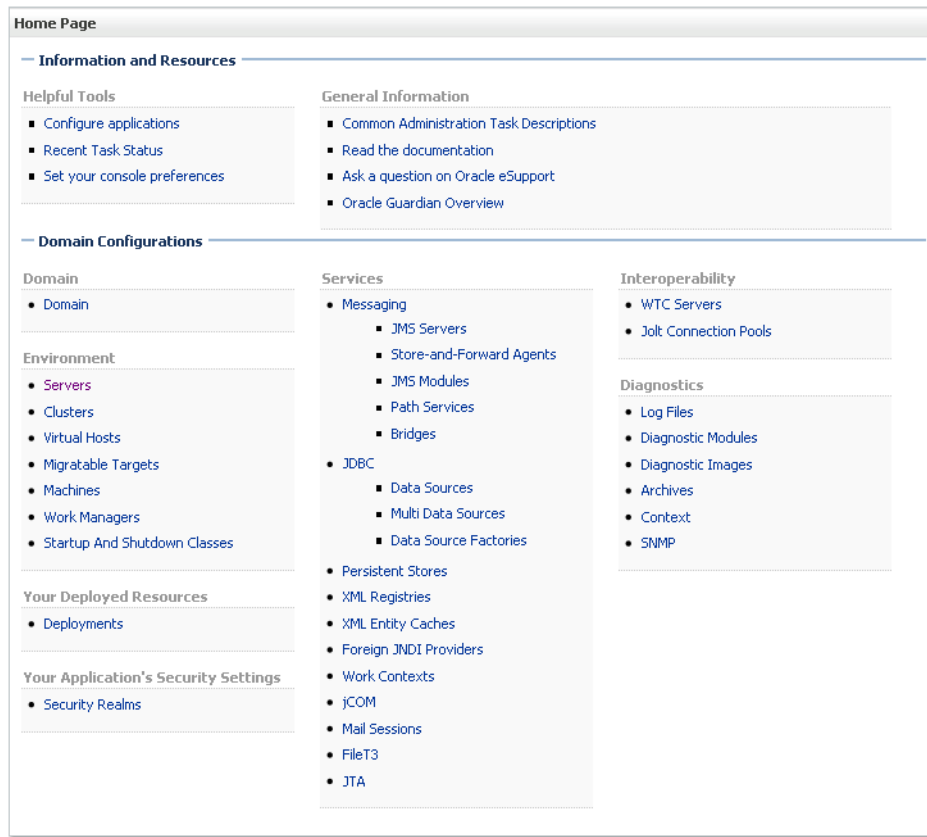

To create a WebLogic Managed Server using the WLS Administration Console:

1. Log in to the WLS Administration Console.

For information on logging into the WLS Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. Navigate to the WLS Administration Console's Home page (see [Figure 7-1](#)).

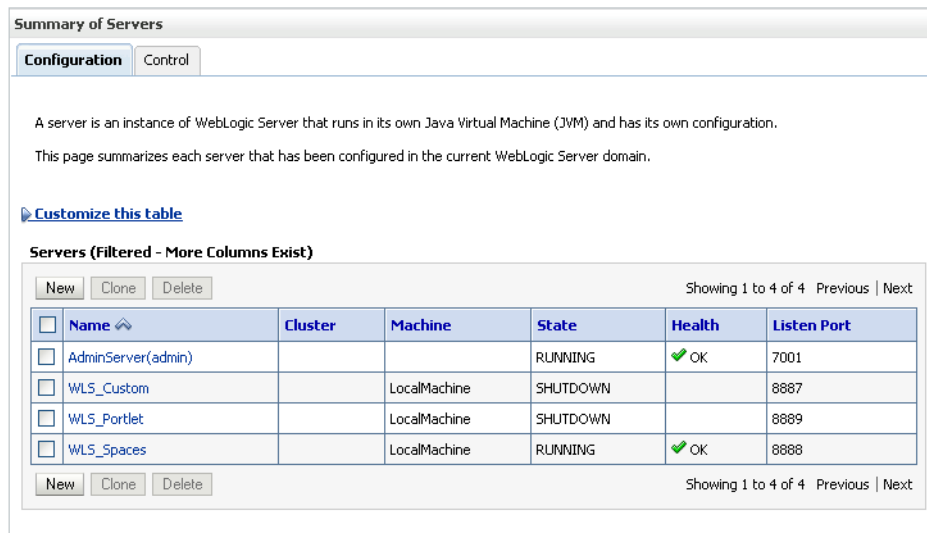

Figure 7–1 WLS Administration Console Home Page

- From the WLS Administration Console's Home page under **Domain Configurations**, click **Servers**.

The Summary of Servers pane displays (see [Figure 7–2](#)).

Figure 7–2 Summary of Servers Pane

4. On the Summary of Servers pane, click **New** to create a WebLogic Managed Server instance.

The Create a New Server pane displays (see [Figure 7-3](#)).

Figure 7-3 Create a New Server pane

5. Enter a **Server Name** for the new Managed Server, and the **Port Number** to be assigned to it. Leave the default settings for the rest of the fields.

Note: Do not set the port number to 7001 as this port number is used by the domain administration server. Also do not leave the port number blank as it defaults to 7001.

6. Click **Finish**, then **Save** to generate the new Managed Server.
7. On the Domain Structure pane, click **Deployment**.

In this step, we provision the new Managed Server with the shared libraries required to run a custom WebCenter application. Several shared libraries are deployed, but you must ensure that the required libraries are targeted to the newly created Managed Server.

Note: If you have set up a cluster with several WebLogic Managed Servers in your WebLogic domain, target all libraries to the cluster instead. All Managed Servers in the cluster inherit from the cluster automatically.

The shared libraries required are different to host a custom WebCenter application that consumes portlets and services than for a portlet producer application. If you want the server to run both consumer and producer applications you must deploy both sets of shared libraries.

For a custom WebCenter application that consumes portlets and services *only*, you must deploy the following libraries to the new Managed Server or cluster:

- content-management-cmis-rest-app-lib(10.3.2,10.3.2)
- content-management-cmis-rest-web-lib(10.3.2,10.3.2)
- content-management-faces-web-lib(10.3.2,10.3.2)
- content-management-web-lib(10.3.2,10.3.2)
- jaxrs-framework-web-lib(10.3.2,10.3.2)
- jersey-web-lib(1.0,1.0.2)
- oracle-ridc-client-app-lib(10.3.2,10.3.2)
- oracle-ucm-spi-app-lib(10.3.2,10.3.2)
- p13n-app-lib-base(10.3.2,10.3.2)
- p13n-core-web-lib(10.3.2,10.3.2)
- vcr-app-lib(10.3.2,10.3.2)
- adf.oracle.domain(1.0,11.1.1.0.0)
- adf.oracle.domain.webapp(1.0,11.1.1.1.0)
- jsf(1.2,1.2.9.0)
- jstl(1.2,1.2.0.1)
- ohw-rcf(5,5.0)
- ohw-uix(5,5.0)
- UIX(11,11.1.1.1.0)
- oracle.adf.dconfigbeans(1.0,11.1.1.0.0)
- oracle.adf.management(1.0,11.1.1.1.0)
- oracle.dconfig-infra
- oracle.jrf.system.filter
- oracle.jsp.next(11.1.1,11.1.1)
- oracle.sdp.client(11.1.1,11.1.1)
- oracle.soa.workflow.wc(11.1.1,11.1.1)
- oracle.webcenter.composer(11.1.1,11.1.1)
- oracle.webcenter.framework(11.1.1,11.1.1)
- oracle.webcenter.framework.view(11.1.1,11.1.1)
- oracle.webcenter.jive.dependency(11.1.1,11.1.1)
- oracle.webcenter.skin(11.1.1,11.1.1)
- oracle.wsm.seedpolicies(11.1.1,11.1.1)
- oracle.portlet-producer.jpdk(11.1.1,11.1.1)
- oracle.portlet-producer.wsrp(11.1.1,11.1.1)

Note: If the two shared libraries `oracle.portlet-producer.jpdk` and `oracle.portlet-producer.wsrp` are not available from the WLS console, you must install them by running the configuration wizard again and selecting the **Portlet** checkbox. If these two libraries are not provisioned to the new Managed Server, portlet-specific functions do not work in a custom WebCenter application.

For a portlet producer application, the following libraries must be deployed to the new Managed Server or cluster:

- `adf.oracle.domain(1.0,11.1.1.0.0)`
- `adf.oracle.domain.webapp(1.0,11.1.1.1.0)`
- `jsf(1.2,1.2.9.1)`
- `jstl(1.2,1.2.0.1)`
- `ohw-rcf(5,5.0)`
- `ohw-uix(5,5.0)`
- `UIX(11,11.1.1.1.0)`
- `oracle.adf.dconfigbeans(1.0,11.1.1.0.0)`
- `oracle.dconfig-infra`
- `oracle.jrf.system.filter`
- `oracle.jsp.next(11.1.1,11.1.1)`
- `oracle.webcenter.skin(11.1.1,11.1.1)`
- `oracle.wsm.seedpolicies(11.1.1,11.1.1)`
- `oracle.portlet-producer.jpdk(11.1.1,11.1.1)`
- `oracle.portlet-producer.wsrp(11.1.1,11.1.1)`

8. In addition, for both WebCenter and portlet producer applications, you must deploy the following applications:

- DMS application
- `wsm-pm`

For each shared library or application to add:

- Click the library or application link.
- Open the Target tab for the library or application.
- Supply the target to the newly created Managed Server.

9. Select the checkbox of the new Managed Server and click **Save**.

10. On the Domain Structure pane, expand Environment and click **Startup and Shutdown classes**. The following classes should show as available:

- Audit Loader Startup Class
- DMS-Startup
- DMS-Shutdown
- JMX Framework Startup Class

- JOC-Shutdown
- JOC-Startup
- JPS-Startup Class
- JRF Startup Class
- ODL-Startup
- OWSM Startup Class

Note: The actual startup and shutdown classes may differ depending on your setup and installation options. All startup and shutdown classes that appear should be targeted to the newly created Managed Server instance.

11. For each class in the list above:

- Click the class name.
- On the Target tab, check the newly created Managed Server.
- Click **Save**.

12. When all the shared libraries and application assignments are complete, do one of the following:

- Start the new Managed Server using Fusion Middleware Control as described in [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)
- Start the new Managed Server by opening a terminal window and invoking the following command from your domain's /bin directory (under *MW_HOME/user_projects* unless the default location has been changed):

```
nohup ./startManagedWebLogic.sh custom_server_id http://server_ip_
addr:server_port_num
-Dweblogic.management.username=user_name
-Dweblogic.management.password=password customServer.out &
```

Where:

- *custom_server_id* is the name of the new Managed Server you created (for example, CustomAppServer3).
- *server_ip_addr* is the IP address of the administration server.
- *server_port_num* is the port number of the administration server.
- *user_name* is the user name to access the server (for example, weblogic).
- *password* is the password to access the server (for example, weblogic).

Once the Managed Server is started, you can continue to deploy your WebCenter application as described in [Section 7.1.4, "Deploying the Application to a WebLogic Managed Server Instance,"](#) or portlet producer application as described in [Section 21.8, "Deploying Portlet Producer Applications."](#)

7.1.3.1.3 Creating a WebLogic Managed Server Using Fusion Middleware Control

Use Fusion Middleware Control to create a WebLogic Managed Server instance for custom WebCenter application deployment.

Note: Although you can create a WebLogic Managed Server using Fusion Middleware Control, you must use the WebLogic Administration Console to provision it as described in [Section 7.1.3.1.2, "Creating and Provisioning a WebLogic Managed Server Using the WLS Administration Console,"](#) or modify the Jython script described in [Section 7.1.3.1.1, "Creating and Provisioning a WebLogic Managed Server Using a Jython Script"](#) to provision the shared libraries required to run a custom WebCenter application.

To create a WebLogic Managed Server using Fusion Middleware Control:

1. Log in to Fusion Middleware Control.
See [Section 6.1, "Displaying Fusion Middleware Control Console."](#)
2. From the Farm menu, choose **Create/Delete Components**.
The Fusion Middleware Components page opens ([Figure 7-4](#)).

Figure 7-4 Fusion Middleware Components Page

Logged in as **weblogic**
Page Refreshed Oct 21, 2008 4:20:12 PM PDT

Fusion Middleware Components
Review the list of Oracle Weblogic Servers, Clusters, System Components, and Oracle Fusion Middleware Components currently available in the farm. You can also create, delete, start, and stop Oracle Weblogic Servers, Clusters, System Components, and Oracle Fusion Middleware Components.

Component Name	Component Type	Status	Host
wlsDomain	Oracle WebLogic Domain	3 (↑3)	
AdminServer	Oracle WebLogic Admin Server	↑	stadm11.us.oracle.cor
em	Application Deployment	↑	stadm11.us.oracle.cor
wls_server	Oracle WebLogic Server	↑	stadm11.us.oracle.cor

3. From the Create menu, select **WebLogic Server**.
4. Enter a unique name for the WebLogic server (for example, myWebCenterWLS, as shown in [Figure 7-5](#)).

Figure 7-5 Create WebLogic Server Page

Page Refreshed Oct 21, 2008 4:32:00 PM PDT

General

* Name
* Listen Port

Weblogic Machine
Weblogic Server can not be started from Enterprise Manager if no machine is selected. Node Manager need to be active before a Weblogic Server can be started on a remote machine.

Create new Weblogic Machine Select existing Weblogic Machine

Name
Machine OS Unix Machine Other
Node Manager Type SSH RSH Plain SSL
Listen Address
Listen Port
Post-Bind UID
Enable Post-Bind UID
Node Manager Home
Shell Command
Post-Bind GID
Enable Post-Bind GID
 Debug Enabled

Clusters
Weblogic Server can not be a member of more than one clusters. If no cluster is selected, the new server will be created as a stand-alone server.

Cluster Name	Cluster Messaging Mode	Default Load Algorithm	Replication Type	Migration Basis	Cluster Broadcast Channel	Cluster Address	Existing Servers
No Clusters							

5. Under Weblogic Machine, create or select the application server instance where this WebLogic Managed Server instance should be created.
6. Click **Create**.
7. When the Confirmation page displays, click **Close**.
8. In the Fusion Middleware Components page, select the new WebLogic Managed Server instance, and click **Start**.
9. Continue by provisioning the shared libraries as described in [Section 7.1.3.1.2, "Creating and Provisioning a WebLogic Managed Server Using the WLS Administration Console"](#) omitting the steps (steps 4 to 7) for creating the Managed Server, or using a modified version of the Jython script described in [Section 7.1.3.1.1, "Creating and Provisioning a WebLogic Managed Server Using a Jython Script."](#)

7.1.3.2 Creating and Registering the Metadata Service Repository

Before you can deploy an application to a Managed Server, you must first create and register a Metadata Service (MDS) repository schema for the application on the WebLogic Domain's Administration Server instance.

At deployment time, some configuration information and application metadata exported into the EAR file must be imported into a MDS schema for use in the production environment. Importing the metadata occurs automatically during deployment when you select a target metadata schema (as explained in [Section 7.1.4, "Deploying the Application to a WebLogic Managed Server Instance"](#)).

Caution: If you deploy using an MDS schema that was created during the WebCenter installation instead of using a custom schema as described in this section, you risk damaging data in those schemas.

You create the MDS schema using the Repository Creation Utility (RCU). After creating the MDS schema, you must register it using either Fusion Middleware Control, or from the command line using WLST.

This section contains the following subsections:

- [Creating an MDS Schema Using the Repository Creation Utility](#)
- [Registering an MDS Schema Using Fusion Middleware Control](#)
- [Registering an MDS Schema Using WLST](#)

7.1.3.2.1 Creating an MDS Schema Using the Repository Creation Utility

Before you deploy an application, you must first create the MDS schema on a database server instance using the Repository Creation Utility (RCU), and then register it on the administration server for the domain to which you're deploying so that the application's metadata can also be deployed.

When following these instructions, be sure to note the MDS schema name and the login credentials for accessing it. You need this information for subsequent steps in the deployment process.

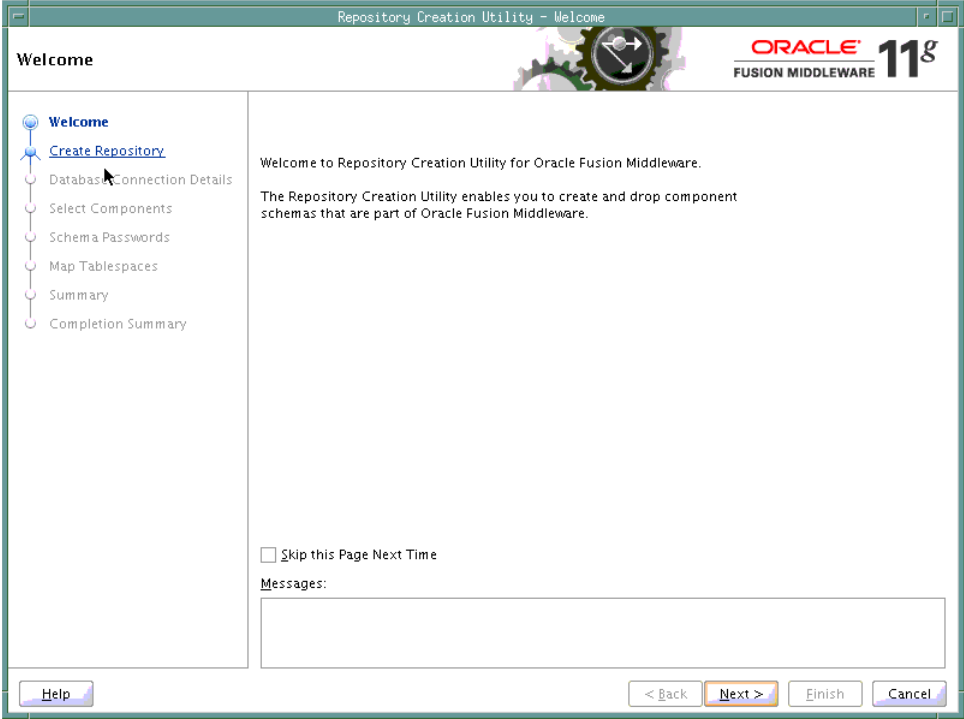

To create the MDS schema:

1. Navigate to `RCU_HOME/bin` and start the RCU with the following command:

```
rcu
```

The RCU Welcome page displays (see [Figure 7-6](#)).

Figure 7-6 RCU Welcome Page

- 2. Click **Next**.
- 3. Select **Create** and click **Next**.

The Database Connection Details page displays (see [Figure 7-7](#)).

Buttons: Help, < Back, Next >, Finish, Cancel

6. Check **Create a New Prefix** and enter a prefix to be prepended to the schema name.
7. Check the **Metadata Services** component. All other components should be left unchecked.
8. Click **Next**, and click **OK** when prompted by the Prerequisites pop-up. The Schema Passwords page displays (see [Figure 7-9](#)).

Figure 7–9 Schema Passwords Page

9. Select how the schema password should be applied, and enter and confirm the password.
10. Click **Next**.
11. On the Map Tablespaces page, click **Next**
12. When prompted to create the tablespaces, click **OK**, and then click **OK** again when the operation is complete.
13. On the Summary page, click **Create** to create the schema.
14. On the Completion Summary page that indicates the successful completion of creating the schema, click **Close**.

7.1.3.2.2 Registering an MDS Schema Using Fusion Middleware Control

Before you deploy your application, you must first register the new MDS schema with the domain so that applications running on the Managed Server can access it.

To register an MDS repository using Fusion Middleware Control:

1. Open Fusion Middleware Control and log in to the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the **farm**, then **WebLogic Domain**.
3. Select the domain to which you want to deploy.
4. From the WebLogic Domain menu, select **Metadata Repositories**.
The Metadata Repositories page displays (see [Figure 7–10](#)).

Figure 7–10 Metadata Repositories Page**Metadata Repositories**

You create most Fusion Middleware component schema repositories in a database using the Repository Creation Utility. Metadata Services (MDS) repositories can be created in a database with the Repository Creation Utility or created on disk as file-based repositories. You must register an MDS repository before you can deploy application metadata to the repository.

Database-Based Repositories

Repository Name	Database Type	Database Name	Schema Name	JNDI Location
mds-SpacesDS	Oracle	wkcdb01	app1_webcenter_mds	jdbc/mds/SpacesDS
mds-owsm	Oracle	wkcdb01	app1_webcenter_mds	jdbc/mds/owsm

File-Based Repositories

Repository Name	Directory
No Repository	

- In the Database-Based Repositories section, click **Register**.

The Register Database-Based Metadata Repository page displays (see [Figure 7–11](#)).

Figure 7–11 Register Database-based Metadata Repository Page

Metadata Repositories > Register Metadata Repository

Register Database-Based Metadata Repository

A repository stores information used by Application Server components and other applications. A metadata repository must be registered to be operational. A database-based repository is created using the Repository Creation Utility. To register, input database connection information and click Query, then select one of the Metadata Repository and click OK button.

Database Connection Information

Database Type: Oracle SQL Server

* Host Name:

* Port:

* Service Name:

Query

* User Name:

* Password:

Role:

Metadata Repository	Is Registered?	Schema Name	Version	Status	Modified Time
No Repository					

Selected Repository

The selected schema can be registered only if it has not already been registered.

Repository Name:

Schema Password:

- In the Database Connection section, enter the following information:
 - Database** - select the type of database.
 - Host Name** - enter the name of the host.
 - Port** - enter the port number for the database (for example, 1521).
 - Service Name** - enter the service name for the database. The default service name for a database is the global database name, comprising the database name, such as `orcl`, and the domain name, such as `example.com`. In this case, the service name would be `orcl.example.com`.

- **User Name** - enter a username for the database which is assigned the SYSDBA role (for example, *SYS*).
 - **Password** - enter the password for the user.
 - **Role** - select a database role (for example, **SYSDBA**).
7. Click **Query**.
- A table is displayed that lists the schemas and their metadata repositories that are available in the database.
8. Select a repository, then enter the following information:
- **Repository Name** - enter a name for the MDS schema.
 - **Schema Password** - enter the schema password you specified when you created the schema.
9. Click **OK**.
- The repository is registered with the Oracle WebLogic Server domain.

7.1.3.2.3 Registering an MDS Schema Using WLST

You can also use WLST to register a database-based MDS repository from the command line using the `registerMetadataDBRepository` command.

To register an MDS schema using WLST:

1. Start WLST as described in [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)
2. Register the MDS schema using the following command:

```
registerMetadataDBRepository(name='mds_name', dbVendor='db_vendor', host='host_name', port='port_number', dbName='db_name', user='username', password='password', targetServers='target_server')
```

Where:

- *mds_name* is the name of the MDS schema to register.
- *db_vendor* is the vendor of the database being used.
- *host_name* is the host ID of the Database Server.
- *port_number* is the port number of the Database Server.
- *db_name* is the name of the database being used to store the MDS.
- *username* is the database schema user name.
- *password* is the database schema password.
- *target_server* is the name of the target server. For multiple targets, separate the target server names with a comma. Be sure to include the WLS administration server in the list of targets so that the MDS database repository name appears in the Deployment Plan dialog when you deploy your application to it.

For example, to register the MDS schema `mds1` on the Oracle database `orcl` on the target server `server1` with the host ID of `example.com`, you would use the following command:

```
registerMetadataDBRepository(name='mds1', dbVendor='ORACLE', host='example.com',
```

```
port='1521', dbName='orcl', user='username', password='password',
targetServers='server1', 'AdminServer')
```

7.1.3.3 Configuring the Target Environment

After your target Managed Server has been created and provisioned, but before you deploy your custom WebCenter application, you must configure your database connections, connections to the Identity Store, and connections to the Policy and Credential Store.

This section contains the following subsections:

- [Configuring the JDBC Data Source](#)

7.1.3.3.1 Configuring the JDBC Data Source

If your custom WebCenter application contains JDBC database connections, you must choose how JDeveloper migrates those database connections to the Oracle WebLogic Managed Server. Through JDeveloper, you can configure the JDBC data source as either an application-level data source with password indirection, or as a global data source. Be sure to choose Global data source, by unchecking the **Auto Generate and Synchronize weblogic-jdbc.xml Descriptors During Deployment** checkbox in the Application Properties dialog. For more information about configuring a custom WebCenter application's JDBC database connections, see "Packaging the Database Connections" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

7.1.4 Deploying the Application to a WebLogic Managed Server Instance

Before deploying a custom WebCenter application archive, it is important to ensure that all the required shared libraries are published in the target WebLogic Managed Server instance.

Note: Oracle does not recommend deploying custom WebCenter applications to any of the three preconfigured Managed Servers created during the installation, or to the Administration Server. For custom WebCenter applications created in JDeveloper, follow the process described in [Section 7.1.3.2, "Creating and Registering the Metadata Service Repository"](#) and [Section 7.1.3.1, "Creating and Provisioning a WebLogic Managed Server Instance"](#) to create and provision a new WLS Managed Server before deploying. For portlet producer applications, you can create a Managed Server instance, or optionally deploy to the `WLS_Portlet` server.

Custom WebCenter applications can be deployed in several ways as described in the following sections:

- [Section 7.1.4.1, "Deploying Applications Using Oracle JDeveloper"](#)
- [Section 7.1.4.2, "Deploying Applications Using Fusion Middleware Control"](#)
- [Section 7.1.4.3, "Deploying Applications Using WLST"](#)
- [Section 7.1.4.4, "Deploying Applications Using the WLS Administration Console"](#)
- [Section 7.1.4.5, "Saving and Reusing the Deployment Plan"](#)

As explained in [Section 7.1.2, "Preparing the Application EAR File,"](#) the packaged EAR file consists of several information artifacts, which includes the application bits, the application configuration, the application metadata, and the portlet customizations.

During the deployment, these information artifacts must be moved to the right information store in the instance where application is deployed. The target information stores for these artifacts are as described in [Table 7-1](#):

Table 7-1 Information Artifact Target Stores

Information Artifact	Target Information Store
Application Bits	Target Server Instance
Application Configuration	MDS
Application Metadata	MDS
Portlet Customizations	Target Producer

The deployment process automatically migrates the application pieces to right target information store, the location for which is provided by the administrator. Regardless of the tool you choose to deploy, you must supply the target information store locations for correct deployment.

Although the application deployment fails if the MDS location is incorrect or not supplied, the application will deploy if the target producer is incorrectly specified. If you incorrectly specify the target producer, the portlets are not imported automatically and, consequently, will not be operational. If that happens, you can remedy it by doing one of the following:

- Edit the portlet producers connections post-deployment using Fusion Middleware Control (see [Section 21.2.1, "Registering a WSRP Producer Using Fusion Middleware Control"](#) and [Section 21.4.1, "Registering an Oracle PDK-Java Producer Using Fusion Middleware Control"](#)) or WLST commands (see [Section 21.2.2, "Registering a WSRP Producer Using WLST"](#) or [Section 21.4.2, "Registering an Oracle PDK-Java Producer Using WLST"](#)), and redeploy the application.
- Export and import the portlet customization using WLST commands (see [Section 25.2, "Exporting and Importing Custom WebCenter Applications for Data Migration"](#)).

Note: If the application is deployed and the target producer is incorrectly specified but the target exists, the portlets are imported but to the wrong producer and the portlets will not be operational.

7.1.4.1 Deploying Applications Using Oracle JDeveloper

You can deploy custom WebCenter applications to a WebLogic server instance directly from a development environment using Oracle JDeveloper, if you have the necessary credentials to access the WebLogic server. For more information, see the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

7.1.4.2 Deploying Applications Using Fusion Middleware Control

When deploying a custom WebCenter application using Fusion Middleware Control you must know the location of the WebCenter application archive, and whether a deployment plan exists for the application. See [Section 7.1.4.5, "Saving and Reusing the Deployment Plan"](#) for more information about deployment plans.

To deploy a custom WebCenter application using Fusion Middleware Control:

1. Log in to Fusion Middleware Control.

See [Section 6.1, "Displaying Fusion Middleware Control Console."](#)

2. In the Navigation pane, expand **WebLogic Domain** and click the domain in which your target Managed Server was created.
3. From the WebLogic Domain menu, select **Application Deployment > Deploy**.

The Select Archive page displays (see [Figure 7–12](#)).

Figure 7–12 Select Archive Page

The screenshot shows the 'Select Archive' page in the Oracle WebLogic Administration Console. The page title is 'Deploy Java EE Application'. It has tabs for 'Select Archive', 'Select Target', 'Application Attributes', and 'Deployment Settings'. The 'Select Archive' tab is active. The page contains sections for 'Archive or Exploded Directory' and 'Deployment Plan', each with radio button options and text input fields with 'Browse...' buttons. An 'Information' panel on the right provides instructions for deploying Java EE applications and SOA composites.

4. In the Archive or Exploded Directory section, do one of the following:
 - Select **Archive is on the machine where this web browser is running** and enter the location of the archive or click **Browse** to find the archive file.
 - Select **Archive or exploded directory is on the server where Enterprise Manager is running** and enter the location of the archive or click **Browse** to find the archive file.
5. In the Deployment Plan section, do one of the following:
 - Select **Create a new deployment plan when deployment configuration is done** to automatically create a new deployment plan after the redeployment process.
 - Select **Deployment plan is on the machine where this web browser is running** and enter the path to the plan or click **Browse** to find the plan.
 - Select **Deployment plan is on the server where Enterprise Manager is running** and enter the path to the plan or click **Browse** to find the plan.
6. Click **Next**.

The Select Target page displays (see [Figure 7–13](#)).

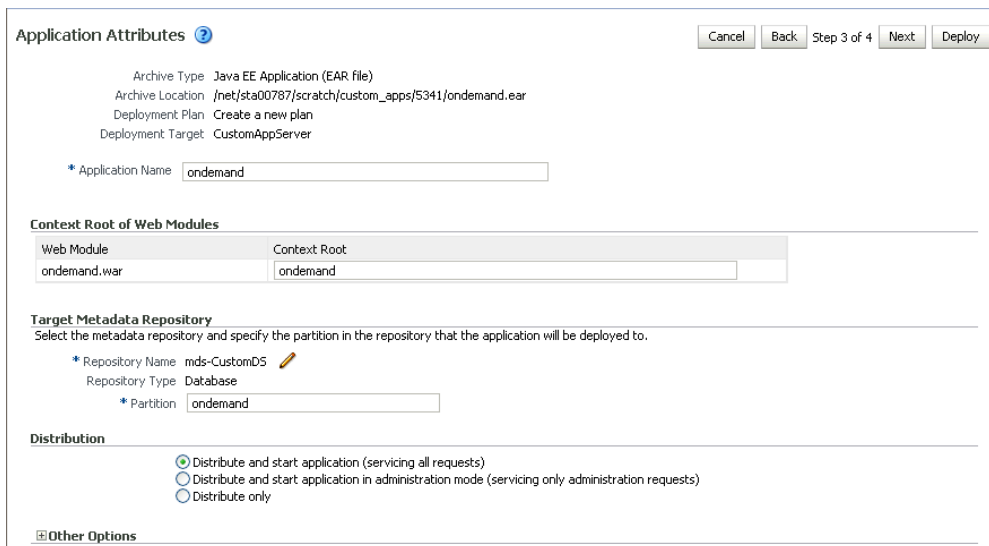

Figure 7–13 Select Target Page

7. Select the target server(s) to deploy the application to (see [Section 7.1.4, "Deploying the Application to a WebLogic Managed Server Instance"](#) for an overview of selecting the targets) and click **Next**.

The Application Attributes page displays (see [Figure 7–14](#)).

Figure 7–14 Application Attributes Page

8. Under Target Metadata Repository, click the icon to display the Select metadata repository window, from where you can select the repository for the application, as shown in [Figure 7–15](#). Use the Repository dropdown to select the required repository and then click **OK**.

Note: The Target Metadata Repository option only displays if the application has metadata to be imported into the MDS repository. This option does not display for a portlet producer application.

Figure 7–15 Select Metadata Repository Window

Metadata Repositories

Select the metadata repository that the application will be deployed to.

Repository:

Repository Details

Name: mds-CustomDS
 Type: Database
 JNDI Location: jdbc/mds/CustomDS
 Database Type: Oracle
 Database Name: db6529
 Database User: DADVM427_MDS
 JDBC URL: jdbc:oracle:thin:example.com:1521:db6529

OK Cancel

9. Enter the name of the partition to use in the repository (typically, the name of the application). Each application must have a unique partition in the repository.

10. Click Next.

The Deployment Settings page displays (see [Figure 7–16](#)).

Figure 7–16 Deployment Settings Page

Deployment Settings

Cancel Back Step 4 of 4 Deploy

Archive Type: Java EE Application (EAR file) Application Name: ondemand
 Archive Location: /net/example/scratch/custom_apps/5341/ondemand.ear Version: V2.0
 Deployment Plan: Create a new plan Context Root: ondemand
 Deployment Target: CustomAppServer Deployment Mode: Distribute and start application (servicing all requests)

Deployment Tasks
 The table below lists common tasks that you may wish to do before deploying the application.

Name	Go To Task	Description
Configure Web Modules		Configure the web modules in your application.
Configure Application Security		Configure application policy migration, credential migration and other security behavior.
Configure ADF Connections		Configure the ADF connections defined in connections.xml in this application.

Deployment Plan

Information
 The metadata repository and ADF connection configurations are not saved to the deployment plan. At deployment time, those changes will be directly saved in the archive that is deployed.

You can optionally use the Edit Deployment Plan option to set more advanced deployment options which the deployment tasks above do not cover.

Edit Deployment Plan

You can optionally save the deployment plan to your local disk. You can redeploy this application later using your saved deployment plan and not have to edit the deployment plan.

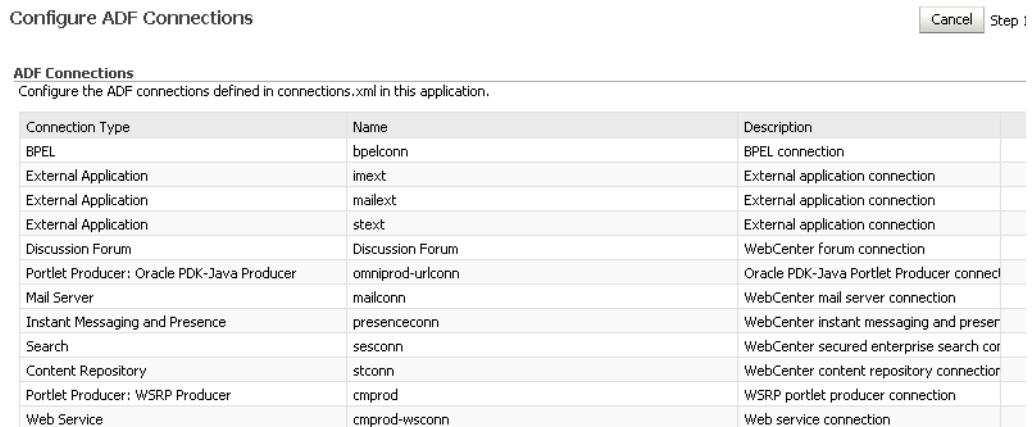

Save Deployment Plan

You have now provided the Target MDS location (described in [Section 7.1.4, "Deploying the Application to a WebLogic Managed Server Instance"](#)).

11. Click the **edit** icon for Configure ADF Connections to check connection settings associated with the custom WebCenter application.

The Configure ADF Connections page displays (see [Figure 7–17](#)).

Figure 7–17 Configure ADF Connections Page

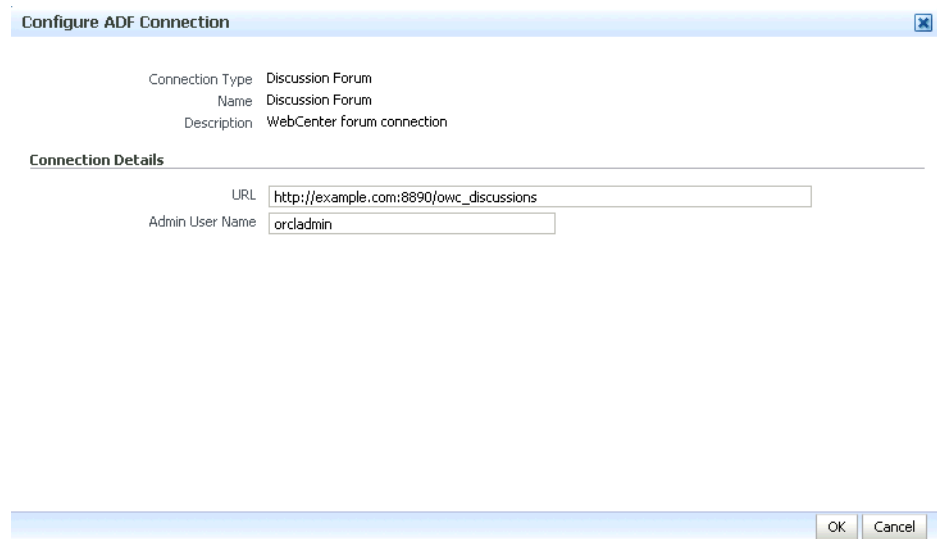

This screenshot shows the Configure ADF Connections page.

- Click the **edit** icon for each connection and check that the connection settings are correct for the target environment (for example, staging or production).

For a Discussion Forum connection (shown in [Figure 7–18](#)), for example, ensure that the URL to the Discussions server, and the user account used to connect to the server are correct for the target environment.

Figure 7–18 Discussion Forum Connection Settings

For WSRP producers, two connections are shown for each producer: a WSRP Producer and a Web Service connection. Typically only the Web Service connection must be changed to the target producer, and this contains four URL endpoints, all of which must be changed. The WSRP Producer connection only configures proxy settings that can be set independent of the default proxy setting for the application server, if this is required.

If any connections to portlet producers in the EAR file must be changed to point to producers in the target deployment environment, it is important to change them

here. This ensures the portlet customizations are imported to the target producers as the application starts. For more information, see [Section 7.1.4, "Deploying the Application to a WebLogic Managed Server Instance"](#).

Note: If any target producers are not reachable as the application starts for the first time, the import fails. After the portlet producer becomes reachable, restart the application and try to import again.

If you do not modify producer connections using the Configure ADF Connections page and they are pointing to incorrect but reachable producer locations (for example, a producer in a development environment), portlets are imported to the incorrect producers.

To remedy, after deployment use Fusion Middleware Control (see [Section 21.2.1, "Registering a WSRP Producer Using Fusion Middleware Control"](#) and [Section 21.4.1, "Registering an Oracle PDK-Java Producer Using Fusion Middleware Control"](#)) or WLST commands (see [Section 21.2.2, "Registering a WSRP Producer Using WLST"](#) or [Section 21.4.2, "Registering an Oracle PDK-Java Producer Using WLST"](#)) to modify the producer URL endpoint, and then redeploy the application as described in [Section 7.3.2, "Redeploying WebCenter Applications Using Fusion Middleware Control"](#).

13. If required, specify additional deployment options such as the Web modules to include in your application or security migration settings.
14. In the Deployment Plan section, click **Edit Deployment Plan** to optionally edit the currently selected Deployment Plan.
15. In the Deployment Plan section, click **Save Deployment Plan** to optionally save the currently selected Deployment Plan for reuse when you redeploy the application.
16. To start the deployment process, click **Deploy**.
Fusion Middleware Control displays processing messages.
17. Click **Close** in the Deployment Succeeded page.
The WebCenter application (and its deployment plan) is now deployed on the WebLogic Managed Server instance.
18. If you restart the WebLogic Managed Server on which you deployed the application during your Fusion Middleware Control session, refresh the Farm from the Farm menu to update the application status.

Note: When after deploying, you reconfigure connections for custom WebCenter applications, these post-deployment customizations are preserved in the MDS repository and do not need to be set again when you redeploy the application.

7.1.4.3 Deploying Applications Using WLST

To deploy a custom WebCenter application using the WLST command line, WLST must be connected to the Administration Server. You must invoke the `deploy` command on the computer that hosts the administration server.

To deploy a custom WebCenter application using WLST:

1. Start the WLST shell.

For information on starting the WLST shell, see [Section 1.12.3, "Oracle WebLogic Scripting Tool \(WLST\)."](#)

2. Connect to the Administration Server of your WebCenter installation:

```
connect("user_name", "password", "host_id:port")
```

Where:

- *user_name* is the user name to access the Administration server (for example, *weblogic*).
- *password* is the password to access the Administration server (for example, *weblogic*).
- *host_id* is the host ID of the Administration Server (for example, *myserver.example.com*).
- *port* is the port number of the Administration Server (7001 by default)

You should see the following message:

```
Successfully connected to Admin Server 'AdminServer' that belongs to domain 'wc_domain'.
```

3. Retrieve the MDS configuration by running the following command:

```
archive = getMDSArchiveConfig(fromLocation='ear_file_path')
```

where *ear_file_path* is the path and file name of the EAR file you are deploying (for example, */tmp/myEarFile.ear*). For more information, see the `getMDSArchiveConfig` command in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

4. After retrieving the MDS configuration information from the EAR file, you must set the proper MDS schema information according to your WebCenter setup (for example, your application might be using a database connection based on a specific schema). To set the MDS schema information, run the following command:

```
archive.setAppMetadataRepository(repository='repository', partition='partition', type='DB', jndi='jndi')
```

Where:

- *repository* is the name of the database schema (for example, *mds-Feb23demo*)
- *partition* is the individual entity in the repository to allow each application to have its own namespace (for example, *webcenter*).
- *jndi* is the path and name used to allow access by the application server's other components (for example, *jdbc/mds/Feb23demo*)

5. After setting the MDS repository information, save function the MDS configuration information with the following command:

```
archive.save()
```

6. Deploy the custom WebCenter application using the WLST deploy command.

```
deploy(app_name, path, [targets] [stageMode], [planPath], [options])
```

Where:

- *appName* is the name of the custom WebCenter application to be deployed (for example, `composerWLSTApp`).
- *path* is the path to the EAR file to be deployed (for example, `/tmp/customApp.ear`).
- *targets* specifies the target Managed Server(s) to which to deploy the application (for example, `CustomAppServer`). You can optionally list multiple comma-separated targets. To enable you to deploy different modules of the application archive on different servers, each target may be qualified with a module name, for example, `module1@server1`. This argument defaults to the server to which WLST is currently connected.
- *[stageMode]* optionally defines the staging mode for the application you are deploying. Valid values are `stage`, `nostage`, and `external_stage`.
- *[planPath]* optionally defines the name of the deployment plan file. The file name can be absolute or relative to the application directory. This argument defaults to the `plan/plan.xml` file in the application directory, if one exists.
- *[options]* is an optional comma-separated list of deployment options, specified as name-value pairs. For more information about valid options, see the WLST deploy command in the Oracle Fusion Middleware WebLogic Scripting Tool Command Reference.

When you see the following message, the application has been successfully deployed and is ready to be accessed:

```
Completed the deployment of Application with status completed
```

Note: Since WLST does not prompt you to modify connections during deployment, the connection information in the EAR file is used to identify the target producer location in the last start-up. If that location is unreachable, correct the location after deploying the application by bringing up the target producers and restarting the application. Migration of portlet customizations starts automatically.

If the producer connections point to incorrect producers (for example, development producers), and those producers are reachable, the migration of portlet customizations starts using those producers. Since the migration completes, although incorrectly, restarting the application does not automatically restart the migration process.

To remedy this, after deployment, use Fusion Middleware Control (see [Section 21.2.1, "Registering a WSRP Producer Using Fusion Middleware Control"](#) and [Section 21.4.1, "Registering an Oracle PDK-Java Producer Using Fusion Middleware Control"](#)) or WLST commands (see [Section 21.2.2, "Registering a WSRP Producer Using WLST"](#) or [Section 21.4.2, "Registering an Oracle PDK-Java Producer Using WLST"](#)) to modify the producer URL endpoint, and then redeploy the application as described in [Section 7.3.2, "Redeploying WebCenter Applications Using Fusion Middleware Control."](#)

7.1.4.4 Deploying Applications Using the WLS Administration Console

The WLS Administration Console can be used to deploy a custom WebCenter application or a portlet producer application. However, the Console does not offer a

means to change ADF connections, including the essential MDS connection. To use the Console to deploy a WebCenter application, the MDS connection in the EAR file must be configured to the target deployment repository. Follow steps 1-5 in [Section 7.1.4.3, "Deploying Applications Using WLST"](#), then follow the steps below to deploy a custom WebCenter application or portlet producer application using the WLS Administration Console.

Note: For custom WebCenter applications, follow the instructions for creating a new WebLogic Managed Server as described in [Section 7.1.3.1, "Creating and Provisioning a WebLogic Managed Server Instance"](#) before deploying. For portlet producer applications, you can optionally create a new WebLogic Managed Server or deploy to the `WLS_Portlet` server.

To deploy a custom WebCenter or portlet producer application using the WLS Administration Console:

1. Log in to the WLS Administration Console.

For information on logging into the WLS Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. In the Domain Structure pane, click **Deployments**.

The Deployments Summary pane displays (see [Figure 7-19](#)).

Figure 7-19 Deployment Summary Pane

3. On the Deployment Summary pane, click **Install**.

The Install Application Assistant page displays (see [Figure 7-20](#)).

Figure 7–20 Install Application Assistant Page

- Using the Install Application Assistant **Path** field, locate the EAR file that corresponds to the Web application or portlet producer application you want to install. Select the EAR file and click **Next**.

Page 2 of the Install Application Assistant page displays (see [Figure 7–21](#)).

Figure 7–21 Install Application Assistant - Page 2

- Select **Install this deployment as an application** (for both custom WebCenter applications and portlet producers) and click **Next**.

Page 3 of the Install Application Assistant displays (see [Figure 7–22](#)).

Figure 7-22 Install Application Assistant - Page 3

Back Next Finish Cancel

Select deployment targets

Select the servers and/or clusters to which you want to deploy this application. (You can reconfigure deployment targets later).

Available targets for jpdK :

Servers
<input type="checkbox"/> AdminServer
<input type="checkbox"/> WLS_Portlet
<input type="checkbox"/> WLS_Services
<input type="checkbox"/> WLS_Spaces
<input type="checkbox"/> WLS_CustomServer

Back Next Finish Cancel

6. Select the deployment target to which to deploy the Web application and click **Next**.
7. Review the configuration settings you specified, and click **Finish** to complete the installation.

To change a producer URL after deployment, use Fusion Middleware Control (see [Section 21.2.1, "Registering a WSRP Producer Using Fusion Middleware Control"](#) and [Section 21.4.1, "Registering an Oracle PDK-Java Producer Using Fusion Middleware Control"](#)) or WLST commands (see [Section 21.2.2, "Registering a WSRP Producer Using WLST"](#) or [Section 21.4.2, "Registering an Oracle PDK-Java Producer Using WLST"](#)) to modify the producer URL endpoint, and then redeploy the application as described in [Section 7.3.2, "Redeploying WebCenter Applications Using Fusion Middleware Control."](#)

7.1.4.5 Saving and Reusing the Deployment Plan

A deployment plan contains the configuration data needed to deploy an archive to a Managed Server. You can create a deployment plan while you're building and testing your application, or when you deploy your EAR file using Fusion Middleware Control as described in [Section 7.1.4.2, "Deploying Applications Using Fusion Middleware Control."](#) If there are deployment descriptors packaged within the EAR file, the deployment uses the data in these files.

Once created, a deployment plan can be saved as part of the application properties on the target Managed Server, and re-used when redeploying the application using Fusion Middleware Control, as described in [Section 7.3.2, "Redeploying WebCenter Applications Using Fusion Middleware Control,"](#) or using WLST as described in [Section 7.3.3, "Redeploying WebCenter Applications Using WLST."](#)

7.1.5 Transporting Customizations Between Environments

You can export and import customizations made to pages, Oracle WebCenter Services, and portlets (PDK-Java and WSRP version 2 producers) of an already deployed application. For more information, see [Chapter 25.2, "Exporting and Importing Custom WebCenter Applications for Data Migration."](#)

7.1.6 Configuring Applications to Run in a Distributed Environment

For information about configuring your custom WebCenter application to run in a distributed environment, see the *Oracle Fusion Middleware Enterprise Deployment Guide for Oracle WebCenter*, and "Configuring High Availability for Oracle ADF and WebCenter Applications" in the *Oracle Fusion Middleware High Availability Guide*.

7.2 Undeploying Custom WebCenter Applications

This section describes how to undeploy a custom WebCenter application or portlet producer application using Fusion Middleware Control, or from the command line using WLST.

Note: When a custom WebCenter application is undeployed, its application credentials and MDS customizations are kept in anticipation of the application being redeployed to the same domain. If the application will not be redeployed in this domain, or if it is important to reset these back to initial conditions before the next deployment, then after undeploying an application you can remove the application's credential map from the Credential Store as described in [Section 7.2.3, "Removing an Application's Credential Map."](#) You can also remove the MDS repository partition as described in "Deleting a Metadata Partition from a Repository" in the *Oracle Fusion Middleware Administrator's Guide*.

This section contains the following subsections:

- [Undeploying WebCenter Applications Using Fusion Middleware Control](#)
- [Undeploying WebCenter Applications Using WLST](#)
- [Removing an Application's Credential Map](#)

7.2.1 Undeploying WebCenter Applications Using Fusion Middleware Control

This section describes how to undeploy a custom WebCenter application using Fusion Middleware Control.

To undeploy a custom WebCenter application using Fusion Middleware Control:

1. Log in to Fusion Middleware Control.
See [Section 6.1, "Displaying Fusion Middleware Control Console."](#)
2. From the Navigation pane, expand **Application Deployments**, then click the application that you want to undeploy.
3. From the Application Deployment menu, select **Application Deployment > Undeploy**.
4. On the confirmation page, click **Undeploy**.
5. When the operation completes, click **Close**.

7.2.2 Undeploying WebCenter Applications Using WLST

This section describes how to undeploy a custom WebCenter application using WLST.

To undeploy a custom WebCenter application using WLST:

1. Start the WLST shell.

For information on starting the WLST shell, see [Section 1.12.3, "Oracle WebLogic Scripting Tool \(WLST\)."](#)

2. Connect to the Administration Server of your WebCenter installation:

```
connect("user_name", "password", "host_id:7001")
```

Where:

- `user_name` is the user name to access the administration server (for example, `weblogic`).
- `password` is the password to access the administration server (for example, `weblogic`).
- `host_id` is the host ID of the administration server (for example, `myserver.example.com`).

You should see the following message:

```
Successfully connected to Admin Server 'AdminServer' that belongs to domain 'wc_domain'.
```

3. Use the `undeploy` command to undeploy the application:

```
undeploy(app_name, [targets], [options])
```

Where:

- `app_name` is the deployment name for the deployed application.
`[targets]` is a list of the target servers from which the application will be removed. Optional. If not specified, defaults to all current targets.
- `[options]` is a comma-separated list of deployment options, specified as name-value pairs. Optional. See the `deploy` command for a complete list of options.

7.2.3 Removing an Application's Credential Map

When a custom WebCenter application is undeployed, its application credentials are not removed. Consequently, you must manually remove the credential map used for the application after it is undeployed using Fusion Middleware Control.

To remove an application's credentials map using Fusion Middleware Control:

1. Determine the credentials map name used by the application by inspecting the contents of the application's `adf-config.xml` and locating the value for `adfAppUID`. For example:

```
<adf:adf-properties-child
xmlns="http://xmlns.oracle.com/adf/config/properties">
<adf-property name="adfAppUID" value="Veeva-7209"/>
</adf:adf-properties-child>
```

In this case, **Veeva-7209** is the credential map name used by the application.

2. Log in to Fusion Middleware Control.

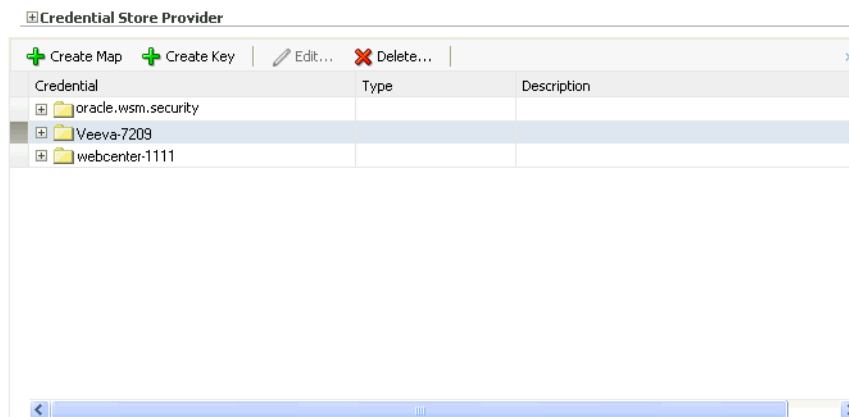

For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)

3. In the Navigation pane, expand the WebLogic Domain node and click the target domain (for example, `wc_domain`).
4. From the WebLogic Domain dropdown menu, select **Security > Credentials**.
The Credentials pane displays (see [Figure 7-23](#)).

Figure 7-23 Credentials Pane

Credentials

A credential store is the repository of security data that certify the authority of entities used by Java 2, J2EE, and ADF applications. Applications can use the Credential Store, a single, consolidated service provider to store and manage their credentials securely.

5. Select the credential map to remove and click **Delete**.
6. Click **Yes** to confirm deleting the credential map.

7.3 Redeploying Custom WebCenter Applications

This section describes how to redeploy a custom WebCenter application using Fusion Middleware Control or from the command line using WLST. When you redeploy a new version of an application, you cannot change:

- the application's deployment targets
- the application's security model

To change deployment targets or application security settings, you must first undeploy the active version of the application. For information on how to undeploy an application, see [Section 7.2, "Undeploying Custom WebCenter Applications"](#).

This section contains the following subsections:

- [Redeployment Considerations](#)
- [Redeploying WebCenter Applications Using Fusion Middleware Control](#)
- [Redeploying WebCenter Applications Using WLST](#)

7.3.1 Redeployment Considerations

In most cases, when redeploying an application, you want to preserve any changes to application data. Three important pieces of information about an application can be altered after deployment during run-time:

- Application Configuration -- which includes connection information.

- Application Metadata -- which includes the customizations and personalizations on the application itself, such as those created when user edits a page and adds content to it.
- Portlets Preferences-- which includes customizations and personalizations of the portlet instances.

The following subsections explain how to preserve these three types of information about an application:

- [Preserving Application Configuration](#)
- [Preserving Application Metadata](#)
- [Preserving Portlet Customizations and Personalizations](#)

Note: To preserve application information, you must redeploy using the same MDS partition that was used or created using the initial deployment.

7.3.1.1 Preserving Application Configuration

In most cases, the end-points of services and portlet-producers are different in a test or staging environment than in a production environment. Therefore, when an application is redeployed to a production environment, you must reconfigure the application to work with the production environment services and producers or reuse the configuration used previously. Fusion Middleware facilitates this by storing the configuration information in the MDS repository.

When you deploy the application for the first time, the base document of the application configuration is created in the MDS repository. This configuration is the set of all of the application's connections and their properties that are packaged in the EAR file. After the deployment, you may need to modify the connections using Fusion Middleware Control or WLST in response to production needs. This reconfiguration creates a layer of customization for the configuration changes in the MDS repository.

When you redeploy the application, the configuration packaged with the application is laid down as the base document, but the customizations to the configuration are preserved. Therefore, the application's redeployment settings match the most recent configuration performed.

However, customizations are completely preserved only when there are no changes in the base document. If you redeploy an application where the packaged connection information has changed, the following can be expected:

- A new connection is added to the packaged configuration.
The new connection should display without problems.
- A connection has been removed in the packaged configuration.
If you configured this connection after the last deployment, then the connection does not display after deployment, and you must re-create it.
- A connection property has been changed in the packaged configuration.
The customized properties are used. Connection customizations are managed at the individual connection level, and not at the properties level.

7.3.1.1.1 Preserving Configuration Across Deployment Using WLST

If you use the WLST to configure the custom WebCenter application, you can easily build a script to remove all the connections and re-create them for the configuration of the production instance. Using this approach, you can always reconfigure an

application to the target configuration without worrying about the details in the packaged configuration.

7.3.1.2 Preserving Application Metadata

Application metadata can change post-deployment due to customizations and personalizations done by users at run time. When you redeploy the application, in most circumstances, you must preserve this customization and personalization information so that users see exactly what they were seeing before.

Application customizations and personalizations are stored in the MDS repository, and the same rules apply for preserving application metadata as for preserving configuration settings.

When the application is redeployed, the base documents for all application artifacts are replaced with what is packaged in the EAR file. However, customizations and personalizations are retained. There is no impact to this information unless the base artifact is changed, in which case the same rules apply as for configuration settings, which are:

- If new elements are added to the package, then they will appear as they are.
- If elements are removed from the package, for which customizations or personalizations were created, those personalizations or customizations are ignored.
- If elements are changed, then the effect depends on what exactly is changed, but must be verified.

Best Practice Note: In some cases, you may want to export all customizations and personalizations in a production application instance and import it into a test or staging instance. You can then test the application against those customizations and personalizations to see that the new changes do not have an undesired impact.

7.3.1.3 Preserving Portlet Customizations and Personalizations

Portlet customizations are packaged with the metadata in the EAR file. Application startup after deployment kicks off the portlet customization migration to the target producers. The target producers are identified by resolving connection customizations. If you have modified your producer connections before redeployment, then those modified connections are used to identify target producers. Note that if you redeploy an EAR file with the same checksum (that is, the same file) as the pre-existing one, portlet customization and personalizations are not overwritten.

7.3.2 Redeploying WebCenter Applications Using Fusion Middleware Control

This section describes how to redeploy a custom WebCenter application using Fusion Middleware Control.

To redeploy a custom WebCenter application using Fusion Middleware Control:

1. Log in to Fusion Middleware Control. For more information, see [Section 6.1, "Displaying Fusion Middleware Control Console."](#)
2. From the Navigation pane, expand the farm, then **WebLogic Domain**, and then the domain.
3. Select the server to which to redeploy the application, and then right click and select **Application Deployment - Redeploy** from the menu.

The Select Application page displays (see [Figure 7-24](#)).

Figure 7-24 Select Application Page

Select	Name	Version	Type	State	Targets
<input type="radio"/>	DMS Application#11.1.1.1.0	11.1.1.1.0	Web Module	Active	AdminServer, CustomApp

<input type="radio"/>	portalTools#11.1.1.1.0	11.1.1.1.0	Application	New	WLS_Portlet

4. Select the application that you want to redeploy.
5. Click **Next** to display the Select Archive page (see [Figure 7-25](#)).

Figure 7-25 Select Archive Page

Archive or Exploded Directory
 Java EE archive, Web Modules (WAR files), EJB Modules (EJB JAR files) and Resource Adapter Modules (RAR files) can be deployed. You can also deploy an exploded archive that is present on the server where Enterprise Manager is running.

- Archive is on the machine where this web browser is running.
- Archive or exploded directory is on the server where Enterprise Manager is running.

Deployment Plan
 The deployment plan is a file that contains the deployment settings for an application. You can use a previously saved deployment plan for this application. Later in the deployment process, you can optionally edit the deployment plan and save it for a future deployment of this application. If you do not have a deployment plan, one will be created automatically during the deployment process when deployment configuration is done.

- Create a new deployment plan when deployment configuration is done.
- Deployment plan is on the machine where this web browser is running.
- Deployment plan is on the server where Enterprise Manager is running.

Information
 Use this page to deploy Java EE applications that require Oracle Metadata Services (MDS) or that take advantage of the Oracle Application Development Framework (Oracle ADF).
 If your application is a SOA composite, use the SOA Composite deployment wizard.
 If your application is not a SOA composite or it does not require an MDS repository or ADF connections, then you can deploy your application using this wizard or the Oracle WebLogic Server Administration Console.

6. In the Archive or Exploded Directory section, do one of the following:
 - Select **Archive is on the machine where this web browser is running** and enter the location of the archive or click **Browse** to find the archive file.
 - Select **Archive or exploded directory is on the server where Enterprise Manager is running** and enter the location of the archive or click **Browse** to find the archive file.
7. In the Deployment Plan section, do one of the following:
 - Select **Create a new deployment plan when deployment configuration is done** to automatically create a deployment plan after the redeployment process.
 - Select **Deployment plan is on the machine where this web browser is running** and enter the path to the plan or click **Browse** to find the plan.

- Select **Deployment plan is on the server where Enterprise Manager is running** and enter the path to the plan or click **Browse** to find the plan.
8. Click **Next**.

The Application Attributes page displays (see [Figure 7–26](#)).

Figure 7–26 Application Attributes Page

Application Attributes Cancel Back Step 3 of 4

Archive Type: Java EE Application (EAR file)
 Archive Location: /net/example/scratch/custom_apps/5341/ondemand.ear
 Deployment Plan: Create a new plan
 Deployment Target: CustomAppServer

Application Name: ondemand
 Current Version: V2.0

Context Root of Web Modules

Web Module	Context Root
ondemand.war	ondemand

Target Metadata Repository
 Select the metadata repository and specify the partition in the repository that the application will be deployed to.

* Repository Name: mds-CustomDS 
 Repository Type: Database
 * Partition: ondemand

9. In the Context Root of Web Modules section, specify the context root for your application if you have not specified it in `application.xml`. The context root is the URI for the web module. Each web module or EJB module that contains web services may have a context root.
10. In the Target Metadata Repository section, select the MDS repository and enter the **Partition**.

Caution: Be careful to use the same repository connection and partition name that you used when you originally deployed the application. If you do not, all customizations are lost.

11. Click **Next**.

The Deployment Settings page displays (see [Figure 7–27](#)).

Figure 7–27 Deployment Settings Page

Deployment Settings Cancel

Deployment Tasks
The table below lists common tasks that you may wish to do before deploying the application.

Name	Go To Task	Description
Configure Web Modules		Configure the web modules in your application.
Configure Application Security		Configure application policy migration, credential migration and other security behavior.
Configure ADF Connections		Configure the ADF connections defined in connections.xml in this application.

Deployment Plan

12. On this page, you can perform common tasks before deploying your application, such as configuring connections, or you can edit the deployment plan or save it to a disk. You can:
 - Configure web modules
 - Configure application security for application roles and policies
 - Configure ADF connection settings
13. Click the **edit** icon for Configure ADF Connections to check connection settings associated with the custom WebCenter application.

Note: Editing ADF Connections is only necessary for connections not set after a prior deployment. Any connections configured after a prior deployment will override settings you make during this step.

The Configure ADF Connections page displays (see [Figure 7–28](#)).

Figure 7–28 Configure ADF Connections Page

Configure ADF Connections Cancel Step 1

ADF Connections
Configure the ADF connections defined in connections.xml in this application.

Connection Type	Name	Description
BPEL	bpelconn	BPEL connection
External Application	imext	External application connection
External Application	mailext	External application connection
External Application	stext	External application connection
Discussion Forum	Discussion Forum	WebCenter forum connection
Portlet Producer: Oracle PDK-Java Producer	omniprod-urlconn	Oracle PDK-Java Portlet Producer connect
Mail Server	mailconn	WebCenter mail server connection
Instant Messaging and Presence	presenceconn	WebCenter instant messaging and preser
Search	sesconn	WebCenter secured enterprise search cor
Content Repository	stconn	WebCenter content repository connector
Portlet Producer: WSRP Producer	cmprod	WSRP portlet producer connection
Web Service	cmprod-wsconn	Web service connection

14. Click the **edit** icon for each connection and check that the connection settings are correct for the target environment (for example, staging or production).

For a Discussion Forum connection (shown in [Figure 7-18](#)), for example, ensure that the URL to the discussions server, and the user account used to connect to the server are correct for the target environment.

Figure 7-29 Discussion Forum Connection Settings

The screenshot shows a window titled "Configure ADF Connection". It contains the following fields:

- Connection Type: Discussion Forum
- Name: Discussion Forum
- Description: WebCenter forum connection
- Section: **Connection Details**
- URL:
- Admin User Name:

Buttons: OK, Cancel

15. If required, specify additional deployment options such as the Web modules to include in your application or security migration settings.

16. Expand Deployment Plan.

The Deployment Plan settings display (see [Figure 7-30](#)).

Figure 7-30 Deployment Settings Page - Deployment Plan Section

The screenshot shows the "Deployment Plan" section with the following content:

- Information**
- The metadata repository and ADF connection configurations are not saved to the deployment plan. At deployment time, those changes will be directly saved in the archive that is deployed.
- You can optionally use the Edit Deployment Plan option to set more advanced deployment options which the deployment tasks above do not cover.
-
- You can optionally save the deployment plan to your local disk. You can redeploy this application later using your saved deployment plan and not have to edit the deployment plan.
-

You can edit and save the deployment plan to your local hard drive, if you choose, so that you can use those settings to redeploy the application again later. See [Section 7.1.4.5, "Saving and Reusing the Deployment Plan"](#) for more information about deployment plans.

17. Click **Redeploy**.

18. When the redeployment completes, click **Close**.

Note: If you restart the WebLogic Managed Server on which you deployed the application during your Fusion Middleware Control session, refresh the Farm from the Farm menu to update the application status.

7.3.3 Redeploying WebCenter Applications Using WLST

To redeploy a custom WebCenter application using the WLST command line, WLST must be connected to the administration server. You must invoke the `redeploy` command on the computer that hosts the administration server.

To redeploy a custom WebCenter application using WLST:

1. Start the WLST shell.

For information on starting the WLST shell, see [Section 1.12.3, "Oracle WebLogic Scripting Tool \(WLST\)."](#)

2. Connect to the administration server of your WebCenter installation:

```
connect("user_name", "password", "host_id:port")
```

Where:

- *user_name* is the user name to access the administration server (for example, `weblogic`).
- *password* is the password to access the administration server (for example, `weblogic`).
- *host_id* is the host ID of the administration server (for example, `myserver.example.com`).
- *port* is the port number of the Administration Server (7001 by default).

You should see the following message:

```
Successfully connected to Admin Server 'AdminServer' that belongs to domain 'wc_domain'.
```

3. Use the `redeploy` command to redeploy the application:

```
redeploy(app_name, [planPath], [options])
```

Where:

- *app_name* is the deployment name for the application to redeploy.
- *[planPath]* Name of the deployment plan file. The filename can be absolute or relative to the application directory. Optional. This argument defaults to the `plan/plan.xml` file in the application directory, if one exists.
- *[options]* is a comma-separated list of deployment options, specified as name-value pairs. Optional. See the `deploy` command for a complete list of options.

7.4 Post-Deployment Configuration

After your custom WebCenter application is deployed, you must check that the settings that were deployed are valid for the target Managed Server. Settings to check include those for security, connections, and data sources.

This section includes the following subsections:

- [Section 7.4.1, "Configuring Security"](#)
- [Section 7.4.2, "Configuring Connections"](#)
- [Section 7.4.3, "Configuring Data Sources"](#)
- [Section 7.4.4, "Tuning the Application"](#)

7.4.1 Configuring Security

Before deploying your application you must set up the Identity Store and the Policy and Credential Store on the target Managed Server. After deployment, check that the application configurations match those of the target server. You should also check that all other applicable post-deployment security configurations, such as SSL and single sign-on, have been properly configured, as described in [Section 23.2.5, "Post-deployment Security Configuration Tasks."](#)

7.4.2 Configuring Connections

After deploying your custom WebCenter application, check that all of the connections used by your application have been properly set. Connections that you may have to configure or reconfigure include connections for:

- BPEL
- External applications
- Discussions server
- Mail server
- Instant Messaging and Presence (IMP) server
- Search
- WSRP portlet producers
- PDK-Java portlet producers
- Web Services

7.4.3 Configuring Data Sources

After deploying your custom WebCenter application to a custom Managed Server, check that the datasources that you configured during testing are still valid for the deployed application. For information on how to configure data sources for the Metadata Services (MDS) repository your custom WebCenter application, see "Configuring JDBC Data Sources" in *Oracle Fusion Middleware Configuring and Managing JDBC for Oracle WebLogic Server*.

7.4.4 Tuning the Application

After your custom WebCenter application has been deployed and correctly configured, check the system file limit, data source settings, and JRockit virtual machine (JVM) arguments as described in [Section A.4, "Tuning Environment Configuration."](#) Also see the chapter on "Oracle WebCenter Performance Tuning" in the Oracle Fusion Middleware Performance and Tuning Guide, and [Section 24, "Monitoring Oracle WebCenter Performance"](#) for information on how to diagnose performance problems.

Starting and Stopping WebCenter Applications

Most WebCenter application configuration changes that you make, through Fusion Middleware Control or using WLST, are not dynamic; you must restart the managed server on which the application is deployed for your changes to take effect. For example, when you add or modify connection details for WebCenter services (Announcements, Discussions, Documents, Mail, Instant Messaging and Presence, Personal Events, Search, Wiki and Blog, Worklists) you must restart the application's managed server.

There are several exceptions; portlet producer and external application registration *is* dynamic. Any new portlet producers and external applications that you register are immediately available in your WebCenter application and any changes that you make to existing connections take effect immediately too.

This chapter includes the following sections:

- [Starting Node Manager](#)
- [Starting and Stopping Managed Servers for WebCenter Application Deployments](#)
- [Starting and Stopping WebCenter Spaces](#)
- [Starting and Stopping Custom WebCenter Applications](#)

You perform all start and stop operations from the Oracle WebLogic Server Administration Console too. .

Note: Node Manager must be running before you can start and stop administration servers, managed servers, and WebCenter applications through Fusion Middleware Control or Oracle WebLogic Server Administration Console.

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools"](#).

8.1 Starting Node Manager

Node Manager must be running before you can start and stop administration servers, managed servers, and WebCenter applications through Fusion Middleware Control or Oracle WebLogic Server Administration Console.

To start Node Manager:

1. (First time only). Run the following script to set `StartScriptEnabled=true` in the `nodemanager.properties` file:

```
(UNIX)    Oracle_Common_Home/common/bin/setNMProps.sh
(Windows) Oracle_Common_Home\common\bin\setNMProps.cmd
```

2. To start the Node Manager:

- a. Navigate to `WL_HOME/server/bin`.
- b. From the command line, enter:

```
WL_HOME/server/bin> ./startNodeManager.sh
```

When you start Node Manager, it reads the `nodemanager.properties` file with the `StartScriptEnabled=true` property, and uses the start scripts when it subsequently starts the managed servers. Note that you need to run the `setNMProps` script only once.

8.2 Starting and Stopping Managed Servers for WebCenter Application Deployments

Most WebCenter configuration changes that you make, through Fusion Middleware Control or using WLST, are not dynamic; you must restart the managed server on which the application is deployed for your changes to take effect.

Note: The only exceptions are portlet producer and external application registration which are both dynamic. New portlet producers and updates to existing producers are immediately available; there is no need to restart the WebCenter application or the managed server. Similarly for external application configuration.

When you start or restart the managed server, all WebCenter applications deployed on the managed server start automatically (including WebCenter Spaces).

This section describes starting and stopping managed servers through Fusion Middleware Control. See also, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in *Oracle Fusion Middleware Administrator's Guide*.

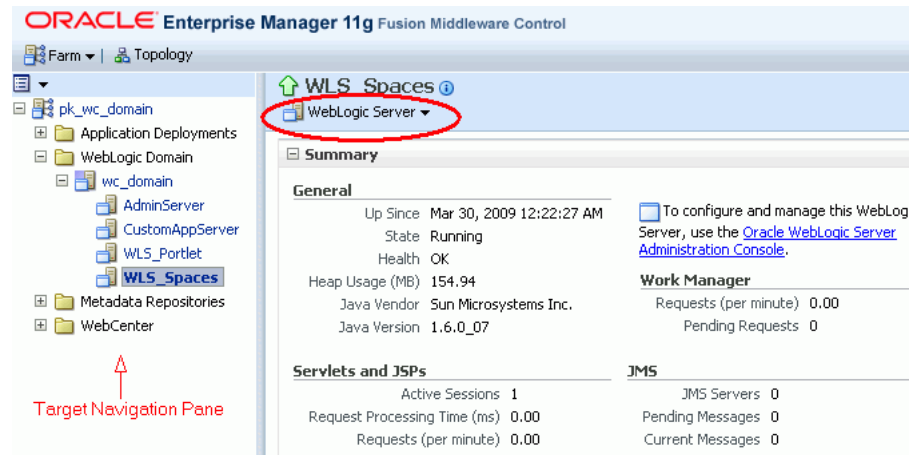

To start, stop, or restart a managed server through Fusion Middleware Control:

1. Login to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or your custom WebCenter application as follows:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Navigate to the home page for this application's managed server:
 - For WebCenter Spaces - Find **WebLogic Server** (Related Components section), and then click the name of the managed server. For WebCenter Spaces, this is always `WLS_Spaces`.
 - For custom WebCenter applications - Find **Deployed On** (Summary section), and then click the name of the managed server.

The home page for the managed server displays ([Figure 8-1](#)).

If you know the name of the managed server where your application's is deployed, you can navigate directly to this page if you expand the parent WebLogic Domain in the Target Navigation Pane.

Figure 8–1 Managed Server Home Page

3. From the **WebLogic Server** menu:

- To start the managed server, choose **Control > Start Up**.
- To stop the managed server, choose **Control > Shut Down**.

Alternatively, right-click the name of the managed server in the Target Navigation Pane to access menu options for the managed server.

8.3 Starting and Stopping WebCenter Spaces

It's easy to start, restart, and shut down WebCenter Spaces from Fusion Middleware Control:

- [Starting WebCenter Spaces Using Fusion Middleware Control](#)
- [Stopping WebCenter Spaces Using Fusion Middleware Control](#)

Alternatively, use WLST:

- [Starting WebCenter Spaces Using WLST](#)
- [Stopping WebCenter Spaces Using WLST](#)

Note: You can also start WebCenter Spaces through Oracle WebLogic Server Administration Console.

8.3.1 Starting WebCenter Spaces Using Fusion Middleware Control

Starting WebCenter Spaces makes the application available to its users; stopping it makes it unavailable.

To start WebCenter Spaces through Fusion Middleware Control:

1. In Fusion Middleware Control, navigate to the home page for WebCenter Spaces. See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).
2. From the main WebCenter menu, choose **WebCenter >Control > Start Up**.

Alternatively, right-click **WebCenter Spaces (WLS_Spaces)** in the Target Navigation Pane to access this menu option.

A progress message displays.

3. Click **Close**.

Note how the application status changes to Up (Green arrow).

8.3.2 Starting WebCenter Spaces Using WLST

Use the WLST command `startApplication` to start WebCenter Spaces. For command syntax and detailed examples, see "startApplication" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For WebCenter Spaces, the `appName` argument is always `webcenter`.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

8.3.3 Stopping WebCenter Spaces Using Fusion Middleware Control

When you stop WebCenter Spaces no one can use it. Stopping an application does not remove its source files from the server; you can later restart a stopped application to make it available again.

When you stop WebCenter Spaces, the managed server on which WebCenter Spaces is deployed (WLS_Spaces) remains available.

To stop a WebCenter Spaces application through Fusion Middleware Control:

1. In Fusion Middleware Control, navigate to the home page for WebCenter Spaces.

See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).

2. From the main menu, choose **WebCenter >Control > Shut Down**.

Alternatively, right-click **WebCenter Spaces (WLS_Spaces)** in the Target Navigation Pane to access this menu option.

3. Click **OK** to continue.

A progress message displays.

4. Click **Close**.

Note how the status changes to Down (Red arrow).

8.3.4 Stopping WebCenter Spaces Using WLST

Use the WLST command `stopApplication` to stop WebCenter Spaces. For command syntax and detailed examples, see "stopApplication" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For WebCenter Spaces, the `appName` argument is always `webcenter`.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

8.4 Starting and Stopping Custom WebCenter Applications

It's easy to start and shut down custom WebCenter applications from Fusion Middleware Control:

- [Starting Custom WebCenter Applications Using Fusion Middleware Control](#)
- [Stopping Custom WebCenter Applications Using Fusion Middleware Control](#)

Alternatively, use WLST:

- [Starting Custom WebCenter Applications Using WLST](#)
- [Stopping Custom WebCenter Applications Using WLST](#)

8.4.1 Starting Custom WebCenter Applications Using Fusion Middleware Control

Starting a custom WebCenter application makes it available to its users; stopping it makes it unavailable.

When you stop a custom WebCenter application, the managed server on which it is deployed remains available.

To start a custom WebCenter application through Fusion Middleware Control:

1. In Fusion Middleware Control, navigate to the home page for the custom WebCenter application.

See [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

2. From the Application Deployment menu, choose **Application Deployment >Control > Start Up**.

Alternatively, right-click the name of the custom WebCenter application in the Target Navigation Pane to access this menu option.

A progress message displays.

3. Click **Close**.

Note how the application status changes to Up (Green arrow).

8.4.2 Starting Custom WebCenter Applications Using WLST

Use the WLST command `startApplication` to start a custom WebCenter application. For command syntax and detailed examples, see "startApplication" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

8.4.3 Stopping Custom WebCenter Applications Using Fusion Middleware Control

When you stop WebCenter Spaces no one can use it. Stopping an application does not remove its source files from the server; you can later restart a stopped application to make it available again.

Note: You can also stop WebCenter Spaces through Oracle WebLogic Server Administration Console.

To stop a custom WebCenter application:

1. In Fusion Middleware Control, navigate to the home page for the custom WebCenter application.

See [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

2. From the main menu, choose **Application Deployment >Control > Shut Down**.

Alternatively, right-click the name of the custom WebCenter application in the Target Navigation Pane to access this menu option.

3. Click **OK** to continue.

A progress message displays.

4. Click **Close**.

Note how the status changes to Down (Red arrow).

8.4.4 Stopping Custom WebCenter Applications Using WLST

Use the WLST command `stopApplication` to stop a custom WebCenter application. For command syntax and detailed examples, see "stopApplication" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Setting Application Properties

This chapter includes the following sections:

- [Section 9.1, "Setting Application Properties for WebCenter Spaces"](#)
- [Section 9.2, "Setting Additional Properties for Custom WebCenter Applications"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools"](#).

9.1 Setting Application Properties for WebCenter Spaces

The WebCenter Spaces home page (in Fusion Middleware Control) is your starting place for configuring WebCenter Spaces deployments. Just like any other J2EE application, you can configure ADF, MDS, security policies and roles, and so on, from here. You can also configure WebCenter service connections, external applications, and portlet producers for WebCenter Spaces. To access this page, see [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).

Additionally, there are several application-level settings for configuring group space workflows and Oracle SES search crawling in WebCenter Spaces. Application settings are described in the following sections:

- [Section 9.1.1, "Specifying the BPEL Server Hosting WebCenter Spaces Workflows"](#)
- [Section 9.1.2, "Enabling Oracle SES Crawlers in WebCenter Spaces"](#)

9.1.1 Specifying the BPEL Server Hosting WebCenter Spaces Workflows

WebCenter Spaces uses the BPEL server included with the Oracle SOA Suite to host internal workflows, such as group space membership notifications, group space subscription requests, and so on. To enable workflow functionality inside WebCenter Spaces, a connection to this BPEL server is required.

Note: WebCenter Spaces workflows must be deployed on the SOA managed server that WebCenter Spaces is configured to use. See also, "Back-End Requirements for WebCenter Spaces Workflows" in *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

To configure a connection to the WebCenter Space workflows:

1. Login to Fusion Middleware Control, and navigate to the home page for WebCenter Spaces.
See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).
2. From the **WebCenter** menu, choose **Settings > Application Configuration**.

Figure 9–1 *Choosing the BPEL Server Where WebCenter Spaces Workflows are Deployed*

3. From the **Connection Name** dropdown, choose the name of the connection you require.
The connections on offer are those currently configured for the Worklist service in WebCenter Spaces.
Ensure that you choose the connection that points to the SOA instance in which WebCenter Spaces workflows are deployed. If that connection is not listed you must create it. To define the connection, see [Section 20.3, "Setting Up Worklist Connections"](#).
4. Click **Apply**.
5. Restart the managed server on which WebCenter Spaces is deployed to effect this change.
See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments"](#).

9.1.2 Enabling Oracle SES Crawlers in WebCenter Spaces

Out-of-the-box, WebCenter Spaces uses its own WebCenter Search service for searching and returning WebCenter Spaces content. If preferred, you can use Oracle Secure Enterprise Search (SES) to search and return unified results for most WebCenter Spaces resources, including documents, discussions, announcements, group spaces, lists, pages, wikis and blogs. To set up Oracle SES searching, see [Section 18.4, "Configuring Oracle SES to Search WebCenter Spaces"](#).

If Oracle SES Search is configured to search WebCenter Spaces resources you can enable or disable the feature at any time through Fusion Middleware Control or using the WLST command `setSpacesCrawlProperties`. You can also configure a suitable full crawl frequency for WebCenter Spaces. For instructions, see step 3 in [Section 18.4.2, "Setting Up WebCenter Spaces for Oracle SES Search"](#).

9.2 Setting Additional Properties for Custom WebCenter Applications

The J2EE Application Deployment home page (in Fusion Middleware Control) is your starting place for configuring custom WebCenter application deployments developed with Oracle WebCenter Framework. Just like any other J2EE application, you can

configure ADF, MDS, security policies and roles, and so on, from here. You can also configure WebCenter service connections, external applications, and portlet producers. To access this page, see [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

See also:

- [Section A.4, "Tuning Environment Configuration"](#)
- [Section A.5, "Tuning WebCenter Application Configuration"](#)
- [Section A.6, "Tuning Back-End Component Configuration"](#)

Part IV

Managing Services, Portlet Producers, and External Applications

The chapters in this part present administration tasks for Oracle WebCenter services, portlet producers, and external applications.

Part IV contains the following chapters:

- Chapter 10, "Managing Services"
- Chapter 11, "Managing Content Repositories"
- Chapter 12, "Managing the Announcements and Discussions Services"
- Chapter 13, "Managing the Events Service"
- Chapter 14, "Managing the Instant Messaging and Presence Service"
- Chapter 15, "Managing the Mail Service"
- Chapter 16, "Managing the People Connections Service"
- Chapter 17, "Managing the RSS Service"
- Chapter 18, "Managing the Search Service"
- Chapter 19, "Managing the Wiki and Blog Services"
- Chapter 20, "Managing the Worklist Service"
- Chapter 21, "Managing Portlet Producers"
- Chapter 22, "Managing External Applications"

Managing Services

This chapter provides an overview of managing WebCenter services WebCenter applications. It also describes how to configure and manage the WebCenter and MDS repositories.

This chapter includes the following sections:

- [Section 10.1, "Introduction to Managing Services"](#)
- [Section 10.2, "Setting Up the WebCenter Repository"](#)
- [Section 10.3, "Setting Up the MDS Repository"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). For more information, see [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

10.1 Introduction to Managing Services

WebCenter expose collaborative, social networking, and personal productivity features through *services*, which, in turn, expose subsets of their features and functionality through *task flows*. Task flows provide reusable functionality that may expose all or a subset of the features available from a particular service.

Services provide a variety of functionality in support of personal and team objectives. For example, the Documents service provides features for uploading and managing content. The Discussions service provides features for creating, managing, and participating in discussion forums.

Always use Fusion Middleware Control or the WLST command-line tool to review and configure back-end services for WebCenter applications. Any changes that you make to WebCenter applications, post deployment, are stored in the MDS metadata store as customizations. For more information, see [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

Note: Changes that you make to WebCenter services configuration, through Fusion Middleware Control or using WLST, are not dynamic so you must restart the managed server on which the WebCenter application is deployed for your changes to take effect. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

10.2 Setting Up the WebCenter Repository

The Events, Links, Lists, People Connections, and Tags services store information in the WebCenter repository, which is a database with the WebCenter schema installed. The WebCenter schema is included with the product. To install the WebCenter schema, follow the steps described in the section, "Installing Oracle WebCenter" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

Note: For WebCenter Spaces, a WebCenter repository is configured out-of-the-box, and therefore, the repository connection does not require reconfiguration.

Table 10–1 describes what information these services store in the WebCenter repository. For more information, see the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

For information on backing up and migrating this information, see [Chapter 25, "Managing Export, Import, Backup, and Recovery of WebCenter."](#)

Table 10–1 WebCenter Services Storing Content in WebCenter Repository

WebCenter Services	Description	Content Stored in WebCenter Repository	WebCenter Spaces	Custom WebCenter application
Events	Scheduled appointments, meetings, presentations, or any other kind of gathering for a particular group space. Group space members can view such events on the group space's dedicated Events page or in any Events task flow that is located on a page in the group space.	Group space event details, such as, meetings, appointments, presentations, and so on. Note: Personal events are stored in Microsoft Exchange Server 2003 and 2007.	Yes	No
Links	Links connect different pieces of previously unlinked information, producing context between items. As users build webs of related information, this knowledge can be communicated to the wider group.	Link maps, that is, relationship information such as what object is linked to what other object.	Yes	Yes
Lists	Enables users to track issues, capture project milestones, publish project assignments, and so on.	List data, that is, column values in List rows.	Yes	No
Tags	Enables users to apply their own meaningful terms to items, making those items more easily discoverable in search results and the Tag Center - a dynamically generated page that displays all the tags users have added.	Resources, bookmarks created on resources, and tag words used in each bookmark.	Yes	Yes

For custom WebCenter applications, you must set up a database connection to the WebCenter repository. This database connection can be of type **JDBC DataSource** or **JDBC URL**. For information on different types of data sources, see the section, "What You May Need to Know About Database Connections and Application Security Migration When Deploying WebCenter Applications" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

Depending on the connection type used in an application, do one of the following:

- Create a global data source, if the application does not include an application-level data source with password indirection. For information on creating global data sources, see the section, "Creating a JDBC Data Source" in *Oracle Fusion Middleware Configuring and Managing JDBC for Oracle WebLogic Server*.
- Map the connection credentials, if the application uses an application-level data source with password indirection. The password is set through the Oracle WebLogic Administration Console on the **Credential Mappings** tab under **Security**. If you change the password for an indirect data source on the **Connection Pool** tab under **Configuration**, then it has no effect. For more information on credential mapping, see "JDBC Data Sources: Security: Credential Mapping" under the section "Creating a JDBC Data Source" in *Oracle Fusion Middleware Configuring and Managing JDBC for Oracle WebLogic Server*.
- Merge the information stored in application credential store with that of the global application store, if the application uses a JDBC URL connection. For more information on credential migration behavior, see the section, "Configuring the Credential Store" in the *Oracle Fusion Middleware Security Guide*.

In a typical business scenario, applications are deployed to different managed servers, and multiple databases are used as repositories for the applications. The repository that you use in a development environment is different from that in a production environment, and therefore, when migrating custom WebCenter applications from development to production, you must reconfigure the database connection.

When a repository connection is reconfigured, the local `datasource` file and the `*-jdbc.xml` file in the `WEB-INF` directory of the WAR file are updated with the new connection details. However, the JNDI Name and `data_source` name remain the same. If you change the JNDI Name for any reason, then you must also update the `adf-config.xml` file. The JNDI name must be of the form `jdbc/connection-nameDS`. For example, if the application has a connection name `connection1`, then the JNDI name is `jdbc/connection1DS`.

10.3 Setting Up the MDS Repository

Some WebCenter services, such as Notes, RSS News Feed, Recent Activities, Worklist, Lists, Events, Search, Page, and Mail store information in the MDS repository. To enable these services in WebCenter applications you must configure the MDS repository. For information, see [Section 7.1.3.2, "Creating and Registering the Metadata Service Repository."](#)

See Also: "Managing the Oracle Metadata Repository" in the *Oracle Fusion Middleware Administrator's Guide*.

Managing Content Repositories

Oracle WebCenter enables content integration through:

- Content Repository data controls, which enable read-only access to a content repository, and maintain tight control over the way the content displays in a custom WebCenter application.
- The Documents service, which enables users to view and manage documents and other types of content in your organization's content repositories.

Content Presenter, available through the Documents service, enables end users to select content in a variety of ways and then display those items using available display templates. A Content Presenter task flow can be added during development of a custom WebCenter application, or can be added to editable pages at runtime through the Documents service.

This chapter describes how to configure and manage content repositories used by WebCenter applications. For more information about managing and including content in WebCenter applications, see:

- "Integrating Content" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter* to configure content repository connections that provide access to decentralized content, and learn how to create custom display templates to integrate and publish decentralized content in your WebCenter application using Content Presenter, as well as how to use Java Content Repository (JCR) controls to enable read-only access to a content repository.
- "Integrating the Documents Service" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter* to integrate the Documents service in custom WebCenter applications to provide end users with a user-friendly interface to manage, display, and search documents at runtime.
- "Working with the Documents Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter* to work with the Documents service and task flows at runtime in WebCenter applications.

Note: Any content repository configuration changes that you make through Fusion Middleware Control or using WLST are not dynamic; you need to restart the managed server on which the WebCenter application is deployed for your changes to take effect. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments"](#).

This chapter contains the following sections:

- [Section 11.1, "What You Should Know About Content Repository Connections"](#)
- [Section 11.2, "Content Repository Prerequisites"](#)
- [Section 11.3, "Registering Content Repositories"](#)
- [Section 11.4, "Changing the Active \(or Default\) Content Repository Connection"](#)
- [Section 11.5, "Modifying Content Repository Connection Details"](#)
- [Section 11.6, "Deleting Content Repository Connections"](#)
- [Section 11.7, "Setting Connection Properties for the WebCenter Spaces Content Repository"](#)
- [Section 11.8, "Testing Content Repository Connections"](#)
- [Section 11.9, "Changing the Maximum File Upload Size"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See [Section 1.8, "Understanding Administrative Operations, Roles, and Tools"](#).

11.1 What You Should Know About Content Repository Connections

WebCenter users need to store, publish, and share files. The Documents service provides content management and storage capabilities for WebCenter applications, including content upload, file and folder creation and management, file check out, versioning, and so on. To do this, the Documents service requires at least one content repository connection (WebCenter applications can support multiple content repository connections) to be made active:

- **WebCenter Spaces** - In WebCenter Spaces, every group space and personal space has its own document folder, unique to its parent space. The back-end service providing this functionality is Oracle Content Server. When a content repository is made active (see [Section 11.4, "Changing the Active \(or Default\) Content Repository Connection"](#)), it becomes the default content repository and additional properties become available for configuration. WebCenter Spaces *requires* the default content repository to be Oracle Content Server. Additionally, administrators may connect WebCenter Spaces to other content repositories that WebCenter Spaces may use.
- **Other WebCenter applications** - When a content repository is made active (see [Section 11.4, "Changing the Active \(or Default\) Content Repository Connection"](#)), Documents service task flows use that content repository in instances where no specific connection details are provided. There is no particular requirement on the default content repository used.

When Oracle Content Server is the content repository (required for WebCenter Spaces), the identity store configured for the Documents service must be LDAP-based, not a file-based jaza store, and Oracle Content Server must be connected to that same identity store.

Just like other service connections, post-deployment, content repository connections are registered and managed through Fusion Middleware Control or using the WLST command-line tool. Connection information is stored in configuration files and in the MDS repository. For more information, see [Section 1.3.5, "Oracle WebCenter Configuration Considerations"](#).

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter applications. Any changes that you make to WebCenter applications, post-deployment, are stored in the Oracle Metadata Service (MDS) repository as customizations.

Once connection details are defined, WebCenter users can expose the content of the connected content repositories through several ADF Faces components, such as `<af:image>`, `<af:inlineFrame>`, and `<af:goLink>`, and built-in Documents service task flows (Content Presenter, Document Manager, Document List Viewer, and Recent Documents). For more information, see "Working with Page Content" and "Working with the Documents Service" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

11.2 Content Repository Prerequisites

Oracle WebCenter's support of the JCR 1.0 open document standard enables integration with multiple back-end content stores. Oracle WebCenter supports the following content repositories: Oracle Content Server, Oracle Portal, and the file system.

Caution: File system connections *must not* be used in production or enterprise application deployments. This feature is provided for development purposes only

Prerequisites for each content repository are described in the following sections:

- [Section 11.2.1, "Oracle Content Server Prerequisites"](#)
- [Section 11.2.2, "Oracle Portal Prerequisites"](#)
- [Section 11.2.3, "File System Prerequisites"](#)

11.2.1 Oracle Content Server Prerequisites

This section discusses the prerequisites for an Oracle Content Server content repository in the following subsections:

- [Section 11.2.1.1, "Oracle Content Server - Installation"](#)
- [Section 11.2.1.2, "Oracle Content Server - Configuration"](#)
- [Section 11.2.1.3, "Oracle Content Server - Security Considerations"](#)
- [Section 11.2.1.4, "Oracle Content Server - Limitations in WebCenter"](#)

11.2.1.1 Oracle Content Server - Installation

Oracle Content Server 10.1.3.5.1 installation is integrated with Oracle WebCenter installation, which is included in the Universal Content Management (UCM) media shipped with Oracle WebCenter. Alternatively, you can choose to install Oracle Content Server separately from the UCM media and then integrate it with Oracle WebCenter, provided certain configuration requirements are satisfied. Before installing Oracle Content Server, ensure that Oracle HTTP Server is installed on the same system.

For information about installing Oracle Content Server, see the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

11.2.1.2 Oracle Content Server - Configuration

After installing Oracle Content Server, you must configure the server to use the same LDAP-based identity store that Oracle WebCenter has been configured to use. You can optionally configure Oracle Content Server for using full-text search and index and Secure Sockets Layer (SSL) for secure identity propagation. [Table 11–1](#) lists the various configuration tasks and specifies whether these tasks are mandatory or optional.

See Also: "Administering Content Server" in *Getting Started With Content Server* at:

http://download-west.oracle.com/docs/cd/E10316_01/cs/cs_doc_10/getting_started/index.htm

Table 11–1 Oracle WebCenter-Specific Postinstallation Configuration Tasks for Oracle Content Server

Task	Mandatory/Optional
Configuring the Identity Store	Mandatory
Enabling Full-Text Searching and Indexing	Optional
Configuring Secure Sockets Layer (SSL)	Optional

Note: If you intend to manage Oracle Content Server through a browser or add content on the server through WebDAV, then you must configure Oracle Content Server to work with Oracle HTTP Server.

11.2.1.2.1 Configuring the Identity Store

Both Oracle Content Server and Oracle WebCenter must be configured to use the same LDAP-based identity store and this identity store must be supported by the user or role API. To enable communication between Oracle Content Server and LDAP-based identity store, you must add a JPS user provider configured for this identity store.

To add a JPS user provider to Oracle Content Server:

1. Stop Oracle Content Server and the Admin Server. For information, see the section "Oracle Content Server - Installation" in *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

See Also: "Starting and Stopping a Content Server" in *Getting Started With Content Server* at:

http://download-west.oracle.com/docs/cd/E10316_01/cs/cs_doc_10/getting_started/index.htm

2. Update the Oracle Content Server's JPS configuration file, `jps-config.xml`:
 - a. `cd CONTENT_SERVER_HOME/config`
 - b. Add a `serviceInstanceEntry` which looks like [Example 11–1](#).

Note: ■

- Ensure that all entries in the service instance match your LDAP server.
- The `security.principal.key` and `security.principal.alias` values (in **bold**) used in [Example 11-1](#) must match the input you provide when running the script. See Step 3.
- Some specific properties like `idstore.type` may vary from [Example 11-1](#), depending on the type of identity store being configured. For information on other permissible values, see the Appendix "OPSS System and Configuration Properties" in *Oracle Fusion Middleware Security Guide*.

Example 11-1 *serviceInstanceEntry in Oracle Content Server's jps-config.xml*

```
<serviceInstance name="idstore.oid" provider="idstore.ldap.provider">
  <property name="subscriber.name" value="dc=example,dc=com"/>
  <property name="idstore.type" value="OID"/>
  <property name="security.principal.key" value="ldap.credential"/>
  <property name="security.principal.alias" value="JPS"/>
  <property name="ldap.url" value="ldap://ldaphost:389"/>
  <extendedProperty>
    <name>user.search.bases</name>
    <values>
      <value>cn=users,dc=example,dc=com</value>
    </values>
  </extendedProperty>
  <extendedProperty>
    <name>group.search.bases</name>
    <values>
      <value>cn=groups,dc=example,dc=com</value>
    </values>
  </extendedProperty>
  <property name="username.attr" value="cn"/>
  <property name="user.login.attr" value="cn"/>
  <property name="groupname.attr" value="cn"/>
</serviceInstance>
```

- c. Ensure that the `<jpsContext>` entry in the `jps-config.xml` file refers to this new `serviceInstance`, that is, `idstore.oid` and not `idstore.ldap`:

```
<jpsContext name="default">
  <serviceInstanceRef ref="idstore.oid"/>
```

3. Run the new script to set up the credentials for `idstore.oid` in the credential store:

- `cd CONTENT_SERVER_HOME/custom/FusionLibraries/tools`

Note: Ensure that the script is executable, for example, `chmod +x run_credtool.sh`.

- On Windows, run the `run_credtool.cmd` script. If platform is Linux, run the `./run_credtool.sh` script.

When the script prompts for input, defaults are shown in [].

- Enter the input on the line following the prompt. The following extracts show you which defaults to take:

On Windows:

```
input] Alias: [JPS]
[input] Key: [ldap.credential]
[input] User Name:
cn=user name
[input] Password:password
[input] JPS Config:
[WC_ORACLE_HOME\ucm\custom\FusionLibraries\tools\..\..\..\config\jps-config.xml]
```

On Linux:

```
[input] Alias: [JPS]
[input] Key: [ldap.credential]
[input] User Name:
cn=user name
[input] Password:password
[input] JPS Config:
[WC_ORACLE_HOME/ucm/custom/FusionLibraries/tools/..\..\..\config/jps-config.xml]
```

Note: The Alias and Key input must match the values used in the `serviceInstance.security.principal.alias` and `security.principal.key` respectively.

4. Restart Oracle Content Server and the Admin Server. For information, see the section "Oracle Content Server - Installation" in *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

See Also: "Starting and Stopping a Content Server" in *Getting Started With Content Server* at:

http://download-west.oracle.com/docs/cd/E10316_01/cs/cs_doc_10/getting_started/index.htm

5. Ensure that the `JpsUserProvider` is available in Oracle Content Server:
 - a. Start the Oracle Content Server console and log on as an administrator.
 - b. From the **Administration** menu, select **Providers**.
 - c. Ensure that the `jpsuser` provider is listed on the **Providers** page and its status is good in the **Connection State** column.
 - d. If an `ldapuser` provider is enabled, disable it.

To disable the `ldapuser` provider, on the **Providers** page, in the **Action** column, click the **info** link next to the provider. In the new page that opens, under the **JPS User Provider Information** section, click the **Disable** button.

11.2.1.2.2 Enabling Full-Text Searching and Indexing

By default, the database used by Oracle Content Server is set up to provide metadata-only searching and indexing capabilities. However, you can modify the

default configuration of SQL Server, Oracle, and DB2 to additionally support full-text searching and indexing. Configuring full-text searching and indexing capabilities is optional, but advisable. For full-text search, it is recommended that you use the `OracleTextSearch` option.

For information about enabling full-text searching and indexing, see the "Setting Up Database Search and Indexing" appendix in the *Content Server Installation Guide for Microsoft Windows* or *Content Server Installation Guide for UNIX* available at:

http://download.oracle.com/docs/cd/E10316_01/owc.htm

11.2.1.2.3 Configuring Secure Sockets Layer (SSL) If Oracle Content Server and the WebCenter application in which you intend to create a repository connection are not on the same system or the same trusted private network, then identity propagation is not secure. To ensure security, you must configure SSL on Oracle Content Server.

Configuration of SSL on Oracle Content Server involves the following tasks:

- [Configuring a Keystore and Key on the Client Side](#)
- [Configuring a Keystore and Key on the Server Side](#)
- [Verifying Signatures of Trusted Clients](#)
- [Securing Identity Propagation](#)

You can also refer to "SSL Properties" in *Content Integration Suite Administration Guide* available at http://download.oracle.com/docs/cd/E10316_01/ouc.htm. Perform these procedures if you use self-signed certificates.

In a production environment, it is recommended that you use real certificates. For information about how to configure keystores when using real certificates, see the "Using Security Providers" chapter in the *Security Providers Component Administration Guide* available at

http://download.oracle.com/docs/cd/E10316_01/ouc.htm.

For more information about configuration for SSL, see [Section 23.6, "Configuring WebCenter Applications and Components to Use SSL"](#).

Configuring a Keystore and Key on the Client Side

To configure a keystore on the WebCenter application (client) side:

1. In your development environment, go to `JDEV_HOME/jdk/bin` and open the command prompt.

2. Generate the client keystore by running the following keytool command:

```
keytool -genkey -keyalg RSA -validity 5000 -alias Client private key alias
-keystore client-keystore.jks
-dname "cn=client" -keypass Private key password -storepass KeyStore password
```

3. To verify that the keys have been correctly created, you can optionally run the following keytool command:

```
keytool -list -keystore client-keystore.jks -storepass KeyStore password
```

4. To use the key, sign it by running the following keytool command:

```
keytool -selfcert -validity 5000 -alias Client private key alias -keystore
client-keystore.jks
-keypass Private key password -storepass KeyStore password
```

5. Export the client public key by running the following keytool command:

```
keytool -export -alias Client private key alias -keystore client-keystore.jks
-file client.pubkey -keypass Private key password -storepass KeyStore password
```

Configuring a Keystore and Key on the Server Side

To configure a keystore on the Oracle Content Server side:

1. In the same development environment, go to `JDEV_HOME/jdk/bin` and open the command prompt.

2. Generate the server keystore by running the following keytool command:

```
keytool -genkey -keyalg RSA -validity 5000 -alias Server public key alias
-keystore server-keystore.jks -dname "cn=server" -keypass Private server key
password -storepass KeyStore password
```

3. To verify that the key has been correctly created, run the following keytool command:

```
keytool -list -keystore server-keystore.jks -keypass Server private key
password -storepass KeyStore password
```

4. To use the key, sign it by running the following keytool command:

```
keytool -selfcert -validity 5000 -alias Server public key alias -keystore
server-keystore.jks
-keypass Private server key password -storepass KeyStore password
```

5. Export the server public key to the server keystore by running the following keytool command:

```
keytool -export -alias Server public key alias -keystore server-keystore.jks
-file server.pubkey -keypass Server private key password -storepass KeyStore
password
```

Verifying Signatures of Trusted Clients

To verify signatures of trusted clients, import the client public key into the server keystore:

1. In your development environment, go to `JDEV_HOME/jdk/bin` and open the command prompt.

2. To verify the signature of trusted clients, import the client's public key in to the server keystore by running the following keytool command:

```
keytool -import -alias Client public key alias -file client.pubkey -keystore
server-keystore.jks -keypass Private server key password -storepass KeyStore
password
```

3. Import the server public key into the client keystore by running the following keytool command:

```
keytool -import -alias Server public key alias -file server.pubkey -keystore
client-keystore.jks -keypass Private key password -storepass KeyStore password
```

When the tool prompts you if the key is self-certified, you must enter Yes.

[Example 11–2](#) shows a sample output that is generated after this procedure is completed successfully.

Example 11–2 Sample Output Generated by the Keytool

```
[user@server]$ keytool -import -alias client -file client.pubkey
-keystore server-keystore.jks -keypass Server private key password -storepass
```

```

Keystore password
Owner: CN=client
Issuer: CN=client
Serial number: serial number, for example, 123a19cb
Valid from: Date, Year, and Time until: Date, Year, and Time
Certificate fingerprints:
    ...
Trust this certificate? [no]: yes
Certificate was added to keystore.

```

Securing Identity Propagation

To secure identity propagation, you must configure SSL on Oracle Content Server.

1. Log on to Oracle Content Server as an administrator.
2. From **Administration**, choose **Providers**.
3. On the Create a New Provider page, click **Add** for **sslincoming**.
4. On the Add Incoming Provider page, in **Provider Name**, enter a name for the provider, for example, `sslincomingprovider`.

When the new provider is set up, a directory with the provider name is created as a subdirectory of the `CONTENT_SERVER_HOME/data/providers` directory.

5. In **Provider Description**, briefly describe the provider, for example, `SSL Incoming Provider for securing the Content Server`.
6. In **Provider Class**, enter the class of the `sslincoming` provider, for example, `idc.provider.ssl.SSLSocketIncomingProvider`.

Note: You can add a new SSL keepalive incoming socket provider or a new SSL incoming socket provider. Using a keepalive socket improves the performance of a session and is recommended for most implementations.

7. In **Connection Class**, enter the class of the connection, for example, `idc.provider.KeepaliveSocketIncomingConnection`.
8. In **Server Thread Class**, enter the class of the server thread, for example, `idc.server.KeepaliveIdcServerThread`.
9. In **Server Port**, enter an open server port, for example, `5555`.
10. Select the **Require Client Authentication** checkbox.
11. In **Keystore password**, enter the password to access the keystore.
12. In **Alias**, enter the alias of the keystore.
13. In **Alias password**, enter the password of the alias.
14. In **Truststore password**, enter the password of the trust store.
15. Click **Add**.

The new incoming provider is now added.

16. Go to the new provider directory that was created in step 4.
17. To specify truststore and keystore, create a file named `sslconfig.hda`.
18. Copy the server keystore to the server.

19. Configure the `sslconfig.hda` file. [Example 11–3](#) shows how the `.hda` file should look after you include the truststore and keystore information.

Example 11–3 Sample `sslconfig.hda` File

```
@Properties LocalData
TruststoreFile=/tmp/ssl/server_keystore
KeystoreFile=/tmp/ssl/server_keystore
@end
```

11.2.1.3 Oracle Content Server - Security Considerations

To secure identity propagation, you must configure SSL on Oracle Content Server. This is required when Oracle Content Server and your WebCenter application are not on the same system or the same trusted private network. For information, see [Section 11.2.1.2.3, "Configuring Secure Sockets Layer \(SSL\)."](#)

11.2.1.4 Oracle Content Server - Limitations in WebCenter

None.

11.2.2 Oracle Portal Prerequisites

This section discusses the prerequisites for an Oracle Portal content repository in the following subsections:

- [Section 11.2.2.1, "Oracle Portal - Installation"](#)
- [Section 11.2.2.2, "Oracle Portal - Configuration"](#)
- [Section 11.2.2.3, "Oracle Portal - Security Considerations"](#)
- [Section 11.2.2.4, "Oracle Portal - Limitations in WebCenter"](#)

11.2.2.1 Oracle Portal - Installation

For information on installing Oracle Portal, see *Oracle Fusion Middleware Installation Guide for Oracle Portal, Forms, Reports and Discoverer*.

11.2.2.2 Oracle Portal - Configuration

Oracle Portal must be up-to-date with all the latest patches. For additional information about patches, see the product release notes. See also *Oracle Fusion Middleware Administrator's Guide for Oracle Portal*.

11.2.2.3 Oracle Portal - Security Considerations

None.

11.2.2.4 Oracle Portal - Limitations in WebCenter

Oracle Portal integration with Oracle WebCenter is read-only. It is not possible to create content in the portal from Oracle WebCenter.

You can expose Oracle Portal pages in WebCenter through the Federated Portal Adapter by publishing them as portlets in Oracle Portal. The following are not returned by the Federated Portal Adapter, and thus are not visible in Oracle WebCenter:

- Seeded page groups:
 - Oracle Portal repository.

- Oracle Portal design-time pages.
- Pages of the following types:
 - Mobile.
 - URL.
 - Navigation pages.
- Items of the following types:
 - Navigation items.
 - PLSQL items.
 - Portlet.
 - Portlet instance.
 - URL items.
 - Mobile items.
 - Page links.
 - Item links.
- Items defined as:
 - Expired.
 - Hidden.

11.2.3 File System Prerequisites

This section discusses the prerequisites for a file system content repository in the following subsections:

- [Section 11.2.3.1, "File System - Security Considerations"](#)
- [Section 11.2.3.2, "File System - Limitations in WebCenter"](#)

11.2.3.1 File System - Security Considerations

All operations are executed as the system user under which the JVM is running and therefore inherit its permissions.

11.2.3.2 File System - Limitations in WebCenter

File system connections must not be used in production or enterprise application deployments, and search capabilities are limited and slow due to the absence of an index. This feature is provided for development purposes only.

11.3 Registering Content Repositories

This section contains the following subsections:

- [Section 11.3.1, "What You Should Know About Registering Content Repositories for WebCenter Spaces"](#)
[Section 11.3.2, "Registering Content Repositories Using Fusion Middleware Control"](#)
- [Section 11.3.3, "Registering Content Repositories Using WLST"](#)

11.3.1 What You Should Know About Registering Content Repositories for WebCenter Spaces

Please consider the following while registering Oracle Content Server repositories for WebCenter Spaces:

- At the start up, WebCenter Spaces applications create seed data, if it does not already exist.
- For active connections in WebCenter Spaces, the Spaces Root and Application Name values are used to create the seed data in the WebCenter Spaces repository, to enable storage of the Group Space data.
- The Spaces Root value is used as the name for the root folder within the content repository under which all Group Spaces content is stored.
- The Application Name value is used when creating the following security settings:
 - The name of the security group
 - The prefix for the role (the name format is *applicationNameUser*)
 - The prefix for all folder and content item accounts
 - To stripe users permissions on accounts for the particular WebCenter Spaces application
 - To stripe default attributes for the particular WebCenter Spaces application

For information about security groups and roles, see *Managing Security and User Access for Content Server*. For information about folders, see *Folders and WebDav Administration Guide*. These guides are available at http://download.oracle.com/docs/cd/E10316_01/owc.htm.

- Oracle does not recommend changing the Spaces Root and Application Name values. However, if you change the Spaces Root value after configuring and running a WebCenter Spaces application, then you must also change the Application Name value, and vice versa. That is, you must change both values (Spaces Root and Application Name) if the WebCenter Spaces application already contains the seed data.

When you change these values, the existing seed data is not renamed in the Oracle Content Server repository. Instead, new seed data is created using the new values, when you start the application. Once the application is started, new Group Space data is created under the new Spaces Root and existing Group Space data under the old Spaces Root is no longer available. This means that any Group Space which had the Documents service provisioned prior to changing the Spaces Root will no longer have it provisioned.

Note: Although the Spaces Root and Application Name values change, the old root content repository folder still appears in search results, like any other root folder in Oracle Content Server.

11.3.2 Registering Content Repositories Using Fusion Middleware Control

To register a content repository:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)

- [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
 3. From the list of services on the WebCenter Service Configuration page, select **Content Repository**.
 4. To connect to a new content repository, click **Add** ([Figure 11-1](#)).

Figure 11-1 Configuring Content Repository Connections

Manage Content Repository Connections		
Name	Repository Type	Active Connection
pktest2	Oracle Content Server	<input checked="" type="checkbox"/>

5. Enter a unique name for this connection, specify the content repository type, and indicate whether this connection is the active (or default) connection for the application. See [Table 11-2](#).

Table 11-2 Manage Content Repository Connections

Field	Description
Connection Name	Enter a unique name for this content repository connection. The name must be unique (across all connection types) within the WebCenter application.
Repository Type	<p>Choose the type of repository you want to connect to. Select one of the following:</p> <ul style="list-style-type: none"> ■ Oracle Content Server - an Oracle Universal Content Management repository. See Section 11.2.1, "Oracle Content Server Prerequisites". ■ Oracle Portal - an Oracle Portal content repository. See Section 11.2.2, "Oracle Portal Prerequisites". ■ File System - a computer file system. See Section 11.2.3, "File System Prerequisites". <p>Caution: File system connections <i>must not</i> be used in production or enterprise application deployments. This feature is provided for development purposes only.</p> <p>(WebCenter Spaces) If you are setting up the backend content repository for WebCenter Spaces, that is, the repository used by WebCenter Spaces to store group space and personal space documents, you must select Oracle Content Server.</p>

Table 11–2 (Cont.) Manage Content Repository Connections

Field	Description
Active Connection	<p>Select to make this the <i>default</i> content repository for your WebCenter application.</p> <p>You can connect your WebCenter application to multiple content repositories; all connections are used. One connection must be designated the <i>default</i> (or active) connection. Do one of the following:</p> <ul style="list-style-type: none"> ■ For WebCenter Spaces: <p>Select to make this the <i>active connection</i>, that is, the back-end repository that WebCenter Spaces uses to store group space and personal space documents. The active connection must be to an Oracle Content Server.</p> <p>If this is the <i>active connection</i> for WebCenter Spaces, some additional configuration is required -- see Table 11–3, "Content Repository Connection - WebCenter Spaces Repository Details".</p> ■ For other WebCenter applications: <p>Select to make this the <i>active connection</i>; that is, the default connection for Documents service task flows (Content Presenter, Document Manager, Document List Viewer, and Recent Documents). When no specific connection details are provided for these task flows, this default (active) connection is used.</p> <p>Deselecting this option does not disable the content repository connection. If a content repository is no longer required, you must delete the connection.</p>

6. (For the active connection in WebCenter Spaces only.) Enter additional details for the WebCenter Spaces repository (see [Table 11–3](#)).

See Also: [Section 11.3.1, "What You Should Know About Registering Content Repositories for WebCenter Spaces"](#)

Table 11–3 Content Repository Connection - WebCenter Spaces Repository Details

Field	Description
Administrator User Name	<p>Enter the user name of the content repository administrator.</p> <p>For example: <code>sysadmin</code></p> <p>Administrative privileges are required for this connection so that operations can be performed on behalf of WebCenter users.</p>
Spaces Root	<p>Enter the root folder under which all Group Spaces content is stored. Specify a content repository folder that does not yet exist and use the format: <code>/foldername</code>.</p> <p>For example: <code>/MyWebCenterSpaces</code></p> <p>The <code>spacesRoot</code> cannot be <code>/</code>, the root itself, and it must be unique across applications. The folder specified is created for you when the WebCenter application starts up.</p> <p>Invalid entries include: <code>/</code>, <code>/foldername/</code>, <code>/foldername/subfolder</code></p>

Table 11–3 (Cont.) Content Repository Connection - WebCenter Spaces Repository

Field	Description
Application Name	<p>Enter a unique name for this WebCenter Spaces application within this content repository.</p> <p>For example: MyWCS</p> <p>The name must begin with an alphabetical character, followed by any combination of alphanumeric characters or the underscore character. The string must be less than or equal to 30 characters.</p>

7. Enter connection details for the content repository. For detailed parameter information, see:

- [Table 11–4, " Oracle Content Server Connection Parameters"](#)
- [Table 11–6, " Oracle Portal Connection Parameters"](#)
- [Table 11–7, " File System Connection Parameters"](#)

Table 11–4 Oracle Content Server Connection Parameters

Field	Description
RIDC Socket Type	<p>Specify whether Oracle Content Server connects on the content server listener port or the Web server filter, and whether the listener port is SSL enabled. Choose from:</p> <ul style="list-style-type: none"> ■ Socket - Uses an <code>intradoc</code> socket connection to connect to the Oracle Content Server. The client IP address must be added to the list of authorized addresses in the Oracle Content Server. In this case, the client is the machine on which Oracle WebCenter is running. ■ Socket SSL - Uses an <code>intradoc</code> socket connection to connect to the Oracle Content Server that is secured using the SSL protocol. The client's certificates must be imported in the server's trust store for the connection to be allowed. This is the most secure option, and the recommended option whenever identity propagation is required (for example, in WebCenter Spaces). ■ Web - Uses an HTTP(S) connection to connect to the Oracle Content Server. <p>For WebCenter Spaces, the Web option is not suitable for a back-end Oracle Content Server repository that is being used to store group space and personal space documents, because it does not allow identity propagation.</p> <p>For more information on the configuration parameters required for each RIDC socket type, see the table "Oracle Content Server Connection Parameters for Each RIDC Socket Type" in <i>Oracle Fusion Middleware Developer's Guide for Oracle WebCenter</i>.</p>

Table 11–4 (Cont.) Oracle Content Server Connection Parameters

Field	Description
Authentication Method	<p>Choose from:</p> <ul style="list-style-type: none"> ■ Identity Propagation - Oracle Content Server and the WebCenter application use the same identity store to authenticate users. (WebCenter Spaces) Identity propagation is required on the active connection for WebCenter Spaces, that is, for the content repository being used to store group space and personal space documents. ■ External Application - An external application authenticates users against the Oracle Content Server. Select this option if you want to use public, shared, or mapped credentials. <p>If an external application is used for authentication, use the Associated External Application drop down list to identify the application. If the application you want is not listed, select Create New to define the external application now.</p>
Server Host	<p>Enter the hostname of the machine where the Oracle Content Server is running.</p> <p>For example: <code>mycontentserver.mycompany.com</code></p> <p>Server Host is required when the RIDC Socket Type is set to Socket or Socket SSL.</p>
Server Port	<p>Enter the port on which the Oracle Content Server listens:</p> <ul style="list-style-type: none"> ■ Socket - Port specified for the <code>incoming</code> provider in the server. ■ Socket SSL - Port specified for the <code>sslincoming</code> provider in the server. <p>For example, <code>4444</code></p> <p>Server Port is required when the RIDC Type is set to Socket or Socket SSL.</p>
Connection Timeout (ms)	<p>Specify the length of time allowed to log in to Oracle Content Server (in milliseconds) before issuing a connection timeout message. If no timeout is set, there is no time limit for the login operation.</p>
Web URL	<p>Enter the Web server URL for the Oracle Content Server.</p> <p>Use the format: <code>http://<hostname>:<port>/<web_root>/<plugin_root></code></p> <p>For example: <code>http://mycontentserver/cms/idcplg</code></p> <p>Web URL is applicable when the RIDC Type is set to Web.</p>
Key Store Location	<p>Specify the location of key store that contains the private key used to sign the security assertions. The key store location must be an absolute path.</p> <p>For example: <code>D:\keys\keystore.xyz</code></p> <p>Key Store Location is required when the RIDC Type is set to Socket SSL.</p>
Key Store Password	<p>Enter the password required to access the keystore.</p> <p>For example: <code>T0PS3CR3T</code></p> <p>Key Store Password is required when the RIDC Type is set to Socket SSL.</p>

Table 11–4 (Cont.) Oracle Content Server Connection Parameters

Field	Description
Private Key Alias	<p>Enter the client private key alias in the keystore. The key is used to sign messages to the server. The public key corresponding to this private key must be imported in the server keystore.</p> <p>Ensure that the alias does not contain special characters or white space. For example: <code>enigma</code></p> <p>Private Key Alias is required when the RIDC Type is set to Socket SSL.</p>
Private Key Password	<p>Enter the password to be used with the private key alias in the key store.</p> <p>For example: <code>c0d3bR3ak3R</code></p> <p>Private Key Password is required when the RIDC Socket Type is set to Socket SSL.</p>

Table 11–5 Connection Details - Oracle Content Server - Cache Details

Element	Description
Cache Invalidation Interval (minutes)	<p>Specify the polling interval (in minutes) used by the Oracle Content Server service provider interface (SPI) to check for cache invalidations.</p> <p>The default is 0 which means that cache invalidation is disabled.</p> <p>The minimum interval is 2 minutes.</p>
Maximum Cached Document Size (bytes)	<p>Enter the maximum size (in bytes) for documents that are cached in the virtual content repository (VCR) binary cache.</p> <p>The default is 1024 bytes (1K).</p> <p>Tune this value based on your machine's memory configuration and the types of binary documents that you expect to cache.</p>
Administrator User Name	Enter a user name with administrative rights for this Oracle Content Server instance.
Administrator Password	Enter the password for the Oracle Content Server administrator.

Table 11–6 Oracle Portal Connection Parameters

Field	Description
Data Source Name	<p>Enter the JNDI DataSource location used to connect to the portal.</p> <p>For example: <code>jdbc/MyPortalDS</code></p> <p>The datasource must be on the server where the WebCenter application is deployed.</p>
Connection Timeout (ms)	Specify the length of time allowed to log in to Oracle Portal (in milliseconds) before issuing a connection timeout message. If no timeout is set, there is no time limit for the login operation.

Table 11–6 (Cont.) Oracle Portal Connection Parameters

Field	Description
Authentication Method	<p>Specify how to authenticate users against Oracle Portal. Choose from:</p> <ul style="list-style-type: none"> ▪ Identity Propagation - Select this option when the WebCenter application and Oracle Portal both use the same user identity store. ▪ External Application - Use an external application to authenticate users against Oracle Portal. Select this option if you want to use public, shared, or mapped credentials. <p>If an external application is used for authentication, use the Associated External Application dropdown list to identify the application.</p>
Associated External Application	<p>Associate Oracle Portal with an external application. External application credential information is used to authenticate Oracle Portal users.</p> <p>You can select an existing external application from the dropdown list, or click Create New to configure a new external application now.</p>

Table 11–7 File System Connection Parameters

Field	Description
Base Path	<p>Enter the full path to a folder on a local file system in which your content is placed. For example: C:\MyContent</p> <p>Caution: File system content <i>must not</i> be used in production or enterprise application deployments. This feature is provided for development purposes only.</p>

8. Click **OK** to save this connection.
9. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed.

The registered connections are now available to Documents service task flows, which you can add to pages in WebCenter Spaces or custom WebCenter applications. See also, "Working with the Documents Service" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

11.3.3 Registering Content Repositories Using WLST

Use the following WLST commands to register new content repository connections:

- **Oracle Content Server** - `createJCRContentServerConnection`
- **File System** - `createJCRFileSystemConnection`
- **Oracle Portal** - `createJCRPortalConnection`

For command syntax and examples, see the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To configure a particular connection as the default connection, set `isPrimary='true'`. See [Section 11.4, "Changing the Active \(or Default\) Content Repository Connection"](#).

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

Note: To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. See "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

11.4 Changing the Active (or Default) Content Repository Connection

WebCenter applications support multiple content repository connections but only one content repository connection can be designated the active (or default) connection.

In WebCenter Spaces, the *active connection* becomes the default back-end repository for group space and personal space documents and the repository must be an Oracle Content Server.

For other WebCenter applications, the *active connection* becomes the default connection for Documents service task flows (Content Presenter, Document Manager, Document List Viewer, and Recent Documents). When no specific connection details are provided for these task flows, the default (active) connection is used.

This section contains the following subsections:

- [Section 11.4.1, "Changing the Active \(or Default\) Content Repository Connection Using Fusion Middleware Control"](#)
- [Section 11.4.2, "Changing the Active \(or Default\) Content Repository Connection Using WLST"](#)

11.4.1 Changing the Active (or Default) Content Repository Connection Using Fusion Middleware Control

To change the active (or default) content repository connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Content Repository**.

The Manage Content Repository Connections table indicates the current active connection (if any).

4. Select the connection you want to become the active (or default) connection, and then click **Edit**.
5. Select the **Active Connection** checkbox.
6. Click **OK** to update the connection.

7. To start using the updated active connection you must restart the managed server on which the WebCenter application is deployed.

11.4.2 Changing the Active (or Default) Content Repository Connection Using WLST

Use the following WLST commands with `Primary='true'` to designate an existing content repository connection as the default connection:

- **Oracle Content Server** - `setJCRContentServerConnection`
- **File System** - `setJCRFileSystemConnection`
- **Oracle Portal** - `setJCRPortalConnection`

For command syntax and examples, see the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To subsequently disable a default content repository connection, run the same WLST command with `isPrimary='false'`. Connection details are retained but the connection is no longer named as the primary connection in `adf-config.xml`.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

Note: To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. See, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

11.5 Modifying Content Repository Connection Details

This section contains the following subsections:

- [Section 11.5.1, "Modifying Content Repository Connection Details Using Fusion Middleware Control"](#)
- [Section 11.5.2, "Modifying Content Repository Connection Details Using WLST"](#)

11.5.1 Modifying Content Repository Connection Details Using Fusion Middleware Control

To update content repository connection details:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, choose **Content Repository**.

4. Select the connection name, and click **Edit**.
5. Edit connection details, as required. For detailed parameter information, see:
 - [Table 11-4, "Oracle Content Server Connection Parameters"](#)
 - [Table 11-6, "Oracle Portal Connection Parameters"](#)
 - [Table 11-7, "File System Connection Parameters"](#)
6. Click **OK** to save your changes.
7. To start using the updated (active) connection details, you must restart the managed server on which the WebCenter application is deployed.

11.5.2 Modifying Content Repository Connection Details Using WLST

Use the following WLST commands to edit content repository connections:

- **Oracle Content Server** - `setJCRContentServerConnection`
- **File System** - `setJCRFileSystemConnection`
- **Oracle Portal** - `setJCRPortalConnection`

For command syntax and examples, see the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To configure a particular connection as the active (or default) connection, set `isPrimary='true'`. See [Section 11.4, "Changing the Active \(or Default\) Content Repository Connection"](#).

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

Note: To start using the updated (active) connection details, you must restart the managed server on which the WebCenter application is deployed. See "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

11.5.3 Modifying Cache Settings of Virtual Content Repository (VCR)

For each content connection, caches are created automatically at runtime. However, you can configure or modify Universal Content Management (UCM) repository caches in two ways: in the EAR project file `META-INF/p13n-cache-config.xml` or in the Portal Administration Console (under **Configuration & Monitoring > Service Administration**). Cache settings configured in the Portal Administration Console take precedence over the file-based settings. You can also flush the caches from the Portal Administration Console.

Note: If you already have a `p13n-cache-config.xml` file configured for another repository, you can add the UCM repository cache settings to this file.

[Table 11-8](#) and [Table 11-9](#) describe the default cache settings in the `p13n-cache-config.xml` file. [Table 11-8](#) describes the VCR caches, which are caches used by the VCR component. These caches are repository-specific and can exist

for any repository. [Table 11-9](#) describes the SPI caches, which are specific to the UCM SPI adapter component.

The pattern for the cache entry names is `<elementName>.<repositoryName>`, where `<repositoryName>` is the name of the UCM repository as specified in the `META-INF/content-config.xml` file. For example, `nodeCache.StellentRepository`.

Note that some `<time-to-live>` values are specified in milliseconds.

Table 11-8 VCR-Level Cache Entry Descriptions

Cache Entry Name	Description
<code>nodeCache.<repositoryName></code>	Caches node Id of repository's node instance. Defaults: <code>enabled = true</code> ; <code>time-to-live = 60000</code> , <code>max-entries = 50</code> .
<code>nodePathCache.<repositoryName></code>	Caches node path to repository's node Id. Default values: <code>enabled = true</code> ; <code>time-to-live = 2 minutes (2*60*1000)</code> , <code>max-entries = 200</code> .
<code>typeCache.<repositoryName></code>	Caches type Id of repository's type instance. Default values: <code>enabled = true</code> ; <code>time-to-live = 300000</code> , <code>max-entries = 200</code> .
<code>typeNameCache.<repositoryName></code>	Caches type name for repository's type Id. Default values: <code>enabled = true</code> ; <code>time-to-live = 10 minutes (10*60*1000)</code> , <code>max-entries = 200</code> .
<code>binaryCache.<repositoryName></code>	Default values: <code>enabled = true</code> ; <code>time-to-live = 5 minutes (5*60*1000)</code> , <code>max-entries = 50</code> . The maximum binary entry size is specified as the repository property <code>binaryCacheMaxEntrySize</code> which has a default value of 102400 bytes (100 kb).
<code>searchCache.<repositoryName></code>	Caches search results for a repository. Default values: <code>enabled = true</code> ; <code>time-to-live = 300000</code> , <code>max-entries = 500</code> .
<code>nativeAuthCache.<repositoryName></code>	Authorization cache for a repository when using native security. Default values: <code>enabled = true</code> ; <code>time-to-live = 5000</code> , <code>max-entries = 5000</code> .

Table 11-9 SPI-Level Cache Entry Descriptions

Cache Entry Name	Description
<code>repo.ucm.typeNameCache.<repositoryName></code>	Caches UCM server type metadata by type name. Default values: <code>enabled = true</code> ; <code>time-to-live = 1800000 (30 minutes)</code> , <code>max-entries = 5000</code>
<code>repo.ucm.nodePathToUIDCache.<repositoryName></code>	Caches UCM server node Ids by node path. Default values: <code>enabled = true</code> ; <code>time-to-live = 1800000 (30 minutes)</code> , <code>max-entries = 5000</code>
<code>repo.ucm.nodeUIDCache.<repositoryName></code>	Caches UCM server node metadata by node Id. Default values: <code>enabled = true</code> ; <code>time-to-live = 1800000 (30 minutes)</code> , <code>max-entries = 5000</code>
<code>repo.ucm.securityInfoCache.<repositoryName></code>	Caches UCM server node security information. Default values: <code>enabled = true</code> ; <code>time-to-live = 1800000 (30 minutes)</code> , <code>max-entries = 5000</code>

Table 11–9 (Cont.) SPI-Level Cache Entry Descriptions

Cache Entry Name	Description
repo.ucm.securityUserCache.<repositoryName>	Caches the relationship between the UCM user names and UCM server user Ids (user security information.) Default value: 10 minutes (10*60*1000), time-to-live =user authentication decision is valid, max-entries=5000
repo.ucm.typeNamesCache.<repositoryName>	Caches the list of UCM type names. Default values: enabled=true, time-to-live=1800000 (30 minutes), max-entries=5000
repo.ucm.indexedFieldsCache.<repositoryName>	Caches information about which UCM fields are indexed. Default values: enabled=true, time-to-live=1800000 (30 minutes), max-entries=5000

11.6 Deleting Content Repository Connections

This section contains the following subsections:

- [Section 11.6.1, "Deleting Content Repository Connections Using Fusion Middleware Control"](#)
- [Section 11.6.2, "Deleting Content Repository Connections Using WLST"](#)

Caution: Delete a content repository connection only if it is not in use. If a connection is marked as active, it should first be removed from the active list, and then deleted.

11.6.1 Deleting Content Repository Connections Using Fusion Middleware Control

To delete a content repository connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, choose **Content Repository**.
4. Select the connection name, and click **Delete**.
5. To effect this change you must restart the managed server on which the WebCenter application is deployed.

11.6.2 Deleting Content Repository Connections Using WLST

Use the WLST command `deleteConnection` to remove a content repository connection. For command syntax and examples, see "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

Note: To effect this change you must restart the managed server on which the WebCenter application is deployed. See, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

11.7 Setting Connection Properties for the WebCenter Spaces Content Repository

You can view, modify, and delete connection properties for the back-end Oracle Content Server repository that is being used by WebCenter Spaces to store group space and personal space documents. Specifically, you can define the root folder under which group space content is stored, the name of the content repository administrator, and a unique application identifier for separating application data on the Oracle Content Server.

This section contains the following subsections:

- [Section 11.7.1, "Setting Connection Properties for the WebCenter Spaces Content Repository Using Fusion Middleware Control"](#)
- [Section 11.7.2, "Setting Connection Properties for the WebCenter Spaces Content Repository Using WLST"](#)

11.7.1 Setting Connection Properties for the WebCenter Spaces Content Repository Using Fusion Middleware Control

To set content repository connection properties:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).
2. From the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, choose **Content Repository**.
4. Select the connection name, and click **Edit**.
5. (For the active connection in WebCenter Spaces only.) Set connection properties for the WebCenter Spaces repository (see [Table 11–10](#)).

Table 11–10 Content Repository Connection - WebCenter Spaces Repository Details

Field	Description
Administrator User Name	Enter the user name of the content repository administrator. For example: sysadmin Administrative privileges are required for this connection so that operations can be performed on behalf of WebCenter users.

Table 11–10 (Cont.) Content Repository Connection - WebCenter Spaces Repository

Field	Description
Spaces Root	<p>Enter the root folder under which group space content is stored. Specify a folder that does not yet exist and is unique across applications. Use the format: /foldername. This name cannot be the same as the Application Name.</p> <p>For example: /MyWebCenterSpaces</p> <p>If it does not already exist, the folder specified is automatically created when the WebCenter application starts.</p> <p>Invalid entries include: /, /foldername/, /foldername/subfolder</p>
Application Name	<p>Enter a unique name for this WebCenter Spaces application within this content repository.</p> <p>For example: MyWCS</p> <p>The name must begin with an alphabetical character, followed by any combination of alphanumeric characters or the underscore character. The string must be less than or equal to 30 characters.</p>

6. Click **OK** to save your changes.
7. To start using the updated (active) connection properties, you must restart the managed server on which the WebCenter application is deployed.

11.7.2 Setting Connection Properties for the WebCenter Spaces Content Repository Using WLST

The following commands are valid only for the WebCenter Spaces application to view, set, and delete properties for the Oracle Content Server repository that is being used by WebCenter Spaces to store group space and personal space documents:

- `listDocumentsSpacesProperties`
- `setDocumentsSpacesProperties`
- `deleteDocumentsSpacesProperties`

For command syntax and detailed examples, see the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

11.8 Testing Content Repository Connections

After setting up content repository connections, you can test them to make sure that you can access the content repository, as described in the following sections:

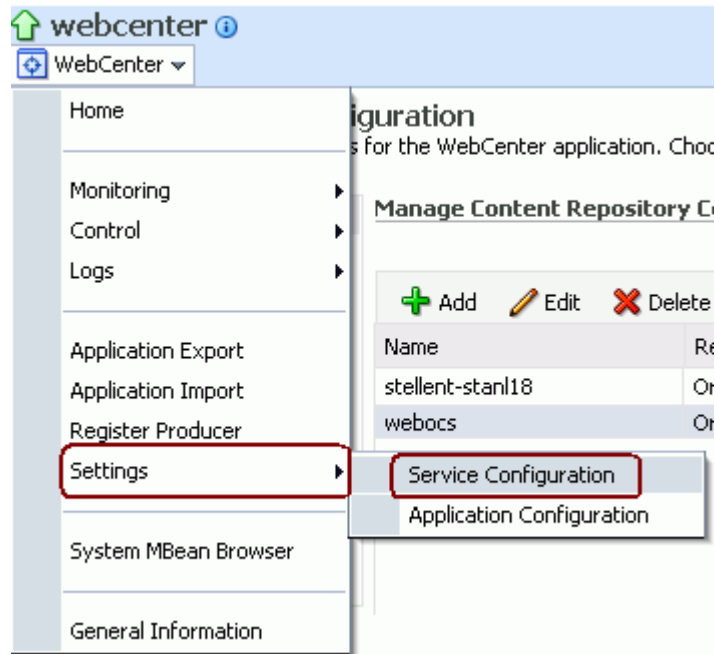

- [Section 11.8.1, "Testing Oracle Content Server Connections"](#)
- [Section 11.8.2, "Testing Oracle Portal Connections"](#)

11.8.1 Testing Oracle Content Server Connections

To verify a connection of the socket type `web`, log in to the Web interface of Oracle Content Server as `administrator`. You can obtain the URL of a socket type connection through Fusion Middleware Control as follows:

1. In Fusion Middleware Control, from the **WebCenter** menu, choose **Settings** and select **Service Configuration** (Figure 11-2).

Figure 11-2 Fusion Middleware Control WebCenter Menu

2. On the **Manage Content Repository Connections** page, select the connection and click **Edit** (Figure 11-3).

Figure 11-3 Manage Content Repository Connections Page

3. On the **Edit Content Repository Connection** page, copy the Web URL (Figure 11-4).

Note: Remove the `/idcplg/` suffix from the URL before using it.

The URL format is: `http://host_name/web_root/`
 For example: `http://mycontentserver/cms/`

Figure 11–4 Edit Content Repository Connection Page

webcenter

WebCenter

Edit Content Repository Connection

Name and Type

Connection Name: webocs

Repository Type: Oracle Content Server

Active Connection:

Connection Details

* CIS Socket Type: Web

* Web URL: http://mycontentserver:8888/cms/

Authentication Method: External Application

* Associated External Application: ocsextapp

11.8.2 Testing Oracle Portal Connections

To verify the full state of an Oracle Portal connection:

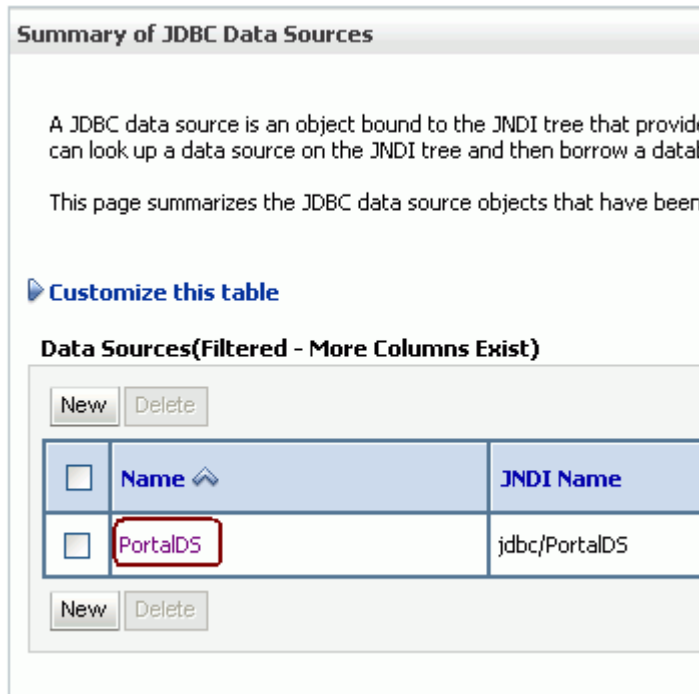

1. In the Oracle WebLogic Administration Console, under **Domain Structure**, expand **Services** > **JDBC**, then double-click **Data Sources** (Figure 11–5).

Figure 11–5 Oracle WebLogic Administration Console

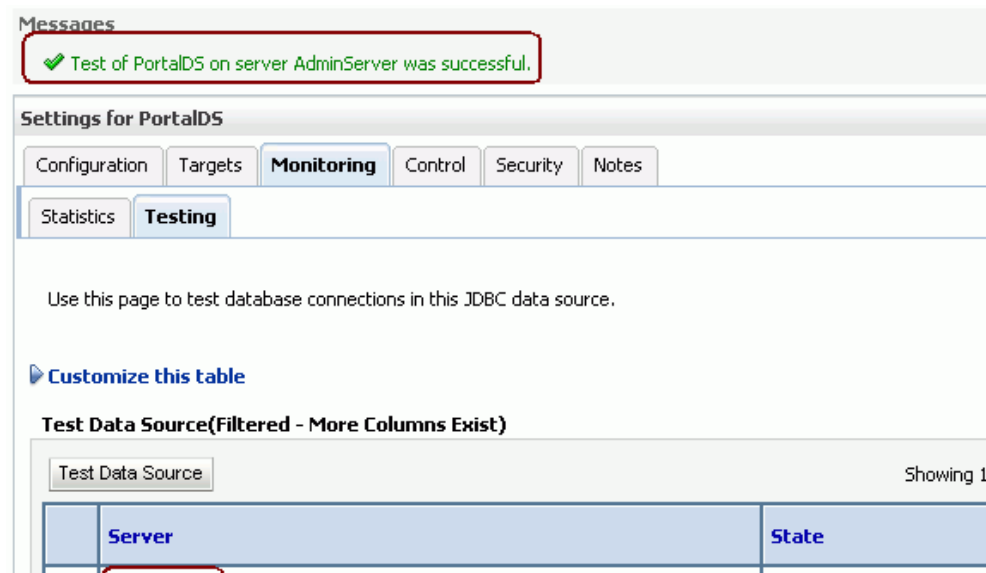

2. On the **Summary of JDBC Data Sources** page, select the data source you intend to test (Figure 11–6).

Figure 11–6 Summary of JDBC Data Sources Page

- In the **Settings for *datasource_name*** section, select the tabs **Monitoring**, then **Testing**. Select the data source target server, then click **Test Data Source** to test the connection (Figure 11–7).

Figure 11–7 Data Source Settings Section

11.9 Changing the Maximum File Upload Size

By default, the maximum upload size for files is:

- 2 MB for custom WebCenter applications. This default is imposed by Apache MyFaces Trinidad, which handles uploading files from a browser to the application server.
- 2 GB for WebCenter Spaces applications.

The WebCenter application developer can customize the default file upload size at design time by setting the `UPLOAD_MAX_MEMORY`, `UPLOAD_MAX_DISK_SPACE`, and `UPLOAD_TEMP_DIR` parameters in the `web.xml` file. For information about manually editing `web.xml`, see [Section A.1.2, "web.xml"](#).

For more information, see "Setting Parameters to Upload Files to Content Repositories" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

Managing the Announcements and Discussions Services

This chapter describes how to configure and manage the Announcements and Discussions services for WebCenter Spaces and custom WebCenter applications. These two services are grouped together because they both use the same connection to a back-end Oracle WebCenter Discussions server.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter applications. Any changes that you make to WebCenter applications, post deployment, are stored in MDS metadata store as customizations. See [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

Note: Changes that you make to WebCenter services configuration, through Fusion Middleware Control or using WLST, are not dynamic so you must restart the managed server on which the WebCenter application is deployed for your changes to take effect. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

This chapter includes the following sections:

- [Section 12.1, "What You Should Know About Discussions Server Connections"](#)
- [Section 12.2, "Discussions Server Prerequisites"](#)
- [Section 12.3, "Registering Discussions Servers"](#)
- [Section 12.4, "Choosing the Active Connection for Discussions and Announcements"](#)
- [Section 12.5, "Modifying Discussions Server Connection Details"](#)
- [Section 12.6, "Deleting Discussions Server Connections"](#)
- [Section 12.7, "Setting Up Discussions Service Defaults"](#)
- [Section 12.8, "Setting Up Announcements Service Defaults"](#)
- [Section 12.9, "Testing Discussions Server Connections"](#)
- [Section 12.10, "Setting Discussion Forum Options"](#)
- [Section 12.11, "Granting Administrator Role for Oracle WebCenter Discussions Server"](#)
- [Section 12.12, "Troubleshooting Issues with Announcements and Discussions"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

12.1 What You Should Know About Discussions Server Connections

The Discussions service enables users to start, publish, and store discussions and announcements in WebCenter applications. The Announcements service lets you create and expose announcements on your application pages.

Both the Discussions service and the Announcements service require a Discussions server. The Oracle WebCenter Discussions software is installed automatically with Oracle Fusion Middleware.

The Discussions service and the Announcements service require a connection to the WebCenter Discussions server. Both services use the same connection. You can register connections for your WebCenter application through the Fusion Middleware Control Console or using WLST:

- [Section 12.3.1, "Registering Discussions Servers Using Fusion Middleware Control"](#)
- [Section 12.3.2, "Registering Discussions Servers Using WLST"](#)

WebCenter Spaces

Some additional configuration is required to use Discussions and Announcements services in WebCenter Spaces. This includes choosing the category (on the Discussions server) under which all WebCenter Spaces discussions and announcements are stored, and more. This configuration takes place inside WebCenter Spaces. For more information, see [Section 12.10, "Setting Discussion Forum Options."](#)

In WebCenter Spaces, the `group.mapping` parameter determines whether a subcategory or a single forum is created on the Discussions server for new group spaces. For more information, see [Table 12-4](#).

You can register additional WebCenter Discussion connections through the Fusion Middleware Control Console, but only one connection is active at a time.

12.2 Discussions Server Prerequisites

This section includes the following subsections:

- [Section 12.2.1, "Discussions Server - Security Considerations"](#)
- [Section 12.2.2, "Discussions Server - Limitations"](#)

12.2.1 Discussions Server - Security Considerations

- By default, all Web service calls are secured and require Web Services Security (WS-Security) trusted authentication. WS-Security establishes a trust relationship between your WebCenter application and Oracle WebCenter Discussions so that your WebCenter application can pass the user identity information to the server without knowing the user's credentials.

To enable the WS-Security trusted authentication for Oracle WebCenter Discussions, you must:

1. Create a keystore by importing the certificate containing the public key of the WebCenter domain.
2. Store the server-side keystore certificate configuration in a properties file (`keystore.properties`) and specify it as a system property on the Discussions server.
3. Load the properties file in the ClassLoader for the WS-Secure Handler to pick it up.
4. Add the WS-Security-related properties in your Oracle WebCenter Discussions connection into WebCenter Spaces or your WebCenter application. For information on how to add new properties, see [Table 12–4, "Additional Discussion Connection Properties"](#) in [Section 12.3.1, "Registering Discussions Servers Using Fusion Middleware Control."](#)

For more information on configuring WS-Security for WebCenter Discussions, depending on your topology, see [Section 23.8, "Configuring WS-Security."](#)

Note: Oracle WebCenter Discussions-specific Web Services messages sent by WebCenter applications to Oracle WebCenter Discussions server are not encrypted. For message confidentiality, the Discussions server URL must be accessed over Secure Socket Layer (SSL). For more information, see [Section 23.6, "Configuring WebCenter Applications and Components to Use SSL."](#)

- By default, Oracle WebCenter Discussions is tied to the embedded LDAP: all users in the embedded the LDAP can log on to the Discussions server, and all users in the `Administrators` group have administrator privileges on Oracle WebCenter Discussions.

However, for production environments you will want to reassociate the identity store with an external LDAP server. You will then also need to either move the Fusion Middleware administrator account to the external LDAP, or if you choose not to move the administrator account, you will need to perform some additional steps to identify the new administrator account for the Discussions server. For more information, see [Section 23.4, "Configuring the Policy and Credential Store."](#)

- You can configure Oracle WebCenter Discussions to leverage single sign-on security using Oracle Access Manager, Oracle Single Sign-On, or SAML-based single sign-on. For information, see [Section 23.7, "Configuring a WebCenter Application to Use Single Sign-On."](#)

Note: If you set up SAML single sign-on (SSO), with WebCenter Spaces as the source application and Oracle WebCenter Discussions as the destination application, then you can access Oracle WebCenter Discussions administration pages from WebCenter Spaces as follows:

- Group Space > Settings > Services page
- Administration > WebCenter Administration > Services page

However, because the administration pages of Oracle WebCenter Discussions do not participate in SSO, if you access the administration pages directly, you are required to log in to Oracle WebCenter Discussions again.

- If WebCenter is not integrated with a single sign-on solution, then different login sessions are required for the `owc_discussion` user (`/owc_discussions`) and the `owc_discussion admin` user (`/owc_discussions/admin`).

12.2.2 Discussions Server - Limitations

The Oracle WebCenter Discussions URL supports only English and Spanish languages for displaying labels; however, data can be entered in UTF-8 format. Oracle recommends using the WebCenter application (with all WebCenter-supported languages) for user operations in the Discussions server. All WebCenter-supported languages are supported for data, such as discussion topics or announcements, and they are displayed in the Discussions server also.

The Discussions and Announcements services do not support non-ASCII user names if the Oracle WebCenter instance is running in a native encoding on Microsoft Windows. In a Linux environment, to allow support for non-ASCII user names in the Discussions and Announcements services, the server on which Oracle WebCenter is deployed must have the environment variable `LC_ALL` set to `utf-8`.

WebCenter Spaces

Do not change user permissions in the Discussions server, as this might cause unexpected behavior. Always manage user permissions for discussions and announcements in WebCenter Spaces. For more information, see [Section 28.1.4, "Understanding Discussions Server Role and Permission Mapping."](#)

12.3 Registering Discussions Servers

You can register multiple WebCenter Discussion connections with a WebCenter application, but only one is active at a time.

To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed.

This section includes the following subsections:

- [Section 12.3.1, "Registering Discussions Servers Using Fusion Middleware Control"](#)
- [Section 12.3.2, "Registering Discussions Servers Using WLST"](#)

12.3.1 Registering Discussions Servers Using Fusion Middleware Control

To register a WebCenter Discussion connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.

3. From the list of services on the WebCenter Service Configuration page, select **Discussions and Announcements**.
4. To connect to a new Discussions server, click **Add** (Figure 12–1).

Figure 12–1 Configuring Discussion and Announcement Connections

5. Enter a unique name for this connection, and indicate whether this connection is the active (or default) connection for the application (Table 12–1).

Table 12–1 Discussion and Announcement Connection - Name

Field	Description
Connection Name	Enter a unique name for the connection. The name must be unique (across all connection types) within the WebCenter application.
Active Connection	Select to use this connection for the Discussions and Announcements services in the WebCenter application. While you can register multiple Discussions server connections for a WebCenter application, only one connection is used for discussion and announcement services—the default (or active) connection.

6. Enter connection details for the Discussions server. For details, see Table 12–2.

Table 12–2 Discussion and Announcement Connection - Connection Details

Field	Description
Server URL	Enter the URL of the Discussions server hosting Discussions and Announcements For example: <code>http://discuss-server.com:8890/owc_discussions</code>
Administrator User Name	Enter the user name of the Discussions server administrator. This account is used by the Discussions and Announcement services to perform administrative operations on behalf of WebCenter users. In WebCenter Spaces, this account is mostly used for managing group space discussions and announcements. It is not necessary for this user to be a super admin. However, the user must have administrative privileges on the application root category configured for the WebCenter Spaces, that is, the category (on the Discussions server) under which all group space discussions and announcements are stored.

Table 12–2 (Cont.) Discussion and Announcement Connection - Connection Details

Field	Description
Connection Secured	<p>Select to indicate that a secured (WS-Security) Discussions server connection should be established.</p> <p>Additional WS-Security configuration is also required. Use the Additional Properties section to specify the keystore information (Table 12–4).</p> <p>Do not deselect this option: WS-Security is mandatory for Discussions server connections.</p>

7. Configure advanced options for the discussion and announcement connection (Table 12–3).

Table 12–3 Discussion and Announcement Connection - Advanced Configuration

Field	Description
Connection Timeout (in Seconds)	<p>Specify a suitable timeout for the connection.</p> <p>This is the length of time (in seconds) the WebCenter application waits for a response from the Discussions server before issuing a connection timeout message.</p> <p>The default is -1 which means that the service default is used. The service default is 10 seconds.</p>

8. Sometimes, additional parameters are required to connect to the Discussions server, for example, those listed in Table 12–4.

Table 12–4 Additional Discussion Connection Properties

Additional Connection Property	Description
<code>keystore.location</code>	<p>Enter the certificate file path in your local directory. For example, <code>/fmwconfig/webcenter.jks</code>.</p> <p>Keystore information is required to communicate with the Discussions server over WS-Security. For more information, see Section 12.2.1, "Discussions Server - Security Considerations."</p>
<code>keystore.type</code>	<p>Enter the keystore type associated with the certificate. Valid values are <code>jks</code> (Java keystore) and <code>pks</code>.</p>
<code>keystore.password</code>	<p>Enter the keystore password. To encrypt this password, check Is Property Secured.</p>
<code>encryption.key.alias</code>	<p>Enter the key alias to be used for encryption.</p> <p>This is the alias specified in the <code>keystore.properties</code> file on the Discussions server (see Section 23.8.1.2.5, "Configuring the Discussions Server Connection Settings").</p>
<code>encryption.key.password</code>	<p>Enter the password for accessing the encryption key. To encrypt this password, check Is Property Secured.</p>

Table 12–4 (Cont.) Additional Discussion Connection Properties

Additional Connection Property	Description
<code>group.mapping</code>	<p>(WebCenter Spaces only) Determines whether a subcategory or a single forum is created on the Discussions server for new group spaces. When set to <code>forum</code> (the default), a single forum is created under the application root category per group space. When set to <code>category</code>, a subcategory is created under the application root category per group space. When a subcategory that supports multiple forums is more suitable, set <code>group.mapping</code> to <code>category</code>.</p> <p>If a group space template has been configured with a forum-based taxonomy, then the template takes precedence over this connection entry. If a group space template does not define the mapping (the Blank template, for example), then this <code>group.mapping</code> property is used. If there is no value in the template or the connection, then the default setting is used (<code>forum</code>).</p>

If additional parameters are required to connect to the Discussions server, expand **Additional Properties** and enter details as required (Table 12–5).

Table 12–5 Discussion and Announcement Connection - Additional Properties

Field	Description
Add	<p>Click Add to specify an additional connection parameter:</p> <ul style="list-style-type: none"> ■ Name -Enter the name of the connection property. ■ Value - Enter the default value for the property. ■ Is Property Secured - Indicate whether encryption is required. When selected, the property value is stored securely using encryption. <p>For example, select this option to secure the <code>admin.password</code> property where the value is the actual password.</p>
Delete	<p>Click Delete to remove a selected property.</p> <p>Select the correct row before clicking Delete.</p> <p>Note: Deleted rows appear disabled until you click OK.</p>

9. Click **OK** to save this connection.

10. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

For WebCenter Spaces, some additional configuration is recommended for the Discussions service. For details, see [Section 12.10, "Setting Discussion Forum Options."](#)

12.3.2 Registering Discussions Servers Using WLST

Use the WLST command `createDiscussionForumConnection` to create a WebCenter Discussion connection. For command syntax and examples, see the section, "createDiscussionForumConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To configure the Discussions and Announcements services to actively use the new connection, set `default=true`.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

12.4 Choosing the Active Connection for Discussions and Announcements

You can register multiple WebCenter Discussion connections with a WebCenter application but only one connection is active at a time.

For WebCenter Spaces and any custom WebCenter applications, the *active connection* becomes the back-end Discussions server for:

- Discussions task flows (Discussion Forum Manager, Discussions, Popular Topics, Recent Topics, Watched Forums, Watched Topics)
- Announcements task flows (Announcements Manager, Announcements)

This section includes the following subsections:

- [Section 12.4.1, "Choosing the Active Connection for Discussions and Announcements Using Fusion Middleware Control"](#)
- [Section 12.4.2, "Choosing the Active Discussion for Discussions and Announcements Using WLST"](#)

12.4.1 Choosing the Active Connection for Discussions and Announcements Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, choose **Discussions and Announcements**.

The Manage Discussion and Announcement Connections table indicates the current active connection (if any).

4. Select the connection you want to make the active (or default) connection, and then click **Edit**.
5. Select the **Active Connection** checkbox.
6. Click **OK** to update the connection.
7. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

12.4.2 Choosing the Active Discussion for Discussions and Announcements Using WLST

Use the WLST command `setDiscussionForumConnection` with `default=true` to activate an existing connection. For command syntax and examples, see the section, "setDiscussionForumConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To disable a Discussions and Announcements connection, either delete it, make another connection the 'active connection', or use the `removeDiscussionForumServiceProperty` command:

```
removeDiscussionForumServiceProperty('appName='webcenter',
property='selected.connection')
```

Using this command, connection details are retained but the connection is no longer named as an active connection. For more information, see the section, "removeDiscussionForumServiceProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information see, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

12.5 Modifying Discussions Server Connection Details

You can modify WebCenter Discussion connection details at any time.

To start using the modified (active) connection you must restart the managed server on which the WebCenter application is deployed.

This section includes the following subsections:

- [Section 12.5.1, "Modifying Discussions Server Connection Details Using Fusion Middleware Control"](#)
- [Section 12.5.2, "Modifying Discussions Server Connection Details Using WLST"](#)

12.5.1 Modifying Discussions Server Connection Details Using Fusion Middleware Control

To update WebCenter Discussion connection details:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, choose **Discussions and Announcements**.
4. Select the connection name, and click **Edit**.
5. Edit connection details, as required. For detailed parameter information, see [Table 12-2](#) and [Table 12-4](#).
6. Click **OK** to save your changes.
7. To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments"](#).

12.5.2 Modifying Discussions Server Connection Details Using WLST

Use the WLST command `setDiscussionForumConnection` to edit connection details. For command syntax and examples, see the section, "setDiscussionForumConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

If additional parameters are required to connect to your Discussions server, use the `setDiscussionForumConnectionProperty` command. For more information, see the section, "setDiscussionForumConnectionProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

12.6 Deleting Discussions Server Connections

You can delete WebCenter Discussion connections at any time but take care when deleting the active connection. If you delete the active connection, none of the Discussions or Announcements task flows work, as they all require a back-end Discussions server.

This section includes the following subsections:

- [Section 12.6.1, "Deleting a Discussions Server Connection Using Fusion Middleware Control"](#)
- [Section 12.6.2, "Deleting a Discussions Server Connection Using WLST"](#)

12.6.1 Deleting a Discussions Server Connection Using Fusion Middleware Control

To delete a WebCenter Discussion connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Discussions and Announcements**.
4. Select the connection name, and click **Delete**.
5. To effect this change you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

Note: Before restarting the managed server, mark another connection as active; otherwise, the service is disabled.

12.6.2 Deleting a Discussions Server Connection Using WLST

Use the WLST command `deleteConnection` to remove a connection. For command syntax and examples, see the section, "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Ensure that another connection is marked active; otherwise, the service is disabled.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To effect this change you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

12.7 Setting Up Discussions Service Defaults

Use the WLST command `setDiscussionForumServiceProperty` to set defaults for the Discussions service:

- `topics.fetch.size`: Maximum number of topics fetched by the Discussions service and displayed in the topics view.
- `forums.fetch.size`: Maximum number of forums fetched by the Discussions service and displayed in the forums view.
- `recentTopics.fetch.size`: Maximum number of topics fetched by the Discussions service and displayed in the recent topics view.
- `watchedTopics.fetch.size`: Maximum number of topics fetched by the Discussions service and displayed in the watched topics view.
- `watchedForums.fetch.size`: Maximum number of forums fetched by the Discussions service and displayed in the watched forums view.
- `application.root.category.id`: Application root category ID on the Discussions server under which all discussion forums are stored. For example, if set to 3, all forums are stored inside category 3.
- `ForumGatewayManager.AUTO_START`: Mail communication through group space mail distribution lists of a mail server can be published as discussion forum posts on a Discussions server, as described in [Section 12.10.3, "Enabling Discussion Forums to Publish Group Space Mail."](#) This parameter starts or stops the gateway for this communication.

For WebCenter Spaces, the default value is `true`, which means that as soon as you configure mail server settings through WebCenter Spaces administration, the gateway starts. Set this to `false`, and restart the managed server, to stop the gateway and disable this feature.

For custom WebCenter applications, the default value is `false`. Set this to `true`, and restart the managed server, to start the gateway and enable this feature.

For command syntax and examples, see the section, "setDiscussionForumServiceProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

12.8 Setting Up Announcements Service Defaults

Use the WLST command `setAnnouncementServiceProperty` to set defaults for the Announcements service:

- `miniview.page_size`: Maximum number of announcements displayed in the Announcements sidebar view.
- `mainview.page_size`: Maximum number of announcements displayed in the Announcements main view.
- `linksview.page_size`: Maximum number of announcements displayed in the Announcements links view.
- `announcements.expiration.days`: Number of days that announcements display and remain editable.

For command syntax and examples, see the section, "setAnnouncementServiceProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

12.9 Testing Discussions Server Connections

Try accessing the Discussions server with the following URL:

```
http://host:port/owc_discussions
```

You should see a page listing all public information.

12.10 Setting Discussion Forum Options

Discussion forums allow group space members to capture, share, and preserve content that is relevant to their project or community goals.

As WebCenter Spaces administrator, you are responsible for setting discussion forum options through WebCenter Spaces Administration ([Figure 12–2](#)).

Figure 12–2 *Setting Discussion Forum Options*

From here, you can configure the following:

- [Section 12.10.1, "Specifying Where Discussions and Announcements are Stored on the Discussions Server"](#)
- [Section 12.10.2, "Setting Up a Default Group Space Discussion Forum"](#)
- [Section 12.10.3, "Enabling Discussion Forums to Publish Group Space Mail"](#)

Note: The Fusion Middleware administrator maintains the connection between WebCenter Spaces and the Discussions server. If you are experiencing issues with this connection, report the problem to the Fusion Middleware Administrator. See also, [Section 12.3, "Registering Discussions Servers."](#)

12.10.1 Specifying Where Discussions and Announcements are Stored on the Discussions Server

Administrators can change the root category (on the Discussions server) under which all WebCenter Spaces discussions and announcements are stored.

If the root category is not defined within the connection, then the default system root category is selected. You can choose a different location. This might be useful when WebCenter Spaces is connected to a Discussions server that is hosting discussion forums for multiple applications.

Oracle recommendations:

- Choose a category that is dedicated to this WebCenter Spaces application. There may be conflicts when multiple WebCenter Spaces applications share the same root category.
- Do not switch the root category after WebCenter Spaces is up and running. If you change the root category, then all the discussion forums under the old root continue to work, but you cannot use the Links service to create links to discussions or announcements stored in the old category.

Group spaces either own a category (supporting multiple forums) or a single forum under the root category that you specify. It is the group space's template that determines whether it can support multiple forums. For example:

- **Communities of Interest** - A subcategory is created under the root category for each new group space based on the Community of Interest template.
- **Group Projects** - As single forum is created under the root category for each new group space based on the Group Project template.
- **Group Spaces Based on Blank Templates** - By default, a single forum is created under the root category for each new group space based on the Blank template. Your systems administrator might override this if they feel that a sub category, that supports multiple forums, is more suitable. See also, [Section 12.3, "Registering Discussions Servers."](#)

To specify where WebCenter Spaces discussion forums are stored:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)
2. Click the **Administration** link at the top of the application.
3. Click the **Services** tab, and then select **Discussions**.
4. Specify an appropriate **Root Category** for storing WebCenter Spaces discussions.
Click the **Find** icon to view the categories available and then select the most appropriate location.

To create a new category especially for this WebCenter Spaces application, click **Create Category**. You must have system administrator permissions on the Discussions server to create new categories.

5. Click **Apply** to save the settings.

12.10.2 Setting Up a Default Group Space Discussion Forum

A default discussion forum is created for any group space based on the Community of Interest or Group Project template. This default forum is named after the group space.

Group spaces based on the Community of Interest template support multiple forums. You can choose your own name and description for the default forum in these group spaces or you can disable the default forums feature.

Note: Default forum properties do not apply to group spaces based on the Group Project template. Project-based group spaces offer a single discussion forum that is always available and named after the group space.

For example, even if the **Create Default Forum** option is deselected, then a default forum still is created for group spaces based on the Group Project template.

To set up or disable the default discussion forum for any group space based on the Community of Interest template:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)
2. Click the **Administration** link at the top of the application.
3. Click the **Services** tab, and then select **Discussions**.
4. Select **Create Default Forum** to provide a default forum in group spaces.

Deselect this option to disable this feature. Group space moderators and members with the `Discussions-Manage` permission can create a discussion forum when one is needed.

5. For default forums, enter a name and description:
 - a. Use **Forum Name** to specify a name for the default discussion forum.

To include the name of the parent group space in the forum name, use the syntax `{groupSpace.name}`.

For example: `General - {groupSpace.Photography}`

- b. Use **Forum Description** to create a description based on the group space's name, with the syntax `{groupSpace.description}`.

For example: `{groupSpace.This is a general discussion forum for the Photography group space.}`

A group space named 'Photography', has a default discussion forum with the following description: This is a general discussion forum for the Photography group space.

6. Click **Apply** to save the settings.

12.10.3 Enabling Discussion Forums to Publish Group Space Mail

Mail communication through group space distribution lists can be published as discussion forum posts. When an mail is new, a new topic is created for it. When an

mail is a reply to an existing mail, a topic reply is created for it. Emails sent to a group space distribution list get archived on the Discussions server in the group space's default forum.

To enable this feature in WebCenter Spaces, you must specify the mail server and mail account used to receive group space mail. WebCenter Spaces monitors mail sent to this account and publishes mail content on the appropriate group space discussion forum.

Note: Special formatting might be done by mail servers that is not handled well in Oracle WebCenter Discussions. As a result, you may see special tags (like <!DOCTYPE), or other tags might not appear.

To ensure mail is not missed, the user account that you specify must be a member of every group space mail distribution list; that is, the user must be listed as a *default user* on the LDAP directory server. Default users are configured using a mail server connection property called **LDAP Default User**; this property takes multiple user names. See, [Section 15.3, "Registering Mail Servers."](#)

After you set up the mail server and account to receive group space mail for all of WebCenter Spaces, the moderator of each group space determines which mail distribution list is monitored and which discussion forum is used to publish the group space mail. While it is possible for multiple group spaces to use the same distribution list, it is archived only once.

See also "Publishing Group Space Mail in a Discussion Forum" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

To configure the mail server to receive and store group space mail:

1. Log on to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)
2. Click the **Administration** link at the top of the application.
3. Click the **Services** tab, and then select **Discussions**.
4. Configure **Mail Settings**:
 - a. Enter the **User Name** and **Password** for the mail account used to receive group space mail. The user name and password are encrypted and stored in a secure store.

The specified user must be listed as a default user on the LDAP directory server. See [Section 15.3, "Registering Mail Servers."](#)
 - b. Enter the **Host** name and **Port** of the IMAP mail server used to receive group space mail.

Specify the mail server that is managing all group space distribution lists.
 - c. Enable or disable secure (encrypted) communication between WebCenter Spaces and the mail server.

If you enable this option, then the mail server must support SSL.
5. Click **Apply** to save the settings.

12.11 Granting Administrator Role for Oracle WebCenter Discussions Server

The default domain administrator created for Oracle WebCenter is also the administrator for Oracle WebCenter Discussions. You can make a nondefault user the administrator for Oracle WebCenter Discussions.

While creating a domain, if you specify any other user as the domain administrator, that user is granted all the domain administrative rights. However, after creating the domain, you must manually grant the administrator role to that nondefault user for WebCenter Spaces and Oracle WebCenter Discussions server. For information on how to grant administrator privileges to a nondefault user for WebCenter Spaces, see [Section 23.3.5, "Granting the WebCenter Spaces Administrator Role to a WebCenter Spaces User."](#)

For Oracle WebCenter Discussions, the default user is the super administrator. This section describes how to grant administrator privileges to a nondefault user.

12.11.1 Granting the Administrator Role

To grant the administrator role for Oracle WebCenter Discussions to a nondefault user:

1. Log on to the Jive Forum Admin Console as an administrator by using the following URL format: `http://host:port/owc_discussions/admin`.
2. Click the **Settings** link in the list of links across the top of the page.
3. Click the **Admins/Moderators** link, if not selected, in the navigation panel on the left.
4. On the **Admins & Moderators** page, click the **Grant New Permissions** tab.
5. Select the **System Admin** checkbox.
6. Select the **A Specific User** checkbox and specify the user to whom you want to grant administrative privilege for Oracle WebCenter Discussions.
7. Click **Grant New Permission**.

You can now log on to Oracle WebCenter Discussions as the user whom you have assigned the administrative privilege.

Figure 12–3 Granting the Administrator Role on Oracle WebCenter Discussions

Grant New Permissions

Permission Summary | Grant New Permissions

Follow the steps below to grant new user or group permissions: Note, it is not possible to set per Summary page.

- Choose the permissions: [\[select all\]](#)
 - System Admin
 - Category Admin
 - User Admin
 - Group Admin
 - Moderator
- Choose a user or group to grant the permissions to:
 - A Specific User: (enter username - separate multiple usernames with commas)
 - A Specific Group: (enter group name - separate multiple group names with commas)
- Done:

12.11.2 Revoking the Administrator Role

After assigning the administrator role to the required nondefault user, you may want to revoke the administrator role from the default user.

To revoke the administrator role:

- Log on to Jive Forum Admin Console as the nondefault user whom you have assigned the administrator role.
- Click the **Settings** link in the list of links across the top of the page.
- Click the **Admins/Moderators** link, if not selected, in the navigation panel on the left.
- On the Admins & Moderators page, under the **Permission Summary** tab, uncheck the **System Admin** checkbox for the required user, for example, **weblogic**. (Figure 12–4)

Figure 12–4 Revoking the Administrator Role

Permissions Summary

Permission Summary | Grant New Permissions

	System Admin	Category Admin	User Admin	Group Admin	Moderator	Remove
Users						
admin	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="button" value="X"/>
fmwadmin	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="button" value="X"/>
oc4jadmin	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="button" value="X"/>
orcladmin	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="button" value="X"/>
weblogic	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="button" value="X"/>
Groups						
No group permissions.						
						<input type="button" value="Save Changes"/> <input type="button" value="Cancel"/>

5. Click **Save Changes**.

The administrative privileges for managing Oracle WebCenter Discussions are now revoked from the default user.

You may want to change the default password of the default user. To change the password:

1. Log on to the Jive Forum Admin Console as an administrator.
2. On the Admins & Moderators page, under the **Permission Summary** tab, click the link for the user, for example, **weblogic**.
3. On the User Profile page, click the **edit user settings** link.
4. Click the **Change Password** link. (Figure 12–5)

Figure 12–5 Changing Password

User Summary: weblogic

View and edit user properties using the form below. Other useful information is provided as well such as last post time and group memberships.

» [Change Password](#) » [View Messages](#) » [User Email Notifications](#) » [User Properties](#)
 » [Delete User](#)

User Properties	
User ID:	12
Username:	weblogic
Password:	Change Password
Posts:	95

5. Enter the new password in the **New Password** and **Confirm Password** fields.
6. Click **Change Password**.

12.12 Troubleshooting Issues with Announcements and Discussions

This troubleshooting section includes the following subsections:

- [Section 12.12.1, "Discussions Cannot Be Enabled in Group Spaces"](#)
- [Section 12.12.2, "Login Does Not Function Properly After Configuring Oracle Access Manager"](#)
- [Section 12.12.3, "Category Not Found Exceptions"](#)

12.12.1 Discussions Cannot Be Enabled in Group Spaces

Problem

Discussions cannot be enabled in any group space, even new group spaces.

Solution

This error may be caused due to various reasons. Check the following:

- Oracle WebCenter Discussions server is up and running and accessible. See [Section 12.9, "Testing Discussions Server Connections."](#)
- Administrator User Name (`adminUser`) property configured for the active connection has administrative privileges on the application root category (the

category configured for the WebCenter Spaces). See [Section 12.3, "Registering Discussions Servers."](#)

It is not necessary for this user to be a `super admin`. However, the user must have administrative privileges on the application root category configured for the WebCenter Spaces, that is, the category (on the Discussions server) under which all group space discussions and announcement are stored.

- Application root category, where all group space discussions and announcement are stored, exists on the back-end server.

You can check the application root category ID configured for the WebCenter Spaces application by navigating WebCenter Administration, selecting **Services**, and then **Discussions**. See [Section 12.10.1, "Specifying Where Discussions and Announcements are Stored on the Discussions Server."](#)

12.12.2 Login Does Not Function Properly After Configuring Oracle Access Manager

Problem

When you log in to the Oracle WebCenter Discussions server after configuring Oracle Access Manager single sign-on, a `500 - Internal Server Error` occurs.

Solution

This error occurs if the LDAP back-end is configured for the Discussions server and you add a new `SSOAuthFactory` property to configure single sign-on instead of editing the existing property.

Go to the Administration page and remove `LDAP AuthFactory` and `single sign-on AuthFactory` properties. If needed, run the following SQL to restore the correct value:

```
insert into jiveproperty
values ('AuthFactory.className', 'oracle.jive.security.JpsAuthFactory');
```

Consider the following when configuring Oracle Access Manager single sign-on:

- If the Discussions server *is not* configured with the `LDAP AuthFactory` property, then you must add a new property to configure single sign-on:

```
AuthFactory.className=oracle.jive.security.JpsAuthFactory
```

- If the Discussions server *is* configured with an `LDAP AuthFactory`, then you must edit the `AuthFactory.className` property while configuring single sign-on and set it to:

```
oracle.jive.security.JpsAuthFactory
```

- Property values are case-sensitive.

12.12.3 Category Not Found Exceptions

Problem

If you change the connection to use a different Discussions server, and if you change the application root category ID from `administrator-services-discussions`, then you could see exceptions like, "Category Not Found."

Solution

Restart the managed server on which the WebCenter application is deployed.

Managing the Events Service

This chapter describes how to configure and manage the Events service for WebCenter Spaces.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter Spaces.

Any changes that you make to WebCenter applications, post deployment, are stored in MDS metadata store as customizations. See [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

Note: Changes that you make to WebCenter services configuration, through Fusion Middleware Control or using WLST, are not dynamic so you must restart the managed server on which the WebCenter application is deployed for your changes to take effect. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

This chapter includes the following sections:

- [Section 13.1, "What You Should Know About Events Connections"](#)
- [Section 13.2, "Events Service Prerequisites"](#)
- [Section 13.3, "Registering Events Servers"](#)
- [Section 13.4, "Choosing the Active Events Server Connection"](#)
- [Section 13.5, "Modifying Events Server Connection Details"](#)
- [Section 13.6, "Deleting Event Server Connections"](#)
- [Section 13.7, "Testing Event Server Connections"](#)
- [Section 13.8, "Troubleshooting Issues with Events"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

13.1 What You Should Know About Events Connections

The Events service provides group calendars that you can use to schedule meetings, appointments, and any other type of team or group occasion. The Events service also

provides you with a personal calendar where you can schedule events that are not related to a particular group space.

Note: The Events service is available only in WebCenter Spaces, not in custom WebCenter applications.

Personal calendars are available through a Microsoft Exchange Server, therefore a connection to that server is required.

You can register the Microsoft Exchange Server connection through the Fusion Middleware Control Console or using WLST.

You must mark a connection as active for the service to work. You can register additional Microsoft Exchange Server connections, but only one connection is active at a time.

To view personal events in WebCenter Spaces, the user must have an account on the Microsoft Exchange Server.

13.2 Events Service Prerequisites

This section includes the following subsections:

- [Section 13.2.1, "Microsoft Exchange Server 2007 Prerequisites"](#)
- [Section 13.2.2, "Microsoft Exchange Server 2003 Prerequisites"](#)

13.2.1 Microsoft Exchange Server 2007 Prerequisites

This section describes the Microsoft Exchange Server 2007 prerequisites when used as the server for the Events service.

This section includes the following subsections:

- [Section 13.2.1.1, "Microsoft Exchange Server 2007 - Installation"](#)
- [Section 13.2.1.2, "Microsoft Exchange Server 2007 - Configuration"](#)
- [Section 13.2.1.3, "Microsoft Exchange Server 2007 - Security Considerations"](#)
- [Section 13.2.1.4, "Microsoft Exchange Server 2007 - Limitations"](#)

13.2.1.1 Microsoft Exchange Server 2007 - Installation

Refer to the Microsoft Exchange Server 2007 documentation for installation information.

13.2.1.2 Microsoft Exchange Server 2007 - Configuration

To use Microsoft Exchange Server 2007 as the server for the Events service, you must edit the Microsoft Exchange Server 2007 web service WSDL to specify the location of the web service.

To specify the location of the Microsoft Exchange Server 2007 web service:

1. Open the WSDL file for the Microsoft Exchange Server web service, for example:

```
C:\Program Files\Microsoft\Exchange  
Server\ClientAccess\exchweb\ews\Services.wsdl
```

2. Add a service section that points to your Microsoft Exchange Server web service, for example:

```
<wsdl:definitions>
...
  <wsdl:service name="ExchangeServices">
    <wsdl:port name="ExchangeServicePort" binding="tns:ExchangeServiceBinding">
      <soap:address location="https://machine.example.com/EWS/Exchange.asmx"/>
    </wsdl:port>
  </wsdl:service>
</wsdl:definitions>
```

13.2.1.3 Microsoft Exchange Server 2007 - Security Considerations

The Events service includes a Microsoft Exchange Server 2007 adapter that communicates with the Microsoft Exchange Server 2007 generic web service through a JAX-WS proxy. To set up the communication between the adapter and the web service, you must edit the Microsoft Exchange Server security settings.

To edit security settings:

1. On the Microsoft Exchange Server, open Internet Information Services (IIS) Manager.
2. Under Node *machine_name* > Web Sites > Default Web Site > EWS, click **Properties**.
3. On the **Directory Security** tab, in the Authentication and access control, click **Edit**.
4. Select **Basic authentication**.
5. Click **OK**.

You must enable anonymous access to *Services.wsdl*, *Messages.vsd*, and *Types.vsd* so that JAX-WS can access them to create the service port before committing any web service call.

6. Right-click **Services.wsdl** and choose **Edit**.
7. On the **File Security** tab, in the Authentication and access control, click **Edit**.
8. Select **Enable anonymous access**.
9. Click **OK**.
10. Repeat steps 6 through 9 for **Messages.xsd** and **Types.xsd**.

The Events service uses Basic Authentication to communicate with the Microsoft Exchange Server. To secure the communication, you should enable SSL. For more information, see:

<http://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/56bdf977-14f8-4867-9c51-34c346d48b04.msp?mfr=true>

13.2.1.4 Microsoft Exchange Server 2007 - Limitations

There are currently no known limitations.

13.2.2 Microsoft Exchange Server 2003 Prerequisites

This section describes the Microsoft Exchange Server 2003 prerequisites when used as the server for the Events service.

This section includes the following subsections:

- [Section 13.2.2.1, "Microsoft Exchange Server 2003 - Installation"](#)
- [Section 13.2.2.2, "Microsoft Exchange Server 2003 - Configuration"](#)
- [Section 13.2.2.3, "Microsoft Exchange Server 2003 - Security Considerations"](#)
- [Section 13.2.2.4, "Microsoft Exchange Server 2003 - Limitations"](#)

13.2.2.1 Microsoft Exchange Server 2003 - Installation

Refer to the Microsoft Exchange Server 2003 documentation for installation information.

13.2.2.2 Microsoft Exchange Server 2003 - Configuration

Microsoft Exchange Server 2003 does not provide a web service, so to use Microsoft Exchange Server 2003 as the server for the Events service, you must install the WebCenter Personal Events Web Service Plug-in on the IIS machine. The plug-in is available on the Companion CD.

To install the WebCenter Personal Events Web Service Plug-in:

1. Extract the contents of the `ExchangeWebService.zip` file to a folder on the machine where Microsoft Exchange Server is installed. You can find the ZIP file in the following directory on the Oracle Fusion Middleware companion CD:

```
/Disk1/WebCenter/services/cal/NT/ExchangeWebService.zip
```

2. Open Internet Information Services (IIS) Manager.
3. Under Node *machine_name* > **Web Sites** > **Default Web Site**, create a new virtual directory called `ExchangeWS`.
4. Point the new virtual directory to the folder to which you extracted the ZIP file.
5. Make sure the folder has **Read** privileges.
6. Right-click the virtual directory and choose **Properties**.
7. On the **Virtual Directory** tab, under Application settings, click **Create**.
8. Set the **Execute permissions** to **Scripts and Executables**.
9. On the **ASP.NET** tab, ensure that the **ASP.NET version** is **2.0.XXXXX**.
10. Click **Edit Configuration**.
11. In the ASP .NET Configuration Settings dialog, make sure the **ExchangeServerURL** has the correct value, for example:

```
http://localhost:port/Exchange/user/calendar
```

Change the port, if necessary, to reflect the IIS port number.

12. Apply the changes and close the dialog.
13. Create a folder called `C:\WSErrorLogs`.
14. Test the web service by launching a web browser and going to the following URL:

```
http://localhost/ExchangeWS/PersonalEventsWebService.asmx
```

13.2.2.3 Microsoft Exchange Server 2003 - Security Considerations

The Events service uses Basic Authentication to communicate with the Microsoft Exchange Server. To secure the communication, you should enable SSL. For more information, see:

<http://www.microsoft.com/technet/prodtechnol/WindowsServer2003/Library/IIS/56bdf977-14f8-4867-9c51-34c346d48b04.mspx?mfr=true>

13.2.2.4 Microsoft Exchange Server 2003 - Limitations

There are currently no known limitations.

13.3 Registering Events Servers

You can register multiple events servers for a WebCenter application but only one is active at a time.

To start using a new (active) connection you must restart the managed server on which the WebCenter application is deployed.

This section includes the following subsections:

- [Section 13.3.1, "Registering Events Servers Using Fusion Middleware Control"](#)
- [Section 13.3.2, "Registering Event Servers Using WLST"](#)

13.3.1 Registering Events Servers Using Fusion Middleware Control

To register an events server with WebCenter applications:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces. For more information, see [Section 6.2, "Navigating to the Home Page for WebCenter Spaces."](#)
2. From the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Personal Events**.
4. To connect to a new events server instance, click **Add** ([Figure 13-1](#)).

Figure 13-1 Configuring Events Connections

Add Personal Events Connection ? OK Cancel

Name

* Connection Name

* Connection Type

Active Connection

Connection Details

* Web Service URL

* Associated External Application

5. Enter a unique name for this connection, specify the version of Microsoft Exchange Server, and indicate whether this connection is the active (or default) connection for the application ([Table 13-1](#)).

Table 13–1 Personal Events Connection - Name

Field	Description
Connection Name	Enter a unique name for the connection. The name must be unique (across all connection types) within the WebCenter application.
Connection Type	Choose the version of the Microsoft Exchange Server to connect to. Select one of the following: <ul style="list-style-type: none"> ■ Microsoft Exchange Server 2003 ■ Microsoft Exchange Server 2007
Active Connection	Select to use this connection in the WebCenter application for the Events service. While you can register multiple events server connections, only one connection is used by the Events service—the default (or active) connection.

6. Enter connection details for the events server ([Table 13–2](#)).

Table 13–2 Personal Events - Connection Details

Field	Description
Web Service URL	Enter the URL of the Web service exposing the event application. Use the format: protocol://host:port/appWebServiceInterface/WSName For example http://myexchange.com:80/ExchangeWS/PersonalEventsWebService.asmx http://myexchange.com:80/EWS/Services.wsdl
Associated External Application	Associate the events service with an external application. External application credential information is used to authenticate users against the Microsoft Exchange Server hosting events services.

7. Click **OK** to save this connection.
8. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

13.3.2 Registering Event Servers Using WLST

Use the WLST command `createPersonalEventConnection` to create an events service connection. Use `setPersonalEventConnection` to alter an existing connection. For command syntax and examples, see the sections, "createPersonalEventConnection" and "setPersonalEventConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. See, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

13.4 Choosing the Active Events Server Connection

You can register multiple events server connections with WebCenter Spaces but only one connection is active at a time.

This section includes the following subsections:

- [Section 13.4.1, "Choosing the Active Events Server Using Fusion Middleware Control"](#)
- [Section 13.4.2, "Choosing the Active Events Server Connection Using WLST"](#)

13.4.1 Choosing the Active Events Server Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces. For more information, see [Section 6.2, "Navigating to the Home Page for WebCenter Spaces."](#)
2. From the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Personal Events**.

The Manage Personal Events Connections table indicates the current active connection (if any).

4. Select the connection you want to make the active (or default) connection, and then click **Edit**.
5. Select the **Active Connection** checkbox.
6. Click **OK** to update the connection.
7. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

13.4.2 Choosing the Active Events Server Connection Using WLST

Use the WLST command `setPersonalEventConnection` with `default=true` to activate an existing events connection. For command syntax and examples, see the section, "setPersonalEventConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To subsequently disable an events connection, run the same WLST command with `default=false`. Connection details are retained but the connection is no longer named as an active connection.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the active connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

13.5 Modifying Events Server Connection Details

You can modify events server connection details at any time.

To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed.

This section includes the following subsections:

- [Section 13.5.1, "Modifying Events Server Connection Details Using Fusion Middleware Control"](#)
- [Section 13.5.2, "Modifying Events Server Connection Details Using WLST"](#)

13.5.1 Modifying Events Server Connection Details Using Fusion Middleware Control

To update connection details for an events server:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces. For more information, see [Section 6.2, "Navigating to the Home Page for WebCenter Spaces."](#)
2. From the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Personal Events**.
4. Select the connection name, and click **Edit**.
5. Edit connection details, as required. For detailed parameter information, see [Table 13-2](#).
6. Click **OK** to save your changes.
7. To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

13.5.2 Modifying Events Server Connection Details Using WLST

Use the WLST command `setPersonalEventConnection` to edit an existing events server connection. For command syntax and examples, see the section, "setPersonalEventConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

13.6 Deleting Event Server Connections

You can delete events server connections at any time but take care when deleting the active connection. If you delete the active connection, users cannot create events in their personal calendar.

This section includes the following subsections:

- [Section 13.6.1, "Deleting Event Server Connections Using Fusion Middleware Control"](#)
- [Section 13.6.2, "Deleting Event Server Connections Using WLST"](#)

13.6.1 Deleting Event Server Connections Using Fusion Middleware Control

To delete an events server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces. For more information, see [Section 6.2, "Navigating to the Home Page for WebCenter Spaces."](#)
2. From the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From list of services on the WebCenter Service Configuration page, select **Personal Events**.
4. Select the connection name, and click **Delete**.
5. To effect this change you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

13.6.2 Deleting Event Server Connections Using WLST

Use the WLST command `deleteConnection` to remove an events server connection. For command syntax and examples, see the section, "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

13.7 Testing Event Server Connections

To confirm the connection to the event servers:

1. In WebCenter Spaces, create a page in your personal space.
2. Add the Events task flow to the page.
3. Log in to your Microsoft Exchange Server account.
4. Your personal events from Microsoft Exchange Server should display in the task flow.

13.8 Troubleshooting Issues with Events

If users cannot see their personal events, verify the following:

- Is the Microsoft Exchange Server/IIS server is accessible from the managed server on which the WebCenter application is deployed? Can they ping each other?
- Is the configuration correct on the Microsoft Exchange Server? For more information, see [Section 13.2.1.2, "Microsoft Exchange Server 2007 - Configuration"](#) or [Section 13.2.2.2, "Microsoft Exchange Server 2003 - Configuration."](#)
- Is the events server connection correct in the managed server. For more information, see [Section 13.3, "Registering Events Servers."](#)
- Did the user enter the correct user name and password for the account on the Microsoft Exchange Server.

Managing the Instant Messaging and Presence Service

This chapter describes how to configure and manage the Instant Messaging and Presence (IMP) service for WebCenter Spaces and custom WebCenter applications.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter applications. Any changes that you make to WebCenter applications, post deployment, are stored in MDS metadata store as customizations. See [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

Note: Changes that you make to WebCenter services configuration, through Fusion Middleware Control or using WLST, are not dynamic so you must restart the managed server on which the WebCenter application is deployed for your changes to take effect. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

This chapter includes the following sections:

- [Section 14.1, "What You Should Know About Instant Messaging and Presence Connections"](#)
- [Section 14.2, "Instant Messaging and Presence Server Prerequisites"](#)
- [Section 14.3, "Registering Instant Messaging and Presence Servers"](#)
- [Section 14.4, "Choosing the Active Connection for Instant Messaging and Presence"](#)
- [Section 14.5, "Modifying Instant Messaging and Presence Connection Details"](#)
- [Section 14.6, "Deleting Instant Messaging and Presence Connections"](#)
- [Section 14.7, "Setting Up Instant Messaging and Presence Service Defaults"](#)
- [Section 14.8, "Testing Instant Messaging and Presence Connections"](#)
- [Section 14.9, "Troubleshooting Issues with Instance Messaging and Presence"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

14.1 What You Should Know About Instant Messaging and Presence Connections

The IMP service enables you to observe the presence status of other authenticated application users (online, offline, busy, or away) and provides instant access to interaction options, such as phone calls, instant messages (IM), and mails.

A single connection to a back-end presence server is required.

WebCenter is certified with Microsoft Office Live Communications Server (LCS) 2005, and it can integrate with other presence servers. Oracle WebLogic Communications Services (OWLCS) 11g is available for download on Oracle Technology Network (OTN) at <http://www.oracle.com/technology/index.html>. For information on OWLCS installation, see *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

Note: To add or remove buddies to your account, you must use the LCS/OWLCS client. In WebCenter applications you can see buddies but you cannot add or remove buddies. For more information, see the *Oracle WebLogic Communication Services Administrator's Guide*.

You can register the presence server connection for your WebCenter application through the Fusion Middleware Control Console or using WLST. You must mark a connection as active for the service to work. You can register additional presence server connections, but only one connection is active at a time.

14.2 Instant Messaging and Presence Server Prerequisites

This section includes the following subsections:

- [Section 14.2.1, "Microsoft Live Communications Server \(LCS\) Prerequisites"](#)
- [Section 14.2.2, "Oracle WebLogic Communications Server \(OWLCS\) Prerequisites"](#)

14.2.1 Microsoft Live Communications Server (LCS) Prerequisites

This section describes the Microsoft Live Communications Server 2005 (LCS) prerequisites as the presence server for the Instant Messaging and Presence service

This section includes the following subsections:

- [Section 14.2.1.1, "LCS - Installation"](#)
- [Section 14.2.1.2, "LCS - Configuration"](#)
- [Section 14.2.1.3, "LCS - Security Considerations"](#)
- [Section 14.2.1.4, "LCS - Limitations"](#)

14.2.1.1 LCS - Installation

Refer to the Microsoft Live Communications Server 2005 documentation for installation information.

14.2.1.2 LCS - Configuration

To use Microsoft Live Communications Server 2005 as the presence server for the Instant Messaging and Presence service, you must install the Oracle RTC Web service for Microsoft LCS 2005.

To install the Oracle RTC Web service for Microsoft Live Communications Server 2005:

1. Extract the `owc_lcs.zip` file from the Oracle Fusion Middleware companion CD. It is located in the directory `/Disk1/WebCenter/services/imp/NT`. The zip file contains the following:

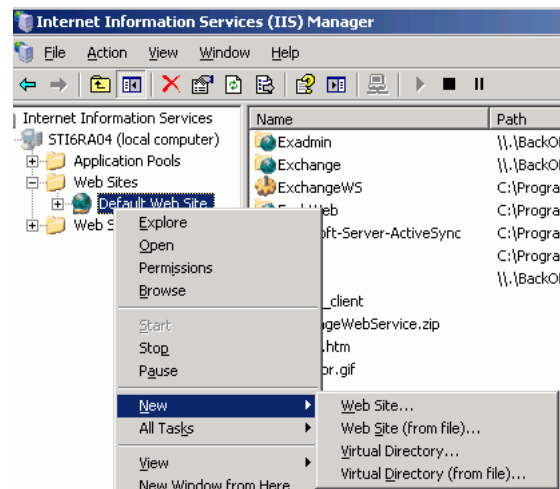

```

/Bin
/images
ApplicationConfigurationService.asmx
BlafPlus.css
ExtAppLogin.aspx
ExtAppLogin.aspx.cs
Global.asax
Log4Net.config
RTCService.asmx
Web.Config
WebcenterTemplate.master

```

2. Open the Internet Information Services (IIS) Manager.
3. Expand the server node and then **Web Sites** in the Internet Information Services (IIS) Manager window.
4. Right-click **Default Web Site**, choose **New**, and then select **Virtual Directory** to create a site for the Oracle RTC Web service, as shown in [Figure 14-1](#). The Virtual Directory Creation Wizard displays.

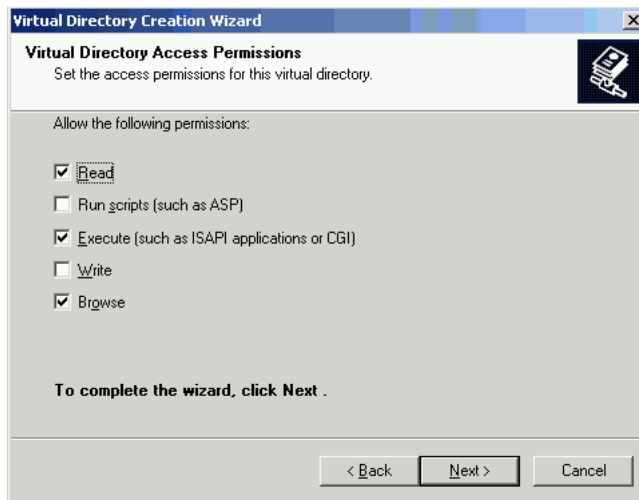

Figure 14-1 Creating a Virtual Directory

5. Click **Next**.
6. Enter an alias for the virtual directory in the **Alias** field, for example **RTC**.
7. Enter the path to the directory where you extracted the `owc_lcs.zip` file. Alternatively, use the **Browse** button to navigate to that directory.
8. Click **Next**.

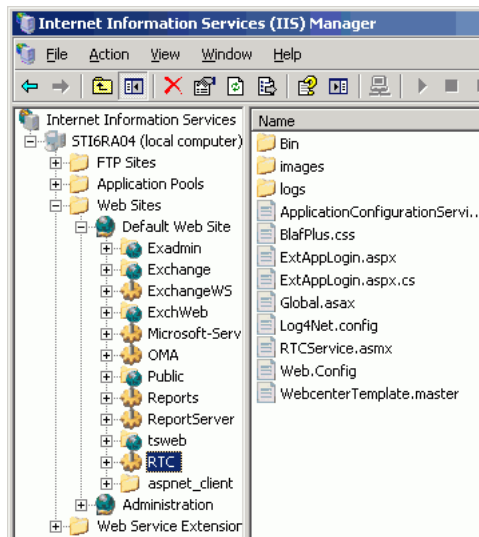

- Ensure that the virtual directory has the Read, Execute, and Browse privileges. (Figure 14-2)

Figure 14-2 Virtual Directory Properties

- Click **Next**.
- Click **Finish**. The newly created virtual directory appears under **Default Web Site** in the Internet Information Services (IIS) Manager window (Figure 14-3).

Figure 14-3 Adding a Virtual Directory

- Right-click the newly created virtual directory for the Oracle RTC Web service, and then choose **Properties** to open the Properties dialog.
- In the Virtual Directory tab, under **Application settings**, click **Create**. Notice that the button label changes to **Remove**, and the name of your newly created virtual directory appears in the **Application name** field.
- Select **Scripts and Executables** from the **Execute permissions** dropdown list (Figure 14-4).

Figure 14–4 Virtual Directory Properties

15. Under the **ASP.NET** tab, select the ASP.NET version as 2.0 or higher from the **ASP.NET version** dropdown list. IIS should be configured to consume ASP.NET 2.0 applications.
16. Click **OK**.
17. Ensure that the LSC pool name in the LCS connection has been set.
18. Test the Web service by accessing the Web site from the following URL format:

```
http://localhost/default_website/ApplicationConfigurationService.asmx
```

Where *default_website* refers to the virtual directory that you created for the Oracle RTC Web service.

For example:

```
http://localhost/RTC/ApplicationConfigurationService.asmx
```

14.2.1.3 LCS - Security Considerations

You must configure an external application for Microsoft Live Communications Server connections so that users can supply credentials to authenticate themselves on the LCS server.

With a secured application, users get buddies and presence status. With LCS, if security is required, then LCS should be on a private trusted network.

LCS provides an option for changing external credentials, which works as an alternative to using an external application. A logged-in user can click any Presence tag and select **Change Credentials** from the menu.

For more information, see [Section 14.3.1, "Registering Instant Messaging and Presence Servers Using Fusion Middleware Control."](#)

14.2.1.4 LCS - Limitations

WebCenter applications do not support phone conferencing.

14.2.2 Oracle WebLogic Communications Server (OWLCS) Prerequisites

For OWLCS prerequisites, see the *Oracle WebLogic Communication Services Installation Guide*.

This section includes the following subsections:

- [Section 14.2.2.1, "OWLCS - Installation"](#)
- [Section 14.2.2.2, "OWLCS - Configuration"](#)
- [Section 14.2.2.3, "OWLCS - Security Considerations"](#)
- [Section 14.2.2.4, "OWLCS - Limitations"](#)

14.2.2.1 OWLCS - Installation

For detailed OWLCS installation instructions, see the *Oracle WebLogic Communication Services Installation Guide*.

14.2.2.2 OWLCS - Configuration

OWLCS supports both identity propagation and external application-based connections. Oracle recommends using identity propagation for OWLCS connections, since additional security can be set with WS-Security.

OWLCS and the WebCenter application should point to the same LDAP-based identity store. If the OWLCS server and the WebCenter application use different LDAP-based identity stores, then you must configure an external application for the connection so that users can supply credentials to authenticate themselves on the OWLCS server.

For information on reassociating the WebCenter applications identity store, see [Section 23.3, "Configuring the Identity Store."](#)

If necessary, reconfigure OWLCS to use the same identity store. For more information, see the *Oracle WebLogic Communication Services Administrator's Guide*.

14.2.2.3 OWLCS - Security Considerations

If the OWLCS server is running with WS-Security enabled, then the administrator must set the `policyURI` parameter in the presence server connection.

If WS-Security is not required, then the administrator should disable WS-Security on the OWLCS server.

For more information, see [Section 23.8.4, "Securing Oracle WebLogic Communication Services \(OWLCS\) with WS-Security"](#) and [Section 23.6.10, "Securing the WebCenter Spaces Connection to OWLCS with SSL."](#)

14.2.2.4 OWLCS - Limitations

With OWLCS, user creation and deletion is manual. Any time a new user is added to (or removed from) the application's identity store, the same user must be created in (or removed from) the OWLCS user store.

Each OWLCS user has a watcher list, which is a list of the other users allowed to see his presence. This watcher list must be under 125 KB (approximately 400 users). In WebCenter, the presence of all users must be visible, even if they are not buddies of the logged-in user. To get their presence, WebCenter creates a new account on OWLCS with the group space GUID and adds this new user as a watcher of the visible users. In other words, each member of a group space has an entry of that group space GUID in his watcher list. A problem can arise when a user is part of many group spaces.

Because the watcher list contains entries for each group space, its size can grow greater than 125KB. When that happens, updates to the watcher list are rejected, giving the user a "Subscription Request" popup with that scope GUID. If this happens, then the user should just cancel the subscription request.

14.3 Registering Instant Messaging and Presence Servers

You can register multiple presence server connections with a WebCenter application but only one of them is active at a time.

To start using the new (active) presence server you must restart the managed server on which the WebCenter application is deployed.

This section includes the following subsections:

- [Section 14.3.1, "Registering Instant Messaging and Presence Servers Using Fusion Middleware Control"](#)
- [Section 14.3.2, "Registering Instant Messaging and Presence Servers Using WLST"](#)

14.3.1 Registering Instant Messaging and Presence Servers Using Fusion Middleware Control

To register a presence server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, choose **Instant Messaging and Presence**.
4. To connect to a new presence server, click **Add** ([Figure 14-5](#)).

Figure 14-5 *Configuring Instant Messaging and Presence Services*

Manage Instant Messaging and Presence Connections

 Add  Edit  Delete			
Name	Connection Type	Server URL	Active Connection
No Data Available			

- Enter a unique name for this connection, specify the presence server type, and indicate whether this connection is the active (or default) connection for the application (Table 14-1).

Table 14-1 Instant Messaging and Presence Connection - Name

Field	Description
Name	Enter a unique name for the connection. The name must be unique (across all connection types) within the WebCenter application.
Connection Type	Specify the type of presence server: <ul style="list-style-type: none"> ■ LCS - Microsoft Live Communication Server ■ OWLCS - Oracle WebLogic Communications Server Out-of-the-box, two presence connection types are available—LCS and OWLCS.
Active Connection	Select to use this connection in the WebCenter application for instant messaging and presence services. While you can register multiple presence server connections for a WebCenter application, only one connection is used by the IMP service—the default (or active) connection.

- Enter connection details for the server hosting instant messaging and presence services (Table 14-2).

Table 14-2 Instant Messaging and Presence Connection - Connection Details

Field	Description
Server URL	Enter the URL of the sever hosting instant messaging and presence services. For example: <code>http://myowlcshost.com:8888</code>
Domain	Enter the domain associated with this connection. The domain specified is used to construct each user's IM ID. For example, if the domain is <code>oracle.com</code> and presence is requested for user with name <code>john</code> , then the IM address resolved is <code>john@oracle.com</code> . If the user IM address must be resolved from the Oracle Internet Directory/LDAP server, then specify the user profile attribute that provides the IM address here as <code>profile:<attribute></code> where <code>profile</code> is a keyword and <code>attribute</code> is the user profile attribute name where the IM address is stored. For example, <code>profile:primarySipAddress</code> . WebCenter and the presence server should share the same Oracle Internet Directory/LDAP. The IM ID for OWLCS and LCS is the SIP ID; that is, <code>sip:john@oracle.com</code> . SIP is short for Session Initiation Protocol - an Internet protocol for live communication between people.
Connection Timeout (in seconds)	Specify a suitable timeout for the connection. This is the length of time (in seconds) the WebCenter application waits for a response from the presence server before issuing a connection timeout message. The default is -1 which means that the service default is used. The service default is 10 seconds.

Table 14–2 (Cont.) Instant Messaging and Presence Connection - Connection Details

Field	Description
Associated External Application	<p>Associate the instant messaging and presence server with an external application. External application credential information is used to authenticate users against the instant messaging and presence server.</p> <p>An external application is mandatory for LCS server connections.</p> <p>You can select an existing external application from the list, or click Create New to configure a new external application.</p> <p>The external application you configure for the Instant Messaging and Presence service must use the <code>POST</code> authentication method, and specify an additional field named <code>Account</code> (Name property) that is configured to <code>Display to User</code> (checked). For more information, see Chapter 22, "Managing External Applications."</p>
Authentication Method	<p>(OWLCS Only) Specify how to authenticate users against the instant messaging and presence server. Select from:</p> <ul style="list-style-type: none"> ▪ Identity Propagation - Select this option if you want the application and OWLCS to use the same user identity. ▪ External Application - Use an external application to authenticate users against the instant messaging and presence server. Select this option to use public, shared, or mapped credentials. <p>If an external application is used for authentication, use the Associated External Application list to identify the application. If the application you want is not listed, select Create New... to define the external application.</p>
Policy URI	<p>(OWLCS Only) Specify the URI to the WS-Security policy that is required for authentication on the Oracle WebLogic Communication Server. Specify <code>oracle/wss11_saml_token_with_message_protection_client_policy</code> when OWLCS is WS-Security enabled.</p>
LCS Pool Name	<p>(LCS Only) Enter the name of the Microsoft Live Communication Server pool used for this connection. The pool name is mandatory for LCS connections.</p> <p>See the Microsoft Live Communication Server documentation for details on the pool name.</p>

7. Sometimes, additional parameters are required to connect to the presence server.

If WS-Security is enabled on this connection, add a property named `recipient.alias` and enter the alias used to import the OWLCS certificate. Ensure that this value is unique and is not used by some other service. If no alias name is supplied, then the default value is used (`webcenter_owlcs`).

[Table 14–3](#) lists additional parameters.

Table 14–3 Additional IMP Connection Properties

Additional Connection Property	Description
<code>presence.url</code>	<p>(OWLCS only) URL to the OWLCS Presence service.</p> <p>Required if the OWLCS Presence service is deployed on a separate node. When no value is specified, the <code>Server URL</code> property is used.</p>

Table 14–3 (Cont.) Additional IMP Connection Properties

Additional Connection Property	Description
<i>contacts.url</i>	(OWLCS only) URL to the OWLCS Contact Management service. Required if the OWLCS Contact Management service is deployed on a separate node. When no value is specified, the <code>Server URL</code> property is used.
<i>call.url</i>	(OWLCS only) URL to the OWLCS Third Party Call service. Required if the OWLCS Third Party Call service is deployed on a separate node. When no value is specified, the <code>Server URL</code> property is used.
<i>call.method</i>	(OWLCS only) Third party call method. Valid values are: <code>sip</code> and <code>pstn</code> . The default value is <code>sip</code> . When set to <code>sip</code> , the IMP service forwards the user's SIP address to the third-party call service. The third-party call service must decide on the routing of the call. If it is set to <code>pstn</code> , then the user's phone number is based on the user's profile attribute (<code>BUSINESS_PHONE</code>). This default profile attribute (<code>BUSINESS_PHONE</code>) can be changed to any other attribute with the connection property <code>call.number.attribute</code> .
<i>call.domain</i>	(OWLCS only) Domain name of the PSTN gateway. Required when the <code>call.method</code> is <code>pstn</code> .
<i>contact.number.attribute</i>	(OWLCS only) User profile attribute used to store users' phone numbers. The default attribute is <code>BUSINESS_PHONE</code> . Required when the <code>call.method</code> is <code>pstn</code> .
<i>primary.domain</i>	(OWLCS and LCS) User domain. This property is required when WebCenter user names are qualified with a domain. For example, when user names are <code>xyz@example.com</code> , the <code>primary.domain</code> is <code>example.com</code> . This property is used by <code>IMPAddressResolver</code> to resolve user names to sip-address, and vice-versa. If this property is not supplied, then there could be inconsistencies in the resolver functions, which can affect IMP service performance.

If additional parameters are required to connect to the presence server, expand **Additional Properties** and enter details as required ([Table 14–4](#)).

Table 14–4 Instant Messaging and Presence Connection - Additional Properties

Field	Description
Add	Click Add to specify an additional connection parameter: <ul style="list-style-type: none"> ■ Name -Enter the name of the connection property. ■ Value - Enter the default value for the property. ■ Is Property Secured - Indicate whether encryption is required. When selected, the property value is stored securely using encryption. For example, select this option to secure the <code>admin.password</code> property where the value is the actual password.

Table 14–4 (Cont.) Instant Messaging and Presence Connection - Additional Properties

Field	Description
Delete	Click Delete to remove a selected property. Select the correct row before clicking Delete . Note: Deleted rows appear disabled until you click OK .

8. Click **OK** to save this connection.
9. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

14.3.2 Registering Instant Messaging and Presence Servers Using WLST

Use the WLST command `createIMPConnection` to create a presence server connection. For command syntax and examples, see the section, "createIMPConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

To configure the Instant Messaging and Presence service to actively use a new IMP connection, set `default=true`. For more information, see [Section 14.4.2, "Choosing the Active Connection for Instant Messaging and Presence Using WLST."](#)

Note: To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

14.4 Choosing the Active Connection for Instant Messaging and Presence

You can register multiple instant messaging and presence server connections with a WebCenter application but only one connection is active at a time.

For WebCenter Spaces and any custom WebCenter application, the *active connection* becomes the back-end presence server for the Buddies task flow.

This section includes the following subsections:

- [Section 14.4.1, "Choosing the Active Connection for Instant Messaging and Presence Using Fusion Middleware Control"](#)
- [Section 14.4.2, "Choosing the Active Connection for Instant Messaging and Presence Using WLST"](#)

14.4.1 Choosing the Active Connection for Instant Messaging and Presence Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Instant Messaging and Presence**.

The Manage Instant Messaging and Presence Connections table indicates the current active connection (if any).
4. Select the connection you want to make the active (or default) connection, and then click **Edit**.
5. Select the **Active Connection** checkbox.
6. Click **OK** to update the connection.
7. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

14.4.2 Choosing the Active Connection for Instant Messaging and Presence Using WLST

Use the WLST command `setIMPConnection` with `default=true` to activate an existing presence server connection. For command syntax and examples, see the section, "setIMPConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To disable a presence server connection, either delete it, make another connection the 'active connection' or use the `removeIMPServiceProperty` command:

```
removeIMPServiceProperty('appName='webcenter', property='selected.connection')
```

Using this command, connection details are retained but the connection is no longer named as an active connection. For more information, see the section, "removeIMPServiceProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using this active connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

14.5 Modifying Instant Messaging and Presence Connection Details

You can modify instant messaging and presence server connection details at any time.

To start using an updated (active) connection you must restart the managed server on which the WebCenter application is deployed.

This section includes the following subsections:

- [Section 14.5.1, "Modifying Instant Messaging and Presence Connections Details Using Fusion Middleware Control"](#)
- [Section 14.5.2, "Modifying Instant Messaging and Presence Connections Details Using WLST"](#)

14.5.1 Modifying Instant Messaging and Presence Connections Details Using Fusion Middleware Control

To update connection details for an instant messaging and presence server:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Instant Messaging and Presence**.
4. Select the connection name, and click **Edit**.
5. Edit connection details, as required. For detailed parameter information, see [Table 14–2, "Instant Messaging and Presence Connection - Connection Details"](#).
6. Click **OK** to save your changes.
7. To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

14.5.2 Modifying Instant Messaging and Presence Connections Details Using WLST

Use the WLST command `setIMPConnection` to edit presence server connection details. For command syntax and examples, see the section, "setIMPConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

If additional parameters are required to connect to your presence server, then use the `setIMPConnectionProperty` command. For more information, see the section, "setIMPConnectionProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

14.6 Deleting Instant Messaging and Presence Connections

You can delete instant messaging and presence connections at any time but take care when deleting the active connection. If you delete the active connection, Buddies task flows does not work and user presence options are not available, as these require a back-end instant messaging and presence server.

When you delete a connection, consider deleting the external application associated with the instant messaging and presence service *if* the application's sole purpose was to support this service. For more information, see [Section 22.5, "Deleting External Application Connections."](#)

This section includes the following subsections:

- [Section 14.6.1, "Deleting Instant Messaging and Presence Connections Using Fusion Middleware Control"](#)
- [Section 14.6.2, "Deleting Instant Messaging and Presence Connections Using WLST"](#)

14.6.1 Deleting Instant Messaging and Presence Connections Using Fusion Middleware Control

To delete an instant messaging and presence server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Instant Messaging and Presence**.
4. Select the connection name, and click **Delete**.
5. To effect this change you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

Note: Before restarting the managed server, mark another connection as active; otherwise, the service is disabled.

14.6.2 Deleting Instant Messaging and Presence Connections Using WLST

Use the WLST command `deleteConnection` to remove a presence server connection. For command syntax and examples, see the section, "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

14.7 Setting Up Instant Messaging and Presence Service Defaults

Use the WLST command `setIMPServiceProperty` to set defaults for the IMP service:

- `selected.connection`: Connection used by the Instant Messaging and Presence service.
- `rtc.cache.time`: Cache timeout for instant messaging and presence data.
- `resolve.display.name.from.user.profile`: Whether the display name of the user should be resolved by making an LDAP lookup. Valid values are `true` and `false`. If enabled (`true`), then the IMP service makes an LDAP lookup to find each user's display name. This should be enabled only when the same LDAP store is used for both WebCenter and the presence server. If different LDAP servers are used, then irrelevant information may display. This property can impact performance.

For command syntax and detailed examples, see the section, "setIMPServiceProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

14.8 Testing Instant Messaging and Presence Connections

To verify an OWLCS connection, try accessing the endpoint for the following Web services. For example:

- `protocol://host:port/PresenceConsumerService/services/PresenceConsumer`
- `protocol://host:port/PresenceSupplierService/services/PresenceSupplier`
- `protocol://host:port/ThirdPartyCallService/services/ThirdPartyCall`
- `protocol://host:port/services`

To verify an LCS connection, try accessing the endpoint for the WebCenter RTC Web services deployed on it. For example (assuming the application context path is `/RTC`):

- `protocol://host/RTC/ApplicationConfigurationService.asmx`
- `protocol://host/RTC/RTCService.asmx`

These Web services expose a set of Web methods that you can invoke to test the validity.

14.9 Troubleshooting Issues with Instance Messaging and Presence

This section contains troubleshooting tips for the IMP service.

Problem

Buddies are not visible in a custom WebCenter application. Further, the presence status of users is not available.

Solution

Ensure the following:

- IMP connection is configured properly and the base URL and domain values are correct. See [Section 14.3, "Registering Instant Messaging and Presence Servers."](#)
- Web Services for the presence server is installed properly and is up and running. For Web Services installation for Oracle WebLogic Communications Server, see the *Oracle WebLogic Communication Services Administrator's Guide*. For Web Services installation for Microsoft Live Communications Server, see [Section 10.2.2.2, "Microsoft Live Communications Server \(LCS\) Prerequisites."](#)
- Back-end presence server (Oracle WebLogic Communications Server or Microsoft Live Communications Server) is up and running. A quick way to verify this is to ensure that the user can connect to the communication server by using a supported SIP client (Oracle Communicator or Microsoft Communicator).
- User is logged in with valid user credentials and the user exists on the communication server. For Microsoft LCS, verify that user has provided correct credentials in the external application.

Managing the Mail Service

This chapter describes how to configure and manage the Mail service for WebCenter Spaces and custom WebCenter applications. It also describes how to configure the "Send Mail" feature, which allows application resources to send mail directly from them. The Send Mail feature does not require the Mail service. That is, even if the Mail service has not been configured in your application, users can send mail notifications with the local mail client. For more information on using the Send Mail notifications, see the section "What You Should Know About the Send Mail Feature" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter applications. Any changes that you make to WebCenter applications, post deployment, are stored in MDS metadata store as customizations. See [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

Note: Changes that you make to WebCenter services configuration, through Fusion Middleware Control or using WLST, are not dynamic so you must restart the managed server on which the WebCenter application is deployed for your changes to take effect. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

This chapter includes the following sections:

- [Section 15.1, "What You Should Know About Mail Server Connections"](#)
- [Section 15.2, "Mail Server Prerequisites"](#)
- [Section 15.3, "Registering Mail Servers"](#)
- [Section 15.4, "Choosing the Active \(or Default\) Mail Server Connection"](#)
- [Section 15.5, "Modifying Mail Server Connection Details"](#)
- [Section 15.6, "Deleting Mail Server Connections"](#)
- [Section 15.7, "Setting Up Mail Service Defaults"](#)
- [Section 15.8, "Testing Mail Server Connections"](#)
- [Section 15.9, "Setting Send Mail Notifications"](#)
- [Section 15.10, "Troubleshooting Issues with Mail"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server

Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

15.1 What You Should Know About Mail Server Connections

WebCenter supports the Microsoft Exchange Server or any mail server that supports IMAP4 and SMTP. To enable WebCenter users to access mail within a WebCenter application and perform basic operations such as read, reply, and forward, you must first register the appropriate mail server with the WebCenter application. The Mail service is not configured out-of-the-box.

You can register multiple mail server connections:

- **WebCenter Spaces** supports multiple mail connections. The mail connection marked *active* is the default connection for mail services in WebCenter Spaces. All additional connections are offered as alternatives; WebCenter Spaces users can choose which one they want to use through user preferences.
- **Custom WebCenter applications** only use one mail connection—the connection marked *active*. Any additional connections are ignored.

15.2 Mail Server Prerequisites

This section includes the following subsections:

- [Section 15.2.1, "Mail Server - Installation"](#)
- [Section 15.2.2, "Mail Server - Configuration"](#)
- [Section 15.2.3, "Mail Server - Security Considerations"](#)
- [Section 15.2.4, "Mail Server - Limitations"](#)

15.2.1 Mail Server - Installation

See your mail server documentation for installation information.

15.2.2 Mail Server - Configuration

You can allow WebCenter to create and manage group space distribution lists in WebCenter Spaces (or in custom WebCenter applications leveraging WebCenter Spaces group space management). This feature is supported only with Microsoft Exchange. The group space distribution list is created automatically whenever a group space is created. Users added or removed from the group space are implicitly added or removed from the corresponding group space distribution list, provided users created on Microsoft Exchange Active Directory correspond with users created in the identity store used by the WebCenter application. To disable this feature, do not enter the LDAP (Active Directory) server details in the mail connection. For more information, see step 7 of [Section 15.3.1, "Registering Mail Servers Using Fusion Middleware Control."](#)

For information about adding users on a mail server, see the mail server's product documentation. For information about adding users to the WebCenter application's identity store, see [Section 23.3, "Configuring the Identity Store."](#)

Microsoft Exchange 2007 is the only mail server for which there are configuration prerequisites. If you are working with a different mail server (including Microsoft Exchange 2003), then you can skip the rest of this section.

15.2.2.1 Configuring Microsoft Exchange Server 2007 for WebCenter

The Microsoft Exchange Server 2007 certificate must be added to the WebCenter keystore. This requires the following steps.

1. [Section 15.2.2.1.1, "Obtain the Certificate from the Microsoft Exchange Server 2007."](#)
2. [Section 15.2.2.1.2, "Add the Certificate to the WebCenter Keystore."](#)
3. Restart the server after the certificate is imported.

15.2.2.1.1 Obtain the Certificate from the Microsoft Exchange Server 2007 Obtain the certificate from your mail server installation administrator. This section describes one way to get the certificate from the Microsoft Exchange Server 2007.

Follow these steps to obtain the certificate from a Microsoft Exchange 2007 server.

1. Open a browser and connect to your IMAP server with the following command:

```
https://host_name/owa
```

Where *host_name* is the name of the Microsoft Exchange Server 2007.

2. Place your cursor on the page, right-click, and select **Properties**, then click **Certificate**.
3. In the popup window, click the **Details** tab, and click **Copy to File...**
Be sure to use the DER encoded binary (X.509) format, and copy to a file.
4. Convert the .DER format certificate to .PEM format.

Note: WebLogic only recognizes .PEM format.

Use Firefox 3.0 or later to download the certificate directly to .PEM format. For other browsers, use the WebLogic Server `der2pem` tool to convert to .PEM format. For more information about `der2pem` see the *Oracle Fusion Middleware Command Reference for Oracle WebLogic Server*.

15.2.2.1.2 Add the Certificate to the WebCenter Keystore

1. Import the downloaded certificate into the keystore, which is generally the file named `cacerts` in the `JAVA_HOME`. For example:

```
keytool -import -alias imap_cer -file cert_file.cer -keystore cacerts
-storepass changeit
```

Where `cert_file` is the name of the certificate file you downloaded. In a standard installation, the `JAVA_HOME` is in the following location:

```
/scratch/wcinstall/ps2/1225/wlshome/jrockit_160_17_R28.0.0-616
```

See [Section 23.7.3.2.2, "Generating and Registering Certificates,"](#) for information about adding the certificate to the keystore.

2. Restart the server.

15.2.2.1.3 Microsoft Exchange Server Considerations

- The IMAP port is 993 and secured true. SMTP port is 587 and secured true. (Microsoft Exchange Server 2005 used 465.)

- If you see the following error, then you must change the trust store entry in the domain startup file `setDomainEnv.sh`:

```
Caused by: java.io.IOException: Keystore was tampered with, or password was
incorrect
    at sun.security.provider.JavaKeyStore.engineLoad(JavaKeyStore.java:771)
    at sun.security.provider.JavaKeyStore$JKS.engineLoad(JavaKeyStore.java:38)
    at java.security.KeyStore.load(KeyStore.java:1185)
    at com.sun.net.ssl.internal.ssl.TrustManagerFactoryImpl.getCacertsKeyStore
(TrustManagerFactoryImpl.java:202)
    at com.sun.net.ssl.internal.ssl.DefaultSSLContextImpl.getDefaultTrustManager
(DefaultSSLContextImpl.java:70)
```

To change the entry:

- a. Shutdown the managed server on which WebCenter is deployed.
- b. Edit the domain startup script `setDomainEnv` located at:

Unix: `DOMAIN_HOME/bin/setDomainEnv.sh`

Windows: `DOMAIN_HOME\bin\setDomainEnv.cmd`

- c. Add the Java property, as follows:

```
-Djavax.net.ssl.trustStore=<path to truststore>
-Djavax.net.ssl.trustStorePassword=<truststore password>
```

For example:

```
set JAVA_PROPERTIES=-Dplatform.home=%WL_HOME% -Dwls.home=%WLS_HOME%
-Dweblogic.home=%WLS_HOME%
-Djavax.net.ssl.trustStore=C:\jive\mailtool\jssecacerts
-Djavax.net.ssl.trustStorePassword=changeit
```

- d. Restart the managed server.

15.2.3 Mail Server - Security Considerations

For more information, see [Section 23.6.8, "Securing the WebCenter Spaces Connection to IMAP and SMTP with SSL."](#)

Note: If LDAP is configured to run in secure mode, then add the LDAP Secured property (set to `true/false`) to use LDAP while creating distribution lists. For more information, see [Table 15-3](#).

15.2.4 Mail Server - Limitations

In WebCenter Spaces, the Mail service requires a Microsoft Exchange mail server connection to enable automatic group space distribution lists.

15.3 Registering Mail Servers

You can register multiple mail server connections. To start using the new mail connections you must restart the managed server on which the WebCenter application is deployed.

This section includes the following subsections:

- [Section 15.3.1, "Registering Mail Servers Using Fusion Middleware Control"](#)

- [Section 15.3.2, "Registering Mail Servers Using WLST"](#)

15.3.1 Registering Mail Servers Using Fusion Middleware Control

To register a mail server with WebCenter applications:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Mail Server**.
4. To connect to a new mail server, click **Add** ([Figure 15-1](#)).

Figure 15-1 *Configuring Mail Servers*

Manage Mail Server Connections			
Name	IMAP Host	SMTP Host	Active Connection
MailConnection	stport13.idc.oracle.com	stport13.idc.oracle.com	✓

5. Enter a unique name for this connection, and indicate whether this connection is the active (or default) connection for the application ([Table 15-1](#)).

Table 15-1 *Mail Server Connection - Name*

Field	Description
Name	Enter a unique name for the connection. The name must be unique (across all connection types) within the WebCenter application.

Table 15–1 (Cont.) Mail Server Connection - Name

Field	Description
Active Connection	<p>Select to indicate whether this connection is the default (or active) connection for the Mail service.</p> <p>You can register multiple mail server connections:</p> <ul style="list-style-type: none"> ▪ WebCenter Spaces supports multiple mail connections. The mail connection marked <i>active</i> is the default connection for mail services in WebCenter Spaces. All additional connections are offered as alternatives; WebCenter Spaces users can choose which one they want to use through user preferences. ▪ Custom WebCenter applications only use one mail connection—the connection marked <i>active</i>. Any additional connections are ignored.

6. Enter connection details for the mail server (Table 15–2).

Table 15–2 Mail Server Connection Parameters

Field	Description
IMAP Host	Enter the host name of the computer where the IMAP (Internet Message Access Protocol) service is running.
IMAP Port	Enter the port on which the IMAP service listens.
IMAP Secured	Indicate whether a secured connection (SSL) is required for incoming mail over IMAP.
SMTP Host	Enter the host name of the computer where the SMTP (Simple Mail Transfer Protocol) service is running.
SMTP Port	Enter the port on which the SMTP service listens.
SMTP Secured	Indicate whether a secured connection (SSL) is required for outgoing mail over SMTP.
Associated External Application	<p>(Mandatory) Associate the mail server with an external application. External application credential information is used to authenticate users against the IMAP and SMTP servers. The Mail service uses the same credentials to authenticate the user on both IMAP and SMTP.</p> <p>You can select an existing external application from the list, or click Create New to configure a new external application.</p> <p>The external application you configure for the Mail service must use the <code>POST</code> authentication method, and specify an additional field named <code>Email Address</code> (Name property) that is configured to <code>Display to User</code> (checked). For more information, see Chapter 22, "Managing External Applications."</p> <p>If your WebCenter application offers a self-registration page with the facility to mail user ID information on request, then you must ensure that public credentials are configured for the external application selected here. If public credentials are <i>not</i> defined, then mails cannot be sent to users on their request. WebCenter Spaces offers this feature on its self-registration page.</p>

7. Specify LDAP connection details for the Active Directory server managing group space distribution lists (Table 15–3).

This section applies to WebCenter Spaces (or custom WebCenter applications leveraging the WebCenter Spaces group space management feature). WebCenter

applications support Microsoft Exchange where distribution lists are managed on an Active Directory server.

Note: Active Directory server details must be provided as part of the mail connection for *group space distribution lists* to work.

Table 15–3 LDAP Directory Server Configuration Parameters

Field	Description
LDAP Host	Enter the host name of the computer where the LDAP directory server (Lightweight Directory Access Protocol) is running.
LDAP Port	Enter the port on which the LDAP directory server listens.
LDAP Base DN	Enter the base distinguished name for the LDAP schema. For example, CN=Users, DC=oracle, DC=com.
LDAP Domain	Enter the domain to be appended to distribution list names. In WebCenter Spaces, for example, if the domain value is set to <code>example.com</code> , then the Finance Project group space maintains a distribution list named <code>FinanceProject@example.com</code> .
LDAP Administrator User Name	Enter the user name of the LDAP directory server administrator. A valid user with privileges to make entries into the LDAP schema.
LDAP Administrator Password	Enter the password for the LDAP directory server administrator. The password is stored in a secured store.
LDAP Default User	Enter a comma-delimited list of user names to whom you want to grant moderation capabilities. These users become members of every group space distribution list that is created. The users specified must exist in the base LDAP schema (specified in the LDAP Base DN field).
LDAP Secured	Indicate whether a secured connection (SSL) is required between the WebCenter application and the LDAP directory server.

8. Configure advanced options for the mail server connection ([Table 15–4](#)).

Table 15–4 Mail Server Connection - Advanced Configuration

Field	Description
Connection Timeout (in Seconds)	Specify a suitable timeout for the connection. This is the length of time (in seconds) the WebCenter application waits for a response from the mail server before issuing a connection timeout message. The default is -1, which means that the service default is used. The service default is 10 seconds.

9. Optionally, you add can more parameters to the mail server connection ([Table 15–5](#)).

Table 15–5 Additional Mail Connection Properties

Additional Connection Property	Description
Various IMAP properties	<p>Any valid IMAP connection property. For example, <code>mail.imap.connectionpoolsize</code>.</p> <p>For a list of valid protocol properties, see your mail server documentation. For a list of standard IMAP properties, see the Java Mail APIs:</p> <p>http://java.sun.com/products/javamail/javadocs/com/sun/mail/imap/package-summary.html</p>
Various SMTP properties	<p>Any valid SMTP connection property. For example, <code>mail.smtp.timeout</code>.</p> <p>For a list of valid protocol properties, see your mail server documentation. For a list of standard SMTP properties, see the Java Mail APIs:</p> <p>http://java.sun.com/products/javamail/javadocs/com/sun/mail/smtp/package-summary.html</p>

If additional parameters are required to connect to the mail server, expand **Additional Properties** and enter details as required (see [Table 15–6, "Mail Connection - Additional Properties"](#)).

Table 15–6 Mail Connection - Additional Properties

Field	Description
Add	<p>Click Add to specify an additional connection parameter:</p> <ul style="list-style-type: none"> ▪ Name -Enter the name of the connection property. ▪ Value - Enter the default value for the property. ▪ Is Property Secured - Indicate whether encryption is required. When selected, the property value is stored securely using encryption. <p>For example, select this option to secure the <code>admin.password</code> property where the value is the actual password.</p>
Delete	<p>Click Delete to remove a selected property.</p> <p>Select the correct row before clicking Delete.</p> <p>Note: Deleted rows appear disabled until you click OK.</p>

10. Click **OK** to save this connection.

11. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

15.3.2 Registering Mail Servers Using WLST

Use the WLST command `createMailConnection` to create a mail server connection. For command syntax and examples, see the section, "createMailConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To configure the Mail service to use the new mail server connection as its default connection, set `default=true`. For more information, see [Section 15.4.2, "Choosing the Active \(or Default\) Mail Server Connection Using WLST."](#)

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using new connections you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

15.4 Choosing the Active (or Default) Mail Server Connection

You can register multiple mail server connections with a WebCenter application but only one connection can be designated as the default connection.

For WebCenter Spaces and custom WebCenter applications, the *default connection* becomes the back-end mail server for:

- Mail task flows
- Group space distribution lists
- Anywhere there is a **Send Mail** icon

This section includes the following subsections:

- [Section 15.4.1, "Choosing the Active \(or Default\) Mail Server Connection Using Fusion Middleware Control"](#)
- [Section 15.4.2, "Choosing the Active \(or Default\) Mail Server Connection Using WLST"](#)

15.4.1 Choosing the Active (or Default) Mail Server Connection Using Fusion Middleware Control

To change the default connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Mail Server**.

The Manage Mail Server Connections table indicates the current active connection (if any).

4. Select the connection you want to make the active (or default) connection, and then click **Edit**.
5. Select the **Active Connection** checkbox.
6. Click **OK** to update the connection.
7. To start using the new default connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

15.4.2 Choosing the Active (or Default) Mail Server Connection Using WLST

Use the WLST command `setMailConnection` with `default=true` to make an existing mail server connection the default connection for the Mail service. For command syntax and examples, see the section, "setMailConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

A connection does not cease to be the default connection for the Mail service if you change the default argument from `true` to `false`.

To disable a mail connection, either delete it, make another connection the 'active connection', or use the `removeMailServiceProperty` command:

```
removeMailServiceProperty(appName='webcenter', property='selected.connection')
```

Using this command, connection details are retained but the connection is no longer named as an active connection. For more information, see the section, "removeMailServiceProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the active connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

15.5 Modifying Mail Server Connection Details

You can modify mail server connection details at any time.

To start using updated mail connections you must restart the managed server on which the WebCenter application is deployed.

This section includes the following subsections:

- [Section 15.5.1, "Modifying Mail Server Connection Details Using Fusion Middleware Control"](#)
- [Section 15.5.2, "Modifying Mail Server Connection Details Using WLST"](#)

15.5.1 Modifying Mail Server Connection Details Using Fusion Middleware Control

To update mail server connection details:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Mail Server**
4. Select the connection name, and click **Edit**.
5. Edit connection details, as required. For detailed parameter information, see [Table 15–2, "Mail Server Connection Parameters"](#).
6. Click **OK** to save your changes.
7. To start using updated connection details you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

15.5.2 Modifying Mail Server Connection Details Using WLST

Use the WLST command `setMailConnection` to edit existing mail server connection details. For command syntax and examples, see the section, "setMailConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

If additional parameters are required to connect to your mail server, use the `setMailConnectionProperty` command. For more information, see the section, "setMailConnectionProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the updated connections you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

15.6 Deleting Mail Server Connections

You can delete mail server connections at any time but take care when deleting the active (or default) connection. If you delete the active connection, Mail task flows do not work, as they all require a back-end mail server.

When you delete a connection, consider deleting the external application associated with the mail server connection *if* the application's sole purpose was to support this

connection. For more information, see [Section 22.5, "Deleting External Application Connections."](#)

This section includes the following subsections:

- [Section 15.6.1, "Deleting a Mail Connection Using Fusion Middleware Control"](#)
- [Section 15.6.2, "Deleting a Mail Connection Using WLST"](#)

15.6.1 Deleting a Mail Connection Using Fusion Middleware Control

To delete a mail server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Mail Server**.
4. Select the connection name, and click **Delete**.
5. To effect this change you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

Note: Before restarting the managed server, mark another connection as active; otherwise, the service is disabled.

15.6.2 Deleting a Mail Connection Using WLST

Use the WLST command `deleteConnection` to remove a mail server connection. For command syntax and examples, see the section, "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

15.7 Setting Up Mail Service Defaults

Use the WLST command `setMailServiceProperty` to set defaults for the Mail service:

- `mail.messages.fetch.size`: Maximum number of messages displayed in mail inboxes
- `resolve.email.address.to.name`

For command syntax and examples, see the section, "setMailServiceProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

15.8 Testing Mail Server Connections

Confirm that the mail server is up by connecting to the server using any client, such as Thunderbird or Outlook.

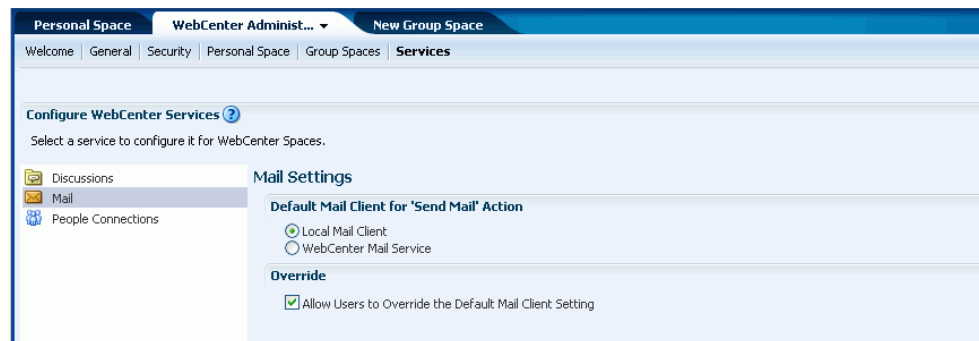

For Microsoft Exchange, go to **Administrative Tools - Services** to confirm that the following services are running (Status: Started):

- Microsoft Exchange IMAP4
- Simple Mail Transfer Protocol (SMTP)

15.9 Setting Send Mail Notifications

As the WebCenter Spaces administrator, you are responsible for setting mail options through WebCenter Spaces Administration ([Figure 15-2](#)).

Figure 15-2 *Setting Mail Options*

From this page, you can assign the mail client for the "Send Mail" feature. This feature allows application resources to send mail directly from them, with the **Send Mail** icon ([Figure 15-3](#)).

Figure 15-3 *Send Mail Icon*

For example, from an announcement, users can click the **Send Mail** icon to open a mail window prepopulated with information including the announcement text, author, date created, and location. They can edit and add to the mail, as necessary. The way the mail window is prepopulated depends on the resource sending it. For example, from your Buddies list, users can click the **Send Mail** icon to open a mail window prepopulated only with the address of that person.

With group spaces, the mail can be addressed to the individual members of the group space, and, if the group space is configured with a distribution list, then it can be addressed to the distribution list. Group space moderators select the default for Send Mail actions (whether mails should be addressed to a distribution list, or individual member mail addresses, or both, or none) on the **Settings - Services - Mail** page.

Note: When the **Send Mail** icon is clicked from a group space with a large number of members, length restrictions may prevent the local mail client from prepopulating the addresses of all group space members. The user gets an error and must enter the addresses manually. To avoid this error, configure a distribution list for the group space.

For all Send Mail notifications throughout WebCenter, you can choose to use either a local mail client or the WebCenter Mail service. The local mail client is the default. The Send Mail feature does not require the Mail service. That is, even if the Mail service has not been configured in your application, you can use the Send Mail feature with your local mail client.

The local mail (mailto) client allows plain text editing of the mail, but it does not allow attachments. Due to the limitations with the mailto URL (used for launching the local mail client), the text could be truncated.

The WebCenter Mail service launches the Mail Compose window. Although users cannot edit the prepopulated HTML (shown as the `content.html` attachment), they can view the prepopulated attachment, add other attachments, and add plain text to the compose window. If the WebCenter Mail service has not been configured in your application, then this option does not appear on the page.

You can select the checkbox to enable users to override the default mail client setting.

Note: The Fusion Middleware administrator maintains the connection between WebCenter Spaces and the mail server. If you are experiencing issues with this connection, report the problem to the Fusion Middleware Administrator. See also, [Section 15.3, "Registering Mail Servers."](#)

15.10 Troubleshooting Issues with Mail

This section includes the following subsections:

- [Section 15.10.1, "Mail Service is Not Accessible in Secure Mode"](#)
- [Section 15.10.2, "Mail Service is Not Accessible in Non-Secure Mode"](#)
- [Section 15.10.3, "Unable to Create Distribution Lists in the Non-Secure Mode"](#)
- [Section 15.10.4, "Unable to Create Distribution Lists in the Secure Mode"](#)
- [Section 15.10.5, "Unable to Configure the Number of Mails Downloaded"](#)
- [Section 15.10.6, "Unable to Publish and Archive Group Space Mail"](#)
- [Section 15.10.7, "Changing Passwords on Microsoft Exchange"](#)

15.10.1 Mail Service is Not Accessible in Secure Mode

Problem

You configured the Mail service to function in secure mode, but the service is not accessible.

Solution

Ensure the following:

- IMAP and SMTP ports are specified correctly. See [Section 15.3, "Registering Mail Servers."](#)
- Properties are set to `true` in your mail server.
 - `mail.imap.Secured = true`
 - `mail.smtp.Secured = true`

15.10.2 Mail Service is Not Accessible in Non-Secure Mode

Problem

You configured the Mail service to function in non-secure mode, but the service is not accessible.

Solution

Ensure the following:

- IMAP and SMTP ports are specified correctly. See, [Section 15.3, "Registering Mail Servers."](#)
- Properties are set to `false` in your mail server.
 - `mail.imap.Secured = false`
 - `mail.smtp.Secured = false`

15.10.3 Unable to Create Distribution Lists in the Non-Secure Mode

Problem

You are unable to create group space distribution lists in non-secure mode (SSL not configured).

Solution

Check if the mail server has been reinstalled or the user has been deleted. Also ensure that the following parameters are configured accurately in non-secure mode, in the LDAP server:

- `ldapHost`
- `defaultUser`
- `ldapAdminPassword`
- `ldapBaseDN`
- `ldapPort`

See [Section 15.3, "Registering Mail Servers."](#)

15.10.4 Unable to Create Distribution Lists in the Secure Mode

Problem

You are unable to create group space distribution list in secure mode, that is, SSL is configured on the LDAP server.

Solution

Check if the mail server has been reinstalled or the user has been deleted. Also ensure that the following parameters are configured accurately in secure mode, in the LDAP server:

- ldapHost
- defaultUser
- ldapAdminPassword
- ldapBaseDN
- ldapPort
- ldap.connection.secure, 'true'

See [Section 15.3, "Registering Mail Servers."](#)

15.10.5 Unable to Configure the Number of Mails Downloaded

Problem

You cannot configure how many mails are downloaded to each user's Inbox.

Solution

Use the `setMailServiceProperty WLST` command. For example, to download 100 mails from the mail client, specify the `mail.messages.fetch.size` parameter as 100, as shown in the following example:

```
setMailServiceProperty(appName='webcenter', property='mail.messages.fetch.size',
value='100')
```

For command syntax and examples, see "setMailServiceProperty" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

15.10.6 Unable to Publish and Archive Group Space Mail

Problem

You are unable to archive group space mail.

Solution

If the archiving fails, check the following:

- In WebCenter Spaces, open WebCenter Administration pages, navigate to the Services tab, and then choose Discussions. Check whether the required configuration is accurate. See also, [Section 12.10.3, "Enabling Discussion Forums to Publish Group Space Mail."](#)
- Check whether the user account configured here is a member of the distribution list.
- For a particular group space, check whether the forum configured is available in the discussions server. See "Publishing Group Space Mail in a Discussion Forum" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.
- Check whether the user who sends mails to the distribution list is available in the discussions server and his mail address is the same.

15.10.7 Changing Passwords on Microsoft Exchange

Problem

If multiple users log on to Microsoft Exchange with the same user name and password, and then one user changes the password, the original password remains valid until all users log off.

For example, say the current password of the user monty is welcome1. Two users, A and B, log on from different clients using either WebCenter or Microsoft Exchange. Both log on as monty/welcome1, and both are able to see the mails. Now user A changes the password in Microsoft Exchange to oracle1. Because there currently are clients using the passwords oracle1 and welcome1, both are valid passwords; that is, new users can log on as monty/welcome1 and still see the mails.

Solution

After all existing users with the original password log off, the new password takes effect. Until then, users can use both passwords to log on.

Managing the People Connections Service

This chapter describes how to set application defaults for the People Connections service in WebCenter Spaces. You must log in to WebCenter Spaces with administrative privileges to set any of the application-wide properties described here.

This chapter includes the following sections:

- [Section 16.1, "What You Should Know About Administering the People Connections Service"](#)
- [Section 16.2, "People Connections Prerequisites"](#)
- [Section 16.3, "Configuring the People Connections Service in WebCenter Spaces"](#)
- [Section 16.4, "Troubleshooting Issues with the People Connections Service"](#)

Audience

The contents of this chapter is intended for WebCenter Spaces application administrators. Application administrators are users who are granted the WebCenter Spaces Administrator role or a custom role that grants the Application-Manage permission. Users with Application-Configure and Manage People Connections permission can also administer people connections.

Note: The application skin determines the look and feel of your application. The application skin used for the screenshots in this chapter may not be the same as the application skin selected for your application; therefore, the look and feel of your application is likely to differ from that depicted in the screenshots in this chapter. However, the features depicted in the screenshots are the same.

16.1 What You Should Know About Administering the People Connections Service

People Connections administrative settings are useful for controlling all users' initial views of People Connections features, including:

- Activity Stream—A summary view of user activity
- Connections—Users who have agreed to be a given user's connections
- Profile—A summary of user information
- Message Board—A place for posting and receiving messages
- Feedback—A place for posting and receiving feedback

Use the People Connections administrative settings to enforce the values you specify or to enable users to override these values with their own People Connections Preferences (for more information, see the "Setting People Connections Preferences" section in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*).

Setting default values on the **WebCenter Administration** page affects all users' views of People Connections features. There are a few other levels at which these values can be set, and these setting levels are subject to an order of precedence:

- Administrative settings affect all users' views of People Connections features.
- Preferences settings affect the view of the user who set them, and they override administrative settings.
- Settings on a particular task flow affect just that task flow instance, and they override Preference settings:
 - Values set in edit mode (customization) affect all users' views of the task flow instance.
 - Values set in view mode (personalization) affect only that user's view of the task flow instance, and they override task flow customizations.

16.2 People Connections Prerequisites

No special set up is required to enable users to access the People Connections service. For the most part, the People Connections service stores information in the WebCenter Repository, which is a database with the WebCenter schema installed. The WebCenter schema is included with the product. To install the WebCenter schema, follow the steps described in the section, "Installing Oracle WebCenter" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

For Profile information, all but three attributes are stored and read from the LDAP identity store that is configured against WebCenter Spaces. The three exceptions include: the profile photo, status message, and expertise. These are stored with other WebCenter data in the WebCenter Repository.

See Also: For information about WebCenter Spaces and the LDAP identity store, see [Section 23.3, "Configuring the Identity Store."](#)

16.3 Configuring the People Connections Service in WebCenter Spaces

This section steps you through the process of setting application-wide values for People Connections features. It includes the following subsections:

- [Section 16.3.1, "Accessing People Connections Administrative Settings"](#)
- [Section 16.3.2, "Configuring Activity Stream"](#)
- [Section 16.3.3, "Configuring Connections"](#)
- [Section 16.3.4, "Configuring Profile"](#)
- [Section 16.3.5, "Configuring Message Board"](#)
- [Section 16.3.6, "Configuring Feedback"](#)

16.3.1 Accessing People Connections Administrative Settings

To access People Connections administrative settings:

1. Log in to WebCenter Spaces using your administrative user name and password.

2. Click the **Administration** link at the top of the application (Figure 16–1) to open the WebCenter Administrator Center page.

Figure 16–1 Administration Link at the Top of the Application

3. Click the **Services** tab to bring it forward.
4. Select **People Connections** (Figure 16–2).

Figure 16–2 People Connections Option on the Services Tab

Tabs with the names of People Connections features appear to the right.

16.3.2 Configuring Activity Stream

Activity Stream provides a means of publishing your own application activity and tracking the activity of other users. The types of activity that are tracked depend on Activity Stream configuration. Table 16–1 lists the types of activities that may be tracked by Activity Stream.

Table 16–1 Activities Tracked by Activity Stream

Service	Tracked Activities	Scope	Activities Shared or Private
Announcements	<ul style="list-style-type: none"> ■ Create announcement ■ Edit announcement ■ Delete announcement 	Group space	Shared with other group space members
Discussions	<ul style="list-style-type: none"> ■ Create forum ■ Delete forum ■ Create topic ■ Delete topic ■ Reply to topic ■ Delete reply 	Group space	Shared with other group space members
Documents	<ul style="list-style-type: none"> ■ Create document ■ Edit document ■ Delete document ■ Add tag ■ Remove tag 	<ul style="list-style-type: none"> ■ Group space ■ Personal space 	<ul style="list-style-type: none"> ■ Activities on group space documents are shared with other group space members. ■ Activities on personal space documents are private to user. ■ Activities on public page documents are shared with all users.
Events	<ul style="list-style-type: none"> ■ Create an event ■ Edit an Event ■ Delete an event 	Group space	Shared with other group space members
Group Space	<ul style="list-style-type: none"> ■ Create group space ■ Join group space ■ Delete group space 	Group space	Shared with other group space members
Lists	<ul style="list-style-type: none"> ■ Create a list ■ Add a row to a list ■ Edit a list row ■ Delete a list 	Group space	Shared with other group space members

Table 16–1 (Cont.) Activities Tracked by Activity Stream

Service	Tracked Activities	Scope	Activities Shared or Private
Page	<ul style="list-style-type: none"> ■ Create page ■ Edit page ■ Delete page ■ Add tag ■ Remove tag 	<ul style="list-style-type: none"> ■ Group space ■ Personal space 	<ul style="list-style-type: none"> ■ Activities on group space pages are shared with other group space members. ■ Activities on personal space pages are private to user. ■ Activities on public pages are shared with all users.
People Connections	<ul style="list-style-type: none"> ■ People are connected ■ Message Board post ■ Feedback post ■ Photo updated ■ Profile updated ■ Personal status note updated ■ Add tag to People Connections pages ■ Remove tag from People Connections pages 	Personal space	Shared with whomever is permitted to view such activities (for more information, see this section and the section "Setting People Connections Preferences" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>).
Wiki and Blog	<ul style="list-style-type: none"> ■ Create wiki ■ Edit wiki ■ Add wiki comment ■ Delete wiki ■ Create blog entry ■ Edit blog entry ■ Add blog entry comment ■ Delete blog entry <p>Note: An Oracle WebCenter Wiki and Blog Server scheduled job (<code>ActivityPublishJob</code>) must be run in order for wiki and blog activities to be published to the Activity Stream. For more information, see Section 19.2.2.1.2, "About Administration Mode."</p>	<ul style="list-style-type: none"> ■ Group space ■ Personal space 	<ul style="list-style-type: none"> ■ Activities in a group space are shared with all group space members. ■ Activities in a personal space are shared with whomever is permitted to view such activities (for more information, see this section and the section "Setting People Connections Preferences" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>).

Activity Stream configuration falls under three categories:

- **Filter**—Use Filter options to select the default services from which to show activities.
- **Source**—Use Source options to specify whether personal and group space activities are shown in Activity Stream.
- **Privacy**—Use Privacy options to set default user access to other users' Activity Stream information.

To configure Activity Stream:

1. Access People Connections administrative settings as described in [Section 16.3.1](#).

2. Click the **Activity Stream** tab to bring it forward.
3. Expand the **Filter** node (Figure 16-3).

Figure 16-3 Activity Stream Filter Node

4. Select the default services from which to publish activity.

Note: The activities of services that are not selected are still tracked, but they do not appear in the Activity Stream. If you select to show the service activities at some later point, all of the activities that occurred when the service was not selected now appear in the Activity Stream.

See Also: For information about which service activities are tracked, see [Table 16-1, "Activities Tracked by Activity Stream"](#).

5. Expand the **Source** node (Figure 16-4).

Figure 16–4 Activity Stream Source Node

Table 16–2 lists and describes each option.

Table 16–2 Activity Stream Source Options

Option	Description
Connections	<p>Select whether to track personal space activity from a user's connections</p> <p>Choose from:</p> <ul style="list-style-type: none"> ▪ Don't include personal space activities—Select to omit all personal space activity from Activity Stream. ▪ Include personal space activities from all connections—Select to track all personal space activity from the current user and the current user's connections in Activity Stream.
Group Spaces	<p>Select whether to track group space activity</p> <p>Choose from:</p> <ul style="list-style-type: none"> ▪ Don't include group space activities—Select to omit all group space activity from Activity Stream. ▪ Include all group space activities—Select to track all group space activity from the group spaces to which the current user has access in Activity Stream.

- Expand the **Privacy** node (Figure 16–5).

Figure 16–5 Activity Stream Privacy Node

Table 16–3 lists and describes each option.

Table 16–3 Activity Stream Privacy Options

Option	Description
Allow all of my activities to be viewed by	Specify who can view another user's activities Choose from: <ul style="list-style-type: none"> ▪ Everyone—Any user, whether logged in or not, can view other users' activities. ▪ Authenticated Users—Users who have logged in can view other users' activities. ▪ My Connections—User A can view user B's activities if user B has accepted user A as a connection. User A can also view user A's activities. ▪ Myself—A user can view only his own activities.
Allow Owner Override	Enable users to override the application default settings using their own People Connections Preferences (for more information, see the "Setting People Connections Preferences" section in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>).

7. Click **Apply** to save your configuration settings.

16.3.3 Configuring Connections

Connections configuration involves specifying who can view another user's connections and whether users accept invitations to connect automatically.

To configure Connections:

1. Access People Connections administrative settings as described in [Section 16.3.1](#).
2. Click the **Connections** tab to bring it forward ([Figure 16–6](#)).

Figure 16–6 Connections Configuration Settings

People Connections

Use these settings to control user access to other users' Connections.

Access **Allow Owner Override**

Grant View Access to: User's Connections ▼

Other Settings

Accept Invitations Automatically

Table 16–4 lists and describes each option.

Table 16–4 Connections Configuration Options

Option	Description
Grant View Access to	<p>Classes of users to whom to grant automatic view access to a user's connections</p> <p>The users you select can view and interact with another user's connections.</p> <p>Choose from:</p> <ul style="list-style-type: none"> ▪ Everyone—All users, including users who are not logged in, can see other users' connections. ▪ Authenticated users—Only users who are logged in can see other users' connections. ▪ User's Connections—Only the user himself and the users to whom he is connected can see his connections. ▪ User Only—Only a user can see his own connections.
Allow Owner Override	<p>Option to allow or prohibit users from overriding the administrator View access setting:</p> <ul style="list-style-type: none"> ▪ Select to allow users to override the administrative View access setting specified here using their personal Preferences (for more information, see the "Setting People Connections Preferences" section in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>). ▪ Clear to prohibit users from overriding the administrative View access setting.
Accept Invitations Automatically	<ul style="list-style-type: none"> ▪ Select to specify that, by default, all invitations to connect are accepted automatically. ▪ Clear to specify that, by default, a user must explicitly accept or reject invitations to connect.

3. Click **Apply** to save your configuration settings.

16.3.4 Configuring Profile

Every WebCenter user has a profile that displays personal information, such as the user's email address, phone number, office location, department, manager, direct reports, and so on. All but three attributes are stored and read from the LDAP identity

store that is configured against WebCenter Spaces. The three exceptions include the profile photo, status message, and expertise.

Personal profiles are presented in four sections: **Summary**, **Employee**, **Business Contact**, **Personal Information**. Each section provides information related to the section heading. For example, **Summary** includes a collection of basic details, such as the user's name, email address, and office location.

It is the administrator's job to specify the information to show in each section and whether users are allowed to edit their profile data and their application password within WebCenter Spaces.

To configure Profile:

1. Access People Connections administrative settings as described in [Section 16.3.1](#).
2. Click the **Profile** tab to bring it forward ([Figure 16-7](#)).

Figure 16-7 Profile Configuration Settings

People Connections

Activity Stream | Connections | **Profile** | Message Board | Feedback

Allow Password Change
Specify whether users can change their WebCenter password in WebCenter Spaces
Allow Password Change

Profile Gallery Pages
User Profile Gallery View Edit Restore Default
My Profile Gallery View Edit Restore Default

Profile Access
Personal profiles present user information in the sections listed here. Use these settings to control which profile sections display and whether users are allowed to update their profile details.

Profile Section	View Settings		Can Edit
	Who can view this section	Allow Owner Override	
Summary	Authenticated users	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Employee	User's Connections	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Business Contact	User's Connections	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Personal Information	User's Connections	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Profile Attributes - Edit Settings
Each profile section displays several user attributes. If section updates are allowed, use these settings to specify exactly which profile attributes WebCenter users may update and those that are read-only.

Profile Section	Attribute	Allow Update
Summary	Email	<input checked="" type="checkbox"/>
	Display Name	<input checked="" type="checkbox"/>
	Department	<input checked="" type="checkbox"/>

Table 16–5 lists and describes each option.

Table 16–5 Profile Configuration Options

Option	Description
Allow Password Change	<p>Specify whether users are allowed to change their application password</p> <ul style="list-style-type: none"> ■ Select to enable users to change their application password. ■ Clear to prevent users from changing their application password. The option is useful when your organization provides a single, separate application for managing user credentials and, consequently, prefers not to offer password management through each application.
Profile Gallery Pages	<p>Access and edit default Gallery pages</p> <p>User Profile Gallery Page—The page users see when they view another user's profile gallery. Choose either:</p> <ul style="list-style-type: none"> ■ View—Click to view the other users' Gallery page. ■ Edit—Click to edit the other users' Gallery page in Oracle Composer. For more information, see the "Editing Pages" section in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>. <p>My Profile Gallery Page—The page users see when they view their own profile gallery (by clicking their user name at the top of the application). Choose either:</p> <ul style="list-style-type: none"> ■ View—Click to view the user's own Gallery page. ■ Edit—Click to edit the user's own Gallery page in Oracle Composer. For more information, see the "Editing Pages" section in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>.
Profile Access	<p>Specify which Profile sections to show and whether users are allowed to update their profile details</p> <p>Set application defaults in the following table columns:</p> <p>Profile Section—Identifies the groups of information shown in a user profile.</p> <p>View Settings—Specify which users can view a particular profile section, and indicate whether users can change these defaults in their personal Preferences (for more information, see the "Setting People Connections Preferences" section in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>).</p> <p>View Settings for the Summary section control not only who can view summary details but also for whom the user appears in people search results.</p> <p>Set values for:</p> <ul style="list-style-type: none"> ■ Who can view this section—Specify which class of users can view the associated profile section by default. Choose from: <ul style="list-style-type: none"> Everyone—All users, including users who are not logged in, can see the associated profile section in other users' profiles. Authenticated Users—Only users who are logged in can see the associated profile section in other user's profiles. User Only—Only a user can see his own details in the associated profile section. None—The section is hidden from all users. ■ Allow Owner Override—Enable or disable users' from overriding the default application settings you specify here. Select to enable; clear to disable. <p>Can Edit—Select to enable users to edit the associated profile section of their own personal profiles; clear to prohibit users from editing the associated profile section.</p>
Profile Attributes	<p>Indicate the section attributes that users are allowed to edit by default</p> <p>Under Allow Update:</p> <ul style="list-style-type: none"> ■ Select an attribute to enable users to edit its value in their own profiles. ■ Clear an attribute to prohibit users from editing it in their own profiles.

3. Click **Apply** to save your configuration settings.

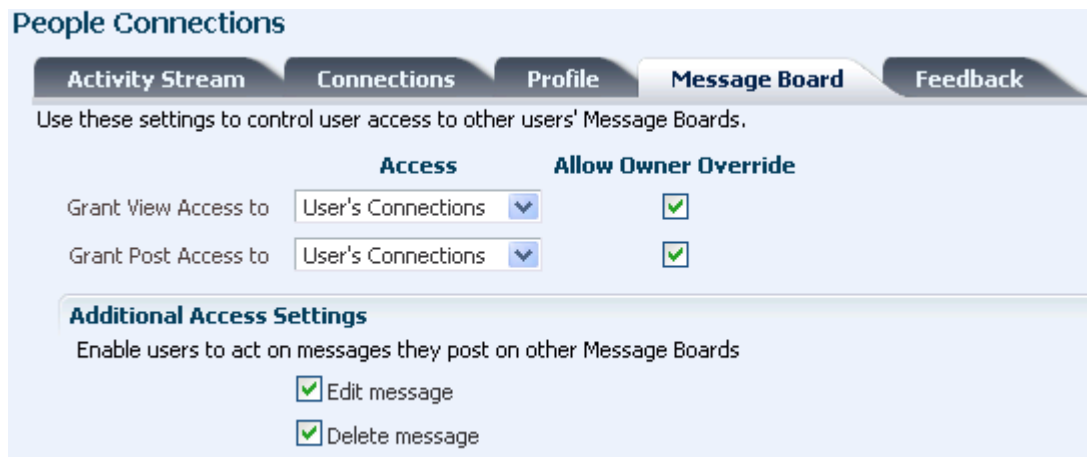

16.3.5 Configuring Message Board

Message Boards provide users with a means of viewing and posting messages to their connections. Message Board configuration settings control who can view and post to another user's Message Board and whether users can edit and delete messages they have posted.

To configure Message Board:

1. Access People Connections administrative settings as described in [Section 16.3.1](#).
2. Click the **Message Board** tab to bring it forward ([Figure 16–8](#)).

Figure 16–8 Message Board Configuration Settings

[Table 16–6](#) lists and describes each option.

Table 16–6 Message Board Configuration Options

Option	Description
Grant View Access to	<p>Specify who can view Message Board messages</p> <ul style="list-style-type: none"> ■ Everyone—All users, whether logged in or not, can see users' Message Board messages. ■ Authenticated Users—Only logged in users can see users' Message Board messages. ■ User's Connections—Only the user himself and the users to whom he is connected can view his Message Board. ■ User Only—Only a Message Board owner can see his Message Board messages.
Grant Post Access to	<p>Specify who can post Message Board Messages</p> <ul style="list-style-type: none"> ■ Everyone—All users, whether logged in or not, can post Message Board messages. ■ Authenticated Users—Only logged in users can post messages to Message Boards. ■ User's Connections—Only the user himself and the users to whom he is connected can post messages to his Message Board. ■ User Only—Only a Message Board owner can post messages to his Message Board.
Allow Owner Override	<p>Specify whether users can override these administrative defaults</p> <ul style="list-style-type: none"> ■ Select to enable users to edit the default settings through user Preferences (for more information, see the "Setting People Connections Preferences" section in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>). ■ Clear to enforce the administrator default application settings.
Additional Access Settings	<p>Specify whether users who are allowed to post messages to Message Boards are also allowed to edit and delete their posts</p> <p>Choose from:</p> <ul style="list-style-type: none"> ■ Edit message—Select to enable users to edit their own Message Board posts. ■ Delete message—Select to enable users to delete their own Message Board posts.

3. Click **Apply** to save your configuration settings.

16.3.6 Configuring Feedback

Feedback provides a means of viewing and posting user feedback for other application users. Feedback configuration settings offer controls for identifying who can view, post, and delete feedback.

To configure Feedback:

1. Access People Connections administrative settings as described in [Section 16.3.1](#).
2. Click the **Feedback** tab to bring it forward ([Figure 16–9](#)).

Figure 16–9 Feedback Configuration Settings

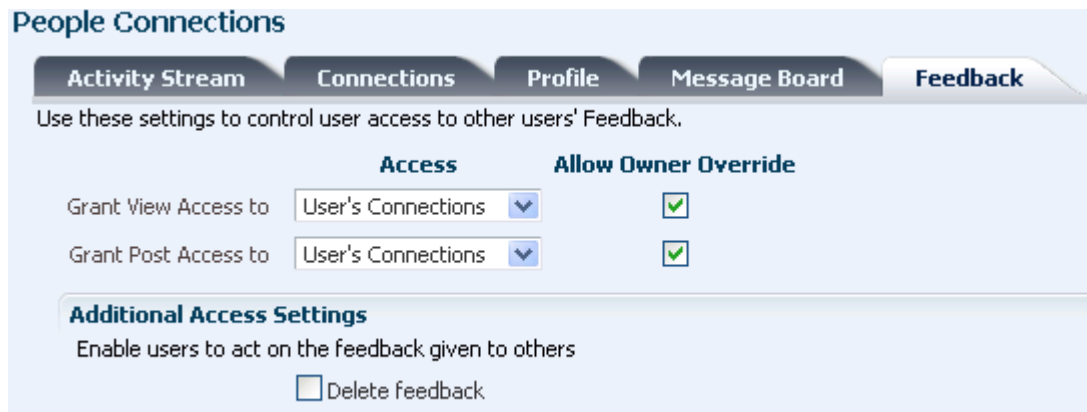

Table 16–7 lists and describes each option.

Table 16–7 Feedback Configuration Options

Option	Description
Grant View Access to	Specify who can view user Feedback Choose from: <ul style="list-style-type: none"> ▪ Everyone—All users, whether logged in or not, can see other users' Feedback. ▪ Authenticated Users—Only logged in users can see other users' Feedback. ▪ User's Connections—Only the user himself and the users to whom he is connected can view his Feedback. ▪ User Only—Users are the only ones who can view the Feedback left for them.
Grant Post Access to	Specify who can post Feedback Choose from: <ul style="list-style-type: none"> ▪ Everyone—All users, whether logged in or not, can post Feedback. ▪ Authenticated Users—Only logged in users can post Feedback. ▪ User's Connections—Only the user himself and the users to whom he is connected can post Feedback for him. ▪ User Only—Disables other users from posting Feedback messages.
Allow Owner Override	Specify whether users can override these administrative defaults <ul style="list-style-type: none"> ▪ Select to enable users to revise application default settings through user Preferences (for more information, see the "Setting People Connections Preferences" section in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i>). ▪ Clear to enforce the administrator default application settings.
Additional Access Settings	Indicate whether users can delete the Feedback they post Delete feedback <ul style="list-style-type: none"> ▪ Select to enable users to delete the Feedback they post. ▪ Clear to prohibit users from deleting the Feedback they post.

3. Click **Apply** to save your configuration settings.

16.4 Troubleshooting Issues with the People Connections Service

This section identifies the types of problems that may occur with each People Connections feature and provides suggestions for how to respond to them. It includes the following subsections:

- [Section 16.4.1, "Troubleshooting Activity Stream"](#)
- [Section 16.4.2, "Troubleshooting Connections"](#)
- [Section 16.4.3, "Troubleshooting Profile"](#)
- [Section 16.4.4, "Troubleshooting Message Board"](#)
- [Section 16.4.5, "Troubleshooting Feedback"](#)

16.4.1 Troubleshooting Activity Stream

[Table 16–8](#) lists problems and responses for troubleshooting Activity Stream in WebCenter Spaces.

Table 16–8 Activity Stream Errors and Responses

Problem	Response
Unexpected error or exception	Contact Oracle Support Services.
Connections exception is thrown	Check the exception's detail for an explanation of the exception.
Service Framework exception is thrown	Check the exception's detail for an explanation of the exception.
Settings exception is thrown	Check the exception's detail for an explanation of the exception.
Property value entered is not reflected in task flow	An invalid value may have been entered for the task flow property. In such cases, the default value is used. Ensure that task flow properties have valid values. For more information, see the section, "Setting People Connections Task Flow Properties" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
Database exception in Toplink module	Contact Oracle Support Services.
Query exception in Toplink module	Contact Oracle Support Services.
Unable to publish analytics event	Contact Oracle Support Services.
Operation not supported	Contact Oracle Support Services.
Cannot retrieve user Profile information	Contact Oracle Support Services.
Check for valid repository failed	Either the database is down or the WebCenter repository is not installed. Check the exception's detail for an explanation of the exception, and respond accordingly.
Activity exception during bulk publish	Check the individual activity exception's detail for an explanation of the exception.

16.4.2 Troubleshooting Connections

[Table 16–9](#) lists problems and responses for troubleshooting Connections in WebCenter Spaces.

Table 16–9 Connections Errors and Responses

Problem	Response
Unexpected errors or exceptions	Contact Oracle Support Services.
User name null or blank	Supply a valid user name.
Could not find user name	Supply a valid user name.
Connection list name not specified	An invalid value may have been entered for the task flow property. Ensure that task flow properties have valid values. For more information, see the section, "Setting People Connections Task Flow Properties" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
Insufficient privileges	Contact the application administrator, and request the required permission. For more information, see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
Cannot invite oneself as a connection	Supply a user name other than your own.
Cannot invite a user who has been invited	Wait for the invited user to act on your invitation.
Cannot invite a user who has invited you	Accept the invitation you have received from the user.
Cannot invite a user to whom you are connected	Supply a user name other than that of your existing connection.

16.4.3 Troubleshooting Profile

Table 16–10 lists problems and responses for troubleshooting Profile in WebCenter Spaces.

Table 16–10 Profile Errors and Responses

Problem	Response
Unexpected errors or exceptions	Contact Oracle Support Services.
Personal status message cannot be changed	Only you can change your personal status message.
User cannot view Profile.	Contact the application administrator, and request the required permission. For more information, see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
User cannot edit Profile.	Contact the application administrator, and request the required permission. For more information, see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
User was not specified	The supplied user name was null or blank. Enter a valid user name.
Modifying property is not allowed	The task flow property may be read-only. In this case, you cannot supply a value.
Error getting an Instant Message address	Contact the application administrator. For more information, see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
Error getting tag data	Contact the application administrator. For more information, see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .

Table 16–10 (Cont.) Profile Errors and Responses

Problem	Response
Tried to upload an invalid image	Try again with a valid image type. The file must have the mime-type <i>image</i> , and cannot have the extension <i>*.ico</i> .
Error instantiating object	Contact the application administrator. For more information, see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
Error instantiating Profile	Contact Oracle Support Services.

16.4.4 Troubleshooting Message Board

Table 16–11 lists problems and responses for troubleshooting Message Board in WebCenter Spaces.

Table 16–11 Message Board Errors and Responses

Problem	Response
Unexpected errors or exceptions	Contact Oracle Support Services.
Failed to create an instance of Message Board	Make sure the user is logged in.
Failed to persist Message Board message	Contact Oracle Support Services.
Failed to publish Message Board activity	Verify the reason for the failure in the Activity Stream subsystem.
Message Board message cannot be deleted	The application administrator must explicitly allow users to delete the messages they send. Contact the application administrator, and request the required permission. For more information, see Section 16.3.5, "Configuring Message Board." Also see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
Message Board message cannot be updated	Contact the application administrator, and request the required permission. For more information, see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
Message Board message cannot be added	Message content is empty. Enter message content, and try again. Otherwise, contact Oracle Support Services.
Message Board message cannot be hidden	User does not have permission to hide the message. You can hide only those messages you receive, and not the ones you send.
Failed to query preferences for Message Board	Contact Oracle Support Services.

16.4.5 Troubleshooting Feedback

Table 16–12 lists problems and responses for troubleshooting Feedback in WebCenter Spaces.

Table 16–12 Feedback Errors and Responses

Problem	Response
Unexpected errors or exceptions	Contact Oracle Support Services.
Failed to create an instance of Feedback	Make sure the user is logged in.
Failed to persist Feedback message	Contact Oracle Support Services.
Failed to publish Feedback activity	Verify the reason for the failure in the Activity Stream subsystem.

Table 16–12 (Cont.) Feedback Errors and Responses

Problem	Response
Feedback cannot be deleted	The application administrator must explicitly allow users to delete the Feedback they post. Contact the application administrator, and request the required permission. For more information, see Section 16.3.6, "Configuring Feedback." Also see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> . Otherwise, contact Oracle Support Services.
Feedback cannot be updated	Contact the application administrator, and request the required permission. For more information, see the section, "Contacting Your Application Administrator" in the <i>Oracle Fusion Middleware User's Guide for Oracle WebCenter</i> .
Feedback cannot be added	Feedback content is empty. Enter Feedback content, and try again. Otherwise, contact Oracle Support Services.
Feedback cannot be hidden	User does not have permission to hide the Feedback. You can hide only the Feedback you receive; you cannot hide the Feedback you give.
Failed to query preferences for Feedback	Contact Oracle Support Services.

Managing the RSS Service

This chapter describes how to configure and manage the RSS service for WebCenter Spaces and custom WebCenter applications deployed to Oracle WebLogic Server.

This chapter includes the following sections:

- [Section 17.1, "What You Should Know About the RSS Service"](#)
- [Section 17.2, "RSS Prerequisites"](#)
- [Section 17.3, "Specifying the RSS Feed Proxy"](#)
- [Section 17.4, "Testing RSS News Feed Connections"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

17.1 What You Should Know About the RSS Service

The RSS service provides the ability to expose information from WebCenter Services and external sources, as news feeds in WebCenter applications. The RSS service delivers content update information from the following WebCenter Services: Recent Activities, Discussions, Lists, and Announcements.

17.2 RSS Prerequisites

The RSS service does not require any back-end server. You do not need to set up a connection to use this service. Depending on your network configuration, you may need to set up a proxy server for your application to display content from external RSS news feeds.

17.3 Specifying the RSS Feed Proxy

To specify the proxy host and port used by the RSS service, use the WLST command `setRssProxyConfig`. For command syntax and examples, see the section, "setRssProxyConfig" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information about how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using new proxy details, you must restart the managed server to which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

Note: Proxy servers for the RSS service cannot be set by using Fusion Middleware Control.

17.4 Testing RSS News Feed Connections

To ensure that the proxy information is accurately configured for the RSS service:

1. In WebCenter Spaces, drag the RSS Viewer task flow to a page.
2. Edit the RSS Viewer task flow and set the URL to an external RSS feed. For example:

http://rss.cnn.com/rss/cnn_topstories.rss

If this feed renders correctly, it confirms that the proxy configuration is set up properly.

Managing the Search Service

This chapter describes how to configure and manage the Search service for WebCenter Spaces and custom WebCenter applications.

WebCenter Search allows users to search WebCenter objects. WebCenter services provide *search adapters* for objects that they manage, and you can integrate with the Oracle Secure Enterprise Search (SES) adapter to include non-WebCenter objects.

Additionally, with WebCenter Spaces, you can override the default WebCenter search adapters and make the Oracle SES adapter index and search all WebCenter objects. Oracle SES search provides unified ranking results. The results are listed together, instead of being grouped into separate sections for Documents, Discussions, and so on, with the most relevant items appearing first.

This chapter describes both of these modes of searching; that is, using the default WebCenter adapters and using the Oracle SES adapter.

Always use Fusion Middleware Control or the WLST command-line tool to review and configure back-end services for WebCenter applications. Any changes that you make to WebCenter applications, post deployment, are stored in MDS metadata store as customizations. See [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

Note: Changes that you make to WebCenter services configuration, through Fusion Middleware Control or using WLST, are not dynamic so you must restart the managed server on which the WebCenter application is deployed for your changes to take effect. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

This chapter includes the following sections:

- [Section 18.1, "What You Should Know About WebCenter Search with Oracle SES"](#)
- [Section 18.2, "WebCenter Search Prerequisites for using Oracle SES"](#)
- [Section 18.3, "Setting Up Oracle SES Connections"](#)
- [Section 18.4, "Configuring Oracle SES to Search WebCenter Spaces"](#)
- [Section 18.5, "Troubleshooting Issues with Search"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server

Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

18.1 What You Should Know About WebCenter Search with Oracle SES

You can extend WebCenter searches to external content repositories by connecting the WebCenter application to an Oracle SES instance. Providing that the Oracle SES instance is set up to search external repositories, results from these search sources can appear alongside WebCenter application search results. Supported versions include Oracle SES 10.1.8.4.x. You can register multiple Oracle SES connections but only one of them is active at a time.

Additionally, with WebCenter Spaces, you can override the default search adapters and use Oracle SES to get unified ranking results. This provides a faster, more unified search experience across WebCenter objects. For more information, see [Section 18.4, "Configuring Oracle SES to Search WebCenter Spaces."](#)

18.2 WebCenter Search Prerequisites for using Oracle SES

This section includes the following subsections:

- [Section 18.2.1, "Oracle SES - Installation"](#)
- [Section 18.2.2, "Oracle SES - Configuration"](#)
- [Section 18.2.3, "Oracle SES - Security"](#)
- [Section 18.2.4, "Oracle SES - Limitations"](#)

18.2.1 Oracle SES - Installation

For installation directions, see the section, "Back-End Requirements for the Search Service" in *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

See Also: Check the Release Notes for the latest information on required patches from Oracle SES.

18.2.2 Oracle SES - Configuration

1. Oracle SES must be configured with an identity management system to validate and authenticate users. This is necessary for secure searches, so searches return only results that the user is allowed to view based on access privileges.

Because WebCenter uses identity propagation when communicating with Oracle SES, WebCenter's user base must match that in Oracle SES. One way this can happen is by configuring WebCenter and Oracle SES to the same identity management system, such as Oracle Internet Directory.

Note: Oracle SES includes numerous identity plug-ins for identity management systems including Oracle Internet Directory, Oracle Content Server, and Microsoft Active Directory.

Only one identity plug-in can be set up for each Oracle SES instance. If you are using Oracle SES to search WebCenter Spaces and you are using multiple crawler types (WebCenter Spaces crawler, Documents crawler, and Discussions crawler) on your Oracle SES instance, then each of those repositories (WebCenter Spaces,

Oracle Content Server, and Oracle WebCenter Discussions) must share the same user base as Oracle SES.

The following example sets up the identity plug-in for Oracle Internet Directory:

- a. In the Oracle SES administration tool, navigate to the Global Settings - Identity Management Setup page, select **Oracle Internet Directory** from the available identity plug-ins, and click **Activate**.
 - b. Provide the following values:
 - Host name:** The host name of the machine where Oracle Internet Directory is running
 - Port:** The Oracle Internet Directory port number
 - Use SSL:** `true` or `false` based on your preference
 - Realm:** The Oracle Internet Directory realm, for example, `dc=us,dc=oracle,dc=com`
 - User name:** The Oracle Internet Directory admin username; for example, `cn=orcladmin`
 - Password:** Admin user password
 - c. Click **Submit**.
2. Each Oracle SES instance must have a trusted entity for allowing WebCenter end users to be securely propagated at query time. (A trusted entity allows the WebCenter application to authenticate itself to Oracle SES and assert its users when making queries on Oracle SES.) This trusted entity can be any user that either exists on the identity management server behind Oracle SES or is created internally in Oracle SES.
 - a. In the Oracle SES administration tool, navigate to the Global Settings - Federation Trusted Entities page.
 - b. Enter a name for a trusted entity. This is the name that WebCenter uses to authenticate itself to Oracle SES at query time (before it propagates the end user identity to Oracle SES).
 - To allow the entity to be authenticated through the active identity plug-in:**
 - Make sure that the entity name is the name of a user that exists in the identity management system.
 - Leave the password field blank.
 - Select the **Use Identity Plug-in for authentication** checkbox.
 - Enter the authentication attribute value corresponding to the Authentication Attribute in your active identity plug-in.
 - To allow the entity to be authenticated through Oracle SES:**
 - Enter any user name and password.
 - Do *not* select the **Use Identity Plug-in for authentication** checkbox.
- For more information, see the online help for that page in Oracle SES.

18.2.3 Oracle SES - Security

Most enterprise deployments require that their HTTP connections be secure. SSL (secure socket layer) is an encryption protocol for securely transmitting private content

on the internet. Oracle strongly recommends that you use an SSL-protected channel to transmit password and other secure data over networks.

For information on how to do this, see [Section 23.6.9, "Securing the WebCenter Spaces Connection to Oracle SES with SSL."](#)

18.2.4 Oracle SES - Limitations

There are currently no known limitations.

18.3 Setting Up Oracle SES Connections

This section includes the following subsections:

- [Section 18.3.1, "Registering Oracle SES Services"](#)
- [Section 18.3.2, "Choosing the Active Oracle SES Connection"](#)
- [Section 18.3.3, "Modifying Oracle SES Connection Details"](#)
- [Section 18.3.4, "Deleting Oracle SES Connections"](#)
- [Section 18.3.5, "Testing Oracle SES Connections"](#)

18.3.1 Registering Oracle SES Services

You can register multiple Oracle SES connections with a WebCenter application but only one of them is active at a time.

To start using a new (active) Oracle SES connection you must restart the managed server on which the WebCenter application is deployed.

You can register Oracle SES connections using *either* Fusion Middleware Control *or* WLST. This section includes the following subsections:

- [Section 18.3.1.1, "Registering Oracle SES Search Services Using Fusion Middleware Control"](#)
- [Section 18.3.1.2, "Registering and Modifying Oracle SES Services Using WLST"](#)

18.3.1.1 Registering Oracle SES Search Services Using Fusion Middleware Control

To register an Oracle SES instance with WebCenter applications:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Search**.

- To connect to a new Oracle SES instance, click **Add** (Figure 18–1).

Figure 18–1 Configuring Oracle Secure Search Services

- Enter a unique name for this connection, and indicate whether this connection is the active (or default) connection for the application (Table 18–1).

Table 18–1 Search Connection - Name

Field	Description
Name	Enter a unique name for the connection. The name must be unique (across all connection types) within the WebCenter application.
Active Connection	Select to use the Oracle SES instance defined on this connection to search repositories outside the WebCenter application and include Oracle SES search results in your result set. While you can register multiple search connections for a WebCenter application, only one connection is used by the Search service—the default (or active) connection.

- Enter connection details for the Oracle SES instance (Table 18–2).

Table 18–2 Oracle Secure Enterprise Search - Connection Details

Field	Description
SOAP URL	Enter the Web Services URL that Oracle SES exposes to enable search requests. Use the format: <code>http://host:port/search/query/OracleSearch</code> For example: <code>http://myHost:7777/search/query/OracleSearch</code>
Federation Trusted Entity Name	Enter the user name of the Oracle SES federation trusted entity created in Section 18.2.2, "Oracle SES - Configuration." Tip: This user is configured in the Oracle SES administration tool, on the Global Settings - Federation Trusted Entities page. The user must be present in both the identity management server configured for your WebCenter application and the identity management server configured for Oracle SES. The WebCenter application must authenticate itself as a trusted application to Oracle SES to perform searches on behalf of WebCenter users. Examples in this chapter use <code>wpadmin</code> for this value.

Table 18–2 (Cont.) Oracle Secure Enterprise Search - Connection Details

Field	Description
Federation Trusted Entity Password	Enter the password for the federation trusted entity. This is not required if you selected the Use Identity Plug-in for authentication checkbox when setting up the federation trusted entity.

7. On Advanced Configuration, enter the Oracle SES data group (also known as a source group) in which to search. This parameter is specific to the Oracle SES search adapter. If a value is not provided, then everything in the Oracle SES instance is searched.
8. Optionally, configure additional options for the Oracle SES connection (Table 18–3). With the exception of the Oracle Secure Enterprise Data Group parameter, these parameters apply to all search adapters.

Note: These Oracle SES advanced configuration parameters can be left blank if you are setting up Oracle SES for the first time. You can return here to tune these parameters later.

Table 18–3 Oracle Secure Enterprise Search - Advanced Configuration

Field	Description
Oracle Secure Enterprise Search Data Group	Specify the Oracle SES data group in which to search. If a value is not provided, then everything in the Oracle SES instance is searched.
Execution Timeout	Enter the maximum time that a service is allowed to execute a search (in ms).
Executor Preparation Timeout	Enter the maximum time that a service is allowed to initialize a search (in ms).
Results per Service - Saved Search Task Flows	Enter the number of search results displayed, per service, in a Saved Search task flow.
Results per Service - Search Page	Enter the number of search results displayed, per service, for searches submitted from the main search page. Users can click Show All to see all the results.
Results per Service - Search Toolbar	Enter the number of search results displayed, per service, for searches submitted from the global search toolbar.
Number of Saved Searches in Search Page	Enter the number of saved searches displayed in the Saved Search dropdown list (on the main search page).

9. Click **OK** to save this connection.
10. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

18.3.1.2 Registering and Modifying Oracle SES Services Using WLST

Use the WLST command `createSESConnection` to create an Oracle SES connection. Use `setSESConnection` to alter an existing Oracle SES connection. For command syntax and examples, see the sections, "createSESConnection" and "setSESConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To configure the WebCenter Search service to actively use a new Oracle SES connection, set `default=true`. For more information, see [Section 18.3.2.2, "Choosing the Active Oracle SES Connection Using WLST."](#)

Use the WLST command `setSearchConfig` to edit properties relating to the Search service, such as the number of search results displayed. For command syntax and examples, see the section, "setSearchConfig" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the new (active) connection or settings, you must restart the managed server on which the WebCenter application is deployed. See, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

18.3.2 Choosing the Active Oracle SES Connection

You can register multiple Oracle SES connections with a WebCenter application but only one connection is active at a time.

For WebCenter Spaces and any custom WebCenter application, the *active connection* becomes the back-end search engine.

Note: These steps in this section are not necessary if you already selected the active connection in [Section 18.3.1, "Registering Oracle SES Services."](#)

This section includes the following subsections:

- [Section 18.3.2.1, "Choosing the Active Oracle SES Connection Using Fusion Middleware Control"](#)
- [Section 18.3.2.2, "Choosing the Active Oracle SES Connection Using WLST"](#)

18.3.2.1 Choosing the Active Oracle SES Connection Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.

3. From the list of services on the WebCenter Services Configuration page, select **Search**.
The Manage Secure Enterprise Search Connections table indicates the current active connection (if any).
4. Select the connection you want to make the active (or default) connection, and then click **Edit**.
5. Select the **Active Connection** checkbox.
6. Click **OK** to update the connection.
7. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

18.3.2.2 Choosing the Active Oracle SES Connection Using WLST

Use the WLST command `setSESConnection` with `default=true` to activate an existing Oracle SES connection. For command syntax and examples, see the section, "setSESConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To subsequently disable an Oracle SES connection, run the same WLST command with `default=false`. Connection details are retained but the connection is no longer named as an active connection.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the active connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

18.3.3 Modifying Oracle SES Connection Details

You can modify Oracle SES connection details at any time.

To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed.

Note: The steps in this section are required only if you want to modify the details configured in [Section 18.3.1, "Registering Oracle SES Services."](#)

This section includes the following subsections:

- [Section 18.3.3.1, "Modifying Oracle SES Connection Details Using Fusion Middleware Control"](#)
- [Section 18.3.3.2, "Modifying Oracle SES Connection Details Using WLST"](#)

18.3.3.1 Modifying Oracle SES Connection Details Using Fusion Middleware Control

To update connection details for an Oracle SES instance:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Search**.
4. Select the connection name, and click **Edit**.
5. Edit connection details, as required. For detailed parameter information, see [Table 18-2](#).
6. Click **OK** to save your changes.
7. To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

18.3.3.2 Modifying Oracle SES Connection Details Using WLST

Use the WLST command `setSESConnection` to edit an existing Oracle SES search connection. For command syntax and examples, see the section, "setSESConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Use the command `setSearchSESConfig` to set additional Oracle SES connection properties, such as the Oracle SES data group in which to search. For syntax details and examples, see the section, "setSearchSESConfig" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

18.3.4 Deleting Oracle SES Connections

You can delete Oracle SES connections at any time but take care when deleting the active connection. If you delete the active connection, users are not able to search content on external repositories.

This section includes the following subsections:

- [Section 18.3.4.1, "Deleting Search Connections Using Fusion Middleware Control"](#)
- [Section 18.3.4.2, "Deleting Search Connections Using WLST"](#)

18.3.4.1 Deleting Search Connections Using Fusion Middleware Control

To delete an Oracle SES server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the Service Connection drop-down, select **Search**.
4. Select the connection name, and click **Delete**.
5. To effect this change you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

18.3.4.2 Deleting Search Connections Using WLST

Use the WLST command `deleteConnection` to remove a search connection. For command syntax and examples, see the section, "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

18.3.5 Testing Oracle SES Connections

Confirm the Oracle SES connection by entering in a browser the URL for Oracle SES Web Services operations:

```
http://host:port/search/query/OracleSearch
```

If the URL address *does not* render in the browser, then either the host or port for the Oracle SES server is incorrect, or Oracle SES has not been started.

If the URL address *does* render in the browser, then click the **proxyLogin** operation to log in Oracle SES using proxy authentication.

Enter the following parameters:

- **username:** User name that WebCenter uses to authenticate itself to Oracle SES, created in [Section 18.2.2, "Oracle SES - Configuration."](#) This user must be a valid trusted entity registered in the federation trusted entities on Oracle SES.
- **password:** Password of this user created in [Section 18.2.2, "Oracle SES - Configuration."](#)
- **searchUser:** User name of an end user present in the identity management system used by Oracle SES

When a request is sent for **proxyLogin**, Oracle SES calls the identity plug-in (which returns the call) to authenticate the entity. Click **Invoke** to run the operation ([Figure 18–2](#)).

Figure 18–2 Web Services API proxyLogin

Click [here](#) for a complete list of operations.

proxyLogin

Test

To test the operation using the HTTP GET protocol, click the 'Invoke' button.

Parameter	Type	Value
username	string	<input type="text" value="wpadmin"/>
password	string	<input type="text" value="welcome1"/>
searchUser	string	<input type="text" value="monty"/>

If the connection is good, then you should see a response similar to the following:

```
<?xml version='1.0' encoding='UTF-8'?>
<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
<SOAP-ENV:Body>
<ns1:proxyLoginResponse
xmlns:ns1="http://oracle.search.query.webservice/OracleSearchService.wsdl"
SOAP-ENV:encodingStyle="http://schemas.xmlsoap.org/soap/encoding/">
<return xmlns:ns2="http://oes.oracle.com/OracleSearch" xsi:type="ns2:Status">
<message xsi:type="xsd:string" xsi:nil="true"/>
<status xsi:type="xsd:string">successful</status>
</return>
</ns1:proxyLoginResponse>

</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

18.4 Configuring Oracle SES to Search WebCenter Spaces

With WebCenter Spaces, you can override the default search adapters and use Oracle SES to get unified ranking results for the following resources:

- Documents
- Group Spaces
- Group Space Announcements
- Group Space Discussions

- Lists
- Pages
- People
- Wikis and blogs

The results are listed together, instead of being grouped into separate sections for Documents, Discussions, and so on. The most relevant items appear first.

For example, when you run a search for a user name, most likely, you are looking for that person's contact information (that is, the exact user name in the People Connections service), not necessarily documents that the user wrote. The unified ranking results in Oracle SES allow you to see the most relevant results, across all different types of searches, without configuring Search Preferences.

You can create the following crawlers on Oracle SES to crawl WebCenter Spaces resources:

- **Oracle WebCenter Documents Crawler:** This uses the Oracle Content Server source type to crawl documents. The Oracle Content Server source type is provided out-of-the-box in Oracle SES.
- **Oracle WebCenter Discussions Crawler:** This uses the Database source type to crawl discussions and announcements. The Database source type is provided out-of-the-box in Oracle SES.
- **Oracle WebCenter Spaces Crawler:** This uses a Secure RSS source type to crawl the WebCenter Spaces application and certain objects, such as lists, pages, group spaces, wikis and blogs, and people connections profiles. You must create this source type in Oracle SES (one time for each Oracle SES instance).

Note: Oracle SES crawls information collected as a *source*. Each source has a *type* that identifies where the information is stored, such as in a database or a content repository.

All crawlers (Documents, and Discussions, and WebCenter Spaces), must be configured on the same Oracle SES instance.

Even after Oracle SES is configured to search these specific WebCenter Spaces resources, all other non-crawled resources (for example, tags, notes, and events) continue to be returned in search results, in their own grouping.

This section describes the steps necessary to set up Oracle SES to search WebCenter Spaces:

- [Section 18.4.1, "Setting Up Oracle SES for WebCenter Spaces"](#)
- [Section 18.4.2, "Setting Up WebCenter Spaces for Oracle SES Search"](#)
- [Section 18.4.3, "Setting Up Oracle Content Server for Oracle SES Search"](#)
- [Section 18.4.4, "Setting Up Oracle WebCenter Discussions for Oracle SES Search"](#)
- [Section 18.4.5, "Setting Up Oracle SES to Search WebCenter Spaces"](#)

18.4.1 Setting Up Oracle SES for WebCenter Spaces

Run the following steps to set up WebCenter Spaces for Oracle SES search.

1. Verify that you have the latest information on required patches from Oracle SES. These are noted in the section "Back-End Requirements for the Search Service" in *Oracle Fusion Middleware Installation Guide for Oracle WebCenter* and in the Release Notes.
2. Verify that a federation trusted identity exists on Oracle SES for WebCenter, as described in [Section 18.2.2, "Oracle SES - Configuration"](#) and [Section 18.3.5, "Testing Oracle SES Connections."](#)
3. Get `webcenter_search_ses_plugins.zip` from the `$WC_ORACLE_HOME/ses` directory, and put it in the `OracleSES_Home` directory on the Oracle SES instance.

Note: `OracleSES_Home` represents the software location that you specified at the time of installing Oracle SES.

The WebCenter instance and the Oracle SES instance might be on different machines.

4. Change to the Oracle SES home directory. For example:

```
cd $OracleSES_Home
```

5. Run the following command to install necessary WebCenter plug-ins:

```
unzip webcenter_search_ses_plugins.zip
```

This adds the following WebCenter jar files to an SES installation:

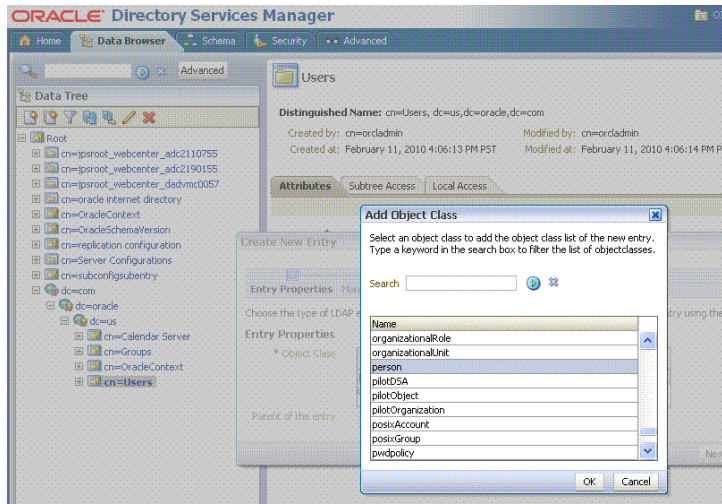

- `OracleSES_Home/search/lib/plugins/webcenter/search-auth-share.jar`
 - `OracleSES_Home/search/lib/plugins/webcenter/search-auth-plugin.jar`
 - `OracleSES_Home/search/lib/plugins/doc/search-crawl-ucm.jar`
6. To use Oracle SES to search group spaces, lists, pages, or wikis, you must first create a *crawl admin user* in WebCenter Spaces and in your back-end identity management server (for example, `mycrawladmin`). You only need to create a crawl admin user one time.

Note: See your identity management system documentation for information on creating users.

The following example uses Oracle Directory Services Manager to create the `mycrawladmin` user.

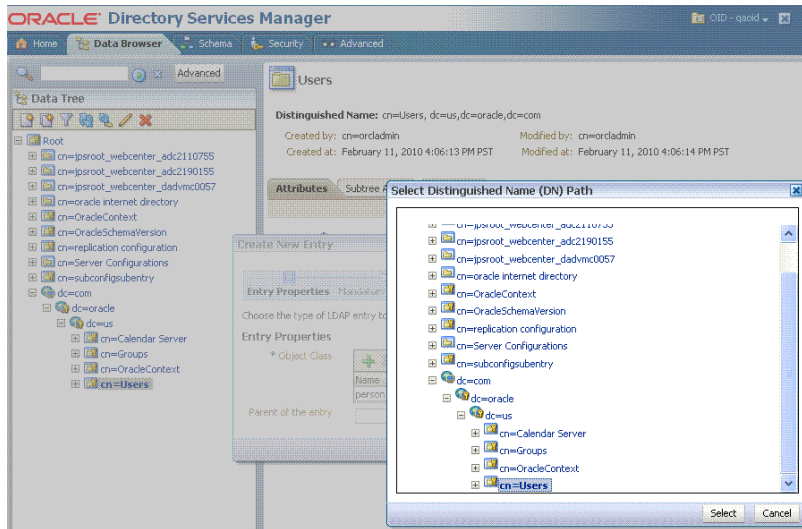

- a. On the Data Browser tab, navigate to the target cn and click **Create**. This example navigates to "`dc=com,dc=oracle,dc=us,cn=Users`". In the Add Object Class dialog, select the appropriate object class, and click **OK**. ([Figure 18-3](#)).

Figure 18–3 Oracle Directory Services Manager - Add Object Class

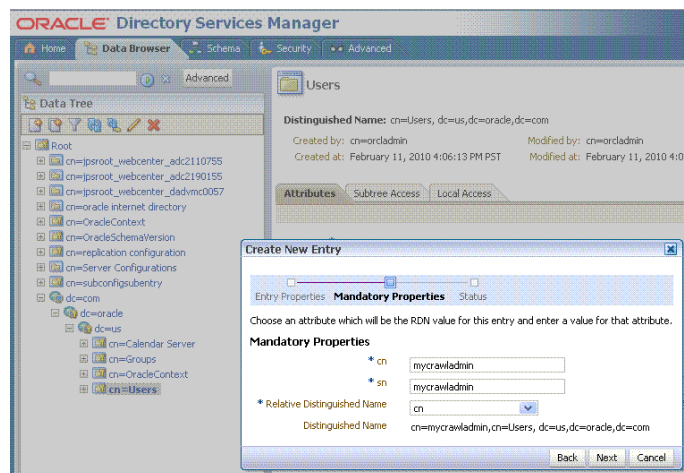

- b. Find the distinguished name (DN) path, and click **Select**. (Figure 18–4). This example selects "dc=com,dc=oracle,dc=us,cn=Users".

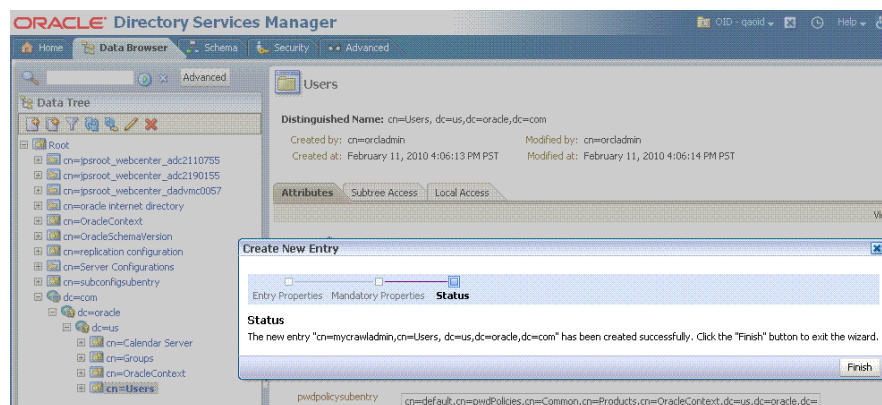

Figure 18–4 Oracle Directory Services Manager - Select DN Path

- c. In the Create New Entry dialog, enter the following properties, and click **Next**. (Figure 18–5).

Figure 18–5 Oracle Directory Services Manager - Create New Entry

- d. When you see that the new entry was created successfully, click **Finish**. (Figure 18–6)

Figure 18–6 Oracle Directory Services Manager - Status

18.4.2 Setting Up WebCenter Spaces for Oracle SES Search

This section describes how to configure WebCenter Spaces to work with Oracle SES, using WLST commands. After completing these steps you must restart the managed server on which WebCenter Spaces is deployed to effect your changes.

Note: Although some of the operations in this section can be run using Fusion Middleware Control, for consistency it is best to complete these operations using WLST.

For more information about using WLST, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

For more information about the WLST commands in this section, see *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*:

- `createSESConnection`
 - `setSearchSESConfig`
 - `setSearchConfig`
 - `listAppRoles`
 - `createAppRole`
 - `grantPermission`
 - `grantAppRole`
 - `setSpacesCrawlProperties`
 - `getSpacesCrawlProperties`
 - `listDocumentsSpacesProperties`
-

1. Use WLST to configure the connection between WebCenter Spaces and Oracle SES.
 - a. Use the WLST command `createSESConnection` to create a connection to Oracle SES, if you do not have a connection already. For example:

```
createSESConnection(appName='webcenter',
                   name='MySesConnection',
                   url='http://myhost.com:7777/search/query/OracleSearch',
                   appUser='wadmin',
                   appPassword='welcome1',
                   default=true)
```

where `appUser` is the user name of the Oracle SES federation trusted entity created in [Section 18.2.2, "Oracle SES - Configuration."](#)

- b. Specify a data group (also known as source group) under which you will be searching Oracle SES. For example:

```
setSearchSESConfig(appName='webcenter',
                  dataGroup='MySources')
```

where `dataGroup` is the source group created in [Section 18.4.5.5, "Additional Oracle SES Configuration."](#)

For more information on Oracle SES configuration, see [Table 18-3](#).

- c. Increase the number of search results displayed in Oracle SES results. (Five is the default setting, but Oracle SES result sets generally are larger than five.) For example:

```
setSearchConfig(appName='webcenter',
                numResultsMain=20,
                numResultsToolbar=20)
```

2. Create a *crawl application role* for WebCenter Spaces.

- a. See if the crawl application role exists with the following command:

```
listAppRoles (appStripe='webcenter')
```

The list may be very long. Look for 'webcenter#-#defaultcrawl' as a Principal Name in the results. For example:

```
[ [Principal Clz Name :
oracle.security.jps.internal.core.principals.JpsApplicationRoleImpl,
Principal Name :webcenter#-#defaultcrawl, Type : APP_ROLE], Display Name :
Crawl Role. This role never gets updated by webcenter UIs., Description :
null, Guid : DA91B6572AF911DFBF70237926348A3B]
```

If 'webcenter#-#defaultcrawl' does not exist, then you must create the crawl application role with the following WLST command:

```
createAppRole(appStripe='webcenter',
              appRoleName='webcenter#-#defaultcrawl');
```

Then grant "view" permissions to WebCenter Spaces content as follows:

```
grantPermission(appStripe="webcenter",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
principalName="webcenter#-#defaultcrawl",
permClass="oracle.webcenter.community.model.security.CommunityPermission",
permTarget="*",
permActions="view")

grantPermission(appStripe="webcenter",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
principalName="webcenter#-#defaultcrawl",
permClass="oracle.webcenter.relationship.model.security.RelationshipPermiss
ion",
permTarget="*",
permActions="view")

grantPermission(appStripe="webcenter",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
principalName="webcenter#-#defaultcrawl",
permClass="oracle.webcenter.list.model.security.ListPermission",
permTarget="*",
permActions="view")

grantPermission(appStripe="webcenter",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
principalName="webcenter#-#defaultcrawl",
permClass="oracle.webcenter.page.model.security.CustomPagePermission",
permTarget="*",
permActions="view")

grantPermission(appStripe="webcenter",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
principalName="webcenter#-#defaultcrawl",
permClass="oracle.webcenter.page.model.security.PagePermission",
permTarget="*",
permActions="view")

grantPermission(appStripe="webcenter",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
```

```
principalName="webcenter#-#defaultcrawl",
permClass="oracle.webcenter.note.model.security.NotePermission",
permTarget="*",
permActions="view")

grantPermission(appStripe="webcenter",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
principalName="webcenter#-#defaultcrawl",
permClass="oracle.webcenter.collab.calendar.model.security.EventPermission"
,
permTarget="*",
permActions="view")
```

- b. Grant the crawl application role to the crawl admin user created in [Section 18.4.1, "Setting Up Oracle SES for WebCenter Spaces."](#) For example:

```
grantAppRole(appStripe="webcenter",
appRoleName="webcenter#-#defaultcrawl",
principalClass="weblogic.security.principal.WLSUserImpl",
principalName="mycrawladmin");
```

3. Enable the Oracle SES crawlers in WebCenter Spaces.

With the same WLST command, you can set crawler properties (that is, enable/disable the crawlers) and specify an interval between full crawls for the WebCenter Spaces crawler. By default, full crawls for the WebCenter Spaces crawler occur every seven days, but you can specify a different frequency. (Incremental crawls, for all three crawlers, are initiated by the schedule set in Oracle SES.)

For example:

```
setSpacesCrawlProperties (appName='webcenter',
fullCrawlIntervalInHours=168,
spacesCrawlEnabled = true,
documentCrawlEnabled=true,
discussionsCrawlEnabled=true)
```

Notes: You can configure components like Oracle Content Manager and Oracle WebCenter Discussions and still use the default search adapters in WebCenter Spaces by setting `documentCrawlEnabled=false` or `discussionsCrawlEnabled=true`.

A clustered instance additionally requires the server parameter; for example, `server="WLS_Spaces1"`.

The following example specifies that WebCenter Spaces runs a full crawl through the WebCenter Spaces crawler every 8 days.

```
setSpacesCrawlProperties (appName='webcenter', fullCrawlIntervalInHours=192)
```

You also can use WLST to return the current crawl settings for WebCenter Spaces, such as the number of hours between full crawls (WebCenter Spaces crawler), and which Oracle SES crawlers are enabled (WebCenter Spaces crawler, Discussions crawler, and Document crawler). For example, the following command returns the current crawl settings for WebCenter Spaces.

```
getSpacesCrawlProperties (appName='webcenter')
```

```
WebCenter Spaces Crawl Properties:
```

```
-----
fullCrawlIntervalInHours: 124
spacesCrawlEnabled:      true
documentCrawlEnabled:    true
discussionsCrawlEnabled: false
```

4. Use the `listDocumentsSpacesProperties` command to determine the unique name that the back-end Oracle Content Server is using to identify this WebCenter Spaces application and the connection name for the primary Oracle Content Server that WebCenter Spaces is using to store documents. For example:

```
listDocumentsSpacesProperties('webcenter')
```

The response should look something like the following:

```
The Documents Spaces container is "/WebCenter1109"
The Documents repository administrator is "sysadmin"
The Documents application name is "WC1109"
The Documents primary connection is "stan118-ucm11g"
```

Note: Record the application name and the primary connection returned. These values are required later (in [Section 18.4.5.2, "Setting up Oracle SES to Search Documents"](#)) to set up Oracle SES to crawl WebCenter Spaces documents.

5. Restart the managed server on which the WebCenter Spaces application is deployed. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

These steps complete WebCenter Spaces application configuration for Oracle SES. However, for Oracle SES searching to work, you must also configure the following:

- [Section 18.4.3, "Setting Up Oracle Content Server for Oracle SES Search"](#)
- [Section 18.4.4, "Setting Up Oracle WebCenter Discussions for Oracle SES Search"](#)
- [Section 18.4.5, "Setting Up Oracle SES to Search WebCenter Spaces"](#)

18.4.2.1 Enabling Oracle SES Crawlers Using Fusion Middleware Control

In addition to enabling crawlers using WLST commands, you also can enable or disable crawlers anytime using Fusion Middleware Control.

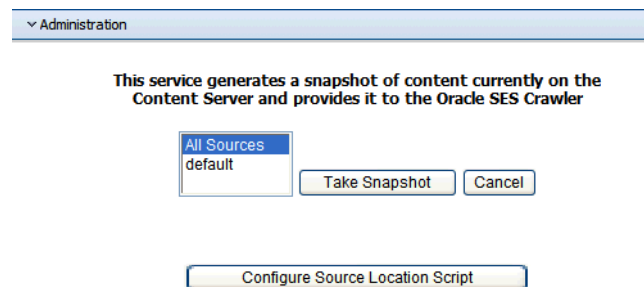

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces. For more information, see [Section 6.2, "Navigating to the Home Page for WebCenter Spaces."](#)
2. From the **WebCenter** menu, choose **Settings > Application Configuration**.
3. Select the crawlers you want to enable, and click **Apply** ([Figure 18–1](#)).

You can specify an interval between full crawls for the WebCenter Spaces crawler. By default, full crawls for the WebCenter Spaces crawler occur every seven days, but you can specify a different frequency. (Incremental crawls, for all three crawlers, are initiated by the schedule set in Oracle SES.)

You do not need to restart the managed server on which the WebCenter application is deployed.

- e. If the **SESCrawlerExport** is not listed under Enabled Components, then you must install it. In the Download section of the page, select **SESCrawlerExport** from the dropdown list and click **Download**. Or, in the Install New Component section, browse to find `SESCrawlerExport.zip` (generally, this is located in `$CONTENT_SERVER_HOME/custom/CS10gR35UpdateBundle/extras`), and click **Install**.
 - f. Enter configuration parameters. (You can change configuration parameters after installation on the Update Component Configuration page.)
 In a clustered environment, the **feedLoc** parameter must specify a location on the shared disk accessed by the nodes of content server, and they each must reference it the same way; for example, `sharedDrive/dir1/dir2`. Note that this is not the default location (relative path) provided.
 Disable security on authentication/authorization APIs provided by the **SESCrawlerExport**. (Clear the **Disable the security on authentication/authorization APIs provided by the SESCrawlerExport** checkbox.)
 - g. Restart Oracle Content Server.
2. Take a snapshot of the Oracle Content Server repository.
 - a. Log on to Oracle Content Server as a system administrator. For example: `http://host:port/idc`.
 - b. From the Administration dropdown menu, select **SES Crawler Export**.
 - c. Select **All sources**, and click **Take Snapshot**.

Figure 18–9 Oracle Content Server Snapshot

It is important to take a snapshot before the first crawl or any subsequent full crawl of the source.

The snapshot generates `configFile.xml` at the location specified during component installation, and feeds are created at the subdirectory with the source name under **feedLoc**.

For detailed information on Oracle Content Server configuration, see the `Deployment Guide.pdf` included with the product.

18.4.4 Setting Up Oracle WebCenter Discussions for Oracle SES Search

This section describes how to configure Oracle WebCenter Discussions to be crawlable by Oracle SES (in particular, the Oracle WebCenter Discussions Server that WebCenter Spaces uses for storing discussions and announcements).

Note: These steps is not required if you have a new installation of WebCenter (with an Oracle database) and Oracle WebCenter Discussions. It is only required if you are using upgraded (patched) instances.

You can find database schema details for the corresponding data sources from your Oracle WebLogic Server console.

1. Run the Repository Creation Utility (RCU) to confirm that the Discussions Crawler WebCenter component has been installed on the system.

Verify that the Oracle WebCenter Discussions back end has been configured properly by noting that the *MyPrefix_DISCUSSIONS* user is installed in RCU.

Then verify that the Oracle WebCenter Discussions Crawler has been configured properly by noting that the *MyPrefix_DISCUSSIONS_CRAWLER* user is installed in RCU.

If the Discussions Crawler component is not installed, then you must install it using RCU, selecting the same prefix that was used for the Oracle WebCenter Discussions component. Also, during the tablespace specification step in RCU, select *Prefix_IAS_DISCUSSIONS* as the default tablespace. This installs the user for Oracle SES.

For more information, see [Chapter 7, "Deploying WebCenter Applications."](#)

2. Run the following tool to upgrade the data in the Oracle WebCenter Discussions database schema, if you have not run the tool already.

```
java -jar \
$MW_HOME/discussionserver/discussionserver-upgradeforses.jar \
<command_line_parameters>
```

where *command_line_parameters* are the following MDS schema details and discussions database schema details:

```
-mds_jdbc_user user_id \
-mds_jdbc_password password \
-mds_jdbc_url url \
-discussions_jdbc_user user_id \
-discussions_jdbc_password password \
-discussions_jdbc_url url
```

where *mds_jdbc_user*, *mds_jdbc_password*, and *mds_jdbc_url* are the values to log into the MDS schema, and *discussions_jdbc_user*, *discussions_jdbc_password*, and *discussions_jdbc_url* are the values to log into the discussions database schema.

For example:

```
java -jar
$MW_HOME/as11r1wc/discussionserver/discussionserver-upgradeforses.jar \
-mds_jdbc_user foo \
-mds_jdbc_password welcome1 \
-mds_jdbc_url jdbc:oracle:thin:@host:port:SID \
-discussions_jdbc_user foo \
-discussions_jdbc_password welcome1 \
-discussions_jdbc_url jdbc:oracle:thin:@host:port:SID
```

18.4.5 Setting Up Oracle SES to Search WebCenter Spaces

The steps in this section must be performed in the Oracle SES administration tool.

The following steps are required:

1. [Chapter 18.4.5.1, "Logging on to the Oracle SES Administration Tool"](#)
2. [Section 18.4.5.2, "Setting up Oracle SES to Search Documents"](#)
3. [Section 18.4.5.3, "Setting Up Oracle SES to Search Discussions and Announcements"](#)
4. [Section 18.4.5.4, "Setting Up Oracle SES to Search Group Spaces, Lists, Pages, People, Wikis and Blogs"](#)
5. [Section 18.4.5.5, "Additional Oracle SES Configuration"](#)

Tip: For detailed information about Oracle SES configuration steps, see the Oracle SES documentation on the Oracle Fusion Middleware documentation library (in the WebCenter product area).

18.4.5.1 Logging on to the Oracle SES Administration Tool

To open the Oracle SES administration tool:

1. Open a browser and enter the URL provided after the installation. (This has the form `http://host:port/search/admin/index.jsp`.)
2. Log on with the user name `eqsys` and the password specified during installation.

18.4.5.2 Setting up Oracle SES to Search Documents

To search WebCenter Spaces documents using Oracle SES, you must first set up a Document Service Manager (with a Document Service Instance and a Document Service Pipeline), and then create an Oracle Content Server source.

1. Configure the Document Service Manager (one time for each Oracle SES instance).

Note: Document services are plug-ins involved in the processing of a document when it is being crawled. A document service allows WebCenter to add indexable attributes for documents used in a WebCenter Spaces application.

- a. On the Global Settings - Document Services page, click **Create**. Select **Create New Manager**, click **Next**, and enter the following parameters:

Manager Class Name:

`oracle.webcenter.search.crawl.ucm.ses.WcUcmDsManager`

Manager Jar File Name: `search-crawl-ucm.jar`

Click **Next**, and then click **Finish**.

- b. Create the Documents Service Instance.

Again, on the Global Settings - Document Services page, click **Create**. This time, select **Select From Available Managers** with the **Secure Enterprise Search WebCenter UCM Plug-in**. Click **Next**, and, in addition to the entering an instance name, enter the following parameters:

WebCenter Application Name: The unique name being used to identify this WebCenter Spaces application in the back-end Oracle Content Server.

Connection Name: The name of the primary Oracle Content Server connection that WebCenter Spaces is using to store group space and personal space documents.

WebCenter URL Prefix: The host and port where the WebCenter Spaces application is running; for example: `http://myhost:8888`

Note: Use the `listDocumentsSpacesProperties` command to determine the application name and connection name for WebCenter Spaces, as described in [Section 18.4.2, "Setting Up WebCenter Spaces for Oracle SES Search."](#)

- c. Create the Document Services Pipeline. This invokes the document service instance.

Again, on the Global Settings - Document Services page, under the **Document Services Pipelines** section, click **Create**.

Enter a name and select the instance created in the previous step.

- 2. Create the Oracle Content Server source for documents.

- a. Go to **Home > Sources**.
- b. From the Source Type dropdown list, select **Oracle Content Server**. Click **Create**, and enter the following parameters:

Source Name: *unique_name*

Configuration URL: *Content_Server_SES_Crawler_Export_endpoint*;
for example,
`http://host:port/idc/idcplg?IdcService=SES_CRAWLER_DOWNLOAD_CONFIG&source=default`

Note: The `source=default` parameter denotes the name of the source created in the configuration of the SES Crawler Export. The default one is created automatically and called "default".

Authentication Type:

If Oracle Content Server is not protected by SSO, then enter `NATIVE`.

If Oracle Content Server is protected by Oracle SSO, then enter `ORASSO`.

User ID:

If Authentication Type is `NATIVE`, then enter `sysadmin`.

If Authentication Type is `ORASSO`, then enter a user ID (and password) of a user in the identity management server fronted by Oracle SSO. This user must have been granted the same permissions as `sysadmin`. If it is not possible to grant those permissions, then delete the "remote" user corresponding to this user in Oracle Content Server, and create a "local" version of the user (same name) in Oracle Content Server.

Password: Password for this Oracle Content Server user.

Realm:

If Authentication Type is `NATIVE`, then enter "Idc Security /idc/idcplg", where /idc/ is the context root you provided when you installing Oracle Content Server.

If Authentication Type is `ORASSO`, then leave this parameter blank.

Scratch Directory: Specify a directory on the system under which the Oracle SES instance resides.

Oracle SSO Login URL:

If Authentication Type is `ORASSO`, then specify a value for Oracle SSO. For example:

`https://login.oracle.com/mysso/signon.jsp?site2pstoretoken =`

If Authentication Type is `NATIVE`, then leave this field blank.

Oracle SSO Action URL:

If Authentication Type is `ORASSO`, then specify a value for Oracle SSO. For example: `https://login.oracle.com/sso/auth`

If Authentication Type is `NATIVE`, then leave this field blank.

Click **Next**.

- c. On the Create User-Defined Source : Step 2 : Authorization page, enter the following parameters in the Authorization Manager section, if not already entered by default:

Plug-in Class Name:

`oracle.search.plugin.security.auth.stellent.StellentAuthManager`

Jar File Name: `oracleapplications/StellentCrawler.jar`

HTTP endpoint for authorization: for example,

`http://host:port/idc/idcplg`

Display URL Prefix: for example, `http://host:port/idc`

Authentication Type: `NATIVE`

Administrator User: Crawl admin user you registered in [Section 18.4.1, "Setting Up Oracle SES for WebCenter Spaces"](#); for example, `mycrawladmin`

Administrator Password: Password for crawl admin user

Authorization User ID Format: Authentication attribute used in the active identity plug-in. To find this value, go to the Global Settings - Identity Management Setup page in Oracle SES. Enter the value of the Authentication Attribute under the Active Plug-in (for example, `nickname` or `username` or something else). If you are using the Oracle E-Business Suite R12 identity plug-in, then leave the this parameter blank.

Realm:

If Authentication Type is `NATIVE`, then enter "Idc Security /idc/idcplg", where /idc/ is the context root you provided when you installing Oracle Content Server.

If Authentication Type is `ORASSO`, then leave this field blank.

- d. Click **Create & Customize** (or edit a created source) to see other source parameters. On the **Crawling Parameters** tab, enter the following crawling parameter:

Document Service Pipeline

- e. Click **Enable** and select the pipeline you created.

18.4.5.3 Setting Up Oracle SES to Search Discussions and Announcements

To search WebCenter Spaces discussions and announcements using Oracle SES, you must first set up two Oracle SES Database sources: one for discussions and one for announcements. For example, the discussions source might have the source name `GS_Discussions` and a View of `FORUMCRAWLER_VW`, and the announcements source might have the source name `GS_Announcements` and a View of `ANNOUNCEMENTS_VW`.

Notes: There are slightly different steps for Oracle and Microsoft SQL Server databases.

1. Required for Microsoft SQL Server database only:

Copy the Microsoft JDBC driver file `sqljdbc.jar` into directory `OracleSES_Home/search/lib/plugins/oracleapplications` in the Oracle SES instance.

2. Create a Discussions source or an Announcements source.

- a. In Oracle SES, go to **Home > Sources**.
- b. From the Source Type dropdown list, select **Database**. Click **Create**, and enter the following parameters:

Source Name: *unique_name*; for example, `GS_Discussions` to crawl discussions or `GS_Announcements` to crawl announcements

Database Connection String: Enter one of the following

- For an Oracle database, enter one of the following

`jdbc:oracle:thin:@host:port:sid`

`jdbc:oracle:thin@host:port/serviceId`

- For a Microsoft SQL Server database, enter

`jdbc:sqlserver://host_or_IP_address:port;database_name`

User ID: Enter the user `MyPrefix_DISCUSSIONS_CRAWLER` created during Oracle WebCenter Discussions installation

Password: Password for this user

View:

For an Oracle database, enter either `FORUMCRAWLER_VW` or `ANNOUNCECRAWLER_VW`: Use `FORUMCRAWLER_VW` for the source crawling discussion forums, and use `ANNOUNCECRAWLER_VW` for the source crawling announcements.

For a Microsoft SQL Server database, leave this parameter blank.

Query:

For an Oracle database, leave this parameter blank.

For a Microsoft SQL Server database, enter one of the following queries:

```
SELECT * FROM FORUMCRAWLER_VW
SELECT * FROM ANNOUNCECRAWLER_VW
```

Use FORUMCRAWLER_VW for the source crawling discussion forums, and use ANNOUNCECRAWLER_VW for the source crawling announcements.

URL Prefix: The URL prefix for the WebCenter Spaces application, including host and port; for example, `http://host:port/`

Grant Security Attributes: FORUMID

- c. Click **Next**.
- d. On the Create User-Defined Source : Step 2 : Authorization page, enter the following parameters (if not already prepopulated) in the Authorization Manager section:

Plug-in Class Name:

`oracle.search.plugin.security.auth.db.DBAuthManager`

Jar File Name: `oracleapplications/DBCrawler.jar`

Authorization Database Connection String: Enter one of the following:

- For an Oracle database, enter one of the following:

`jdbc:oracle:thin:@host:port:sid`

`jdbc:oracle:thin@host:port/serviceId`

- For a Microsoft SQL Server database, enter

`jdbc:sqlserver://host_or_IP_address:port;database_name`

User ID: Enter the user `MyPrefix_DISCUSSIONS_CRAWLER`

Password: This user password

Single Record Query: `false`

Authorization Query: Enter the following (on one line):

```
SELECT forumID
FROM AUTHCRAWLER_FORUM_VW
WHERE (username = ? or userID=-1)
UNION SELECT f.forumID
FROM jiveForum f, AUTHCRAWLER_CATEGORY_VW c
WHERE f.categoryID = c.categoryID AND (c.username = ? or userID=-1)
```

Authorization User ID Format: Authentication attribute used in the active identity plug-in. To find this value, go to the Global Settings - Identity Management Setup page in Oracle SES. Enter the value of the Authentication Attribute under the Active Plug-in (for example, `nickname` or `username` or something else).

If you are using the Oracle E-Business Suite R12 identity plug-in, then leave the this parameter blank.

- e. Click **Create** to complete the source creation.

18.4.5.4 Setting Up Oracle SES to Search Group Spaces, Lists, Pages, People, Wikis and Blogs

In Oracle SES, you must first create the WebCenter source type and then set up a WebCenter source to search WebCenter Spaces objects like group spaces, lists, pages, people, wikis and blogs.

1. Create the WebCenter (Secure RSS) *source type* in Oracle SES. This source type only needs to be created one time in the Oracle SES instance.

- a. Go to the Global Settings - Source Types page. Click **Create**, and enter the following:

Name: Enter a name for the source type; for example, *SecureWebCenterRss*

Plug-in Manager Java Class Name:

`oracle.search.plugin.rss.RSSSecureCrawlerMgr`

Plug-in Jar File Name: `oracleapplications/rsscrawler.jar`

Note: The plug-in collects document attributes and contents to submit to the crawler. The crawler uses this information to index the documents.

- b. Click **Next**, and on the following page click **Finish** to accept the default values.

2. Create the WebCenter source.

- a. Go to the **Home > Sources** page.

- b. From the **Source Type** dropdown list, select the source type name you entered in the previous step (for example, **SecureWebCenterRss**). This is the source type you created in the previous step. Click **Create**, and enter the following source parameters:

Source Name: *unique_name*

Configuration URL: *host:port_of_WebCenterSpaces/rsscrawl*; for example, `http://myhost:8888/rsscrawl`

Authentication Type: BASIC

User ID: Crawl admin user you registered in [Section 18.4.1, "Setting Up Oracle SES for WebCenter Spaces"](#); for example, `mycrawladmin`

Password: Password for the crawl admin user

Realm: `jazn.com`

Scratch Directory: Specify a directory on the system under which the Oracle SES instance resides.

Oracle SSO Login URL:

Leave this field blank.

Oracle SSO Action URL:

Leave this field blank.

Click **Next**.

- c. On the Create User-Defined Source : Step 2 : Authorization page, enter the following parameters in the Authorization Manager section:

Plug-in Class Name:

oracle.webcenter.search.auth.plugin.WebCenterAuthManager

Jar File Name: webcenter/search-auth-plugin.jar

Click the **Get Parameters** button to display the following additional parameters:

Authorization Endpoint:

host:port_of_WebCenterSpaces/sesUserAuth; for example,
http://myhost:8888/sesUserAuth

Realm: jazn.com

User ID: Crawl admin user you registered in [Section 18.4.1, "Setting Up Oracle SES for WebCenter Spaces"](#); for example, mycrawladmin

Password: Password for the crawl admin user

Authorization User ID Format: Authentication attribute used in the active identity plug-in. To find this value, go to the Global Settings - Identity Management Setup page in Oracle SES. Enter the value of the Authentication Attribute under the Active Plug-in (for example, nickname or username or something else). If you are using the Oracle E-Business Suite R12 identity plug-in, then leave the this parameter blank.

- d. Click **Create** to complete the source creation.

Note: If WebCenter is fronted with an Oracle HTTP Server, then the Configuration URL and the Authorization Endpoint used in this example would require the following in `mod_wl_ohs.conf` file.

In a non-clustered environment:

```
<Location /rsscrawl>
SetHandler weblogic-handler
WebLogicHost host_name
WebLogicPort port
</Location>
```

```
<Location /sesUserAuth>
SetHandler weblogic-handler
WebLogicHost host_name
WebLogicPort port
</Location>
```

In a clustered environment:

```
<Location /rsscrawl>
WebLogicCluster host_name1:port,host_name2:port
SetHandler weblogic-handler
</Location>
```

```
<Location /sesUserAuth>
WebLogicCluster host_name1:port,host_name2:port
SetHandler weblogic-handler
</Location>
```

where *host_name1* and *host_name2* are the cluster nodes, and *port* is the listening port number of the managed server on which the WebCenter application is deployed.

18.4.5.5 Additional Oracle SES Configuration

1. Create a *source group* that includes the names of the Oracle Content Server, Discussions, Announcements, and WebCenter services sources you created.
 - a. Go to the Search - Source Groups page, and click **Create**.
 - b. Enter the same source group name used in [Section 18.4.2, "Setting Up WebCenter Spaces for Oracle SES Search."](#)
 - c. From the **Select Source Type** dropdown list, select each source type (Database, Oracle Content Server, Secure Rss), and then from the Available Sources listed for each source type, move the source you created for that source type into the Assigned Sources list.
 - d. Click **Finish**.
2. Optionally configure the security filter lifespan. This refreshes the authorization policies for users in the system. It is best to have a short lifespan when user policies change frequently. (This example set up has the Oracle Internet Directory identity plug-in as the security filter.)

For example, on the Global Settings - Query Configuration page, under **Secure Search Configuration**, enter 0 for **Security Filter Lifespan (minutes)**.

Valid values for the security filter lifespan are between 0 minutes (no cache) and 526500 minutes (cache for one year).

3. To index everything, you must force a full crawl for each source; that is, you must change the existing incremental crawl schedule for each source to first process ALL documents.

This step is very important, in that searching will not work unless the content is first indexed completely.

Go to the Home - Schedules page, select the source schedule, and click **Edit** to force a full crawl.

After each source has been crawled, go back to the same page and change the crawl policy back to incremental (index documents that have changed since the previous crawl). Also, in the Frequency section of the page, select a non-manual type for running incremental crawl (for example, weekly or daily).

Note: Before the first crawl of Oracle Content Server, remember to go to the Oracle Content Server Administration page, select **SES Crawler Export**, and take a snapshot. For more information, see [Section 18.4.3, "Setting Up Oracle Content Server for Oracle SES Search."](#)

18.5 Troubleshooting Issues with Search

This section provides troubleshooting tips on administering the Search service.

18.5.1 Cannot Grant View Permissions to WebCenter Spaces

Problem

You get the following error when granting "view" permissions, as described in [Section 18.4.2, "Setting Up WebCenter Spaces for Oracle SES Search."](#)

```
Command FAILED, Reason: javax.naming.directory.AttributeInUseException: [LDAP: e
```

```
rror code 20 - uniquemember attribute has duplicate value.]; remaining name 'orclguid=F0CC506017B711DFBFFED9EA6A94EAEC,cn=Permissions,cn=JAAS Policy,cn=webcenter,cn=wc_domain,cn=JPSTContext,cn=jpsroot_webcenter_dadvmc0057'
```

Solution

This error appears if the permissions have been granted already. Ignore the error.

18.5.2 Oracle SES Cannot Search WebCenter Objects

Problem

The configuration for using Oracle SES to search WebCenter objects does not work.

Solution

1. Confirm that you have installed all required patches for Oracle SES. For the latest information on required patches, see "Back-End Requirements for the Search Service" in *Oracle Fusion Middleware Installation Guide for Oracle WebCenter* and the Release Notes.
2. Confirm that Oracle SES is configured with an identity management system to validate and authenticate users. Also confirm that WebCenter and Oracle SES use the same identity management system, such as Oracle Internet Directory. If you are using multiple crawler types (WebCenter Spaces crawler, Documents crawler, and Discussions crawler) on your Oracle SES instance, then each of those repositories (WebCenter Spaces, Oracle Content Server, and Oracle WebCenter Discussions) must share the same user base as Oracle SES.

Additionally, for identity propagation to work, the Oracle SES identity management system must contain a user that represents applications or trusted federation entities.

To test the Oracle SES is connection with a federated trusted entity user, see [Section 18.3.5, "Testing Oracle SES Connections."](#)

3. Monitor the crawl process in the Oracle SES administration tool by using a combination of the following:
 - Check the crawler progress and status on the Home - Schedules page. (Click **Refresh Status**.) From the Status page, you can view statistics of the crawl.
 - Monitor your crawler statistics on the Home - Schedules - Crawler Progress Summary page and the Home - Statistics page.
 - Monitor your search statistics on the Home - General page and the Home - Statistics page.

See the *Oracle Secure Enterprise Search Administrator's Guide* for tips to tune crawl performance.

18.5.3 "Results Not Currently Available" with Oracle SES Results

Problem

The "Results Not Currently Available" message appears after a search. This may appear inconsistently, such as after you click the **More** button on the search results dialog.

Solution

This message appears when the service times out. This largely depends on the load of the system. To alleviate this problem, adjust the `Execution Timeout` parameter.

For more information, see [Section 18.3.1, "Registering Oracle SES Services."](#)

Managing the Wiki and Blog Services

This chapter describes how to configure and manage the Wiki and Blog services for WebCenter Spaces and custom WebCenter applications deployed to Oracle WebLogic Server.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter applications. Any changes that you make to WebCenter applications, post deployment, are stored in the MDS metadata store as customizations. For information, see [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

Note: Changes that you make to WebCenter services configuration, through Fusion Middleware Control or using WLST, are not dynamic. So, for your changes to take effect you must restart the managed server to which your WebCenter application is deployed. For information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

This chapter includes the following sections:

- [Section 19.1, "What You Should Know About the Wiki and Blog Server Connections"](#)
- [Section 19.2, "Oracle WebCenter Wiki and Blog Server Prerequisites"](#)
- [Section 19.3, "Registering Oracle WebCenter Wiki and Blog Server"](#)
- [Section 19.4, "Choosing the Active Wiki and Blog Server Connection"](#)
- [Section 19.5, "Modifying the Wiki and Blog Server Connection Details"](#)
- [Section 19.6, "Deleting Wiki and Blog Server Connections"](#)
- [Section 19.7, "Testing Wiki and Blog Server Connections"](#)
- [Section 19.8, "Monitoring Oracle WebCenter Wiki and Blog Server"](#)
- [Section 19.9, "Troubleshooting Issues with Wiki and Blogs"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

19.1 What You Should Know About the Wiki and Blog Server Connections

A wiki is a collection of useful content or information that users can browse and can update and remove, sometimes without the need for registration. This ease of interaction and the variety of operations makes wiki an effective tool for collaborative authoring, where multiple people create written content together using the wiki markup language. Blogs provide a useful tool for discussing and/or evangelizing any type of idea, strategy, or point of view. Blogs may be projected out to a select group of people or to a wider audience. Typically, blogs invite readers to comment on the overall concepts.

The Wiki service enables integration of wikis into WebCenter applications. The Blog service provides the ability to expose blogs on application pages.

Both the Wiki service and the Blog service rely on Oracle WebCenter Wiki and Blog Server at the back end. The Wiki and Blog services require a connection to the server. Both the services use the same connection to connect to the server.

19.2 Oracle WebCenter Wiki and Blog Server Prerequisites

This section contains the following subsections:

- [Section 19.2.1, "Oracle WebCenter Wiki and Blog Server - Installation"](#)
- [Section 19.2.2, "Oracle WebCenter Wiki and Blog Server - Configuration"](#)
- [Section 19.2.3, "Oracle WebCenter Wiki and Blog Server - Security Considerations"](#)
- [Section 19.2.4, "Oracle WebCenter Wiki and Blog Server - Limitations"](#)

19.2.1 Oracle WebCenter Wiki and Blog Server - Installation

Oracle WebCenter Wiki and Blog Server is a component of Oracle WebCenter. You can install Oracle WebCenter Wiki and Blog Server while installing Oracle WebCenter, or you can install it later by extending your existing WebCenter domain. For information about installing Oracle WebCenter Wiki and Blog Server, see *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

19.2.2 Oracle WebCenter Wiki and Blog Server - Configuration

This section describes the basic administration and configuration tasks you can perform on Oracle WebCenter Wiki and Blog Server.

Note: Depending on your requirements, you may need to perform only some of the configuration tasks listed in this section.

This section contains the following subsections:

- [Section 19.2.2.1, "What You Should Know About Oracle WebCenter Wiki and Blog Server"](#)
- [Section 19.2.2.2, "Accessing the Oracle WebCenter Wiki and Blog Server"](#)
- [Section 19.2.2.3, "Setting Up Domains and Menus"](#)
- [Section 19.2.2.4, "Changing the Theme"](#)
- [Section 19.2.2.5, "Creating a User Interface Template"](#)

- [Section 19.2.2.6, "Unlocking a Page"](#)
- [Section 19.2.2.7, "Managing Users and Roles"](#)
- [Section 19.2.2.8, "Blocking an IP Address"](#)
- [Section 19.2.2.9, "Deleting Wiki Pages and Blog Entries"](#)
- [Section 19.2.2.10, "Specifying Configuration Parameters"](#)
- [Section 19.2.2.11, "Importing Templates and Attachments"](#)
- [Section 19.2.2.12, "Specifying Features Supported on Oracle WebCenter Wiki and Blog Server"](#)
- [Section 19.2.2.13, "Configuring application_config_script"](#)
- [Section 19.2.2.14, "Generating the Passcode"](#)
- [Section 19.2.2.15, "Backing Up and Restoring Wiki Content"](#)

19.2.2.1 What You Should Know About Oracle WebCenter Wiki and Blog Server

When you log on to your Oracle WebCenter Wiki and Blog Server, the home page of the default wiki domain is displayed. The server displays a toolbar of useful links across the top of the page, a search feature, a domain-specific menu on the navigation panel on the left, and additional navigation under the **General** heading, as shown in [Figure 19–1](#).

For administrators, Oracle WebCenter Wiki and Blog Server displays an extra **Administration** link on the top header.

Note: The supported browsers for Oracle WebCenter Wiki and Blog Server are Internet Explorer 7.0 or later, Mozilla Firefox 2.0 or later, and Apple Safari 4.0 or later.

Figure 19–1 Oracle WebCenter Wiki and Blog Server Interface

Note: The wiki and blog server provides the **logout** link. The link can be customized to any URL based on the single sign-on scheme used. To customize the link, you can modify the `logout_url` variable in the `application_config.script` file. Leaving `logout_url` blank renders the user session invalid and redirects to the login screen.

The `application_config.script` file is located in the `WEB-INF/classes` directory of your deployed Oracle WebCenter Wiki and Blog Server.

This section contains the following subsections:

- [Section 19.2.2.1.1, "About the General Menu"](#)
- [Section 19.2.2.1.2, "About Administration Mode"](#)

19.2.2.1.1 About the General Menu The General menu is a default menu and cannot be edited. You use the General menu to perform common operations on Oracle WebCenter Wiki and Blog Server.

[Table 19–1](#) describes the links available in the General menu of a wiki domain.

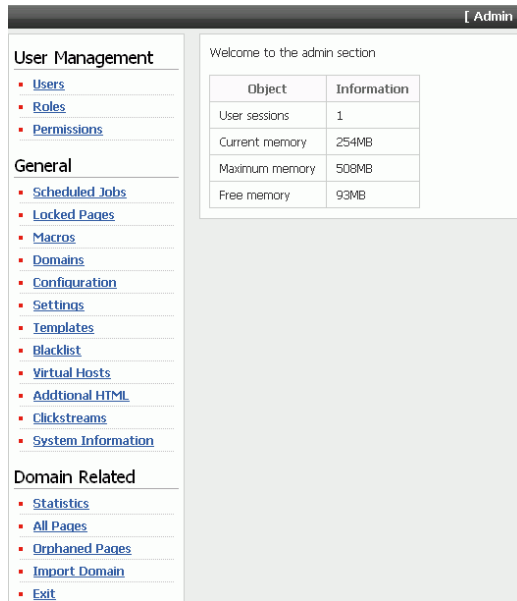

Table 19–1 Links Available Under the General Menu

Link	Description
Activities	<p>Displays the Latest activities page that lists recent activities related to wiki pages and blog entries.</p> <p>The Latest activities page summarizes activities on domain pages, including the thing acted upon (such as blog entry), the action performed (such as Deleted), a link to the changed object, the user name of the person performing the action, and the date and time the action was performed. The page lists the following activities:</p> <ul style="list-style-type: none"> ■ Wiki pages added, updated, or deleted ■ Blog entries added, updated, or deleted ■ Blog comments added or deleted
All Pages	Displays a list of all wiki pages in the current domain.
All Blogs	Displays a list of all personal and domain blogs. You can access different blogs to add blog entries and manage blog authors.
Domain Information	Summarizes useful information about the current domain, such as details about popular pages and recently updated pages.
Recently Changed	Displays a list of recently updated wiki pages.
Popular Pages	Displays a list of wiki pages, in the current domain, with the most number of page views.
New Wiki Page	Enables you to create a new wiki page in the current domain.

19.2.2.1.2 About Administration Mode To configure Oracle WebCenter Wiki and Blog Server, you use Administration mode of the server. You access Administration mode by clicking the **Administration** link. ([Figure 19–2](#))

Figure 19–2 Administration Link

Figure 19–3 shows all the links available in Administration mode.

Figure 19–3 Administration Mode

Administration mode contains various links that you can use to configure settings specific to the current domain or the entire wiki and blog server. Table 19–2 describes the links available in Administration mode.

Table 19–2 Links in Administration Mode of Oracle WebCenter Wiki and Blog Server

Link	Description
User Management	
Users	Displays details, such as the name, e-mail address, status, and role of all wiki users. You can use this link to add new users, block or unblock users, reset their password, and edit their profile to assign them different roles. For more information, see Section 19.2.2.7.1, "Managing Users." Note: When you deploy Oracle WebCenter Wiki and Blog Server by leveraging single sign-on security, users are not initially imported from the security store. A user entry is created on Oracle WebCenter Wiki and Blog Server only upon first login by that user.
Roles	Enables you to add a new role and edit a role to manage permissions. For information about how to assign permissions to a role, see Section 19.2.2.7.2, "Managing Permissions for a Role."
Permissions	Displays a list of permissions that you can assign to various roles.
General	

Table 19–2 (Cont.) Links in Administration Mode of Oracle WebCenter Wiki and Blog

Link	Description
Scheduled Jobs	<p>Displays a list of administrative jobs that you can run. For example, you can run <code>DailyIndexerJob</code> for updating the search index and <code>ActivityPublishJob</code> for publishing activities from the Activities list to the Activity Stream feature of the WebCenter Spaces People Connections service. For information about activities published, see the Activities row in Table 19–1.</p> <p>The <code>ActivityPublishJob</code> communicates with the Activity Stream in Oracle WebCenter by using the <code>WEBCENTER</code> schema. Therefore, you must ensure that the <code>WEBCENTER</code> schema is created in your Oracle WebCenter database. For information about schemas, see the section, "Create Schemas for Oracle WebCenter" in the <i>Oracle Fusion Middleware Installation Guide for Oracle WebCenter</i>.</p> <p>The Scheduled Jobs link also shows the next time a job is scheduled to run. If you wish a job to run sooner, use the run now link.</p>
Locked Pages	<p>Displays details of pages that have been locked. Details include name of the user who locked the page, the time when the page was locked, and the time when the page will get unlocked automatically.</p> <p>To unlock a page, you can either wait for the time of the automatic unlock, or as an administrator, you can manually unlock a page by clicking the remove lock link.</p> <p>For information about how to unlock a page, see Section 19.2.2.6, "Unlocking a Page."</p>
Macros	<p>Enables you to execute complex or specialized functions on a wiki page. You can invoke a macro by using the <code><macro:></code> tag.</p> <p>Oracle WebCenter Wiki and Blog Server includes several sample macros, such as <code>TaskMacro</code> and <code>Link</code>. The Macro page provides a list and description of all sample macros.</p>
Domains	<p>Displays a list of all domains and domain details, such as page counts and the name of the domain home page. It also displays the total number of domains and pages on your wiki and blog server.</p> <p>The Domains link also enables you to add or delete a domain, edit details of a domain, and specify the members who can manage a domain. For information about how to manage domains, see Section 19.2.2.3, "Setting Up Domains and Menus."</p>
Configuration	<p>Enables you to configure your wiki and blog server by specifying details such as the default domain and wiki theme.</p> <p>For more information, see Section 19.2.2.10, "Specifying Configuration Parameters."</p>
Settings	<p>Enables you to specify your wiki and blog server settings. You can specify details such as whether attachments, page ratings, and trackbacks are supported.</p> <p>For more information, see Section 19.2.2.12, "Specifying Features Supported on Oracle WebCenter Wiki and Blog Server."</p>
Templates	<p>Enables you to add, view, edit, and delete templates used for creating wiki pages.</p> <p>For more information, see Section 19.2.2.5, "Creating a User Interface Template."</p>

Table 19–2 (Cont.) Links in Administration Mode of Oracle WebCenter Wiki and Blog

Link	Description
Blacklist	Enables you to block certain IP addresses from adding or editing pages on your Oracle WebCenter Wiki and Blog Server. However, a blocked IP address can access the server to view pages. For more information, see Section 19.2.2.8, "Blocking an IP Address."
Virtual Hosts	Enables you to create multiple sites within Oracle WebCenter Wiki and Blog Server, differentiated by their host names.
Additional HTML	Enables you to define the additional HTML header and footer information that appears on every wiki page.
Clickstreams	Enables you to monitor the pages or functions that your users have accessed or clicked. Users are identified by their IP addresses. This link shows the IP addresses of users and the URLs accessed.
System Information	Displays the version number of your Oracle WebCenter Wiki and Blog Server. The version is the open source version number. The Build option refers to the Oracle version and the build number.
Domain Related	
Statistics	Displays statistics of the current domain for the specified time period. Domain statistics include the names of wiki pages viewed, the page view count, and the dates on which pages were last viewed within the specified date range.
All Pages	Displays details of all the pages within the current domain. You can use this link to delete a wiki page or to reduce the versions of that wiki page available on the server. For more information, see Section 19.2.2.9, "Deleting Wiki Pages and Blog Entries."
Orphaned Pages	Displays the pages that are not linked to any other page.
Export Domain	Enables you to publish wiki pages in a domain as HTML files so that the pages can be placed on a web server and accessed directly. Note: By default, the Export Domain link is not available. To access this link, you must enable the ExportDomain permission for the ADMIN role.
Import Domain	Enables you to point to a directory containing wiki pages, like wiki pages of the 10.1.3.2 version of the wiki and blog server, and import the domain into the database-based repository. For information about importing domains, see the section, "Migrating the Wiki Data" in the <i>Oracle Fusion Middleware Upgrade Guide for Oracle SOA Suite, WebCenter, and ADF</i> .
Exit	Exits Administration mode.

19.2.2.2 Accessing the Oracle WebCenter Wiki and Blog Server

You can access the Oracle WebCenter Wiki and Blog Server by using the following URL format:

```
http://host:port/owc_wiki
```

Where:

- *host:port* refer to the host and the port number of the server where you deployed Oracle WebCenter Wiki and Blog Server.
- *owc_wiki* refers to the deployment directory of your Oracle WebCenter Wiki and Blog Server.

For example, if the managed server where you deployed Oracle WebCenter Wiki and Blog Server is running on port 8001, you can access Oracle WebCenter Wiki and Blog Server by using the following path:

```
http://localhost:8001/owc_wiki
```

19.2.2.3 Setting Up Domains and Menus

Domains are an organizing model on Oracle WebCenter Wiki and Blog Server similar to folders on a file system. A wiki domain encompasses an identified group of wiki pages. It helps you organize wiki pages and secure them by role or specific users. Each wiki domain contains an associated blog, where blog authors can create blog entries and users can post comments.

As a wiki administrator, you can create, edit, or delete domains and manage domain members and blog authors. You can also create and edit domain menus to enable easy access to pages within each domain. This section discusses basic domain and menu administration tasks.

This section contains the following subsections:

- [Section 19.2.2.3.1, "Adding a Domain"](#)
- [Section 19.2.2.3.2, "Editing a Domain Menu"](#)
- [Section 19.2.2.3.3, "Managing Domain Members"](#)
- [Section 19.2.2.3.4, "Managing Blog Authors"](#)

19.2.2.3.1 Adding a Domain

To create a new domain:

1. Log on to Oracle WebCenter Wiki and Blog Server as an administrator and access Administration mode.
2. In the navigation panel on the left, under **General**, click **Domains**.
The **Domains** page lists all the wiki domains on the server.
3. On the **Domains** page, click **add** to create a new domain.
4. Enter a domain name, a description, and a name for the home page, also called the start page, of your domain, as shown in [Figure 19-4](#).

Figure 19-4 Adding a New Domain

Add domain

Name:

Description:

Startpage :

5. Click **Save**.

The newly created domain is listed on the Domains page, as shown in [Figure 19-5](#).

Figure 19–5 List of Domains

[Domains]						
add						
Name	Description	Startpage	Page Count	Created	Actions	
owc_wiki	All about owc_wiki	WelcomePage	13	fmwadmin at 10/14/2008 17:23	edit	delete manage members
Seattle	Wiki Domain For Seattle Support Training	SeattleHome	2	fmwadmin at 12/25/2008 22:27	edit	delete manage members

- In the **Startpage** column, click the start page link of the new domain to navigate directly to the new domain.

To exit Administration mode, under **General**, click **Exit**. This displays the wiki page of the last domain that you accessed before entering Administration mode.

Note: You can also create a domain by using the `scope` parameter in a wiki URL in any WebCenter application. If the specified domain does not exist, it is automatically created with the name specified in the `scope` parameter. The parameter also creates a start page named `WelcomePage`. For more information, see the "Integrating Oracle WebCenter Wiki and Blog Server" chapter in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

After creating a new domain, you can create wiki pages and blog entries in the domain. For information, see the "Working with Wikis and Blogs" chapter in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

19.2.2.3.2 Editing a Domain Menu As an administrator, you can create or edit the menu of a domain. The domain-specific menu appears at the top in the navigation panel. [Figure 19–6](#) shows the menu of the default domain, `owc_wiki`.

A menu comprises menu topics, which display as headers. Menu topics contain menu items. For example, in the `owc_wiki` domain, **Documentation** is a menu topic and **Home** is a menu item. Menu topics display on the navigational panel in the order in which you create them.

A newly created domain contains an empty wiki page named **Menu**. You use this page to create or edit the domain's menu. You can edit the **Menu** wiki page by using the **edit menu** link on the navigation panel.

Figure 19–6 Domain Menu

Note: You can configure Oracle WebCenter Wiki and Blog Server to display the required wiki management tools. You use the query string parameter `inline` to control how much wiki capability to render. The navigation panel on the left and the **Menu** wiki page appear when `inline=0`. The **edit menu** link appears only when `inline=0` and the user is an administrator.

When using `inline=1`, the **Menu** wiki page does not appear. Instead a menu is auto-generated showing all wiki pages in the domain. For information about `inline` modes, see the "Integrating Oracle WebCenter Wiki and Blog Server" chapter in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

To modify the menu of a domain:

1. Log on to Oracle WebCenter Wiki and Blog Server as an administrator.
2. Click the **All Domains** link on the toolbar of links on the top-left corner of your wiki and blog server user interface. (Figure 19–7)

You do not need to access Administration mode to edit a domain menu.

Figure 19–7 All Domains Link

3. Click the start page link of the domain for which you wish to edit the menu.
4. Click the **edit menu** link. Figure 19–8 shows the blank menu of a newly created domain.

Tip: When you click the **edit menu** link, the Edit Page displays. You can also access the Edit Page by clicking **All Pages** under **General** on the navigation panel. This displays a list of all wiki pages of the current domain. You can click the **Menu** wiki page to view the menu, and then click the **Edit** tab to edit the menu.

Figure 19–8 *Menu of a New Domain*

5. Specify the menu topic and menu items that you want to add or change. You edit the menu the same way you edit a wiki page. For information, see the "Editing a Wiki Page" section in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Within each menu topic, you can define menu items and link them to the required wiki pages or to the targets that are external to your wiki and blog server. When you create a menu item, you must provide a name and specify either the name of a wiki page or a URL. The name that you specify displays in the menu on the navigation panel.

Tip: When naming your page, ensure that you adhere to wiki markup standards, that is, you use the camel case notation for naming wiki pages. This notation uses an initial uppercase letter followed by lowercase letters, then another uppercase letter, and another series of lowercase letters, for example, `MyWikiPage`. To use an alternate name for your page, use the following convention:

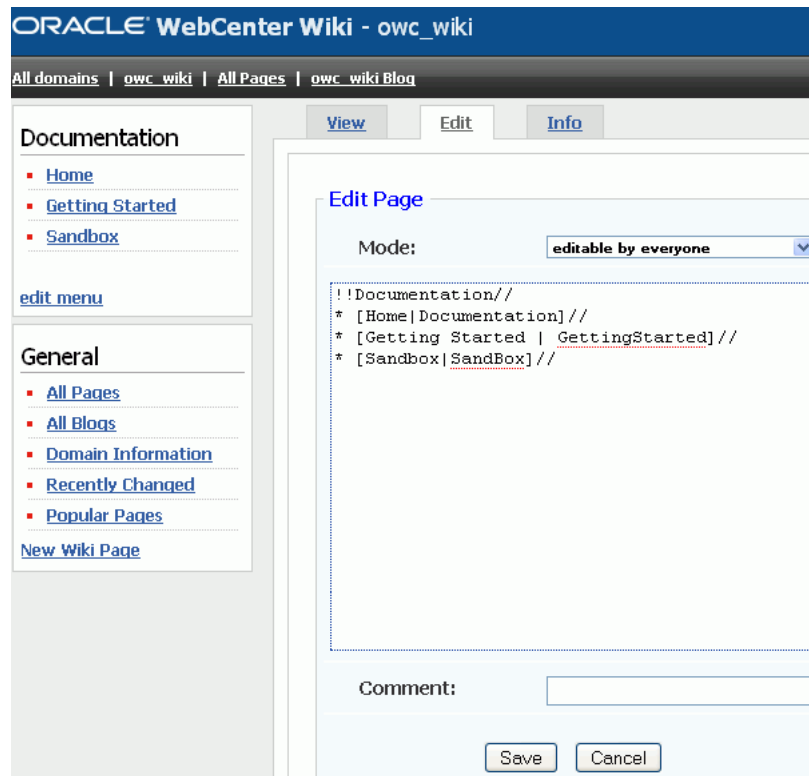

```
[ alternate name | wiki page name ]
```

For example:

```
[ My Page | MyPage ]
```

For information about wiki markup language to format page content, see "Using Wiki Mark-Up" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Figure 19–9 Editing a Domain Menu

Tip: After you edit a menu, it is good practice to change the mode to **only admins are allowed to edit** in the **Mode** dropdown list in the **Edit** tab. Although the **Edit menu** link is automatically removed from the menu, if the registered user is not an administrator, users may accidentally edit the menu page.

6. Click **Save**.

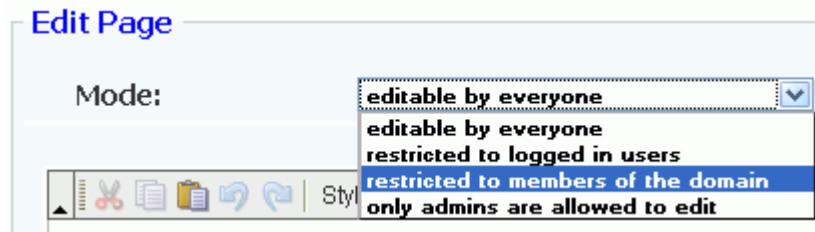

19.2.2.3.3 Managing Domain Members By default, all authorized wiki users can view and modify wiki pages in a wiki domain. However, you can restrict the permission to edit wiki pages in a domain by specifying domain members. You can add selected users and specific roles as domain members. [Figure 19–10](#) shows that the user **monty** and the **Admin** role are defined as members of the **Seattle** wiki domain.

Figure 19–10 Adding Domain Members

If members of a domain are defined, then while creating a wiki page in the domain, users can select the **restricted to members of the domain** option if they want only the domain members to be able to edit the wiki page. For example, for the Seattle wiki domain, the user monty and the ADMIN role are the members (Figure 19–10). While creating or editing a page in this domain, if the user selects the **restricted to members of the domain** option, then only **monty** and all users with the **ADMIN** role can edit that wiki page.

Figure 19–11 Restricting Access to Domain Members

To manage domain members:

1. In Administration mode, click **Domains**.
2. On the **Domains** page, click the **manage members** link of the domain for which you want to specify members.
3. From the **Username** list, select the user whom you want to add as a domain member.
4. Click **Add**.

The new user's name displays in the **Users** section, as shown in Figure 19–10.

5. From the **Role** list, select the role to which you want to grant domain membership.
6. Click **Add**.

The role assigned to the domain member displays in the **Roles** section, as shown in Figure 19–10.

Repeat step 3 through 6 if you want to add any other user or role as a domain member.

7. Click the **remove** link next to a member's name under **Members** if you do not want that member to be able to manage the domain.

19.2.2.3.4 Managing Blog Authors By default, only a wiki administrator or the person who owns the blog can add blog entries. For a personal blog, the blog author is the person who owns that personal blog. In a domain (such as a blog associated with a WebCenter group space), the blog author is the domain creator, which is usually a wiki administrator.

A wiki administrator or the blog owner can specify additional users who can add blog entries. For information about enabling or disabling additional blog authors, see the section, "Adding and Removing Additional Blog Authors" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Note: If a user creates a domain, the user does not automatically become the blog author for the domain blog. The user must be specifically added as a blog author.

19.2.2.4 Changing the Theme

You can apply themes to change the look and feel of Oracle WebCenter Wiki and Blog Server.

To change the default theme:

1. In Administration mode, under **General**, click **Configuration**.
2. Select a theme from the **Theme** list.
3. Click **Save**.

Figure 19–12 *Selecting a Theme*

The screenshot shows the 'Configuration' page with a table of settings. A dropdown menu is open for the 'Theme' setting, displaying a list of themes. The 'Wiki Default (wiki)' theme is selected and highlighted in blue.

Name	Description
Theme	Wiki Default (wiki)
Max LRU	Deep Sea (deepsea)
	Sand (sand)
	Monochrome (monochrome)
Default page encoding	White (white)
	Tech Gray (tech_gray)
	Bighorn (bighorn)
Default Domain	Storm (storm)
	Olive (olive)
	WebCenter Theme (webcenter)
Max attachment size	Red (red)
	WebCenter Default (default)
	Blue (blue)
Supported attachment types	Blue Sky (bluesky)
	Onyx (onyx)
	Wiki Default (wiki)
	Flatirons (flatirons)

4. Click **Exit** to exit Administration mode and see your changes take effect.

Note: Users can change the theme for a login session if they use a wiki or blog URL that includes the `theme` parameter.

19.2.2.5 Creating a User Interface Template

Templates enable you to set up a framework for users for creating pages. You can create new user interface templates as well as edit or delete the existing ones.

To create a template:

1. In Administration mode, under **General**, click **Templates**.

The **Templates** page displays a list of existing templates. You can edit, view, or delete templates by clicking the appropriate link displayed in the **Actions** column, as shown in [Figure 19–13](#).

2. Click **add** at the top-right corner of the **Templates** page to create a new template.

Figure 19–13 Managing Templates

Name	Actions
SimpleHTMLPage	edit delete view
SimpleWikiMarkupPage	edit delete view

3. In the **Add template** page, in the **Name** field, enter the name of the template.

While creating or editing a template, use the correct syntax. If the template is intended as a template for wiki markup, then use wiki markup. If it is intended to be a template for HTML pages, then use HTML. Template names should follow the same convention as wiki page names.

4. In the **Template** box, enter the content for the template.
5. Click **Save**.

After you create a new template, users can choose to use this new template while creating a new page, as shown in [Figure 19–14](#).

Figure 19–14 Creating a Page Based on a Template

19.2.2.6 Unlocking a Page

Every time a user edits a wiki page, the page gets locked for a specified time period for that user before other users can modify that page. Sometimes as an administrator, you may need to unlock a page. For example, if a user starts editing a wiki page and then clicks away from that page without clicking the Save or the Cancel button, then the page is still considered locked for editing. If another user tries to edit the same page, a warning message displays that the page is currently being edited by some other user, and any changes may be overwritten by a newer version. As an administrator, you can unlock the page manually to remove this warning.

To unlock a page:

1. In Administration mode, under **General**, click the **Locked Pages** link.
2. On the Locked pages page, click the **remove lock** link for the page you want to unlock. ([Figure 19–15](#))

Figure 19–15 Unlocking a Page

The screenshot shows the Oracle WebCenter Wiki Administration interface. At the top, there is a navigation bar with the text "ORACLE WebCenter Wiki - Administration" and a link "[Locked pages]". Below this, there are two main sections: "User Management" and "General". The "User Management" section includes links for "Users", "Roles", and "Permissions". The "General" section includes links for "Scheduled Jobs" and "Locked Pages". The "Locked Pages" link is selected, displaying a table with the following data:

Page	SID	Locked	Unlock time	Actions
Seattle:SeattleHome	fmwadmin	12/26/2008 01:29	12/26/2008 01:39	remove lock

Tip: Details of a locked page are no longer displayed in Locked pages as soon as the page is unlocked, whether manually or automatically.

19.2.2.7 Managing Users and Roles

You can add users on Oracle WebCenter Wiki and Blog Server and assign them required roles. You can also create new roles and assign permissions to those roles.

This section contains the following subsections:

- [Section 19.2.2.7.1, "Managing Users"](#)
- [Section 19.2.2.7.2, "Managing Permissions for a Role"](#)

19.2.2.7.1 Managing Users To define the operations that a user can perform, you can assign specific roles to the user. To manage your users, you can edit user passwords, block users, add or delete the assigned roles, and add new users. This section describes the various tasks you can perform to manage your Oracle WebCenter Wiki and Blog users.

To assign a role to a user:

1. In Administration mode, under **User Management**, click **Users**.
The **Users** page displays a list of all the users and roles assigned to them.
2. On the **Users** page, click the **edit** link for the user whose role you want to modify.
The **Edit users** page displays a list of all the roles assigned to the user, permissions included in the assigned roles, and the roles that can be assigned to the user, as shown in [Figure 19–16](#).

Figure 19–16 Assigning a Role to a User

The screenshot shows the "Edit users" page for a user named "GMAAdmin". The page has a header "[Edit users]" and a sub-header "User: GMAAdmin". Below this is a table with the following data:

Set	Name	Permissions	Actions
no	ADMIN	RemoveLocks DeleteTrackbacks MailSetup ViewIP AdminRoles BlogAdmin DeleteDomain DeleteThread AccessAdmin AdminSettings AttachFile Synchronize EditMenu SuperEditPage AdminMailsetup AdminUser AdminConfiguration DeletePost DeletePage AdminDomains ManageBlacklist AdminTemplates AdminPermissions	add
yes	USER	AttachFile	remove
no	USER_ADMIN	AdminUser AccessAdmin	add

3. To assign a role to the user, click the **add** link, in the **Actions** column, for the required role.

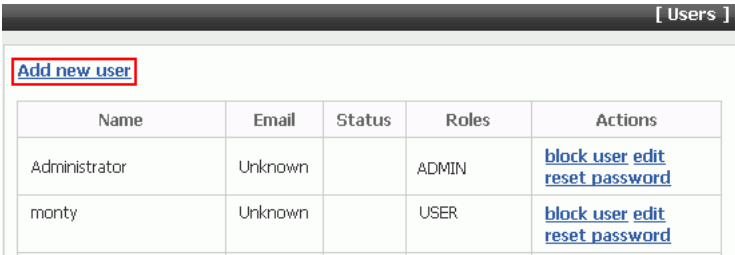

4. If you want to revoke a role from the user, click the **remove** link, in the **Actions** column, for the required role.

In Administration mode, you can block users and reset passwords. These features are useful only when the wiki and blog server is used as a standalone application. Changing user passwords through Administration mode changes passwords only in the local security store of Oracle WebCenter Wiki and Blog Server. If the server is integrated with another Oracle application through single sign-on or LDAP, then users are authenticated through single sign-on and passwords are stored in the external security store. In such a case, if a password needs to be changed, then you must change the password in the external security store.

When you deploy the wiki and blog server by leveraging single sign-on security, users are not initially imported from the external security store. Once a user is authenticated by the external security store, Oracle WebCenter Wiki and Blog Server checks whether the user exists in its local security store. If not, a user entry is created upon first login by that user and a default role, such as USER, is assigned to that user.

You can manually add a user by using the **Add new user** link on the **Users** page in Administration mode (Figure 19–17).

Figure 19–17 Adding a User

Name	Email	Status	Roles	Actions
Administrator	Unknown		ADMIN	block user edit reset password
monty	Unknown		USER	block user edit reset password

19.2.2.7.2 Managing Permissions for a Role For different wiki operations, you can create specific roles and assign required permissions to those roles. You can also modify existing roles to add or remove permissions. You can then assign the required roles to different users to define the operations that those users can perform.

To edit the permissions granted to a role:

1. In Administration mode, under **User Management**, click **Roles**.

The **Roles** page displays various roles and the permissions assigned to each role.

2. On the **Roles** page, click the **edit** link under the role that you want to modify. For example, to modify the ADMIN role, click **edit** under **ADMIN** (Figure 19–18).

The Edit role page displays a list of all permissions that have been assigned or that can be assigned to the selected role (Figure 19–19).

Figure 19–18 Editing a Role

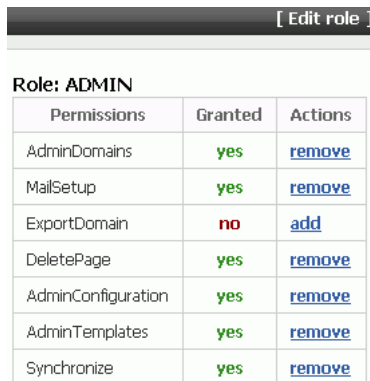

Tip: If you want to create a new role, then specify a role name in the **Name** field and then click **Save** on the **Roles** page (Figure 19–18). You can then click the **edit** link under the newly created role to add the required permissions.

- In the **Actions** column, click the **add** link of the required permission to add that permission to the selected role, or click the **remove** link corresponding to a permission to remove that permission from the selected role. (Figure 19–19)

Tip: You can view the description of each permission by clicking **Permissions** under **User Management** on the navigation panel in Administration mode.

Figure 19–19 Specifying Permissions for a Role

- Click the **Roles** link at the bottom of the Edit role page to return to the Roles page.

19.2.2.8 Blocking an IP Address

You can block selected IP addresses from creating or updating wiki pages on your Oracle WebCenter Wiki and Blog Server. However, a blocked IP address can still access the server to view wiki pages.

To block an IP address:

- In Administration mode, under **General**, click **Blacklist**.
- In the **IP** field, enter the IP address that you want to block.
- Click **Add**.

The IP address displays in the list of blocked IP addresses (Figure 19–20).

Figure 19–20 Blocking an IP Address

[Blacklist]

Add IP to blacklist

IP:

IP	Actions
10.177.255.100	delete

19.2.2.9 Deleting Wiki Pages and Blog Entries

As a wiki administrator, you can delete wiki pages and blog entries that are no longer required.

This section contains the following subsections:

- [Section 19.2.2.9.1, "Deleting a Wiki Page"](#)
- [Section 19.2.2.9.2, "Deleting a Blog Entry"](#)

19.2.2.9.1 Deleting a Wiki Page

To delete a wiki page:

1. In the Administration mode, under **Domain Related**, click **All Pages**.

This displays a list of all pages in the current domain.

Note: To delete wiki pages of a domain, you must first navigate to that domain and then access Administration mode.

2. On the **All Pages** page, in the **Actions** column, click the **delete** link corresponding to the wiki page that you want to delete, as shown in [Figure 19–21](#). If you want to delete multiple pages, then select the checkboxes for those pages in the **Delete** column, and then click the **Delete Selected** button.

Figure 19–21 Deleting a Wiki Page

[All Pages]

[Delete all empty pages](#)

All Pages

Delete	Name	Revision	Mode	Last Update	Last Author	Actions
<input checked="" type="checkbox"/>	CustomerTraining	1	editable by everyone	01/21/2009 02:50	fmwadmin	delete reduce
<input type="checkbox"/>	Menu	0	editable by everyone	01/21/2009 00:13	fmwadmin	delete reduce
<input type="checkbox"/>	SeattleHome	0	editable by everyone	01/21/2009 00:13	fmwadmin	delete reduce

3. Click the **reduce** link corresponding to a wiki page if you want to reduce the versions of that wiki page available on the server. It makes the current or the latest version of a wiki page the only version and deletes all previous versions.

- Click the **Delete all empty pages** link at the top on the All Pages page if you want to delete wiki pages that do not contain any text.

Note: Users can delete the wiki pages that they created only if you select **true** for the **Allow users to delete pages they created** option. You access this option by selecting **Settings** under **General** in Administration mode. If this option is enabled, then a **Delete** icon is displayed to a user for the wiki pages that the user created.

If the option is set to **false**, then only wiki administrators can delete wiki pages.

19.2.2.9.2 Deleting a Blog Entry A wiki administrator or users who have the permission to manage blogs can edit and delete blog entries. For information about how to delete blog entries, see the section, "Deleting a Blog Entry" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

19.2.2.10 Specifying Configuration Parameters

You can use Administration mode to configure various parameters for your Oracle WebCenter Wiki and Blog Server. These configuration parameters include specifying the:

- Default server theme
- Maximum number of Last Recent Updates (LRU) pages listed
- Default page encoding format
- Default domain of the server
- Maximum attachment size in kilobytes (KB) supported on the server
- Attachment types supported on the server
- Default wiki page, that is the home page, of the server

To configure these settings, use the **Configuration** page, shown in [Figure 19–22](#). You access this page by selecting **Configuration** under **General** in Administration mode.

Figure 19–22 Configuration Page

Name	Description
Theme	Wiki Default (wiki) ▼
Max LRU	10
Default page encoding	UTF-8
Default Domain	owc_wiki
Max attachment size	1024
Supported attachment types	gif,jpg,png,doc,xls,ppt,pdf
Default Wiki page	owc_wiki>WelcomePage

Save

19.2.2.11 Importing Templates and Attachments

Oracle WebCenter Wiki and Blog Server supports only a database repository; templates and attachments are also stored in the database repository. In previous versions of Oracle WebCenter Wiki and Blog Server, regardless of the repository type configured for the server, templates and attachments were stored in a file-based repository.

If you migrate from any previous version of Oracle WebCenter Wiki and Blog Server configured to use a database repository, then during migration templates and attachments are migrated to the database repository of your server. If you migrate from a previous version of Oracle WebCenter Wiki and Blog Server configured to use a file-based repository, then templates and attachments are migrated to a file-based repository and not to the database repository of your Oracle WebCenter Wiki and Blog Server. To make these templates and attachments available in your Oracle WebCenter Wiki and Blog Server, you must manually migrate them to the database repository.

To import attachments for a wiki page, the user who owns that wiki page or you as an administrator must reupload the attachments on the wiki page. When you reupload an attachment, the attachment gets stored in the database repository. Note that attachments must be reuploaded for each wiki page individually.

To migrate templates:

1. In Administration mode of your Oracle WebCenter Wiki and Blog Server 11.1.1.2.0, click **Templates**.
2. Click **import**.
3. On the **Import Templates** page, in the **Folder** field, enter the path to templates. For example,

`$APPLICATIONS_DIRECTORY/owc_wiki/templates.`

Where, `$APPLICATIONS_DIRECTORY` is the directory where you installed Oracle WebCenter Wiki and Blog Server 11.1.1.2.0. That is, `APPLICATIONS_DIRECTORY = MW_HOME/user_projects/applications/WEBCENTER_DOMAIN_NAME.`

4. Click **Import Templates**. The existing file-based templates are individually re-created in the wiki database repository.

19.2.2.12 Specifying Features Supported on Oracle WebCenter Wiki and Blog Server

As an administrator, you can choose to enable or disable certain features on your Oracle WebCenter Wiki and Blog Server. For example, you can specify whether attachments, page menu, and remote synchronization are supported.

To set your wiki and blog server features, in Administration mode, click the **Settings** link, and then select the value for the specified features as **true** or **false**, as shown in [Figure 19-23](#).

Figure 19–23 Wiki and Blog Server Settings

Description	Value	Change
Support friends	false	false ▾
Support forum for every page	false	false ▾
Support page ratings	false	false ▾
Allow users to delete pages they created	true	true ▾
Support WYSIWYG editing	true	true ▾
Support trackbacks	false	false ▾
Support attachments	false	false ▾
Use cached data (select false for use in clustered/multi-node environment)	true	true ▾
Show the page menu	true	true ▾
Show page info	true	true ▾

Save

Table 19–3 describes the settings that you can configure on Oracle WebCenter Wiki and Blog Server.

Table 19–3 Oracle WebCenter Wiki and Blog Server Settings

Setting	Description
Support friends	Provides the ability to keep a set of bookmarked links to blogs of users whom you consider your friends.
Support forum for every page	Enables discussion forums associated with each wiki page.
Allow users to delete pages they created	Enables users to delete the wiki pages that they created. If this option is set to <code>false</code> , then only a wiki administrator can delete a wiki page.
Support WYSIWYG editing	Enables users to perform WYSIWYG editing, that is, view the result of their changes as they make the changes on wiki pages.
Support trackbacks	Enables a way for wiki authors to keep track of links to their pages.
Support attachments	Enables users to upload attachments to a wiki page. With this setting enabled, an Attachments tab appears on wiki pages.
Use cached data (select false for use in clustered/multi-node environment)	Enables use of cached data. You can enable this feature in a single-server environment to gain performance improvements from caching. Caches are not shared in a clustered environment. It is recommended that you disable this feature in a clustered or multi-node environment.
Show the page menu	Displays the domain-specific menu in the navigation panel on the wiki and blog server.
Show page info	Enables page information displayed in the footer of wiki pages.

19.2.2.13 Configuring `application_config_script`

You can configure the `application_config_script` file to enable or disable various features on your Oracle WebCenter Wiki and Blog Server. The

`application_config_script` file is located in the `WEB-INF/classes` directory of your deployed Oracle WebCenter Wiki and Blog Server.

Table 19–4 describes the entries that you can configure in `application_config_script`.

Table 19–4 *application_config_script Configuration Settings*

Entry	Description
<code>index_cron</code>	<p>Specifies the schedule for search indexing.</p> <p>Use the following format:</p> <p>SecondsOfDay MinutesOfDay HourOfDay DayOfMonth MonthOfYear ?</p> <p>An asterisk in any of these parameters implies "all". For example, to run search indexing every day at 2:30 a.m., use the following entry:</p> <p>0 30 2 * * ?</p>
<code>index_on_startup</code>	<p>Performs a full search indexing on server startup if <code>index_on_startup=true</code>.</p> <p>Running this search ensures that the search index is properly synchronized with the wiki and blog server data when the server is running.</p>
<code>activity_job_cron</code>	<p>Specifies the schedule for activity job publishing. Use the following format:</p> <p>SecondsOfDay MinutesOfDay HourOfDay DayOfMonth MonthOfYear ?</p> <p>An asterisk in any of these parameters implies "all". For example, to run activity publish job every day at 2:30 a.m., use the following entry:</p> <p>0 30 2 * * ?</p> <p>To disable the job, use the following value:</p> <p>0 0 0 0 0 ?</p>
<code>custom_analyzer</code>	<p>Specifies the fully qualified class name of the custom search analyzer to be used for tokenizing wiki content.</p> <p>For example, if you are using the Chinese Sandbox, then the entry should look like:</p> <p><code>custom_analyzer :</code> <code>org.apache.lucene.analysis.cn.ChineseAnalyzer</code></p>

Note: Oracle WebCenter 11g Release 1 (11.1.1.2.0) does not provide the feature to publish the wiki activity data to Analytics. Therefore, in the `application_config_script` file, by default, the `support_analytics` entry is set to `false`.

19.2.2.14 Generating the Passcode

Oracle WebCenter Wiki and Blog Server provides Web Services that enable interaction with WebCenter applications. All Web Services methods are protected to prevent unauthorized access. Every method contains a String key parameter to ensure authorized access. This key is generated as a function of a user's name and a preconfigured passcode. The passcode is an arbitrary string that you create in the

credential store of the WebCenter domain in which Oracle WebCenter Wiki and Blog Server is deployed.

Note: You may skip this section if you do not plan to use Oracle WebCenter Wiki and Blog Server Web Services.

To create the passcode, you must create a password credential key named `wsPasscode` in the credential map named `owc_wiki`. In this key, you need to specify the user name as `owc_wiki` and the desired passcode. The passcode must be shared with trusted application developers wishing to use Web Services. For information about Oracle WebCenter Wiki and Blog Server Web Services, see the "Oracle Wiki Server Web Services Interface" section in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

Note: In Oracle WebCenter Wiki and Blog Server 11g, Release 1 (11.1.1.1.0), the default value of passcode for Web Services configuration was `owCwIKi`. The passcode was stored as cleartext in `web.xml` of the server. In Oracle WebCenter Wiki and Blog Server 11g, Release 1 (11.1.1.2.0), there is no default passcode and the passcode is stored in a credential store.

You can create the password credential key by using the WLST command `createCred` or by using Oracle Enterprise Manager Fusion Middleware Control Console.

To generate the passcode by using the `createCred` WLST command:

```
createCred
(map="mapname",key="keyname",user="username",password="password",desc="description")
```

For example:

```
createCred(map="owc_wiki",key="wsPasscode",user="owc_wiki",password="123456",desc="OWC Wiki Web Services passcode")
```

To create the passcode by using Fusion Middleware Control Console:

1. Start Fusion Middleware Control Console. For information, see [Section 6.1, "Displaying Fusion Middleware Control Console."](#)
2. Right-click the domain in which Oracle WebCenter Wiki and Blog Server is deployed. Next, select **Security** and then click **Credentials**.
3. On the **Credentials** page, click the **Create Map** button to create a credential map for your wiki and blog server.
4. In the Create Map dialog, in the **Map Name** field, enter `owc_wiki` as the credential map name.
5. Click **OK**.
6. Select the newly created credential map, `owc_wiki`.
7. Click the **Create Key** button.
8. In the Create Key dialog, ensure that `owc_wiki` is selected in the **Select Map** list, and **Password** is selected in the **Type** list.

9. In the **Key** field, enter `wsPasscode` as the name of the key.
10. In the **User Name** field, enter a user name.
11. In the **Password** field, enter the desired passcode.
12. Click **OK**.
13. Restart the server to which Oracle WebCenter Wiki and Blog Server is deployed.

19.2.2.15 Backing Up and Restoring Wiki Content

Oracle WebCenter Wiki and Blog Server uses a database repository. You can back up all your wiki content stored in the database by using SQL scripts or any database backup tool. You can also back up the wiki configuration file, `application_config.script`, which is located at the following path:

```
$APPLICATIONS_DIRECTORY/owc_wiki/WEB-INF/classes/application_config.script
```

19.2.3 Oracle WebCenter Wiki and Blog Server - Security Considerations

You can configure Oracle WebCenter Wiki and Blog Server to leverage single sign-on security. You can use Oracle Access Manager (OAM), Oracle Single Sign-On (OSSO), or a SAML-based single sign-on security to secure Oracle WebCenter Wiki and Blog Server. For information, see [Section 23.7, "Configuring a WebCenter Application to Use Single Sign-On."](#)

When you integrate wikis and blogs into your WebCenter applications, users defined for your applications must match the users created on the Oracle WebCenter Wiki and Blog Server. Once a user is authenticated, if the user does not exist on Oracle WebCenter Wiki and Blog Server, the user is created and a default role is assigned to the user.

19.2.4 Oracle WebCenter Wiki and Blog Server - Limitations

Wiki pages on Oracle WebCenter Wiki and Blog Server do not support global preference settings and bi-directional languages.

19.3 Registering Oracle WebCenter Wiki and Blog Server

You can register multiple Oracle WebCenter Wiki and Blog Server connections with a WebCenter application, but only one of the connections is active at a time.

To start using a new (active) connection, you must restart the managed server on which the WebCenter application is deployed.

This section contains the following subsections:

- [Section 19.3.1, "Registering Oracle WebCenter Wiki and Blog Server Using Fusion Middleware Control"](#)
- [Section 19.3.2, "Registering Oracle WebCenter Wiki and Blog Server Using WLST"](#)

19.3.1 Registering Oracle WebCenter Wiki and Blog Server Using Fusion Middleware Control

To register a connection to Oracle WebCenter Wiki and Blog Server:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **WikiServer**.
4. To register a connection to the wiki and blog server, click **Add** ([Figure 19–24](#)).

Figure 19–24 Registering a Wiki and Blog Server Connection

5. On the **Add Wiki and Blog Server Connection** page, in the **Name** section, enter a unique name for the connection, and indicate whether the connection is the active (or default) connection for the application ([Table 19–5](#)).

Table 19–5 Wiki and Blog Connection - Name

Field	Description
Name	Enter a unique name for the connection. The name must be unique (across all connection types) within the WebCenter application.
Active Connection	Select the checkbox to use this connection in the WebCenter application for Wiki and Blog services. While you can register multiple wiki and blog server connections, only one connection is used by the Wiki and Blog services— the default (or active) connection.

6. In the Connection Details section, enter connection details for your Oracle WebCenter Wiki and Blog Server. For details, see [Table 19–6](#).

Table 19–6 Wiki and Blog Connection - Connection Details

Field	Description
Server URL	<p>Enter the base URL of the server providing Wiki and Blog services. The server must be an Oracle WebCenter Wiki and Blog Server.</p> <p>Use the format: <i>protocol://host:port/</i> For example: <i>http://mywiki.com:8001/</i></p>
Passcode	<p>Enter the passcode that is required to call methods in Oracle WebCenter Wiki and Blog Server Web Services.</p> <p>The passcode is an arbitrary string that the administrator sets up in Oracle WebCenter Wiki and Blog Server after installation to prevent unauthorized access. Contact the administrator to obtain the server's passcode.</p>

7. Click **OK** to save this connection.
8. To start using the new (active) connection, you must restart the managed server to which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

19.3.2 Registering Oracle WebCenter Wiki and Blog Server Using WLST

Use the `createWikiserverConnection` WLST command to create a wiki and blog server connection for a named WebCenter application. For command syntax and examples, see the section "createWikiserverConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the new (active) connection, you must restart the managed server to which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

19.4 Choosing the Active Wiki and Blog Server Connection

You can register multiple wiki and blog server connections with a WebCenter application but only one connection is active at a time.

For WebCenter Spaces and custom WebCenter applications, the *active connection* becomes the back-end wiki and blog server for:

- Wiki and blog pages (created through page styles)
- Wiki search adapter
- Wiki Oracle SES crawl adapter

This section contains the following subsections:

- [Section 19.4.1, "Choosing the Active Wiki and Blog Server Connection Using Fusion Middleware Control"](#)

- [Section 19.4.2, "Choosing the Active Wiki and Blog Server Connection Using WLST"](#)

19.4.1 Choosing the Active Wiki and Blog Server Connection Using Fusion Middleware Control

To change the active connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, choose **WikiServer**.
 The Manage Wiki and Blog Server Connections table indicates the current active connection (if any).
4. Select the connection you want to make the active (or default) connection, and then click **Edit**.
5. Select the **Active Connection** checkbox.
6. Click **OK** to update the connection.
7. To start using the new (active) connection you must restart the managed server to which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

19.4.2 Choosing the Active Wiki and Blog Server Connection Using WLST

Use the WLST command `setWikiserverConnection` with `default=true` to activate an existing wiki and blog server connection. Use the `listDefaultWikiserverConnection` command to find out the active or default connection used by the Wiki and Blog services. For command syntax and examples, see the sections, "setWikiserverConnection" and "listDefaultWikiserverConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To start using the new (active) connection, you must restart the managed server to which the WebCenter application is deployed. For more information, see "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

19.5 Modifying the Wiki and Blog Server Connection Details

You can modify the wiki and blog server connection details at any time.

To start using the modified (active) connection, you must restart the managed server to which the WebCenter application is deployed.

This section contains the following subsections:

- [Section 19.5.1, "Modifying Wiki and Blog Server Connection Details Using Fusion Middleware Control"](#)
- [Section 19.5.2, "Modifying Wiki and Blog Server Connection Details Using WLST"](#)

19.5.1 Modifying Wiki and Blog Server Connection Details Using Fusion Middleware Control

To update wiki and blog server connection details:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, choose **WikiServer**.
4. Select the connection name, and click **Edit**.
5. Edit the connection details, as required. For detailed parameter information, see [Table 19–6](#).
6. Click **OK** to save your changes.
7. To start using the updated (active) connection, you must restart the managed server to which the WebCenter application is deployed. For information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments"](#).

19.5.2 Modifying Wiki and Blog Server Connection Details Using WLST

Use the WLST command `setWikiserverConnection` to edit the wiki and blog server connection details. For command syntax and examples, see the section, "setWikiserverConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the updated (active) connection, you must restart the managed server to which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

19.6 Deleting Wiki and Blog Server Connections

You can delete wiki and blog server connections at any time, but be careful when deleting the active connection. If you delete the active connection, none of the wiki and blog server web services will work because they all require Oracle WebCenter Wiki and Blog Server at the back end.

This section contains the following subsections:

- [Section 19.6.1, "Deleting a Wiki and Blog Server Connection Using Fusion Middleware Control"](#)
- [Section 19.6.2, "Deleting a Wiki and Blog Server Connection Using WLST"](#)

19.6.1 Deleting a Wiki and Blog Server Connection Using Fusion Middleware Control

To delete a wiki and blog server connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the **WebCenter Services Configuration** page, select **WikiServer**.
4. Select the connection name, and click **Delete**.
5. To effect this change, you must restart the managed server to which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

Note: Before restarting the managed server, mark another connection as active; otherwise the service will be disabled.

19.6.2 Deleting a Wiki and Blog Server Connection Using WLST

Use the WLST command `deleteConnection` to remove a connection. For command syntax and examples, see the section, "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Ensure that another connection is marked active; otherwise, the service will be disabled.

For information about how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To effect this change, you must restart the managed server to which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

19.7 Testing Wiki and Blog Server Connections

Try accessing your Oracle WebCenter Wiki and Blog Server with the following URL format:

```
http://host:port/owc_wiki
```

This should show the home page of the default wiki domain.

19.8 Monitoring Oracle WebCenter Wiki and Blog Server

You can monitor Oracle WebCenter Wiki and Blog Server by viewing the log file, `owc_wiki.log`. This file is located in the following directory:

```
$APPLICATIONS_DIRECTORY/owc_wiki
```

Where:

- `$APPLICATIONS_DIRECTORY` is the directory where you installed Oracle WebCenter Wiki and Blog Server. That is, `APPLICATIONS_DIRECTORY = MW_HOME/user_projects/applications/WEBCENTER_DOMAIN_NAME`.
- `owc_wiki` is the directory where your Oracle WebCenter Wiki and Blog Server is deployed.

To change the log level, modify the `jlo_logging.xml` file located at the following path:

```
$APPLICATIONS_DIRECTORY/owc_wiki/WEB-INF/classes
```

You can change the targets of the loggers in this file. The following targets are supported: `trace`, `info`, `debug`, `warn`, `error`, and `fatal`. You can also use two special targets: `off` (to switch off all the targets) or `all` (to switch on all the targets). For more information about the jLo logger, see:

<http://jlo.jzonic.org/GettingStarted.html>

Note: You can change the location of the log file by using the jLo handlers. For more information, see:

<http://jlo.jzonic.org/AllHandlers.html>

19.9 Troubleshooting Issues with Wiki and Blogs

This section describes a possible issue that you may face after configuring OAM-SSO on Oracle WebCenter Wiki and Blog Server.

Problem

After configuring OAM-SSO on Oracle WebCenter Wiki and Blog Server ,when you log out, the server does not redirect to the login page properly.

Solution

Ensure that the `logout_url` property is set accurately in the `application_config.script` file, which is located in the `Web-INF/classes` directory of your deployed Oracle WebCenter Wiki and Blog Server.

The link can be customized to any URL based on the single sign-on scheme used. Leaving `logout_url` blank renders the user session invalid and redirects to the login screen.

Managing the Worklist Service

This chapter describes how to configure and manage the Worklist service for WebCenter Spaces and custom WebCenter applications deployed on Oracle WebLogic Server.

Always use Fusion Middleware Control or WLST command-line tool to review and configure back-end services for WebCenter applications. Any changes that you make to WebCenter applications, post deployment, are stored in MDS metadata store as customizations. See [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

Note: Changes that you make to WebCenter services configuration, through Fusion Middleware Control or using WLST, are not dynamic so you must restart the managed server on which the WebCenter application is deployed for your changes to take effect. See [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

This chapter includes the following sections:

- [Section 20.1, "What You Should Know About BPEL Connections"](#)
- [Section 20.2, "BPEL Server Prerequisites"](#)
- [Section 20.3, "Setting Up Worklist Connections"](#)
- [Section 20.4, "Troubleshooting Issues with Worklists"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

20.1 What You Should Know About BPEL Connections

Both the Worklist service and the WebCenter Spaces workflows require a connection to a BPEL (Business Process Execution Language) server. These WebCenter services can share the same BPEL server connection or each connect to different BPEL servers.

- **Worklist service** - allows multiple connections so that WebCenter users can monitor and manage assignments and notifications from a range of BPEL servers. For more information, see [Section 20.3, "Setting Up Worklist Connections."](#)

- **WebCenter Spaces workflows** - requires a single connection to the BPEL server included with the Oracle SOA Suite. For more information, see [Section 9.1.1, "Specifying the BPEL Server Hosting WebCenter Spaces Workflows."](#)

20.2 BPEL Server Prerequisites

Consider the following to ensure smooth functioning of the Worklists service:

- Pages that include Worklists task flows must be secured through ADF security.
- The Worklists service must be configured to use an Oracle SOA Suite BPEL server that is accessible through the BPEL Worklists application. The URL is in the following format:

```
http://host:port/integration/worklistapp
```

Users must be identical in both identity stores (LDAP).

- Clocks on the Worklists service's managed server and the Oracle SOA Suite BPEL's managed server must be synchronized such that the SAML authentication condition, `NotBefore`, which checks the freshness of the assertion, is not breached.
- While configuring the BPEL server to LDAP, in the OID Authenticator, use the value `dc=example,dc=com`.
- No configuration-related exceptions must exist. Use the WLST command `listWorklistConnections` to display the configured connections and validate the connection details.
- If the Oracle SOA Suite BPEL's managed server is configured to use a shared identity store and that store does not contain the required user by default, then the user must be configured, as described in [Section 20.4.2.2, "Shared User Directory Does Not Include the weblogic User."](#)
- The `wsm-pm` application must be running on both the Worklists service's and Oracle SOA Suite's BPEL server's managed servers without any issues. This can be validated through the URL:

```
http://host:port/wsm-pm/validator
```

For information on how to resolve BPEL server issues, see [Section 20.4, "Troubleshooting Issues with Worklists."](#)

This section includes the following subsections:

- [Section 20.2.1, "BPEL Server - Installation and Configuration"](#)
- [Section 20.2.2, "BPEL Server - Security Considerations"](#)
- [Section 20.2.3, "BPEL Server - Limitations in WebCenter"](#)

20.2.1 BPEL Server - Installation and Configuration

The Worklist service relies on the Oracle BPEL Process Manager (BPEL) server, which is included with Oracle SOA Suite.

To work with the Worklist service, you must install Oracle SOA Suite. For information about how to install Oracle SOA Suite, see the *Oracle Fusion Middleware Installation Guide for Oracle SOA Suite*.

After installing Oracle SOA Suite, you can integrate the Worklist service into your WebCenter applications by setting up connections to the BPEL server. No further configuration is required on Oracle SOA or Oracle WebCenter.

20.2.2 BPEL Server - Security Considerations

The Worklist service displays tasks for the currently authenticated user. For WebCenter users to store and retrieve tasks on an Oracle SOA Suite BPEL server, their user names must either exist in a shared user directory (LDAP), or be set up similarly (same user name and password) on both the WebCenter application and the BPEL Server.

For example, if the user `rsmith` wants to use the Worklist service to store and retrieve tasks from the BPEL server, you must ensure that the user `rsmith` exists (with the same password) on both the BPEL server and within your application.

To access BPEL task details from the WebCenter Worklist component, without incurring additional login prompts, WebCenter and Oracle SOA Suite servers must be configured to a shared Oracle Single Sign-On server. For more information, see [Section 23.7.2, "Configuring Oracle Single Sign-On \(OSSO\)."](#)

For information on configuring WS-Security between SOA and WebCenter Spaces, see [Section 23.8, "Configuring WS-Security."](#)

20.2.3 BPEL Server - Limitations in WebCenter

Worklist task flows function inside authenticated pages only. If Worklist task flows are placed on unsecured pages, that is, public pages, a security error message displays.

20.3 Setting Up Worklist Connections

This section includes the following subsections:

- [Section 20.3.1, "What You Should Know About Worklist Connections"](#)
- [Section 20.3.2, "Registering Worklist Connections"](#)
- [Section 20.3.3, "Activating a Worklist Connection"](#)
- [Section 20.3.4, "Modifying Worklist Connection Details"](#)
- [Section 20.3.5, "Deleting Worklist Connections"](#)
- [Section 20.3.6, "Testing Worklist Connections"](#)

20.3.1 What You Should Know About Worklist Connections

The Worklist service enables WebCenter applications to show authenticated users a list of BPEL worklist items currently assigned to them through the Worklist task flow. BPEL worklist items are open BPEL tasks from one or more BPEL worklist repositories.

A connection to every BPEL server that delivers worklist items is required. Multiple worklist connections are allowed so that WebCenter users can monitor and manage assignments and notifications from a range of BPEL servers.

Worklist connection details are stored in `connections.xml`. Another file, `adf-config.xml`, identifies which connections are actively used by the Worklist service.

If a BPEL server cannot be contacted, the Worklist task flow indicates that the connection is unavailable and any reason for the error is recorded in the application's diagnostic log.

WebCenter Spaces

WebCenter Spaces requires a BPEL server connection to support its internal workflows, that is, group space membership notifications and group space subscription requests. The BPEL server providing this functionality is always a BPEL server included with the Oracle SOA Suite. For more information, see [Section 9.1.1, "Specifying the BPEL Server Hosting WebCenter Spaces Workflows."](#)

The Worklist service can share the SOA instance connection and by doing so, display worklist items relating to group space activity in each user's Worklist task flow.

20.3.2 Registering Worklist Connections

This section includes the following subsections:

- [Section 20.3.2.1, "Registering Worklist Connections Using Fusion Middleware Control"](#)
- [Section 20.3.2.2, "Registering Worklist Connections Using WLST"](#)

20.3.2.1 Registering Worklist Connections Using Fusion Middleware Control

To register a Worklist connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Worklist**.
4. To register a new connection, click **Add** ([Figure 20-1](#)).

Figure 20–1 Configuring Worklist Connections

Manage Worklist Connections		
 Add  Edit  Delete		
Name	BPEL SOAP URL	Active Connection
WebCenter Worklist	http://hostname:portnumber	<input checked="" type="checkbox"/>

5. Enter a unique name for the Worklist connection and activate the connection to use the connection immediately (Table 20–1).

Table 20–1 Worklist Connection - Name

Field	Description
Name	<p>Enter a unique name for the connection. The name must be unique (across all connection types) within the WebCenter application.</p> <p>This name may be displayed to users working with the worklist feature in the WebCenter application. Users may organize their worklist assignments through various sorting and grouping options. The option "Group By Worklist Server" displays the name you specify here so it's important to enter a meaningful name that other users will easily recognize, for example, Human Resources.</p>
Active Connection	<p>Select to activate this worklist connection in the WebCenter application. Once activated, worklist items from the associated BPEL server display in users' worklists.</p> <p>Multiple worklist connections may be active at a time, enabling WebCenter users to monitor and manage assignments and notifications from a range of BPEL servers. If you need to disable a connection for any reason, deselect this option.</p> <p>(Edit mode only.) Check boxes indicate whether other components share this connection:</p> <p>WebCenter Spaces Application</p> <p>Indicates whether WebCenter Spaces uses this BPEL server connection for internal workflows, such as Group Space membership notifications, Group Space subscription requests, and more. The BPEL server that provides this functionality is the BPEL server included with the Oracle SOA Suite. For more information, see Section 9.1.1, "Specifying the BPEL Server Hosting WebCenter Spaces Workflows."</p> <p>Before modifying connection properties, consider impact to any other components that share this connection.</p>

6. Enter connection details for the BPEL server (Table 20–2).

Table 20–2 Worklist Connection - Connection Details

Field	Description
BPEL Soap URL	<p>Enter the URL required to access the BPEL server. Use the format:</p> <pre>protocol://host:port</pre> <p>For example:</p> <pre>http://mybpelserver.com:8001</pre> <p>Note: WebCenter Spaces uses the BPEL server included with the Oracle SOA Suite to implement group space subscription workflows. If you are setting up the workflow connection, make sure you enter the SOA Suite's BPEL server URL here. For more information, see Section 9.1.1, "Specifying the BPEL Server Hosting WebCenter Spaces Workflows."</p>
SAML Token Policy URI	<p>Select the SAML (Security Assertion Markup Language) token policy this connection uses for authentication.</p> <p>SAML is an XML-based standard for passing security tokens defining authentication and authorization rights. An attesting entity (that has a trusted relationship with the receiver) vouches for the verification of the subject by method called sender-vouches.</p> <p>Options available are:</p> <ul style="list-style-type: none"> ■ SAML Token Client Policy (oracle/wss10_saml_token_client_policy) - Select to verify your basic configuration without any additional security. This is the default setting. ■ SAML Token With Message Protection Client Policy (oracle/wss10_saml_token_with_message_protection_client_policy) - Select to increase the security using SAML-based BPEL Web Services. If selected, you must configure keystores both in your WebCenter application and in the BPEL application. For information about configuring the BPEL server's Worklist connection to use this policy, see Section 23.8.1.3, "Configuring the BPEL Server for a Simple Topology."

7. Click **OK** to save this connection.
8. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

20.3.2.2 Registering Worklist Connections Using WLST

Use the WLST command `createBPELConnection` to create a BPEL server connection. For command syntax and examples, see the section, "createBPELConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To configure the Worklist service to actively use a new BPEL server connection some additional configuration is required. For more information, see [Section 20.3.3.2, "Activating a Worklist Connections Using WLST."](#)

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

20.3.3 Activating a Worklist Connection

In WebCenter applications, multiple Worklist connections may be active at a time. Multiple connections enable WebCenter users to monitor and manage assignments and notifications from a multiple BPEL servers. From time to time you may need to temporarily disable an active connection, or enable an existing connection.

This section includes the following subsections:

- [Section 20.3.3.1, "Activating a Worklist Connections Using Fusion Middleware Control"](#)
- [Section 20.3.3.2, "Activating a Worklist Connections Using WLST"](#)

20.3.3.1 Activating a Worklist Connections Using Fusion Middleware Control

To activate or disable a Worklist connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Worklist**.

The Manage Worklist Connections table indicates currently active connections (if any).

4. Select the Worklist connection you want to activate (or disable), and then click **Edit**.
5. Select the **Worklist** check box to activate this Worklist connection in the WebCenter application.

Once activated, worklist items from the associated BPEL server display in Worklist task flows. If you need to disable a connection for any reason, deselect this option.

6. Click **OK** to update the connection.
7. To start using the new (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see

[Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

20.3.3.2 Activating a Worklist Connections Using WLST

Use the WLST command `addWorklistConnection` to activate an existing BPEL connection for Worklist services. For command syntax and examples, see the section, "addWorklistConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

To subsequently disable a BPEL connection used by the Worklist service, run the WLST command `removeWorklistConnection`. Connection details are retained but the connection is no longer named as an active connection.

Use `listWorklistConnections` to see which connections are currently active. If the `listWorklistConnections` command indicates an invalid connection name, a connection was removed from `connections.xml` using the `deleteConnection` command but it was not removed from `adf-config.xml` with `removeWorklistConnection`. To resolve this issue, you can either re-create the named connection using `createBPELConnection`, or run the `removeWorklistConnection` command.

For syntax details and examples, see "removeWorklistConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the active connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

20.3.4 Modifying Worklist Connection Details

This section includes the following subsections:

- [Section 20.3.4.1, "Modifying Worklist Connection Details Using Fusion Middleware Control"](#)
- [Section 20.3.4.2, "Modifying Worklist Connection Details Using WLST"](#)

20.3.4.1 Modifying Worklist Connection Details Using Fusion Middleware Control

To update worklist connection details:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings** > **Service Configuration**.

- For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Worklist**.
 4. Select the Worklist connection you want to activate, and then click **Edit**.
 5. Edit connection details, as required. For detailed parameter information, see [Table 20–2, "Worklist Connection - Connection Details"](#).
 6. Click **OK** to update the connection.
 7. To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

20.3.4.2 Modifying Worklist Connection Details Using WLST

Use the WLST command `setBPELConnection` to edit existing BPEL server connection details. For command syntax and examples, see the section, "setBPELConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Note: To start using the updated (active) connection you must restart the managed server on which the WebCenter application is deployed. For more information, see the section, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

20.3.5 Deleting Worklist Connections

Before you delete a Worklist connection, verify whether the WebCenter Spaces workflows use the same connection.

This section includes the following subsections:

- [Section 20.3.5.1, "Deleting Worklist Connections Using Fusion Middleware Control"](#)
- [Section 20.3.5.2, "Deleting Worklist Connections Using WLST"](#)

20.3.5.1 Deleting Worklist Connections Using Fusion Middleware Control

To delete a worklist connection:

1. Log in to Fusion Middleware Control and navigate to the home page for WebCenter Spaces or the custom WebCenter application. For more information, see:
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
2. Do one of the following:

- For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
 - For WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
3. From the list of services on the WebCenter Services Configuration page, select **Worklist**.
 4. Select the Worklist connection you want to delete, and then click **Delete**.
 5. To confirm, click **Yes**.
 6. To effect this change you must restart the managed server on which the WebCenter application is deployed. For more information, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments."](#)

20.3.5.2 Deleting Worklist Connections Using WLST

Use the WLST command `deleteConnection` to remove a BPEL connection previously registered for the Worklist service. For command syntax and examples, see the section, "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Use the WLST command `removeWorklistConnection` to remove a BPEL server that is configured in `adf-config.xml`. The Worklist service no longer uses the connection specified but BPEL server connection details are retained in `connections.xml` for future use.

Use the WLST command `deleteConnection` to remove a BPEL server connection from `connections.xml`.

For command syntax and detailed examples, see "removeWorklistConnection" and "deleteConnection" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

20.3.6 Testing Worklist Connections

To test a Worklist connection, log in to the SOA BPEL Worklist application with valid user credentials. A Worklist application is accessible through a URL in the following format:

```
protocol://host:port/integration/worklistapp
```

For example:

```
http://mybpelserver.com:8001/integration/worklistapp
```

You can also verify the status of the `wsm-pm` application, that manages the SAML policy Web service authentication mechanism used by the Worklist service. To list `wsm-pm` policies, log in to both the SOA BPEL server and the server running the Worklist task flow, using the following URL format:

```
protocol://SOA_server_host:port/wsm-pm/validator
```

For example:

```
http://mybpelserver.com:8001/wsm-pm/validator
http://myWorklistHostingServer.com:8888/wsm-pm/validator
```

20.4 Troubleshooting Issues with Worklists

The Worklist service relies on several middleware components to display worklist items to logged-in users and therefore, several factors may cause the Worklist service to fail. The issues and solutions discussed in this section relate to some common problems you may encounter.

This section includes the following subsections:

- [Unavailability of the Worklist Service Due to Application Configuration Issues](#)
- [Unavailability of the Worklist Service Due to Server Failure](#)

Note: To identify causes of failures, examine log files on the managed servers hosting Worklist service processes and the managed servers for any SOA BPEL servers you have configured.

20.4.1 Unavailability of the Worklist Service Due to Application Configuration Issues

Issues described in this section pertain to the unavailability of the Worklist service—Worklist task flows display the message **The Worklist service is unavailable** with the following warning:

Either no BPEL connections are configured, or there is an issue with the existing connection configuration. Verify that at least one BPEL Worklist connection is configured for this application, and that no unresolved "ConfigurationExceptions" exceptions are logged.

This section includes the following subsections:

- [adf-config.xml Refers to a Non-Existent BPEL Connection](#)
- [adf-config.xml Has No Reference to a BPEL Connection](#)
- [No Rows Yet Message Displays](#)

20.4.1.1 adf-config.xml Refers to a Non-Existent BPEL Connection

Problem

The connection listed in the `adf-config.xml` file does not exist in the application's `connections.xml` file. The following entries exist in the diagnostic log file for the managed server on which the application is running:

```
[2009-03-22T13:33:54.140+00:00] [DefaultServer] [WARNING]
[WCS-32008] [oracle.webcenter.worklist.config][tid:
[ACTIVE].ExecuteThread: '12' for queue: 'weblogic.kernel.Default
(self-tuning)'] userId: user][ ecid:
0000I0iOmdTFk3FLN2o2ye19kTB0000V,0][APP: Worklist#V2.0 arg:
Human Resources The BPEL Connection named 'connection_name' was
not present in the connections.xml file. This will prevent the
Worklist service from being able to interact with the required
this BPEL connection.
```

Solution

Either create a BPEL connection with the name stated in the log, or remove the connection. For more information about how to update the Worklist configuration post deployment, see [Section 20.3, "Setting Up Worklist Connections."](#)

During development, refer to the chapter "Integrating the Worklist Service" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

To find out which connections names are referenced and to validate the Worklist service configuration, run the WLST command, `listWorklistConnections(appName='myApp', verbose=true)`. For more information, see "listWorklistConnections" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

20.4.1.2 adf-config.xml Has No Reference to a BPEL Connection

There is no reference to a Worklist service connection in the application's `adf-config.xml`, but this connection exists in the `connections.xml` file.

Problem

In diagnostic log files for the managed server on which the application is running, you see entries such as the following:

```
[2009-03-23T10:23:56.943+00:00] [DefaultServer] [WARNING]
[WCS-32009] [oracle.webcenter.worklist.config] [tid:
[ACTIVE].ExecuteThread: '21' for queue: 'weblogic.kernel.Default
(self-tuning)'] [userId: user] [ecid:
0000I0mqx8Fk3FLN2o2ye19lqBV000008,0] [APP: Worklist#V2.0] The
Worklist service does not have a ConnectionName configuration
entry in adf-config.xml that maps to a BPELConnection in
connections.xml, therefore the Worklist service was not
configured for this application.
```

Solution

Configure a connection to at least one BPEL server so that the Worklist service can query worklist items.

Post deployment, create Worklist connections through WLST or Fusion Middleware Control. For information, see [Section 20.3, "Setting Up Worklist Connections."](#) During development, create Worklist connections through Oracle JDeveloper. For information, see the chapter "Integrating the Worklist Service" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

20.4.1.3 No Rows Yet Message Displays

Problem

The Worklist task flow continues to display the **No Rows Yet** message.

Solution

The following are possible solutions to address this problem:

- No '**Assigned**' worklist items exist for the logged in user:

If worklist items are assigned to the logged-in user and the state of these items is **Assigned**, then they always show in the Worklist task flow. The **No Rows Yet** message indicates that no assigned Worklist items exist for the logged-in user. This is not an issue, but expected behavior.

To confirm that this message is displaying correct information, open the Oracle SOA Suite BPEL Worklist application, and check whether any worklist items exist. The URL of BPEL Worklist application is:

`http://host:port/integration/worklistapp`. Where `host` and `port` are the same as those used in the Worklist connection.

- The ADF page on which the Worklist task flow exists is not ADF-secured:

The Worklist task flow is not able to query the Worklist repository, because there is no authenticated user associated with the application session to access the Oracle SOA Suite BPEL server. Apply the ADF security on the page. For information, see the section "Setting Security for the Worklist Service in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

20.4.2 Unavailability of the Worklist Service Due to Server Failure

Server failure is the likely cause of an issue if a Worklist service connection exists, and the Worklist task flow shows the **The Worklist service is unavailable** warning. In case of multiple connections, the **More items not currently available** message displays. These generic warning messages display when there is an issue with Worklist service interactions with the Oracle SOA Suite BPEL repository.

To identify the root cause of the issue, examine the managed server's diagnostic logs at the time when the service fails. In some cases it is necessary to also examine the log files of the managed server on which the Oracle SOA Suite BPEL processes run. Typically, an entry such as the following exists in diagnostic logs of the Worklist application's managed server:

```
[2009-03-23T11:35:21.735+00:00] [DefaultServer] [ERROR]
[WCS-32100] [oracle.webcenter.worklist.model] [tid:
[ACTIVE].ExecuteThread: '0' for queue: 'weblogic.kernel.Default
(self-tuning)'] [userId: user] [ecid:
0000I0n7GBZFk3FLN2o2ye19lrBX00000L,0] [APP: Worklist#V2.0] [arg:
WebCenter Worklist] The WebCenter Worklist has queried the BPEL
Worklist connection named 'WebCenter Worklist', and encountered
a WebCenter Executor error. Please see related exception for
details. If the WebCenter Worklist is running in an Application
Server, check to see if the wsm-pm application is up and
running.
```

This states that there is an issue with the `wsm-pm` application. There can also be some other causes related to the exception. It is recommended that you examine the logged exceptions on both the WebCenter managed server and the configured Oracle SOA suites managed servers when these issues occur.

This section includes the following sub sections:

- [Users Mismatch in Identity Stores](#)
- [Shared User Directory Does Not Include the weblogic User](#)
- [Issues with the wsm-pm Application](#)
- [Clocks are Out of Sync for More Than Five Minutes](#)
- [Worklist Service Timed Out or is Disabled](#)

20.4.2.1 Users Mismatch in Identity Stores

Mismatch in identity stores used by the managed server on which the Worklist service task flow is running and that of the Oracle SOA Suite BPEL server.

Problem

If a user exists in the Worklist managed server's identity store but not in the Oracle SOA Suite's identity store, then the following messages display:

In the diagnostic logs of the Worklist service's managed server:

```
[2009-03-23T11:35:21.407+00:00] [DefaultServer] [ERROR] []
[oracle.webcenter.worklist.config] [tid: pool-1-daemon-thread-12] [userId: Luke]

[WEBSERVICE_PORT.name: TaskQueryServicePortSAML] [APP:
soa-infra] [J2EE_MODULE.name:
/integration/services/TaskQueryService] [WEBSERVICE.name:
TaskQueryService] [J2EE_APP.name: soa-infra] Web service
authentication failed.

```

Solution

The same users must exist in identity stores of both managed servers. For information, see the section "Setting Security for the Worklist Service in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

This can be easily accomplished with a common LDAP identity store. A useful check is to validate that you can log in to the Oracle SOA Suite's BPEL Worklist application with the user ID for which the Worklist service is unavailable. That is, try accessing the integration Worklist application at:

`http://host:port/integration/worklistapp`. Where the host and port are the same as those used in the Worklist connection for the task flow application.

20.4.2.2 Shared User Directory Does Not Include the weblogic User

Problem

BPEL Web services cannot respond to requests received from the Worklist service because the shared user directory does not include the `weblogic` user.

Solution

Ensure that you have tried the solution provided in [Users Mismatch in Identity Stores](#). If that solution did not resolve the issue, then try the solution described in this section.

If Oracle SOA Suite is connected to a shared user directory (LDAP), and the user `weblogic` does not exist in the identity store, then the following step assigns the `BPMWorkflowAdmin` role to a valid user in the identity store. Use WLST to revoke an application role from `SOAAdmin` and grant it to a member of the external identity store. This can be done by running the following WLST command from the `SOA_ORACLE_HOME`. For example:

```

cd SOA_ORACLE_HOME/common/bin/
wlst.sh
connect('weblogic','weblogic','## soa host ##:## soa administration port ##')
revokeAppRole(appStripe="soa-infra", appRoleName="BPMWorkflowAdmin",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
principalName="SOAAdmin")
grantAppRole(appStripe="soa-infra", appRoleName="BPMWorkflowAdmin",

```

```
principalClass="weblogic.security.principal.WLSUserImpl",
principalName="user")
```

In this example, the LDAP identity store has a user named `user`. If the user to which you want to grant the `BPMWorkflowAdmin` role does not exist in the LDAP identity store, then you must restart the Oracle SOA Suite's managed server to make this change effective.

20.4.2.3 Issues with the `wsm-pm` Application

Problem

Issue with the `wsm-pm` application on either the Worklist service's managed server, or the Oracle SOA Suite's managed server, or on both.

Solution

The `wsm-pm` application manages the Web service security policies that control the SAML authentication in the Worklist service. To validate the `wsm-pm` application, log in to the `wsm-pm` application's validation page as a user with administrative rights. Use this format for validation: `http://host:port/wsm-pm/validator`. If there are no issues with this application, then accessible policies must display. If policies do not display, then investigate the related logged information on the server whose `wsm-pm` application is failing.

20.4.2.4 Clocks are Out of Sync for More Than Five Minutes

Due to security reasons, the Web service security interaction between the Worklist service's managed server and that of the Oracle SOA Suite BPEL must take place with a time difference of less than five minutes. That is, the clocks on both host machines must have a time difference of less than five minutes, otherwise authentication fails. The SAML assertion uses the `NotBefore` condition to verify this.

Problem

Clocks of the Worklist service's managed server and the Oracle SOA Suite BPEL's managed server are out of sync for more than five minutes.

Solution

Ensure that the current time is not set to earlier than the SAML assertion's `clockskew`, which is 300 seconds by default.

Either match the time on the client and service machines, or configure the `agent.clock.skew` property (in seconds) in the `policy-accessor-config.xml` file. This file is located in the `DOMAIN_HOME/config/fmwconfig` directory.

20.4.2.5 Worklist Service Timed Out or is Disabled

Problem

The Worklist service cannot obtain a query result from the Oracle SOA Suite BPEL server within a defined period.

The Worklist service issues queries to the Oracle SOA Suite BPEL server using concurrent threads. These threads are allotted a certain amount of time in which to respond. If these threads do not respond in the allotted time, for example 15 seconds, then the Worklist service times out the call, and it allows the task flow to display the

unavailability message. In such a case, log files include related exceptions such as the following:

```
[2009-03-03T12:09:34.769-08:00] [WLS_Spaces] [ERROR] [WCS-32103]
[oracle.webcenter.worklist.model] [tid: [ACTIVE].ExecuteThread: '3' for queue:
'weblogic.kernel.Default (self-tuning)'] [userId: user] [ecid:
0000HzDx68KC0zT6uBbAEH19fOWs00002q,0] [APP: webcenter] Unable to query BPEL

java:352)
    at java.util.TimerThread.mainLoop(Timer.java:512)
    at java.util.TimerThread.run(Timer.java:462)]]
```

Solution

If errors such as this occur consistently, then there may be fundamental issues with the resources available to the managed servers running the Worklist service and the Oracle SOA Suite BPEL server.

Validate that the volume of users and resources provided is adequate to run these servers in the infrastructure provided.

Note: Continuous occurrence of `TimeoutExceptions` can also disable the Worklist service. Due to which this service cannot connect to the BPEL instance that is failing to respond quickly. In such a case, the logs contain

```
oracle.webcenter.concurrent.DisabledException
exceptions. These exceptions are related to the Worklist service failure.
```

Managing Portlet Producers

This chapter describes how to register, edit, delete, and deploy portlet producers.

This chapter includes the following sections:

- [Section 21.1, "What You Should Know About Portlet Producers"](#)
- [Section 21.2, "Registering WSRP Producers"](#)
- [Section 21.3, "Testing WSRP Producer Connections"](#)
- [Section 21.4, "Registering Oracle PDK-Java Producers"](#)
- [Section 21.5, "Testing Oracle PDK-Java Producer Connections"](#)
- [Section 21.6, "Editing Producer Registration Details"](#)
- [Section 21.7, "Deregistering Producers"](#)
- [Section 21.8, "Deploying Portlet Producer Applications"](#)
- [Section 21.9, "Troubleshooting Portlet Producer Issues"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). For more information, see [Section 1.12, "Oracle WebCenter Administration Tools."](#)

21.1 What You Should Know About Portlet Producers

Consider the following while working with portlet producers:

- Several out-of-the-box producers are provided with Oracle WebCenter: OmniPortlet, Web Clipping, Rich Text Portlet, and WSRP Tools. The following EAR files are packaged with Oracle WebCenter:
 - `portalTools.ear` - OmniPortlet and Web Clipping
 - `wsrp-tools.ear` - Rich Text Portlets and WSRP Tools

You can install the `portalTools.ear` and `wsrp-tools.ear` files using the `registerOOTBProducers WLST` command. For command syntax and examples, see "registerOOTBProducers" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

- Before users can add JSR 168 or Oracle PDK-Java portlets to a page, you must register the owning WSRP and Oracle PDK-Java producers. See also,

"registerSampleProducers" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

- The Oracle Portlet Producer product (server) must be installed in the production environment and the `wsrp-tools` and `portalTools` URLs must be accessible. If the Oracle Portlet Producer is not installed, see the section "Extending an Existing Domain" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter* to install it in the production environment.
- When you create a connection to a portlet producer, the producer gets registered with the WebCenter application and the connection is added to the `connections.xml` file during registration. For WSRP producers, a Web service connection is also created, which follows the naming convention, `connectionname-wsconn`. For Oracle PDK-Java producers, an underlying URL connection is created, which follows the naming convention, `connectionname-urlconn`. During the registration, the connection metadata is created in the MDS and in the producer being registered. When a producer is consumed, the user customizations are saved to the producer. During de-registration the producer connection and customizations are removed.
- All post deployment connection configuration is stored in the Oracle Metadata Services (MDS) repository. For more information, see [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#) For detailed information about MDS, see the chapter "Managing the Oracle Metadata Repository" in the *Oracle Fusion Middleware Administrator's Guide*.
- Portlet producer registration is dynamic. New portlet producers and updates to existing producers are immediately available; it is not necessary to restart the WebCenter application or the managed server.
- To migrate producers from one instance to another, use the migration utilities described in the appendix "Portlet Preference Store Migration Utilities" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.
- For information on securing portlet producers, see [Section 23.8.5, "Securing a WSRP Producer with WS-Security"](#) and [Section 23.9, "Securing a PDK-Java Producer."](#)

21.2 Registering WSRP Producers

This section describes how to register WSRP producers using Fusion Middleware Control and WLST commands. This section includes the following subsections:

- [Section 21.2.1, "Registering a WSRP Producer Using Fusion Middleware Control"](#)
- [Section 21.2.2, "Registering a WSRP Producer Using WLST"](#)

For information about how to register WSRP producers using JDeveloper, see the section "How to Register a WSRP Portlet Producer" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

21.2.1 Registering a WSRP Producer Using Fusion Middleware Control

To register a WSRP portlet producer:

1. Login to Fusion Middleware Control and navigate to the home page for your custom WebCenter application (or WebCenter Spaces). For more information, see:
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

- [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
2. Do one of the following:
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Register Producer**.
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Register Producer**.
 3. In the **Add Portlet Producer Connection** section, enter connection details for the WSRP producer.

For detailed parameter information, see [Table 21–1](#).

Table 21–1 WSRP Producer Connection Parameters

Field	Description
Connection Name	<p>Enter a unique name to identify this portlet producer registration within the WebCenter application. The name must be unique across all WebCenter connection types.</p> <p>The name you specify here appears in the Oracle Composer (under the <i>Portlets</i> folder).</p>
Producer Type	Indicate the type of this producer. Select WSRP Producer .
WSDL URL	<p>The registration URL for the WSRP producer.</p> <p>The syntax varies according to your WSRP implementation. For example, possible URL formats for a portlet deployed to the Oracle WSRP container include:</p> <p><code>http://host_name:port_number/context_root/portlets/wsrp2?WSDL</code></p> <p><code>http://host_name:port_number/context_root/portlets/wsrp1?WSDL</code></p> <p><code>http://host_name:port_number/context_root/portlets/?WSDL</code> (WSRP 1.0 for backward compatibility)</p> <p>Where:</p> <ul style="list-style-type: none"> ■ <code>host_name</code> is the server where your producer is deployed. ■ <code>port_number</code> is the HTTP listener port number. ■ <code>context_root</code> is the Web application's context root. ■ <code>portlets_wsrp(1 2)?WSDL</code> is static text. All producers deployed to the Oracle WSRP container are exposed as WSRP version 1 and version 2 producers. <p>In WebCenter Spaces, only v2 WSDLs are supported for Oracle WebLogic Portal Producers.</p> <p>For example:</p> <p><code>http://myhost.com:7778/MyPortletApp/portlets/wsrp2?WSDL</code></p> <p>For WSRP producers, you can obtain this registration URL by accessing the producer test page at:</p> <p><code>http://host_name:port_number/context_root/info</code></p>
Use Proxy?	<p>Select if the WebCenter application must use an HTTP proxy when contacting this producer. If selected, enter values for Proxy Host and Proxy Port.</p> <p>A proxy is required when the WebCenter application and the remote portlet producer are separated by a firewall and an HTTP proxy is needed to communicate with the producer.</p>

Table 21–1 (Cont.) WSRP Producer Connection Parameters

Field	Description
Proxy Host	Enter the address for the proxy server. Do not prefix <code>http://</code> to the proxy server name.
Proxy Port	Enter the port number on which the proxy server listens. The default port is 80.
Default Execution Timeout (Seconds)	Enter a suitable timeout for design time operations. For example, the maximum time the producer may take to register, deregister, or display portlets on WebCenter pages. Individual portlets may define their own timeout period, which takes precedence over the value expressed here. This default is 30 seconds.

4. Use the **Security** section to specify the type of security token to use for the identity propagation/assertion.

The security token with the propagated or asserted user information is represented as an XML element in the SOAP header. The security token and the SOAP message body are then digitally signed to prove the authenticity of the SOAP message origin from the WebCenter application. WebCenter Spaces supports three types of security tokens: *Username Tokens Without Password*, *Username Tokens With Password*, and *SAML Tokens*.

Note: PeopleSoft WSRP producers support two profiles: *Username Token With Password* and *SAML Token With Message Integrity*. Oracle Portal (as a consumer) supports three profiles: *Username Token Without Password*, *Username Token With Password*, *SAML Token With Message Integrity*. Other Oracle WSRP producers support all profiles. For other WSRP containers, check with the specific vendor to determine the token formats they support.

For detailed parameter information, see [Table 21–2](#).

Table 21–2 WSRP Producer Security Connection Parameters

Field	Description
Token Profile	<p>Select the type of token profile to use for authentication with this WSRP producer. Select from:</p> <ul style="list-style-type: none"> <li data-bbox="695 338 1390 394">■ None—No security on this connection. If you select None, no WS-Security header is attached to the SOAP message. <li data-bbox="695 407 1442 632">■ WSS 1.0 SAML Token (oracle/wss10_saml_token_client_policy)—This policy provides SAML-based authentication for outbound SOAP request messages in accordance with the WS-Security 1.0 standard. The policy propagates user identity and is typically used in intra departmental deployments where message protection and integrity checks are not required. This policy does not require any keystore configuration. <li data-bbox="695 644 1442 884">■ WSS 1.0 SAML Token With Message Integrity (wss10_saml_token_with_message_integrity_client_policy)—This policy provides message-level integrity protection and SAML-based authentication for outbound SOAP requests in accordance with the WS-Security 1.0 standard. A SAML token, included in the SOAP message, is used in SAML-based authentication with sender vouches confirmation. This policy uses WS-Security's Basic 128 suite of asymmetric key technologies and SHA-1 hashing algorithm for message integrity. <li data-bbox="695 896 1442 1251">■ WSS 1.0 SAML Token With Message Protection (oracle/wss10_saml_token_with_message_protection_client_policy)—This policy provides message-level protection (integrity and confidentiality) and SAML-based authentication for outbound SOAP requests in accordance with the WS-Security 1.0 standard. The Web service consumer includes a SAML token in the SOAP header and the confirmation type is sender-vouches. This policy uses WS-Security's Basic 128 suite of asymmetric key technologies. Specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption. When you select this policy, you must also specify the Recipient Alias. <li data-bbox="695 1264 1442 1791">■ WSS 1.0 Username With Password (oracle/wss10_username_token_with_message_protection_client_policy)—This policy provides username (with password) token profile based identity propagation with certificate based message protection for outbound SOAP requests in accordance with the WS-Security v1.0 standard. Both plain text and digest mechanisms are supported. This policy uses WS-Security's Basic128 suite of asymmetric key technologies. Specifically, RSA key mechanism for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption. Use this token profile if the WSRP producer has a different identity store. You must define an external application pertaining to the producer and associate the external application with this producer. The external application defined here is used to retrieve and propagate the user credentials to the producer. The producer verifies this against the identity store configured for the external application. When you select this policy, you must also specify the Recipient Alias.

Table 21–2 (Cont.) WSRP Producer Security Connection Parameters

Field	Description
Token Profile (cont.)	<ul style="list-style-type: none"> <li data-bbox="613 262 1365 646"> <p>■ WSS 1.0 Username Without Password (oracle/wss10_username_id_propagation_with_msg_protection_client_policy)—This policy provides username (with password) token profile based identity propagation with certificate based message protection for outbound SOAP requests in accordance with the WS-Security 1.0 standard. Credentials (username only) are included in outbound SOAP request messages through a WS-Security UsernameToken header. No password is included. Message protection is provided using WS-Security 1.0's Basic128 suite of asymmetric key technologies. Specifically, RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.</p> <p>When you select this policy, you must also specify the Recipient Alias.</p> <li data-bbox="613 659 1365 926"> <p>■ WSS 1.1 SAML Token with Message Protection (oracle/wss11_saml_token_with_message_protection_client_policy)—This policy provides message-level protection (integrity and confidentiality) and SAML token population for outbound SOAP requests in accordance with the WS-Security 1.1 standard. A SAML token, included in the SOAP message, is used in SAML-based authentication with sender vouches confirmation. This policy uses the symmetric key technology for signing and encryption, and WS-Security's Basic128 suite of asymmetric key technologies for endorsing signatures.</p>
Configuration	<p>Select:</p> <ul style="list-style-type: none"> <li data-bbox="613 982 1208 1010">■ Default to use a default token profile configuration. <li data-bbox="613 1022 1273 1077">■ Custom to provide a custom Oracle Web Service Manager configuration. <p>Additional security options display (including all the keystore properties) when you select Custom.</p>
Issuer Name	<p>Enter the name of the issuer of the SAML Token.</p> <p>For example: <code>www.example.com</code></p> <p>The issuer name is the attesting entity that vouches for the verification of the subject, and it must be a trusted SAML issuer on the producer end.</p> <p>Valid for: WSS 1.0 SAML Token With Message Integrity, WSS1.0 SAML Token With Message Protection, WSS 1.0 SAML Token, and WSS 1.1 SAML Token with Message Protection</p>

Table 21–2 (Cont.) WSRP Producer Security Connection Parameters

Field	Description
Default User	<p>Enter a user name to assert to the remote producer when the user is not authenticated with the WebCenter application.</p> <p>When unauthenticated, the identity <i>anonymous</i> is associated with the application user. The value <i>anonymous</i> may be inappropriate for the remote producer, so it may be necessary to specify an alternative identity here. Keep in mind though, that in this case, the WebCenter application has not authenticated the user so the default user you specify should be a low privileged user in the remote producer. If the user has authenticated to the application, the user's identity is asserted rather than the default user.</p> <p>The WSRP producer must be configured with <i>strict-authentication</i> to support <i>anonymous</i> to a default user mapping. The <i>strict-authentication</i> flag is defined in the producer's <i>oracle-portlet.xml</i> file. For more information, see the appendix "oracle-portlet.xml Syntax" in the <i>Oracle Fusion Middleware Developer's Guide for Oracle WebCenter</i>.</p> <p>Valid for: WSS 1.0 SAML Token With Message Integrity, WSS 1.0 SAML Token With Message Protection, WSS 1.0 SAML Token, WSS 1.1 SAML Token with Message Protection and WSS 1.0 Username Without Password.</p>
Associated External Application (Username With Password)	<p>If this producer uses an external application for authentication, use the Associated External Application dropdown list to identify the application. If the application you want is not listed, select Create New to define the external application now.</p> <p>An external application is required to support producers using the security option <i>Username With Password</i>. The external application stores and supplies the user credentials. See also Section 22.2, "Registering External Applications."</p> <p>Valid for: WSS 1.0 Username With Password only.</p>

- Use the **Keystore** section to specify the location of the key store that contains the certificate and private key that is used for signing some parts (security token and SOAP message body) of the SOAP message.

For detailed parameter information, see [Table 21–3](#).

Table 21–3 WSRP Producer Key Store Connection Parameters

Field	Description
Store Type	The keystore type for this producer—always Java Key Store (jks).
Store Path	<p>Enter the absolute path to the keystore that contains the certificate and the private key that is used for signing or encrypting the soap message (security token and message body). The signature, encryption, and recipient keys described in this table must be available in this keystore.</p> <p>The keystore should be created using JDK's keytool utility.</p>
Password	Provide the password to the keystore that was set when the keystore was created. The producer is not available if a password is not specified or incorrect.
Signature Key Alias	<p>Enter the signature key alias.</p> <p>The Signature Key Alias is the identifier for the certificate associated with the private key that is used for signing.</p>

Table 21–3 (Cont.) WSRP Producer Key Store Connection Parameters

Field	Description
Signature Key Password	Enter the password for accessing the key identified by the alias specified in Signature Key Alias .
Encryption Key Alias	Enter the key alias to use for encryption.
Encryption Key Password	Enter the password for accessing the encryption key.
Recipient Alias	Specify the key store alias that is associated with the producer's certificate. This certificate is used to encrypt the message to the producer.

6. Click **OK**.

The new producer appears in the connection table.

21.2.2 Registering a WSRP Producer Using WLST

Use the WLST command `registerWSRPProducer` to create a connection to a WSRP portlet producer and register the producer with your WebCenter application. For command syntax and examples, see the section "registerWSRPProducer" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

See Also: `deregisterWSRPProducer`, `listWSRPProducers`, `refreshProducer`, `registerOOTBProducers`, `registerSampleProducers`

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

21.3 Testing WSRP Producer Connections

To verify a WSRP producer connection, first obtain the producer URL from:

```
http://host_name:port_number/context_root/info
```

Then, run the producer URL in a browser window.

For a WSRP v1 producer connection, the URL format is:

```
http://host_name:port_number/context_root/portlets/wsrp1?WSDL
```

For example:

```
http://myhost.com:7778/MyPortletApp/portlets/wsrp1?WSDL
```

For a WSRP v2 producer connection, the URL format is:

```
http://host_name:port_number/context_root/portlets/wsrp2?WSDL
```

For example:

```
http://myhost.com:7778/MyPortletApp/portlets/wsrp2?WSDL
```

21.4 Registering Oracle PDK-Java Producers

This section describes how to register PDK-Java producers using Fusion Middleware Control and WLST commands. This section includes the following subsections:

- [Section 21.4.1, "Registering an Oracle PDK-Java Producer Using Fusion Middleware Control"](#)
- [Section 21.4.2, "Registering an Oracle PDK-Java Producer Using WLST"](#)

For information about how to register PDK-Java producers using JDeveloper, see the section "How to Register an Oracle PDK-Java Portlet Producer" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

21.4.1 Registering an Oracle PDK-Java Producer Using Fusion Middleware Control

To register an Oracle PDK-Java portlet producer:

1. Login to Fusion Middleware Control and navigate to the home page for your custom WebCenter application (or WebCenter Spaces):
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
2. Do one of the following:
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Register Producer**.
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Register Producer**.
3. In the **Add Portlet Producer Connection** section, enter connection details for the Oracle PDK-Java producer.

For detailed parameter information, see [Table 21–4, "Oracle PDK-Java Producer Connection Parameters"](#).

Table 21–4 Oracle PDK-Java Producer Connection Parameters

Field	Description
Connection Name	Enter a unique name that identifies this portlet producer registration within the WebCenter application. The name must be unique across all WebCenter connection types. The name you specify here appears in the Oracle Composer (under the <i>Portlets</i> folder).
Producer Type	Indicate the type of this producer. Select Oracle PDK-Java Producer .

Table 21–4 (Cont.) Oracle PDK-Java Producer Connection Parameters

Field	Description
URL End Point	<p>Enter the Oracle PDK-Java producer's URL using the following syntax:</p> <pre>http://host_name:port_number/context_root/providers</pre> <p>Where:</p> <ul style="list-style-type: none"> ■ host_name is the server where the producer is deployed ■ port_number is the HTTP Listener port number ■ context_root is the Web application's context root. ■ providers is static text. <p>For example:</p> <pre>http://myHost.com:7778/myEnterprisePortlets/providers</pre>
Service ID	<p>Enter a unique identifier for this producer.</p> <p>PDK-Java enables you to deploy multiple producers under a single adapter servlet. Producers are identified by their unique service ID. A service ID is required only if the service ID is not appended to the URL end point.</p> <p>For example, the following URL endpoint requires <code>sample</code> as the service ID:</p> <pre>http://domain.us.oracle.com:7778/xyz/providers</pre> <p>However, the following URL endpoint, does not require a service ID:</p> <pre>http://domain.us.oracle.com:7778/xyz/providers/sample</pre> <p>The service ID is used to look up a file called <code><service_id>.properties</code>, which defines the characteristics of the producer, such as whether to display its test page. Use any value to create the service ID. When no Service ID is specified, <code>_default.properties</code> is used.</p>
Use Proxy?	<p>Select this checkbox if the WebCenter application must use an HTTP proxy when contacting this producer. If selected, enter values for Proxy Host and Proxy Port.</p> <p>A proxy is required if the WebCenter application and the remote portlet producer are separated by a firewall and an HTTP proxy is needed for communication with the producer.</p>
Proxy Host	<p>Enter the host name for the proxy server.</p> <p>Do not prefix <code>http://</code> to the proxy server name.</p>
Proxy Port	<p>Enter the port number on which the proxy server listens. The default port is 80.</p>
Associated External Application	<p>If one of this producer's portlets requires authentication, select Associate Producer with an External Application, and then select the relevant external application from the dropdown list. See also Section 22.2, "Registering External Applications."</p>

Table 21–4 (Cont.) Oracle PDK-Java Producer Connection Parameters

Field	Description
Establish Session?	<p>Select to enable a user session when executing portlets from this producer. When sessions are enabled, they are maintained on the producer server. This allows the portlet code to maintain information in the session.</p> <p>Message authentication uses sessions, so if you specify a shared key, you must also select this option.</p> <p>For sessionless communication between the producer and the server, do not select this option.</p>
Default Execution Timeout (Seconds)	<p>Enter a suitable timeout for design time operations. For example, the maximum time the producer may take to register, deregister, or display portlets on WebCenter pages. This defaults to 30 seconds.</p> <p>Individual portlets may define their own timeout period, which takes precedence over the value expressed here.</p>
Subscriber ID	<p>Enter a string to identify the consumer of the producer being registered.</p> <p>When a producer is registered with an application, a call is made to the producer. During the call, the consumer (WebCenter application in this instance) passes the value for Subscriber ID to the producer. If the producer does not see the expected value for Subscriber ID, it might reject the registration call.</p>
Shared Key	<p>Enter a shared key to use for producers that are set up to handle encryption.</p> <p>The shared key is used by the encryption algorithm to generate a message signature for message authentication. Note that producer registration fails if the producer is set up with a shared key and you enter an incorrect shared key here. The shared key can contain between 10 and 20 alphanumeric characters.</p> <p>This key is also used when registering a producer using the Federated Portal Adapter (FPA). The Shared Key is also known as the HMAC key.</p>

4. Click OK.

The new producer appears in the connection table.

21.4.2 Registering an Oracle PDK-Java Producer Using WLST

Use the WLST command `registerPDKJavaProducer` to create a connection to a PDK-Java portlet producer and register the producer with your WebCenter application. For command syntax and examples, see the section "registerPDKJavaProducer" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

See Also: `deregisterPDKJavaProducer`,
`listPDKJavaProducers`, `refreshProducer`

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

21.5 Testing Oracle PDK-Java Producer Connections

To verify an Oracle PDK-Java producer connection, run the producer URL in a browser window in the following format:

```
http://host_name:port_number/context-root/providers/producer_name
```

For example:

```
http://domain.us.oracle.com:7778/axyz/providers/sample
```

21.6 Editing Producer Registration Details

You can update producer registration details at any time.

If a producer moves to a different location, then you must reconfigure any connections you have defined to this producer. You can use Fusion Middleware Control or WLST to edit the URL property:

- WDSL URL for a WSRP producer
- URL End Point for an Oracle PDK-Java producer

To retain all the portlet customizations and personalizations that users have made while working with WebCenter applications, you must also migrate producer customizations and personalizations to the producer's new location. Use WLST commands `exportProducerMetadata` and `importProducerMetadata` to migrate portlet client metadata to a different location. For more information, see [Section 25.2.3, "Exporting Portlet Client Metadata \(Custom WebCenter Applications\)"](#) and [Section 25.2.4, "Importing Portlet Client Metadata \(Custom WebCenter Applications\)."](#)

Note: If you want to migrate all the metadata for a particular producer (rather than portlet customizations and personalizations only), then use the Producer migration tool. For more information, see [Section 25.1.3.15, "Exporting Portlet Producers"](#) and [Section 25.1.3.16, "Importing Portlet Producers."](#)

This section includes the following subsections:

- [Section 21.6.1, "Editing Producer Registration Details Using Fusion Middleware Control"](#)
- [Section 21.6.2, "Editing Producer Registration Details Using WLST"](#)
- [Section 21.6.3, "Migrating WSRP Producer Metadata to a New WSDL URL"](#)

21.6.1 Editing Producer Registration Details Using Fusion Middleware Control

To update connection details for a portlet producer:

1. Login to Fusion Middleware Control and navigate to the home page for your custom WebCenter application (or WebCenter Spaces):
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
2. Do one of the following:

- For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Portlet Producers**.
 4. In the **Manage Portlet Producer Connections** section, select the producer you want to modify, and click **Edit**.
 5. In the **Edit Portlet Producer Connection** section, modify connection details, as required. For more information, see:
 - [Table 21-1, "WSRP Producer Connection Parameters"](#)
 - [Table 21-4, "Oracle PDK-Java Producer Connection Parameters"](#)
 6. Click **OK**.

21.6.2 Editing Producer Registration Details Using WLST

Use the following WLST commands to edit portlet producer connections:

- **WSRP producers** - `setWSRPProducer`
- **PDK-Java producers** - `setPDKJavaProducer`

For command syntax and examples, see the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

21.6.3 Migrating WSRP Producer Metadata to a New WSDL URL

If you want to move a WSRP producer to a new WSDL URL, you can use the `exportPortletClientMetadata`, `setWSRPProducer`, and `importPortletClientMetadata` WLST commands to migrate the existing producer metadata to the new location. Before importing the producer metadata, you must deregister the existing producer and then reregister the producer with the new URL endpoint. If you do not reregister the producer, "Portlet Unavailable" messages display in your WebCenter application.

To migrate WSRP producer metadata to a new URL endpoint:

1. Export the producer metadata, using the WLST command `exportPortletClientMetadata`. For command syntax and examples, see "exportPortletClientMetadata" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.
2. Change the producer's WSDL URL, using the WLST command `setWSRPProducer`. For command syntax and examples, see "setWSRPProducer" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.
3. Use Fusion Middleware Control or the WLST command `deregisterWSRPProducer` to remove the existing producer connection, and the producer's metadata, from the WebCenter application. For more information, see [Section 21.7, "Deregistering Producers."](#)
4. Use Fusion Middleware Control or the WLST command `registerWSRPProducer` to reregister the WSRP producer with the same name

but the new WSDL URL. For more information, see [Section 21.2, "Registering WSRP Producers."](#)

5. Import the producer metadata, using the WLST command `importPortletClientMetadata`. For command syntax and examples, see "importPortletClientMetadata" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

21.7 Deregistering Producers

You can deregister producers at any time but, before doing so, consider any impact to the WebCenter application as portlets associated with a deregistered producer no longer work. Check the *Portlets Producer Invocation* metric to see how frequently the producer is being used. For more information, see [Section 24.2, "Viewing Performance Information."](#)

When you deregister a producer, registration data is removed from both the WebCenter application and the remote producer:

- WebCenter application - The producer connection is deleted and producer metadata is also deleted.
- Remote producer - Portlet instances are deleted (not the portlets themselves).

Portlet instances are not removed from WebCenter application pages. In place of the portlet, WebCenter users see a "Portlet unavailable" message.

Note: Consider deleting the external application associated with this portlet producer *if* the application's sole purpose was to support this producer. See [Section 22.5, "Deleting External Application Connections."](#)

This section includes the following subsections:

- [Section 21.7.1, "Deregistering Producers Using Fusion Middleware Control"](#)
- [Section 21.7.2, "Deregister Producers Using WLST"](#)

21.7.1 Deregistering Producers Using Fusion Middleware Control

To deregister a portlet producer:

1. Login to Fusion Middleware Control and navigate to the home page for your custom WebCenter application (or WebCenter Spaces):
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#)
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
2. Do one of the following:
 - For custom WebCenter applications - From the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
 - For WebCenter Spaces - From the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, select **Portlet Producers**.

4. Select the name of the producer you want to remove, and click **Delete**.

The connection details are removed. Portlets associated with this producer are no longer accessible within the WebCenter application.

21.7.2 Deregister Producers Using WLST

Use the following WLST commands to deregister portlet producer connections:

- **WSRP producers** - `deregisterWSRPProducer`
- **PDK-Java producers** - `deregisterPDKJavaProducer`

Use the following WLST commands to deregister the out-of-the-box or sample producers provided with Oracle WebCenter:

- **Out-of-the-box producers** - `deregisterOOTBProducers`
- **Sample producers** - `deregisterSampleProducers`

For command syntax and examples, see the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

21.8 Deploying Portlet Producer Applications

To deploy a portlet producer to an Oracle WebLogic Managed Server instance, you can use Fusion Middleware Control, Oracle WebLogic Server Administration Console, or WLST. For information on deploying a portlet producer through Oracle JDeveloper, see the chapter "Testing and Deploying Your Portlets" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

This section includes the following subsections:

- [Section 21.8.1, "Understanding Portlet Producer Application Deployment"](#)
- [Section 21.8.2, "Converting a JSR 168 Portlet Producer EAR File into a WSRP EAR File"](#)
- [Section 21.8.3, "Deploying Portlet Producer Applications Using Oracle JDeveloper"](#)
- [Section 21.8.4, "Deploying Portlet Producer Applications Using Fusion Middleware Control"](#)
- [Section 21.8.5, "Deploying Portlet Producer Applications Using Oracle WebLogic Server Administration Console"](#)
- [Section 21.8.6, "Deploying Portlet Applications Using WLST"](#)

For more information about deploying applications, see the chapter "Deploying Application" in *Oracle Fusion Middleware Administrator's Guide*.

21.8.1 Understanding Portlet Producer Application Deployment

You can deploy your portlet producer application to any Oracle WebLogic Managed Server instance that is configured to support WebCenter portlet producers. To deploy an application to a managed server, you can use Oracle Enterprise Manager Fusion Middleware Control, Oracle WebLogic Administration Console, or WLST. For more information about these administration tools, see [Section 1.12, "Oracle WebCenter Administration Tools."](#)

21.8.2 Converting a JSR 168 Portlet Producer EAR File into a WSRP EAR File

To deploy JSR 168 portlets to the WSRP Oracle Portlet Container, the portlet application EAR files must be converted into a WSRP application, which contains the necessary WSDL documents. To convert the JSR 168 portlet producer EAR file into a WSRP EAR file, run the WSRP producer predeployment tool located in the Middleware directory at

`WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1`, as follows:

```
java -jar wsrp-predeploy.jar source EAR target EAR
```

For JSR 168 portlets developed with servlet version 2.3, you must specify Web proxies using the following command:

```
java -Dhttp.proxyHost=proxy host -Dhttp.proxyPort=proxy port -jar wsrp-predeploy.jar source EAR target EAR
```

where:

- `proxy host` is the server to which your producer has been deployed.
- `proxy port` is the HTTP Listener port.
- `wsrp-predeploy.jar` is located in the `WC_ORACLE_HOME/webcenter/modules/oracle.portlet.server_11.1.1` directory.
- `source EAR` is the name of the JSR 168 EAR file.
- `target EAR` file is the name of the new EAR file to be created. If the file name for the targeted EAR file is not specified, then a new EAR file called `WSRP-source EAR` is produced.

In the following example Web proxy is specified:

```
java -Dhttp.proxyHost=myhttpproxy.com -Dhttp.proxyPort=80 -jar wsrp-predeploy.jar wsrp-samples.ear
```

This example produces `WSRP-wsrp-samples.ear`.

The `wsrp-predeploy.jar` predeployment tool makes all the necessary changes to a JSR 168 portlet to be able to deploy it to the Oracle portlet container and expose it as a WSRP producer. Here are some examples of what the predeployment tool does:

- Creates the `wsdldeploy` directory in the `java.io.tmpdir` folder.
 - On UNIX, the default value of this property is `/tmp` or `/var/tmp`
 - On Microsoft Windows, the default value of this property is `c:\temp`.
- Unpacks the EAR file into `wsdldeploy/EAR`.
- Unpacks the WAR files into `wsdldeploy/[warfilename.war]/`.
- Inserts `WEB-INF/WSDLs` into the unpacked application.
- Modifies `WEB-INF/web.xml` in the unpackaged WAR files.
- Inserts or modifies `WEB-INF/webservices.xml` in the WAR files.
- Inserts or modifies `WEB-INF/oracle-webservices.xml` in the WAR files.
- Repackages the WARs and builds a new EAR file.

21.8.3 Deploying Portlet Producer Applications Using Oracle JDeveloper

You can deploy portlet applications to an Oracle WebLogic Managed Server instance directly from the development environment using Oracle JDeveloper, if you have the necessary credentials to access the WebLogic server. For more information, see the section "Deploying a Portlet Application to an Oracle WebLogic Managed Server Instance" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

21.8.4 Deploying Portlet Producer Applications Using Fusion Middleware Control

For information about deploying a portlet producer application using Fusion Middleware Control, see [Section 7.1.4.2, "Deploying Applications Using Fusion Middleware Control."](#)

21.8.5 Deploying Portlet Producer Applications Using Oracle WebLogic Server Administration Console

For information about deploying a portlet producer application using Oracle WebLogic Server Administration Console, see [Section 7.1.4.4, "Deploying Applications Using the WLS Administration Console."](#)

21.8.6 Deploying Portlet Applications Using WLST

For information on deploying a portlet application using the WLST command, see [Section 7.1.4.3, "Deploying Applications Using WLST."](#)

21.9 Troubleshooting Portlet Producer Issues

This section includes the following sub sections:

- [Section 21.9.1, "Producer Registration Fails for a Custom WebCenter Application"](#)
- [Section 21.9.2, "Portlet Unavailable: WSM-00101 Exception"](#)

21.9.1 Producer Registration Fails for a Custom WebCenter Application

This section describes producer registration and portlet unavailability issues.

Problem

You are unable to register a WSRP producer.

Solution

Ensure the following:

- Back-end producer is up and running. To test the producer, access the WSDL URL of the producer through a browser window. See, [Section 21.3, "Testing WSRP Producer Connections."](#)
- Producer application is packaged accurately. If not, then register the producer at design time (in JDeveloper), as described in the section "Registering Portlet Producers with a WebCenter Application" in the chapter "Consuming Portlets" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*, and redeploy the application, as described in [Section 7.1, "Deploying Custom WebCenter Applications."](#) After redeployment, verify that the packaged application includes the MBean, `ProducerManager`:

1. In Fusion Middleware Control, from the **Application Deployment** menu, select **System MBean Browser**.
 2. In the Navigator, expand **Application Defined MBeans > oracle.webcenter.portlet > Application: *application_name* > Producer Manager > Producer Manager**.
- PortletServletContextListener is added to the web.xml file.

For applications that support post deployment registration of producers, the producer must be registered at least once at design time. This adds PortletServletContextListener to the web.xml file, which registers the appropriate runtime MBeans to enable post deployment registration of producers. For example, see the text in **bold** in the following web.xml snippet:

```
<listener>
  <description>
    WebCenter Portlet Context Listener
  </description>
  <display-name>
    WebCenterPortletContextListener
  </display-name>
  <listener-class>
    oracle.webcenter.portlet.listener.PortletServletContextListener
  </listener-class>
</listener>
```

21.9.2 Portlet Unavailable: WSM-00101 Exception

Setting up the **User Name with Password** token profile in a WSRP portlet producer throws the exception WSM-00101.

Problem

If you configure the **User Name with Password Token** profile for a WSRP producer through Fusion Middleware Control (or WLST) while portlets associated with this producer are in use, the portlets display the following exception in the WebCenter application:

```
oracle.wsm.common.sdk.WSMException: WSM-00101:
The specified Keystore file
/keys/user_projects/domains/pv_0309/config/fmwconfig/default-keystore.jks
cannot be found; it either does not exist or its path is not included in the
application classpath.
```

Solution

Ensure that you have configured the default keystore in your portlet producer. For information, see [Section 23.8.5.3, "Setting Up the Keystores."](#)

Managing External Applications

An external application is any application that implements its own authentication process. Specifically, it is an application that does not take part in your WebCenter application's single sign-on process.

You can use Fusion Middleware Control or the WLST command-line tool to register and manage external applications for WebCenter application deployments. All external application changes that you make for WebCenter applications, post deployment, are stored in the MDS repository as customizations.

Note: External application configuration through Fusion Middleware Control or WLST is dynamic. Configuration changes are immediately reflected in the WebCenter application; it is not necessary to restart the application or the managed server.

This chapter includes the following sections:

- [Section 22.1, "What You Should Know About External Applications"](#)
- [Section 22.2, "Registering External Applications"](#)
- [Section 22.3, "Modifying External Application Connection Details"](#)
- [Section 22.4, "Testing External Application Connections"](#)
- [Section 22.5, "Deleting External Application Connections"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` or `Operator` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

22.1 What You Should Know About External Applications

If your WebCenter application interacts with an application that handles its own authentication, you can associate that application with an external application definition to allow for credential provisioning. In doing so, you use an external application definition to provide a means of accessing content from these independently authenticated applications.

To replicate a single sign-on experience from the end user's perspective, the external application service captures the user name and password, and any other credentials for the external application, and supplies it to the WebCenter service or application

requiring the credentials. The WebCenter service or other application then uses this information to log in on behalf of the end user. This username and password combination is securely stored in a credential store configured for the WebLogic domain where the application is deployed.

The user provides login credentials when prompted, and these credentials are mapped to the WebCenter application user and stored in the credential store configured for the domain. The credential store subsequently supplies that information during authentication to the external application. Unless the external application's credentials change, the user supplies the credentials only once as the mapped information is read from the credential store for future requests.

Note: When logging in to an external application, if you clear the **Remember My Login Information** check box, then the credentials provisioned for that user session are lost in the event of a failover in a high availability (HA) environment. You are prompted to specify the credentials again if you try to access the external application content in the same user session.

The external applications that are to be used by a custom WebCenter application can be specified before deployment through a wizard in Oracle JDeveloper, or after deployment through Fusion Middleware Control Console (Figure 22–1) or using WLST commands. Post-deployment, external applications specified at design time in JDeveloper display automatically. However, after deployment you must reprovision design-time shared and public credentials using Fusion Middleware Control or WLST commands. For information, see [Section 23.3, "Configuring the Identity Store."](#) and [Section 23.4, "Configuring the Policy and Credential Store."](#)

Figure 22–1 Edit External Application

Edit External Application Connection ? OK Cancel

Name

Application Name MS-Exchange
 Display Name

Login Details
 View the HTML source of the application's login form to determine the Login URL and field names for the HTML User ID and User Password

Enable Automatic Login
 * Login URL
 * HTML User ID Field Name
 * HTML User Password Field Name

Authentication Details
 The authentication method specifies how message data is sent by the browser. View the HTML source of the application's login form to determine the method used, for example, <form method="POST">.

Authentication Method

Additional Login Fields

Shared Credentials
 When shared credentials are enabled, authenticated WebCenter users log in to the application using the user name and password defined here. WebCenter users are not presented with a login form.

Enable Shared Credentials
 User Name
 Password

Public Credentials
 When public credentials are enabled, unauthenticated WebCenter users (public users) log in to the application using the user name and password defined here. WebCenter users are not presented with a login form.

Enable Public Credentials
 User Name
 Password

22.2 Registering External Applications

You can register external applications for WebCenter applications through Fusion Middleware Control or using WLST commands.

Before registering an external application, access the application's login page and examine the HTML source for the application's login form. All the registration details you require are located in the `<form tag>`.

For example, the underlying code for the *Yahoo! Mail* login form looks something like this:

```
<form method=post action="https://login.yahoo.com/config/login?" autocomplete=off
name=login_form>
...
<td><input name=login size=17</td>
...
<td><input name=passwd size=17</td>
...
```

In this example, to provide WebCenter users with a direct link to the *Yahoo! Mail* application, the following sample registration information is required:

Registration Information	Sample Value	HTML Source
Login URL	https://login.yahoo.com/config/login?	action
User Name / User ID Field	login	name=login
Password Field Name:	passwd	name=passwd
Authentication Method	post	method

Note: External application configuration is dynamic. New external applications and updates to existing applications are immediately available; there is no need to restart the WebCenter application.

For information about services that use external applications, see the section "Secured Service Connections" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

This section includes the steps for:

- [Section 22.2.1, "Registering External Applications Using Fusion Middleware Control"](#)
- [Section 22.2.2, "Registering External Applications Using WLST"](#)

22.2.1 Registering External Applications Using Fusion Middleware Control

To register an external application:

1. Login to Fusion Middleware Control and navigate to the home page for your WebCenter application (or WebCenter Spaces):
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)

2. Do one of the following:
 - For custom WebCenter applications: from the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
 - For WebCenter Spaces: from the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, choose **External Applications**.
4. To register a new external application, click **Add** (Figure 22–2).

Figure 22–2 Configuring External Application Connections

5. Enter a unique name for the external application and a display name that WebCenter users working with this external application will see.

See also, [Table 22–1](#).

Table 22–1 External Application Connection - Name

Field	Description
Application Name	Enter a name for the application. The name must be unique (across all connection types) within the WebCenter application. For example: yahoo Note: Once registered, you cannot edit the Application Name.
Display Name	Enter a user friendly name for the application that WebCenter users will recognize. WebCenter end-users working with this external application will see the display name you specify here. For example: My Yahoo If you leave this field blank, the Application Name is used.

6. Enter login details for the external application.

For details, see [Table 22–2](#).

Table 22–2 External Application Connection - Login Details

Field	Description
Enable Automatic Login	<p>Select to allow automatically log users in to this application. Choosing this option requires you to complete the Login URL, HTML User ID Field Name, and HTML User Password Field Name fields</p> <p>With automated single sign-on, the user directly links to the application and is authenticated automatically, as their credentials are retrieved from the credential store. Selecting this option provides the end user with a seamless single sign-on experience.</p> <p>Note: Automated login is not supported for:</p> <ul style="list-style-type: none"> ■ External applications using BASIC authentication. ■ External applications configured for SSO. ■ External applications with a customized login form (built using ADF Faces) that does not implement the J2EE security container login method <code>j_security_check</code> for authentication. ■ External sites that do not support UTF8 encoding
Login URL	<p>Enter the login URL for the external application.</p> <p>To determine the URL, navigate to the application's login page and record the URL.</p> <p>For example: <code>http://login.yahoo.com/config/login</code></p> <p>Note: A login URL is not required if the sole purpose of this external application is to store and supply user credentials on behalf of another service. When omitted, the external application is not available for display in the WebCenter Spaces Application pane. See Section 30.2, "Making an Application Available to WebCenter Users."</p>
HTML User ID Field Name	<p>Enter the name that identifies the "user name" or "user ID" field on the login form.</p> <p>Tip: To find this name, look at the HTML source for the login page.</p> <p>This property does not specify user credentials.</p> <p>Note: You must complete this field if the Authentication Method is GET or POST. Leave this field blank if the application uses basic authentication (see Authentication Method).</p>
HTML User Password Field Name	<p>Enter the name that identifies the "password" field on the login form.</p> <p>Tip: To find this name, look at the HTML source for the login page.</p> <p>Note: You must complete this field if the Authentication Method is GET or POST. Leave this field blank if the application uses basic authentication (see Authentication Method).</p>

7. Select the authentication method used by the external application.

For details, see [Table 22–3](#).

Table 22–3 External Application Connection - Authentication Details

Field	Description
Authentication Method	<p>Select the form submission method used by the external application. Choose from one of the following:</p> <ul style="list-style-type: none"> ■ GET: Presents a page request to a server, submitting the login credentials as part of the login URL. This authentication method may pose a security risk because the user name and password are exposed in the URL. ■ POST: Submits login credentials within the body of the form. This is the default. ■ BASIC: Submits login credentials to the server as an authentication header in the request. This authentication method may pose a security risk because the credentials can be intercepted easily and this scheme also provides no protection for the information passed back from the server. The assumption is that the connection between the client and server computers is secure and can be trusted. <p>The Authentication Method specifies how message data is sent by the browser. You can find this value by viewing the HTML source for the external application's login form, for example, <code><form method="POST" action="https://login.yahoo.com/config/login?" AutoComplete="off"></code></p>

8. Specify additional login fields and details, if required.

For details, see [Table 22–4, "External Application Connection - Additional Login Fields"](#).

Table 22–4 External Application Connection - Additional Login Fields

Field	Description
Additional Login Fields	<p>If your application requires additional login criteria, expand Additional Login Fields.</p> <p>For example, in addition to <i>user name</i> and <i>password</i>, the Lotus Notes application requires two additional fields - <i>Host</i> and <i>MailFilename</i>.</p> <p>Click Add to specify an additional field for the login form. For each new field, do the following:</p> <ul style="list-style-type: none"> ■ Name - Enter the name that identifies the field on the HTML login form that may require user input to log in. This field is not applicable if the application uses basic authentication. ■ Value - Enter a default value for the field or leave blank for a user to specify. This field is not applicable if the application uses basic authentication. ■ Display to User - Select to display the field on the external application login screen. If the field is not displayed (unchecked), then a default Value must be specified. <p>Click Delete to remove a login field.</p>

9. Specify shared and public user credentials, if required.

For details, see [Table 22–5](#).

Table 22–5 External Application Connection - Shared User and Public User Credentials

Field	Description
Enable Shared Credentials	<p>Indicate whether this external application enables shared user credentials, and specify the credentials. Select Enable Shared Credentials, and then enter User Name and Password credentials for the shared user.</p> <p>When shared credentials are specified, every user accessing this external application, through the WebCenter application, is authenticated using the user name and password defined here. WebCenter users are not presented with a login form.</p> <p>Because WebCenter users do not need to define personal credentials of their own, external applications with shared credentials are not listed in the external application's change password task flows such as <i>My Accounts</i> (see also <i>User's Guide -Managing Your Application Login Credentials</i>).</p>
Enable Public Credentials	<p>Indicate whether unauthenticated users (public users) may access this external application. Select Enable Public Credentials, and then enter User Name and Password credentials for the public user.</p> <p>When public credentials are specified, public users accessing this external application through the WebCenter application's public pages are logged in using the username and password defined here. If public credentials are not specified, public users will see an authorization error indicating this external application is not accessible to public users.</p>

10. Click **OK** to register the application.

In WebCenter Spaces, registered applications for automated login are not available to WebCenter users immediately. The WebCenter Spaces administrator decides which registered applications to expose through the Applications pane, see [Section 30.2, "Making an Application Available to WebCenter Users."](#)

22.2.2 Registering External Applications Using WLST

Use the WLST command `createExtAppConnection` to create an external application connection. For command syntax and examples, see `createExtAppConnection` in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Use the WLST command `addExtAppCredentials` to add shared or public credentials for an existing external application connection. For details, see `addExtAppCredentials` in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Use the WLST command `addExtAppField` to define additional login criteria for an existing external application connection. For details, see `addExtAppField` in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

22.3 Modifying External Application Connection Details

This section shows you how to modify the external application connection details by:

- [Section 22.3.1, "Modifying External Application Connection Using Fusion Middleware Control"](#)

- [Section 22.3.2, "Modifying External Application Connection Using WLST"](#)

22.3.1 Modifying External Application Connection Using Fusion Middleware Control

To update external application connection details:

1. Log in to Fusion Middleware Control and navigate to the home page for your custom WebCenter application (or WebCenter Spaces):
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
2. Do one of the following:
 - For custom WebCenter applications - from the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
 - For WebCenter Spaces - from the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, choose **External Applications**.
4. Select the name of the external application you want to modify, and click **Edit**.
5. Edit connection details, as required. For detailed parameter information, see [Table 22-2](#).

Note that you cannot edit the name of the external application.
6. Click **OK** to save your changes.

22.3.2 Modifying External Application Connection Using WLST

Use the WLST command `setExtAppConnection` to edit existing external application connection details. For command syntax and examples, see `setExtAppConnection` in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Note: To edit details relating to an additional login field, use `setExtAppField`. To edit existing shared or public credentials, use `setExtAppCredential`.

To delete an additional login field, use `removeExtAppField`. To delete shared or public credentials, use `removeExtAppCredential`.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

22.4 Testing External Application Connections

For external applications that are created using login URLs, ensure that their login URLs are accessible. For information about direct URLs, see the section "Automated Single Sign-On" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

22.5 Deleting External Application Connections

Take care when deleting an external application connection as WebCenter application users will no longer have access to that application, and any services dependent on the external application may not function correctly.

In WebCenter Spaces, links to external applications are not automatically removed from the Applications pane when an external application is deleted. To prevent unsuccessful access attempts, administrators are advised to remove links to unavailable applications. For details, see [Section 30.6, "Removing Links from the Applications Pane."](#)

This section includes the following subsections:

- [Section 22.5.1, "Deleting External Application Connections Using Fusion Middleware Control"](#)
- [Section 22.5.2, "Deleting External Application Connections Using WLST"](#)

22.5.1 Deleting External Application Connections Using Fusion Middleware Control

To delete an external application connection:

1. Login to Fusion Middleware Control and navigate to the home page for your WebCenter application (or WebCenter Spaces):
 - [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).
 - [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#)
2. Do one of the following:
 - For WebCenter applications - from the **Application Deployment** menu, choose **WebCenter > Service Configuration**.
 - For WebCenter Spaces - from the **WebCenter** menu, choose **Settings > Service Configuration**.
3. From the list of services on the WebCenter Service Configuration page, choose **External Applications**.
4. Select the name of the external application you want to remove, and click **Delete**.

22.5.2 Deleting External Application Connections Using WLST

Use the WLST command `deleteConnection` to remove an external application connection. For command syntax and examples, see `deleteConnection` in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Note: To delete an additional login field, use `removeExtAppField`.
To delete shared or public credentials, use `removeExtAppCredential`.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Part V

Advanced Systems Administration for Oracle WebCenter

Part V contains the following chapters:

- [Chapter 23, "Managing Security"](#)
- [Chapter 24, "Monitoring Oracle WebCenter Performance"](#)
- [Chapter 25, "Managing Export, Import, Backup, and Recovery of WebCenter"](#)

Managing Security

This chapter describes how to configure your WebCenter application to handle authentication and authorization, and other aspects of application security.

This chapter includes the following sections:

- [Section 23.1, "Introduction to WebCenter Application Security"](#)
- [Section 23.2, "Default Security Configuration"](#)
- [Section 23.3, "Configuring the Identity Store"](#)
- [Section 23.4, "Configuring the Policy and Credential Store"](#)
- [Section 23.5, "Managing Users and Roles"](#)
- [Section 23.6, "Configuring WebCenter Applications and Components to Use SSL"](#)
- [Section 23.7, "Configuring a WebCenter Application to Use Single Sign-On"](#)
- [Section 23.8, "Configuring WS-Security"](#)
- [Section 23.9, "Securing a PDK-Java Producer"](#)
- [Section 23.10, "Troubleshooting Security Configuration Issues"](#)

Audience

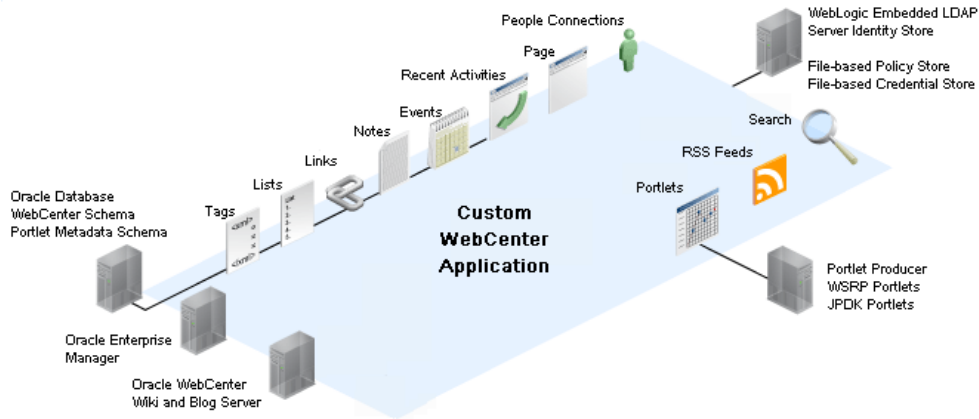

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` role through the Oracle WebLogic Server Administration Console). Users with the `Monitor` or `Operator` roles can view security information but cannot make changes. See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools."](#)

23.1 Introduction to WebCenter Application Security

The recommended security model for Oracle WebCenter is based on Oracle ADF Security, which implements the Java Authentication and Authorization Service (JAAS) model. For more information about Oracle ADF Security, see the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

[Figure 23–1](#) shows the relationship between a WebCenter application deployment and its services, servers, portlets, portlet producers, its identity, credential and policy stores, and Oracle Enterprise Manager.

Figure 23–1 Basic WebCenter Application Architecture

The diagram in [Figure 23–2](#) shows a basic WebCenter application after deployment with its back-end server connections.

Figure 23–2 WebCenter Application Architecture with Back-end Server Connections

The diagram in [Figure 23–3](#) shows the security layers for the WebCenter Spaces application.

Figure 23–3 WebCenter Spaces Security Layers

The security layers for a custom WebCenter application could have the same four bottom layers (WebCenter Security Framework, ADF Security, OPSS, and WebLogic Server Security) depending on how the application was structured. The application layer will, of course, depend on the implementation.

WebCenter Spaces Application Security

WebCenter Spaces provides support for:

- Application role management and privilege mapping
- Self-registration
- Group space security management
- Account management
- External application credential management

WebCenter Security Framework

WebCenter Security Framework provides support for:

- Service Security Extension Framework
- Permission-based authorization
- Role-mapping based authorization
- External applications and credential mapping

ADF Security

ADF Security provides support for:

- Page authorization
- Task flow authorization
- Secure connection management
- Credential mapping APIs
- Logout invocation, including logout from SSO-enabled configurations with Oracle Access Manager and Oracle SSO
- Secured login URL for ADF Security-based applications (the `adfAuthentication` servlet)

Oracle Platform Security Services (OPSS)

OPSS provides support for:

- Anonymous-role support
- Authenticated-role support
- Identity store, policy store, and credential store
- Identity Management Services
- Oracle Web Service Manager Security

WebLogic Server Security

WebLogic Server Security provides support for:

- WebLogic authenticators
- Identity asserters

- J2EE container security
- SSL

23.2 Default Security Configuration

This section describes the security configuration that is in place when custom WebCenter applications and WebCenter Spaces are deployed, and the tasks that need to be carried out after deployment:

- [Section 23.2.1, "Administrator Accounts"](#)
- [Section 23.2.2, "Application Roles and Enterprise Roles in WebCenter Spaces"](#)
- [Section 23.2.3, "Default Identity and Policy Stores"](#)
- [Section 23.2.4, "Default Policy Store Permissions and Grants"](#)
- [Section 23.2.5, "Post-deployment Security Configuration Tasks"](#)

23.2.1 Administrator Accounts

Custom WebCenter applications do not contribute any pre-seeded accounts, and therefore rely on the Fusion Middleware administrator account (`weblogic` by default) that is set up when Fusion Middleware is installed. Use this administrator account to log into Fusion Middleware Control and set up new accounts.

Although WebCenter Spaces does not contribute any pre-seeded accounts, there are certain pre-seeded grants that are given to the default Fusion Middleware administrator account (`weblogic`) for the WebCenter Spaces application. If your installation does not use `weblogic` as the account name for the Fusion Middleware administrator role, you will need to configure one or more other users for this role as described in [Section 23.3.5.1, "Granting the WebCenter Spaces Administrator Role Using Fusion Middleware Control."](#)

23.2.2 Application Roles and Enterprise Roles in WebCenter Spaces

Application roles and permissions are defined within WebCenter Spaces and are stored in an application-specific stripe of the policy store. Consequently, WebCenter Spaces roles apply only to WebCenter Spaces; WebCenter Spaces roles and permissions do not extend to other applications.

Application roles differ from roles that appear in the identity store portion of the embedded LDAP server or in roles defined by the enterprise LDAP provider. Application roles are specific to an application and defined in the application policy store.

Enterprise roles, which are stored in the enterprise identity store, apply at the enterprise level. That is, the roles and permissions that you or a system administrator define within the enterprise identity store do not imply permissions within WebCenter Spaces.

Within WebCenter Spaces you can assign application roles and permissions to users in the corporate identity store. You can also assign application roles and permissions to enterprise roles defined in the enterprise identity store.

23.2.3 Default Identity and Policy Stores

By default, WebCenter applications are configured to use a file-based embedded LDAP identity store to store application-level user IDs, and a file-based LDAP policy store to store policy grants.

Although secure, the embedded LDAP identity store is not a "production-class" store and should be replaced with an external LDAP-based identity store such as Oracle Internet Directory for enterprise production environments.

The default file-based policy store can only be used for single-node WebCenter Spaces configurations. For multi-node configurations, you must reassociate the policy and credential store with an external LDAP-based store (such as Oracle Internet Directory) as described in [Section 23.4, "Configuring the Policy and Credential Store."](#)

The policy store can be configured to use Oracle Internet Directory 11gR1 and 10.1.4.3, and OVD 11gR1 with the Local Store Adapter (LSA).

The identity store can be configured to use the following LDAP servers:

- Oracle Internet Directory (OID) 11gR1 and 10.1.4.3
- Oracle Virtual Directory (OVD) 11gR1 and 10.1.4
- Sun iPlanet version 4.1.3
- Active Directory shipped as part of Windows 2000
- Open LDAP version 2.0.7
- Novell NDS version 8.5.1

For more information on reconfiguring the identity, policy and credential stores, see [Section 23.3, "Configuring the Identity Store"](#) and [Section 23.4, "Configuring the Policy and Credential Store."](#)

Note: Oracle Content Server and Oracle WebCenter Discussions rely on external LDAP-based identity stores. Consequently, if you want to use the Documents service (which relies on Oracle Content Server) or the Discussions service (which relies on Oracle WebCenter Discussions) you must reassociate the identity store with one of the external LDAP servers listed above.

For WebCenter Spaces, Oracle recommends that both WebCenter Spaces and Oracle Content Server share the same LDAP server.

23.2.3.1 File-based Credential Store

The out-of-the-box credential store is wallet-based (that is, file-based) and is contained in the file `cwallet.sso`. The location of this file is specified in the Oracle Platform Security configuration file `jps-config.xml`. When you reassociate the policy store to an LDAP directory, the application credentials are automatically migrated to the same LDAP directory as the policy store.

23.2.4 Default Policy Store Permissions and Grants

The ADF Security permissions model supports both permission-based and role-based authorization. These two types of authorization, and the default Policy Store permissions and code based grants are discussed in the following sections:

- [Section 23.2.4.1, "Permission-based Authorization"](#)

- [Section 23.2.4.2, "Role-mapping Based Authorization"](#)
- [Section 23.2.4.3, "Default Policy Store Permissions for WebCenter Spaces"](#)
- [Section 23.2.4.4, "Default Code-based Grants"](#)

23.2.4.1 Permission-based Authorization

Permission-based authorization is used for services, such as Lists, where access control is implemented within the WebCenter application using Oracle Platform Security Services (OPSS). WebCenter Spaces provides extensive user and role management tools with which you can create application roles, and define what permissions should be granted to those roles. For information on managing users and roles in WebCenter Spaces, see [Section 28.3, "Managing Application Roles and Permissions."](#)

23.2.4.2 Role-mapping Based Authorization

Services that need to access "remote" (back-end) resources require role-mapping based authorization. For example, for the Discussions service, role mapping is required when the users of a WebCenter application (mapping to one or more group space roles) need to be mapped to another set of roles on the Oracle WebCenter Discussions Server (or Oracle Content Server).

In WebCenter Spaces:

- Default application and group space roles for WebCenter Spaces are mapped to the corresponding service roles. For default mappings, see [Table 28–4](#) and [Table 28–5](#).
- When a new user is granted an application or group space role, a similar grant (privilege) is granted in the back-end server. For example, when user Pat is granted `Discussions-Manage` permissions in WebCenter Spaces, Pat is granted corresponding permissions in the back-end discussion server. See also, [Section 28.1.4, "Understanding Discussions Server Role and Permission Mapping."](#)

23.2.4.3 Default Policy Store Permissions for WebCenter Spaces

The tables in this section describe out-of-the-box permissions and roles for WebCenter Spaces:

- [Table 23–1](#) shows the default permissions for pre-seeded application roles in the WebCenter Spaces policy store. Application roles determine what users can do in their *personal space*.
- [Table 23–2](#) shows the default permissions for group space roles that come pre-seeded with out-of-the-box group space templates: Community of Interest (COI), Group Project, Blank. When a new group space is created, these group space roles and their corresponding permissions are added to the policy store at runtime.

Legend	Description
✓	Shows an explicitly granted permission or action.
⊕	Shows an implied permission as a result of an explicitly granted permission. The permission implementation itself does the implication.

23.2.4.4 Default Code-based Grants

WebCenter applications make internal calls to APIs on the security platform that are secured with permission checks. To facilitate this, the WebCenter application must be granted appropriate permissions to invoke the OPSS APIs. For example, the permission to access the policy store and grant or revoke permissions (`PolicyStoreAccessPermission`), as well as CRUD on application roles. In the case of WebCenter Spaces, CRUD permission are granted by default, out of the box.

Similarly, WebCenter applications must pre-authorize access to various operations that it wants to expose using the WebCenter permissions (described in [Table 23–1](#) and [Table 23–2](#)), and then invoke the OPSS APIs as privileged actions.

23.2.5 Post-deployment Security Configuration Tasks

After deploying your custom WebCenter application or WebCenter Spaces, consider the following security-related configuration tasks for your site:

- **Reassociating the identity store to use an external LDAP**

By default, WebCenter applications use an embedded LDAP for its identity store. Although secure, the out-of-the-box embedded LDAP may not scale appropriately for large enterprise production environments. For instructions on how to configure the identity store to use an external LDAP such as Oracle Internet Directory (OID), see [Section 23.3, "Configuring the Identity Store."](#)

Note: Oracle Content Server and Oracle WebCenter Discussions rely on external LDAP-based identity stores. Consequently, if you want to use the Documents service (which relies on Oracle Content Server) or the Discussions service (which relies on Oracle WebCenter Discussions) you must reassociate the identity store to use an external LDAP server. For more information on reconfiguring the identity store, see [Section 23.3, "Configuring the Identity Store."](#)

- **Reassociating the policy store to use an external LDAP**

By default, custom WebCenter applications use a file-based `system-jazn-data.xml` policy store to store policy grants. You should consider using an LDAP-based policy store. For information on how to configure the policy store to use an LDAP server, see [Section 23.4, "Configuring the Policy and Credential Store."](#)

- **Configuring WS-Security**

Although the use of WS-Security adds complexity to the configuration and management of a WebCenter application and the set of producers it consumes, it helps ensure the security of the information being published by the WebCenter application. Adding WS-Security provides authentication for the consumer, and message-level security.

For information on how to configure WS-Security for WebCenter applications and components, see [Section 23.8, "Configuring WS-Security."](#)

- **Configuring SSO**

Single Sign-On (SSO) allows users to log in once across WebCenter applications and components rather than having to log in for each sub-application (for example, for accessing a wiki page in WebCenter Spaces). Users do not have to maintain a separate user ID and password for each application or component that they access. However, you can still configure a variety of authentication methods, so that more sensitive applications can be protected using more stringent methods. WebCenter supports four single sign-on solutions: Oracle Access Manager (OAM), Oracle Single Sign-on (OSSO), a SAML-based single sign-on solution for Oracle WebCenter applications only, and an SSO solution for Microsoft clients, using Windows authentication based on the Simple and Protected Negotiate (SPNEGO) mechanism and the Kerberos protocol. For a discussion of these solutions and an overview of single sign-on, see [Section 23.7, "Configuring a WebCenter Application to Use Single Sign-On."](#)

- **Configuring SSL**

Secure Sockets Layer (SSL) provides additional security for connections between WebCenter applications or components by providing an additional authentication layer, and by encrypting the data exchanged. For connections between applications or components where the data exchanged is sensitive, consider securing the connection with SSL. For a list of the connections that can and should be protected with SSL in a production environment, see [Section 23.6, "Configuring WebCenter Applications and Components to Use SSL."](#)

Note: Using SSL is computationally intensive and adds overhead to a connection. SSL should therefore not be used where it is not required, and is best reserved for production environments.

23.3 Configuring the Identity Store

This section describes how to reassociate the identity store with an external LDAP rather than the default embedded identity store. It also describes how to configure an LDAP server for Oracle Content Server and contains the following subsections:

- [Section 23.3.1, "Reassociating the Identity Store with an External LDAP"](#)
- [Section 23.3.2, "Tuning the Identity Store for Performance"](#)
- [Section 23.3.3, "Adding Users to the Identity Store"](#)
- [Section 23.3.4, "Moving the Administrator Account to an External LDAP Server"](#)
- [Section 23.3.5, "Granting the WebCenter Spaces Administrator Role to a WebCenter Spaces User"](#)
- [Section 23.3.6, "Configuring the Oracle Content Server to Share the Identity Store LDAP Server"](#)

Note that for custom WebCenter applications, the steps for [Granting the WebCenter Spaces Administrator Role to a WebCenter Spaces User](#) and [Migrating the WebCenter Discussions Server to use an External LDAP](#) are not required. For more information about the identity store, see the *Oracle Fusion Middleware Security Guide*.

Caution: Before reassociating the identity store, be sure to back up the relevant configuration files:

- `config.xml`
- `jps-config.xml`
- `system-jazn-data.xml`

As a precaution, you should also back up the `boot.properties` file for the Administration Server for the domain.

23.3.1 Reassociating the Identity Store with an External LDAP

In almost all cases, you will want to reassociate the identity store with an external LDAP server rather than using the default embedded LDAP. Although you can use many different types of LDAP servers (see [Section 23.2, "Default Security Configuration"](#) for a list of supported LDAPs), this section focuses on how to configure the identity store to use Oracle Internet Directory (OID).

To reassociate the identity store with OID:

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. In the Domain Structure pane (see [Figure 23-4](#)), click **Security Realms**.

Figure 23–4 Domain Structure Pane

The Summary of Security Realms pane displays (see [Figure 23–13](#)).

Figure 23–5 Summary of Security Realms pane

3. In the Name column, click the realm for which you want to reassociate the identity store.

The Realm Settings pane displays (see [Figure 23–6](#)).

Figure 23–6 Realm Settings Pane

4. Open the **Providers** tab.
The Providers Settings pane displays (see [Figure 23–7](#)).

Figure 23–7 Settings Pane - Providers

Settings for myrealm

Configuration Users and Groups Roles and Policies Credential Mappings **Providers** Migration

Authentication Authorization Adjudication Role Mapping Auditing Credential Mapping Certification Path Keystores

An Authentication provider allows WebLogic Server to establish trust by validating a user. You must have one Authentication provider in a security realm, and you can configure multiple Authentication providers in a security realm. Different types of Authentication providers are designed to access different data stores, such as LDAP servers or DBMS. You can also configure a Realm Adapter Authentication provider that allows you to work with users and groups from previous releases of WebLogic Server.

Customize this table

Authentication Providers

New Delete Reorder Showing 1 to 2 of 2 Previous | Next

<input type="checkbox"/>	Name	Description	Version
<input type="checkbox"/>	DefaultAuthenticator	WebLogic Authentication Provider	1.0
<input type="checkbox"/>	DefaultIdentityAsserter	WebLogic Identity Assertion provider	1.0

New Delete Reorder Showing 1 to 2 of 2 Previous | Next

- Click **New** to add a new provider.

The Create a New Authentication Provider pane displays (see [Figure 23–8](#)).

Figure 23–8 Create a New Authentication Provider Pane

Create a New Authentication Provider

OK Cancel

Create a new Authentication Provider

The following properties will be used to identify your new Authentication Provider.

* Indicates required fields

The name of the authentication provider.

*Name:

This is the type of authentication provider you wish to create.

Type: ▼

OK Cancel

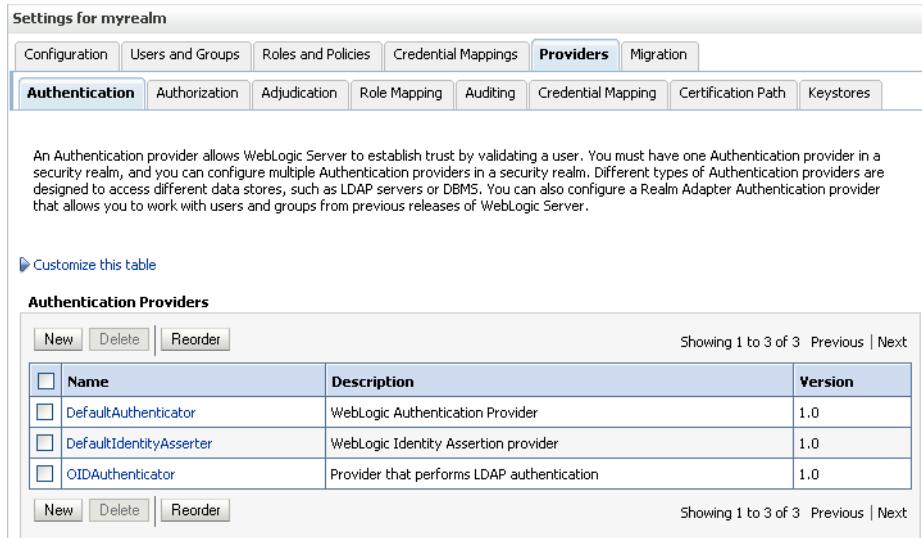

- Enter a name for the provider (for example `OIDAuthenticator` for a provider that will authenticate the user for the Oracle Internet Directory).
- Select the authenticator appropriate for your LDAP directory from the list of authenticators.

Be sure to select the authenticator associated with the LDAP you are configuring rather than choosing the generic `DefaultAuthenticator`. For example, for OID select `OracleInternetDirectoryAuthenticator`, or for iPlanet select `IPlanetAuthenticator`.

- Click **OK** to save your settings.

The Settings pane displays with the new authentication provider (see [Figure 23–9](#)).

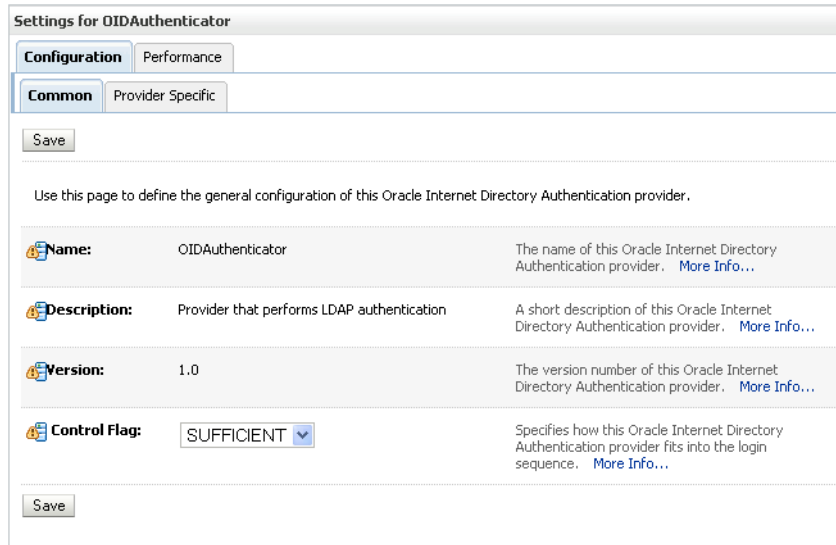

Figure 23–9 Settings Pane - Authentication Providers

- In the list of Authentication Providers, click the newly created provider.

The Settings Pane for the new authentication provider displays (see [Figure 23–10](#)).

Figure 23–10 Settings Pane for Authenticator

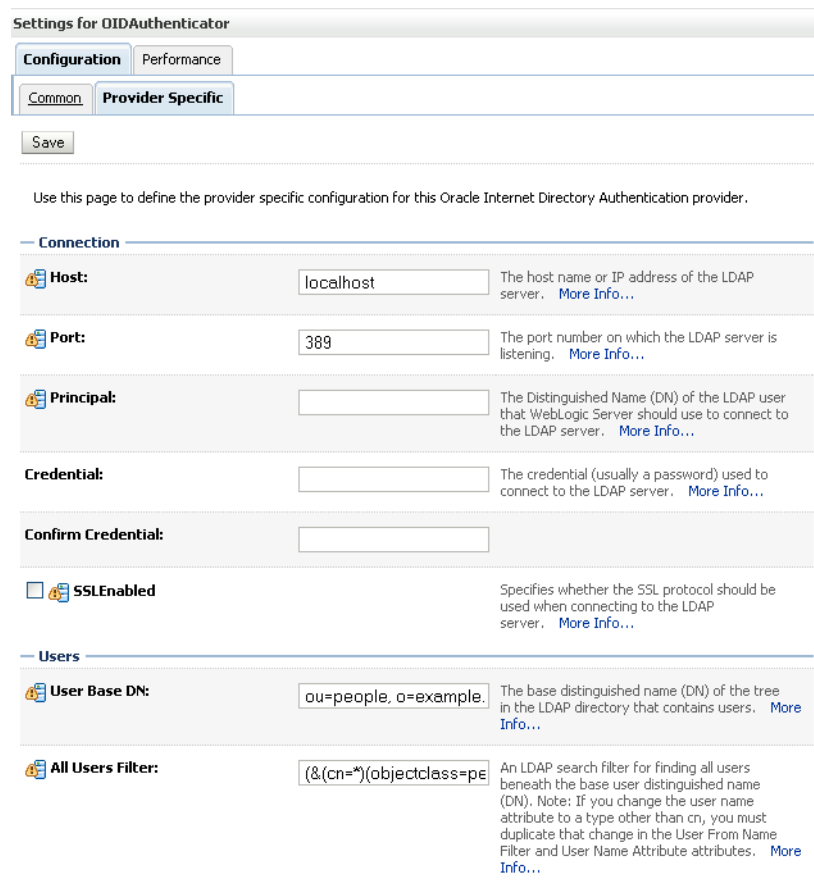

- Set the Control Flag to SUFFICIENT.

Setting the Control Flag to SUFFICIENT indicates that if a user can be authenticated successfully by this authenticator, then the authentication provider should accept that authentication and should not invoke any additional authenticators.

Note: If the authentication fails, it will fall through to the next authenticator in the chain. Therefore, be sure all subsequent authenticators also have their control flag set to SUFFICIENT.

11. Click **Save** to save this setting.
12. Open the Provider Specific tab to enter the details for the LDAP server.
The Provider Specific pane displays (see [Figure 23–11](#)).

Figure 23–11 Provider Specific Pane

This screenshot shows the Provider Specific authenticator settings pane.

13. Enter the details specific to *your* LDAP server.

Parameter	Value	Description
Host:		The LDAP server's server ID (for example, <code><ldap_host>example.com</code>)
Port:		The LDAP server's port number (for example, 3060)
Principal:		The LDAP user DN used to connect to the LDAP server (for example, <code>cn=orcladmin</code>)

Parameter	Value	Description
Credential:		The password used to connect to the LDAP server
User Base DN:		Specify the DN under which your Users start (for example, <code>cn=users,dc=example,dc=com</code>)
Group Base DN:		Specify the DN that points to your Groups node (for example, <code>cn=groups,dc=example,dc=com</code>)
Use Retrieved User Name as Principal	Checked	Must be turned on
All Users Filter:	<code>(&(uid=*)(objectclass=person))</code>	Search to find all users under the User Base DN
User From Name Filter:	<code>(&(uid=%u)(objectclass=person))</code>	
User Name Attribute:	uid	

If you modify a username attribute to something other than the default set for the LDAP server in the authenticator, you must also edit the `jps-config.xml` file to correspond to these values. Specifically, the **username.attr** and **user.login.attr** properties (highlighted below) must be added for user lookups to function correctly:

```
<!-- JPS WLS LDAP Identity Store Service Instance -->
<serviceInstance name="idstore.ldap" provider="idstore.ldap.provider">
<property name="idstore.config.provider"
value="oracle.security.jps.wls.internal.idstore.WlsLdapIdStoreConfigProvider"/>
<property name="username.attr" value="uid"/>
<property name="user.login.attr" value="uid"/>
</serviceInstance>
```

14. Click Save.

- 15. Return to the Providers tab and reorder the providers so that the new authentication provider is on top, followed by any other authenticators with the `DefaultAuthenticator` placed at the end of the list.**

All should have their Control Flags set to `SUFFICIENT` so that subsequent authenticators can authenticate identities that fall through from the new provider all the way through to the `DefaultAuthenticator` (which is used only for the default file-based embedded LDAP). For example, logins such as the default administrator account are not typically created in the LDAP directory, but still need to be authenticated to start up the server. Unless identities are allowed to fall through to the `DefaultAuthenticator`, the default administrator account will not be authenticated. For more information about the `DefaultAuthenticator` and the default administrator account, see [Section 23.3.4, "Moving the Administrator Account to an External LDAP Server."](#)

Note: WebCenter Spaces uses only the first authenticator to authenticate users in the identity store.

- Restart the Administration Server and the managed server for the changes to take effect.

23.3.2 Tuning the Identity Store for Performance

For a production environment, Oracle recommends that you add the following configuration entry to the `jps-config.xml` file for best performance:

```
<serviceInstance provider="idstore.ldap.provider" name="idstore.ldap">
  <property
    value="oracle.security.jps.wls.internal.idstore.WlsLdapIdStoreConfigProvider"
    name="idstore.config.provider"/>
  <property name="CONNECTION_POOL_CLASS"
    value="oracle.security.idm.providers.stldldap.JNDIPool"/>
</serviceInstance>
```

23.3.3 Adding Users to the Identity Store

You can add users to the embedded LDAP or an external LDAP using the WebLogic Server Administration Console. For Oracle Internet Directory, although users are typically managed using ODSM (described in the section on "Managing Directory Entries" in the *Oracle Fusion Middleware Administrator's Guide for Oracle Internet Directory*), you can also use the WebLogic Server Administration Console as described below.

Note: If you are planning to reassociate your identity store with an external LDAP, carry out that step (as described in [Section 23.3.1, "Reassociating the Identity Store with an External LDAP"](#)) prior to adding users to avoid having to migrate the users from the embedded LDAP to the newly configured external LDAP.

WebCenter Spaces supports self-registration. New users who self-register with WebCenter Spaces are added directly to the identity store. For more information about self-registration, see [Section 28.4, "Allowing Self-Registration."](#)

You can also add users directly into the embedded LDAP identity store using an LDIF file and LDAP commands. Using an LDIF file lets you add additional attributes not available through the WebLogic Server Administration Console.

Note: Adding users to the identity store is typically a system administrator task and may not be a task for which application-level administrators have the required permissions.

This section includes the following subsections:

- [Section 23.3.3.1, "Adding Users Using the WebLogic Server Administration Console"](#)
- [Section 23.3.3.2, "Adding Users to the Embedded LDAP Using an LDIF File"](#)

23.3.3.1 Adding Users Using the WebLogic Server Administration Console

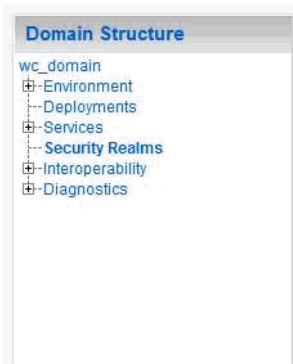

To add users to the embedded LDAP or to an external LDAP from the WebLogic Server Administration Console:

- Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

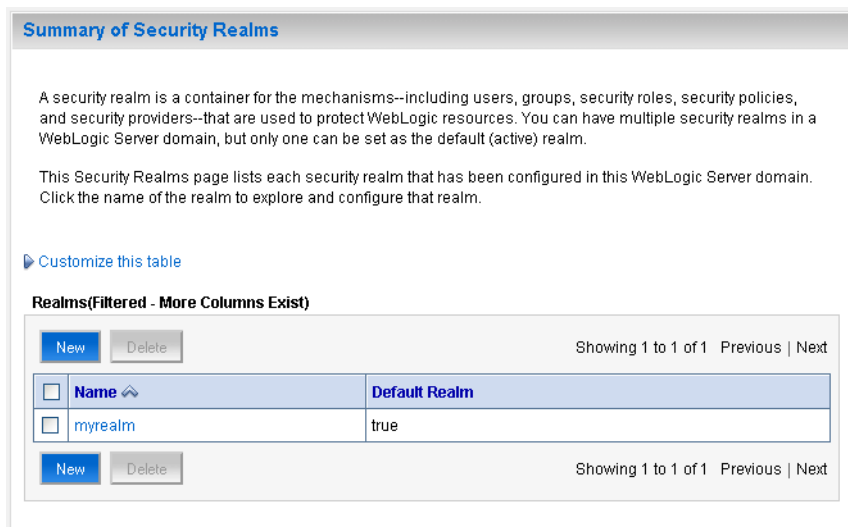

2. In the Domain Structure pane (see [Figure 23–12](#)), click **Security Realms**.

Figure 23–12 Domain Structure Pane

The Summary of Security Realms pane displays (see [Figure 23–13](#)).

Figure 23–13 Summary of Security Realms pane

3. In the Name column, click the realm to which you want to add users.

The Realm Settings pane displays (see [Figure 23–14](#)).

Figure 23–14 Realm Settings Pane

Use this page to configure the general behavior of this security realm.

Note:
If you are implementing security using JACC (Java Authorization Contract for Containers as defined in JSR 115), you must use the DD Only security model. Other WebLogic Server models are not available and the security functions for Web applications and EJBs in the Administration Console are disabled.

Name:	myrealm	The name of this security realm. More Info...
Security Model Default:	DD Only ▼	Specifies the default security model for Web applications or EJBs that are secured by this security realm. You can override this default during deployment. More Info...
<input checked="" type="checkbox"/> Combined Role Mapping Enabled		Determines how the role mappings in the Enterprise Application, Web application, and EJB containers interact. This setting is valid only for Web applications and EJBs that use the Advanced security model and that initialize roles from deployment descriptors. More Info...
<input type="checkbox"/> Use Authorization Providers to Protect JMX Access		Configures the WebLogic Server MBean servers to use the security realm's Authorization providers to determine whether a JMX client has permission to access an MBean attribute or invoke an MBean operation. More Info...

▶ Advanced

Save

4. Click the **Users and Groups** tab to display the list of current users.
5. Click **New** to add a new user.

Figure 23–15 Create a New User Page

This screenshot shows the Create a New User page.

6. On the Create a New User page, enter the new user login name in the **Name** field.
 User names are case sensitive and must be unique. Do not use commas, tabs or any other characters in the following comma-separated list:
 <>, #, |, &, ?, (), { }
7. In the **Description** field, enter a description for the user (for example, the user's full name).
8. From the **Provider** drop-down menu, select the Authentication provider for the user.
 If multiple WebLogic Authentication providers are configured in the security realm, they will appear in the list. For the embedded LDAP, choose DefaultAuthenticator; for Oracle Internet Directory, choose OracleInternetDirectoryAuthenticator. For other external LDAPs, choose the authenticator associated with that LDAP.
9. In the **Password** field, enter a password for the user.
 The minimum password length for a user defined in the WebLogic Authentication provider is 8 characters (note that other LDAP providers may have different requirements for the password length). Do not use user name/password combinations such as weblogic/weblogic in a production environment.
10. Re-enter the password in the **Confirm Password** field.
11. Click **OK** to save your changes and add the user.

The user should now appear in the list of users.

23.3.3.2 Adding Users to the Embedded LDAP Using an LDIF File

LDIF files enable you to specify additional user attributes. This particular feature is not available through the WebLogic Server Administration Console.

As the embedded LDAP server is a conformant LDAP server, you can use LDAP commands to add or modify users. You can also search the directory, which is useful when exporting and importing user accounts.

To add users to the embedded LDAP using an LDIF file you need to carry out the following tasks:

- [Enable External LDAP Access](#)
- [Create an LDIF File](#)
- [Add the Users](#)

Enable External LDAP Access

When WebLogic Server is installed, the LDAP access credential is set as a randomized value and encrypted in the `config.xml` file. To enable external LDAP access, you need to reset the access credential for the embedded LDAP.

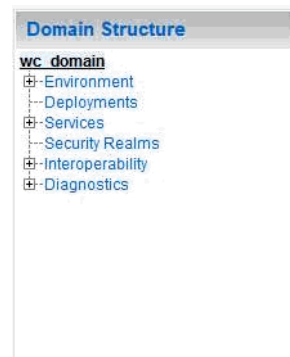

To reset the access credential for the embedded LDAP:

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. In the Domain Structure pane (see [Figure 23–16](#)), click on `wc_domain`.

Figure 23–16 Domain Structure Pane (`wc_domain`)

3. In the Settings pane for `wc_domain`, click the Security tab, and then click the Embedded LDAP tab.

The Settings Pane for `wc_domain` displays the embedded LDAP settings (see [Figure 23–17](#)).

Figure 23–17 Settings Pane with Embedded LDAP Settings

Settings for wc_domain

Configuration Monitoring Control Security Web Service Security Notes

General Filter Unlock User Embedded LDAP Roles Policies

Save

This page allows you to configure the embedded LDAP server for this WebLogic Server domain.

Credential: The credential (usually a password) used to connect to the embedded LDAP server. [More Info...](#)

Confirm Credential:

4. Enter a new password in the **Credential** field, and re-enter it in the **Confirm Credential** field.
5. Click **Save** to save your settings.
6. Restart the WebLogic server.

After this, you are ready to access the LDAP server with the following values:

- the DN value for admin access is "cn=Admin"
- the password is the value you entered in the Credential field
- the port is the same as the admin port, which by default is 7001

Create an LDIF File

You can create an LDIF file with any text editor, and can include any attributes appropriate for the embedded LDAP directory. The `objectclasses` that are supported by default in the embedded LDAP server for WebLogic Server are the following:

- `person`
- `inetOrgPerson`
- `organizationalPerson`
- `wlsUser`

In order to interact successfully with the embedded LDAP server, you should understand the default layout of the directory information tree (DIT). The default layout in the embedded LDAP directory is shown in [Figure 23–18](#).

Figure 23–18 Embedded LDAP Directory Information Tree

This graphic shows an expanded embedded LDAP Directory Information Tree.

Note: The naming attribute for the user entry in the embedded LDAP directory tree is "uid". This is different from the default configuration for Oracle Internet Directory (OID), where the naming attribute is "cn". Also, the location of the users in this tree is "ou=people,ou=myrealm,dc=wc_domain".

The following example shows an LDIF file with the attributes that are displayed in WebCenter Spaces user profile screens:

```
dn: uid=john.doe,ou=people,ou=myrealm,dc=wc_domain
description: John Doe
cn: john.doe
uid: john.doe
sn: Doe
objectclass: wlsUser
objectclass: organizationalperson
objectclass: inetOrgPerson
objectclass: person
objectclass: top
userpassword: welcome1
displayName: John Doe
employeeNumber: 12345
employeeType: Regular
givenName: John
homePhone: 650-555-1212
mail: john.doe@example.com
title: Manager
manager: uid=mary.jones,ou=people,ou=myrealm,dc=wc_domain
preferredLanguage: en
departmentNumber: tools
facsimiletelephonenumber: 650-555-1200
mobile: 650-500-1200
pager: 650-400-1200
telephoneNumber: 650-506-1212
postaladdress: 200 Oracle Parkway
l: Redwood Shores
homepostaladdress: 123 Main St., Anytown 12345
```

To create a file with multiple user entries, just replicate the above lines as many times as required, with a blank line between entries.

Note: WebCenter Spaces user profiles include some attributes that are only available in Oracle Internet Directory. These include the following attributes from the `orclUserV2` objectclass:

- `orclTimeZone`
- `orclDateOfBirth`
- `maidenName`

You cannot add these attributes to an embedded LDAP identity store.

Add the Users

The example below uses the `ldappadd` command, a part of the LDAP command line utilities provided with the Oracle Internet Directory server. For more information about using the `ldappadd` command, see "Oracle Internet Directory Data Management Tools" in the *Oracle Fusion Middleware User Reference for Oracle Identity Management*.

```

23.3.4 Moving the Administrator Account to an External LDAP Server

When configuring the domain to use an external LDAP server, you can also optionally move the Fusion Middleware administrator account (`weblogic` by default) to the LDAP server.

If the Fusion Middleware administrator account, or any other appropriate user in LDAP, is in an LDAP group called "Administrators", then this account should be sufficient to manage the server, and the `DefaultAuthenticator` provider can be removed from the list of authentication providers. In this case, all users, including the administrator account, are authenticated against the external LDAP.

If you cannot create the `weblogic` (default) user in the external LDAP directory, there are two options. You can:

- Keep the `DefaultAuthenticator` provider and use the `weblogic` account with the local embedded LDAP server in WebLogic Server to start and stop servers and do other administrator operations from the WebLogic Server Administration Console. If you keep the `DefaultAuthenticator`, make sure that the control flag for the `DefaultAuthentication` provider is set to `SUFFICIENT`. If you choose this option, you will also need to perform the additional steps described in [Section 23.3.4.1, "Migrating the WebCenter Discussions Server to use an External LDAP."](#)

Note: If the `weblogic` user account is used from the `DefaultAuthenticator`, this account should not be used to access the WebCenter Spaces application as the application code will not be able to find the user in the external LDAP store.

- Remove the `DefaultAuthenticator` and make sure that any valid user account used for administrator operations, such as starting and stopping servers, is included in an "Administrators" group or other named group that contains the list of users that are allowed to manage your domain in OID or other external LDAP. If a name other than "Administrators" is used, then you need to update the group name in the definition of the WebLogic Server Global Administrator role. By default, this is defined as membership in the enterprise group called "Administrators". For information about changing the administrator group name, see [Section 23.3.4.2, "Changing the Administrator Group Name."](#)

23.3.4.1 Migrating the WebCenter Discussions Server to use an External LDAP

If you've installed Oracle WebCenter Discussions Server and choose **not to move** the administrator account to an external LDAP (as described in [Section 23.3.4, "Moving the Administrator Account to an External LDAP Server"](#)), you will need to perform some additional steps to identify the new administrator account for the discussions server prior to reordering the authenticators on the WebLogic Server:

1. Select a user account from the external LDAP to be the administrator for the discussions server.
2. Create an administrator account in the `DefaultAuthenticator` (i.e., the embedded LDAP) that matches the one you selected from the external LDAP. The account names in the embedded LDAP and the external LDAP server must be the same.

For information about adding users to the embedded LDAP, see [Section 23.3.3, "Adding Users to the Identity Store."](#)

3. Log in to the Oracle WebCenter Discussions Server Admin Console with the boot-identity account (i.e., `weblogic`) at:

```
http://host:port/owc_discussions/admin
```

Where *host* and *port* are the host ID and port number of the `WLS_Services` managed server .

4. Click **Settings > Admins/Moderators**.

The Admins & Moderators page displays (see [Figure 23–19](#)).

Figure 23–19 Admins & Moderators Page

Admins & Moderators Main » Admins & Moderators

Global category admin or system admin privileges to users or groups. Note, this sets permission for admins over all categories. To designate administrators for individual categories or forums, click on the "Content" tab, choose a category or forum then choose "Admins/Moderators" from the left menu.

Permissions are either additive or negative. Additive permissions () are permissions that should be 'added' to the permissions retrieved from parent categories and those that are globally set, while negative permissions () are permissions that should be revoked or removed from permissions retrieved from parent categories and those that are globally set. For more information about permissions, please read the administrator guide distributed with this product or click the help icon above.

Note: Checkboxes on this page have three states () Click a checkbox repeatedly to rotate through all three states.

- Check that the properties marked in red have been added and are set as shown in [Figure 23–23](#).
- Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

10. In the Domain Structure pane (see [Figure 23–23](#)), click **Security Realms**.

Figure 23–23 Domain Structure Pane

The Summary of Security Realms pane displays (see [Figure 23–24](#)).

Figure 23–24 Summary of Security Realms pane

Summary of Security Realms

A security realm is a container for the mechanisms—including users, groups, security roles, security policies, and security providers—that are used to protect WebLogic resources. You can have multiple security realms in a WebLogic Server domain, but only one can be set as the default (active) realm.

This Security Realms page lists each security realm that has been configured in this WebLogic Server domain. Click the name of the realm to explore and configure that realm.

[Customize this table](#)

Realms(Filtered - More Columns Exist)

Showing 1 to 1 of 1 Previous | Next

<input type="checkbox"/>	Name	Default Realm
<input type="checkbox"/>	myrealm	true

11. In the Name column, click the realm for which you want to change the administrator group name.

The Realm Settings pane displays (see [Figure 23–25](#)).

Figure 23–25 Realm Settings Pane

This screenshot shows the Realm Settings Panel.

12. Select the Providers tab and the Authentication sub-tab, and reorder the authentication providers so that the authenticator for the external LDAP appears at the top of the list as shown in [Figure 23–26](#):

Figure 23–26 Providers Tab with Reordered Authentication Providers

Settings for myrealm

Configuration Users and Groups Roles and Policies Credential Mappings **Providers** Migration

Authentication Authorization Adjudication Role Mapping Auditing Credential Mapping Certification Path Keystores

An Authentication provider allows WebLogic Server to establish trust by validating a user. You must have one Authentication provider in a security realm, and y realm. Different types of Authentication providers are designed to access different data stores, such as LDAP servers or DBMS. You can also configure a Realm, and groups from previous releases of WebLogic Server.

Customize this table

Authentication Providers

New Delete Reorder

<input type="checkbox"/>	Name	Description
<input type="checkbox"/>	MyOIDProvider	Provider that performs LDAP authentication
<input type="checkbox"/>	DefaultAuthenticator	WebLogic Authentication Provider
<input type="checkbox"/>	DefaultIdentityAsserter	WebLogic Identity Assertion provider

New Delete Reorder

13. Restart the domain Administration Server and discussions server.

23.3.4.2 Changing the Administrator Group Name

You can change the group name to any other valid enterprise role in your LDAP server that contains users authorized to manage the domain. This lets you delegate the administration of specific domains in your enterprise. You can create various administration groups in the directory and have the corresponding domains be configured to use the appropriate group for defining its administrators.

The following example LDIF file creates an administrative group in Oracle Internet Directory:

```
dn: cn=wc_domain_Admin,cn=groups,dc=example,dc=com
cn: wc_domain_Admin
uniquemember: cn=joe.admin,cn=users,dc=example,dc=com
owner: cn=orcladmin
displayname: WebLogic Administrators Group
description: WebLogic Administrators Group
objectclass: orclgroup
objectclass: groupofuniquenames
```

Once this group is created, you need to update the role definition for the WebLogic Server global Admin role using the WebLogic Server Administration Console.

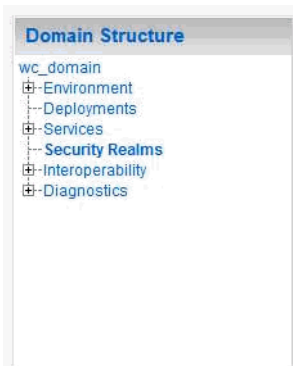

To update the role definition for the WebLogic Server global Admin role:

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

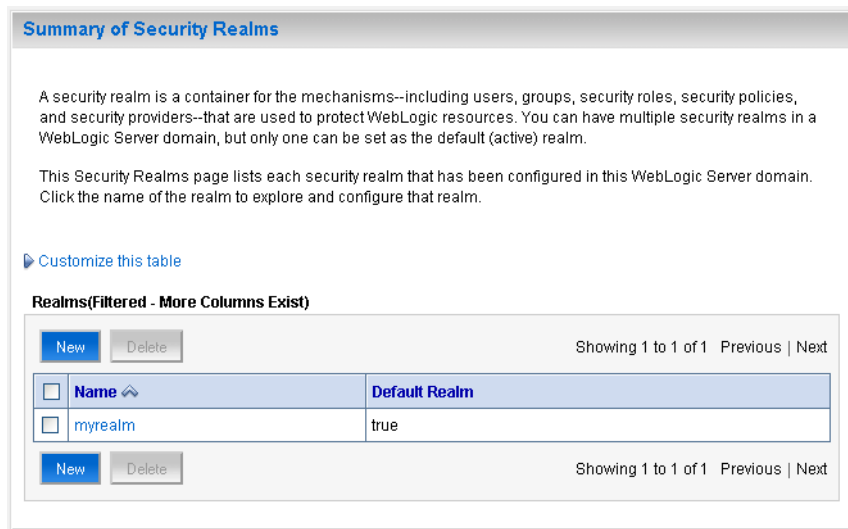

2. In the Domain Structure pane (see [Figure 23–27](#)), click **Security Realms**.

Figure 23–27 Domain Structure Pane

The Summary of Security Realms pane displays (see [Figure 23–28](#)).

Figure 23–28 Summary of Security Realms pane

3. In the Name column, click the realm for which you want to change the administrator group name.

The Realm Settings pane displays (see [Figure 23–29](#)).

Servers		

Edit Role Showing 1 to 7 of 7 Previous | Next

- Expand the Global Roles node, and then the Roles node.
- Click **View Role Conditions** for the Admin role.
The Edit Global Role page displays (see [Figure 23–31](#)).

Figure 23–31 Edit Global Role Page

By default, the `Administrators` group in Oracle Internet Directory (or other configured identity store) defines who has the administrator role in WebLogic Server.

7. Click **Add Conditions** to add a different group name.

The Edit Global Role - Predicate List page displays (see [Figure 23–32](#)).

Figure 23–32 Edit Global Role Page - Predicate List

8. Select `Group` from the **Predicate List** list and click **Next**.

The Edit Global Role - Arguments page displays (see [Figure 23–33](#)).

Figure 23–33 Edit Global Role Page - Arguments

9. Enter the name for the new administrator group and click **Add**.
10. Select the pre-existing administrator group and click **Remove** to delete it leaving the new one you've selected in its place.
11. Click **Finish** to save your changes.

After making this change, any members of the new group specified will be authorized to administer WebLogic Server.

23.3.5 Granting the WebCenter Spaces Administrator Role to a WebCenter Spaces User

WebCenter Spaces only recognizes users in the identity store that is mapped by the first authenticator. Since the WebCenter Spaces Administrator account is initially created only in the embedded LDAP server, if an external LDAP such as Oracle Internet Directory is configured as the primary authenticator for WebCenter Spaces, you must also create a user in that LDAP and grant that user the WebCenter Spaces Administrator role.

You can grant a user the WebCenter Administrator role using Fusion Middleware Control or WLST as shown below in the sections on:

- [Section 23.3.5.1, "Granting the WebCenter Spaces Administrator Role Using Fusion Middleware Control"](#)
- [Section 23.3.5.2, "Granting the WebCenter Spaces Administrator Role Using WLST"](#)

For more information, see "Granting the Administrator Role to a Non-Default User" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

23.3.5.1 Granting the WebCenter Spaces Administrator Role Using Fusion Middleware Control

This section describes how to grant the WebCenter Spaces administrator role to a user account other than the default "weblogic" account.

To grant the WebCenter Spaces Administrator role using Fusion Middleware Control:

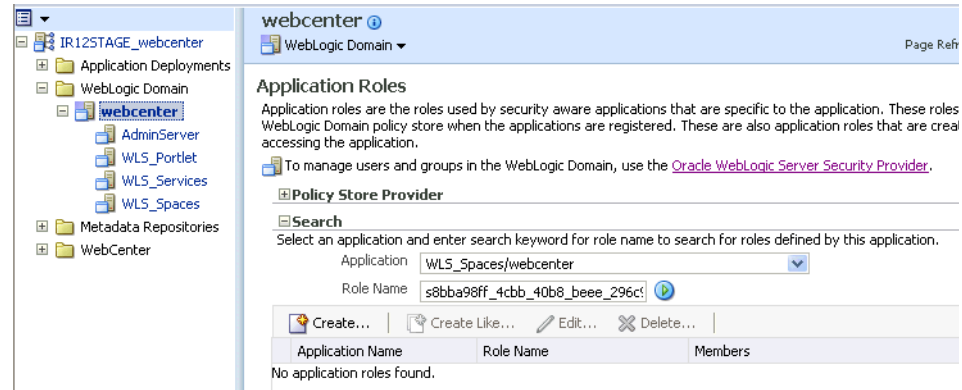

1. Log into Fusion Middleware Control and select the WebLogic domain for WebCenter Spaces.

For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)

- From the WebLogic Domain menu, select **Security -> Application Roles**.

The Application Roles page displays (see [Figure 23–34](#)).

Figure 23–34 Application Roles Page

- Search for the Administration application role by selecting the **Application** name for WebCenter Spaces (WLS_Spaces/webcenter), and providing the following internal identifier used by WebCenter Spaces as the **Role Name**:

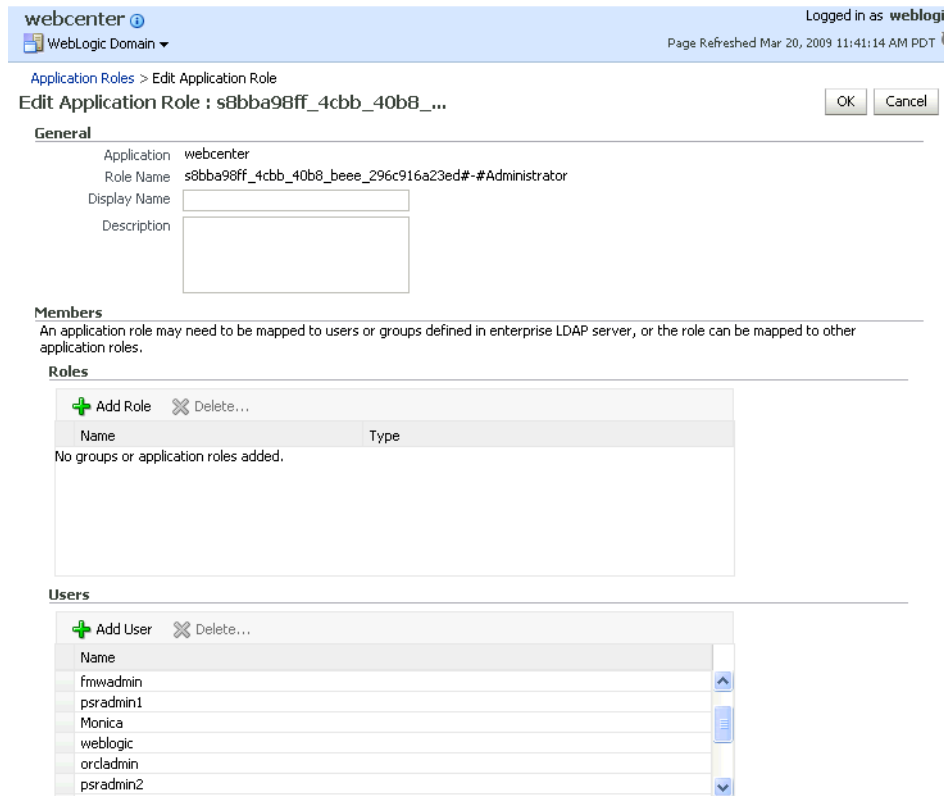

s8bba98ff_4cbb_40b8_beee_296c916a23ed#-#Administrator

The search should return s8bba98ff_4cbb_40b8_beee_296c916a23ed#-#Administrator, which is the administrator role identifier.

- Click the administrator role name (s8bba98ff_4cbb_40b8_beee_296c916a23ed#-#Administrator) in the Role Name column.

The Edit Application Role page displays (see [Figure 23–35](#)).

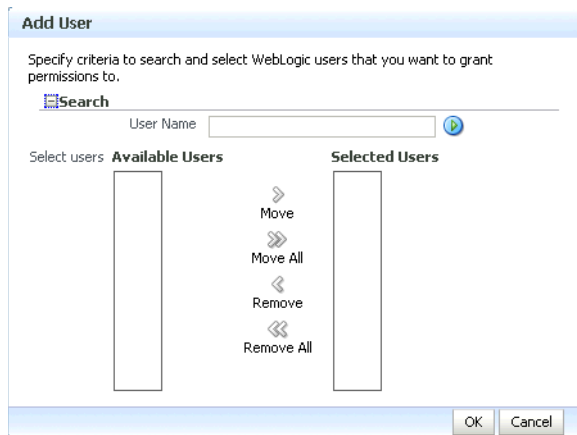

Figure 23–35 Edit Application Role Page

5. Click **Add User**.

The Add User pop-up displays (see [Figure 23–36](#)).

Figure 23–36 Add User Pop-up

6. Use the Search function to search for the user to assign the Administrator role to.
7. Use the arrow keys to move the user from the Available Users column to the Selected Users column, and click **OK**.
8. On the Edit Application Role page, click **OK**.

9. To remove the weblogic role, on the Edit Application Role page under **Users**, click `weblogic` and the click **Delete**.
10. Restart the `WLS_Spaces` managed server.
When you login to WebCenter Spaces, the Administration link should appear and you should be able to perform all administrator operations. See also, [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)

23.3.5.2 Granting the WebCenter Spaces Administrator Role Using WLST

To grant the WebCenter Administrator role using WLST:

1. Start WLST as described in [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)
2. Connect to the WebCenter Spaces Administration Server for the target domain with the following command:

```
connect('user_name', 'password', 'host_id:port')
```

Where:

- `user_name` is the name of the user account with which to access the Administration Server (for example, `weblogic`)
 - `password` is the password with which to access the Administration Server
 - `host_id` is the host ID of the Administration Server
 - `port` is the port number of the Administration Server (for example, 7001).
3. Grant the WebCenter Spaces administrator application role to the user in Oracle Internet Directory using the `grantAppRole` command as shown below:

```
grantAppRole(appStripe="webcenter", appRoleName="s8bba98ff_4cbb_40b8_beee_296c916a23ed#-#Administrator",
principalClass="weblogic.security.principal.WLSUserImpl", principalName="wc_admin")
```

Where `wc_admin` is the name of the administrator account to create.

4. To test the new account, log into WebCenter Spaces using the new account name.
The Administration link should appear, and you should be able to perform all administrator operations. See also, [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)
5. After granting the WebCenter Spaces Administrator role to new accounts, remove this role from accounts that no longer need it or should no longer have it using the WLST `revokeAppRole` command. For example, if WebCenter Spaces was installed with a different administrator user name than "weblogic", the administrator role should be given to that user and should be revoked from the default "weblogic".

```
revokeAppRole(appStripe="webcenter", appRoleName="s8bba98ff_4cbb_40b8_beee_296c916a23ed#-#Administrator",
principalClass="weblogic.security.principal.WLSUserImpl",
principalName="weblogic")
```

23.3.6 Configuring the Oracle Content Server to Share the Identity Store LDAP Server

Oracle Content Server (OCS) must be configured to use the same identity store LDAP server as Oracle WebCenter Spaces. For more information on configuring the OCS, see

the section "Configuring the Identity Store Service" in the *Oracle Fusion Middleware Security Guide*.

23.4 Configuring the Policy and Credential Store

For most environments, and especially production environments, you will want to reassociate your policy store with an external LDAP such as Oracle Internet Directory (OID).

Reassociating the policy and credential store with OID consists of creating a root node in the LDAP directory, and then reassociating the policy and credential store with the OID server using Fusion Middleware Control, or from the command line using WLST as described in the following sections:

- [Section 23.4.1, "Creating a root Node"](#)
- [Section 23.4.2, "Reassociating the Credential and Policy Store Using Fusion Middleware Control"](#)
- [Section 23.4.3, "Reassociating the Credential and Policy Store Using WLST"](#)
- [Section 23.4.4, "Managing Credentials"](#)

23.4.1 Creating a root Node

The first step in reassociating the policy and credential store with OID, is to create an LDIF file in the LDAP directory and add a root node under which all data is added. After creating the file and adding the node, continue by reassociating the store using either Fusion Middleware Control or WLST.

To create a root node:

1. Create a root node by adding the following to an LDIF file (for example, `root.ldif`) in the LDAP directory:

```
dn: cn=root_webcenter_xxxx
cn: root_webcenter_xxxx
objectclass: top
objectclass: orclcontainer
```

Where `xxxx` is a string (for example, the server name) that uniquely identifies the node.

2. Add this node to the directory by running the following LDAP command from your LDAP installation directory:

```
OID_ORACLE_HOME/as_1/bin/ldapadd -h ldap_host_name -p ldap_port -D cn=orcladmin
-w password -v -f root.ldif
```

where:

- `OID_ORACLE_HOME` is the directory in which LDAP is installed
- `ldap_host_name` is the host name of the OID server
- `ldap_port` is the OID server port number
- `password` is the password with which to access the OID server

Note that each root container must have a unique name.

23.4.2 Reassociating the Credential and Policy Store Using Fusion Middleware Control

When initially installed, WebCenter Spaces and Enterprise Manager are already associated and deployed in the same domain.

Before reassociating the policy and credential store with Oracle Internet Directory, you must first have created the root node as described in [Section 23.4.1, "Creating a root Node."](#)

To reassociate the policy and credential store with the OID server:

1. Open Fusion Middleware Control and log into your target instance.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, click your domain.
3. From the WebLogic Domain menu, select **Security > Security Provider Configuration**.

The Security Provider Configuration page displays (see [Figure 23–37](#)).

Figure 23–37 Security Provider Configuration Page

WebLogic Domain Page Refreshed Dec 7, 2009 11:27:05 AM

Security Provider Configuration

Use this page to configure WebLogic Domain policy and credential store providers, keystore and login modules used by Web Services Manager.

Policy and Credential Store Providers

Current policy and credential store providers are shown below. To change the current policy and credential providers use the Change Association button.

Provider Name	Provider Type	Location	Policy and Credential Store
polystore.ldap	LDAP	ldap://dadvmc0538.us.oracle.com:3060/cn=dadvm537_domain,cn	

Identity Store Provider

Web Services Manager Authentication Providers

You can configure the login modules and keystore for Web Services Manager authentication.

Login Modules

The following table lists all configured login modules for Web Services Manager. Use this list to create, configure or delete a login module.

Name	Class	Control Flag	Description
saml.loginmodule	oracle.security.jps.internal.jaas.module.saml.JpsSAMLLoginModule	Required	SAML Login Module
krb5.loginmodule	com.sun.security.auth.module.Krb5LoginModule	Required	Kerberos Login Module
digest.authenticator.log	oracle.security.jps.internal.jaas.module.digest.DigestLoginModule	Required	Digest Authenticator Log
certificate.authenticator	oracle.security.jps.internal.jaas.module.x509.X509LoginModule	Required	X509 Certificate Login M
wss.digest.loginmodule	oracle.security.jps.internal.jaas.module.digest.WSSDigestLoginMc	Required	WSS Digest Login Modul
user.authentication.log	oracle.security.jps.internal.jaas.module.authentication.JpsUserAt	Required	User Authentication Log
user.assertion.log	oracle.security.jps.internal.jaas.module.assertion.JpsUserAsserti	Required	User Assertion Login Mo

Keystore

Single Sign-On Provider

Advanced Properties

This screenshot shows the Security Provider Configuration Page.

4. On the Security Provider Configuration page, click **Change Association...** to add the new Oracle Internet Directory provider.

The Set Security Provider page displays (see [Figure 23–38](#)).

Figure 23–38 Set Security Provider Page

WebLogic Domain Page Refreshed Dec 7, 2009 11:38:21 AM

Security Provider Configuration > Set Security Provider

Information
All changes made in this page require a server restart to take effect.

Set Security Provider OK Cancel
Specify LDAP specific attributes to reassociate the policy and credential stores to the LDAP server.

LDAP Server Details
Provide valid credential to connect to LDAP server. Farm uses this credential to connect to LDAP server for authentication and authorization.

LDAP Server Type: Oracle Internet Directory

* Host:

* Port:

Use SSL to connect:

* Connect DN: Test LDAP Authentication

* Password:

LDAP Root Node Details
Use this section to define provider specific configuration for this LDAP store. To specify the LDAP root DN, enter the desired root name and domain name. Under Custom Properties, click Add, enter the name and desired value of the property in the resulting dialog, and click OK.

* JPS Root DN:

Create New Domain:

* Domain Name:

5. Under LDAP Server Details, select **Oracle Internet Directory** as the LDAP Server Type.
6. In the **Host** and **Port** fields, enter the host name and the LDAP port for Oracle Internet Directory.
7. Set the **User DN** field to `cn=orcladmin`, and enter the associated password in the **Password** field.
8. Under LDAP Root Node Details, set the **JPS Root DN** field to the one you added to the `root.ldif` file (for example, `cn=root_webcenter_abcd99`). Be sure to include the `cn=`.
9. Click **OK** to begin the reassociation. Restart the WebLogic server when prompted after migration.

23.4.3 Reassociating the Credential and Policy Store Using WLST

Before reassociating the policy and credential store with Oracle Internet Directory, you must first have created the root node as described in [Section 23.4.1, "Creating a root Node."](#)

1. Start WLST as described in [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)
2. Connect to the Administration Server for the target domain with the following command:

```
connect('username>', 'password', 'host_id:port')
```

where:

- `username` is the administrator account name used to access the Administration Server (for example, `weblogic`)
- `password` is the administrator password used to access the Administration Server (for example, `weblogic`)
- `host_id` is the server ID of the Administration Server (for example, `example.com`)

- *port* is the port number of the Administration Server (for example, 7001).
3. Reassociate the policy and credential store using the `reassociateSecurityStore` command:

```
reassociateSecurityStore(domain="domain_name", admin="admin_name",
password="password",
ldapurl="ldap_uri", servertype="ldap_srvr_type", jpsroot="root_webcenter_xxxx")
```

Where:

- *domain_name* specifies the domain name where reassociation takes place.
- *admin_name* specifies the administrator's user name on the LDAP server. The format is `cn=usrName`.
- *password* specifies the password associated with the user specified for the argument `admin`.
- *ldap_uri* specifies the URI of the LDAP server. The format is `ldap://host:port`, if you are using a default port, or `ldaps://host:port`, if you are using a secure LDAP port. The secure port must have been configured to handle an anonymous SSL connection, and it is distinct from the default (non-secure) port.
- *ldap_srvr_type* specifies the kind of the target LDAP server. Valid types are `OID` (Oracle Internet Directory) or `OVD` (Oracle Virtual Directory).
- *root_webcenter_xxxx* specifies the root node in the target LDAP repository under which all data is migrated. Be sure to include the `cn=`. The format is `cn=nodeName`.

All arguments are required. For example:

```
reassociateSecurityStore(domain="myDomain", admin="cn=adminName",
password="myPass", ldapurl="ldaps://myhost.example.com:3060", servertype="OID",
jpsroot="cn=testNode")
```

23.4.4 Managing Credentials

Administrators can manage credentials for the WebCenter domain credential store using Fusion Middleware Control and WLST commands. For more information, see "Managing Credentials" in the *Oracle Fusion Middleware Security Guide*.

23.4.5 Configuring Self-Registration By Invitation in WebCenter Spaces

WebCenter Spaces supports self-registration by invitation, as described in [Section 28.4.1, "Enabling Self-Registration By Invitation-Only."](#) The self-registration 'by-invitation' feature requires that the WebCenter domain credential store contain the following password credentials:

- `map name = o.webcenter.security.selfreg`
- `key= o.webcenter.security.selfreg.hmackey`
- `user name = o.webcenter.security.selfreg.hmackey`

To enable 'self-registration by invitation' in WebCenter Spaces, use Fusion Middleware Control or the WLST command `createCred` to create the password credentials detailed above. For example:

```
createCred(map="o.webcenter.security.selfreg",
key="o.webcenter.security.selfreg.hmackey", type="PC",
user="o.webcenter.security.selfreg.hmackey", password="<password>", url="<url>",
```

```
port="<port>", [desc="<description>"])
```

For more information, see "Managing Credentials" in the *Oracle Fusion Middleware Security Guide*.

23.5 Managing Users and Roles

WebCenter Spaces provides a *Users tab* from which an administrator can add users defined in the identity store, and assign roles to those users within WebCenter Spaces. For information about managing users and user roles for WebCenter Spaces, see [Chapter 28, "Managing Users and Roles for WebCenter Spaces."](#)

Caution: The "Allow Password Change" property, which specifies whether users can change their passwords within WebCenter Spaces, should be carefully controlled for corporate identity stores. WebCenter Spaces administrators can set this property from the Profile Management Settings page in WebCenter Spaces. For more information, see [Section 16.3.4, "Configuring Profile."](#)

The user interface and management tools with which to manage users and user roles for custom WebCenter applications depends on what has been implemented for the particular deployment. For more information about role-mapping for ADF-security based WebCenter applications, see the section *What You May Need to Know About Application Roles and Enterprise Roles* in the *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

23.6 Configuring WebCenter Applications and Components to Use SSL

This section includes the following sub-sections:

- [Section 23.6.1, "Securing the Browser Connection to WebCenter Spaces with SSL"](#)
- [Section 23.6.2, "Securing the Browser Connection to a Custom WebCenter Application with SSL"](#)
- [Section 23.6.3, "Securing the Connection from Oracle HTTP Server to WebCenter Spaces with SSL"](#)
- [Section 23.6.4, "Securing the Browser Connection to the Wiki Service with SSL"](#)
- [Section 23.6.5, "Securing the WebCenter Spaces Connection to Portlet Producers with SSL"](#)
- [Section 23.6.6, "Securing the WebCenter Spaces Connection to the LDAP Identity Store"](#)
- [Section 23.6.7, "Securing the WebCenter Spaces Connection to OCS with SSL"](#)
- [Section 23.6.8, "Securing the WebCenter Spaces Connection to IMAP and SMTP with SSL"](#)
- [Section 23.6.9, "Securing the WebCenter Spaces Connection to Oracle SES with SSL"](#)
- [Section 23.6.10, "Securing the WebCenter Spaces Connection to OWLCS with SSL"](#)
- [Section 23.6.11, "Securing the WebCenter Spaces Connection to Microsoft Live Communication Server with SSL"](#)

Note: The following can use WS-Security with message protection, and consequently have no hard requirement for SSL:

- BPEL servers - Worklist service
 - WSRP Producers
 - Oracle WebLogic Communication Services (OWLCS) - IMP service
 - Microsoft Live Communication Server (LCS) - IMP service
 - Oracle WebCenter Discussions - Discussions and Announcements
-
-

23.6.1 Securing the Browser Connection to WebCenter Spaces with SSL

Securing the browser connection to WebCenter Spaces with SSL consists of the following steps:

- [Section 23.6.1.1, "Creating the Custom Keystore"](#)
- [Section 23.6.1.2, "Configuring the Custom Identity and Java Trust keystores"](#)
- [Section 23.6.1.3, "Configuring the SSL Connection"](#)

23.6.1.1 Creating the Custom Keystore

The first step is to generate a custom keystore for WebCenter Spaces.

To create a custom keystore:

1. Go to `JAVA_HOME/bin/` and open a command prompt.
2. Using `keytool`, generate a key pair:

```
keytool -genkeypair -keyalg RSA -dname "dname" -alias alias
-keypass key_password -keystore keystore -storepass keystore_password
-validity days_valid
```

Where:

- `dname` is the DN (distinguished name) to use (for example, `cn=customidentity,dc=example,dc=com`)
- `alias` is the alias to use (for example, `webcenter_wls`)
- `key_password` is the password for the new public key, (for example, `welcome1`)
- `keystore` is the keystore name, (for example, `webcenter_wls.jks`)
- `keystore_password` is the keystore password, (for example, `welcome1`)
- `days_valid` is the number of days for which the key password is valid (for example, 360).

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

3. Export the certificate containing the public key so WebCenter Spaces clients can import it into their trust store:

```
keytool -exportcert -v -alias alias -keystore keystore
-storepass keystore_password -rfc -file certificate_file
```

Where:

- *alias* is the WebCenter Spaces alias (for example, *webcenter_wls*)
- *keystore* is the keystore name, (for example, *webcenter_wls.jks*)
- *keystore_password* is the keystore password, (for example, *welcome1*)
- *certificate_file* is the file name for the certificate to export the key to (for example, *webcenter_wls.cer*)

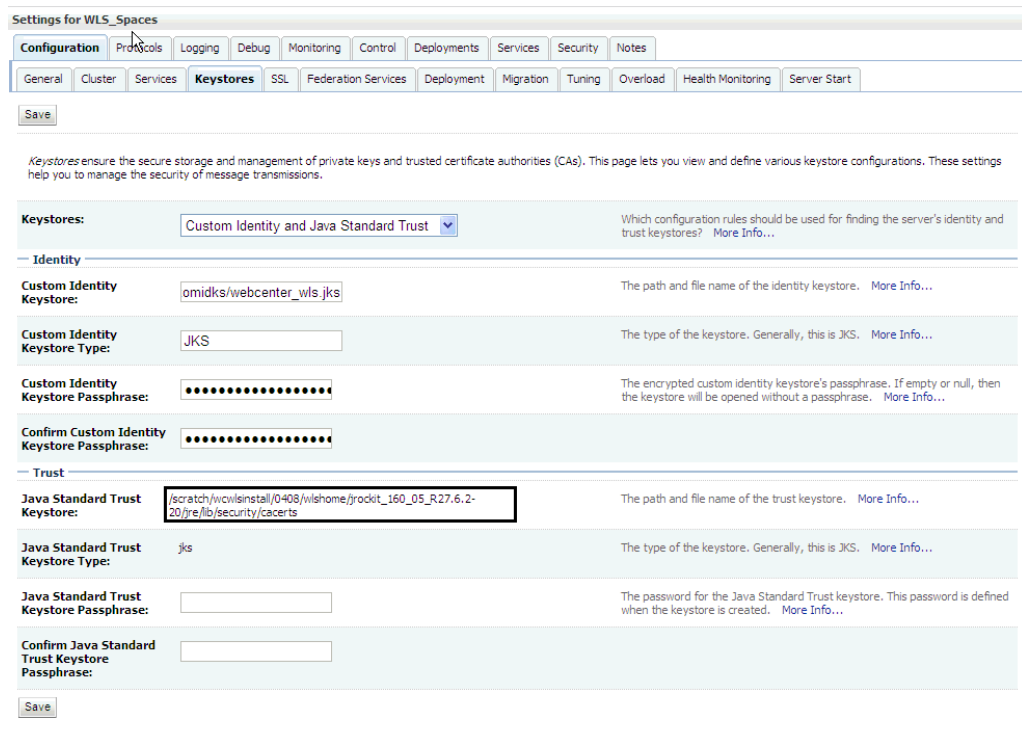

4. Determine the trust store to use:

Since you are using a self-signed certificate, you must update it as a trusted certificate in the server trust store. To do this, you must determine your trust store by going to the server:

- a. Log into the WebLogic Server Administration Console.
- b. In the Domain Structure pane, expand Environments and click *Servers*.
- c. In the list of servers, click *WLS_Spaces*.
- d. Open the Configuration tab, and the Keystores subtab.

The Keystores Settings pane displays (see [Figure 23–39](#)).

Figure 23–39 Keystores Settings Pane

- e. Note down the location of the server in the **Java Standard Trust Keystore** field (shown in [Figure 23–39](#)).

Note that the *cacerts* file may be "read only", in which case you will need to change it's permissions so that it's writable.

5. Import the self-signed certificate generated above in this trust store:

```
keytool -importcert -trustcacerts -alias alias -file certificate_file
-keystore cacerts -storepass changeit
```

Where:

- *alias* is the WebCenter Spaces alias (for example, *webcenter_wls*)
- *certificate_file* is the file name for the certificate to export the key to (for example, *webcenter_wls.cer*)

23.6.1.2 Configuring the Custom Identity and Java Trust Keystores

The next step is to configure the Custom Identity and Java Trust keystores on the WebCenter Spaces server.

To configure the identity and trust keystores:

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. In the Domain Structure pane, expand **Environment** and click **Servers**.

The Summary of Servers pane displays (see [Figure 23–40](#)).

Figure 23–40 Summary of Servers Pane

Summary of Servers

Configuration Control

A server is an instance of WebLogic Server that runs in its own Java Virtual Machine (JVM) and has its own configuration.
This page summarizes each server that has been configured in the current WebLogic Server domain.

[Customize this table](#)

Servers (Filtered - More Columns Exist)

New Clone Delete Showing 1 to 4 of 4 Previous | Next

<input type="checkbox"/>	Name	Cluster	Machine	State	Health	Listen Port
<input type="checkbox"/>	AdminServer(admin)			RUNNING	✔ OK	7001
<input type="checkbox"/>	WLS_Custom		LocalMachine	SHUTDOWN		8887
<input type="checkbox"/>	WLS_Portlet		LocalMachine	RUNNING	✔ OK	8889
<input type="checkbox"/>	WLS_Spaces		LocalMachine	RUNNING	✔ OK	8888

New Clone Delete Showing 1 to 4 of 4 Previous | Next

3. Click the WebCenter Spaces server (*WLS_Spaces*) to configure the identity and trust keystores.

The Settings pane for the WebCenter Spaces server displays (see [Figure 23–41](#)).

Figure 23–41 Settings Pane for WebCenter Spaces Server

This screenshot shows the WebLogic Server Administration Console's Settings panel for the WebCenter Spaces server.

4. Open the **Configuration** tab, and then the **Keystores** subtab.

The Keystores pane displays (see [Figure 23–42](#)).

Figure 23–42 Keystores Pane

Keystores ensure the secure storage and management of private keys and trusted certificate authorities (CAs). This page lets you view and define various keystore configurations. These settings help you to manage the security of message transmissions.

Keystores: Custom Identity and Java Standard Trust Which configuration rules should be used for finding the server's identity and trust keystores? [More Info...](#)

Identity

Custom Identity Keystore: The path and file name of the identity keystore. [More Info...](#)

Custom Identity Keystore Type: The type of the keystore. Generally, this is JKS. [More Info...](#)

Custom Identity Keystore Passphrase: The encrypted custom identity keystore's passphrase. If empty or null, then the keystore will be opened without a passphrase. [More Info...](#)

Confirm Custom Identity Keystore Passphrase:

Trust

Java Standard Trust Keystore: /u01/app/oracle/product/IR11/fmw/ohme/jdk160_05_R27.6.1-25/jre/lib/security/cacerts The path and file name of the trust keystore. [More Info...](#)

Java Standard Trust Keystore Type: jks The type of the keystore. Generally, this is JKS. [More Info...](#)

Java Standard Trust Keystore Passphrase: The password for the Java Standard Trust keystore. This password is defined when the keystore is created. [More Info...](#)

Confirm Java Standard Trust Keystore Passphrase:

Save

5. For **Keystores**, select Custom Identity and Java Standard Trust and click **Save**.
6. Under Identity, enter the path and filename of the **Custom Identity Keystore** you created in [Section 23.6.1.1, "Creating the Custom Keystore."](#)
7. Enter JKS as the **Custom Identity Keystore Type**.
8. Enter and confirm the **Custom Identity Keystore** password.
9. Under Trust, enter and confirm the **Java Standard Trust Keystore** password.
10. Click **Save** to save your entries.
11. Open the SSL tab.
12. Enter the **Private Key Alias**.
13. Enter the **Private Key Passphrase**.
14. Click **Save** to save your entries.

23.6.1.3 Configuring the SSL Connection

To configure the SSL connection:

1. On the Settings pane for the WebCenter Spaces server, open the Configuration tab and then the General subtab.

The General Configuration pane displays (see [Figure 23–43](#)).

Figure 23–43 General Configuration Pane

Settings for WLS_Spaces

Hostname Verification:	BEA Hostname Verifier	Specifies whether to ignore the installed implementation of the <code>weblogic.security.SSL.HostnameVerifier</code> interface (when this server is acting as a client to another application server). More Info...
Custom Hostname Verifier:		The name of the class that implements the <code>weblogic.security.SSL.HostnameVerifier</code> interface. More Info...
Export Key Lifespan:	500	Indicates the number of times WebLogic Server can use an exportable key between a domestic server and an exportable client before generating a new key. The more secure you want WebLogic Server to be, the fewer times the key should be used before generating a new key. More Info...
<input type="checkbox"/> Use Server Certs		Sets whether the client should use the server certificates/key as the client identity when initiating a connection over https. More Info...
Two Way Client Cert Behavior:	Client Certs Not Requested	The form of SSL that should be used. More Info...
Cert Authenticator:		The name of the Java class that implements the <code>weblogic.security.ad.CertAuthenticator</code> class, which is deprecated in this release of WebLogic Server. This field is for Compatibility security only, and is only used when the Realm Adapter Authentication provider is configured. More Info...
<input checked="" type="checkbox"/> SSLRejection Logging Enabled		Indicates whether warning messages are logged in the server log when SSL connections are rejected. More Info...
<input type="checkbox"/> Allow Unencrypted Null Cipher		Test if the <code>AllowUnEncryptedNullCipher</code> is enabled. More Info...
Inbound Certificate Validation:	Builtin SSL Validation Only	Indicates the client certificate validation rules for inbound SSL. More Info...
Outbound Certificate Validation:	Builtin SSL Validation Only	Indicates the server certificate validation rules for outbound SSL. More Info...
Save		

5. Set the **Two Way Client Cert Behavior** option to `Client Certs Not Requested` and click **Save**.
6. Open the Control tab.
The Control Settings pane displays (see [Figure 23–45](#)).

Figure 23–45 Control Settings Pane

7. Click **Restart SSL**.
8. Restart the WebLogic Server and open the SSL WebCenter Spaces URL.
9. Accept the certificate for the session and log in.

23.6.2 Securing the Browser Connection to a Custom WebCenter Application with SSL

Securing the browser connection to a custom WebCenter application uses the same configuration steps as for securing the browser connection to WebCenter Spaces. The only difference is that the configuration occurs on the managed server that is hosting the custom WebCenter application deployment rather than the WLS_Spaces server. For more information, see [Section 23.6.1, "Securing the Browser Connection to WebCenter Spaces with SSL."](#)

23.6.3 Securing the Connection from Oracle HTTP Server to WebCenter Spaces with SSL

Securing the connection between the Oracle HTTP Server (OHS) and WebCenter Spaces consists of these steps:

- [Configure the Identity and Trust Keystores](#)
- [Configure the SSL Connection](#)

- [Install OHS](#)
- [Wire WebCenter Spaces Ports to OHS](#)
- [Configure the SSL Certificates](#)

Configure the Identity and Trust Keystores

For instructions on how to configure the Identity and Trust keystores, see [Section 23.6.1, "Securing the Browser Connection to WebCenter Spaces with SSL."](#)

Configure the SSL Connection

1. On the Settings pane for the WebCenter Spaces server, open the Configuration tab and then the General subtab.

The General Configuration pane displays (see [Figure 23–46](#)).

Figure 23–46 General Configuration Pane

Settings for WLS_Spaces

[Advanced](#)

Save

2. Check **SSL Listen Port Enabled**.
3. Enter an **SSL Listen Port** number and click **Save**.

4. On the **Configuration** tab, open the **SSL** subtab, and then expand the **Advanced** options at the bottom of the page.

The SSL advanced options are displayed (see [Figure 23–47](#)).

Figure 23–47 Advanced SSL Configuration Settings

The screenshot displays the 'Advanced' configuration settings for SSL. The settings are as follows:

- Hostname Verification:** BEA Hostname Verifier (dropdown). Description: Specifies whether to ignore the installed implementation of the `weblogic.security.SSL.HostnameVerifier` interface (when this server is acting as a client to another application server). [More Info...](#)
- Custom Hostname Verifier:** (text input). Description: The name of the class that implements the `weblogic.security.SSL.HostnameVerifier` interface. [More Info...](#)
- Export Key Lifespan:** 500 (text input). Description: Indicates the number of times WebLogic Server can use an exportable key between a domestic server and an exportable client before generating a new key. The more secure you want WebLogic Server to be, the fewer times the key should be used before generating a new key. [More Info...](#)
- Use Server Certs:** (checkbox, unchecked). Description: Sets whether the client should use the server certificates/key as the client identity when initiating a connection over https. [More Info...](#)
- Two Way Client Cert Behavior:** Client Certs Not Requested (dropdown). Description: The form of SSL that should be used. [More Info...](#)
- Cert Authenticator:** (text input). Description: The name of the Java class that implements the `weblogic.security.ac.CertAuthenticator` class, which is deprecated in this release of WebLogic Server. This field is for Compatibility security only, and is only used when the Realm Adapter Authentication provider is configured. [More Info...](#)
- SSLRejection Logging Enabled:** (checkbox, checked). Description: Indicates whether warning messages are logged in the server log when SSL connections are rejected. [More Info...](#)
- Allow Unencrypted Null Cipher:** (checkbox, unchecked). Description: Test if the `AllowUnEncryptedNullCipher` is enabled. [More Info...](#)
- Inbound Certificate Validation:** Builtin SSL Validation Only (dropdown). Description: Indicates the client certificate validation rules for inbound SSL. [More Info...](#)
- Outbound Certificate Validation:** Builtin SSL Validation Only (dropdown). Description: Indicates the server certificate validation rules for outbound SSL. [More Info...](#)

A 'Save' button is located at the bottom left of the configuration area.

5. Set the **Two Way Client Cert Behavior** option to **Client Certs Not Requested** and click **Save**.
6. Open the **Control** tab on the Settings pane, and select the **Start/Stop** subtab.
7. Click **Restart SSL**.
8. Open the SSL WebCenter Spaces URL.
9. Accept the certificate for the session and log in.
10. In the WSL Administration Console, click **View Changes and Restarts** on the Change Center pane and restart any affected servers or components.

Install OHS

1. Install the WebTier.
 - Do not select WebCache; only select the HTTP Server.
 - Uncheck the checkbox to associate a WebLogic server during install.

2. Navigate to the `WT_ORACLE_HOME/instances/<your_instance>/bin` directory and start OHS using the following command:

```
./opmnctl startall
```

3. Check the status of OHS using the following command:

```
./opmnctl status -l
```

Wire WebCenter Spaces Ports to OHS

1. Open the file `WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/mod_wl.conf`.
2. Add the following entry to `mod_wl.conf` to make WebCenter Spaces work with OHS:

```
<IfModule mod_weblogic.c>
    WebLogicHost host_id
    WebLogicPort port
    Debug OFF
    WLLogFile /tmp/ohs.log
    MatchExpression *.jsp
</IfModule>

<Location />
    SetHandler weblogic-handler
</Location>
```

Replacing *host_id* and *port* with the WebCenter Spaces server ID and port number.

3. Open the file `WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/mod_ssl.conf`.
4. Add the following entry to `mod_ssl.conf` to make WebCenter Spaces run on the OHS SSL port:

```
<IfModule mod_weblogic.c>
    WebLogicHost host_id
    WebLogicPort port
    WLLogFile /tmp/ohs_ssl.log
    Debug OFF
    DebugConfigInfo ON
    SecureProxy ON
    MatchExpression *.jsp
    WLSslWallet SSL_wallet
</IfModule>

<Location />
    SetHandler weblogic-handler
</Location>
```

Replacing *host_id* and *port* with the WebCenter SSL server ID and port number, and *SSL_wallet* with the path to the WebLogic SSL wallet (for example, `WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/keystores/default`).

5. Go to `WT_ORACLE_HOME/instances/<your_instance>/bin` and start and check the status of OHS using the following commands:

```
./opmnctl stopall
```

```
./opmnctl startall
./opmnctl status -l
```

Configure the SSL Certificates

1. For OHS to trust WebCenter's certificate, the WLS_Spaces certificate must be imported into the OHS trust store. Export the certificate from the WLS_Spaces identity keystore:

```
keytool -exportcert -v -alias webcenter_wls -keystore webcenter_wls.jks
-storepass <password> -rfc -file webcenter_wls.cer
```

2. Import the certificate into the wallet on the OHS side using orapki:

```
orapki wallet add -wallet . -trusted_cert -cert webcenter_wls.cer -auto_login_
only
```

3. For WebCenter to trust OHS certificates, export the user certificate from OHS wallet and import it as a trusted certificate in the WebLogic trust store.

```
orapki wallet export -wallet . -cert cert.txt -dn 'CN=\"Self-signed
Certificate for ohs1
\", OU=EXAMPLEORGUNIT, O=EXAMPLEORG, L=EXAMPLELOCATION, ST=CA, C=US'
```

4. Import the above certificate into the WLS_Spaces managed server trust store available in /scratch/wcwlinstall/0408/wlshome/jrockit_160_05_R27.6.2-20/jre/lib/security/cacerts:

```
keytool -file cert.txt -importcert -trustcacerts -alias ohs_cert -keystore
cacerts -storepass changeit
```

5. Restart OHS and the WLS_Spaces server.

You should now be able to access the SSL OHS, as well as the non-SSL OHS.

23.6.4 Securing the Browser Connection to the Wiki Service with SSL

As with securing the browser connection to WebCenter Spaces, securing the Wiki service connection with SSL consists of two steps:

- [Configure the identity and trust keystores](#)
- [Configure the SSL connection](#)

Configure the identity and trust keystores

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. In the Domain Structure pane, expand **Environment** and click **Servers**.

The Summary of Servers pane displays (see [Figure 23-48](#)).

Figure 23–48 Summary of Servers Pane

Configuration Control

A server is an instance of WebLogic Server that runs in its own Java Virtual Machine (JVM) and has its own configuration.
This page summarizes each server that has been configured in the current WebLogic Server domain.

6. Restart the `WLS_Services` server and open the SSL Wiki URL at `https://host:port/owc_wiki`.
7. Accept the certificate for the session and log in.

23.6.5 Securing the WebCenter Spaces Connection to Portlet Producers with SSL

Securing the connection to WSRP and PDK-Java portlet producers with SSL consists of the following steps:

- [Configure the identity and trust keystores](#)
- [Configure the SSL connection](#)
- [Register the SSL-enabled WSRP producer and run the portlets](#)
- [Register the SSL-enabled PDK-Java Producer and run the portlets](#)

Configure the identity and trust keystores

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. In the Domain Structure pane, expand **Environment** and click **Servers**.

The Summary of Servers pane displays (see [Figure 23–54](#)).

Figure 23–54 Summary of Servers Pane

Summary of Servers

Configuration Control

A server is an instance of WebLogic Server that runs in its own Java Virtual Machine (JVM) and has its own configuration.
This page summarizes each server that has been configured in the current WebLogic Server domain.

7. Click **Restart SSL**.

Configure the SSL connection

1. In the Domain Structure pane, expand **Environment** and select **Servers**.
2. Click on the Portlet server (for example, WLS_Portlet) for which you want to configure SSL.
3. Select **Configuration**.
4. Check **SSL Listen Port Enable**.
5. Enter a listen port number.
6. Select **Configuration > SSL**, and then open the Advanced options at the bottom of the page.
7. Select the **Two Way Client Cert Behavior** attribute and choose the **Client Certs Not Requested** option.
8. Click **Save**.
9. Restart the WebLogic Server and open the SSL URL.
10. Accept the certificate for the session and log in.

Register the SSL-enabled WSRP producer and run the portlets

1. Configure the WebCenter Spaces managed server to use the Custom Identity and Java Standard Trust store. This also uses the certificates in `JAVA_HOME/jre/lib/security/cacerts`.

2. Download the certificate of the HTTPS producer URL and save it in `.PEM` format.

Use Firefox 3.0 or later to download the certificate directly to `.PEM` format, or for other browsers use the WebLogic Server `der2pem` tool to convert to PEM format. For more information about using the `der2pem` tool, see "der2pem" in the *Oracle Fusion Middleware Command Reference for Oracle WebLogic Server*. Note that WebLogic does not recognize any other format other than `.PEM` format.

3. Import the certificate into the `cacerts` file in `JAVA_HOME/jre/lib/security` using the following `keytool` command:

```
keytool -importcert -alias portlet_cert -file HOME/portlet_pem -keystore
./cacerts -storepass password
```

Where:

- `portlet_cert` is the portlet certificate alias
- `portlet_pem` is the portlet certificate file (for example, `portlet_cert.pem`)
- `password` is the keystore password

4. Restart `WLS_Spaces`.

5. Start WLST as described in [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

6. Connect to the Administration Server for the target domain with the following command:

```
connect('user_name', 'password', 'host_id:port')
```

Where:

- `user_name` is the name of the user account with which to access the `WLS_Spaces` server (for example, `weblogic`)
- `password` is the password with which to access the `WLS_Spaces` server
- `host_id` is the host ID of the Administration Server
- `port` is the port number of the Administration Server (for example, `7001`).

7. Run the `registerWSRPProducer` WLST command to register the producer:

```
registerWSRPProducer('webcenter', 'sslwsrpprod', 'producer_wSDL')
```

Where:

- `sslwsrpprod` is the name of the SSL-enabled WSRP producer
- `producer_wSDL` is the WSDL URL of the SSL-enabled WSRP producer

For example:

```
registerWSRPProducer('webcenter',
'sslwsrpprod', 'https://example.oracle.com:7004/richtextportlet/portlets/wsrp2?W
SDL')
```

8. Navigate to the HTTP or HTTPS WebCenter URL.

9. Create a page and go to the Portlets link.
10. Go to the registered WSRP producer.
11. Add the portlet to the page.
12. Go to the view mode of the page and check that the WSRP portlet renders correctly.

Register the SSL-enabled PDK-Java Producer and run the portlets

1. Configure the WebCenter Spaces managed server to use the Demo Identity and Trust store. This also uses the certificates in `JAVA_HOME/jre/lib/security/cacerts`.

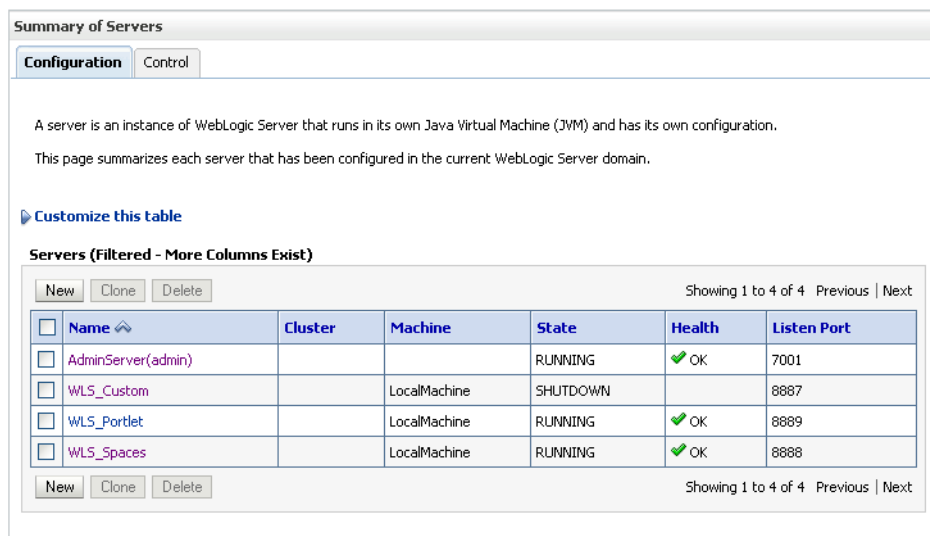

2. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

3. On the Domain Structure pane, expand **Environment** and click **Servers**.

The Summary of Servers pane displays (see [Figure 23–58](#)).

Figure 23–58 Summary of Servers Pane

4. Click `WLS_Spaces` in the servers list.

The Settings pane displays (see [Figure 23–59](#)).

Figure 23–59 Settings Pane (WLS_Spaces Server)

[Advanced](#)

Save

5. Open the Configuration tab and select the Keystores tab.
6. Make sure that the value for **Demo Identity and Demo Trust** is either `jks` or left blank.
7. Click **Save**.
8. Download the certificate of the HTTPS producer URL and save it in `.PEM` format.
Use Firefox 3.0 or later to download the certificate directly to `.PEM` format, or for other browsers use the WebLogic Server `der2pem` tool to convert to PEM format. For more information about using the `der2pem` tool, see "der2pem" in the *Oracle Fusion Middleware Command Reference for Oracle WebLogic Server*. Note that WebLogic does not recognize any other format other than `.PEM` format.
9. Import the certificate into the `cacerts` file in `JAVA_HOME/jre/lib/security` using the following keytool command:

```
keytool -importcert HOME/portlet_cert.pem -keystore ./cacerts -storepass changeit
```
10. Restart WLS_Spaces.
11. Start WLST as described in [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

12. Connect to the Administration Server for the target domain with the following command:

```
connect('user_name','password','host_id:port')
```

where:

- *user_name* is the name of the user account with which to access the WLS_Spaces server (for example, weblogic)
 - *password* is the password with which to access the WLS_Spaces server
 - *host_id* is the host ID of the Administration Server
 - *port* is the port number of the Administration Server (for example, 7001).
13. Run the `registerPDKJavaProducer` command:

```
registerPDKJavaProducer('webcenter','ssljpdkprod','producer_wsd1')
```

Where:

- *ssljpdkprod* is the name of the SSL-enabled PDK-Java producer
- *producer_wsd1* is the WSDL URL of the SSL-enabled PDK-Java producer

This will enable one-way SSL for a Web producer. That is, only the server side (web producer) uses certificates. The Web producer code also uses a shared key feature (discussed later) for client authentication.

14. Go to the HTTP or HTTPS WebCenter URL.
15. Create a page and go to the Portlets link.
16. Go to the registered PDK-Java producer.
17. Add the portlet to the page.
18. Go to the view mode of the page and check that the PDK-Java portlet renders correctly.

23.6.6 Securing the WebCenter Spaces Connection to the LDAP Identity Store

To configure the LDAP server port for SSL, refer to the appropriate administration documentation for the LDAP server. For Oracle Internet Directory (OID), an SSL port is installed by default. To use this port for LDAP communication from WebCenter, the identity store should be configured for authentication with the appropriate authenticator. See [Section 23.3, "Configuring the Identity Store"](#) for the steps to do this for the identity store.

Note: When entering the Provider Specific information, be sure to specify an SSL port and to check the SSL Enabled checkbox.

If the CA is unknown to the Oracle WebLogic server, complete the two additional steps described in the following subsections:

- [Exporting the OID Certificate Authority \(CA\)](#)
- [Setting Up the WebLogic Server](#)

For more information, see "Setting Up a One- Way SSL Connection" in the *Oracle Fusion Middleware Security Guide*.

23.6.6.1 Exporting the OID Certificate Authority (CA)

If the CA is unknown to the Oracle WebLogic server (the command prompts the user to enter the keystore password) you will need to use `orapki` to create a certificate. The following example shows how to use this command to create the certificate `serverTrust.cert`:

```
orapki wallet export -wallet CA -dn "CN=myCA" -cert oid_server_trust.cert
```

23.6.6.2 Setting Up the WebLogic Server

If the CA is unknown to the Oracle WebLogic server, use the utility `keytool` to import the Oracle Internet Directory's CA into the WebLogic trust store. The following example shows how to use `keytool` to import the file `oid_server_trust.cert` into the server trust store `cacerts`:

```
keytool -importcert -v -trustcacerts -alias oid_server_trust -file oid_server_trust.cer -keystore cacerts -storepass changeit
```

23.6.7 Securing the WebCenter Spaces Connection to OCS with SSL

For instructions on how to configure Oracle Content Server (OCS) for SSL, see [Section 11.2.1.2.3, "Configuring Secure Sockets Layer \(SSL\)."](#) For instructions on adding a trusted certificate to the WebCenter Spaces trust store, see the section on importing the certificate into the trust store in [Section 23.6.1.2, "Configuring the Custom Identity and Java Trust Keystores."](#)

23.6.8 Securing the WebCenter Spaces Connection to IMAP and SMTP with SSL

Before reconfiguring the mail server connection, you must first import the certificate into the trust store. Follow the steps below to put the certificate in the trust store and configure WebCenter Spaces to use the trust store.

To secure the WebCenter Spaces connection to IMAP and SMTP with SSL:

1. Open a browser and connect to your IMAP server with the following command:

```
https://imapserver:ssl_port
```

For example:

```
https:mailserver.example:993
```

2. Place your cursor on the page, right-click, and select **Properties**.
3. Click **Certificate**.
4. In the popup window, click the **Details** tab and click **Copy to File...**

Be sure to use the DER encoded binary (X.509) format and copy to a file.

5. Convert the .DER format certificate to .PEM format.

Use Firefox 3.0 or later to download the certificate directly to .PEM format, or for other browsers use the WebLogic Server `der2pem` tool to convert to PEM format. For more information about using the `der2pem` tool, see "der2pem" in the *Oracle Fusion Middleware Command Reference for Oracle WebLogic Server*. Note that WebLogic does not recognize any other format other than .PEM format.

6. Import the certificate into the `cacerts` in the `JAVA_HOME` using the following command:

```
keytool -import -alias imap_cer -file cert_file.cer -keystore cacerts -storepass changeit
```

Where *cert_file* is the name of the certificate file you downloaded.

7. Register the mail server connection as described in [Section 15.3, "Registering Mail Servers."](#)
8. Restart Webcenter Spaces.
9. Log into WebCenter Spaces and provide your mail credentials.

23.6.9 Securing the WebCenter Spaces Connection to Oracle SES with SSL

Before registering the SES connection, you must first import the certificate into the trust store. Follow the steps below to put the certificate in the trust store and register the Oracle Secure Enterprise Search (SES) connection.

To download the certificate of the HTTPS URL and save it:

1. Use your browser to navigate to the Web Services URL that Oracle Secure Enterprise Search exposes to enable search requests at:

```
http://host:port/search/query/OracleSearch
```

For example:

```
https://example.com:7777/search/query/OracleSearch
```

2. Place your cursor on the page, right-click with your mouse, and select **Properties**.
3. Click **Certificate**.

4. In the popup window, open the Details tab, and click **Copy to File...**

Use **DER encoded binary(X.509)** format and copy the certificate to a file.

5. Convert the .DER format certificate to .PEM format.

Use Firefox 3.0 or later to download the certificate directly to .PEM format, or for other browsers use the WebLogic Server `der2pem` tool to convert to PEM format. For more information about using the `der2pem` tool, see "der2pem" in the *Oracle Fusion Middleware Command Reference for Oracle WebLogic Server*. Note that WebLogic does not recognize any other format other than .PEM format.

6. Import the certificate into `DemoTrustKeyStore.jks` or `cacerts` in the `JAVA_HOME` using one of the following commands:

```
keytool -import -alias ses_cer -file cert_file.cer -keystore cacerts -storepass changeit
```

where *cert_file* is the name of the certificate file you downloaded.

7. Register the SES connection as described in [Section 18.3.1, "Registering Oracle SES Services."](#)
8. Restart WebCenter Spaces.

23.6.10 Securing the WebCenter Spaces Connection to OWLCS with SSL

To secure the WebCenter Spaces connection to Oracle WebLogic Communication Services (OWLCS) with SSL, follow the steps below to import the certificate into the trust store, and point WebCenter Spaces to use the trust store. Note that securing the WebCenter Spaces connection to OWLCS with SSL is optional since OWLCS can be configured with confidentiality using WS-Security. See [Section 23.8.4, "Securing Oracle WebLogic Communication Services \(OWLCS\) with WS-Security."](#)

Before registering the OWLCS connection, you must first import the certificate into the trust store. Follow the steps below to put the certificate in the trust store:

1. Open your browser and go to the OWLCS server (for example, `https://example.com:port/PresenceConsumerService/services/PresenceConsumer`)
2. Place your cursor on the page, right-click, and select **Properties**.
3. Click **Certificate**.
4. In the popup window, open the **Details** tab and click **Copy to File...**
Use Firefox 3.0 or later to download the certificate directly to .PEM format, or for other browsers use the WebLogic Server `der2pem` tool to convert to PEM format. For more information about using the `der2pem` tool, see "der2pem" in the *Oracle Fusion Middleware Command Reference for Oracle WebLogic Server*. Note that WebLogic does not recognize any other format other than .PEM format.
5. Import the certificate into the `cacerts` using the following keytool command:

```
keytool -import -alias owlcs_cer -file cert_file.cer -keystore cacerts -storepass changeit
```

where `cert_file` is the name of the certificate file you downloaded.
6. Locate the `cacerts` file used by the OWLCS server in the OWLCS installation, and also update the OWLCS referenced `cacerts` file with this certificate:

```
keytool -import -alias owlcs_cer -file cert_file.cer -keystore cacerts -storepass changeit
```
7. Register the Oracle WebLogic Communication Services connection as described in [Section 14.3, "Registering Instant Messaging and Presence Servers."](#)
8. Restart the WebCenter Spaces server.

23.6.11 Securing the WebCenter Spaces Connection to Microsoft Live Communication Server with SSL

To secure the WebCenter Spaces connection to Microsoft Live Communication Server with SSL, follow the steps below to import the certificate into the trust store, and point WebCenter Spaces to use the trust store. Note that securing the WebCenter Spaces connection to Microsoft Live Communication Server with SSL is optional since Microsoft Live Communication Server can be configured with confidentiality using WS-Security.

Before registering the LCS connection, you must first import the certificate into the trust store. Follow the steps below to put the certificate in the trust store:

1. Open your browser and go to the Microsoft Live Communication Server (for example, `https://example.com:port/PresenceConsumerService/services/PresenceConsumer`)
2. Place your cursor on the page, right-click, and select **Properties**.
3. Click **Certificate**.
4. In the popup window, open the **Details** tab and click **Copy to File...**
Use Firefox 3.0 or later to download the certificate directly to .PEM format, or for other browsers use the WebLogic Server `der2pem` tool to convert to PEM format.

For more information about using the `der2pem` tool, see "der2pem" in the *Oracle Fusion Middleware Command Reference for Oracle WebLogic Server*. Note that WebLogic does not recognize any other format other than .PEM format.

5. Import the certificate into the `cacerts` using the following `keytool` command:

```
keytool -import -alias lcs_cer -file cert_file.cer -keystore cacerts -storepass changeit
```

where `cert_file` is the name of the certificate file you downloaded.

6. Locate the `cacerts` file used by the Microsoft Live Communication Server in the Microsoft Live Communication Server installation, and also update the Microsoft Live Communication Server referenced `cacerts` file with this certificate:

```
keytool -import -alias lcs_cer -file cert_file.cer -keystore cacerts -storepass changeit
```

7. Register the Microsoft Live Communication Server connection as described in [Section 14.3, "Registering Instant Messaging and Presence Servers."](#)
8. Restart the WebCenter Spaces server.

23.7 Configuring a WebCenter Application to Use Single Sign-On

Oracle Access Manager (OAM), part of Oracle's enterprise class suite of products for identity management and security, provides a wide range of identity administration and security functions, including several single sign-on options for WebCenter Spaces and custom WebCenter applications. OAM is the recommended single sign-on solution for Oracle WebCenter 11g installations.

For deployment environments that are already invested in Oracle 10g infrastructure, and where the Oracle Application Server Single Sign-On (OSSO) server is used as the primary SSO solution, WebCenter 11g can also be configured to use OSSO for single sign-on.

For smaller scale Oracle WebCenter 11g installations, where you do not have an enterprise-class single sign-on infrastructure like Oracle Access Manager or Oracle SSO, and you only need to provide a single sign-on capability within WebCenter Spaces and its associated web applications like Wiki, Discussions, RSS and Worklist, you can configure a SAML-based SSO solution. If you need to provide single sign-on with other enterprise applications, this solution is not recommended.

If your enterprise uses Microsoft desktop logins that authenticate with a Microsoft domain controller with user accounts in Active Directory, then configuring SSO with Microsoft Clients may also be an option to consider.

The setup required for each of these SSO solutions is described in the following subsections:

- [Section 23.7.1, "Configuring Oracle Access Manager \(OAM\)"](#)
- [Section 23.7.2, "Configuring Oracle Single Sign-On \(OSSO\)"](#)
- [Section 23.7.3, "Configuring SAML-based Single Sign-on"](#)
- [Section 23.7.4, "Configuring SSO with Microsoft Clients"](#)

23.7.1 Configuring Oracle Access Manager (OAM)

Oracle Access Manager (OAM) provides flexible and extensible authentication and authorization, and provides audit services. This section describes how to configure

WebCenter Spaces and custom WebCenter applications for OAM single sign-on authentication, including how to configure the WebLogic server side and the WebCenter application as the partner application participating in SSO.

Much of the configuration can be done using scripts (recommended). To use the scripts, follow the instructions in [Section 23.7.1.2, "Configuring OAM Using Scripts,"](#) and complete the instructions in [Section 23.7.1.3, "Configuring the Webtier Components"](#) and [Section 23.7.1.6, "Configuring the Policy Manager,"](#) and any additional configurations as appropriate in [Section 23.7.1.7, "Additional Configurations."](#)

To perform the configuration manually, complete the instructions in all of the subsections, with the exception of [Section 23.7.1.2, "Configuring OAM Using Scripts."](#)

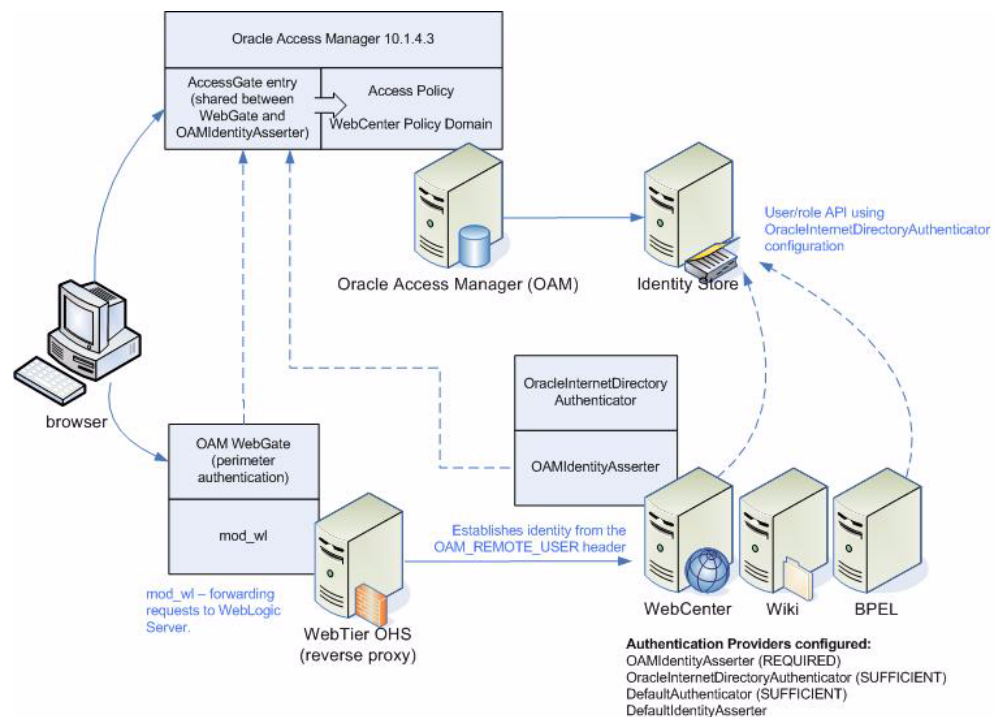

The scripted and equivalent manual configuration steps are presented in the following subsections:

- [Section 23.7.1.1, "OAM Components and Topology"](#)
- [Section 23.7.1.2, "Configuring OAM Using Scripts"](#)
- [Section 23.7.1.3, "Configuring the Webtier Components"](#)
- [Section 23.7.1.4, "Manually Configuring the Access System"](#)
- [Section 23.7.1.5, "Manually Defining the WebCenter Policy Domain"](#)
- [Section 23.7.1.6, "Configuring the Policy Manager"](#)
- [Section 23.7.1.7, "Additional Configurations"](#)

23.7.1.1 OAM Components and Topology

[Figure 23–60](#) shows the components and topology required to set up single sign-on with Oracle Access Manager for a WebCenter application.

Figure 23–60 OAM Single Sign-On Components and Topology

OAM consists of the following components:

- **Access Server** - a standalone server that provides authentication, authorization, and auditing services for Access Gates. There is one access server set up on OAM. This is done as part of the OAM install itself.
- **WebGate** - an out-of-the-box plugin that intercepts Web resource (HTTP) requests and forwards them to the Access Server for authentication and authorization.
- **Identity Assertion Provider (IAP)** - a type of security provider that asserts the identity of the user based on header information that is set by perimeter authentication. The OAM integration provides an OAM ID Asserter that can be configured as the OAM IAP. The OAM ID Asserter can be used for authentication or for identity assertion. For OAM SSO integration, the OAM ID Asserter should be configured as an Identity Assertion Provider (IAP) by selecting `obSSOCookie` under **Active Types** in the provider's Common settings.

23.7.1.2 Configuring OAM Using Scripts

These steps assume that you've installed Oracle WebCenter (see [Section 2.3, "Installing WebCenter Spaces"](#)). By default, an Oracle WebCenter installation creates a WebLogic Server domain, including an Administration Server and three managed servers: WLS_Spaces, WLS_Services and WLS_Portlet.

1. Install the WebTier, which contains the Oracle HTTP Server (OHS) and `mod_wl` (see the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter* for information on how to install the WebTier).
2. Configure the module `mod_wl` in the WebTier OHS so that it forwards requests to the Oracle WebLogic Server for WebCenter, as described in [Section 23.7.1.3.1, "Configure `mod_weblogic` \(`mod_wl_ohs.conf`\)"](#).
3. Determine which access server to use.
 - a. Log onto the Access Manager.
 - b. Click **Access System Console**.
 - c. Open the Access System Configuration tab.
 - d. Click **Access Server Configuration** to display a list of all access servers.
 - e. Click an access server in the list to see server details.

The host name and port are the values you need for the `oam_aaa_host` and `oam_aaa_port` parameters respectively in the script.

4. Run the following command.

The `oamcfgtool.jar` is available in `ORACLE_HOME/modules/oracle.oamprovider_11.1.1/oamcfgtool.jar` in the WebCenter installation. Values in bold are the one that you need to supply based on the settings of your WebCenter and OAM instances.

```
java -jar ORACLE_HOME/modules/oracle.oamprovider_11.1.1/oamcfgtool.jar
mode=CREATE app_domain="your_domain_name"
protected_uris="/webcenter/adfAuthentication,/webcenter/content,/owc_
wiki/user/login.jz,/owc_wiki/adfAuthentication,/integration/worklistapp,
/workflow/sdpmessagingsca-ui-worklist/faces/adf.task-flow,/workflow/WebCenterWo
rklistDetail/faces/adf.task-flow,
/workflow/sdpmessagingsca-ui-worklist,/rss/rssservlet,/owc_
discussions/login!withRedirect.jspa,
/owc_discussions/login!default.jspa,/owc_discussions/login.jspa,/owc_
discussions/admin,/rest"
```

```
public_uris="/webcenter,/owc_wiki,/owc_discussions,/rss,/workflow"
app_agent_password=<Password to be provisioned for App Agent>
ldap_host=<Hostname of LDAP server> ldap_port=<Port of LDAP server>
ldap_userdn=<DN of LDAP Admin User, usually "cn=orcladmin">
ldap_userpassword=<Password of LDAP Admin User> oam_aaa_host=<HOST of OAM
server> oam_aaa_port=<Port of OAM server>
```

We recommend that you register your domain (for <your_domain_name>) as something like "webtier.example.com", where "webtier.example.com" is your Webtier, so that you can easily distinguish the various policies in OAM.

If your command ran successfully, you should see something like the following output depending on the values you used:

```
Processed input parameters
Initialized Global Configuration
Successfully completed the Create operation.
Operation Summary:
Policy Domain : webtier.example.com
Host Identifier: webtier.example.com
Access Gate ID : webtier.example.com_AG
```

You can also run the Validate command to validate your configurations:

```
java -jar WC_ORACLE_HOME/modules/oracle.oamprovider_11.1.1/oamcfgtool.jar
mode=VALIDATE app_domain="your_domain_name"
ldap_host=<Hostname of LDAP server> ldap_port=<Port of LDAP server>
*ldap_userdn=<DN of LDAP Admin User, usually "cn=orcladmin">*
ldap_userpassword=<Password of LDAP Admin User> oam_aaa_host=<HOST of OAM
server> oam_aaa_port=<Port of OAM server>
test_username=<Username to be used for policy validation> test_
userpassword=<Userpassword to be used for policy validation>
```

If your command runs successfully, you should see the same output as above.

5. Check the Policy Domain settings.

- a. Log on to the Oracle Access Manager.
- b. Click **Policy Manager**.
- c. Click **My Policy Domains**.

You should see the domain you just created in the list of policy domains. In the URL prefixes column, you should also see the URIs you specified during the creation of this domain.

- d. Click the domain you just created and open the Resources tab.

The URIs you specified should be showing. You can also open other tabs to view and verify other settings, and manually add additional resources later, if required.

6. Check the Access Gate Configurations.

- a. Click on **Access System Console**.
- b. Open the Access System Configuration tab.
- c. Click **AccessGate Configuration**.
- d. Enter some search criteria and click **Go**.
- e. When the Access Gate for the domain you just created shows up (it will have the suffix `_AG`), click on it to see the setting details.

7. Run the WebGate Installer as described in the section on "Installing the WebGate" in the *Oracle Fusion Middleware Enterprise Deployment Guide for Oracle Identity Management*.

The InstallShield Wizard will prompt you for several inputs during the installation. Supply the information requested based on the settings for your environment.

8. Continue with the steps for configuring the Policy Manager in [Section 23.7.1.6, "Configuring the Policy Manager,"](#) and any further configurations, as required, in [Section 23.7.1.7, "Additional Configurations."](#)

23.7.1.3 Configuring the Webtier Components

Configuring the Webtier components is described in the following sections:

- [Configure mod_weblogic \(mod_wl_ohs.conf\)](#)
- [Create an AccessGate Entry](#)
- [Install WebGate on the WebTier](#)

23.7.1.3.1 Configure mod_weblogic (mod_wl_ohs.conf)

Configure the module `mod_wl` in the WebTier OHS so that it forwards requests to the Oracle WebLogic Server for WebCenter, by uncommenting lines at `WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/mod_wl_ohs.conf`. This file is included by the `httpd.conf` file.

To configure Web Tier OHS to work with multiple non-clustered servers, use the example below in `mod_wl_ohs.conf`. Make sure that the WebLogic port numbers match your configuration.

```
<IfModule mod_weblogic.c>
MatchExpression /webcenter WebLogicHost=webcenter.example.com|WebLogicPort=8888
MatchExpression /rss WebLogicHost=webcenter.example.com|WebLogicPort=8890
MatchExpression /owc_wiki WebLogicHost=webcenter.example.com|WebLogicPort=8890
MatchExpression /owc_discussions
WebLogicHost=webcenter.example.com|WebLogicPort=8890
MatchExpression /workflow WebLogicHost=soa.example.com|WebLogicPort=8888
MatchExpression /integration/worklistapp
WebLogicHost=soa.example.com|WebLogicPort=8888
MatchExpression /integration/services
WebLogicHost=soa.example.com|WebLogicPort=8888
MatchExpression /soa-infra WebLogicHost=soa.example.com|WebLogicPort=8888
MatchExpression /rest WebLogicHost=webcenter.example.com|WebLogicPort=8890
</IfModule>
```

Note: The entries in the `MatchExpression` list above map the incoming paths to the appropriate WebLogic Server managed servers on which the corresponding applications reside.

23.7.1.3.2 Create an AccessGate Entry

An AccessGate entry needs to be created on the Access Manager to be shared by the OAM Identity Assertion Provider (IAP), and the WebGate performing perimeter authentication on the webtier reverse proxy.

Note: If you are doing the configuration using the `oamcfgtool` scripted installation, this step is not required, as the installation script does it automatically.

To create an AccessGate entry:

1. Log in to the Access Server Console using your browser to navigate to:

`http://host:port/access/oblix`

Where *host* is the host ID of the server hosting the Access Manager (for example, `oam.example.com`), and *port* is the HTTP port number (for example, 8888).

2. Open the Access System Configuration page.
3. Click **Add New AccessGate** to create a new AccessGate entry.
4. Click **List Access Servers** on the Details pane and bind the AccessGate to the Access Server that has been set up for OAM Single Sign-on.

Some of the settings specified here will be needed for WebGate installation and OAM Identity Assertion Provider (IAP) setup. [Table 23-3](#) shows settings for a typical AccessGate entry.

Table 23-3 Sample Settings for AccessGate Entry

Setting	Value
AccessGate Name	webcenter-access-gate
Description	
State	Enabled
Hostname	webtier.example.com
Port	9010
Access Gate Password	<Not Displayed>
Debug	Off
Maximum user session time (seconds)	3600
Idle Session Time (seconds)	3600
Maximum Connections	1
Transport Security	Open
IPValidation	On
IPValidationException	
Maximum Client Session Time (hours)	24
Failover threshold	1
Access server timeout threshold	
Sleep For (seconds)	60
Maximum elements in cache	100000
Cache timeout (seconds)	1800

Table 23–3 (Cont.) Sample Settings for AccessGate Entry

Setting	Value
Impersonation username	
Impersonation password	<Not Displayed>
ASDK Client	
Access Management Service	On
Web Server Client	
Primary HTTP Cookie Domain	.example.com
Preferred HTTP Host	webtier.example.com:9010
Deny On Not Protected	Off
CachePragmaHeader	no-cache
CacheControlHeader	no-cache
LogOutURLs	

23.7.1.3.3 Install WebGate on the WebTier

This section describes how to install the WebGate.

To install the WebGate:

1. Copy the ZIP file (`Oracle_Access_Manager10_1_4_3_0_linux_GCClib.zip`) containing the two `gcc` libraries required for the installation (`libgcc_s.so.1` and `libstdc++.so.5`) to a `/tmp` directory.
2. Run the installation as `root`. For example, from the `/tmp` directory run:

```
sudo -u root ./Oracle_Access_Manager10_1_4_3_0_linux_OHS11g_WebGate
```
3. Follow the installation runtime instructions, providing the installation directory, information of the AccessGate that you created earlier and the absolute path to the `httpd.conf` file of the web server. For example:

```
WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/httpd.conf
```

Information for the AccessGate can be found in the Access System Console. For more information, see [Section 23.7.1.3.2, "Create an AccessGate Entry."](#)

4. After the installation a new section is inserted in the `httpd.conf` file between the following entries:

```
*** BEGIN WEBGATE SPECIFIC ***
*** END Oblix NetPoint Specific ***
```

Check to see if the content is consistent with your environment.

23.7.1.4 Manually Configuring the Access System

To configure the Access System, you need to add a host identifier:

1. Log in to the Access Server Console using your browser to navigate to:

```
http://host:port/access/oblix
```

Where *host* is the host ID of the server hosting the Access Manager (for example, `oam.example.com`), and *port* is the HTTP port number (for example, 8888).

2. Open the Access System Configuration page.
3. On the navigation pane, click **Host Identifiers**.
4. Add a host identifier for the webtier and enter the **Host Identifier name** (for example, `webtier`), a **Description**, and all **Hostname variations**. The hostname variations should include all the ways that a browser could issue a request to the webtier. For example, `webtier` and `webtier.example.com` if the webtier is using the default port; and additionally `webtier:8080` and `webtier.example.com:8080` if the webtier is not using the default port.

23.7.1.5 Manually Defining the WebCenter Policy Domain

This section describes the steps to set up the WebCenter Policy Domain that will configure the WebCenter application for OAM SSO authentication.

To configure the WebCenter Policy Domain:

1. Log in to the Access Server Console using your browser to navigate to:

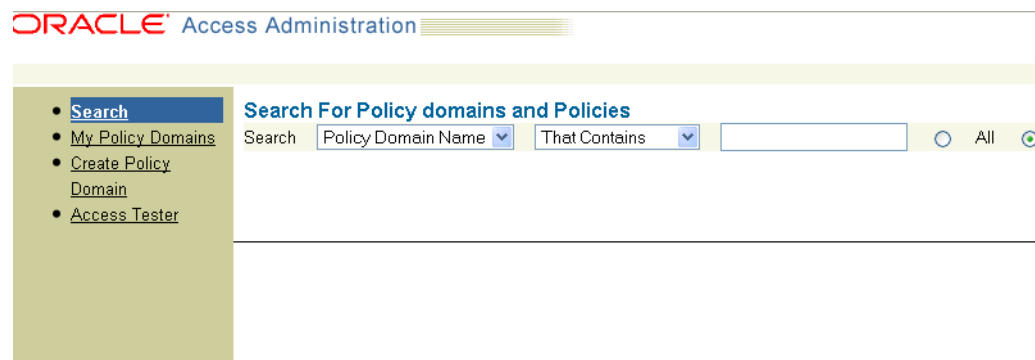

`http://host:port/access/oblix`

where *host* is the host ID of the server hosting the Access Manager (for example, `oam.example.com`), and *port* is the HTTP port number (for example, 8888).

2. Click **Policy Manager**.

The Policy Manager pane displays (see [Figure 23–61](#)).

Figure 23–61 Policy Manager Pane

3. Click **Create Policy Domain** in the Navigation pane to create a new policy domain to protect the WebCenter resources.

The Create Policy Domain page displays (see [Figure 23–62](#)).

Figure 23–62 Create Policy Domain Page

Create Policy Domain

Update Cache

Save Cancel

6. Add the resources that need to be secured. For each resource:
 - a. Select `http` as the **Resource Type**.
 - b. Select the **Host Identifier** for the WebCenter `webtier`.
 - c. Enter the **URL Prefix** for the resources you want to protect. The following resources can be protected:

```

/adf.task-flow
/faces/adf.task-flow
/integration/worklistapp
/owc_discussions/login!withRedirect.jspa
/owc_discussions/login!default.jspa
/owc_discussions/login.jspa
/owc_discussions/admin
/owc_wiki/user/login.jz
/owc_wiki/acl
/owc_wiki/adfAuthentication
/owc_wiki/admin
    
```

```

/owc_wiki/attachments
/owc_wiki/default
/owc_wiki/domain
/owc_wiki/export
/owc_wiki/index_dir
/owc_wiki/install

/webcenter/content
/workflow/sdpmessagingsca-ui-worklist
/workflow/WebCenterWorklistDetail/faces
/workflow/sdpmessagingsca-ui-worklist
    
```

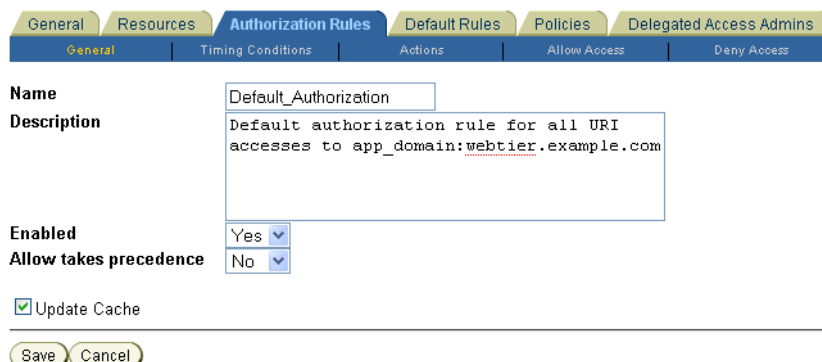

- d. Enter a **Description** for the resource.
- e. Make sure that **Update Cache** is selected, and then click **Save**.
- f. Enter the **URL Prefix** for the context roots of the public resources. The following context roots should be added if the corresponding component is installed:

```

/owc_discussions
/owc_wiki
/rss
/webcenter
/workflow
    
```

- 7. Enter a **Description** for each context root, make sure that **Update Cache** is selected, and then click **Save**.
- 8. Open the Authorization Rules tab and click **Add**.
The Authorization Rules page displays (see [Figure 23–64](#)).

Figure 23–64 Authorization Rules Page

9. Enter a **Name** for the new rule (for example, `Default_Authorization`) and **Description**.
10. Select **Yes** for **Enabled**, and **No** for **Allow takes precedence**, and click **Save**.
11. Click **Allow Access** on the Authorization Rules tab and click **Add**.

The Allow Access page displays (see [Figure 23–65](#)).

Figure 23–65 Allow Access Page

12. In the **Role** drop down list, select **Any one** and click **Save**.
13. Open the **Default Rules** tab and click **Add**.

The Access Manager Authentication Rule page displays (see [Figure 23–66](#)).

Figure 23–66 Access Manager Authentication Rules Page

14. Enter a **Name** (for example, `Default_SSO`) and **Description** for the rule.
15. Set the **Authentication Scheme** to **Oracle: Form Authentication** (or a form-based authentication scheme that was previously created) and click **Save**.
16. Click **Authorization Expression** on the Default Rules tab, and click **Add**.

The Authorization Expression page displays (see [Figure 23–67](#)).

Figure 23–67 Authorization Expression Page

This screenshot shows the Access Manager's Authorization Expression page.

17. Add the `Default-Authorization` authorization rule (or the rule you created previously) to the Authorization Expression and click **Add** to add it to the Authorization Expression list.
18. Click **Save**.
19. Click **Actions** on the Authorization Expression subtab and click **Add**.
The Actions page displays (see [Figure 23–68](#)).

Figure 23–68 Actions Page

23. Use the settings below to add a new policy to protect protected URIs under /context-root in app_domain:JSessionPolicyTest when ;jsessionid* is appended to them as shown in Figure 23–69. Note that /context-root must itself also be listed as a resource.

- **Policy Name:** Protected_JSessionId_Policy
- **Description:** This policy is used to protect protected URIs under /context-root in app_domain:JSessionPolicyTest when ;jsessionid* is appended to them.
- **Resource Type:** http
- **Resource Operation(s):** GET / POST
- **Resource:** Select all
- **URL Pattern:** Enter */jsessionid=*
- **Host Identifiers:** Select the **Host Identifier** (the host identifier of the WebCenter webtier) to which to apply the policy (for example, webtier.example.com)

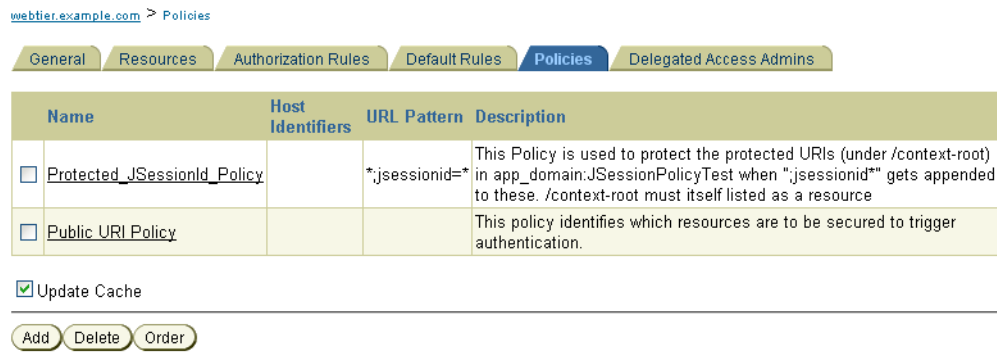

The Authentication Rule and Authorization Expression settings under the corresponding tabs can be left as Default.

24. Click **Save**.

25. Open the Policies tab again.

A list of policies for the current domain displays (see Figure 23–70).

Figure 23–70 Policies List

This screenshot shows the Access Manager's Policies list page.

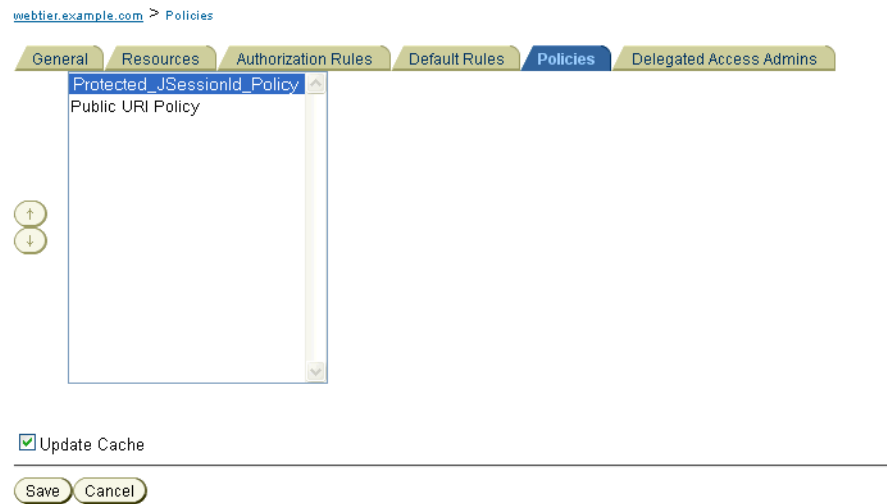

26. Click **Add** and use the following settings to add the policy that will identify which resources are to be secured to trigger authentication.

- **Policy Name:** Enter a name (for example, `Public URI Policy`)
- **Description:** Enter a description (for example "This policy identifies which resources are to be secured to trigger authentication.")
- **Resource Type:** Select `http`.
- **Resource Operation(s):** Select `GET / POST`.
- **Resource:** Select the context roots you added in step 6. Note that `/webcenter` must always be selected.
- **Host Identifiers:** Select the **Host Identifier** (the host identifier of the WebCenter webtier) to which to apply the policy (for example, `webtier.example.com`).

27. Click **Save**.

28. Open the Policies tab again and click **Order**.

A tool you can use to set the order for policies currently defined for the domain displays (see [Figure 23–71](#)).

Figure 23–71 Order Tool

29. Use the Order tool to make sure that `Protected_JSessionId_Policy` is at the top of the list.
30. Click **Save**.

23.7.1.6 Configuring the Policy Manager

Configuring the Policy Manager is described in the subsections below.

- [Section 23.7.1.6.1, "Configuring the Oracle Internet Directory Authenticator"](#)
- [Section 23.7.1.6.2, "Configuring the OAM Identity Asserter"](#)
- [Section 23.7.1.6.3, "Configuring the Default Authenticator and Setting the Provider Order"](#)
- [Section 23.7.1.6.4, "Configuring the Application for Oracle Access Manager SSO"](#)

23.7.1.6.1 Configuring the Oracle Internet Directory Authenticator

Assuming Oracle Internet Directory is backing the OAM identity store, an Oracle Internet Directory authenticator (`OracleInternetDirectoryAuthenticator`) should be configured for the LDAP server that is used as the identity store of OAM, and the provider should be set to `SUFFICIENT`.

To configure the Oracle Internet Directory authenticator:

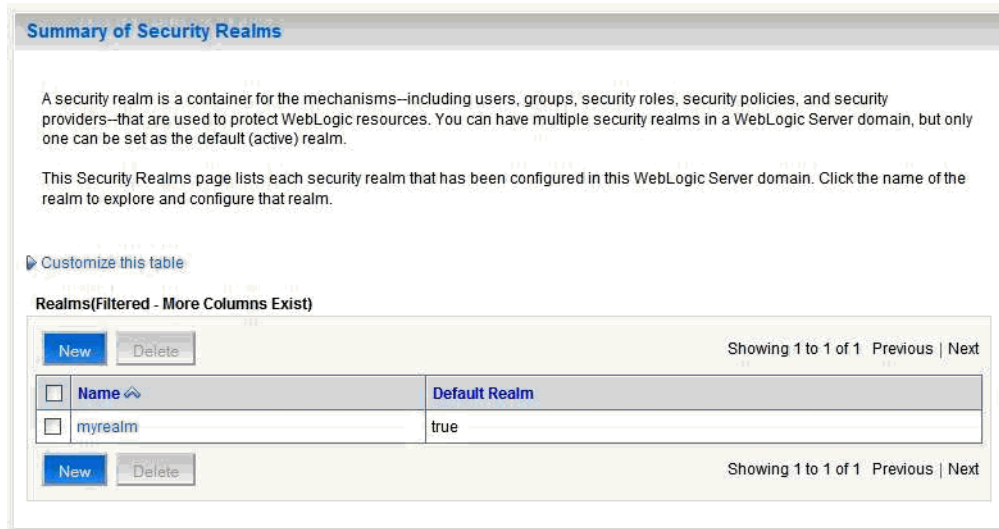

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. From the Domain Structure pane, click **Security Realms**.

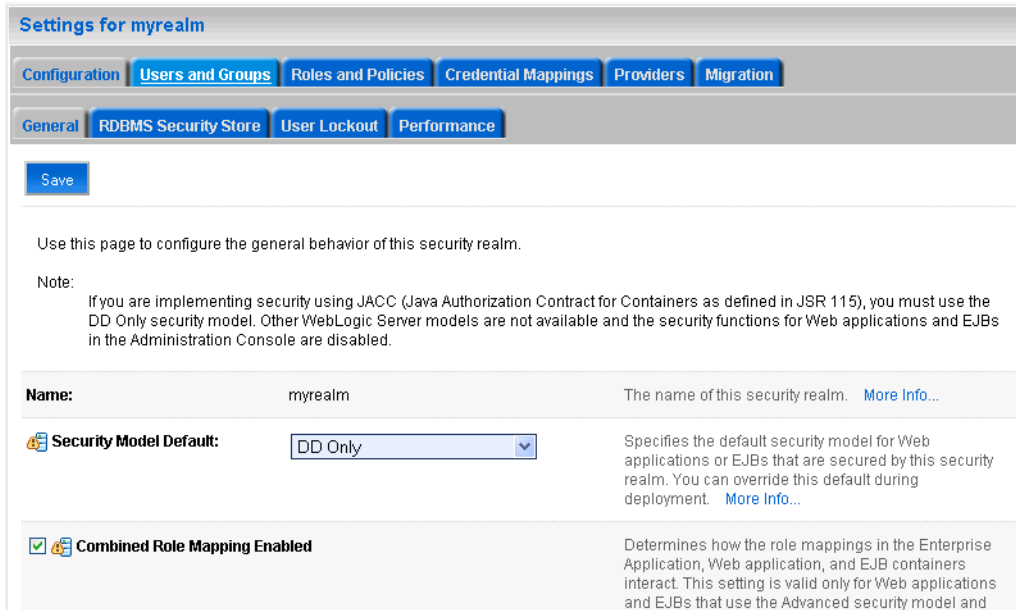

The Summary of Security Realms pane displays (see [Figure 23–72](#)).

Figure 23–72 Summary of Security Realms Pane

3. Click the realm entry for which to configure the OAM authenticator.
The Settings pane for the realm displays (see [Figure 23–73](#)).

Figure 23–73 Settings Pane

4. Open the Providers tab.
The Provider Settings display (see [Figure 23–74](#)).

Figure 23–74 Settings Pane - Providers

Settings for myrealm

Configuration Users and Groups Roles and Policies Credential Mappings **Providers** Migration

Authentication Authorization Adjudication Role Mapping Auditing Credential Mapping Certification Path Keystores

An Authentication provider allows WebLogic Server to establish trust by validating a user. You must have one Authentication provider in a security realm, and you can configure multiple Authentication providers in a security realm. Different types of Authentication providers are designed to access different data stores, such as LDAP servers or DBMS. You can also configure a Realm Adapter Authentication provider that allows you to work with users and groups from previous releases of WebLogic Server.

Customize this table

Authentication Providers

New Delete Reorder Showing 1 to 2 of 2 Previous | Next

The name of the authentication provider.

* Name:

This is the type of authentication provider you wish to create.

Type:

OK Cancel

6. Enter a name for the new provider (for example, `OID Authenticator`), select `OracleInternetDirectoryAuthenticator` as its type and click **OK**.
7. On the Providers tab, click the newly added provider.

The Common Settings pane for the authenticator displays (see [Figure 23–76](#)).

Figure 23–76 Common Settings Pane

The screenshot shows the 'Settings for OID Authenticator' configuration interface. At the top, there are two tabs: 'Configuration' and 'Performance'. Under 'Configuration', there are two sub-tabs: 'Common' (which is selected) and 'Provider Specific'. Below the sub-tabs is a 'Save' button. A descriptive text reads: 'Use this page to define the general configuration of this Oracle Internet Directory Authentication provider.' The main configuration area contains four rows of settings:

Name:	OID Authenticator	The name of this Oracle Internet Directory Authentication provider. More Info...
Description:	Provider that performs LDAP authentication	A short description of this Oracle Internet Directory Authentication provider. More Info...
Version:	1.0	The version number of this Oracle Internet Directory Authentication provider. More Info...
Control Flag:	<input type="text" value="SUFFICIENT"/>	Specifies how this Oracle Internet Directory Authentication provider fits into the login sequence. More Info...

At the bottom of the configuration area is another 'Save' button.

8. Set the control flag to SUFFICIENT and click **Save**.
9. Open the Provider Specific tab.

The Provider Specific Settings pane for the authenticator displays (see [Figure 23–77](#)).

Use this page to define the provider specific configuration for this Oracle Internet Directory Authentication provider.

Connection

Host: localhost The host name or IP address of the LDAP server. [More Info...](#)

Port: 389 The port number on which the LDAP server is listening. [More Info...](#)

Principal: The Distinguished Name (DN) of the LDAP user that WebLogic Server should use to connect to the LDAP server. [More Info...](#)

Credential: The credential (usually a password) used to connect to the LDAP server. [More Info...](#)

Confirm Credential:

SSLEnabled Specifies whether the SSL protocol should be used when connecting to the LDAP server. [More Info...](#)

Users

User Base DN: ou=people, o=example The base distinguished name (DN) of the tree in the LDAP directory that contains users. [More Info...](#)

All Users Filter: (&(cn=*)(objectclass=pe An LDAP search filter for finding all users beneath the base user distinguished name (DN). Note: If you change the user name attribute to a type other than cn, you must duplicate that change in the User From Name Filter and User Name Attribute attributes. [More Info...](#)

User From Name Filter: (&(cn=%u)(objectclass= An LDAP search filter for finding a user given the name of the user. The user name attribute specified in this filter must match the one specified in the All Users Filter and User Name Attribute attributes. [More Info...](#)

User Search Scope: subtree Specifies how deep in the LDAP directory tree the LDAP Authentication provider should search for users. [More Info...](#)

User Name Attribute: cn The attribute of an LDAP user object class that specifies the name of the user. The user name attribute specified must match the one specified in

10. Complete the fields as shown in the table below. Leave the rest of the fields set to their default values.

Field	Value	Comment
Host:		The host ID for the LDAP server
Port:		The LDAP server port number
Principal:		The LDAP administrator principal (for example, cn=orcladmin)
Credential:	<password>	The administrator principal password
Confirm Credential:	<password>	
User Base DN:		User Search Base - this value would be same as #1.d in OAM Access Manager Setup

Field	Value	Comment
All Users Filter:	"(&(uid=*)(objectclass=person))"	
User Name Attribute:	"uid"	
Group Base DN:		Group search base - Same as User Base DN

11. Click **Save**.

12. Restart the WebCenter Administration Server and managed server and validate the configuration by navigating to the Realm Settings page in the WebLogic Server Administration Console and opening the Users and Groups tab.

23.7.1.6.2 Configuring the OAM Identity Asserter

An OAM identity asserter needs to be configured with the provider Control Flag set to REQUIRED.

To configure the OAM Identity asserter:

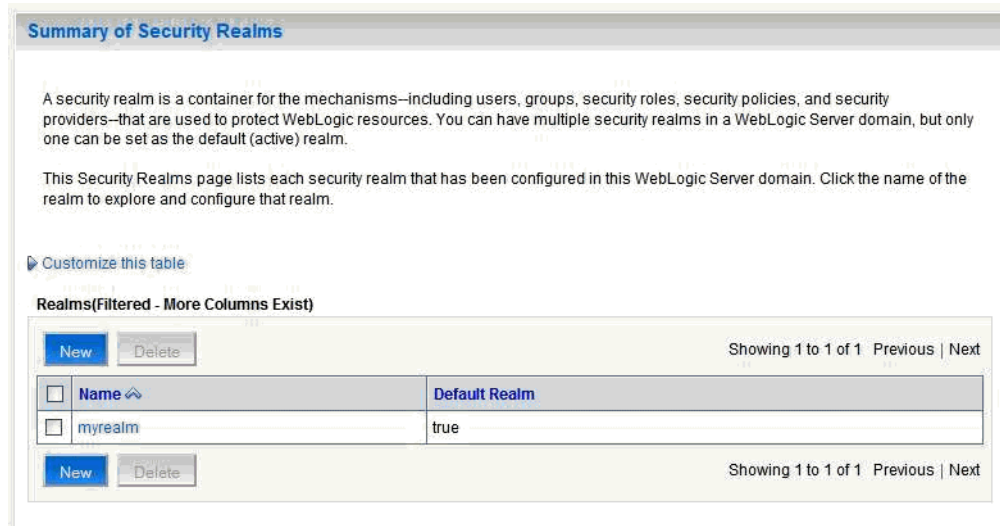

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. From the Domain Structure pane, click **Security Realms**.

The Summary of Security Realms pane displays (see [Figure 23–78](#)).

Figure 23–78 Summary of Security Realms Pane

3. Click the realm entry for which to configure the OAM identity asserter.

The Settings pane for the realm displays (see [Figure 23–79](#)).

Figure 23–79 Settings Pane

Settings for myrealm

Configuration **Users and Groups** Roles and Policies Credential Mappings Providers Migration

11. Complete the fields as shown in the table below. Leave the rest of the fields set to their default values.

Field	Value	Comment
Primary Access Server:		The OAM server endpoint information in HOST:PORT format
Access Gate Name:		Name of the Access Gate
Access Gate Password:		Provide the Access Gate password and confirm in the field below.

12. Click **Save** to save your settings.

23.7.1.6.3 Configuring the Default Authenticator and Setting the Provider Order

After configuring the OAM identity asserter, make sure that the default authenticator's control flag is set to `SUFFICIENT` and reorder the providers as shown below:

1. Navigate to the Provider Settings pane (see [Figure 23–80](#)).
2. Open the Default Authenticator and check that the control flag is set to `SUFFICIENT`.
3. Do the same for any providers other than the two you just created.
4. On the Settings Pane, reset the provider order to:
 - `OAMIdentityAsserter (REQUIRED)`
 - `OracleInternetDirectoryAuthenticator (SUFFICIENT)`
 - `DefaultAuthenticator (SUFFICIENT)`
 - `DefaultIdentityAsserter`

23.7.1.6.4 Configuring the Application for Oracle Access Manager SSO

Configure the applications for SSO by adding a setting to `EXTRA_JAVA_PROPERTIES`.

There is a system property that tells WebCenter and ADF that the application is configured in SSO mode and some special handling is required. The following system property is required in this mode:

Field	Value	Comment
<code>oracle.webcenter.spaces.osso</code>	<code>true</code>	This flag tells WebCenter that SSO is being used, so no login form should be displayed on the default landing page. Instead, it will render a login link that the user can click to invoke the SSO authentication.

To set this property, edit the `setDomainEnv.sh` script located in your `<domain>/bin` directory. Add the property to the `EXTRA_JAVA_PROPERTIES` variable, as follows:

```
EXTRA_JAVA_PROPERTIES="-Dweblogic.security.SSL.ignoreHostnameVerification=true
-Doracle.mds.bypassCustRestrict=true
-Djps.update.subject.dynamic=true -Doracle.webcenter.spaces.osso=true
-noverify ${EXTRA_JAVA_PROPERTIES}"
```

After making this change, restart the following servers:

- WebCenter's Administration Server
- All the domain's managed servers
- WebTier OHS

23.7.1.7 Additional Configurations

The configurations described in the following sections may be necessary or helpful in providing additional security for your site:

- [Section 23.7.1.7.1, "Configuring the WebLogic Server Administration Console and Enterprise Manager"](#)
- [Section 23.7.1.7.2, "Configuring the Discussions Server for SSO"](#)
- [Section 23.7.1.7.3, "Creating a Discussions Server Connection for WebCenter Spaces"](#)

- [Section 23.7.1.7.4, "Configuring the Wiki Server"](#)
- [Section 23.7.1.7.5, "Restricting Access with Connection Filters"](#)

23.7.1.7.1 Configuring the WebLogic Server Administration Console and Enterprise Manager

This section describes how to optionally set up OAM single sign-on for the WebLogic Server Administration Console and Enterprise Manager.

Note: Setting up OAM SSO for Enterprise Manager and the WebLogic Server Administration Console would provide single sign-on access to same set of users for whom OAM SSO access has been configured. If want the Webtier to be accessible to external users through OAM, but want administrators to log in directly to Enterprise Manager and the WebLogic Server Administration Console, then you may not want to complete this additional configuration step.

To set up OAM SSO for the WebLogic Server Administration Console and Enterprise Manager:

1. Log in to the Access Server Console using your browser to navigate to:

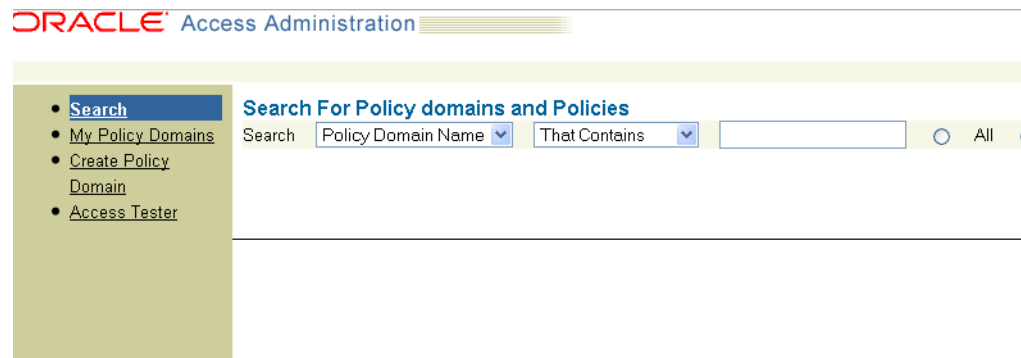

`http://host:port/access/oblix`

Where *host* is the host ID of the server hosting the Access Manager (for example, `oam.example.com`), and *port* is the HTTP port number (for example, 8888).

2. Click **Policy Manager**.

The Policy Manager pane displays (see [Figure 23–84](#)).

Figure 23–84 Policy Manager Pane

3. Search for the policy domain that you created earlier to protect WebCenter resources in [Section 23.7.1.5, "Manually Defining the WebCenter Policy Domain."](#)
4. Open the Resources tab and click **Add**.
The Resource page displays (see [Figure 23–85](#)).

Figure 23–85 Policy Domain Resource Page

5. Add the resources that need to be secured. For each resource:
 - a. Select `http` as the **Resource Type**.
 - b. Select the **Host Identifier** for the WebCenter webtier.
 - c. Enter the **URL Prefix** for the WebLogic Server Administration Console or Enterprise Manager.
 - d. Enter a **Description** for the resource.
 - e. Make sure that **Update Cache** is selected, and then click **Save**.
6. In your webtier, modify the `mod_wl_ohs.conf` file (in `WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/`) to include the WebLogic Server Administration Console and Enterprise Manager, using the actual host ID for the WebCenter Administration Server for `WebLogicHost`.

```
<IfModule mod_weblogic.c>
  MatchExpression /webcenter
  WebLogicHost=example.com|WebLogicPort=8888
  MatchExpression /rss
  WebLogicHost=example.com|WebLogicPort=8888
  MatchExpression /owc_wiki
  WebLogicHost=example.com|WebLogicPort=8890
  MatchExpression /owc_discussions
  WebLogicHost=example.com|WebLogicPort=8890
  MatchExpression /rest
  WebLogicHost=example.com|WebLogicPort=8890
  MatchExpression /console
  WebLogicHost=example.com|WebLogicPort=7001
  MatchExpression /em
  WebLogicHost=example.com|WebLogicPort=7001
</IfModule>
```

7. Restart the Oracle HTTP Server for your changes to take effect.

You should now be able to access the WebLogic Server Administration Console and Enterprise Manager with the following links:

```
http://host:OHS_port/console
http://host:OHS_port/em
```

and be prompted with the OAM SSO login form.

23.7.1.7.2 Configuring the Discussions Server for SSO

This section describes how to configure Oracle WebCenter Discussions Server for single sign-on. Before configuring the discussions server for SSO, be sure that it has been configured to use the same identity store LDAP as WebCenter Spaces, as described in [Section 23.3.4.1, "Migrating the WebCenter Discussions Server to use an External LDAP."](#)

To set up the discussions server for SSO:

1. Log in to the Oracle WebCenter Discussions Server Admin Console at:

```
http://host:port/owc_discussions/admin
```

Where *host* and *port* are the host ID and port number of the `WLS_Services` managed server.

2. Open the System Properties page and edit (if it already exists) or add the `owc_discussions.sso.mode` property, setting its value to `true`.
3. Edit or add the `jiveURL` property to point to the base URL of the SSO server. For example:

```
jiveURL = example.com:8890/owc_discussions
```

23.7.1.7.3 Creating a Discussions Server Connection for WebCenter Spaces

To create a discussions server connection for WebCenter Spaces:

1. Log into Fusion Middleware Control and select the WebLogic domain for WebCenter Spaces.

For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)

2. In the Navigation pane, open the WebCenter node, and then the WebCenter Spaces node, and click `WebCenter Spaces (WLS_Spaces)`.
3. Register the discussion server as described in [Section 12.3.1, "Registering Discussions Servers Using Fusion Middleware Control."](#)

For **Server URL**, enter `http://<host>:<port>/owc_discussions.`

4. Restart the `WLS_Spaces` managed server.

When you log into WebCenter Spaces, you automatically sign on to the discussion server as well.

23.7.1.7.4 Configuring the Wiki Server

Wiki page functionality is supported as an iFrame, which you can embed in a Web page, and OAM single sign-on is supported this way. Since the Oracle WebCenter Wiki and Blog Server does not require or support an identity store, there is no need to configure the LDAP.

To add a wiki page to a WebCenter identity store, follow the steps below:

1. Log in to WebCenter Spaces, and open a group space.
2. Add a page, choosing `Web Page` as the **Style**.
3. When the page is created, click the **Edit** icon.

The Component properties dialog displays.

4. Enter the following URL in the **Source** box:

```
http://host:OHS_port/owc_
wiki/page/show.jz?inline=1&scope=#{communityContext.communityName}
```

Where *host* is the host ID of the *WLS_Spaces* server, and *OHS_port* is the port number of the Oracle HTTP Server. The OHS port is used so the call goes through the WebGate which will initiate SSO.

After specifying the component properties you will see the wiki page contents.

5. Save the changes.

23.7.1.7.5 Restricting Access with Connection Filters

Follow the steps below to only allow users to access WebCenter and other services through the WebTier OHS ports so that they can be properly authenticated.

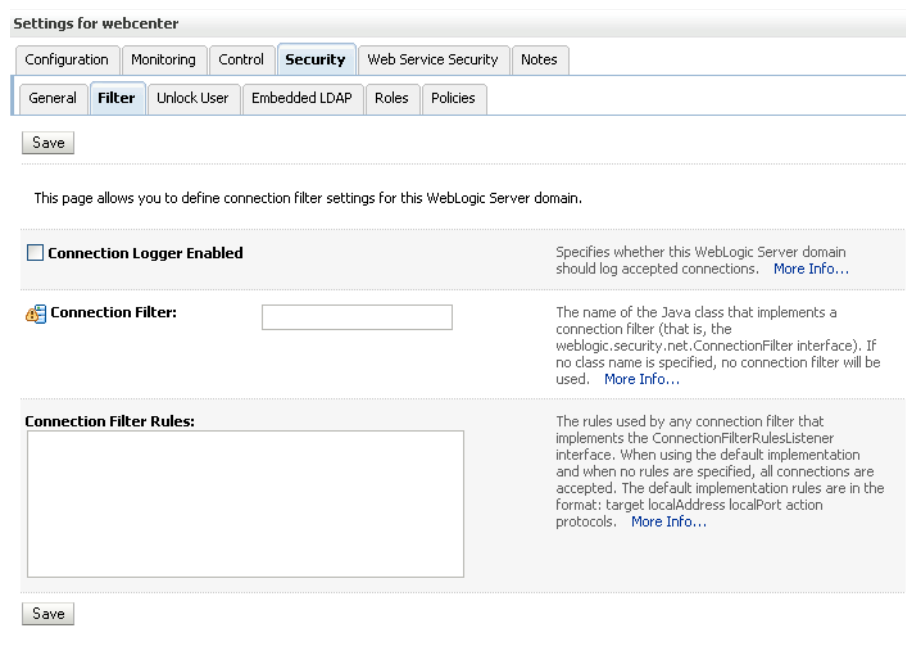

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. In the Domain Structure pane, select the domain you want to configure (for example, *webcenter*).
3. Open the Security tab and the Filter subtab.

The Security Filter Settings pane displays (see [Figure 23–86](#)).

Figure 23–86 Security Filter Settings Page

4. Check **Connection Logger Enabled** to enable the logging of accepted messages.

The Connection Logger logs successful connections and connection data in the server. This information can be used to debug problems relating to server connections.

5. In the **Connection Filter** field, specify the connection filter class to be used in the domain.
 - To configure the default connection filter, specify `weblogic.security.net.ConnectionFilterImpl`.
 - To configure a custom connection filter, specify the class that implements the network connection filter. Note that this class must also be present in the CLASSPATH for WebLogic Server.
6. In the Connection Filter Rules field, enter the syntax for the connection filter rules.

For example:

```
<webtier IP>/0 * * allow
0.0.0.0/0 * * deny
```

which says: allow all traffic coming from the local host and disallow all traffic from any other IP address. You should, of course, write the network filter(s) that are relevant to your environment. For more information about writing connection filters, see "Developing Custom Connection Filters" in *Oracle Fusion Middleware Programming Security for Oracle WebLogic Server*.

7. Click **Save** and activate the changes.
8. Restart all the managed servers and the Administration Server.
9. Verify that all direct traffic to the WebLogic Server is blocked by attempting to navigate to:

```
http://host:WLS_port/webcenter
```

This should produce the following error:

```
"The Server is not able to service this request:
[Socket:000445]Connection rejected, filter blocked Socket,
weblogic.security.net.FilterException: [Security:090220]rule
3"
```

You should, however, still be able to access WebCenter through the OHS port:

```
http://host:OHS_port/webcenter
```

23.7.2 Configuring Oracle Single Sign-On (OSSO)

In a default installation, WebCenter uses the HTTP ports in the Managed Server created for WebCenter. To configure WebCenter with Oracle Single Sign-On, WebCenter needs Oracle HTTP Server and the associated Module `mod_osso` to integrate with Oracle Single Sign-On (OSSO).

Note: The BPEL Console does not support SSO integration. When WebCenter is configured for SSO, login to BPEL must still be done through the standard login page on the BPEL Console.

This section includes the following subsections

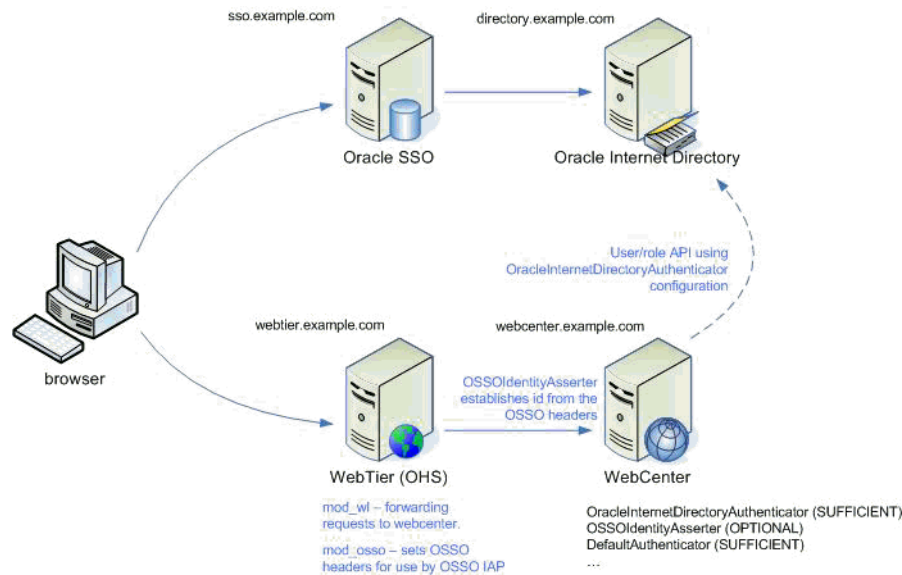

- [Section 23.7.2.1, "OSSO Components and Topology"](#)
- [Section 23.7.2.2, "Configuring the Oracle HTTP Server and Associated mods"](#)
- [Section 23.7.2.3, "Configuring the OSSOIdentityAsserter"](#)

- [Section 23.7.2.4, "Registering OHS with Oracle SSO"](#)
- [Section 23.7.2.5, "Configuring the Discussions Server for SSO"](#)

23.7.2.1 OSSO Components and Topology

In a default installation, WebCenter uses the HTTP ports of the Managed Server created for WebCenter. To configure WebCenter with Oracle Single Sign-On, WebCenter needs the Oracle HTTP Server and the associated Module `mod_osso`, to integrate with Oracle SSO. The diagram below (Figure 23–87) shows the overall architecture of this integration:

Figure 23–87 OSSO Components and Topology

23.7.2.2 Configuring the Oracle HTTP Server and Associated mods

This section describes how to load and configure the Oracle HTTP Server and associated mods.

To load and configure the Oracle HTTP Server and associated mods:

1. Install the WebTier, which contains Oracle HTTP Server (OHS) and associated mods (`mod_osso` and `mod_wl`).
2. Configure the module `mod_wl` in WebTier OHS so that it forwards requests to the Oracle WebLogic Server for WebCenter.

Uncomment the lines at `WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/mod_wl_ohs.conf`. This file is included by the `httpd.conf` file and looks like the following:

```
LoadModule weblogic_module    WT_ORACLE_HOME/ohs/modules/mod_wl_ohs.so
<IfModule mod_weblogic.c>
MatchExpression /webcenter WebLogicHost=webcenter.example.com|WebLogicPort=8888
MatchExpression /rss WebLogicHost=webcenter.example.com|WebLogicPort=8890
MatchExpression /owc_wiki WebLogicHost=webcenter.example.com|WebLogicPort=8890
MatchExpression /owc_discussions
WebLogicHost=webcenter.example.com|WebLogicPort=8890
MatchExpression /workflow WebLogicHost=soa.example.com|WebLogicPort=8888
MatchExpression /integration WebLogicHost=soa.example.com|WebLogicPort=8888
```

```
MatchExpression /rest WebLogicHost=webcenter.example.com|WebLogicPort=8890
</IfModule>
```

23.7.2.3 Configuring the OSSOIdentityAsserter

Include the OSSO Identity Assertion Provider (IAP) provider in the Oracle WebLogic domain for WebCenter. Use the WebLogic Server Administration Console to add the OSSO IAP to your domain as shown in the steps below.

To configure the OSSOIdentityAsserter:

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. From the Domain Structure pane, click **Security Realms**.

The Summary of Security Realms pane displays (see [Figure 23–88](#)).

Figure 23–88 Summary of Security Realms Pane

Summary of Security Realms

A security realm is a container for the mechanisms—including users, groups, security roles, security policies, and security providers—that are used to protect WebLogic resources. You can have multiple security realms in a WebLogic Server domain, but only one can be set as the default (active) realm.

This Security Realms page lists each security realm that has been configured in this WebLogic Server domain. Click the name of the realm to explore and configure that realm.

[Customize this table](#)

Realms(Filtered - More Columns Exist)

5. Click **New** to create a new provider.
The Create a New Authentication Provider pane displays (see [Figure 23–91](#)).

Figure 23–91 Create a New Authentication Provider Pane

6. Enter a name for the new provider, select **OSSOIdentityAsserter** as its type and click **OK**.
7. On the Providers tab, click the newly added provider.
8. Set the control flag to **OPTIONAL**.
9. Make sure that **OracleInternetDirectoryAuthenticator** (or the primary authenticator you selected when you configured the Identity Store to use an external LDAP) is set as the primary authenticator for the domain so that the user profile can be retrieved from the associated Oracle Internet Directory server. For information about configuring the Identity Store to use an external LDAP, see [Section 23.3.1, "Reassociating the Identity Store with an External LDAP."](#)

For OID, the provider list should appear as follows:

- **OracleInternetDirectoryAuthenticator** (SUFFICIENT)
- **OSSOIdentityAsserter** (OPTIONAL)
- **DefaultAuthenticator** (SUFFICIENT)
- **DefaultIdentityAsserter** (OPTIONAL)

Also make sure that the default `jpsContext` in WebCenter's `jps-config.xml` file is set to the `idstore.ldap` serviceInstance.

23.7.2.4 Registering OHS with Oracle SSO

Register the module `mod_osso` in the WebTier OHS with the SSO Server as a partner application by following the steps below.

To register OHS with Oracle SSO:

1. Run `ssoreg` from the SSO server to generate an `osso.conf` file and manually copy it to the partner application (`WT_ORACLE_HOME`).

The following example shows how you would register a remote partner application on a SSO Server. Note that `ORACLE_HOME` here is the `ORACLE_HOME` of the OSSO installation on the SSO server.

```
bash-3.00$ ORACLE_HOME/sso/bin/ssoreg.sh -site_name
webtier.example.com:80 -config_mod_osso TRUE -mod_osso_url
```

```
http://webtier.example.com -remote_midtier -config_file
webtier.example.com.osso.conf
```

Running this command creates a `webtier.example.com.osso.conf` file.

2. Copy the `WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/disabled/mod_osso.conf` file to `WT_ORACLE_HOME/instances/<your_instance>/config/OHS/ohs1/moduleconf`. All files in the `moduleconf` directory are included in the `httpd.conf` file.
3. Add a static rule to the `mod_osso.conf` file to protect the `/webcenter` URL with Oracle SSO.

The `mod_osso.conf` file should look similar to this:

```
LoadModule osso_module WT_ORACLE_HOME/ohs/modules/mod_osso.so
<IfModule mod_osso.c>
    OsoIpCheck off
    OsoIdleTimeout off
    OsoSecureCookies Off

    # whatever the location of your real osso.conf file is, that was generated
    from the ssoreg.sh command.
    OsoConfigFile /OracleWebTier/webtier.example.com.osso.conf

#_____
# Notes
#_____
# 1. Here's what you need to add to protect a resource,
#     e.g. <ApacheServerRoot>/htdocs/private:
# 2. if an application is protected by SSO then no matter what Apache will
always
#     send no-cache headers practically undoing whatever the Apache
configuration or
#     the ADF faces Cache library do. To allow caching for SSO protected
resources
#     add "OsoSendCacheHeaders off " as following.

<Location /webcenter/adfAuthentication*>
    OsoSendCacheHeaders off
    require valid-user
    AuthType Oso
</Location>
<Location /owc_wiki/user/login.jz>
    OsoSendCacheHeaders off
    require valid-user
    AuthType Oso
</Location>

    </Location>
    <Location /workflow/sdpmessagingsca-ui-worklist>
        OsoSendCacheHeaders off
        require valid-user
        AuthType Osso
    </Location>
    <Location /rest>
        OsoSendCacheHeaders off
        require valid-user
        AuthType Osso
    </Location>
</IfModule>
#
# If you would like to have short hostnames redirected to
# fully qualified hostnames to allow clients that need
# authentication via mod_osso to be able to enter short
# hostnames into their browsers uncomment out the following
# lines
#
#PerlModule Apache::ShortHostnameRedirect
#PerlHeaderParserHandler Apache::ShortHostnameRedirect

```

Be sure to change the **OsoConfigFile** parameter to point to the location (and filename if you've changed it) of your `osso.conf` file.

4. Restart the WebTier so that the configuration changes to `mod_osso` and `mod_wl` to take effect.
5. For the Worklist service changes to take effect, run the following command on the WebCenter Administration server:

```

setBPPELConnection('webcenter', 'WebCenter-Worklist',
'http://webcenter-stage.example.com')

```

6. To only allow users to access WebCenter and other services through the WebTier OHS ports so that they can be properly authenticated, follow the steps in [Section 23.7.1.7.5, "Restricting Access with Connection Filters."](#)
7. Complete the configuration for Oracle Single Sign-on (OSSO) by adding a setting to `EXTRA_JAVA_PROPERTIES` as described in [Section 23.7.1.6.4, "Configuring the Application for Oracle Access Manager SSO."](#)

23.7.2.5 Configuring the Discussions Server for SSO

This section describes how to configure Oracle WebCenter Discussions Server for single sign-on. Before configuring the discussions server for SSO, be sure that it has been configured to use the same identity store LDAP as WebCenter Spaces, as described in [Section 23.3.4.1, "Migrating the WebCenter Discussions Server to use an External LDAP."](#)

To set up the discussions server for SSO:

1. Log in to the Oracle WebCenter Discussions Server Admin Console at:

```
http://host:port/owc_discussions/admin
```

Where *host* and *port* are the host ID and port number of the `WLS_Services` managed server.

2. Open the System Properties page and edit (if it already exists) or add the `owc_discussions.sso.mode` property, setting its value to `true`.
3. Edit or add the `jiveURL` property to point to the base URL of the SSO server. For example:

```
jiveURL = example.com:8890/owc_discussions
```

23.7.3 Configuring SAML-based Single Sign-on

Security Assertion Markup Language (SAML) enables cross-platform authentication between Web applications or Web Services running in a WebLogic Server domain and Web browsers or other HTTP clients. WebLogic Server supports single sign-on (SSO) based on SAML. When users are authenticated at one site that participates in a single sign-on (SSO) configuration, they are automatically authenticated at other sites in the SSO configuration and do not need to log in separately.

Note: Although SAML-based single sign-on provides support for logging users onto subsequent applications after initial sign-on, global logout is not supported. Consequently, users must log out of each individual application they open.

Note also that since REST applications don't have a single access point and SAML 1.1 standard does not support wildcards in the Source Redirect URIs (in the asserting party configuration), SAML single sign-on for REST is not supported.

Note also that if you set up SAML-based single sign-on with WebCenter Spaces as the source application and Oracle WebCenter Discussions as the destination application, you can access administration pages of the Discussions application from the WebCenter Spaces Manage Group Space Services screen or Configure WebCenter Services screen. However, since the Oracle WebCenter Discussion administration pages do not participate in SSO, if you access administration pages directly, you are required to log in to Oracle WebCenter Discussions again.

This SSO mechanism can be used for departmental WebCenter installations for which there is no existing Oracle SSO or Oracle Access Manager single sign-on infrastructure, but single sign-on between only WebCenter Spaces and its services is required. For High Availability and large enterprise deployments, the Oracle Access Manager SSO configuration is recommended.

This section describes how to set up SAML 1.1-based single sign-on for Oracle WebCenter Spaces and the Wiki and Worklist services running on different managed servers within the same domain.

This section includes the following subsections:

- [Section 23.7.3.1, "SAML Components and Topology"](#)
- [Section 23.7.3.2, "Configuring SAML-based Single Sign-on"](#)

23.7.3.1 SAML Components and Topology

[Figure 23–93](#) shows the components and their interaction in a SAML-based single sign-on configuration that includes WebCenter Spaces and the Wiki service.

A SAML-based single sign-on solution consists of the following components:

- **SAML Credential Mapper** - The SAML Credential Mapping provider acts as a producer of SAML security assertions, allowing WebLogic Server to act as a source site for using SAML for single sign-on. The SAML Credential Mapping provider generates valid SAML 1.1 assertions for authenticated subjects based on the configuration of the target site or resource.
- **Inter Site Transfer Service (ITS)** - an addressable component that generates identity assertions and transfers the user to the destination site.
- **Assertion Retrieval Service (ARS)** - an addressable component that returns the SAML assertion that corresponds to the artifact. The assertion ID must have been allocated at the time assertion was generated.
- **SAML Identity Asserter** - The SAML Identity Assertion provider acts as a consumer of SAML security assertions, allowing WebLogic Server to act as a destination site for using SAML for single sign-on. The SAML Identity Assertion

provider processes valid SAML 1.1 assertions for authenticated subjects obtained from the source site or resource.

- **Assertion Consumer Service (ACS)** - an addressable component that receives assertions and/or artifacts generated by the ITS and uses them to authenticate users at the destination site
- **SAML Relying party** - A SAML Relying Party is an entity that relies on the information in a SAML assertion produced by the SAML source site. You can configure how WebLogic Server produces SAML assertions separately for each Relying Party or use the defaults established by the Federation Services source site configuration for producing assertion.
- **SAML Asserting party** - A SAML Asserting Party is a trusted SAML Authority (an entity that can authoritatively assert security information in the form of SAML Assertions).

Figure 23-92 shows the components and flow for a POST-configured SAML SSO configuration that includes both a WebCenter and SOA domain. The flow is similar for other destination applications participating in single sign-on such as RSS, Worklist applications, and Discussions.

Figure 23-92 Detailed SAML Single Sign-on Components and Topology (POST Profile Configured)

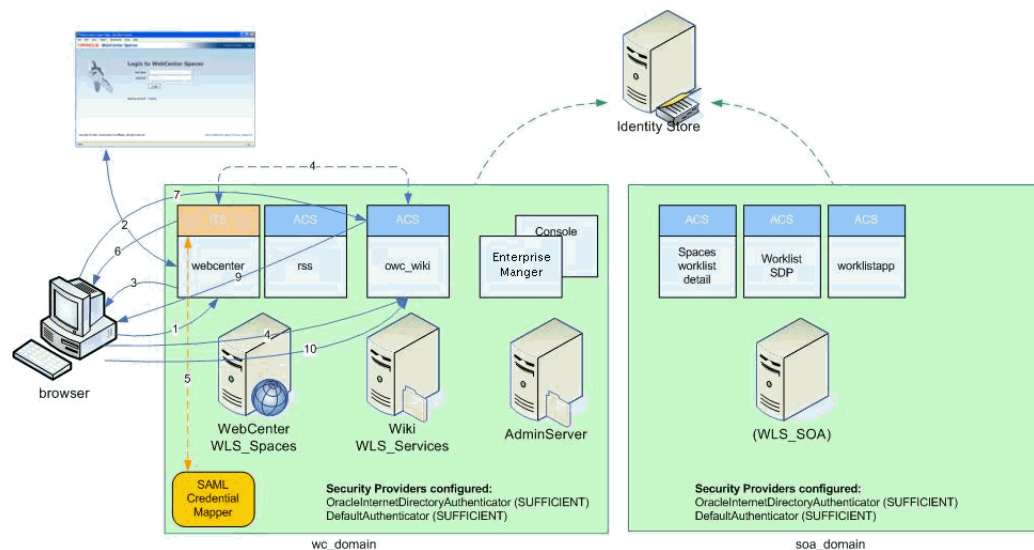

Figure 23-93 shows a simplified version of the components and flow for a POST-configured SAML SSO configuration, including the SAML SSO flow between WebCenter Spaces and the OWC Wiki application.

Figure 23–93 SAML Single Sign-on Components and Topology (POST Profile Configured)

The steps in the flow are:

1. The user's browser accesses WebCenter Spaces (source site), hosted on a WebLogic managed server (WLS_Spaces) in the WebCenter domain (wc_domain), by supplying user credentials.
2. WebCenter Spaces passes the user credentials to the authentication service provider.
3. If authentication is successful, the authenticated session is established, and the WebCenter Spaces welcome page is displayed.
4. From the welcome page, the user then clicks on a link on the page to access a secured Web page of the Wiki service (destination site), hosted on a different WebLogic Server (WLS_Services) in the same domain. This triggers a call to the Inter-Site Transfer Service (ITS) servlet configured. In this case, the ITS servlet is hosted within the source site (that is, on the WebCenter Spaces application on the WLS_Spaces managed server) that will share the same JSESSIONID cookie as WebCenter Spaces.
5. The ITS servlet calls the SAML Credential Mapper configured in the WebCenter domain (wc_domain) to request a caller assertion. The SAML Credential Mapper returns the assertion. It also returns the URL of the destination site application Web page (a secured Web page of the Wiki service) and path to the appropriate POST form (if the source site is configured to use the POST profile).
6. The SAML ITS servlet generates a SAML response containing the generated assertion, signs it, base-64 encodes it, embeds it in the HTML form, and returns the form to the user's browser.
7. The user's browser POSTs the form to the destination site's Assertion Consumer Service (ACS). In this case, the ACS Servlet is hosted in destination site (the Wiki service) and shares its login cookie.
8. The assertion is validated.
9. If the assertion is successful, the user is redirected to the target (the secured Web page of the Wiki service).

10. The user is logged in on the destination site Wiki service without having to reauthenticate.

23.7.3.2 Configuring SAML-based Single Sign-on

This section describes how to configure WebCenter Spaces and services for SAML-based single sign-on.

Configuring SAML-based SSO consists of the following steps:

- [Section 23.7.3.2.1, "Preparing WebCenter Spaces and Services for SAML SSO"](#)
- [Section 23.7.3.2.2, "Generating and Registering Certificates"](#)
- [Section 23.7.3.2.3, "Creating the SAML Credential Mapping Provider Instance"](#)
- [Section 23.7.3.2.4, "Configuring a Relying Party"](#)
- [Section 23.7.3.2.5, "Configuring Source Site Federation Services"](#)
- [Section 23.7.3.2.6, "Configuring the SAML Identity Assertion Provider"](#)
- [Section 23.7.3.2.7, "Configuring Destination Site Federation Services"](#)
- [Section 23.7.3.2.8, "Checking Your Configuration"](#)

23.7.3.2.1 Preparing WebCenter Spaces and Services for SAML SSO

After installing WebCenter Spaces and the Wiki and Worklist services, you must test the single sign-on configuration.

To check the default WebCenter Spaces and Wiki service login:

1. Install WebCenter Spaces, and select the Wiki service and Discussions service, and any other service applications to be configured for SSO (RSS is automatically deployed when you install WebCenter Spaces). For information on installing WebCenter Spaces, see "Installing WebCenter Spaces, Portlet Producers, Discussions, and Wiki and Blogs" in the *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

When the installation is complete, WebCenter Spaces is hosted on the `WLS_Spaces` Managed Server, and Wiki and Discussions services are hosted on the `WLS_Services` Managed Server. Record the host and port that the Wiki service is running on so, later on, you can construct the URL and test single sign-on.

2. Log into WebCenter Spaces and create a personal page with a link to the Wiki service as shown below:
 - a. Log in to WebCenter Spaces as a user with create page permissions.
 - b. Create a new page by clicking on the **Create a page** tab in a group space.
 - c. Title the page appropriately (for example, "Wiki") and choose the Web page template.
 - d. Click the Inspector button and click on the Web page.
 - e. Change the source to be the URL specified below:

```
http://host:port/owc_  
wiki/page/show.jz?inline=1&scope=#{communityContext.communityName}
```

Where *host* is the Wiki server host ID and *port* is the Wiki server port number.

- f. Save the page.

When you click the link, note that you are challenged to log in by the Wiki service. Once you have completed the remainder of the steps, this is not required. You will be automatically logged into Wiki service.

3. For the Worklist service, install SOA (which includes the BPEL server). For information on installing SOA, see *Oracle Fusion Middleware Installation Guide for Oracle SOA Suite*.
4. Configure the BPEL connection for WebCenter Spaces as described in [Section 20.3, "Setting Up Worklist Connections."](#)
5. To test the BPEL connection:
 - a. Log into WebCenter Spaces, create a group space, and add your administrator account as a moderator.
 - b. Log into WebCenter Spaces with your administrator account.

You should see a new item in the Worklist task flow indicating that you have been added as a moderator for the group space.
 - c. Click the link.

Note that you are challenged to log in. After you have completed the rest of the steps you automatically log into the Worklist service on the SOA domain.

6. Deploy the SAML SSO version of the Oracle WebCenter Discussions Server:

By default, the .EAR file that is deployed for the Oracle WebCenter Discussions Server supports form-based Oracle SSO or Oracle Access Manager SSO. Therefore, to configure the Oracle WebCenter Discussions Server for SAML-based single sign-on, you need to deploy the SAML SSO version of the discussion server .EAR file.

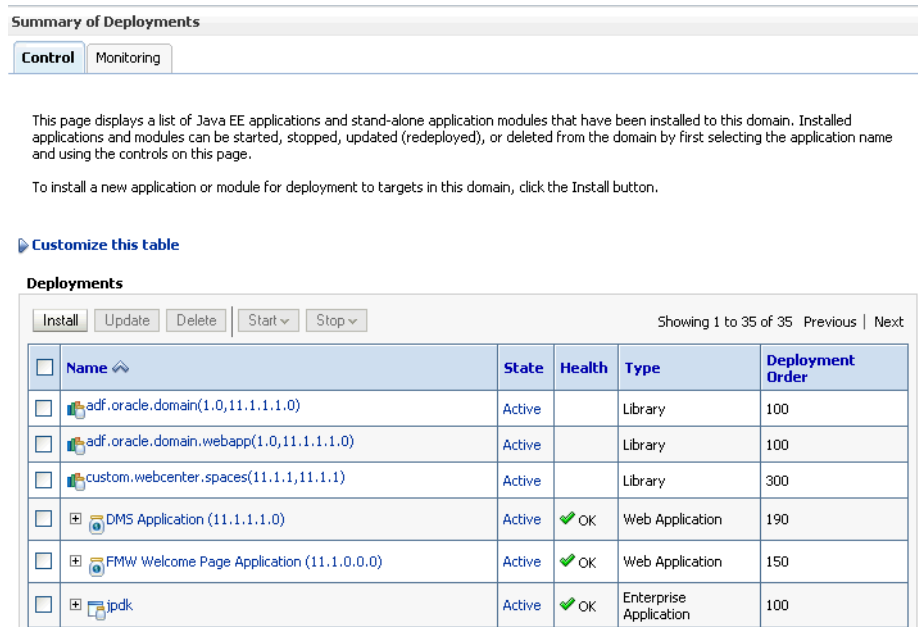

Note: Before configuring the discussions server for SSO, be sure that it has been configured to use the same identity store LDAP as WebCenter Spaces, as described in [Section 23.3.4.1, "Migrating the WebCenter Discussions Server to use an External LDAP."](#)

- a. Log into the WebLogic Server Administration Console as an administrator.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)
- b. In the Domain Structure pane, click **Deployments**.

The Deployments Summary pane displays (see [Figure 23–94](#)).

Figure 23–94 Deployment Summary Pane

- c. On the Deployment Summary page, select `owc_discussions` stop and delete and click **Install**.
- d. Using the Install Application Assistant **Path** field, locate the SSO enabled `owc_discussions` .EAR file (`owc_discussions_samlssso.ear`, typically in `$WC_ORACLE_HOME/discussionserver`).
- e. Select the `owc_discussions_samlssso.ear` file and click **Next**.
- f. Select **Install this deployment as an application** and click **Next**.
- g. Set the **Name** to `owc_discussions`.
- h. Deploy the .EAR file.
- i. Log into the Discussions Server Administration Console as an administrator (see Section 23.7.1.7.2, "Configuring the Discussions Server for SSO" for more information on logging into the Discussions Server Administration Console).
- j. Open the System Properties page and edit (if it already exists) or add the `owc_discussions.sso.mode` property, setting its value to `true`.
- k. Restart the `WLS_Services` Managed Server (where the discussions server is deployed).

23.7.3.2.2 Generating and Registering Certificates

To secure communication between the SAML source and destination sites, communication should be encrypted. Additionally, certificates should be used to verify the identity of the other party during SAML interaction. Follow the steps below to generate a key using the `keytool` utility (available as part of the JDK 6.0), and register it using the WebLogic Server Administration Console.

To create certificates using `keytool`:

1. Navigate to the `JAVA_HOME/bin` directory.
2. Using `keytool`, generate the key with the following command:

```
keytool -genkey -keypass key_password -keystore keystore_name -storepass  
keystore_password -keyalg rsa -alias alias
```

Where:

- *key_password* is the password to apply to the generated key
- *keystore_name* is the name of the custom keystore
- *keystore_password* is the password for the custom keystore
- *alias* is the alias name (for example, *testalias*)

3. Run the keytool command with `-export` option to generate a key file calling it, for example, *testalias.der*.

```
keytool -export -keystore keystore_name -storepass keystore_password -alias  
alias -file testalias.der
```

where:

- *keystore_name* is the name of the custom keystore
- *keystore_password* is the password for the custom keystore
- *alias* is the alias name (for example, *testalias*)
- Determine the trust store to use:

Since you are using a self-signed certificate, you must update it as a trusted certificate in the server trust store. To do this, you must determine your trust store by going to the server:

- a. Log into the WebLogic Server Administration Console.
- b. In the Domain Structure pane, expand Environments and click *Servers*.
- c. In the list of servers, click *WLS_Spaces*.
- d. Open the Configuration tab, and the Keystores subtab.

The Keystores Settings pane displays (see [Figure 23-95](#)).

Figure 23–95 Keystores Settings Pane

- e. Note down the location of the server in the **Java Standard Trust Keystore** field (shown in [Figure 23–39](#)).

Note that the `cacerts` file may be "read only", in which case you will need to change its permissions so that it's writable.

- Import the self-signed certificate generated above in this trust store:

```
keytool -importcert -trustcacerts -alias alias -file certificate_file
-keystore cacerts -storepass changeit
```

Where:

- *alias* is the WebCenter Spaces alias (for example, `webcenter_wls`)
- *certificate_file* is the file name for the certificate to export the key to (for example, `webcenter_wls.cer`)

To register the keystore using the WebLogic Server Administration Console

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. In the Domain Structure pane, expand **Environment** and click **Servers**.

The Summary of Servers pane displays (see [Figure 23–96](#)).

Figure 23–96 Summary of Servers Pane

Summary of Servers

Configuration Control

A server is an instance of WebLogic Server that runs in its own Java Virtual Machine (JVM) and has its own configuration.
This page summarizes each server that has been configured in the current WebLogic Server domain.

Keystores ensure the secure storage and management of private keys and trusted certificate authorities (CAs). This page lets you view and define various keystore configurations. These settings help you to manage the security of message transmissions.

Keystores: Custom Identity and Java Standard Trust Which configuration rules should be used for finding the server's identity and trust keystores? [More Info...](#)

Identity

Custom Identity Keystore: The path and file name of the identity keystore. [More Info...](#)

Custom Identity Keystore Type: The type of the keystore. Generally, this is JKS. [More Info...](#)

Custom Identity Keystore Passphrase: The encrypted custom identity keystore's passphrase. If empty or null, then the keystore will be opened without a passphrase. [More Info...](#)

Confirm Custom Identity Keystore Passphrase:

Trust

Java Standard Trust Keystore: The path and file name of the trust keystore. [More Info...](#)

Java Standard Trust Keystore Type: The type of the keystore. Generally, this is JKS. [More Info...](#)

Java Standard Trust Keystore Passphrase: The password for the Java Standard Trust keystore. This password is defined when the keystore is created. [More Info...](#)

Confirm Java Standard Trust Keystore Passphrase:

Save

5. For **Keystores**, select **Custom Identity and Java Standard Trust**.
6. In the **Identity** section, enter the path to the **Custom Identity Keystore** you created, choose **JKS** as the **Type**, and enter and confirm the **Custom Identity Keystore Passphrase**.
7. In the **Trust** section, enter the path to the trust keystore in **Java Standard Trust Keystore**, enter **JKS** as the **Type**, and enter and confirm the **Java Standard Trust Keystore Passphrase**.
8. Click **Save**.

23.7.3.2.3 Creating the SAML Credential Mapping Provider Instance

This section describes how to create a SAML Credential Mapping Provider V2 instance. Note that the SAML Credential Mapping provider is not part of the default security realm and must be created.

Creating the SAML Credential Mapping Provider instance is the first of two steps required to configure the credential mapping provider:

- Creating the SAML Credential Mapping Provider instance

- Configuring a Relying Party for each of the participating service applications (which can include OWC Wiki, OWC Discussions, RSS, Worklist Community Detail, Worklist SDP, and Worklist Integration)

To create a SAML Credential Mapping Provider instance:

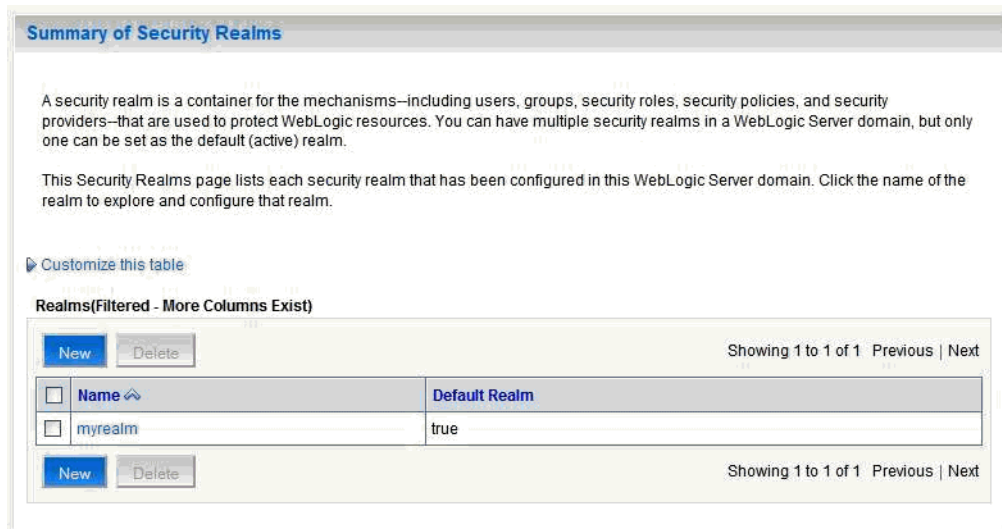

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. From the Domain Structure pane, click **Security Realms**.

The Summary of Security Realms pane displays (see [Figure 23–99](#)).

Figure 23–99 Summary of Security Realms Pane

3. Click your security realm.

The Settings page for the security realm displays (see [Figure 23–100](#)).

Figure 23–100 Security Realm Settings Page

The screenshot shows the 'Settings for myrealm' page. At the top, there are tabs for 'Configuration', 'Users and Groups', 'Roles and Policies', 'Credential Mappings', 'Providers', and 'Migration'. Below these are sub-tabs for 'General', 'RDBMS Security Store', 'User Lockout', and 'Performance'. A 'Save' button is visible. The main content area contains a note about JACC security and a list of settings:

- Name:** myrealm. Description: The name of this security realm. [More Info...](#)
- Security Model Default:** DD Only (dropdown menu). Description: Specifies the default security model for Web applications or EJBs that are secured by this security realm. You can override this default during deployment. [More Info...](#)
- Combined Role Mapping Enabled**. Description: Determines how the role mappings in the Enterprise Application, Web application, and EJB containers interact. This setting is valid only for Web applications and EJBs that use the Advanced security model and that initialize roles from deployment descriptors. [More Info...](#)
- Use Authorization Providers to Protect JMX Access**. Description: Configures the WebLogic Server MBean servers to use the security realm's Authorization providers to determine whether a JMX client has permission to access an MBean attribute or invoke an MBean operation. [More Info...](#)

At the bottom, there is an 'Advanced' section and another 'Save' button.

- Open the Providers tab and select the Credential Mapping subtab. The Credential Mapping pane displays (see Figure 23–101).

Figure 23–101 Credential Mapping Pane

The screenshot shows the 'Credential Mapping Pane' within the 'Providers' tab. It includes sub-tabs for 'Authentication', 'Authorization', 'Adjudication', 'Role Mapping', 'Auditing', 'Credential Mapping', and 'Certification Path'. Below these are 'Keystores' and a descriptive paragraph: 'A Credential Mapping provider allows WebLogic Server to log into a remote system on behalf of a subject that has already been authenticated. You must have one Credential Mapping provider in a security realm, and you can configure multiple Credential Mapping providers in a security realm.' There is a 'Customize this table' link and a table titled 'Credential Mapping Providers'.

Name	Description	Version
<input type="checkbox"/> DefaultCredentialMapper	WebLogic Credential Mapping Provider	1.0

At the bottom of the table, there are 'New', 'Delete', and 'Reorder' buttons, and a status indicator 'Showing 1 to 1 of 1 Previous | Next'.

- Click New.

The Create a New Credential Mapping Provider pane displays (see [Figure 23–102](#)).

Figure 23–102 Create a New Credential Provider Pane

6. Enter a **Name** for the provider, select the **Type** as `SAMLCredentialMapperV2`, and click **OK**.
7. On the Security Realm Settings page, click the provider you just created.
The Settings page for the new provider displays (see [Figure 23–103](#)).

Figure 23–103 Provider Settings Pane

Name	Description	Version
DefaultCredentialMapper	WebLogic Credential Mapping Provider	1.0
MySAML2Provider	WebLogic SAML Credential Mapping Provider. Supports Security Assertion Markup Language v1.1.	2.0

8. Open the Provider Specific tab.
The Provider Specific Settings Pane displays (see [Figure 23–104](#)).

Figure 23–104 Provider Specific Settings Pane

The screenshot shows the 'Settings for MySAML2Provider' configuration pane. It has three tabs: 'Configuration', 'Management', and 'Migration'. Under 'Configuration', there are two sub-tabs: 'Common' and 'Provider Specific'. The 'Provider Specific' tab is active. At the top left of the pane is a 'Save' button. Below it is a message: 'Use this page to configure provider-specific information for this SAML Credential Mapping Version 2 provider.' The form contains several fields with labels and descriptions:

- Issuer URI:** example.com/webcenter. Description: The Issuer URI (name) of this SAML Authority. [More Info...](#)
- Name Qualifier:** example.com. Description: The Name Qualifier value used by the Name Mapper. [More Info...](#)
- Default Time To Live:** 120. Description: Time in seconds that, by default, an assertion should remain valid. [More Info...](#)
- Default Time To Live Offset:** 0. Description: A time factor you can use to allow the Credential Mapper to compensate for clock differences between the source and destination sites. The value is a positive or negative integer representing seconds. [More Info...](#)
- Signing Key Alias:** testalias. Description: The alias used to retrieve from the keystore the key that is used to sign assertions. [More Info...](#)
- Signing Key Pass Phrase:** [masked]. Description: The credential (password) used to retrieve from the keystore the keys used to sign assertions. [More Info...](#)
- Confirm Signing Key Pass Phrase:** [masked].
- Default Name Mapper Class Name:** [empty]. Description: The name of the Java class that maps Subjects to SAML Assertion name information. When no mapper is specified, the default mapper implementation is used. [More Info...](#)

At the bottom left of the pane is another 'Save' button.

- Configure the SAML Credential Mapping provider as a SAML authority, using the **Issuer URI**, **Name Qualifier**, and other attributes as shown below in [Table 23–4](#). Leave the remaining parameters set to their default values.

Table 23–4 SAML Credential Mapping Provider Security Realm Settings

Parameter	Value	Description
Issuer URI	http://www.example.com/webcenter	The Issuer URI (name) of this SAML Authority. This unique URI tells the destination site (Wiki service) the origin of the SAML message and allows it to match with the key. Typically, the URI is used to guarantee uniqueness.
Name Qualifier	example.com	The Name Qualifier value used by the Name Mapper. The value of the Name Qualifier is the security or administrative domain that qualifies the name of the subject. This provides a means to federate names from disparate user stores while avoiding the possibility of subject name collision.
Web Service Assertion Signing Key Alias		The alias used to retrieve from the keystore the key that is used to sign assertions (for example, testalias).

Table 23–4 (Cont.) SAML Credential Mapping Provider Security Realm Settings

Parameter	Value	Description
Web Service Assertion Signing Key Passphrase		The credential (password) used to retrieve from the keystore the keys used to sign assertions (for example, testkeypass).
Please type again To confirm		Re-enter the credential password.

10. Click **Save** to save your settings.
11. Restart the WebLogic Administration server.

23.7.3.2.4 Configuring a Relying Party

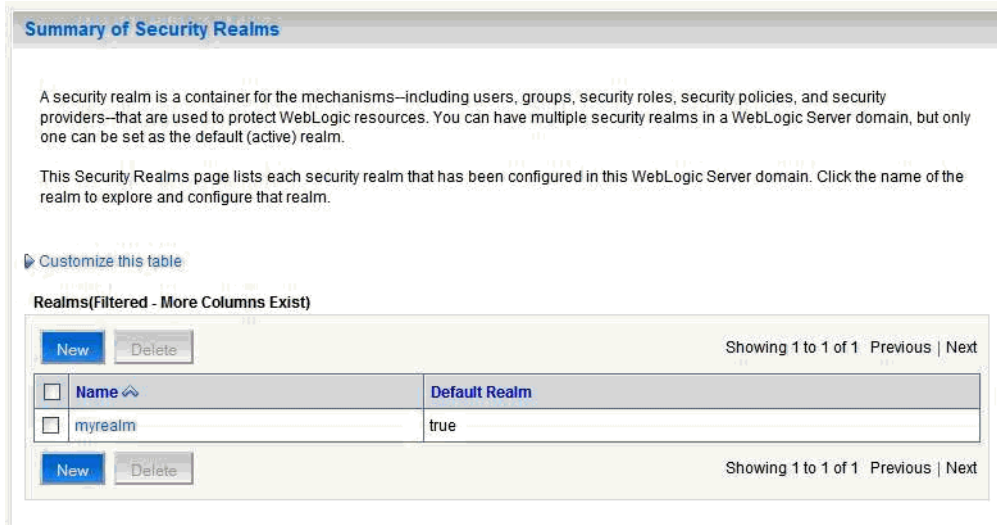

Configuring a relying party is the second of two steps required to configure the credential mapping provider:

- Creating the SAML Credential Mapping Provider instance
- Configuring a relying party for each of the participating service applications (which can include OWC Wiki, OWC Discussions, RSS, Worklist Community Detail, Worklist SDP, and Worklist Integration)

To configure a relying party:

1. From the Domain Structure pane, click **Security Realms**.
The Summary of Security Realms pane displays (see [Figure 23–105](#)).

Figure 23–105 Summary of Security Realms Pane

2. Click your security realm and open the Providers tab and the Credential Mapping subtab.
The Credential Mapping Providers Settings pane displays (see [Figure 23–106](#)).

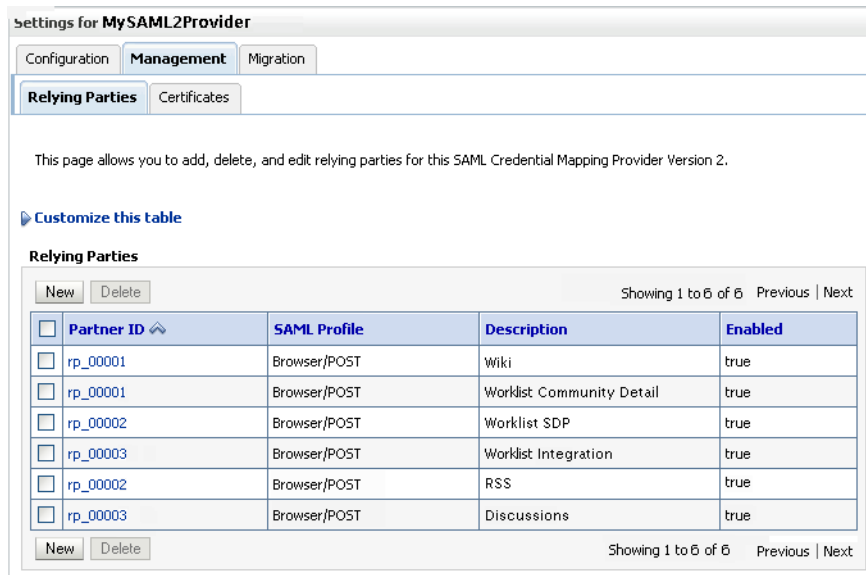

Figure 23–106 Credential Mapping Providers Settings Pane

3. Click the SAML Credential Mapping Provider you created.
4. Open the Management tab and the Relying Parties tab on the Settings page for the provider.

The Relying Parties Management Settings pane displays (see [Figure 23–107](#)).

Figure 23–107 Relying Parties Management Settings Pane

This screenshot shows the Relying Parties Management Settings pane.

5. Click **New**.

The Create a New Relying Parties page displays (see [Figure 23–108](#)).

Figure 23–108 Create a New Relying Party Page

6. Select *Browser/POST* as the SAML **Profile**, and provide a **Description** (for example, *wiki*).
7. Click **OK** to save your settings.
8. On the Relying Parties Management Settings pane, click the Partner ID of the Relying Party you just created (the Partner ID is automatically generated for you). The Relying Party Settings page displays (see [Figure 23–109](#)).

Figure 23–109 Relying Party Settings Page

-------------------	----------------------	---

Assertion Configuration

Audience URI:	<input type="text"/>	An optional set of SAML Audience URIs. If set, an incoming assertion must contain at least one of the specified URIs in order to be considered valid. More Info...
Name Mapper Class:	<input type="text"/>	The name mapper class used for this SAML Relying Party. More Info...
Assertion Time To Live:	<input type="text" value="0"/>	The time to live, in seconds, of assertions generated for this SAML Relying Party. More Info...
Assertion Time To Live Offset:	<input type="text" value="0"/>	A time factor you can use to allow the Credential Mapper to compensate for clock differences between the source and destination sites. The value is a positive or negative integer representing seconds. More Info...

- On the Relying Parties page, use the settings shown in Table 23–4 to configure a relying party for the Wiki service. Leave the remaining parameters set to their default values. Click **Save** when finished.

Table 23–5 Relying Party Settings for Wiki Service

Parameter	Value	Description
Enabled	Checked	The state of this SAML Relying Party.
Description	OWC Wiki	A short description of this Relying Party
Target URL		The destination site URL for which authentication is requested (for example: <code>http://example.com:8890/owc_wiki/user/login.jz</code>).

Table 23–5 (Cont.) Relying Party Settings for Wiki Service

Parameter	Value	Description
Assertion Consumer URL		The URL at which an Assertion Consumer Service for this SAML Relying Party can be reached (for example, <code>http://example.com:8890/owc_wiki/samlacs/acs</code>). Indicates the URL to which an assertion or artifact should be POSTed or redirected. Note: If you have checked ACS requires SSL while configuring destination site federation services, then use HTTPS protocol and the SSL port for the WLS_Services managed server.
Assertion Consumer Properties	APID=ap_00001	One or more optional query parameters, in the form <code>name=value</code> , that will be added to the ACS URL when redirecting to the destination site. In the case of POST profile, these parameters will be included as form variables when using the default POST form. In this case, <code>ap_00001</code> indicates the ID of the asserting party for the Wiki application configured in the SAML Identity Asserter of the WebCenter domain which provides the source site (WebCenter Spaces) and ITS details.
Sign Assertions	Checked	Specifies whether generated assertions for this SAML Relying Party are signed.
Include KeyInfo	Checked	Indicates whether a <code><ds:keyinfo></code> element containing the signing certificate should be included when signing assertions. The default value is <code>true</code> . This value is ignored if Sign Assertions is false.

- Repeat steps 1 - 8 to configure a relying party for the Worklist Community Detail service using the settings shown in [Table 23–5](#). Leave the remaining parameters on the Relying Parties page set to their default values. Click **Save** when finished.

Table 23–6 Relying Party Settings for Worklist Community Detail

Parameter	Value	Description
Enabled	Checked	The state of this SAML Relying Party.
Description	Worklist Detail	A short description of this Relying Party
Target URL		The destination site URL for which authentication is requested (for example: <code>http://example.com:8001/workflow/WebCenterWorklistDetail/faces/adf.task-flow</code>).

Table 23–6 (Cont.) Relying Party Settings for Worklist Community Detail

Parameter	Value	Description
Assertion Consumer URL		The URL at which an Assertion Consumer Service for this SAML Relying Party can be reached (for example, <code>http://example.com:8001/workflow/WebCenterWorklistDetail/samlacs/acs</code>). Indicates the URL to which an assertion or artifact should be POSTed or redirected. Note: If you have checked ACS requires SSL while configuring destination site federation services, then use https protocol and the SSL port for the SOA managed server.
Assertion Consumer Properties	APID=ap_00001	One or more optional query parameters, in the form name=value, that will be added to the ACS URL when redirecting to the destination site. In the case of POST profile, these parameters will be included as form variables when using the default POST form. In this case ap_00001 indicates the ID of the asserting party configured for Worklist Detail in the SAML Identity Asserter of the SOA domain, which provides the source site (WebCenter Spaces) and ITS details.
Sign Assertions	Checked	Specifies whether generated assertions for this SAML Relying Party are signed.
Include KeyInfo	Checked	Indicates whether a <ds:keyinfo> element containing the signing certificate should be included when signing assertions. The default value is true. This value is ignored if Sign Assertions is false.

11. Repeat steps 1 - 8 to configure a relying party for the Worklist SDP service using the settings shown in [Table 23–6](#). Leave the remaining parameters on the Relying Parties pages set to their default values. Click **Save** when finished.

Table 23–7 Relying Party Settings for Worklist SDP

Parameter	Value	Description
Enabled	Checked	The state of this SAML Relying Party.
Description	WebCenter SDP	A short description of this Relying Party
Target URL		The destination site URL for which authentication is requested (for example: <code>http://example.com:8001/workflow/sdpmessagingsca-ui-worklist/faces/adf.task-flow</code>).

Table 23–7 (Cont.) Relying Party Settings for Worklist SDP

Parameter	Value	Description
Assertion Consumer URL		The URL at which an Assertion Consumer Service for this SAML Relying Party can be reached (for example, <code>http://example.com:8001/workflow/sdp/messaging-sca-ui-worklist/samlacs/acs</code>). Indicates the URL to which an assertion or artifact should be POSTed or redirected. Note: If you have checked ACS requires SSL while configuring destination site federation services, then use <code>https</code> protocol and the SSL port for the SOA managed server.
Assertion Consumer Properties	APID=ap_00002	One or more optional query parameters, in the form <code>name=value</code> , that will be added to the ACS URL when redirecting to the destination site. In the case of POST profile, these parameters will be included as form variables when using the default POST form. In this case <code>ap_00002</code> indicates the ID of the asserting party configured for the Worklist SDP application in the SAML Identity Asserter of the SOA domain, which provides the source site (WebCenter Spaces) and ITS details.
Sign Assertions	Checked	Specifies whether generated assertions for this SAML Relying Party are signed.
Include KeyInfo	Checked	Indicates whether a <code><ds:keyinfo></code> element containing the signing certificate should be included when signing assertions. The default value is <code>true</code> . This value is ignored if Sign Assertions is false.

- Repeat steps 1 - 8 to configure a relying party for the Worklist Integration service using the settings shown in Table 23–7. Leave the remaining parameters on the Relying Parties pages set to their default values. Click **Save** when finished.

Table 23–8 Relying Party Settings for Worklist Integration

Parameter	Value	Description
Enabled	Checked	The state of this SAML Relying Party.
Description	WebCenter SDP	A short description of this Worklist Integration
Target URL		The destination site URL for which authentication is requested (for example: <code>http://example.com:8001/integration/worklistapp</code>).

Table 23–8 (Cont.) Relying Party Settings for Worklist Integration

Parameter	Value	Description
Assertion Consumer URL		The URL at which an Assertion Consumer Service for this SAML Relying Party can be reached (for example, <code>http://example.com:8001/workflow/sdp_messagingca-ui-worklist/samlacs/acs</code>). Indicates the URL to which an assertion or artifact should be POSTed or redirected. Note: If you have checked ACS requires SSL while configuring destination site federation services, then use https protocol and the SSL port for the SOA managed server.
Assertion Consumer Properties	APID=ap_00003	One or more optional query parameters, in the form <code>name=value</code> , that will be added to the ACS URL when redirecting to the destination site. In the case of POST profile, these parameters will be included as form variables when using the default POST form. In this case <code>ap_00003</code> indicates the ID of the asserting party configured for Worklist Integration application in the SAML Identity Asserter of the SOA domain, which provides the source site (WebCenter Spaces) and ITS details.
Sign Assertions	Checked	Specifies whether generated assertions for this SAML Relying Party are signed.
Include KeyInfo	Checked	Indicates whether a <code><ds:keyinfo></code> element containing the signing certificate should be included when signing assertions. The default value is <code>true</code> . This value is ignored if Sign Assertions is false.

13. Repeat steps 1 - 8 to configure a relying party for the RSS application using the settings shown in [Table 23–8](#). Leave the remaining parameters on the Relying Parties pages set to their default values. Click **Save** when finished.

Table 23–9 Relying Party Settings for RSS

Parameter	Value	Description
Enabled	Checked	The state of this SAML Relying Party.
Description	RSS	A short description of this Relying Party
Target URL		The destination site URL for which authentication is requested (for example: <code>http://example.com:8888/rss/rssservlet</code>).

Table 23–9 (Cont.) Relying Party Settings for RSS

Parameter	Value	Description
Assertion Consumer URL		The URL at which an Assertion Consumer Service for this SAML Relying Party can be reached (for example, <code>http://example.com:8888/rss/samlacs/acs</code>). Indicates the URL to which an assertion or artifact should be POSTed or redirected. Note: If you have checked ACS requires SSL while configuring destination site federation services, then use <code>https</code> protocol and the SSL port for the <code>WLS_Spaces</code> managed server.
Assertion Consumer Properties	APID=ap_00002	One or more optional query parameters, in the form <code>name=value</code> , that will be added to the ACS URL when redirecting to the destination site. In the case of POST profile, these parameters will be included as form variables when using the default POST form. In this case <code>ap_00002</code> indicates the ID of the asserting party configured for RSS in the SAML Identity Asserter of the WebCenter domain, which provides the source site (WebCenter Spaces) and ITS details.
Sign Assertions	Checked	Specifies whether generated assertions for this SAML Relying Party are signed.
Include KeyInfo	Checked	Indicates whether a <code><ds:keyinfo></code> element containing the signing certificate should be included when signing assertions. The default value is <code>true</code> . This value is ignored if Sign Assertions is false.

- Repeat steps 1 - 8 to configure a relying party for the Discussions application using the settings shown in [Table 23–9](#). Leave the remaining parameters on the Relying Parties pages set to their default values. Click **Save** when finished.

Table 23–10 Relying Party Settings for Discussions

Parameter	Value	Description
Enabled	Checked	The state of this SAML Relying Party.
Description	Discussions	A short description of this Relying Party
Target URL		The destination site URL for which authentication is requested (for example: <code>http://example.com:8890/owc_discussions/admin/content-main.jsp</code>).
Assertion Consumer URL		The URL at which an Assertion Consumer Service for this SAML Relying Party can be reached (for example, <code>http://example.com:8890/owc_discussions/samlacs/acs</code>). Indicates the URL to which an assertion or artifact should be POSTed or redirected. Note: If you have checked ACS requires SSL while configuring destination site federation services, then use <code>https</code> protocol and the SSL port for the managed server.

Table 23–10 (Cont.) Relying Party Settings for Discussions

Parameter	Value	Description
Assertion Consumer Properties	APID=ap_00003	One or more optional query parameters, in the form name=value, that will be added to the ACS URL when redirecting to the destination site. In the case of POST profile, these parameters will be included as form variables when using the default POST form. In this case ap_00003 indicates the ID of the asserting party configured for the Discussions application in the SAML Identity Asserter of the WebCenter domain, which provides the source site (WebCenter Spaces) and ITS details.
Sign Assertions	Checked	Specifies whether generated assertions for this SAML Relying Party are signed.
Include KeyInfo	Checked	Indicates whether a <ds:keyinfo> element containing the signing certificate should be included when signing assertions. The default value is true. This value is ignored if Sign Assertions is false.

23.7.3.2.5 Configuring Source Site Federation Services

This section describes how to create and configure source site Federation services.

To configure Source Site Federation Services:

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. On the Domain Structure pane, expand the **Environment** node and click **Servers**.

The Summary of Servers page displays (see [Figure 23–110](#)).

Figure 23–110 Summary of Servers Page

Summary of Servers

Configuration Control

A server is an instance of WebLogic Server that runs in its own Java Virtual Machine (JVM) and has its own configuration. This page summarizes each server that has been configured in the current WebLogic Server domain.

Customize this table

Servers (Filtered - More Columns Exist)

New Clone Delete Showing 1 to 4 of 4 Previous Next

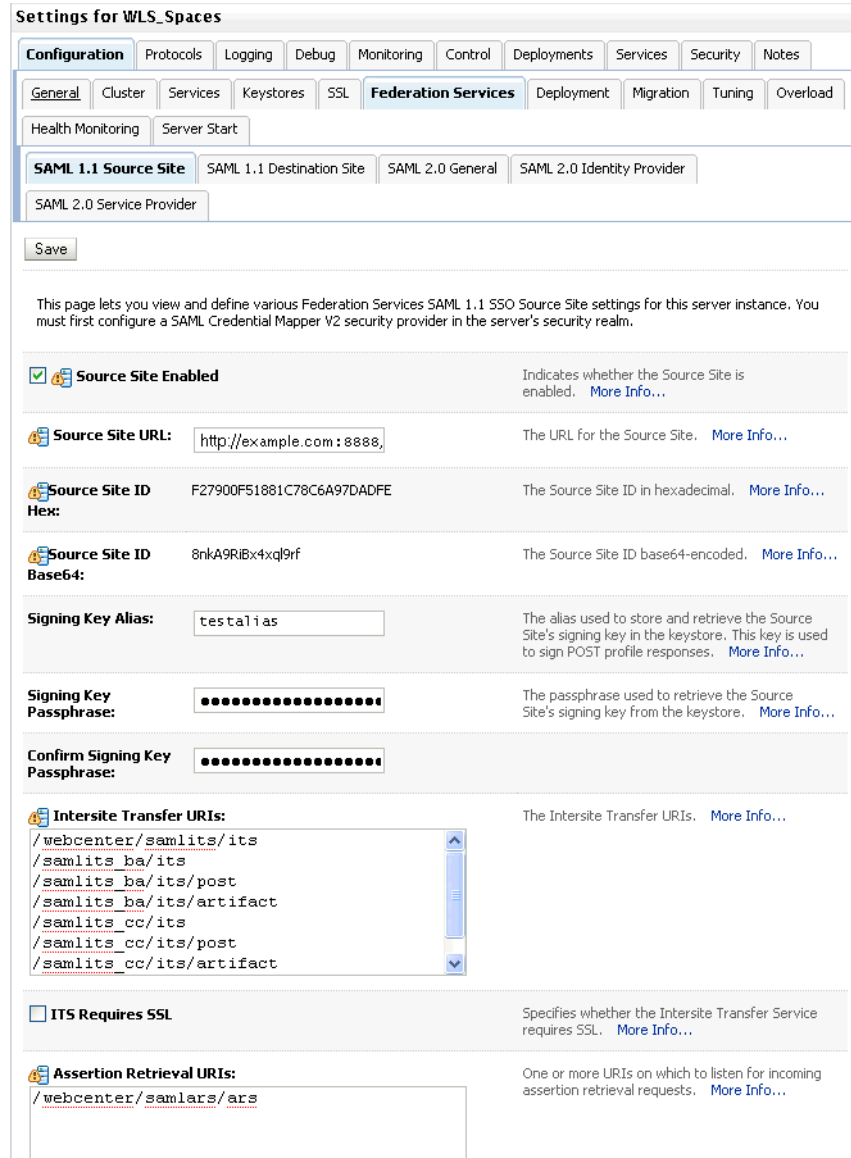

<input type="checkbox"/>	Name	Cluster	Machine	State	Health	Listen Port
<input type="checkbox"/>	AdminServer(admin)			RUNNING	OK	7001
<input type="checkbox"/>	WLS_Portlet		IR12stage	RUNNING	OK	8889
<input type="checkbox"/>	WLS_Services		IR12stage	RUNNING	OK	8890
<input type="checkbox"/>	WLS_Spaces		IR12stage	RUNNING	OK	8888

New Clone Delete Showing 1 to 4 of 4 Previous Next

3. Click **WLS_Spaces** and open the Configuration tab.

- Open the Federation Services subtab and the SAML 1.1 Source Site subtab.
The Federation Services Configuration SAML 1.1 Source Site Settings page for the WLS_Spaces server displays (see [Figure 23–111](#)).

Figure 23–111 Federation Services Configuration SAML 1.1 Source Site Settings Page

- Configure the SAML source site attributes as shown in [Figure 23–11](#). Leave the remaining parameters set to their default values.

Table 23–11 Source Site Federation Services Parameters

Parameter	Value	Description
Source Site Enabled	Checked	Allow the WebLogic server instance to serve as a SAML source site by setting Source Site Enabled to true.

Table 23–11 (Cont.) Source Site Federation Services Parameters

Parameter	Value	Description
Source Site URL		Set the URL for the SAML source site (for example, <code>http://example.com:8888/webcenter</code>). This is the URL that hosts the Intersite Transfer Service and Assertion Retrieval Service. The source site URL is encoded as a source ID in hex and Base64.
Signing Key Alias		The SAML source site requires a trusted certificate with which to sign assertions. Add this certificate to the keystore and enter the alias (for example, <code>testalias</code>) to be used to access the certificate. The server's SSL identity key/certificates will be used by default if a signing alias and passphrase are not supplied.
Signing Key Passphrase		The SAML source site requires a trusted certificate with which to sign assertions. Add this certificate to the keystore and enter the passphrase (for example, <code>testkeypass</code>) to be used to access the certificate. The server's SSL identity key/certificates will be used by default if a signing alias and passphrase are not supplied.
Intersite Transfer URIs	<code>/webcenter/samlits/its</code> [add on top, leave the rest]	Specify the URIs for the Intersite Transfer Service. These URIs are also specified in the configuration of an Asserting Party.
Assertion Retrieval URIs	<code>/webcenter/samlars/ars</code> [add on top, leave the rest]	N/A - URI for Assertion Retrieval Service used when artifact profile is used.
ITS Requires SSL	Unchecked	Note: If you check this, then you need to change the Source Site ITS URL specified in the SAML Asserting Party configuration in the SAML Identity provider as HTTPS and the server's SSL port.
ARS Requires SSL	Unchecked	Applicable only when Artifact profile is used

6. Click **Save** to save your settings when done.

7. Restart the `WLS_Spaces` managed server.

23.7.3.2.6 Configuring the SAML Identity Assertion Provider

This section describes how to create and configure a SAML Identity Assertion Provider V2 instance (the SAML Identity Assertion provider is not part of the default security realm). This section also describes how to establish trust by registering the source site's SSL certificate in the certificate registry maintained by the SAML Identity Assertion provider.

To create a SAML Identity Assertion Provider

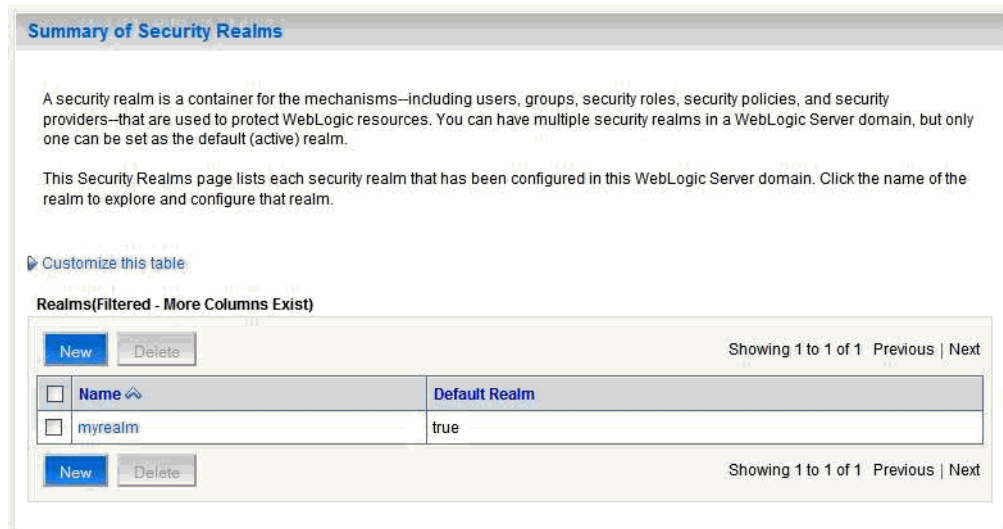

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

- From the Domain Structure pane, click **Security Realms**.

The Summary of Security Realms pane displays (see [Figure 23–112](#)).

Figure 23–112 Summary of Security Realms Pane

- Click your security realm.

The Settings page for the security realm displays (see [Figure 23–113](#)).

Figure 23–113 Security Realm Settings Page

Settings for myrealm

Configuration **Users and Groups** Roles and Policies Credential Mappings Providers Migration

General **RDBMS Security Store** User Lockout Performance

Save

Use this page to configure the general behavior of this security realm.

Note:
If you are implementing security using JACC (Java Authorization Contract for Containers as defined in JSR 115), you must use the DD Only security model. Other WebLogic Server models are not available and the security functions for Web applications and EJBs in the Administration Console are disabled.

Name: myrealm The name of this security realm. [More Info...](#)

Security Model Default: DD Only Specifies the default security model for Web applications or EJBs that are secured by this security realm. You can override this default during deployment. [More Info...](#)

Combined Role Mapping Enabled Determines how the role mappings in the Enterprise Application, Web application, and EJB containers interact. This setting is valid only for Web applications and EJBs that use the Advanced security model and that initialize roles from deployment descriptors. [More Info...](#)

Use Authorization Providers to Protect JMX Access Configures the WebLogic Server MBean servers to use the security realm's Authorization providers to determine whether a JMX client has permission to access an MBean attribute or invoke an MBean operation. [More Info...](#)

Advanced

Save

4. Open the Providers tab and select the Authentication subtab.
The Authentication Settings pane displays (see [Figure 23–114](#)).

Figure 23–114 Authentication Settings Pane

Settings for myrealm

Configuration Users and Groups Roles and Policies Credential Mappings **Providers** Migration

Authentication Authorization Adjudication Role Mapping Auditing Credential Mapping Certification Path

Keystores

An Authentication provider allows WebLogic Server to establish trust by validating a user. You must have one Authentication provider in a security realm, and you can configure multiple Authentication providers in a security realm. Different types of Authentication providers are designed to access different data stores, such as LDAP servers or DBMS. You can also configure a Realm Adapter Authentication provider that allows you to work with users and groups from previous releases of WebLogic Server.

[Customize this table](#)

Authentication Providers

New Delete Reorder Showing 1 to 2 of 2 Previous | Next

<input type="checkbox"/>	Name	Description	Version
<input type="checkbox"/>	DefaultAuthenticator	WebLogic Authentication Provider	1.0
<input type="checkbox"/>	DefaultIdentityAsserter	WebLogic Identity Assertion provider	1.0

New Delete Reorder Showing 1 to 2 of 2 Previous | Next

5. Click New.

The Create a New Authentication Provider page displays (see [Figure 23–115](#)).

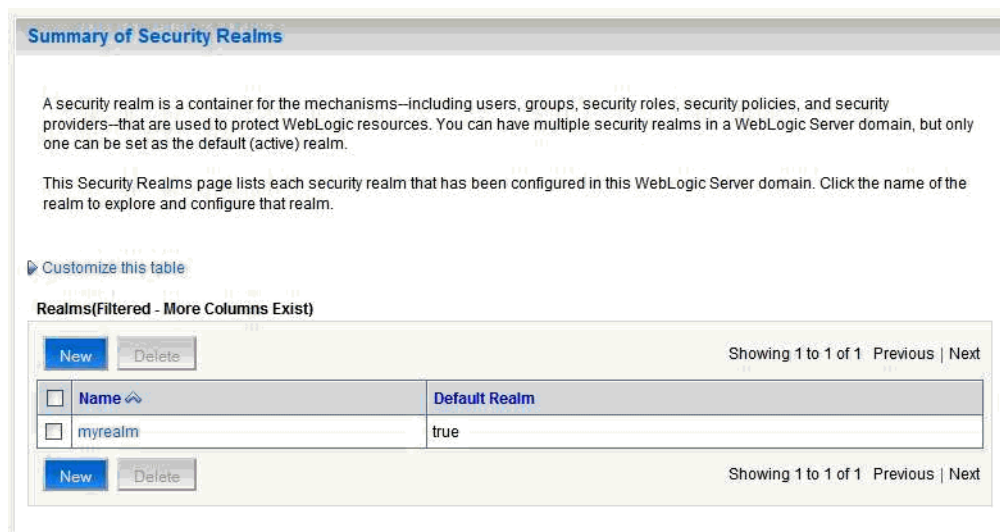

Figure 23–115 Create a New Authentication Provider Page

6. Enter a **Name** for the new SAML Identity Asserter, and select the **Type** as SAMLIdentityAsserterV2.
7. Click **OK** to save your settings.
8. Restart the WebLogic Administration server if indicated in the Messages area.
9. Go to the SOA domain and create a SAML Identity Asserter provider there as well using the steps above.

To configure a certificate for the SAML ID Asserter

1. Log in to the WebLogic Server Administration Console.
For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)
2. From the Domain Structure pane, click **Security Realms**.
The Summary of Security Realms pane displays (see [Figure 23–116](#)).

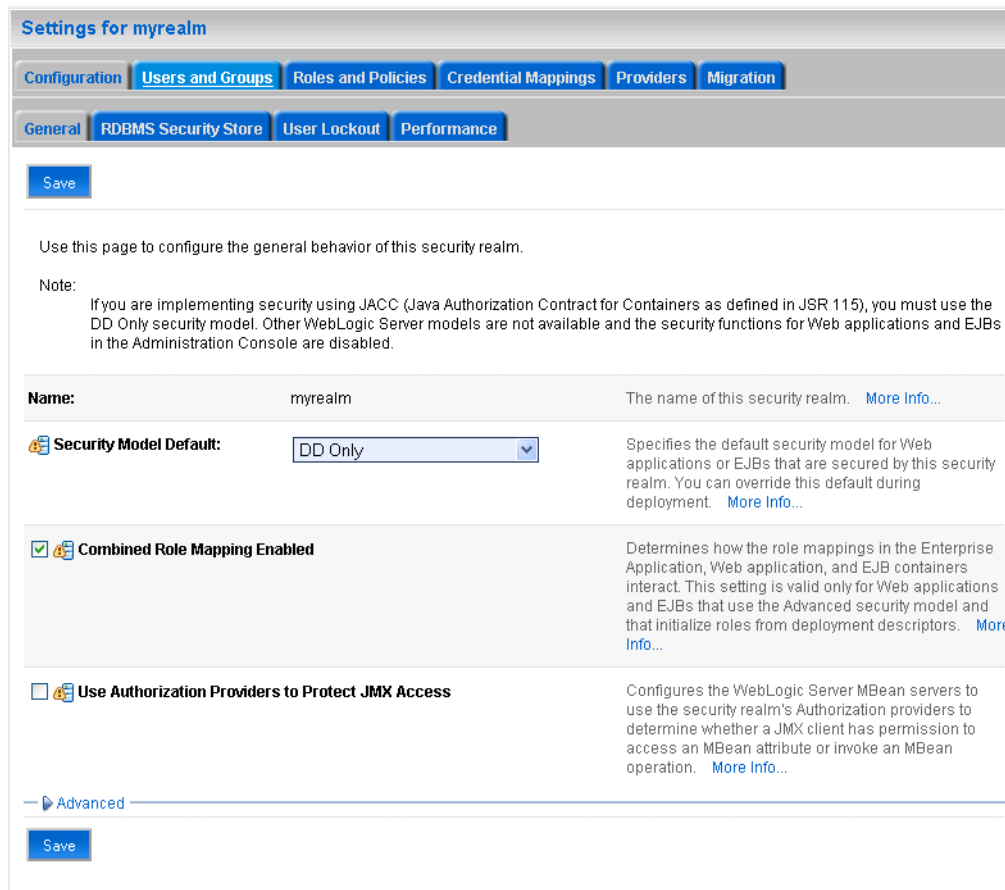

Figure 23–116 Summary of Security Realms Pane

3. Click your security realm.

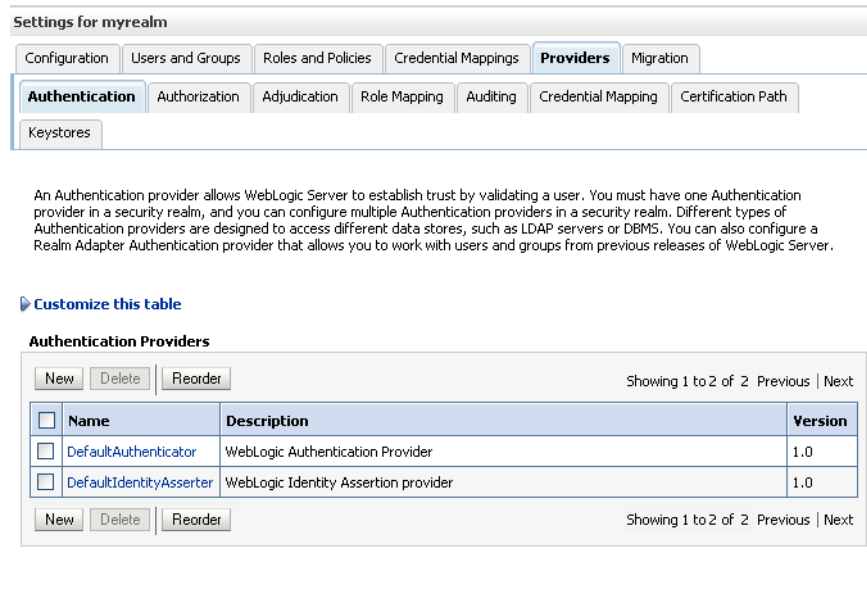

The Settings page for the security realm displays (see Figure 23–117).

Figure 23–117 Security Realm Settings Page

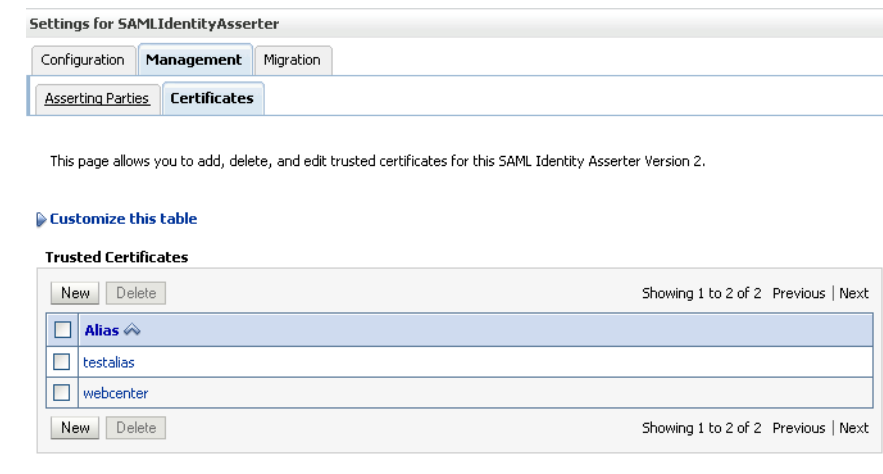

- Open the Providers tab and select the Authentication subtab.
The Authentication Settings pane displays (see [Figure 23–118](#)).

Figure 23–118 Authentication Settings Pane

- Click the SAML Identity Asserter you created and open the Management tab and the Certificates subtab.
The Certificate Settings pane displays (see [Figure 23–119](#)).

Figure 23–119 Certificate Settings Pane

- Click **New**.
The Create a New Identity Asserter Certificate page displays (see [Figure 23–120](#)).

Figure 23–120 Create a New Identity Asserter Certificate Page

Create a New Identity Asserter Version 2 Certificate

OK Cancel

Trusted Certificate Properties

The following properties will be used to identify your new Certificate.

What alias name would you like to assign to your new Certificate?

Alias:

Specify the path name of a .pem or .der file containing the X509 certificate you wish to import.

Path:

Recently Used Paths:

Current Location: stadi60.us.oracle.com / scratch / workdir / Jan200006 / mwhome / user_projects / domains / wc_domain

bin
 config
 servers
 webcenter.der

OK Cancel

7. Configure the certificate as shown in [Table 23–12](#).

Table 23–12 Certificates Page Parameters

Parameter	Value	Description
alias		The name to assign to your new Certificate This is the alias of the keystore you created in Section 23.7.3.2.2, "Generating and Registering Certificates."
Path		Specify the path name of the .der file containing the X509 certificate you wish to import. This is the file you created in Section 23.7.3.2.2, "Generating and Registering Certificates."

8. Click **OK** to save your settings.
9. Repeat the previous step for the SAML ID Asserter created in the SOA domain. Be sure to copy over `testalias.der` (assuming that this was the name given to your .DER file) from your WebLogic Home to the machine hosting the SOA domain.

To Configure an Asserting Party

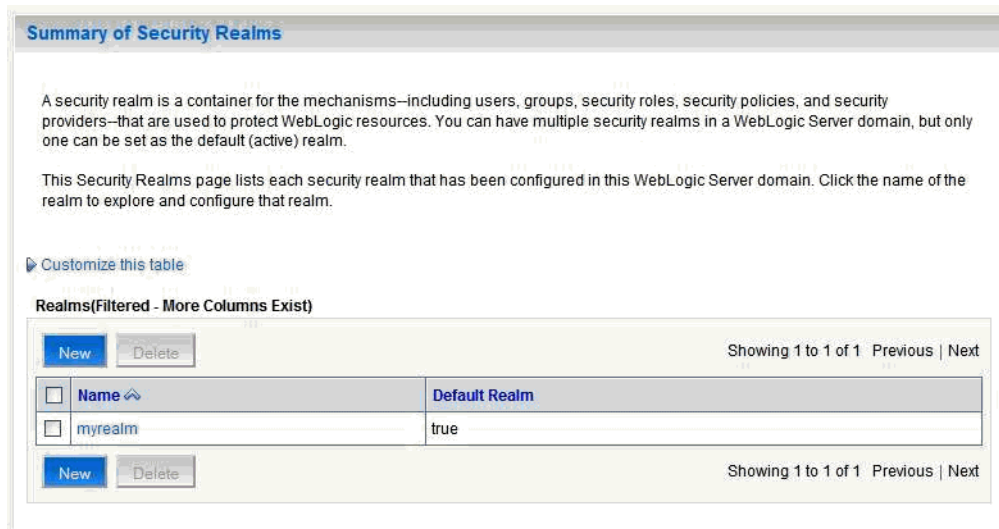

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. From the Domain Structure pane, click **Security Realms**.

The Summary of Security Realms pane displays (see [Figure 23–121](#)).

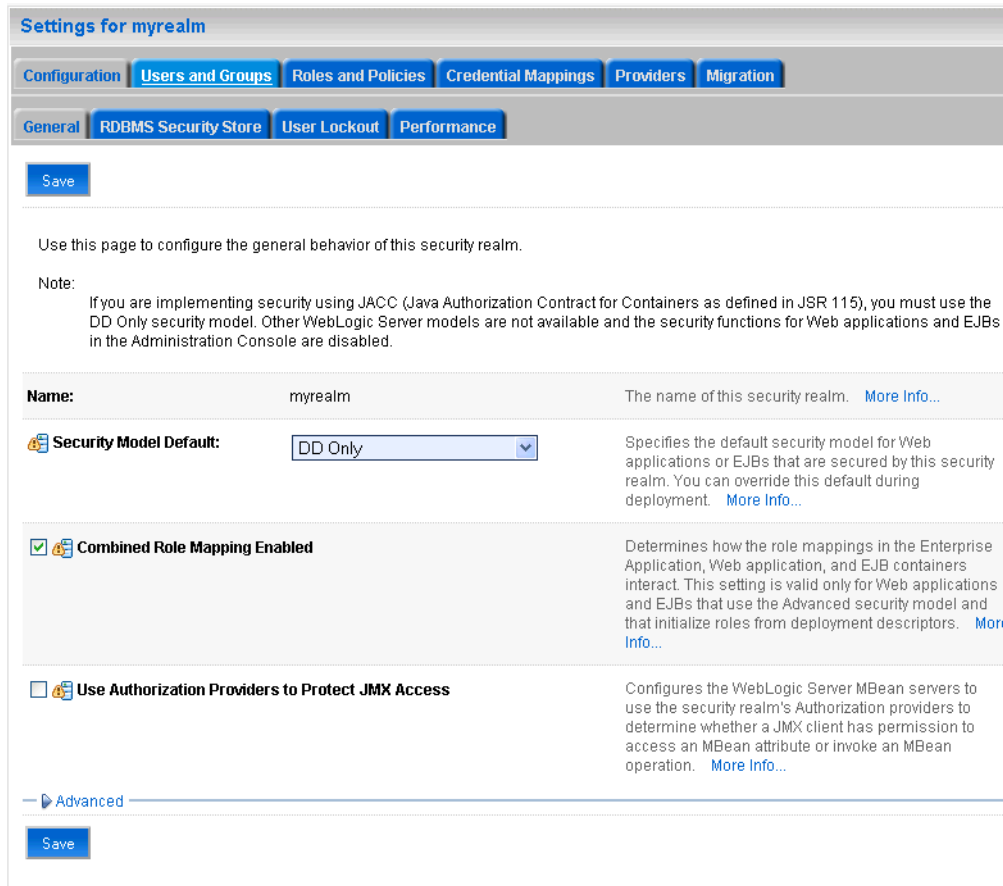

Figure 23–121 Summary of Security Realms Pane

3. Click your security realm.

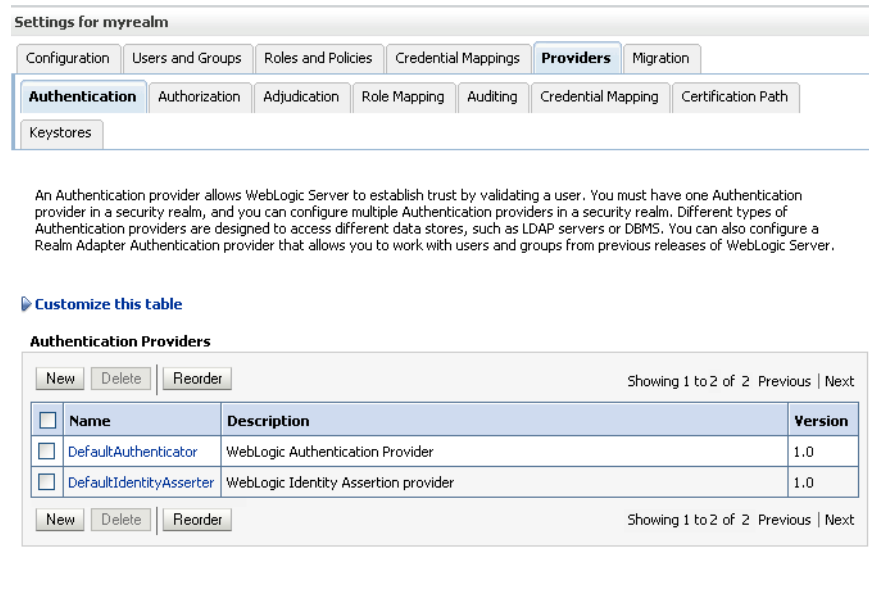

The Settings page for the security realm displays (see [Figure 23–122](#)).

Figure 23–122 Security Realm Settings Page

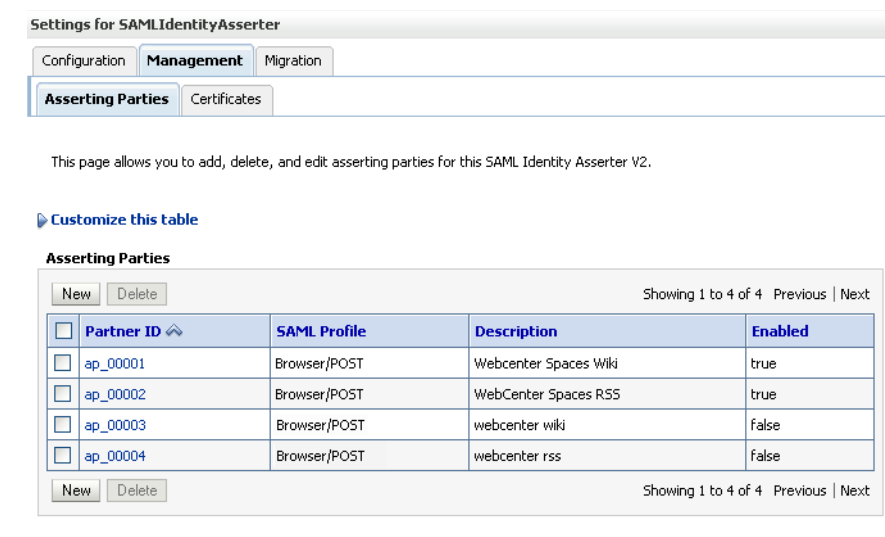

- Open the Providers tab and select the Authentication subtab.
The Authentication Settings pane displays (see [Figure 23–123](#)).

Figure 23–123 Authentication Settings Pane

- Click the SAML Identity Asserter you created and open the Management tab and the Asserting Parties subtab.
The Asserting Parties Settings pane displays (see [Figure 23–124](#)).

Figure 23–124 Asserting Parties Settings Pane

- Click New.
The Create a New Asserting Party page displays (see [Figure 23–125](#)).

Figure 23–125 Create a New Asserting Party Page

7. Select the **Profile** and provide a **Description** for the Asserting Party.
Use the same SAML profile you chose for the corresponding relying party (for example, `Browser / POST`).
8. Click **OK** to save your settings.
9. From the Asserting Parties Settings pane, click the Partner ID of the Asserting Party you just created (the Partner ID is assigned automatically).
The Settings page for the new Asserting Party displays (see [Figure 23–126](#)).

Figure 23–126 Asserting Party Settings Page

Settings for SAMLIdentityAsserter

Configure an Asserting Party that can generate SAML assertions consumed by this SAML Identity Assertion provider.

Partner ID:	ap_00001	The Asserting Party ID. More Info...
Profile:	Browser/POST	The SAML profile used with this partner: one of Browser/Artifact, Browser/POST, WSS/Sender-Vouches, or WSS/Holder-of-Key. More Info...
<input checked="" type="checkbox"/> Enabled		Specifies whether this Asserting Party can be used to obtain SAML assertions. More Info...
Description:	<input type="text" value="Webcenter Spaces Wik"/>	A short description of this Asserting Party. More Info...
Target URL:	<input type="text" value="http://example.com"/>	The target URL of this SAML Asserting Party. More Info...

Profile Configuration

POST Signing Certificate Alias:	<input type="text" value="webcenter"/>	The alias of the certificate trusted for verifying signatures on SAML protocol elements from this Asserting Party. Must be set for Browser/POST profile. More Info...
Source Site Redirect URIs:	<input type="text" value="/owc_wiki/user/login.js"/>	An optional set of URIs from which unauthenticated users will be redirected to the configured ITS URL. If set, the IntersiteTransferURL must also be set. More Info...
Source Site ITS URL:	<input type="text" value="http://example.com"/>	The Intersite Transfer Service (ITS) URL of the SAML Source Site for this Asserting Party. More Info...
Source Site ITS Parameters:	<input type="text" value="RPID=rp_00001"/>	Optionally, zero or more query parameters, of the form name=value, that will be added to the ITS URL when redirecting to the source site. More Info...

- Configure the Asserting Party for the WebCenter domain Wiki service as shown in [Table 23–13](#). For more information, see [Table 23–5](#), "Relying Party Settings for Wiki Service".

Table 23–13 WebCenter Domain - Asserting Party for Wiki

Parameter	Value	Description
Enabled	Checked	Specifies whether this Asserting Party can be used to obtain SAML assertions
Description		A short description of this Asserting Party (for example, WebCenter Spaces for Wiki)
Target URL		The target URL of this SAML Asserting Party (for example, <code>http://example.com:8888/webcenter</code>)
POST Signing Certificate alias		The alias of the certificate trusted for verifying signatures on SAML protocol elements from this Asserting Party (for example, <code>testalias</code>). Must be set when using the Browser/POST profile.

Table 23–13 (Cont.) WebCenter Domain - Asserting Party for Wiki

Parameter	Value	Description
Source Site Redirect URIs	/owc_wiki/user/login.jz	<p>An optional set of URIs from which unauthenticated users will be redirected to the configured ITS URL. If set, the IntersiteTransferURL must also be set.</p> <p>Note: Based on this setting, when you first access the destination site, you are redirected to the configured ITS URL (which in this case is within the source application), your session is established with the source application and then redirected to the destination site.</p>
Source Site ITS URL		<p>The Intersite Transfer Service (ITS) URL of the SAML Source Site for this Asserting Party (for example, <code>http://example.com:8888/webcenter/samlits/its</code>).</p> <p>Used with SSO profiles only, to support the destination site first scenario, whereby a user tries to access a destination site URL prior to being authenticated and is redirected to the source site to be authenticated and obtain a SAML assertion. The Redirect URIs attribute must also be configured for source-site redirection to work.</p> <p>Note: If you check ITS requires SSL in Source Site Federation Services, you must also change the Source Site ITS URL to use HTTPS and the server's SSL port.</p>
Source Site ITS parameters	RPID=rp_00001	<p>Optionally, zero or more query parameters, of the form <code>name=value</code>, that will be added to the ITS URL when redirecting to the source site. In this case, <code>rp_00001</code> is the relying party ID for the OWC Wiki application specified in the SAML Credential Mapping Provider of the WebCenter domain which provides the destination site details. For more information, see Table 23–5, "Relying Party Settings for Wiki Service".</p>
Issuer URI		<p>The issuer URI of the SAML Authority issuing assertions for this SAML Asserting Party (for example, <code>http://www.example.com/webcenter</code>).</p> <p>This URI should be same as the Issuer URI for the SAML Credential Mapping provider as specified in Table 23–4, "SAML Credential Mapping Provider Security Realm Settings".</p>
Signature Required	Checked	<p>If true, assertions must be signed. If false, signature elements are not required, but will be verified if present.</p>
Assertion Signing Certificate alias		<p>The alias of the certificate trusted for verifying signatures on assertions from this Asserting Party (for example, <code>testalias</code>). This must be set if Signature Required is checked. The certificate must also be registered in the SAML Identity Asserter's certificate registry.</p>

11. Click **Save** to save your settings.

12. Repeat steps 1 - 11 using the settings shown in [Table 23–14](#) to configure the Asserting party for the WebCenter domain RSS application.

Table 23–14 WE Domain - Asserting Party for RSS

Parameter	Value	Description
Enabled	Checked	Specifies whether this Asserting Party can be used to obtain SAML assertions.
Description		A short description of this Asserting Party (for example, <i>WebCenter Spaces for RSS</i>)
Target URL		The target URL of this SAML Asserting Party (for example, <code>http://example.com:8888/webcenter</code>)
POST Signing Certificate alias		The alias of the certificate trusted for verifying signatures on SAML protocol elements from this Asserting Party (for example, <code>testalias</code>). Must be set when using the Browser/POST profile.
Source Site Redirect URIs	<code>/rss/rssservlet</code>	An optional set of URIs from which unauthenticated users will be redirected to the configured ITS URL. If set, the <code>IntersiteTransferURL</code> must also be set. Note: Based on this setting, when you first access the destination site, you are redirected to the configured ITS URL (which in this case is within the source application), your session is established with the source application and then redirected to the destination site.
Source Site ITS URL		The Intersite Transfer Service (ITS) URL of the SAML Source Site for this Asserting Party (for example, <code>http://example.com:8888/webcenter/samlits/its</code>). Used with SSO profiles only, to support the destination site first scenario, whereby a user tries to access a destination site URL prior to being authenticated and is redirected to the source site to be authenticated and obtain a SAML assertion. The Redirect URIs attribute must also be configured for source-site redirection to work. Note: If you check ITS requires SSL in Source Site Federation Services, you must also change the Source Site ITS URL to use HTTPS and the server's SSL port.
Source Site ITS parameters	<code>RPID=rp_00002</code>	Optionally, zero or more query parameters, of the form <code>name=value</code> , that will be added to the ITS URL when redirecting to the source site. In this case <code>rp_00002</code> is the relying party ID for RSS specified in the SAML Credential Mapping provider of the WebCenter domain which provides the destination site details. See Table 23–9, "Relying Party Settings for RSS" for more information about RSS settings.

Table 23–14 (Cont.) WE Domain - Asserting Party for RSS

Parameter	Value	Description
Issuer URI		The issuer URI of the SAML Authority issuing assertions for this SAML Asserting Party (for example, <code>http://www.example.com/webcenter</code>). This URI should be same as the Issuer URI for the SAML Credential Mapping provider as specified in Table 23–4, "SAML Credential Mapping Provider Security Realm Settings".
Signature Required	Checked	If true, assertions must be signed. If false, signature elements are not required, but will be verified if present.
Assertion Signing Certificate alias		The alias of the certificate trusted for verifying signatures on assertions from this Asserting Party (for example, <code>testalias</code>). This must be set if Signature Required is checked. The certificate must also be registered in the SAML Identity Asserter's certificate registry.

- Repeat steps 1 - 11 using the settings shown in Table 23–15 to configure the Asserting party for the WebCenter domain Discussions application.

Table 23–15 WebCenter Domain - Asserting Party for Discussions

Parameter	Value	Description
Enabled	Checked	Specifies whether this Asserting Party can be used to obtain SAML assertions.
Description		A short description of this Asserting Party (for example, <code>WebCenter Spaces for Discussions</code>)
Target URL		The target URL of this SAML Asserting Party (for example, <code>http://example.com:8888/webcenter</code>)
POST Signing Certificate alias		The alias of the certificate trusted for verifying signatures on SAML protocol elements from this Asserting Party (for example, <code>testalias</code>). This must be set when using the Browser/POST profile.
Source Site Redirect URIs	<code>/owc_discussions/admin/content-main.jsp</code> <code>/owc_discussions/login!withRedirect.jspa</code> <code>/owc_discussions/login!default.jspa</code> <code>/owc_discussions/login.jspa</code>	<p>An optional set of URIs from which unauthenticated users will be redirected to the configured ITS URL. If set, the <code>IntersiteTransferURL</code> must also be set.</p> <p>Note: Based on this setting, when you first access the destination site, you are redirected to the configured ITS URL (which in this case is within the source application), your session is established with the source application and then redirected to the destination site.</p>

Table 23–15 (Cont.) WebCenter Domain - Asserting Party for Discussions

Parameter	Value	Description
Source Site ITS URL		<p>The Intersite Transfer Service (ITS) URL of the SAML Source Site for this Asserting Party (for example, <code>http://example.com:8888/webcenter/samlits/its</code>).</p> <p>Used with SSO profiles only, to support the destination site first scenario, whereby a user tries to access a destination site URL prior to being authenticated and is redirected to the source site to be authenticated and obtain a SAML assertion. The Redirect URIs attribute must also be configured for source-site redirection to work.</p> <p>Note: If you check ITS requires SSL in Source Site Federation Services, you must also change the Source Site ITS URL to use HTTPS and the server's SSL port.</p>
Source Site ITS parameters	RPID=rp_00006	<p>Optionally, zero or more query parameters, of the form <code>name=value</code>, that will be added to the ITS URL when redirecting to the source site. In this case <code>rp_00006</code> is the relying party ID for OWC Discussions specified in the SAML Credential Mapping provider of the WebCenter domain which provides the destination site details. See Table 23–10, "Relying Party Settings for Discussions" for more information about Discussions settings.</p>
Issuer URI		<p>The issuer URI of the SAML Authority issuing assertions for this SAML Asserting Party (for example, <code>http://www.example.com/webcenter</code>).</p> <p>This URI should be same as the Issuer URI for the SAML Credential Mapping provider as specified in Table 23–4, "SAML Credential Mapping Provider Security Realm Settings".</p>
Signature Required	Checked	<p>If true, assertions must be signed. If false, signature elements are not required, but will be verified if present.</p>
Assertion Signing Certificate alias		<p>The alias of the certificate trusted for verifying signatures on assertions from this Asserting Party (for example, <code>testalias</code>). This must be set if Signature Required is checked. The certificate must also be registered in the SAML Identity Asserter's certificate registry.</p>

- Change domains to the SOA domain and repeat steps 1 - 11 using the settings shown in [Table 23–16](#) to configure the Asserting Party for the SOA domain Worklist Community Detail service.

Table 23–16 SOA Domain - Asserting Party for Worklist Community Detail

Parameter	Value	Description
Enabled	Checked	Specifies whether this Asserting Party can be used to obtain SAML assertions

Table 23–16 (Cont.) SOA Domain - Asserting Party for Worklist Community Detail

Parameter	Value	Description
Description		A short description of this Asserting Party (for example, WebCenter Spaces for Worklist Detail)
Target URL		The target URL of this SAML Asserting Party (for example, <code>http://example.com:8888/webcenter</code>)
POST Signing Certificate alias		The alias of the certificate trusted for verifying signatures on SAML protocol elements from this Asserting Party (for example, <code>testalias</code>). Must be set when using Browser/POST profile.
Source Site Redirect URIs	<code>/workflow/WebCenterWorklistDetail/faces/adf.task-flow</code>	An optional set of URIs from which unauthenticated users will be redirected to the configured ITS URL. If set, the <code>IntersiteTransferURL</code> must also be set. Note: Based on this setting, when you first access the destination site, you are redirected to the configured ITS URL (which in this case is within the source application), your session is established with the source application and then redirected to the destination site.
Source Site ITS URL		The Intersite Transfer Service (ITS) URL of the SAML Source Site for this Asserting Party (for example, <code>http://example.com:8888/webcenter/samlits/its</code>). Used with SSO profiles only, to support the destination site first scenario, whereby a user tries to access a destination site URL prior to being authenticated and is redirected to the source site to be authenticated and obtain a SAML assertion. The Redirect URIs attribute must also be configured for source-site redirection to work. Note: If you check ITS requires SSL in Source Site Federation Services, you must also change the Source Site ITS URL to use HTTPS and the server's SSL port.
Source Site ITS parameters	<code>RPID=rp_00002</code>	Optionally, zero or more query parameters, of the form <code>name=value</code> , that will be added to the ITS URL when redirecting to the source site. In this case <code>rp_00002</code> is the relying party ID for the Worklist Detail application specified in the SAML Credential Mapping provider for the WebCenter domain, which provides the destination site details. For more information, see Table 23–6, "Relying Party Settings for Worklist Community Detail" .
Issuer URI		The issuer URI of the SAML Authority issuing assertions for this SAML Asserting Party (for example, <code>http://www.example.com/webcenter</code>). This URI should be same as the Issuer URI for the SAML Credential Mapping provider as specified in Table 23–4, "SAML Credential Mapping Provider Security Realm Settings" .

Table 23–16 (Cont.) SOA Domain - Asserting Party for Worklist Community Detail

Parameter	Value	Description
Signature Required	Checked	If checked, assertions must be signed. If unchecked, signature elements are not required, but will be verified if present.
Assertion Signing Certificate alias		The alias of the certificate trusted for verifying signatures on assertions from this Asserting Party (for example, <code>testalias</code>). This must be set if Signature Required is checked. The certificate must also be registered in the SAML Identity Asserter's certificate registry.

15. Change domains to the SOA domain and repeat steps 1 - 11 using the settings shown in [Table 23–17](#) to configure the Asserting Party for the SOA domain Worklist SDP service. For more information see [Table 23–7, "Relying Party Settings for Worklist SDP"](#) and [Table 23–8, "Relying Party Settings for Worklist Integration"](#).

Table 23–17 SOA Domain - Asserting Party for Worklist SDP

Parameter	Value	Description
Enabled	Checked	Specifies whether this Asserting Party can be used to obtain SAML assertions.
Description		A short description of this Asserting Party (for example, <code>WebCenter Spaces for Worklist SDP</code>)
Target URL		The target URL of this SAML Asserting Party (for example, <code>http://example.com:8888/webcenter</code>)
POST Signing Certificate alias		The alias of the certificate trusted for verifying signatures on SAML protocol elements from this Asserting Party (for example, <code>testalias</code>). Must be set when using Browser/POST profile.
Source Site Redirect URIs	<code>/workflow/sdpmes sagingsca-ui-wor klist/faces/adf. task-flow</code>	An optional set of URIs from which unauthenticated users will be redirected to the configured ITS URL. If set, the <code>IntersiteTransferURL</code> must also be set. Note: Based on this setting, when you first access the destination site, you are redirected to the configured ITS URL (which in this case is within the source application), your session is established with the source application and then redirected to the destination site.

Table 23–17 (Cont.) SOA Domain - Asserting Party for Worklist SDP

Parameter	Value	Description
Source Site ITS URL		<p>The Intersite Transfer Service (ITS) URL of the SAML Source Site for this Asserting Party (for example, <code>http://example.com:8888/webcenter/samlits/its</code>).</p> <p>Used with SSO profiles only, to support the destination site first scenario, whereby a user tries to access a destination site URL prior to being authenticated and is redirected to the source site to be authenticated and obtain a SAML assertion. The Redirect URIs attribute must also be configured for source-site redirection to work.</p> <p>Note: If you check ITS requires SSL in Source Site Federation Services, you must also change the Source Site ITS URL to use HTTPS and the server's SSL port.</p>
Source Site ITS parameters	RPID=rp_00003	<p>Optionally, zero or more query parameters, of the form <code>name=value</code>, that will be added to the ITS URL when redirecting to the source site. In this case <code>rp_00003</code> is the relying party ID for the Worklist SDP application specified in the SAML Credential Mapping provider of the WebCenter domain, which provides the destination site details.</p> <p>For more information, see Table 23–7, "Relying Party Settings for Worklist SDP".</p>
Issuer URI		<p>The issuer URI of the SAML Authority issuing assertions for this SAML Asserting Party (for example, <code>http://www.example.com/webcenter</code>).</p> <p>This URI should be same as the Issuer URI for the SAML Credential Mapping provider as specified in Table 23–4, "SAML Credential Mapping Provider Security Realm Settings".</p>
Signature Required	Checked	<p>If true, assertions must be signed. If false, signature elements are not required, but will be verified if present.</p>

This must be set if Signature Required is checked. The certificate must also be registered in the SAML Identity Asserter's certificate registry.</p>

- Change domains to the SOA domain and repeat steps 1 - 11 using the settings shown in [Table 23–18](#) to configure the Asserting Party for the SOA domain Worklist Community Integration service.

Table 23–18 In SOA Domain, Asserting party For Worklist Integration

Parameter	Value	Description
Enabled	Checked	Specifies whether this Asserting Party can be used to obtain SAML assertions

Table 23–18 (Cont.) In SOA Domain, Asserting party For Worklist Integration

Parameter	Value	Description
Description	WebCenter Spaces for Worklist SDP	A short description of this Asserting Party (for example, WebCenter Spaces for Worklist SDP)
Target URL		The target URL of this SAML Asserting Party (for example, <code>http://example.com:8888/webcenter</code>)
POST Signing Certificate alias		The alias of the certificate trusted for verifying signatures on SAML protocol elements from this Asserting Party (for example, <code>testalias</code>). Must be set when using Browser/POST profile.
Source Site Redirect URIs	<code>/integration/worklistapp/ssologin</code> <code>/integration/worklistapp/faces/home.jspx</code>	An optional set of URIs from which unauthenticated users will be redirected to the configured ITS URL. If set, the <code>IntersiteTransferURL</code> must also be set. Note: Based on this setting, when you first access the destination site, you are redirected to the configured ITS URL (which in this case is within the source application), your session is established with the source application and then redirected to the destination site.
Source Site ITS URL		The Intersite Transfer Service (ITS) URL of the SAML Source Site for this Asserting Party (for example, <code>http://example.com:8888/webcenter/samlits/its</code>). Used with SSO profiles only, to support the destination site first scenario, whereby a user tries to access a destination site URL prior to being authenticated and is redirected to the source site to be authenticated and obtain a SAML assertion. The Redirect URIs attribute must also be configured for source-site redirection to work. Note: If you check ITS requires SSL in Source Site Federation Services, you must also change the Source Site ITS URL to use HTTPS and the server's SSL port.
Source Site ITS parameters	<code>RPID=rp_00004</code>	Optionally, zero or more query parameters, of the form <code>name=value</code> , that will be added to the ITS URL when redirecting to the source site. In this case <code>rp_00004</code> is the relying party ID for the Worklist Integration application specified in the SAML Credential Mapping provider of the WebCenter domain, which provides the destination site details. For more information, see Table 23–8, "Relying Party Settings for Worklist Integration" .
Issuer URI		The issuer URI of the SAML Authority issuing assertions for this SAML Asserting Party (for example, <code>http://www.example.com/webcenter</code>). This URI should be same as the Issuer URI for the SAML Credential Mapping provider as specified in Table 23–4, "SAML Credential Mapping Provider Security Realm Settings" .

Table 23–18 (Cont.) In SOA Domain, Asserting party For Worklist Integration

Parameter	Value	Description
Signature Required	Checked	If true, assertions must be signed. If false, signature elements are not required, but will be verified if present.
Assertion Signing Certificate alias		The alias of the certificate trusted for verifying signatures on assertions from this Asserting Party (for example, <code>testalias</code>). This must be set if Signature Required is checked. The certificate must also be registered in the SAML Identity Asserter's certificate registry.

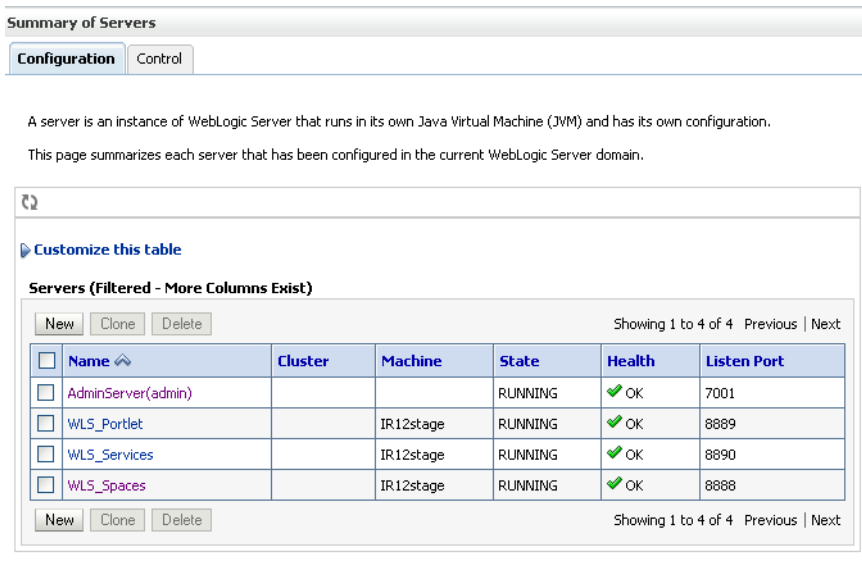

23.7.3.2.7 Configuring Destination Site Federation Services

This section describes how to configure the Destination Site Federation Services for the Wiki service, RSS, and the Worklist service on the WebCenter domain.

To configure the Destination Site Federation Services:

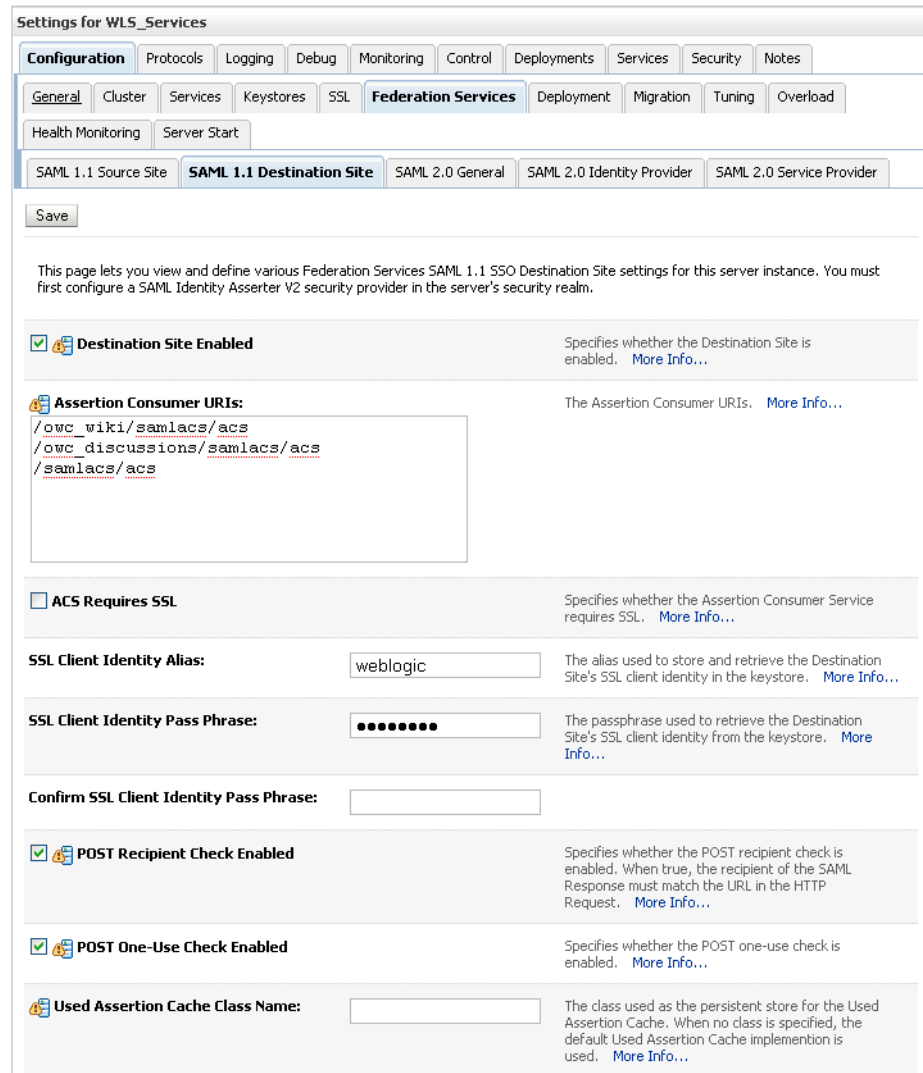

1. Log in to the WebLogic Server Administration Console.
For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)
2. On the Domain Structure pane, expand the **Environment** node and click **Servers**.
The Summary of Servers page displays (see [Figure 23–127](#)).

Figure 23–127 Summary of Servers Page

3. Click `WLS_Services` (the managed server where the Wiki service and Discussions service are deployed) and open the Configuration tab.
4. Open the Federation Services tab and the SAML 1.1 Destination Site subtab.
The SAML 1.1 Destination Site Settings pane displays (see [Figure 23–128](#)).

Figure 23–128 SAML 1.1 Destination Site Settings Pane (Wiki and Discussions)

5. Configure the SAML destination site attributes for the Wiki and Discussions applications as shown in [Table 23–19](#).

Table 23–19 SAML Destination Site Attributes (Wiki and Discussions)

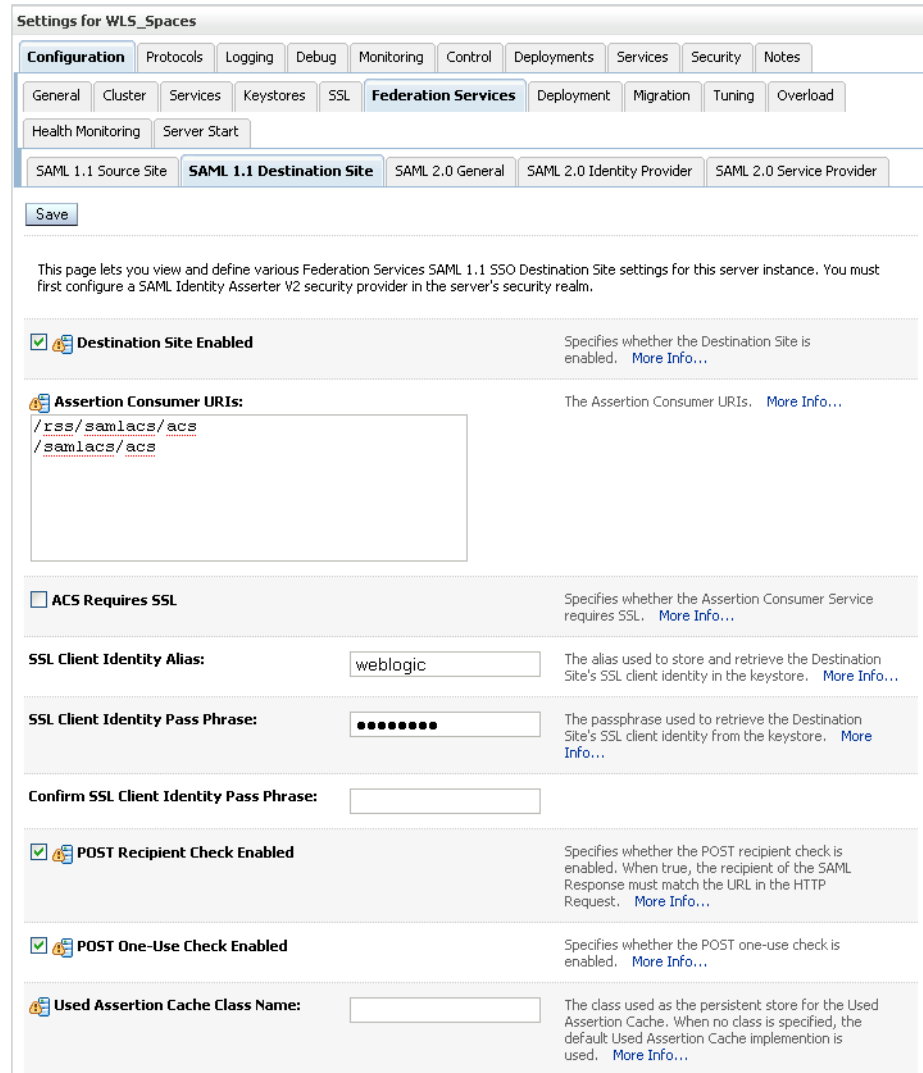

Parameter	Value	Description
Destination Site Enabled	Checked	Specifies whether the Destination Site is enabled.
ACS Requires SSL	Unchecked	Specifies whether the Assertion Consumer Service requires SSL. If checked, then ensure that the ACS URL specified in the Credential Mapper's relying party uses HTTPS and target server's SSL port.

Table 23–19 (Cont.) SAML Destination Site Attributes (Wiki and Discussions)

Parameter	Value	Description
Assertion Consumer URIs	/owc_wiki/samlacs/acs /owc_discussions/samlacs/acs [add on top, leave rest as is]	The Assertion Consumer URIs. In this case, we have chosen for the ACS to reside within the target app so that it uses the same login cookie.
POST Recipient Check Enabled	Checked	Specifies whether the POST recipient check is enabled. When checked, the recipient of the SAML Response must match the URL in the HTTP Request.
POST One use Check Enabled	Checked	Specifies whether the POST one-use check is enabled.

6. Click **Save** to save your settings, and restart the `WLS_Services` server so that they take effect.
7. From the Domain Structure pane, expand the **Environment** node and click **Servers**.
8. Click `WLS_Spaces` (the managed server where RSS is deployed) and open the Configuration tab.
9. Open the Federation Services tab and the SAML 1.1 Destination Site subtab. The SAML 1.1 Destination Site Settings pane displays (see [Figure 23–129](#)).

Figure 23–129 SAML 1.1 Destination Site Settings Pane (RSS)

10. Configure the SAML destination site attributes for RSS as shown in [Table 23–20](#).

Table 23–20 SAML Destination Site Attributes (RSS)

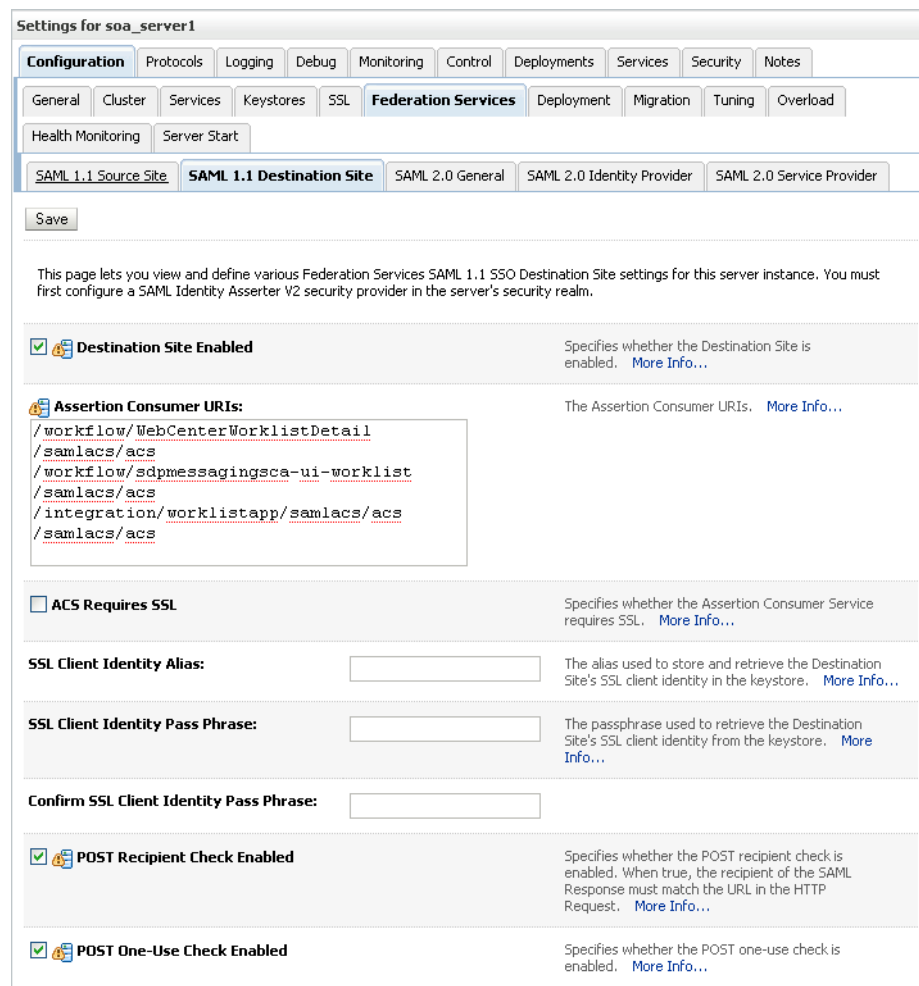

Parameter	Value	Description
Destination Site Enabled	Checked	Specifies whether the Destination Site is enabled.
ACS Requires SSL	Unchecked	Specifies whether the Assertion Consumer Service requires SSL. If checked, then ensure that ACS URL specified in Credential Mapper's relying party uses https and target server's SSL port.
Assertion Consumer URIs	/rss/samlacs/acs (add on top, leave rest as is)	The Assertion Consumer URIs. In this case, we have chosen for the ACS to reside within the target app so that it uses the same login cookie.

Table 23–20 (Cont.) SAML Destination Site Attributes (RSS)

Parameter	Value	Description
POST Recipient Check Enabled	Checked	Specifies whether the POST recipient check is enabled. When true, the recipient of the SAML Response must match the URL in the HTTP Request.
POST One use Check Enabled	Checked	Specifies whether the POST one-use check is enabled.

11. Click **Save** to save your settings, and restart the `WSL_Spaces` server so that they take effect.
12. Navigate to the SOA domain and then to `soa_server1`, or the managed server where the Worklist applications are deployed.
13. Follow the same steps as above to open the SAML 1.1 Destination Site subtab.
The SAML 1.1 Destination Site Settings pane displays (see [Figure 23–130](#)).

Figure 23–130 SAML 1.1 Destination Site Settings Pane (Worklist Detail and SDP)

14. Configure the SAML 1.1 Destination Site attributes for Worklist Detail and SDP as shown in [Table 23–21](#).

Table 23–21 SOA Domain - SAML Destination Site Attributes (Worklist Detail and SDP)

Parameter	Value	Description
Destination Site Enabled	Checked	Specifies whether the Destination Site is enabled.
ACS Requires SSL	Unchecked	Specifies whether the Assertion Consumer Service requires SSL. If checked, then ensure that ACS URL specified in Credential Mapper's relying party uses HTTPS and the target server's SSL port.
Assertion Consumer URIs	<pre>/workflow/WebCenterWorklistDetail/samlacs/acs</pre> <pre>/workflow/sdpmessagingsca-ui-worklist/samlacs/acs</pre> <pre>/integration/worklistapp/samlacs/acs</pre> (add on top, leave rest as is)	The Assertion Consumer URIs. In this case, we have chosen for the ACS to reside within the target app so that it uses the same login cookie.
POST Recipient Check Enabled	Checked	Specifies whether the POST recipient check is enabled. When checked, the recipient of the SAML Response must match the URL in the HTTP Request.
POST One use Check Enabled	Checked	Specifies whether the POST one-use check is enabled.

15. Click **Save** to save your settings.

16. Restart the SOA managed server.

23.7.3.2.8 Checking Your Configuration

The last step in the process is to check that your single sign-on configuration is working. To do that:

1. Check that when you try to access the Wiki and RSS applications independently, you are taken to the WebCenter Spaces login page (source site) and then directed to the URL you were trying to access.
2. Now log into WebCenter Spaces and check that you're not challenged for credentials when:
 - You access the Wiki from a group space
 - You access RSS from a list task flow
 - You click **Forum Administration** from **Group Space Settings > Services > Discussions** (assuming this service is provisioned for the group space)
 - You click a Forum from Group Space Settings from Discussions

23.7.4 Configuring SSO with Microsoft Clients

This section describes how to set up single sign-on (SSO) with Microsoft clients, using Windows authentication based on the Simple and Protected Negotiate (SPNEGO) mechanism and the Kerberos protocol, together with the WebLogic Negotiate Identity

Assertion provider for the WebCenter Spaces application. This SSO approach enables Microsoft clients (such as browsers), authenticated in a Windows domain using Kerberos, to be transparently authenticated to web applications (such as WebCenter Spaces) in a WebLogic domain based on the same credentials, and without the need to type in their password again.

Cross-platform authentication is achieved by emulating the negotiate behavior of native Windows-to-Windows authentication services that use the Kerberos protocol. In order for cross-platform authentication to work, non-Windows servers (in this case, WebLogic Server) need to parse SPNEGO tokens in order to extract Kerberos tokens, which are then used for authentication.

This section contains the following sub-sections:

- [Section 23.7.4.1, "Microsoft Client SSO Concepts"](#)
- [Section 23.7.4.2, "System Requirements"](#)
- [Section 23.7.4.3, "Configuring SSO with Microsoft Clients"](#)

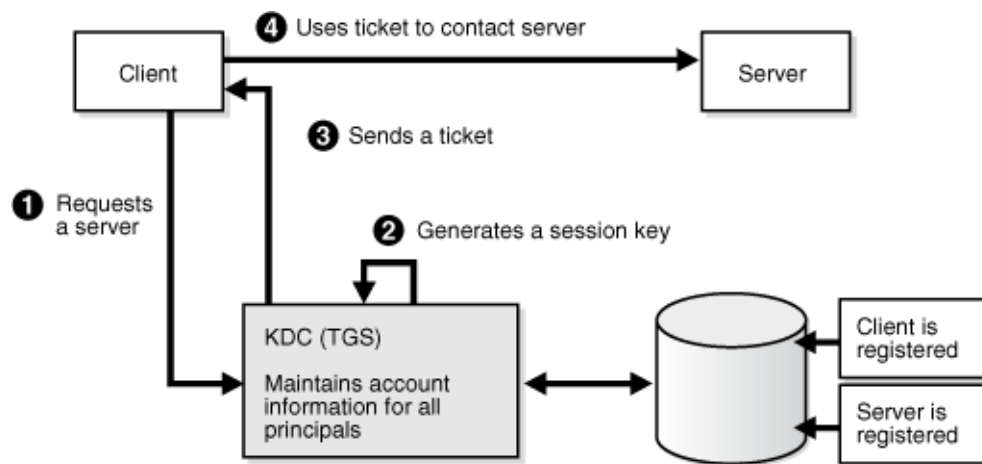

23.7.4.1 Microsoft Client SSO Concepts

Understanding Kerberos

Kerberos is a secure method for authenticating a request for a service in a network. The Kerberos protocol comprises three parties: a client, a server and a trusted third party to mediate between them, known as the KDC (Key Distribution Center). Under Kerberos, a server allows a user to access its service if the user can provide the server a Kerberos ticket that proves its identity. Both the user and the service are required to have keys registered with the KDC.

The diagram below describes the basic exchanges that must take place before a client connects to a server.

Figure 23–131 Connecting to a Server Through a Key Distribution Center

This diagram shows how clients connect to a server through a Key Distribution Center.

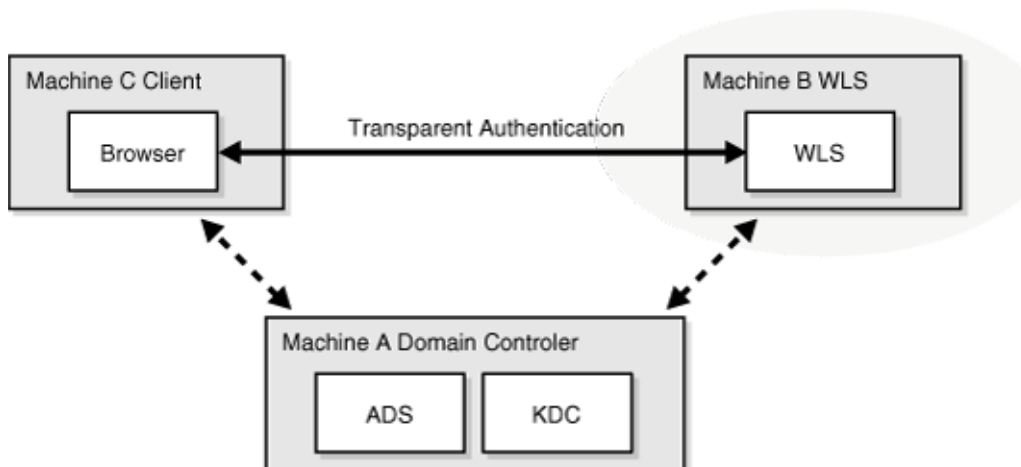

Understanding SPNEGO

SPNEGO (Simple and Protected GSSAPI Negotiation Mechanism) is a GSSAPI "pseudo mechanism" that is used to negotiate one of a number of possible real mechanisms. SPNEGO is used when a client application wants to authenticate to a remote server, but neither end is sure what authentication protocols the other supports. The pseudo-mechanism uses a protocol to determine what common GSSAPI mechanisms are available, selects one, and then dispatches all further security operations to it. This can help organizations deploy new security mechanisms in a phased manner.

SPNEGO's most visible use is in Microsoft's HTTP Negotiate authentication extension. The negotiable sub-mechanisms include NTLM and Kerberos, both used in Active Directory.

This feature enables a client browser to access a protected resource on WebLogic Server, and to transparently provide the WebLogic Server with authentication information from the Kerberos database using a SPNEGO ticket. The WebLogic Server is able to recognize the ticket and extract the information from it. WebLogic Server then uses the information for authentication and grants access to the resource if the authenticated user is authorized to access it. (Kerberos is responsible for authentication only; authorization is still handled by WebLogic Server.)

Figure 23-132 SPNEGO-based Authentication

This diagram shows authentication between a non-WebLogic server and a WebLogic server using SPNEGO.

23.7.4.2 System Requirements

To use SSO with Microsoft clients you need:

A host computer with:

- Windows 2000 or later installed
- Fully-configured Active Directory authentication service. Specific Active Directory requirements include:
 - User accounts for mapping Kerberos services
 - Service Principal Names (SPNs) for those accounts

- Key tab files created and copied to the start-up directory in the WebLogic Server domain
- WebLogic Server installed and configured properly to authenticate through Kerberos, as described in this section

Client systems with:

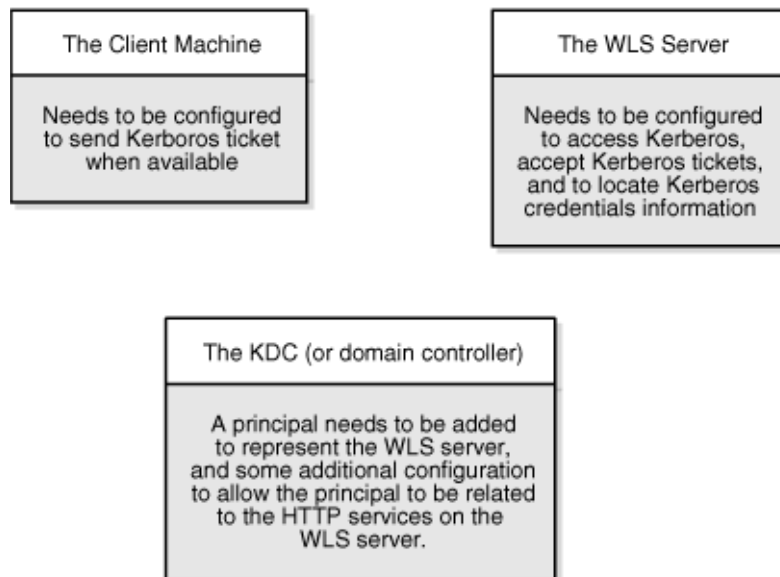

- Windows 2000 Professional SP2 or later installed
- One of the following types of clients:
 - A properly configured Internet Explorer browser. Internet Explorer 6.01 or later is supported.
 - .NET Framework 1.1 and a properly configured Web Service client.

Note: Clients must be logged on to a Windows 2000 domain and have Kerberos credentials acquired from the Active Directory server in the domain. Local logons will not work.

23.7.4.3 Configuring SSO with Microsoft Clients

Configuring SSO with Microsoft clients requires configuring the Microsoft Active Directory, the client, and the WebLogic Server domain shown in [Figure 23-133](#). For detailed configuration steps and troubleshooting, see "Configuring Single Sign-On with Microsoft Clients" in *Oracle Fusion Middleware Securing Oracle WebLogic Server*.

Figure 23-133 *Configuring SSO with Microsoft Clients*

To configure Microsoft clients for SSO:

1. Configure your network domain to use Kerberos.
2. Create a Kerberos identification for WebLogic Server.
 - a. Create a user account in the Active Directory for the host on which WebLogic Server is running.
 - b. Create a Service Principal Name for this account.

- c. Create a user mapping and keytab file for this account.
3. Choose a Microsoft client (in this case Internet Explorer) and configure it to use Windows Integrated authentication.
4. Set up the WebLogic Server domain (`wc_domain` in this case) to use Kerberos authentication.
 - a. Create a JAAS login file that points to the Active Directory server in the Microsoft domain and the keytab file created in Step 2.
 - b. Configure a Negotiate Identity Assertion provider in the WebLogic Server security realm (see [Section 23.7.4.3.1, "Configuring the Negotiate Identity Assertion Provider"](#)).
 - c. Configure the WebLogic Server domain to use the Active Directory Authenticator so that the WebLogic domain uses the same Active Directory of the domain as the identity store. You could also use a different identity store and match the users in this store with the Active Directory users of your domain, but using the Active Directory authenticator is recommended as maintaining two different identity stores risks them getting out of sync. See [Section 23.7.4.3.2, "Configuring an Active Directory Authentication Provider"](#).

Caution: Ensure that only the identity store is configured for Active Directory. The policy and credential stores are not certified for Active Directory.

5. Start the WebLogic Servers (Administration Server and managed servers) using specific start-up arguments. Repeat steps 4 and 5 for the SOA Domain to enable single sign-on for SOA applications.
6. Configure WebCenter Spaces (see [Section 23.7.4.3.3, "Configuring WebCenter Spaces"](#)).
7. Configure the discussions server (see [Section 23.7.4.3.4, "Configuring the Discussions Server for SSO"](#)).

23.7.4.3.1 Configuring the Negotiate Identity Assertion Provider

This section provides instructions for creating and configuring a Negotiate Identity Assertion provider. The Negotiate Identity Assertion provider enables single sign-on (SSO) with Microsoft clients. The identity assertion provider decodes Simple and Protected Negotiate (SPNEGO) tokens to obtain Kerberos tokens, validates the Kerberos tokens, and maps them to WebLogic users. The Negotiate Identity Assertion provider uses the Java Generic Security Service (GSS) Application Programming Interface (API) to accept the GSS security context via Kerberos.

To configure the Negotiate Identity Assertion provider:

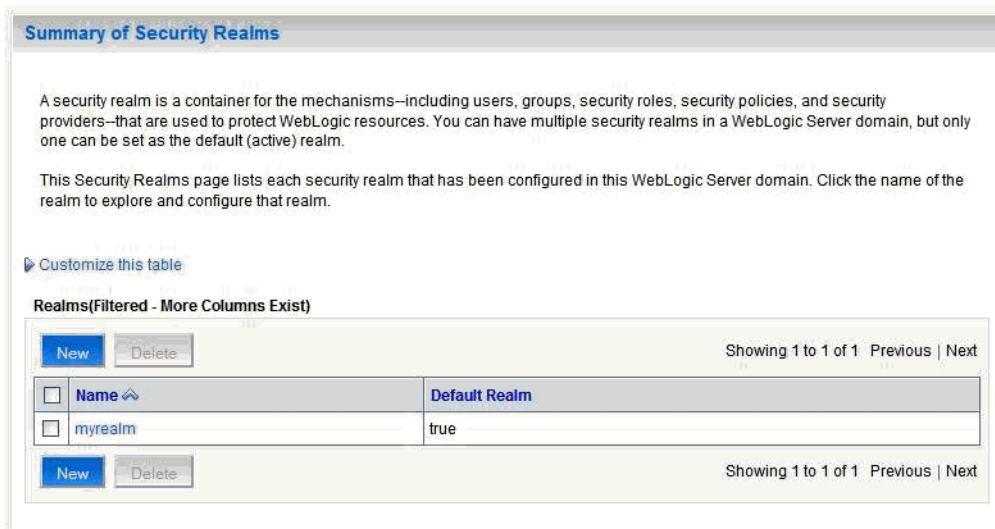

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. From the Domain Structure pane, click **Security Realms**.

The Summary of Security Realms pane displays (see [Figure 23-134](#)).

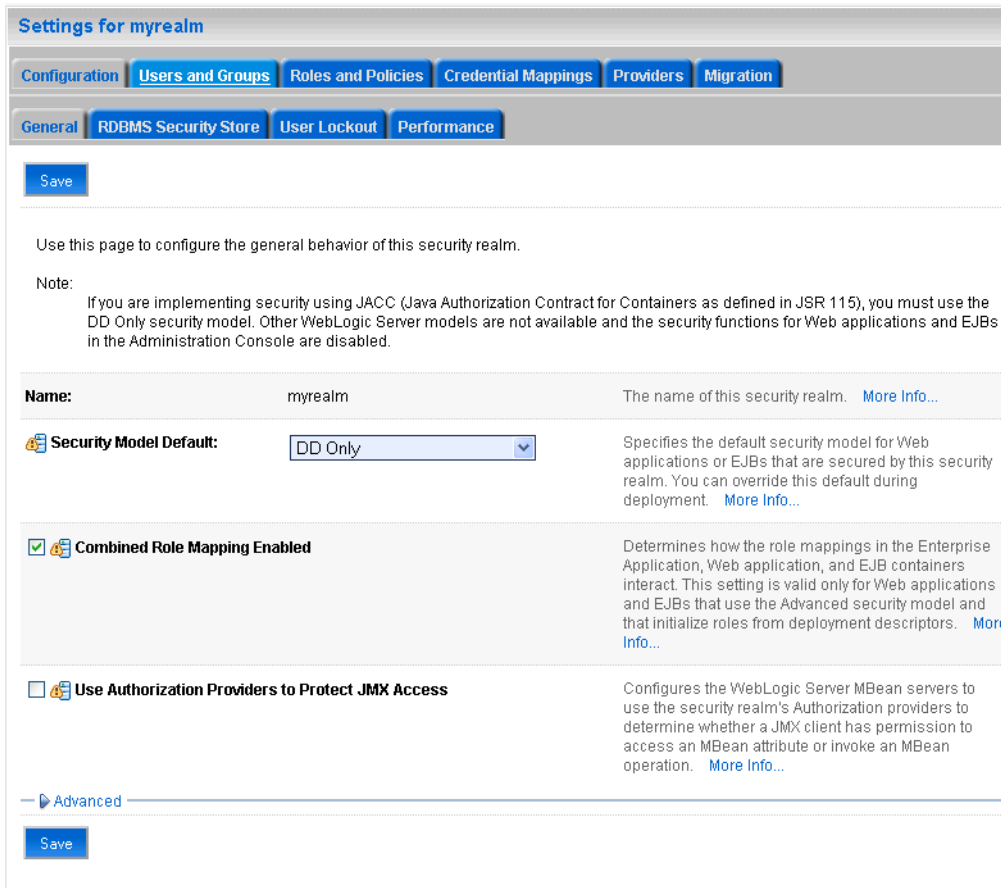

Figure 23–134 Summary of Security Realms Pane

3. Click your security realm.

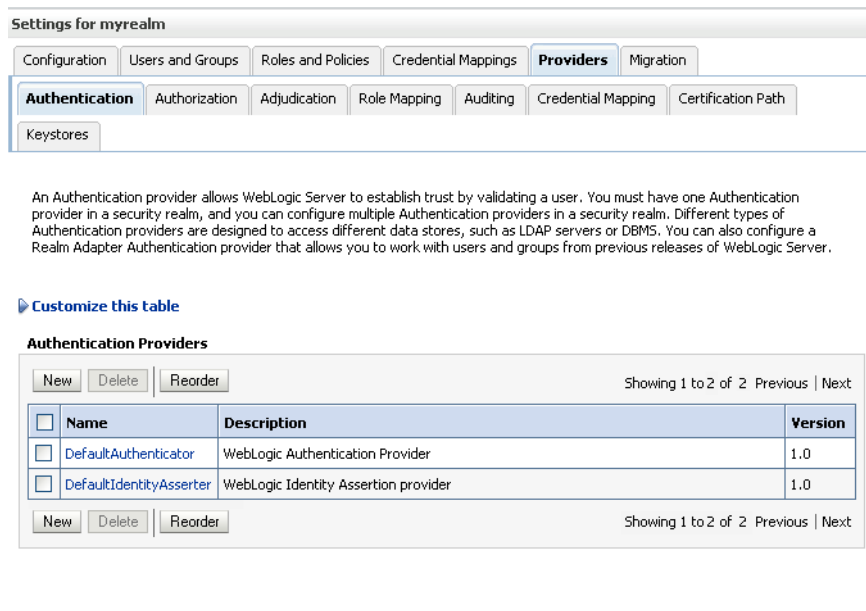

The Settings page for the security realm displays (see [Figure 23–135](#)).

Figure 23–135 Security Realm Settings Page

4. Open the Providers tab and select the Authentication subtab.
The Authentication Settings pane displays (see [Figure 23–136](#)).

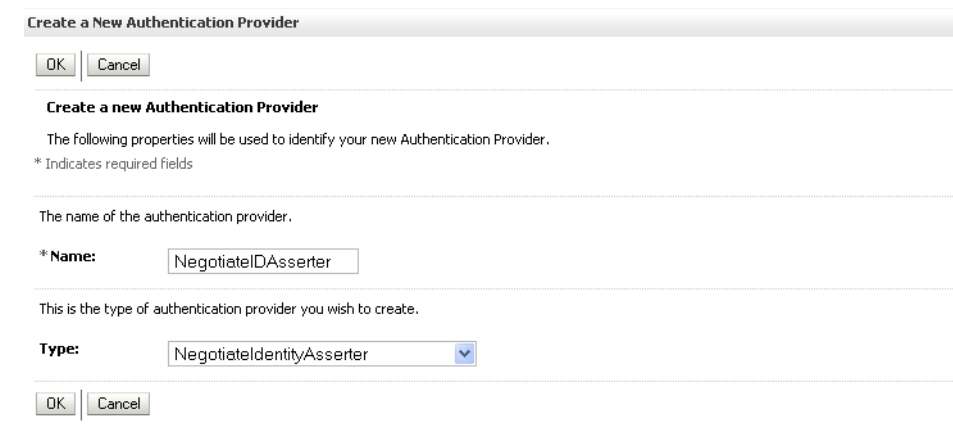

Figure 23–136 Authentication Settings Pane

This screenshot shows the Authentication Settings pane.

5. Click **New**.
The Create a New Authentication Provider pane displays (see [Figure 23–137](#)).

Figure 23–137 Create a New Authentication Provider Pane

6. Enter a **Name** for the identity asserter, and select `NegotiateIdentityAsserter` as the **Type**.
7. Click **OK**.

23.7.4.3.2 Configuring an Active Directory Authentication Provider

Follow the steps below to configure an Active Directory authentication provider using the WebLogic Administration Console.

To configure an Active Directory Authentication provider:

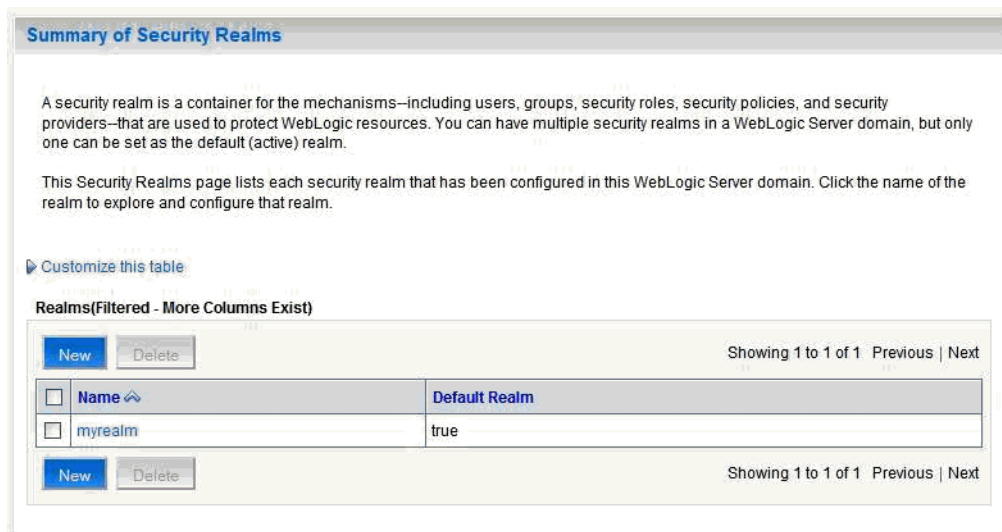

1. Log in to the WebLogic Server Administration Console.

For information on logging into the WebLogic Server Administration Console, see [Section 1.12.2, "Oracle WebLogic Server Administration Console."](#)

2. From the Domain Structure pane, click **Security Realms**.

The Summary of Security Realms pane displays (see [Figure 23–138](#)).

Figure 23–138 Summary of Security Realms Pane

3. Click your security realm.

The Settings page for the security realm displays (see [Figure 23–139](#)).

Figure 23–139 Security Realm Settings Page

9. Open the Configuration tab and the Common subtab.
10. Set the Control Flag to SUFFICIENT and click **Save**.

Note: The Control Flag settings of any other authenticators must also be changed to SUFFICIENT. If there is a pre-existing Default Authenticator that has its Control Flag set to REQUIRED, it must be changed to SUFFICIENT.

11. Open the Provider Specific subtab.
The Provider Specific Settings pane displays (see [Figure 23–143](#)).

Figure 23–143 Provider Specific Settings Pane

Settings for AD Authenticator

Configuration Performance

Common **Provider Specific**

Save

Use this page to define the provider specific configuration for this Active Directory Authentication provider.

Connection

Host: The host name or IP address of the LDAP server. [More Info...](#)

Port: The port number on which the LDAP server is listening. [More Info...](#)

Principal: The Distinguished Name (DN) of the LDAP user that WebLogic Server should use to connect to the LDAP server. [More Info...](#)

Credential: The credential (usually a password) used to connect to the LDAP server. [More Info...](#)

Confirm Credential:

SSLEnabled Specifies whether the SSL protocol should be used when connecting to the LDAP server. [More Info...](#)

Users

User Base DN: The base distinguished name (DN) of the tree in the LDAP directory that contains users. [More Info...](#)

All Users Filter: If the attribute (user object class) is not specified (that is, if the attribute is null or empty), a default search filter is created based on the user schema. [More Info...](#)

User From Name Filter: If the attribute (user name attribute and user object class) is not specified (that is, if the attribute is null or empty), a default search filter is created based on the user schema. [More Info...](#)

User Search Scope: Specifies how deep in the LDAP directory tree the LDAP Authentication provider should search for users. [More Info...](#)

User Name Attribute: The attribute of an LDAP user object that specifies the name of the user. [More Info...](#)

User Object Class: The LDAP object class that stores users. [More Info...](#)

12. Complete the fields as shown in the table below. Leave the rest of the fields set to their default values.

Table 23–22 Active Directory Authenticator Settings

Parameter	Value	Description
Host:		The host ID of the LDAP server
Port:		The port number of the LDAP server
Principal:		The LDAP administrator principal
Credential:		
User Base DN:		The user search base (for example, OU=spnego unit,DC=admin,DC=oracle,DC=com)
User From Name Filter:	(&(cn=%u)(objectclass=user))	
User Search Scope:	subtree	
User Name Attribute:	cn	

Table 23–22 (Cont.) Active Directory Authenticator Settings

Parameter	Value	Description
User Search Scope:	user	
Group Base DN:		The group search base (same as User Base DN)
Group From Name Filter:	(&(cn=%g)(objectclass=group))	
Group Search Scope:	subtree	
Static Group Name Attribute:	cn	
Static Group Object Class:	group	
Static Member DN Attribute:	member	
Static Group DN from Member DN Filter:	(&(member=%M)(objectclass=group))	

13. Click Save.

14. On the Provider Summary page, reorder the providers in the following order, making sure that their Control Flags are set to `SUFFICIENT` where applicable:

1. Negotiate Identity Asserter
2. ActiveDirectoryAuthenticator (`SUFFICIENT`)
3. DefaultAuthenticator (`SUFFICIENT`)
4. Other authenticators...

23.7.4.3.3 Configuring WebCenter Spaces

Once you have completed the steps for configuring the Negotiate Identity Assertion Provider and Active Directory Authenticator, and all applications on your WebLogic domain are configured for single sign-on with Microsoft clients in the required domain, a final step is required to provide a seamless single-sign-on experience for your users when accessing WebCenter Spaces. There are two options for doing this:

- Turn off public access, by logging into WebCenter Spaces as an administrator and removing view access from the Public role. Once public access has been turned off, accessing the URL `http://host:port/webcenter` will directly take the user to the authenticated view rather than the default public page which has a login section. This is recommended when users will be accessing WebCenter Spaces only using Internet Explorer, and will be confined to the domain where WNA is set up.
- If you need to retain public access to WebCenter Spaces, then the recommendation is to use the `oracle.webcenter.osso.enabled` flag when starting the `WLS_Spaces` server. This flag tells WebCenter Spaces that SSO is being used and no login form should be displayed on the default landing page. A login link is displayed instead that the user can click to invoke the SSO authentication where the user will be automatically logged in. If Firefox is used to access WebCenter Spaces within the Windows network configured for WNA, or any browser is used to access WebCenter Spaces from outside the Windows network domain, the user will see the login page after clicking the Login link.

23.7.4.3.4 Configuring the Discussions Server for SSO

This section describes how to configure Oracle WebCenter Discussions Server for single sign-on. Before configuring the discussions server for SSO, be sure that it has been configured to use the same identity store LDAP as WebCenter Spaces, as described in [Section 23.3.4.1, "Migrating the WebCenter Discussions Server to use an External LDAP."](#)

To set up the discussions server for SSO:

1. Log in to the Oracle WebCenter Discussions Server Admin Console at:

```
http://host:port/owc_discussions/admin
```

Where *host* and *port* are the host ID and port number of the WLS_Services managed server.

2. Open the System Properties page and edit (if it already exists) or add the `owc_discussions.sso.mode` property, setting its value to `true`.
3. Edit or add the `jiveURL` property to point to the base URL of the SSO server. For example:

```
jiveURL = example.com:8890/owc_discussions
```

23.8 Configuring WS-Security

This section describes setting up WS-Security for WebCenter applications (including WebCenter Spaces and custom WebCenter applications) and related components based on your topology. This section covers the following configurations:

- a simple topology, with the WebCenter application and all components sharing the same domain,
- a typical topology, with the WebCenter application and components divided across two domains, and
- a complex topology, with the WebCenter application and components divided across multiple domains.

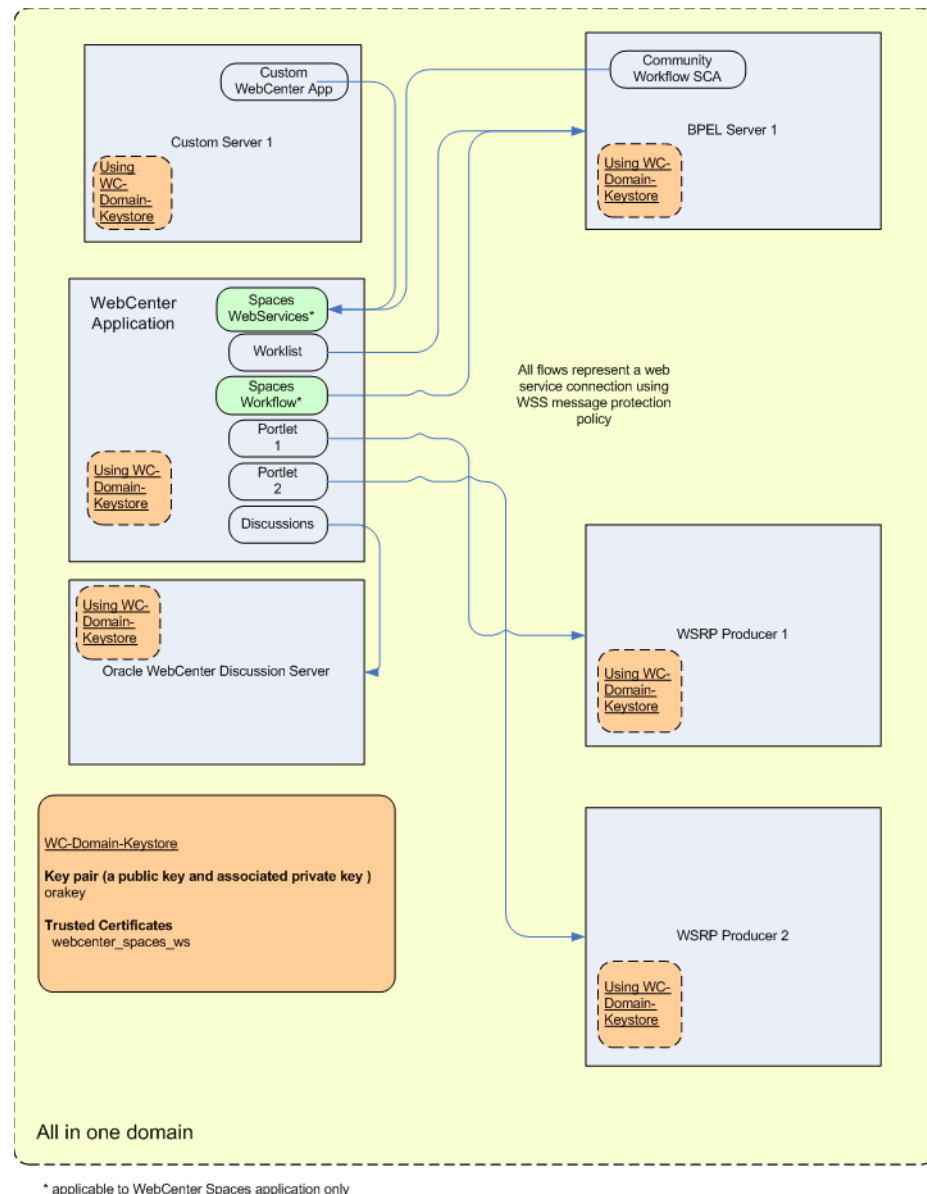

Within these three topologies, configuration is described for the WebCenter application, Oracle WebCenter Discussions, the Worklist service, and WSRP producers. These configurations and the steps for two additional WS-Security configurations are covered in the following sections:

- [Section 23.8.1, "Configuring WS-Security for a Simple Topology"](#)
- [Section 23.8.2, "Configuring WS-Security for a Typical Topology"](#)
- [Section 23.8.3, "Configuring WS-Security for a Complex Topology"](#)
- [Section 23.8.4, "Securing Oracle WebLogic Communication Services \(OWLCS\) with WS-Security"](#)
- [Section 23.8.5, "Securing a WSRP Producer with WS-Security"](#)
- [Section 23.8.6, "Securing WebCenter Spaces for Applications Consuming Spaces Client APIs with WS-Security"](#)

23.8.1 Configuring WS-Security for a Simple Topology

This section describes how to configure WS-Security for a topology where the WebCenter application, the BPEL server, and WSRP producers share the same domain (Figure 23-144).

Figure 23-144 *WS-Security for a Simple Configuration*

The steps to configure WS-Security for a simple single-domain WebCenter topology are described in the following sections:

- [Section 23.8.1.1, "Setting Up the WebCenter Domain Keystore"](#)
- [Section 23.8.1.2, "Configuring the Discussions Server for a Simple Topology"](#)
- [Section 23.8.1.3, "Configuring the BPEL Server for a Simple Topology"](#)

23.8.1.1 Setting Up the WebCenter Domain Keystore

The security credentials of the WebCenter application, discussions server, BPEL server, and WSRP producers can be retrieved and managed using a Java Keystore (JKS). A keystore is a file that provides information about available public and private keys. Keys are used for a variety of purposes, including authentication and data integrity. User certificates and the trust points needed to validate the certificates of peers are also stored securely in the wallet or keystore. See the *Oracle Fusion Middleware Security and Administrator's Guide for Web Services* for information about JKS.

This section contains the following subsections:

- [Section 23.8.1.1.1, "Creating the WebCenter Domain Keystore"](#)
- [Section 23.8.1.1.2, "Configuring the Keystore with WLST"](#)
- [Section 23.8.1.1.3, "Configuring the Keystore Using Fusion Middleware Control"](#)
- [Section 23.8.1.1.4, "Unconfiguring a Keystore Provider Using Fusion Middleware Control"](#)

23.8.1.1.1 Creating the WebCenter Domain Keystore

This section describes how to create a keystore and keys using a Java Keystore (JKS). JKS is the proprietary keystore format defined by Sun Microsystems. To create and manage the keys and certificates in the JKS, use the `keytool` utility that is distributed with the Java JDK 6.

To create the WebCenter domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, generate a key pair:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias orakey -keypass
key_password -keystore keystore -storepass keystore_password -validity days_
valid
```

Where:

- `consumer_dname` is the name of the consumer (for example, `cn=spaces,dc=example,dc=com`)
- `key_password` is the password for the new public key, (for example, `welcome1`)
- `keystore` is the keystore name, (for example, `webcenter.jks`)
- `keystore_password` is the keystore password, (for example, `welcome1`)
- `days_valid` is the number of days for which the key password is valid (for example, `1064`).

Example 23–1 Generating the Keypair

```
keytool -genkeypair -keyalg RSA -dname "cn=spaces,dc=example,dc=com" -alias orakey
-keypass welcome1 -keystore webcenter.jks -storepass welcome1 -validity 1064
```

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

3. Export the certificate containing the public key:

```
keytool -exportcert -v -alias orakey -keystore keystore -storepass keystore_
password -rfc -file orakey.cer
```

Where:

- *keystore* is the keystore name, (for example, *webcenter.jks*)
- *keystore_password* is the keystore password, (for example, *welcome1*)

Example 23–2 Exporting the Certificate Containing the Public Key

```
keytool -exportcert -v -alias orakey -keystore webcenter.jks -storepass welcome1
-rfc -file orakey.cer
```

4. Import the certificate with the alias *webcenter_spaces_ws* (choose **Yes when prompted whether to overwrite the existing certificate with the alias *orakey*):**

```
keytool -importcert -alias webcenter_spaces_ws -file orakey.cer -keystore
webcenter.jks -storepass keystore_password
```

Where:

- *keystore_password* is the keystore password

Example 23–3 Importing the Certificate

```
keytool -importcert -alias webcenter_spaces_ws -file orakey.cer -keystore
webcenter.jks -storepass welcome1
```

5. Continue by configuring the keystore using either WLST as described in [Section 23.8.1.1.2, "Configuring the Keystore with WLST,"](#) or using Fusion Middleware Control as described in [Section 23.8.1.1.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

[Table 23–23](#) shows the keystore contents you should wind up with after creating and configuring the keystore.

Table 23–23 WebCenter Domain Keystore Contents for a Simple Topology

Key Alias	Description
orakey	Key pair used to sign and encrypt outbound messages from WebCenter Spaces. This key is used by both OWSM (Portlets and Worklist) and Discussions.
webcenter_spaces_ws	Certificate containing the public key for the orakey private key used in the WebCenter domain. The certificate is used to encrypt outbound WebService messages from the Workflow application on BPEL Server1 in the WebCenter domain, to the WebService APIs on WebCenter domain.

23.8.1.1.2 Configuring the Keystore with WLST

After creating the keystore, configure the keystore service and update the credential store so that OWSM can read the keystore and keys correctly.

To configure the credential store:

1. Go to the `<DOMAIN_HOME>/config/fmwconfig` directory, and open the file `jps-config.xml` in an editor.
2. Locate the `<serviceInstance node for the keystore.provider Provider`

3. Make sure that the `webcenter.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./webcenter.jks`.
4. Use the following WLST commands to update the credential store:

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password=keystore_password, desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="orakey",
password=private_key_password, desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="orakey",
password=private_key_password, desc="Signing key")
```

Where:

- `keystore_password` is the keystore password specified in step 2 of [Section 23.8.1.1.1, "Creating the WebCenter Domain Keystore,"](#) (for example, `welcome1`)
- `private_key_password` is the private key password specified in step 2 of [Section 23.8.1.1.1, "Creating the WebCenter Domain Keystore,"](#) (for example, `welcome1`)

Example 23–4 Updating the Credential Store

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password="welcome1", desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="orakey",
password="welcome1", desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="orakey",
password="welcome1", desc="Signing key")
```

5. Restart all servers.

23.8.1.1.3 Configuring the Keystore Using Fusion Middleware Control

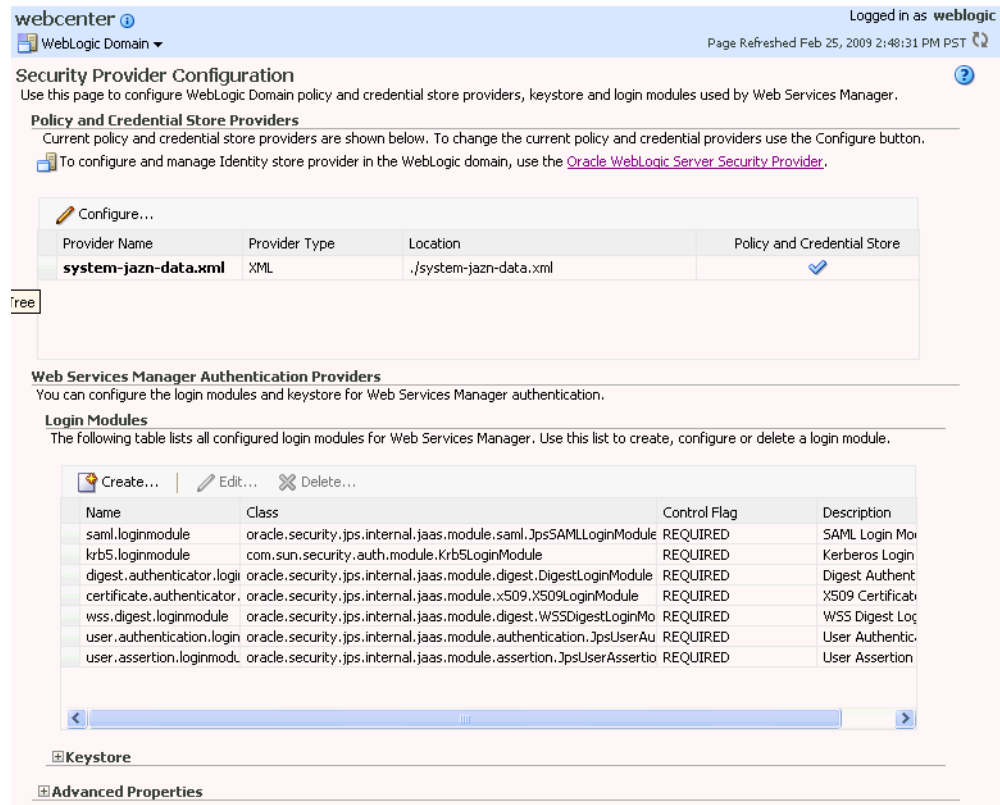

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider as described in [Section 23.8.1.1.4, "Unconfiguring a Keystore Provider Using Fusion Middleware Control."](#) Otherwise, continue with the steps below.

To configure the keystore provider:

1. Make sure that the `webcenter.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./webcenter.jks`.
2. Open Fusion Middleware Control and log into the WebCenter domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
3. In the Navigation pane, expand the WebLogic Domain node and click on the WebCenter domain (`webcenter` by default).
4. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.

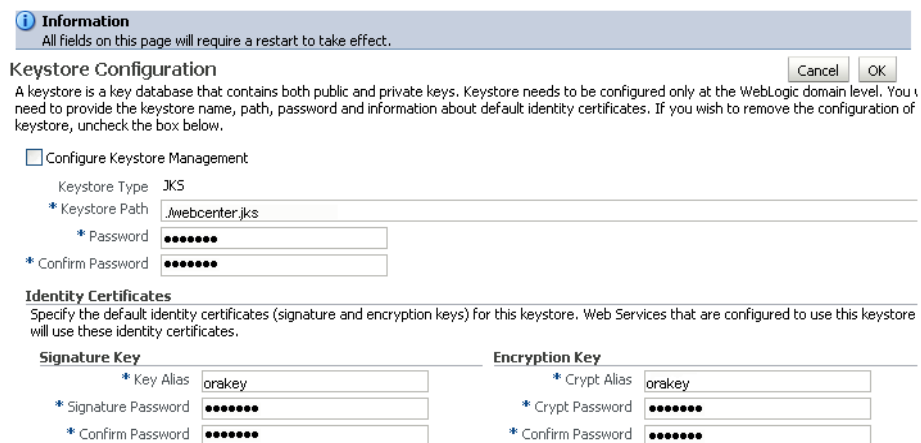

The Security Provider Configuration page displays (see [Figure 23–145](#)).

Figure 23–145 Security Provider Configuration Page

5. Expand the Keystore section on the Security Provider Configuration page.
 6. Click **Configure**.
- The Keystore Configuration page displays (see [Figure 23–146](#)).

Figure 23–146 Keystore Configuration Page

This screenshot shows the Keystore Configuration page.

7. Check **Configure Keystore Management** and use the following settings to specify the location of the keystore that contains the certificate and private key, and the signature key and encryption key aliases:
 - **Keystore Path:** `./webcenter.jks`
 - **Password:** Enter and confirm the password for the keystore.
 - **Key Alias:** `orakey`
 - **Signature Password:** Enter and confirm the password for the signature key.
 - **Crypt Alias:** `orakey`
 - **Crypt Password:** Enter and confirm the password for the encryption key.
8. Click **OK** to save your settings.
9. Restart the Administration server for the domain.

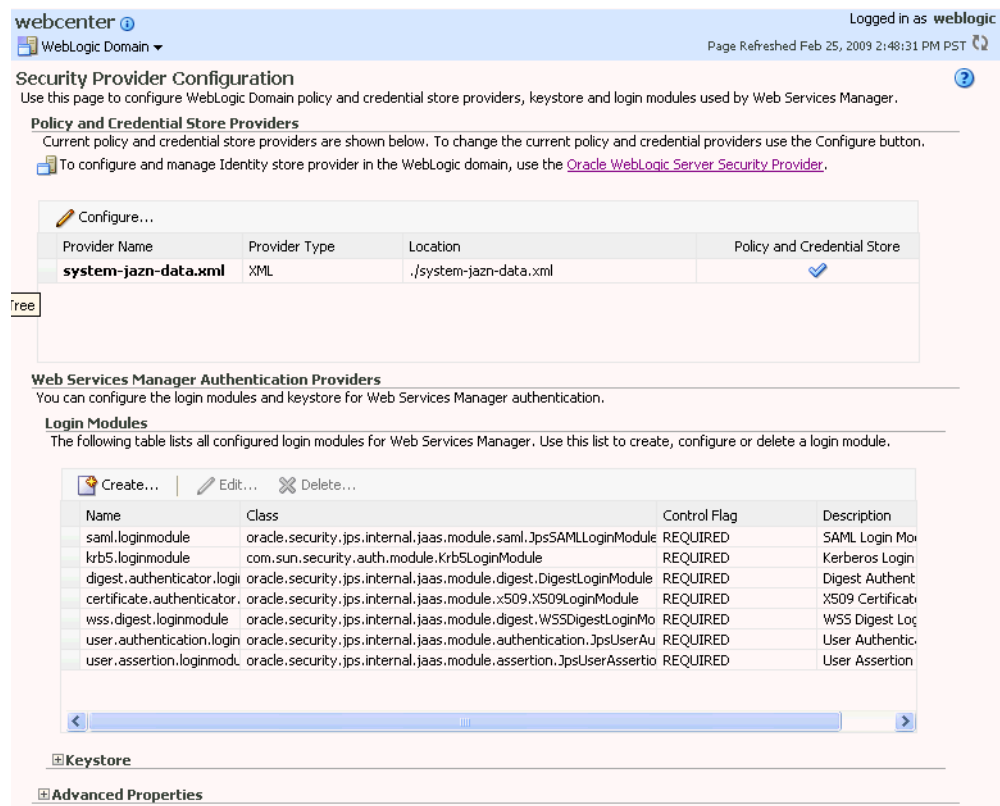

23.8.1.1.4 Unconfiguring a Keystore Provider Using Fusion Middleware Control

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider before configuring a new provider. If a keystore provider is not already configured, ignore this section and continue with the steps to configure the keystore in [Section 23.8.1.1.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

To unconfigure a keystore provider using Fusion Middleware Control:

1. Open Fusion Middleware Control and log into the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.
The Security Provider Configuration page displays (see [Figure 23-147](#)).

Figure 23–147 Security Provider Configuration Page

3. Expand the Keystore section on the Security Provider Configuration page.
4. Click **Configure**.
The Keystore Configuration page displays (see [Figure 23–148](#)).

Figure 23–148 Keystore Configuration Page

5. Uncheck **Configure Keystore Management**.
6. Click **OK**.

23.8.1.2 Configuring the Discussions Server for a Simple Topology

To use the Oracle WebCenter Discussions with WebCenter Spaces or a custom WebCenter application, you must enable Web Services Security (WS-Security) trusted authentication. WS-Security establishes a trust relationship between your WebCenter application and Oracle WebCenter Discussions so that the application can pass the user identity information to the discussions server without knowing the user's credentials.

Note: Discussions-specific Web Services messages sent by WebCenter applications to the Oracle WebCenter Discussions server are not encrypted. For message confidentiality, the Discussions server URL must be accessed over Secure Socket Layer (SSL). For more information, see [Section 23.6, "Configuring WebCenter Applications and Components to Use SSL."](#)

This section describes how to add the WS-Security-related properties in your Oracle WebCenter Discussions connection into WebCenter Spaces or your WebCenter application. For information on how to add new properties, see [Table 12-4, "Additional Discussion Connection Properties"](#) in [Section 12.3.1, "Registering Discussions Servers Using Fusion Middleware Control."](#)

To configure WS-Security on the discussions server side, you must create a keystore certificate properties file, specify it for the ClassLoader, and modify the `webservices.soap.custom.crypto.fileName` system property. These configuration steps are described in the following sub-sections:

- [Section 23.8.1.2.1, "Importing the WebCenter Domain Certificate"](#)
- [Section 23.8.1.2.2, "Creating the Keystore Certificate Properties File"](#)
- [Section 23.8.1.2.3, "Specifying the Properties File for ClassLoader"](#)
- [Section 23.8.1.2.4, "Updating the System Properties for WS-Security"](#)
- [Section 23.8.1.2.5, "Configuring the Discussions Server Connection Settings"](#)

23.8.1.2.1 Importing the WebCenter Domain Certificate

Create a keystore by importing the certificate containing the public key of the WebCenter domain.

To import the WebCenter domain certificate:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, import the certificate containing the public key of the WebCenter domain:

```
keytool -importcert -alias df_orakey_public -file orakey.cer -keystore owc_
discussions.jks -storepass keystore_password
```

Where:

- `keystore_password` is the keystore password, (for example, `welcome1`)

Example 23-5 Importing the WebCenter Domain Certificate

```
keytool -importcert -alias df_orakey_public -file orakey.cer -keystore owc_
discussions.jks -storepass welcome1
```

3. At the prompt "Trust this certificate?", choose `yes`.

23.8.1.2.2 Creating the Keystore Certificate Properties File

The server-side keystore certificate configuration must be stored in a properties file (`keystore.properties`) and specified as a system property on the discussions server. The properties file must then be loaded in the `ClassLoader` for the WS-Secure Handler to pick it up.

To create the properties file:

1. Create a properties file with the following entries:

```
org.apache.ws.security.crypto.provider= <Specify your crypto provider
(typically org.apache.ws.security.components.crypto.Merlin)>
org.apache.ws.security.crypto.merlin.keystore.type=jks
org.apache.ws.security.crypto.merlin.keystore.password=<Specify the keystore
password of your server certificate. Note that the password stored in this file
is in clear text because of a limitation of the Ws-Security provider WSS4J used
in Oracle Discussions Server.>
org.apache.ws.security.crypto.merlin.keystore.alias=df_orakey_public
org.apache.ws.security.crypto.merlin.file=<Absolute path of directory
containing the certificate file created above>/owc_discussions.jks
```

2. Save the file as `keystore.properties`.

23.8.1.2.3 Specifying the Properties File for ClassLoader

There are two ways you can choose to specify your `keystore.properties` file based on your setup. Using the same file mounted across different servers is recommended when using a Clustered Discussions Server installation in Linux.

To specify the properties file for `ClassLoader`, do one of the following:

- Specify the properties file as the `CLASSPATH` in `setDomainEnv.sh`.

For Linux:

1. Place the `keystore.properties` file in a directory (for example, `/home/user/keystore/`)
2. Open `DOMAIN_HOME/bin/setDomainEnv.sh`.
3. Towards the end of the file, add the following lines to specify this directory as the `CLASSPATH`.

```
if [ "${CLASSPATH}" != "" ] ; then
    CLASSPATH="${CLASSPATH}${CLASSPATHSEP}/home/user/keystore/"
    export CLASSPATH
else
    CLASSPATH="/home/user/keystore/"
    export CLASSPATH
fi
```

Note that the `CLASSPATH` directory name must end with `"/`.

For Windows:

1. Place the `keystore.properties` file in a directory (for example, `c:\keystore\`).
2. Open `DOMAIN_HOME\bin\setDomainEnv.cmd`.
3. Towards the end of the file, add the following lines to specify this directory in `CLASSPATH`.

```
if NOT "%CLASSPATH%"==" (
```

```
        set CLASSPATH=%CLASSPATH%;c:\keystore\  
    ) else (  
        set CLASSPATH=c:\keystore\  
    )
```

Note that the CLASSPATH directory name must end with "\".

- Or, add the `keystore.properties` file to a `.JAR` file and place the `.JAR` file in your `DOMAIN_HOME/lib` directory. Be sure to also set the system property `webservices.soap.custom.crypto.fileName` to `keystore.properties` as described in [Section 23.8.1.2.4, "Updating the System Properties for WS-Security."](#)

23.8.1.2.4 Updating the System Properties for WS-Security

This section describes how to add the WS-Security-related properties in your Oracle WebCenter Discussions connection into WebCenter Spaces or your WebCenter application. For information on how to add new properties, see [Table 12-4, "Additional Discussion Connection Properties"](#) in [Section 12.3.1, "Registering Discussions Servers Using Fusion Middleware Control."](#)

To update your system properties:

1. Log in to the Oracle WebCenter Discussions Administration Console at the following URL:

```
http://host:port/owc_discussions/admin
```

Where `host` and `port` are the address and the port number of the server where you deployed Oracle WebCenter Discussions (for example, `http://localhost:7001/owc_discussions`).

2. Click **System Properties** under **Forum System** to display the Jive Properties page.
3. Modify the system property `webservices.soap.custom.crypto.fileName` and specify the properties file that you created (i.e., `keystore.properties`).
Be sure to specify the name of the file, and not the directory or `.JAR` name.
4. Click **OK**.
5. Restart the `WLS_Services` Managed Server.

23.8.1.2.5 Configuring the Discussions Server Connection Settings

After setting the system properties, your WebCenter application also needs to supply the WS-Security client certificate through the connection settings for Oracle Discussion Forum and Announcement Server as described in [Section 12.3, "Registering Discussions Servers."](#) [Figure 23-149](#) shows example settings for the Edit Discussions and Announcement Connection page.

23.8.1.3 Configuring the BPEL Server for a Simple Topology

The BPEL server's Worklist connection must be configured to use message protected SAML service policy. The BPEL server's `oracle-webservices.xml` file must also be edited so that the server-side SAML policy matches that of the client's policy.

To configure the BPEL server:

1. To configure the Worklist connection on the BPEL server to use the SAML policy with message protection, follow the steps in [Section 20.3.2, "Registering Worklist Connections"](#) selecting SAML Token With Message Client Policy in Fusion Middleware Control, or entering `oracle/wss10_saml_token_with_message_protection_client_policy` as the policy value if using WLST.
2. Use `grep` to find the strings `TaskQueryServicePortSAML` and `provider-name` in all the BPEL server's `oracle-webservices.xml` files. For example:

```
cd <domain home>
find . | grep webservices.xml | xargs grep TaskQueryServicePortSAML | grep
provider-name
./servers/BPEL Server 1/tmp/_WL_
user/soa-infra/ugh7wb/war/WEB-INF/oracle-webservices.xml:
<provider-name>TaskQueryServicePortSAML</provider-name>
```

3. Back up the file. For example:

```
cp
./servers/BPEL Server 1/tmp/_WL_
user/soa-infra/ugh7wb/war/WEB-INF/oracle-webservices.xml
./servers/BPEL Server 1/tmp/_WL_
user/soa-infra/ugh7wb/war/WEB-INF/oracle-webservices.xml.original
```

4. Edit the file, replacing:

```
<policy-reference uri="oracle/wss10_saml_token_service_policy"  
category="security" enabled="true"/>
```

with:

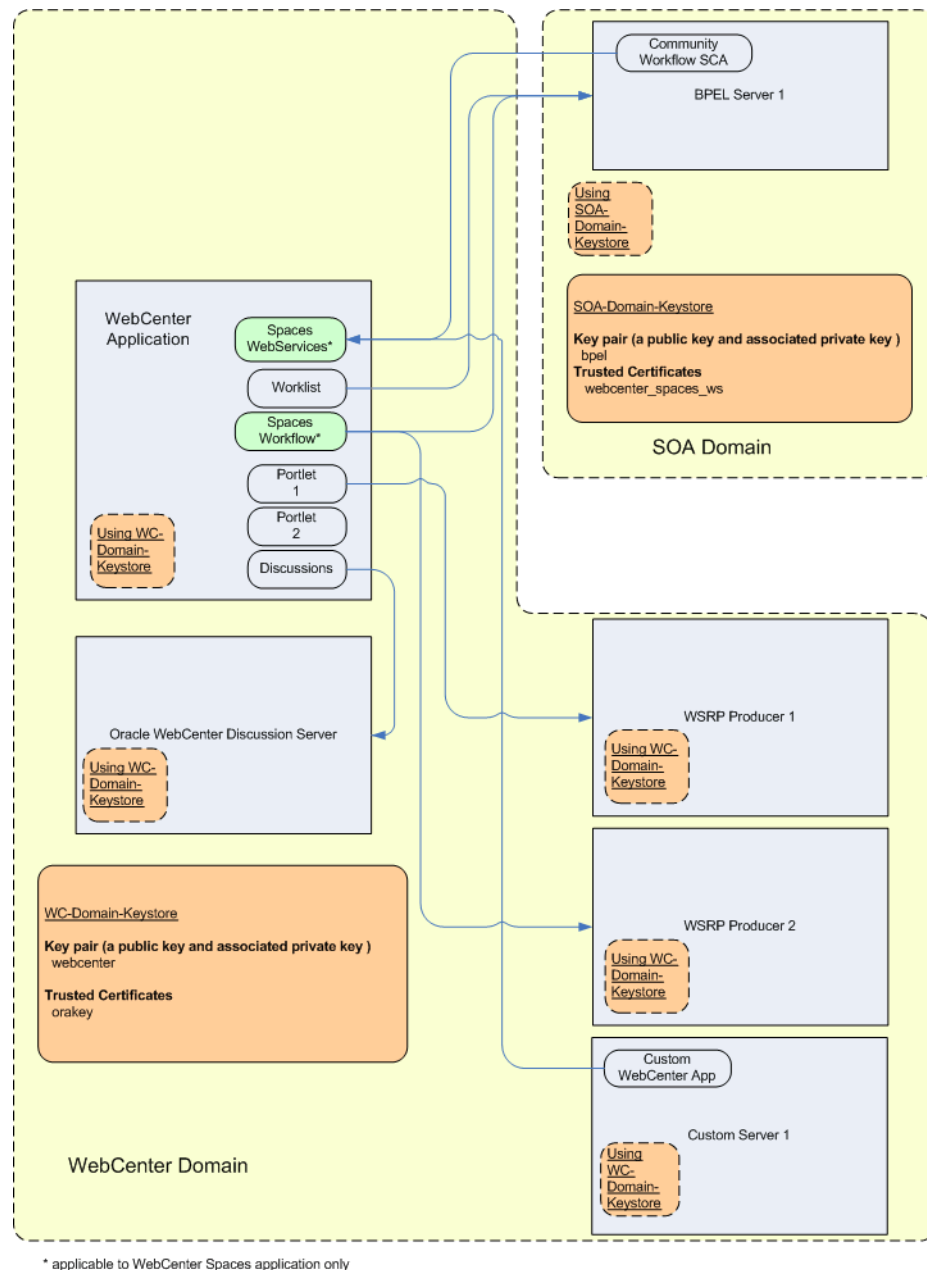

```
<policy-reference uri="oracle/wss10_saml_token_with_message_protection_service_  
policy" category="security" enabled="true"/>
```

5. Save the file and restart the Managed Servers. The message protected SAML access is now configured. Examine the managed server diagnostic logs for exception stack information should the worklist service still not work to obtain information about configuration issues.

23.8.2 Configuring WS-Security for a Typical Topology

This section describes how to configure WS-Security for a topology where the WebCenter application and the WSRP producers share the same domain, but the BPEL server is in an external domain - the SOA domain (see [Figure 23-150](#)).

Figure 23–150 Typical WS-Security Configuration

The steps to configure WS-Security for a typical two domain WebCenter topology are described in the following sections:

- Section 23.8.2.1, "Setting Up the WebCenter Domain Keystore"
- Section 23.8.2.2, "Configuring the Discussions Server for a Typical Topology"
- Section 23.8.3.3, "Setting Up the First SOA Domain"
- Section 23.8.2.4, "Configuring the BPEL Server for a Typical Topology"

23.8.2.1 Setting Up the WebCenter Domain Keystore

The security credentials of a WebCenter application, discussions server, BPEL server (in a separate domain), and WSRP producers can be retrieved and managed using a

Java Keystore (JKS). A keystore is a file that provides information about available public and private keys. Keys are used for a variety of purposes, including authentication and data integrity. User certificates and the trust points needed to validate the certificates of peers are also stored securely in the wallet or keystore. See the *Oracle Fusion Middleware Security and Administrator's Guide for Web Services* for information about JKS.

This section contains the following subsections:

- [Section 23.8.2.1.1, "Creating the WebCenter Domain Keystore"](#)
- [Section 23.8.2.1.2, "Configuring the Keystore Using WLST"](#)
- [Section 23.8.2.1.4, "Unconfiguring a Keystore Provider"](#)
- [Section 23.8.2.1.3, "Configuring the Keystore Using Fusion Middleware Control"](#)

23.8.2.1.1 Creating the WebCenter Domain Keystore

This section describes how to create a keystore and keys using a Java Keystore (JKS). JKS is the proprietary keystore format defined by Sun Microsystems. To create and manage the keys and certificates in the JKS, use the `keytool` utility that is distributed with the Java JDK 6.

To create the WebCenter domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, generate a key pair:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias webcenter
-keypass key_password -keystore keystore -storepass keystore_password -validity
days_valid
```

Where:

- `consumer_dname` is the name of the consumer (for example, `cn=spaces,dc=example,dc=com`)
- `key_password` is the password for the new public key, (for example, `welcome1`)
- `keystore` is the keystore name, (for example, `webcenter.jks`)
- `keystore_password` is the keystore password, (for example, `welcome1`)
- `days_valid` is the number of days for which the key password is valid (for example, `1064`).

Example 23–6 Generating the Keypair

```
keytool -genkeypair -keyalg RSA -dname "cn=spaces,dc=example,dc=com" -alias
webcenter -keypass welcome1 -keystore webcenter.jks -storepass welcome1 -validity
1064
```

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

3. Export the certificate containing the public key:

```
keytool -exportcert -v -alias orakey -keystore keystore -storepass keystore_
```

```
password -rfc -file webcenter_public.cer
```

Where:

- *keystore* is the keystore name, (for example, `webcenter.jks`)
- *keystore_password* is the keystore password, (for example, `welcome1`)

Example 23–7 Exporting the Certificate Containing the Public Key

```
keytool -exportcert -v -alias webcenter -keystore webcenter.jks -storepass
welcome1 -rfc -file webcenter_public.cer
```

4. Continue by configuring the keystore using either WLST, as described in [Section 23.8.2.1.2, "Configuring the Keystore Using WLST,"](#) or Fusion Middleware Control, as described in [Section 23.8.2.1.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

[Table 23–24](#) shows the keystore contents you should wind up with after creating and configuring the keystore.

Table 23–24 WebCenter Domain Keystore Contents for a Typical Topology

Key Alias	Description
webcenter	Key pair used to sign and encrypt outbound messages from WebCenter Spaces. This key is used by both OWSM (Portlets and Worklist) and Discussions.
orakey	Certificate containing the public key for the BPEL private key used in the SOA domain. The certificate is used to encrypt outbound WebService messages from the Workflow application on BPEL Server1 in the WebCenter domain, to the Worklist service to the SOA server on the SOA domain.

23.8.2.1.2 Configuring the Keystore Using WLST

After creating the WebCenter domain keystore, configure the keystore service and update the credential store so that OWSM can read the keystore and keys correctly.

To configure the keystore service:

1. Go to the `<DOMAIN_HOME>/config/fmwconfig` directory, and open the file `jps-config.xml` in an editor.
2. Locate the `<serviceInstance` node for the `keystore.provider Provider`
3. Make sure that the `webcenter.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./webcenter.jks`.
4. Use the following WLST commands to update the credential store:

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password=keystore_password, desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="webcenter",
password=private_key_password, desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="webcenter",
password=private_key_password, desc="Signing key")
```

Where:

- *keystore_password* is the keystore password specified in step 2 of [Section 23.8.2.1.1, "Creating the WebCenter Domain Keystore,"](#) (for example, `welcome1`)
- *private_key_password* is the private key password specified in step 2 of [Section 23.8.2.1.1, "Creating the WebCenter Domain Keystore,"](#) (for example, `welcome1`)

Example 23–8 Updating the Credential Store

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",  
password="welcome1", desc="Keystore key")  
createCred(map="oracle.wsm.security", key="enc-csf-key", user="webcenter",  
password="welcome1", desc="Encryption key")  
createCred(map="oracle.wsm.security", key="sign-csf-key", user="webcenter",  
password="welcome1", desc="Signing key")
```

5. Restart all servers.

23.8.2.1.3 Configuring the Keystore Using Fusion Middleware Control

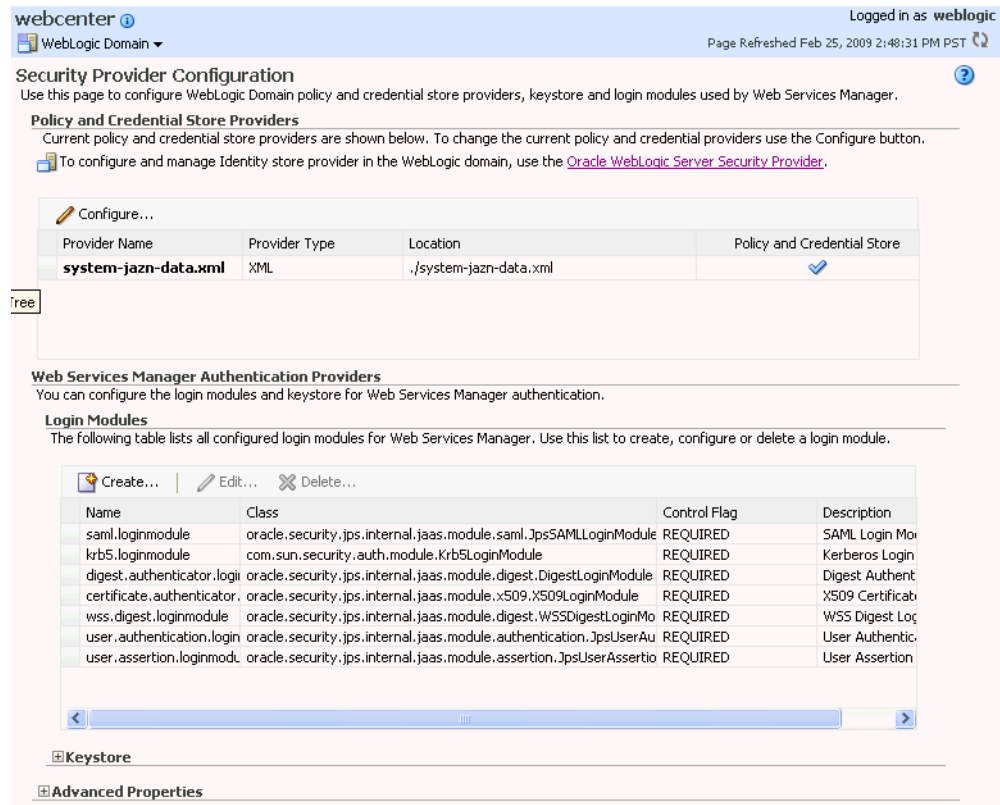

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider as described in [Section 23.8.2.1.4, "Unconfiguring a Keystore Provider."](#) Otherwise, continue with the steps below.

To configure the keystore provider:

1. Open Fusion Middleware Control and log into the WebCenter domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the WebLogic Domain node and click on the WebCenter domain (`webcenter` by default).
3. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.

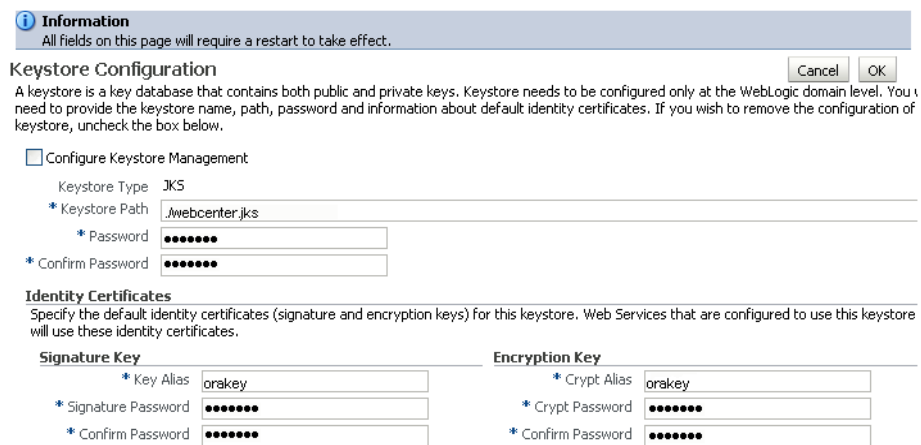

The Security Provider Configuration page displays (see [Figure 23–151](#)).

Figure 23–151 Security Provider Configuration Page

4. Expand the Keystore section on the Security Provider Configuration page.
5. Click **Configure**.
The Keystore Configuration page displays (see Figure 23–152).

Figure 23–152 Keystore Configuration Page

This screenshot shows the Keystore Configuration page.

6. Check **Configure Keystore Management** and use the following settings to specify the location of the keystore that contains the certificate and private key, and the signature key and encryption key aliases:
 - **Keystore Path:** `./webcenter.jks`
 - **Password:** Enter and confirm the password for the keystore.
 - **Key Alias:** `webcenter`
 - **Signature Password:** Enter and confirm the password for the signature key.
 - **Crypt Alias:** `webcenter`
 - **Crypt Password:** Enter and confirm the password for the encryption key.
7. Click **OK** to save your settings.
8. Restart the Administration server for the domain.

23.8.2.1.4 Unconfiguring a Keystore Provider

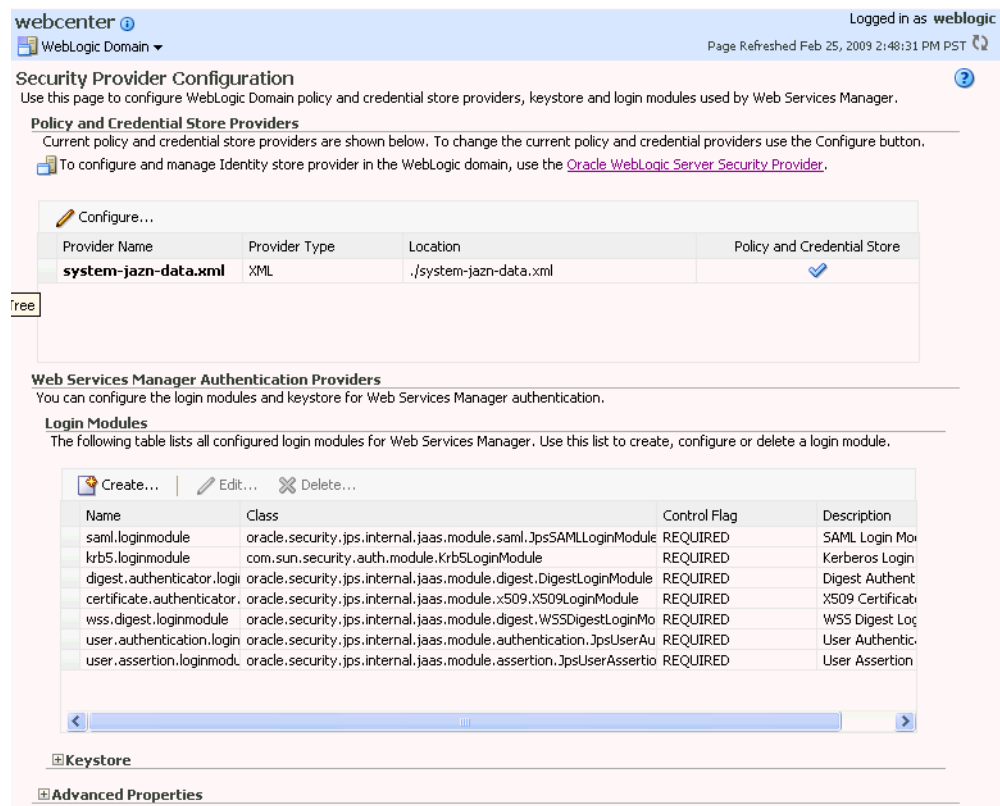

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider before configuring a new provider. If a keystore provider is not already configured, continue with the steps to configure the keystore in [Section 23.8.2.1.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

To unconfigure a keystore provider using Fusion Middleware Control:

1. Open Fusion Middleware Control and log into the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.

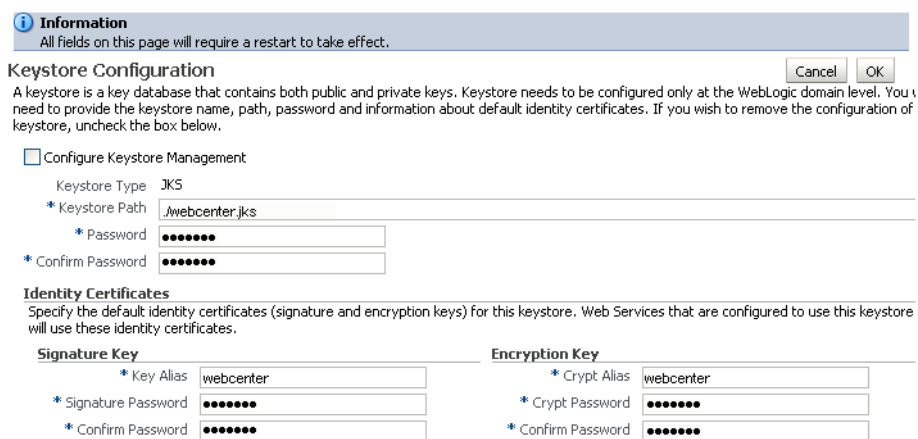

The Security Provider Configuration page displays (see [Figure 23-153](#)).

Figure 23–153 Security Provider Configuration Page

3. Expand the Keystore section on the Security Provider Configuration page.
4. Click **Configure**.
The Keystore Configuration page displays (see [Figure 23–154](#)).

Figure 23–154 Keystore Configuration Page

5. Uncheck **Configure Keystore Management**.
6. Click **OK**.

23.8.2.2 Configuring the Discussions Server for a Typical Topology

To use Oracle WebCenter Discussions with WebCenter Spaces or custom WebCenter applications, you must enable Web Services Security (WS-Security) trusted authentication. WS-Security establishes a trust relationship between your WebCenter application and Oracle WebCenter Discussions so that the application can pass the user identity information to the discussions server without knowing the user's credentials.

Note: Discussions-specific Web Services messages sent by WebCenter applications to the Oracle WebCenter Discussions server are not encrypted. For message confidentiality, the Discussions server URL must be accessed over Secure Socket Layer (SSL). For more information, see [Section 23.6, "Configuring WebCenter Applications and Components to Use SSL."](#)

This section describes how to add the WS-Security-related properties in your Oracle WebCenter Discussions connection into WebCenter Spaces or your WebCenter application. For information on how to add new properties, see [Table 12–4, "Additional Discussion Connection Properties"](#) in [Section 12.3.1, "Registering Discussions Servers Using Fusion Middleware Control."](#)

To configure WS-Security on the discussions server side, you must create a keystore certificate properties file, specify it for the ClassLoader, and modify the `webservices.soap.custom.crypto.fileName` system property.

These configuration steps are described in the following sub-sections:

- [Section 23.8.1.2.1, "Importing the WebCenter Domain Certificate"](#)
- [Section 23.8.1.2.2, "Creating the Keystore Certificate Properties File"](#)
- [Section 23.8.1.2.3, "Specifying the Properties File for ClassLoader"](#)
- [Section 23.8.1.2.4, "Updating the System Properties for WS-Security"](#)

23.8.2.2.1 Importing the WebCenter Domain Certificate

Create a keystore by importing the certificate containing public key of the WebCenter domain.

To import the WebCenter domain certificate:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, import the certificate containing the public key of the WebCenter domain:

```
keytool -importcert -alias df_webcenter_public -file webcenter_public.cer  
-keystore owc_discussions.jks -storepass keystore_password
```

Where:

- `keystore_password` is the keystore password, (for example, `welcome1`)

Example 23–9 Importing the WebCenter Domain Certificate

```
keytool -importcert -alias df_webcenter_public -file webcenter_public.cer  
-keystore owc_discussions.jks -storepass welcome1
```

23.8.2.2.2 Creating the Keystore Certificate Properties File

The server-side keystore certificate configuration must be stored in a properties file (`keystore.properties`) and specified as a system property on the discussions server. The properties file must then be loaded in the `ClassLoader` for the WS-Secure Handler to pick it up.

To create the properties file:

1. Create a properties file with the following entries:

```
org.apache.ws.security.crypto.provider= <Specify your crypto provider
(typically org.apache.ws.security.components.crypto.Merlin)>
org.apache.ws.security.crypto.merlin.keystore.type=jks
org.apache.ws.security.crypto.merlin.keystore.password=<Specify the keystore
password of your server certificate. Note that the password stored in this file
is in clear text because of a limitation of the WS-Security provider WSS4J used
in Oracle Discussions Server.>
org.apache.ws.security.crypto.merlin.keystore.alias=df_orakey_public
org.apache.ws.security.crypto.merlin.file=<Absolute path of directory
containing the keystore (owc_discussions.jks) created above.>
```

2. Save the file as `keystore.properties`.

23.8.2.2.3 Specifying the Properties File for ClassLoader

There are two ways you can choose to specify your `keystore.properties` file based on your setup. Using the same file mounted across different servers is recommended when using a Clustered Discussions Server installation in Linux.

To specify the properties file for `ClassLoader`, do one of the following:

- Specify the properties file as the `CLASSPATH` in `setDomainEnv.sh`.

For Linux:

1. Place the `keystore.properties` file in a directory (for example, `/home/user/keystore/`)
2. Open `DOMAIN_HOME/bin/setDomainEnv.sh`.
3. Towards the end of the file, add the following lines to specify this directory as the `CLASSPATH`.

```
if [ "${CLASSPATH}" != "" ] ; then
    CLASSPATH="${CLASSPATH}${CLASSPATHSEP}/home/user/keystore/"
    export CLASSPATH
else
    CLASSPATH="/home/user/keystore/"
    export CLASSPATH
fi
```

Note that the `CLASSPATH` directory name must end with `"/`.

For Windows:

1. Place the `keystore.properties` file in a directory (for example, `c:\keystore\`).
2. Open `DOMAIN_HOME\bin\setDomainEnv.cmd`.
3. Towards the end of the file, add the following lines to specify this directory in `CLASSPATH`.

```
if NOT "%CLASSPATH%"==" (
    set CLASSPATH=%CLASSPATH%;c:\keystore\
) else (
```

```
        set CLASSPATH=c:\keystore\  
    )
```

Note that the CLASSPATH directory name must end with "\".

- Or, add the `keystore.properties` file to a `.JAR` file and place the `.JAR` file in your `DOMAIN_HOME/lib` directory. Be sure to also set the system property `webservices.soap.custom.crypto.fileName` to `keystore.properties` as described in [Section 23.8.2.2.4, "Updating the System Properties for WS-Security."](#)

23.8.2.2.4 Updating the System Properties for WS-Security To update your system properties:

1. Log in to the Oracle WebCenter Discussions Admin Console at the following URL:

```
http://host:port/owc_discussions/admin
```

Where `host` and `port` are the address and the port number of the server where you deployed Oracle WebCenter Discussions (for example, `http://localhost:7001/owc_discussions`).

2. Click **System Properties** under **Forum System** to display the Jive Properties page.
3. Modify the system property `webservices.soap.custom.crypto.fileName` and specify the properties file that you created (i.e., `keystore.properties`).

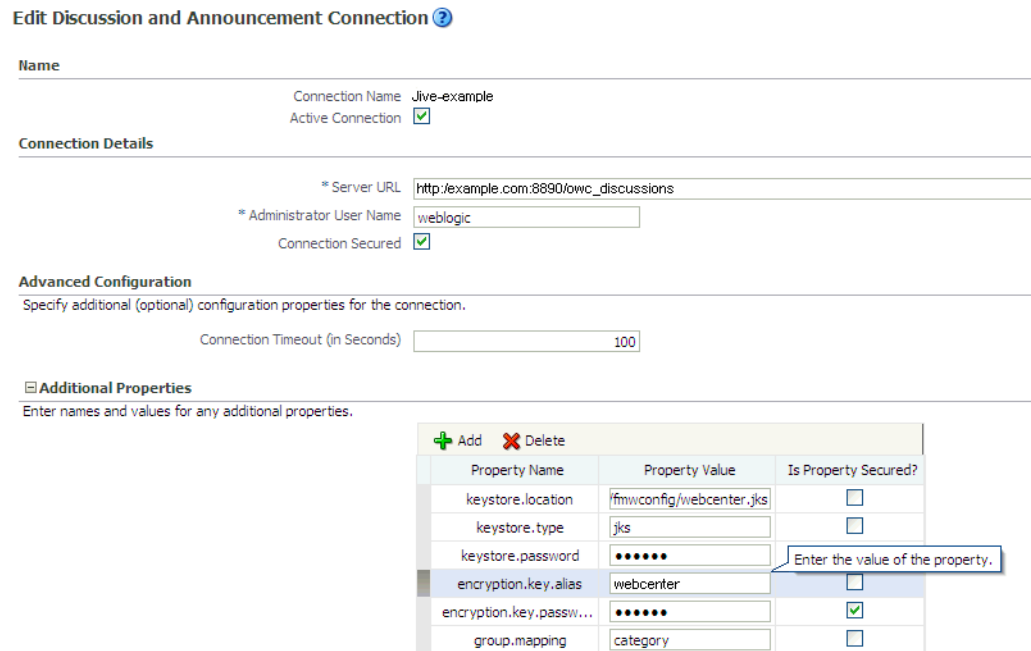

Be sure to specify the name of the file, and not the directory or `.JAR` name.

4. Click **OK**.
5. Restart the `WLS_Services` Managed Server.

23.8.2.2.5 Configuring the Discussions Server Connection Settings

After setting the system properties, your WebCenter application also needs to supply the WS-Security client certificate through the connection settings for Oracle Discussion Forum and Announcement Server as described in [Section 12.3, "Registering Discussions Servers."](#) [Figure 23–155](#) shows example settings for the Edit Discussions and Announcement Connection page.

Figure 23–155 Edit Discussions and Announcement Connection Page

This screenshot shows the Edit Discussions and Announcement Connection page.

23.8.2.3 Setting Up the SOA Domain

This section describes how to set up the SOA domain keystore and contains the following subsections:

- [Section 23.8.2.3.1, "Creating the SOA Domain Keystore"](#)
- [Section 23.8.2.3.2, "Configuring the Keystore Using WLST"](#)
- [Section 23.8.2.3.4, "Unconfiguring a Keystore Provider"](#)
- [Section 23.8.2.3.3, "Configuring the Keystore Using Fusion Middleware Control"](#)

23.8.2.3.1 Creating the SOA Domain Keystore

This section describes how to create a SOA domain keystore and keys using a Java Keystore (JKS).

To create the SOA domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Create a keystore by importing the public certificate (`webcenter_public.cer`) from the WebCenter domain:

```
keytool -importcert -alias webcenter_spaces_ws -file webcenter_public.cer
-keystore bpel.jks -storepass keystore_password
```

Where:

- `keystore_password` is the keystore password, (for example, `welcome1`)

Example 23–10 Importing the Public Certificate

```
keytool -importcert -alias webcenter_spaces_ws -file webcenter_public.cer
-keystore bpel.jks -storepass welcome1
```

- Using `keytool`, create a keypair to be used in the SOA domain for signing and encrypting messages:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias bpel -keypass
key_password -keystore keystore -storepass keystore_password -validity days_
valid
```

Where:

- `consumer_dname` is the name of the consumer (for example, `cn=bpel,dc=example,dc=com`)
- `key_password` is the password for the new public key, (for example, `welcome1`)
- `keystore` is the keystore name, (for example, `bpel.jks`)
- `keystore_password` is the keystore password, (for example, `welcome1`)
- `days_valid` is the number of days for which the key password is valid (for example, `1064`).

Example 23–11 Generating the Keypair

```
keytool -genkeypair -keyalg RSA -dname "cn=bpel,dc=example,dc=com" -alias bpel
-keypass welcome1 -keystore bpel.jks -storepass welcome1 -validity 1064
```

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

- Export the certificate so it can be imported in the WebCenter domain using the `orakey` alias:

```
keytool -exportcert -v -alias orakey -keystore keystore -storepass keystore_
password -rfc -file orakey.cer
```

Where:

- `keystore` is the keystore name, (for example, `webcenter.jks`)
- `keystore_password` is the keystore password, (for example, `welcome1`)

Example 23–12 Exporting the Certificate Containing the Public Key

```
keytool -exportcert -v -alias bpel -keystore bpel.jks -storepass welcome1 -rfc
-file orakay.cer
```

- Import the certificate with a different alias (choose **Yes** when prompted whether to overwrite the existing certificate with the alias `orakey`):

```
keytool -importcert -alias orakey -file orakey.cer -keystore webcenter.jks
-storepass keystore_password
```

Where:

-

- `keystore_password` is the keystore password

Example 23–13 Importing the Certificate

```
keytool -importcert -alias orakey -file orakay.cer -keystore webcenter.jks
-storepass welcome1
```

23.8.2.3.2 Configuring the Keystore Using WLST

After creating the SOA domain keystore, configure the keystore service and update the credential store so that OWSM can read the keystore and keys correctly.

To configure the keystore service:

1. Go to the `<DOMAIN_HOME>/config/fmwconfig` directory, and open the file `jps-config.xml` in an editor.
2. Locate the `<serviceInstance` node for the keystore.provider Provider
3. Make sure that the `bpel.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./bpel.jks`.
4. Use the following WLST commands to configure the credential store:

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password="welcome1", desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="bpel",
password="welcome1", desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="bpel",
password="welcome1", desc="Signing key")
```

5. Restart all servers.

23.8.2.3.3 Configuring the Keystore Using Fusion Middleware Control

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider as described in [Section 23.8.2.3.4, "Unconfiguring a Keystore Provider."](#) Otherwise, continue with the steps below.

To configure the keystore provider:

1. Open Fusion Middleware Control and log into the WebCenter domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the WebLogic Domain node and click on the WebCenter domain (`webcenter` by default).
3. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.
4. Expand the Keystore section on the Security Provider Configuration page.
5. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–156](#)).

Figure 23–156 Keystore Configuration Page

Information
All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type: JKS

* Keystore Path: /webcenter.jks

* Password: [REDACTED]

* Confirm Password: [REDACTED]

Identity Certificates
Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

<p>Signature Key</p> <p>* Key Alias: orakey</p> <p>* Signature Password: [REDACTED]</p> <p>* Confirm Password: [REDACTED]</p>	<p>Encryption Key</p> <p>* Crypt Alias: orakey</p> <p>* Crypt Password: [REDACTED]</p> <p>* Confirm Password: [REDACTED]</p>
--	---

This screenshot shows the Keystore Configuration page.

6. Check **Configure Keystore Management** and use the following settings to specify the location of the keystore that contains the certificate and private key, and the signature key and encryption key aliases:
 - **Keystore Path:** /webcenter.jks
 - **Password:** Enter and confirm the password for the keystore.
 - **Key Alias:** orakey
 - **Signature Password:** Enter and confirm the password for the signature key.
 - **Crypt Alias:** orakey
 - **Crypt Password:** Enter and confirm the password for the encryption key.
7. Click **OK** to save your settings.
8. Restart the Administration server for the domain.

23.8.2.3.4 Unconfiguring a Keystore Provider

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider before configuring a new provider. If a keystore provider is not already configured, continue with the steps to configure the keystore in [Section 23.8.2.3.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

To unconfigure a keystore provider using Fusion Middleware Control:

1. Open Fusion Middleware Control and log into the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.
3. Expand the Keystore section on the Security Provider Configuration page.
4. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–157](#)).

Figure 23–157 Keystore Configuration Page

i **Information**
 All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type: JKS

* Keystore Path:

* Password:

* Confirm Password:

Identity Certificates

Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

Signature Key	Encryption Key
* Key Alias: <input type="text" value="webcenter"/>	* Crypt Alias: <input type="text" value="webcenter"/>
* Signature Password: <input type="password" value="••••••"/>	* Crypt Password: <input type="password" value="••••••"/>
* Confirm Password: <input type="password" value="••••••"/>	* Confirm Password: <input type="password" value="••~•••"/>

5. Uncheck Configure Keystore Management.

6. Click OK.

23.8.2.4 Configuring the BPEL Server for a Typical Topology

The BPEL server's Worklist connection must be configured to use message protected SAML service policy. The BPEL server's `oracle-webservices.xml` file must also be edited so that the server-side SAML policy matches that of the client's policy.

To configure the BPEL server:

- To configure the Worklist connection on the BPEL server to use the SAML policy with message protection, follow the steps in [Section 20.3.2, "Registering Worklist Connections,"](#) selecting SAML Token With Message Client Policy in Fusion Middleware Control, or entering `oracle/wss10_saml_token_with_message_protection_client_policy` as the policy value if using WLST.
- Use `grep` to find the strings `TaskQueryServicePortSAML` and `provider-name` in all the BPEL server's `oracle-webservices.xml` files. For example:

```
cd <domain home>
find . | grep webservices.xml | xargs grep TaskQueryServicePortSAML | grep
provider-name
./servers/BPEL Server 1/tmp/_WL_
user/soa-infra/ugh7wb/war/WEB-INF/oracle-webservices.xml:
<provider-name>TaskQueryServicePortSAML</provider-name>
```

- Back up the file. For example:

```
cp
./servers/BPEL Server 1/tmp/_WL_
user/soa-infra/ugh7wb/war/WEB-INF/oracle-webservices.xml
./servers/BPEL Server 1/tmp/_WL_
user/soa-infra/ugh7wb/war/WEB-INF/oracle-webservices.xml.original
```

- Edit the file, replacing:

```
<policy-reference uri="oracle/wss10_saml_token_service_policy"
category="security" enabled="true"/>
```

with:

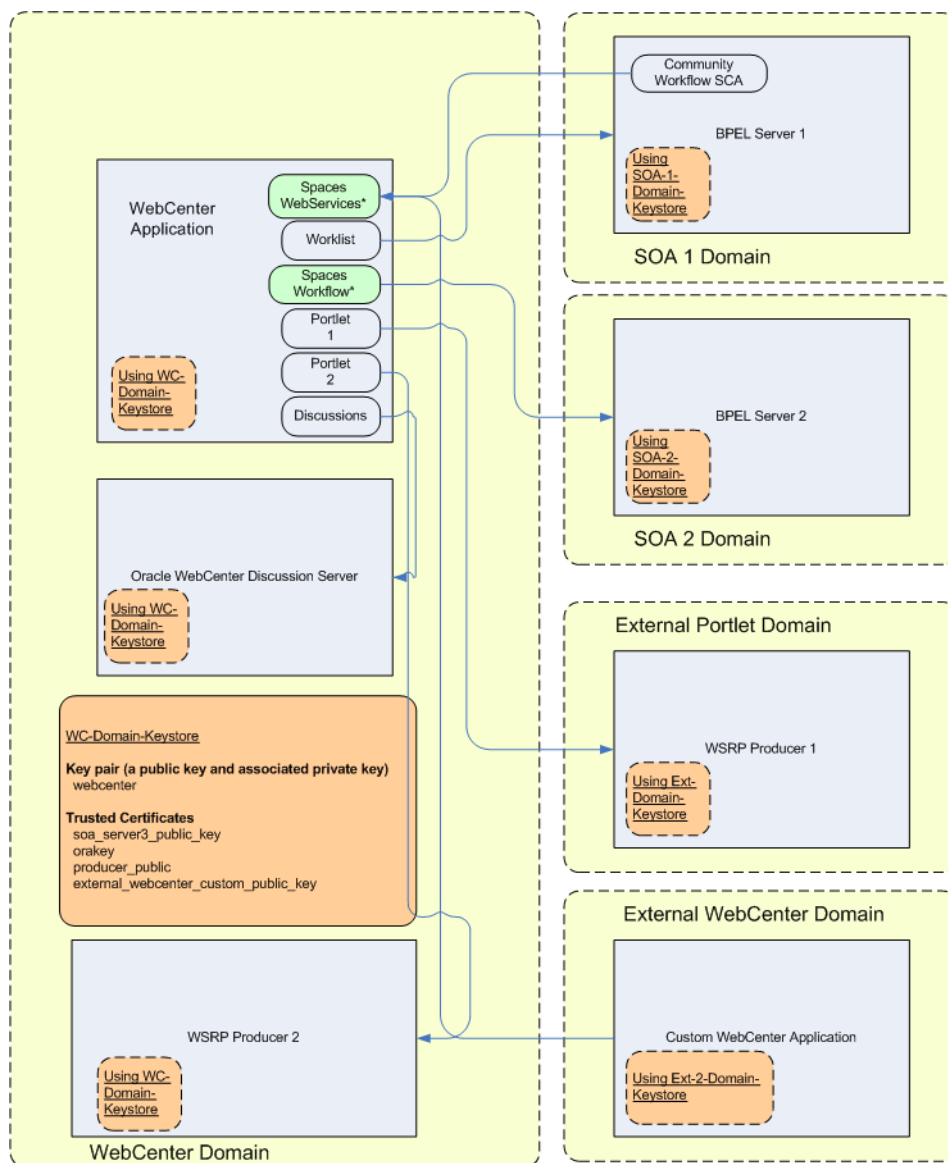

```
<policy-reference uri="oracle/wss10_saml_token_with_message_protection_service_policy" category="security" enabled="true"/>
```

5. Save the file and restart the Managed Servers. The message protected SAML access is now configured. Examine the managed server diagnostic logs for exception stack information should the worklist service still not work to obtain information about configuration issues.

23.8.3 Configuring WS-Security for a Complex Topology

This section describes how to configure WS-Security for a complex topology where the WebCenter application, the discussions server (Jive), and a WSRP producer are in the same domain, two BPEL servers are in separate SOA domains, and one WSRP producer is in an external portlet domain (see [Figure 23-158](#)).

Figure 23-158 Complex Configuration

* applicable to WebCenter Spaces application only

The steps to configure WS-Security for a typical two domain WebCenter topology are described in the following sections:

- [Section 23.8.3.1, "Setting Up the WebCenter Domain Keystore"](#)
- [Section 23.8.3.2, "Configuring the Discussions Server for a Complex Topology"](#)
- [Section 23.8.3.3, "Setting Up the First SOA Domain"](#)
- [Section 23.8.3.4, "Setting Up the Second SOA Domain"](#)
- [Section 23.8.3.5, "Configuring the BPEL Server for a Complex Topology"](#)
- [Section 23.8.3.6, "Setting Up the External Portlet Domain Keystore"](#)
- [Section 23.8.3.7, "Setting Up the External WebCenter Domain Keystore"](#)

23.8.3.1 Setting Up the WebCenter Domain Keystore

The security credentials of WebCenter Spaces, discussions server, BPEL servers (in separate domains), and WSRP producers (also in separate domains) can be retrieved and managed using a Java Keystore (JKS). A keystore is a file that provides information about available public and private keys. Keys are used for a variety of purposes, including authentication and data integrity. User certificates and the trust points needed to validate the certificates of peers are also stored securely in the wallet or keystore. See the *Oracle Fusion Middleware Security and Administrator's Guide for Web Services* for information about JKS.

This section contains the following subsections:

- [Section 23.8.3.1.1, "Creating the WebCenter Domain Keystore"](#)
- [Section 23.8.3.1.2, "Configuring the Keystore Using WLST"](#)
- [Section 23.8.3.1.3, "Configuring the Keystore Using Fusion Middleware Control"](#)
- [Section 23.8.3.1.4, "Unconfiguring a Keystore Provider"](#)

23.8.3.1.1 Creating the WebCenter Domain Keystore

This section describes how to create a keystore and keys using a Java Keystore (JKS). JKS is the proprietary keystore format defined by Sun Microsystems. To create and manage the keys and certificates in the JKS, use the `keytool` utility that is distributed with the Java JDK 6.

To create the WebCenter domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, generate a key pair:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias webcenter
-keypass key_password -keystore keystore -storepass keystore_password -validity
days_valid
```

Where:

- `consumer_dname` is the name of the consumer (for example, `cn=spaces,dc=example,dc=com`)
- `key_password` is the password for the new public key, (for example, `welcome1`)
- `keystore` is the keystore name, (for example, `webcenter.jks`)
- `keystore_password` is the keystore password, (for example, `welcome1`)

- *days_valid* is the number of days for which the key password is valid (for example, 1064).

Example 23–14 Generating the Keypair

```
keytool -genkeypair -keyalg RSA -dname "cn=spaces,dc=example,dc=com" -alias
webcenter -keypass welcome1 -keystore webcenter.jks -storepass welcome1 -validity
1064
```

Note: You must use the `-keyalg` parameter and specify RSA as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

3. Export the certificate containing the public key:

```
keytool -exportcert -v -alias webcenter -keystore wecenter.jks -storepass
keystore_password -rfc -file webcenter_public.cer
```

Where:

- *keystore_password* is the keystore password, (for example, `welcome1`)

Example 23–15 Exporting the Certificate Containing the Public Key

```
keytool -exportcert -v -alias webcenter -keystore webcenter.jks -storepass
welcome1 -rfc -file webcenter_public.cer
```

4. Continue by configuring the keystore using either WLST, as described in [Section 23.8.3.1.2, "Configuring the Keystore Using WLST,"](#) or using Fusion Middleware Control, as described in [Section 23.8.3.1.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

[Table 23–25](#) shows the keystore contents you should wind up with after creating and configuring the keystore.

Table 23–25 WebCenter Domain Keystore Contents for a Complex Topology

Key Alias	Description
webcenter	Key pair used to sign and encrypt outbound messages from WebCenter Spaces. This key is used by both OWSM (Portlets and Worklist) and Discussions.
orakey	Certificate containing the public key for the BPEL private key used in the SOA 1 domain. The certificate is used to encrypt outbound messages from the Worklist service to SOA_Server3 in the SOA 1 domain.
soa_server3_public_key	Certificate containing the public key for the soa_server3 private key used in the SOA 2 domain. The certificate is used to encrypt outbound messages from the Worklist service to BPEL Server2 in SOA 2 domain.
producer_public_key	Certificate containing public key for the producer private key used in the external portlet domain that hosts the WSRP Producer 1 application. This certificate is used to encrypt outbound messages from WebCenter Spaces to WSRP Producer 1 registered in the WebCenter Spaces application.

Table 23–25 (Cont.) WebCenter Domain Keystore Contents for a Complex Topology

Key Alias	Description
external_webcenter_custom_public_key	Certificate containing the public key for the external_webcenter_custom private key used in the external WebCenter domain that hosts the custom WebCenter application that makes WebService call to the WebCenter Spaces WebService. This certificate is used to encrypt outbound messages from WebCenter Spaces to custom WebCenter applications in the external WebCenter domain.

23.8.3.1.2 Configuring the Keystore Using WLST

After creating the WebCenter domain keystore, configure the keystore service and update the credential store so that OWSM can read the keystore and keys correctly.

To configure the keystore service:

1. Go to the `<DOMAIN_HOME>/config/fmwconfig` directory, and open the file `jps-config.xml` in an editor.
2. Locate the `<serviceInstance` node for the keystore.provider Provider
3. Make sure that the `webcenter.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./webcenter.jks`.
4. Use the following WLST commands to update the credential store:

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password="welcome1", desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="webcenter",
password="welcome1", desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="webcenter",
password="welcome1", desc="Signing key")
```

5. Restart all servers.

23.8.3.1.3 Configuring the Keystore Using Fusion Middleware Control

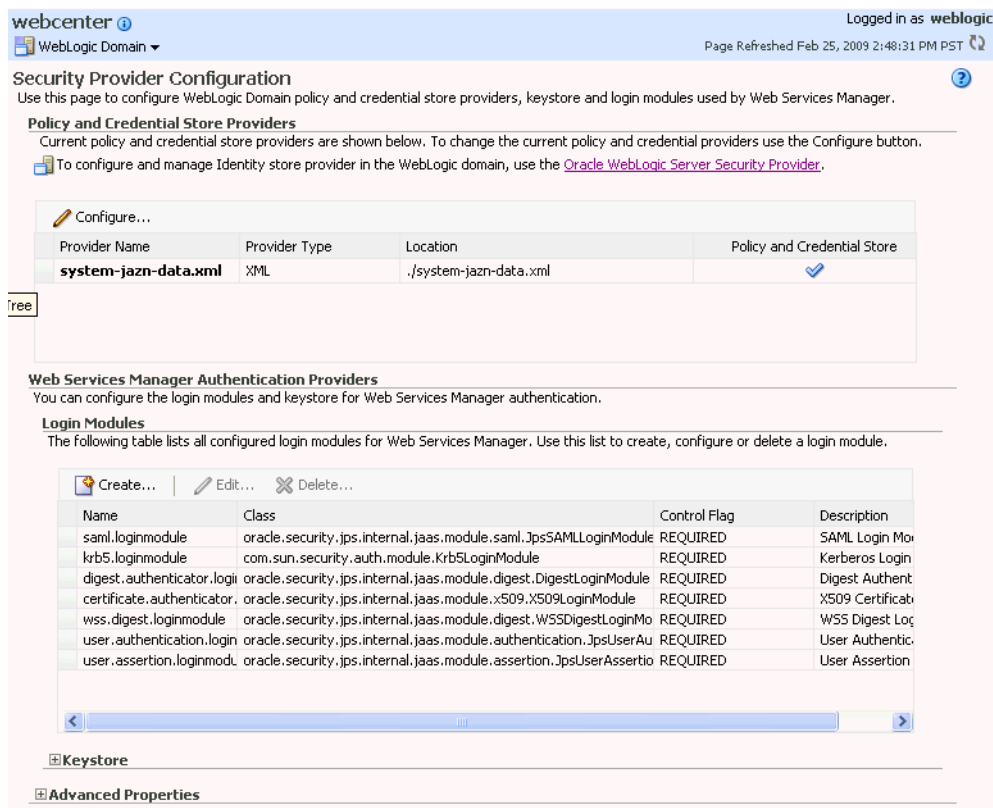

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider as described in [Section 23.8.3.1.4, "Unconfiguring a Keystore Provider."](#) Otherwise, continue with the steps below.

To configure the keystore provider:

1. Open Fusion Middleware Control and log into the WebCenter domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the WebLogic Domain node and click on the WebCenter domain (`wc_domain` by default).
3. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.

The Security Provider Configuration page displays (see [Figure 23–159](#)).

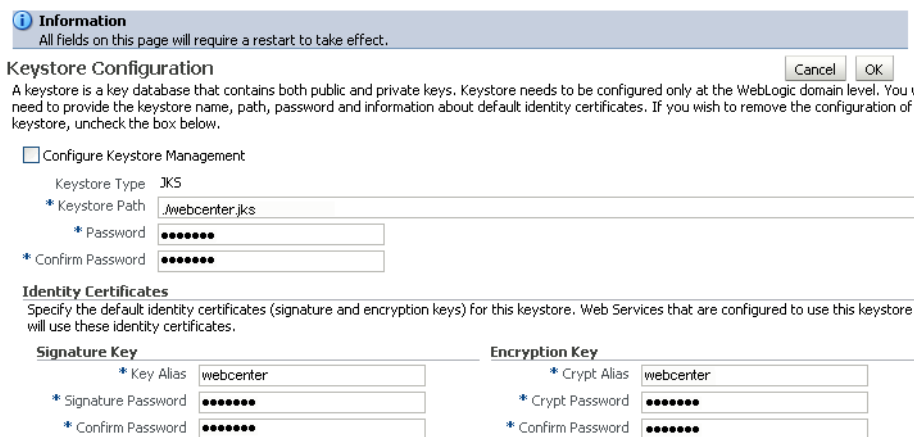

Figure 23–159 Security Provider Configuration Page

4. Expand the Keystore section on the Security Provider Configuration page.
5. Click **Configure**.

The Keystore Configuration page displays (see Figure 23–160).

Figure 23–160 Keystore Configuration Page

This screenshot shows the Keystore Configuration page.

6. Check **Configure Keystore Management** and use the following settings to specify the location of the keystore that contains the certificate and private key, and the signature key and encryption key aliases:
 - **Keystore Path:** `./webcenter.jks`
 - **Password:** Enter and confirm the password for the keystore.
 - **Key Alias:** `webcenter`
 - **Signature Password:** Enter and confirm the password for the signature key.
 - **Crypt Alias:** `webcenter`
 - **Crypt Password:** Enter and confirm the password for the encryption key.
7. Click **OK** to save your settings.
8. Restart the Administration server for the domain.

23.8.3.1.4 Unconfiguring a Keystore Provider

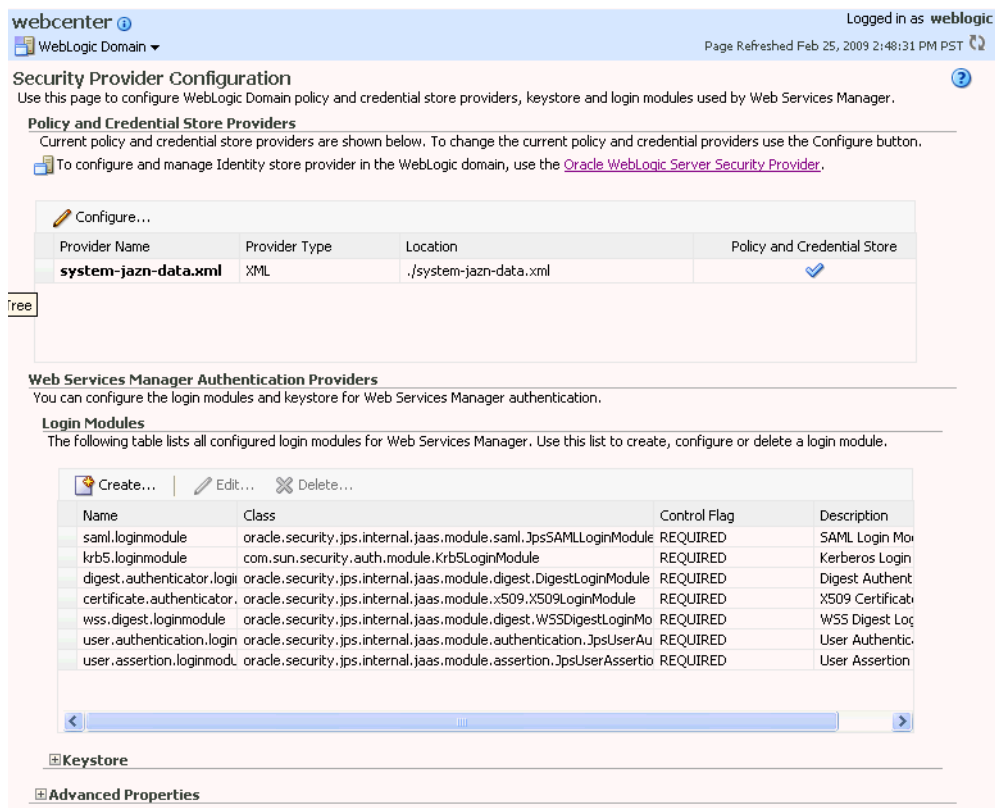

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider before configuring a new provider. If a keystore provider is not already configured, continue with the steps to configure the keystore in [Section 23.8.3.1.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

To unconfigure a keystore provider using Fusion Middleware Control:

1. Open Fusion Middleware Control and log into the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.

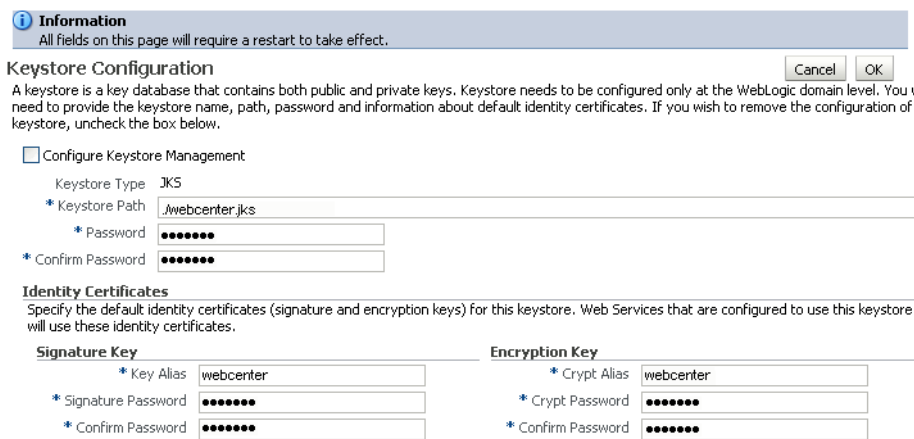

The Security Provider Configuration page displays (see [Figure 23-161](#)).

Figure 23–161 Security Provider Configuration Page

- Expand the Keystore section on the Security Provider Configuration page.
 - Click **Configure**.
- The Keystore Configuration page displays (see [Figure 23–162](#)).

Figure 23–162 Keystore Configuration Page

- Uncheck **Configure Keystore Management**.
- Click **OK**.

23.8.3.2 Configuring the Discussions Server for a Complex Topology

To use the Oracle WebCenter Discussions with WebCenter Spaces or custom WebCenter applications, you must enable Web Services Security (WS-Security) trusted authentication. WS-Security establishes a trust relationship between your WebCenter application and Oracle WebCenter Discussions so that the application can pass the user identity information to the discussions server without knowing the user's credentials.

Note: Discussions-specific Web Services messages sent by WebCenter applications to the Oracle WebCenter Discussions server are not encrypted. For message confidentiality, the Discussions server URL must be accessed over Secure Socket Layer (SSL). For more information, see [Section 23.6, "Configuring WebCenter Applications and Components to Use SSL."](#)

This section describes how to add the WS-Security-related properties in your Oracle WebCenter Discussions connection into WebCenter Spaces or your WebCenter application. For information on how to add new properties, see [Table 12-4, "Additional Discussion Connection Properties"](#) in [Section 12.3.1, "Registering Discussions Servers Using Fusion Middleware Control."](#)

To configure WS-Security on the discussions server side, you must create a keystore certificate properties file, specify it for the ClassLoader, and modify the `webservices.soap.custom.crypto.fileName` system property. These configuration steps are described in the following sub-sections:

- [Section 23.8.3.2.1, "Importing the WebCenter Domain Certificate"](#)
- [Section 23.8.3.2.2, "Creating the Keystore Certificate Properties File"](#)
- [Section 23.8.3.2.3, "Specifying the Properties File for ClassLoader"](#)
- [Section 23.8.3.2.4, "Updating the System Properties for WS-Security"](#)

23.8.3.2.1 Importing the WebCenter Domain Certificate

Create a keystore by importing the certificate containing public key of the WebCenter domain.

To import the WebCenter domain certificate:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, import the certificate containing the public key of the WebCenter domain:

```
keytool -importcert -alias df_orakey_public -file webcenter_public.cer
-keystore owc_discussions.jks -storepass keystore_password
```

Where:

- `keystore_password` is the keystore password, (for example, `welcome1`)

Example 23-16 Importing the WebCenter Domain Certificate

```
keytool -importcert -alias df_webcenter_public -file webcenter_public.cer
-keystore owc_discussions.jks -storepass welcome1
```

23.8.3.2.2 Creating the Keystore Certificate Properties File

The server-side keystore certificate configuration must be stored in a properties file (`keystore.properties`) and specified as a system property on the discussions server. The properties file must then be loaded in the `ClassLoader` for the WS-Secure Handler to pick it up.

To create the properties file:

1. Create a properties file with the following entries:

```
org.apache.ws.security.crypto.provider= <Specify your crypto provider
(typically org.apache.ws.security.components.crypto.Merlin)>
org.apache.ws.security.crypto.merlin.keystore.type=jks
org.apache.ws.security.crypto.merlin.keystore.password=<Specify the keystore
password of your server certificate. Note that the password stored in this file
is in clear text because of a limitation of the Ws-Security provider WSS4J used
in Oracle Discussions Server.>
org.apache.ws.security.crypto.merlin.keystore.alias=df_webcenter_public
org.apache.ws.security.crypto.merlin.file=<Absolute path of directory
containing the keystore created above.>
```

2. Save the file as `keystore.properties`.

23.8.3.2.3 Specifying the Properties File for ClassLoader

There are two ways you can choose to specify your `keystore.properties` file based on your setup. Using the same file mounted across different servers is recommended when using a Clustered Discussions Server installation in Linux.

To specify the properties file for `ClassLoader`, do one of the following:

- Specify the properties file as the `CLASSPATH` in `setDomainEnv.sh`.

For Linux:

1. Place the `keystore.properties` file in a directory (for example, `/home/user/keystore/`)
2. Open `DOMAIN_HOME/bin/setDomainEnv.sh`.
3. Towards the end of the file, add the following lines to specify this directory as the `CLASSPATH`.

```
if [ "${CLASSPATH}" != "" ] ; then
    CLASSPATH="${CLASSPATH}${CLASSPATHSEP}/home/user/keystore/"
    export CLASSPATH
else
    CLASSPATH="/home/user/keystore/"
    export CLASSPATH
fi
```

Note that the `CLASSPATH` directory name must end with `"/`.

For Windows:

1. Place the `keystore.properties` file in a directory (for example, `c:\keystore\`).
2. Open `DOMAIN_HOME\bin\setDomainEnv.cmd`.
3. Towards the end of the file, add the following lines to specify this directory in `CLASSPATH`.

```
if NOT "%CLASSPATH%"==" " (
    set CLASSPATH=%CLASSPATH%;c:\keystore\
) else (
```

```

        set CLASSPATH=c:\keystore\
    )

```

Note that the CLASSPATH directory name must end with "\".

- Or, add the `keystore.properties` file to a `.JAR` file and place the `.JAR` file in your `DOMAIN_HOME/lib` directory. Be sure to also set the system property `webservices.soap.custom.crypto.fileName` to `keystore.properties` as described in [Section 23.8.3.2.4, "Updating the System Properties for WS-Security."](#)

23.8.3.2.4 Updating the System Properties for WS-Security

To update your system properties:

1. Log in to the Oracle WebCenter Discussions Administration Console at the following URL:

```
http://host:port/owc_discussions/admin
```

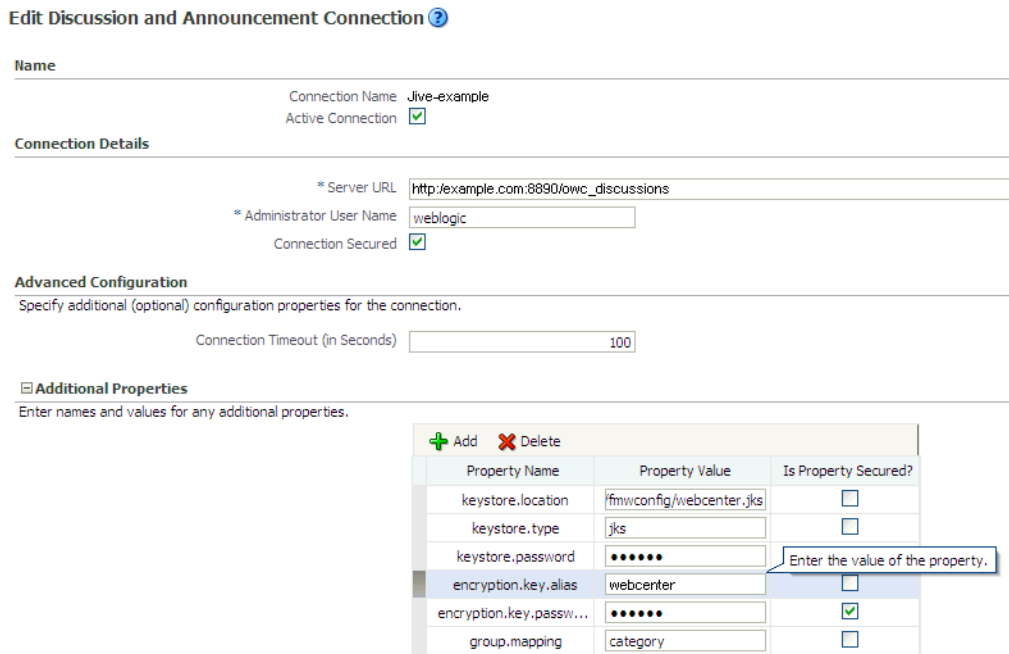

Where `host` and `port` are the address and the port number of the server where you deployed Oracle WebCenter Discussions (for example, `http://localhost:7001/owc_discussions`).

2. Click **System Properties** under **Forum System** to display the Jive Properties page.
3. Modify the system property `webservices.soap.custom.crypto.fileName` and specify the properties file that you created (i.e., `keystore.properties`).
Be sure to specify the name of the file, and not the directory or `.JAR` name.
4. Click **OK**.
5. Restart the `WLS_Services` Managed Server.

23.8.3.2.5 Configuring the Discussions Server Connection Settings

After setting the system properties, your WebCenter application also needs to supply the WS-Security client certificate through the connection settings for Oracle Discussion Forum and Announcement Server as described in [Section 12.3, "Registering Discussions Servers."](#) [Figure 23–163](#) shows example settings for the Edit Discussions and Announcement Connection page.

Figure 23–163 Edit Discussions and Announcement Connection Page

This screenshot shows the Edit Discussions and Announcement Connection page.

23.8.3.3 Setting Up the First SOA Domain

This section describes how to set up the SOA domain keystore and contains the following subsections:

- [Section 23.8.3.3.1, "Creating the SOA Domain Keystore"](#)
- [Section 23.8.3.3.2, "Configuring the Keystore Using WLST"](#)
- [Section 23.8.3.3.3, "Configuring the Keystore Using Fusion Middleware Control"](#)
- [Section 23.8.3.3.4, "Unconfiguring a Keystore Provider"](#)

23.8.3.3.1 Creating the SOA Domain Keystore

This section describes how to create a SOA domain keystore and keys using a Java Keystore (JKS).

To create the SOA domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Create a keystore by importing the public certificate (`webcenter_public.cer`) from the WebCenter domain:

```
keytool -importcert -alias webcenter_spaces_ws -file webcenter_public.cer
-keystore bpel.jks -storepass keystore_password
```

Where:

- `keystore_password` is the keystore password, (for example, `welcome1`)

Example 23–17 Importing the Public Certificate

```
keytool -importcert -alias webcenter_spaces_ws -file webcenter_public.cer
-keystore bpel.jks -storepass welcome1
```

- Using keytool, create a keypair to be used in the SOA domain for signing and encrypting messages:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias bpel -keypass
key_password -keystore bpel.jks -storepass keystore_password -validity days_
valid
```

Where:

- *consumer_dname* is the name of the consumer (for example, `cn=bpel,dc=example,dc=com`)
- *key_password* is the password for the new public key, (for example, `welcome1`)
- *keystore_password* is the keystore password, (for example, `welcome1`)
- *days_valid* is the number of days for which the key password is valid (for example, `1064`).

Example 23–18 Generating the Keypair

```
keytool -genkeypair -keyalg RSA -dname "cn=bpel,dc=example,dc=com" -alias bpel
-keypass welcome1 -keystore bpel.jks -storepass welcome1 -validity 1064
```

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (`DSA`) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

- Export the certificate so it can be imported in the WebCenter domain using the `orakey` alias:

```
keytool -exportcert -v -alias bpel -keystore bpel.jks -storepass keystore_
password -rfc -file orakey.cer
```

Where:

- *keystore_password* is the keystore password (for example, `welcome1`)

Example 23–19 Exporting the Certificate Containing the Public Key

```
keytool -exportcert -v -alias bpel -keystore bpel.jks -storepass welcome1 -rfc
-file orakay.cer
```

- Import the certificate to the WebCenter domain again with a different alias (choose **Yes** when prompted whether to overwrite the existing certificate with the alias `orakey`):

```
keytool -importcert -alias orakey -file orakey.cer -keystore webcenter.jks
-storepass keystore_password
```

Where:

- *keystore_password* is the keystore password (for example, `welcome1`)

Example 23–20 Importing the Certificate

```
keytool -importcert -alias orakey -file orakay.cer -keystore webcenter.jks
-storepass welcome1
```

- Continue by configuring the keystore using either WLST as described in [Section 23.8.3.3.2, "Configuring the Keystore Using WLST,"](#) or using Fusion Middleware Control as described in [Section 23.8.3.3.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

[Table 23–26](#) shows the keystore contents you should wind up with after creating and configuring the SOA 1 domain keystore.

Table 23–26 SOA 1 Domain Keystore Contents for a Complex Topology

Key Alias	Description
bpel	Private key used to sign outbound messages from the SOA 1 domain servers. This key is used by the Worklist application deployed on the SOA 1 domain's SOA server.
webcenter_spaces_ws	Certificate containing the public key for the webcenter private key used in the WebCenter domain. The certificate is used to encrypt outbound Workflow messages on BPEL Server1 in the SOA 1 domain to WebService APIs on the Spaces domain.

23.8.3.3.2 Configuring the Keystore Using WLST

After creating the SOA domain keystore, configure the keystore service and update the credential store so that OWSM can read the keystore and keys correctly.

To configure the keystore service:

- Go to the `<DOMAIN_HOME>/config/fmwconfig` directory, and open the file `jps-config.xml` in an editor.
- Locate the `<serviceInstance` node for the `keystore.provider Provider`
- Make sure that the `bpel.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./bpel.jks`.
- Use the following WLST commands to update the credential store:

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password="welcome1", desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="bpel",
password="welcome1", desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="bpel",
password="welcome1", desc="Signing key")
```

- Restart all servers.

23.8.3.3.3 Configuring the Keystore Using Fusion Middleware Control

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider as described in [Section 23.8.3.3.4, "Unconfiguring a Keystore Provider."](#) Otherwise, continue with the steps below.

To configure the keystore provider:

- Open Fusion Middleware Control and log into the WebCenter domain.

For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)

2. In the Navigation pane, expand the WebLogic Domain node and click on the SOA domain.
3. From the SOA Domain menu, select **Security -> Security Provider Configuration**.
4. Expand the Keystore section on the Security Provider Configuration page.
5. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–164](#)).

Figure 23–164 Keystore Configuration Page

Information
All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type: JKS

* Keystore Path: /bpel.jks

* Password: [masked]

* Confirm Password: [masked]

Identity Certificates
Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

Signature Key	Encryption Key
* Key Alias: bpel	* Crypt Alias: bpel
* Signature Password: [masked]	* Crypt Password: [masked]
* Confirm Password: [masked]	* Confirm Password: [masked]

This screenshot shows the Keystore Configuration page.

- *****
6. Check **Configure Keystore Management** and use the following settings to specify the location of the keystore that contains the certificate and private key, and the signature key and encryption key aliases:
 - **Keystore Path:** `./bpel.jks`
 - **Password:** Enter and confirm the password for the keystore.
 - **Key Alias:** `bpel`
 - **Signature Password:** Enter and confirm the password for the signature key.
 - **Crypt Alias:** `bpel`
 - **Crypt Password:** Enter and confirm the password for the encryption key.
 7. Click **OK** to save your settings.
 8. Restart the Administration server for the domain.

23.8.3.3.4 Unconfiguring a Keystore Provider

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider before configuring a new provider. If a keystore provider is not already configured, continue with the steps to configure the keystore in [Section 23.8.3.3.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

To unconfigure a keystore provider using Fusion Middleware Control:

1. Open Fusion Middleware Control and log into the target domain.

For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)

2. From the SOA Domain menu, select **Security -> Security Provider Configuration**.
3. Expand the Keystore section on the Security Provider Configuration page.
4. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–165](#)).

Figure 23–165 Keystore Configuration Page

Information
All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type: JKS

* Keystore Path: /bpel.jks

* Password: [masked]

* Confirm Password: [masked]

Identity Certificates
Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

<p>Signature Key</p> <p>* Key Alias: bpel</p> <p>* Signature Password: [masked]</p> <p>* Confirm Password: [masked]</p>	<p>Encryption Key</p> <p>* Crypt Alias: bpel</p> <p>* Crypt Password: [masked]</p> <p>* Confirm Password: [masked]</p>
--	---

5. Uncheck **Configure Keystore Management**.
6. Click **OK**.

23.8.3.4 Setting Up the Second SOA Domain

This section describes how to set up a second SOA domain keystore and contains the following subsections:

- [Section 23.8.3.4.1, "Creating the SOA Domain Keystore"](#)
- [Section 23.8.3.4.2, "Configuring the Keystore Using WLST"](#)
- [Section 23.8.3.4.3, "Configuring the Keystore Using Fusion Middleware Control"](#)
- [Section 23.8.3.4.4, "Unconfiguring a Keystore Provider"](#)

23.8.3.4.1 Creating the SOA Domain Keystore

This section describes how to create a SOA domain keystore and keys using a Java Keystore (JKS).

To create the SOA domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, create a keypair to be used in the SOA domain for signing and encrypting messages:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias soa_server3
-keypass key_password -keystore soa_server3.jks -storepass keystore_password
-validity days_valid
```

Where:

- *consumer_dname* is the name of the consumer (for example, `cn=soa_server3,dc=example,dc=com`)
- *key_password* is the password for the new public key, (for example, `welcome1`)
- *keystore_password* is the keystore password, (for example, `welcome1`)
- *days_valid* is the number of days for which the key password is valid (for example, `1064`).

Example 23–21 Generating the Keypair

```
keytool -genkeypair -keyalg RSA -dname "cn=soa_server3,dc=example,dc=com" -alias soa_server3 -keypass welcome1 -keystore soa_server3.jks -storepass welcome1 -validity 1064
```

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

3. Export the certificate so it can be imported in the WebCenter domain using the `orakey` alias:

```
keytool -exportcert -v -alias soa_server3 -keystore soa_server3.jks -storepass keystore_password -rfc -file soa_server3_public_key.cer
```

Where:

- *keystore_password* is the keystore password, (for example, `welcome1`)

Example 23–22 Exporting the Certificate Containing the Public Key

```
keytool -exportcert -v -alias soa_server3 -keystore soa_server3.jks -storepass welcome1 -rfc -file soa_server3_public_key.cer
```

4. Import the certificate to the WebCenter domain with a different alias (choose **Yes** when prompted whether to overwrite the existing certificate with the alias `soa_server3_public_key`):

```
keytool -importcert -alias soa_server3_public_key -file soa_server3_public_key.cer -keystore webcenter.jks -storepass keystore_password
```

Where:

- *keystore_password* is the keystore password (for example, `welcome1`)

Example 23–23 Importing the Certificate

```
keytool -importcert -alias soa_server3_public_key -file soa_server3_public_key.cer -keystore webcenter.jks -storepass welcome1
```

5. Continue by configuring the keystore using either WLST as described in [Section 23.8.3.4.2, "Configuring the Keystore Using WLST"](#), or using Fusion Middleware Control as described in [Section 23.8.3.4.3, "Configuring the Keystore Using Fusion Middleware Control"](#).

[Table 23–27](#) shows the keystore contents you should wind up with after creating and configuring the SOA 2 domain keystore.

Table 23–27 SOA 2 Domain Keystore Contents for a Complex Topology

Key Alias	Description
webcenter	Key pair used to sign and encrypt outbound messages from WebCenter Spaces. This key is used by both OWSM (Portlets and Worklist) and Discussions.
orakey	Certificate containing the public key for the BPEL private key used in the SOA 1 domain. The certificate is used to encrypt outbound messages from the Worklist service to SOA_Server3 in the SOA 1 domain.
soa_server3_public_key	Certificate containing the public key for the soa_server3 private key used in the SOA 2 domain. The certificate is used to encrypt outbound messages from the Worklist service to BPEL Server2 in SOA 2 domain.
producer_public_key	Certificate containing public key for the producer private key used in the external portlet domain that hosts the WSRP Producer 1 application. This certificate is used to encrypt outbound messages from WebCenter Spaces to WSRP Producer 1 registered in the WebCenter Spaces application.
external_webcenter_custom_public_key	Certificate containing the public key for the external_webcenter_custom private key used in the external WebCenter domain that hosts the custom WebCenter application that makes WebService call to the WebCenter Spaces WebService. This certificate is used to encrypt outbound messages from WebCenter Spaces to custom WebCenter applications in the external WebCenter domain.

23.8.3.4.2 Configuring the Keystore Using WLST

After creating the second SOA domain keystore, configure the keystore service and update the credential store so that OWSM can read the keystore and keys correctly.

To configure the keystore service:

1. Go to the `<DOMAIN_HOME>/config/fmwconfig` directory, and open the file `jps-config.xml` in an editor.
2. Locate the `<serviceInstance` node for the keystore.provider Provider
3. Make sure that the `soa_server3.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./soa_server3.jks`.
4. Use the following WLST commands to update the credential store:

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password="welcome1", desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="soa_server3",
password="welcome1", desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="soa_server3",
password="welcome1", desc="Signing key")
```

5. Restart all servers.

23.8.3.4.3 Configuring the Keystore Using Fusion Middleware Control

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider as described in [Section 23.8.3.4.4, "Unconfiguring a Keystore Provider."](#) Otherwise, continue with the steps below.

To configure the keystore provider:

1. Open Fusion Middleware Control and log into the WebCenter domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the WebLogic Domain node and click on the SOA domain.
3. From the SOA Domain menu, select **Security -> Security Provider Configuration**.
4. Expand the Keystore section on the Security Provider Configuration page.
5. Click **Configure**.
The Keystore Configuration page displays (see [Figure 23–166](#)).

Figure 23–166 Keystore Configuration Page

Information
All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type: JKS

* Keystore Path: /soa_server3.jks

* Password: [masked]

* Confirm Password: [masked]

Identity Certificates
Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

Signature Key	Encryption Key
* Key Alias: soa_server3	* Crypt Alias: soa_server3
* Signature Password: [masked]	* Crypt Password: [masked]
* Confirm Password: [masked]	* Confirm Password: [masked]

This screenshot shows the Keystore Configuration page.

- *****
6. Check **Configure Keystore Management** and use the following settings to specify the location of the keystore that contains the certificate and private key, and the signature key and encryption key aliases:
 - **Keystore Path:** ./soa_server3.jks
 - **Password:** Enter and confirm the password for the keystore.
 - **Key Alias:** soa_server3
 - **Signature Password:** Enter and confirm the password for the signature key.
 - **Crypt Alias:** soa_server3
 - **Crypt Password:** Enter and confirm the password for the encryption key.
 7. Click **OK** to save your settings.
 8. Restart the Administration server for the domain.

23.8.3.4.4 Unconfiguring a Keystore Provider

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider before configuring a new provider. If a keystore provider is not already configured, continue with the steps to configure the keystore in [Section 23.8.3.4.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

To unconfigure a keystore provider using Fusion Middleware Control:

1. Open Fusion Middleware Control and log into the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. From the SOA Domain menu, select **Security -> Security Provider Configuration**.
3. Expand the Keystore section on the Security Provider Configuration page.
4. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–167](#)).

Figure 23–167 Keystore Configuration Page

Information
All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type: JKS

* Keystore Path: /soa_server3.jks

* Password: [masked]

* Confirm Password: [masked]

Identity Certificates
Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

<p>Signature Key</p> <p>* Key Alias: soa_server3</p> <p>* Signature Password: [masked]</p> <p>* Confirm Password: [masked]</p>	<p>Encryption Key</p> <p>* Crypt Alias: soa_server3</p> <p>* Crypt Password: [masked]</p> <p>* Confirm Password: [masked]</p>
---	--

5. Uncheck **Configure Keystore Management**.
6. Click **OK**.

23.8.3.5 Configuring the BPEL Server for a Complex Topology

WebCenter Spaces Worklist connections use `oracle/wss10_saml_token_with_message_protection_client_policy` as the secure OWSM policy for generating outbound SOAP messages to the SOA server. However, by default, this policy uses `orakey` to encrypt outbound messages.

When the WebCenter domain (where WebCenter Spaces is installed) is configured to use two or more Worklist connections simultaneously, and those connections use a secure message propagation OWSM policy, an additional OWSM policy must be created. This policy must be configured so that the recipient key alias matches the alias by which the certificate of the intended SOA server is stored on the WebCenter Spaces side.

The following steps are required to use more than one external SOA Domain configuration simultaneously on the WebCenter Spaces server:

1. Export the certificate from the external SOA domain and import it into the WebCenter domain under a specific alias (`soa_server3_key` in the following example).
2. Use Fusion Middleware Control to create a new OWSM policy, and override the recipient key alias to use the same alias as in step 1 above.

3. Create a BPEL connection and use WLST to set the security policy to the policy created in step 2 above.

The following steps show how to carry out steps 2 and 3 above. Note that the keystore should already have been created in [Section 23.8.3.4, "Setting Up the Second SOA Domain."](#)

To configure the BPEL server for multiple Worklist connections:

1. Create a new OWSM security policy and register the new policy in WebCenter Spaces using Fusion Middleware Control.
 - a. Open Fusion Middleware Control and log into the target domain.

For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)

- b. From the WebLogic Domain menu, select **Web Services > Policies**.

The Web Services Policies page displays (see [Figure 23–168](#)).

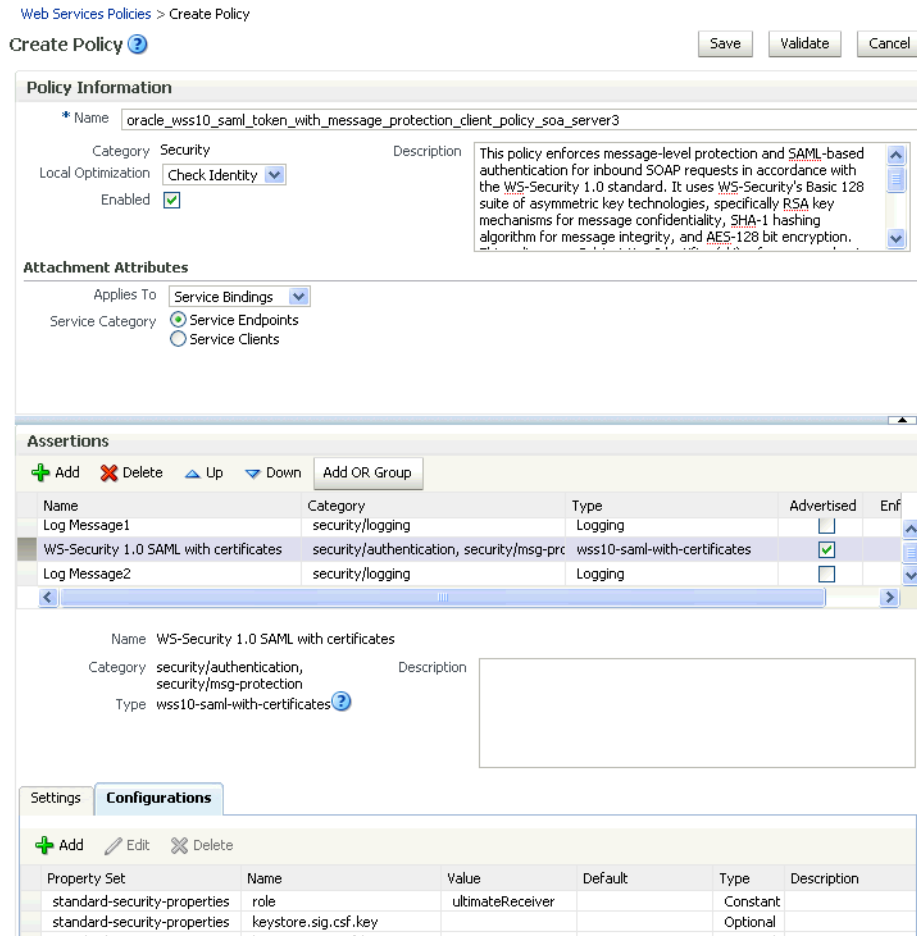

Figure 23–168 Web Services Policies Page

Name	Enabled	Attacher Count	Description	View Full Description
oracle/binding_authorization_denyall_policy	✓	0	This policy is a special c...	bd

oracle/wss11_kerberos_token_with_message_protection_service_policy	✓	0	This policy is enforced in...	bd
oracle/wss11_message_protection_service_policy	✓	0	This policy enforces messa...	bd

- c. Select a client policy to use as a base for creating a new policy and click **Create Like**.

The Create Policy page displays (see [Figure 23–169](#)).

Figure 23–169 Create Policy Page

- d. Name the policy `oracle_wss10_saml_token_with_message_protection_client_policy_soa_server3`.
 - e. On the Configuration tab, select the row for `recipient.key.alias` and click **Edit**.
 - f. Enter `soa_server3_key` as the **Value** and click **OK**.
 - g. On the Create Policy page, click **Save**. The new policy should now be listed on the Web Services Policies page.
2. Create a BPEL connection that uses the new security policy with the following WLST command:

```
setBPELConnection (appName= 'webcenter' ,
name='WebCenter-Worklist-SOAServer3', url='<your_url>', policy='oracle/wss10_
saml_token_with_message_protection_client_policy_soa_server3')
```

23.8.3.6 Setting Up the External Portlet Domain Keystore

This section describes how to set up the keystore for the external portlet domain used by one of the WSRP producers for this complex topology.

This section contains the following subsections:

- [Section 23.8.3.6.1, "Creating the External Portlet Domain Keystore"](#)
- [Section 23.8.3.6.2, "Configuring the Keystore Using WLST"](#)

- [Section 23.8.3.6.3, "Configuring the Keystore Using Fusion Middleware Control"](#)
- [Section 23.8.3.6.4, "Unconfiguring a Keystore Provider"](#)

23.8.3.6.1 Creating the External Portlet Domain Keystore

To create the external portlet domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, generate the keystore by importing the WebCenter domain's public certificate:

```
keytool -importcert -alias webcenter_public -file webcenter_public.cer
-keystore producer.jks -storepass keystore_password
```

Where:

- `keystore_password` is the keystore password

Example 23–24 Importing the Certificate

```
keytool -importcert -alias webcenter_public -file webcenter_public.cer -keystore
producer.jks -storepass welcome1
```

3. Using `keytool`, generate a key pair:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias producer
-keypass key_password -keystore producer.jks -storepass keystore_password
-validity days_valid
```

Where:

- `consumer_dname` is the name of the consumer (for example, `cn=producer,dc=example,dc=com`)
- `key_password` is the password for the new public key, (for example, `welcome1`)
- `keystore` is the keystore name, (for example, `webcenter.jks`)
- `keystore_password` is the keystore password, (for example, `welcome1`)
- `days_valid` is the number of days for which the key password is valid (for example, `1064`).

Example 23–25 Generating the Keypair

```
keytool -genkeypair -keyalg RSA -dname "cn=producer,dc=example,dc=com" -alias
producer -keypass welcome1 -keystore producer.jks -storepass welcome1 -validity
1064
```

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

4. Export the certificate containing the public key so that it can be imported into the WebCenter Spaces domain's keystore:

```
keytool -exportcert -v -alias producer -keystore producer.jks -storepass
keystore_password -rfc -file producer_public_key.cer
```

Where:

- `keystore_password` is the keystore password, (for example, `welcome1`)

Example 23–26 Exporting the Certificate Containing the Public Key

```
keytool -exportcert -v -alias producer -keystore producer.jks -storepass welcome1
-rfc -file producer_public_key.cer
```

5. Import the certificate to the WebCenter domain with a different alias (choose **Yes** when prompted whether to overwrite the existing certificate with the alias `producer_public_key`):

```
keytool -importcert -alias producer_public_key -file producer_public_key.cer
-keystore webcenter.jks -storepass keystore_password
```

Where:

- `keystore_password` is the keystore password (for example, `welcome1`)

Example 23–27 Importing the Certificate

```
keytool -importcert -alias producer_public_key -file producer_public_key.cer
-keystore webcenter.jks -storepass welcome1
```

6. Continue by configuring the keystore using either WLST as described in [Section 23.8.3.6.2, "Configuring the Keystore Using WLST,"](#) or using Fusion Middleware Control as described in [Section 23.8.3.6.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

23.8.3.6.2 Configuring the Keystore Using WLST

After creating the external portlet domain keystore, configure the keystore service and update the credential store so that OWSM can read the keystore and keys correctly.

To configure the keystore service:

1. Go to the `<DOMAIN_HOME>/config/fmwconfig` directory, and open the file `jps-config.xml` in an editor.
2. Locate the `<serviceInstance` node for the `keystore.provider Provider`
3. Make sure that the `producer.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./producer.jks`.
4. Use the following WLST commands to update the credential store:

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password="welcome1", desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="producer",
password="welcome1", desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="producer",
password="welcome1", desc="Signing key")
```

5. Restart all servers.

23.8.3.6.3 Configuring the Keystore Using Fusion Middleware Control

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider as described in [Section 23.8.3.6.4, "Unconfiguring a Keystore Provider."](#) Otherwise, continue with the steps below.

To configure the keystore provider:

1. Open Fusion Middleware Control and log into the WebCenter domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the WebLogic Domain node and click on the WebCenter domain (webcenter by default).
3. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.
4. Expand the Keystore section on the Security Provider Configuration page.
5. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–170](#)).

Figure 23–170 Keystore Configuration Page

Information
All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type

* Keystore Path

* Password

* Confirm Password

Identity Certificates
Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

This screenshot shows the Keystore Configuration page.

- *****
6. Check **Configure Keystore Management** and use the following settings to specify the location of the keystore that contains the certificate and private key, and the signature key and encryption key aliases:
 - **Keystore Path:** `./producer.jks`
 - **Password:** Enter and confirm the password for the keystore.
 - **Key Alias:** `producer`
 - **Signature Password:** Enter and confirm the password for the signature key.
 - **Crypt Alias:** `producer`
 - **Crypt Password:** Enter and confirm the password for the encryption key.
 7. Click **OK** to save your settings.
 8. Restart the Administration server for the domain.

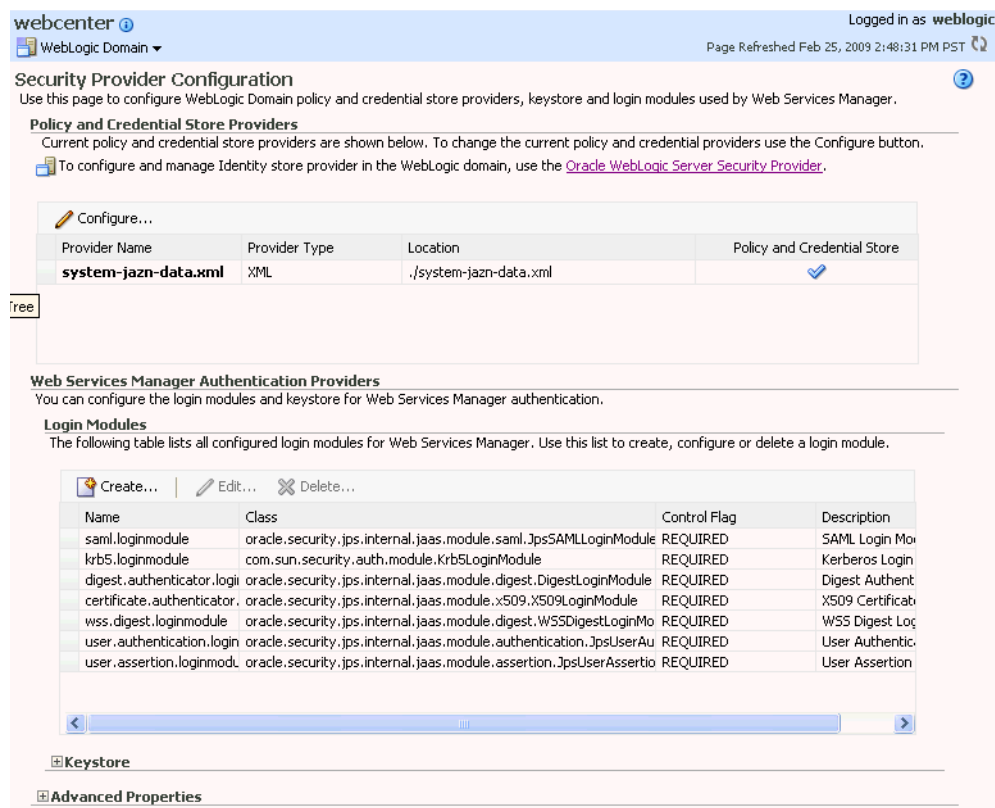

23.8.3.6.4 Unconfiguring a Keystore Provider

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider before configuring a new provider. If a keystore provider is not already configured, continue with the steps to configure the keystore in [Section 23.8.3.6.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

To unconfigure a keystore provider using Fusion Middleware Control:

1. Open Fusion Middleware Control and log into the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.
The Security Provider Configuration page displays (see [Figure 23–171](#)).

Figure 23–171 Security Provider Configuration Page

3. Expand the Keystore section on the Security Provider Configuration page.
4. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–172](#)).

Figure 23–172 Keystore Configuration Page

Information
All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type: JKS

* Keystore Path: /producer.jks

* Password: [REDACTED]

* Confirm Password: [REDACTED]

Identity Certificates
Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

Signature Key	Encryption Key
* Key Alias: producer	* Crypt Alias: producer
* Signature Password: [REDACTED]	* Crypt Password: [REDACTED]
* Confirm Password: [REDACTED]	* Confirm Password: [REDACTED]

5. Uncheck Configure Keystore Management.

6. Click OK.

23.8.3.7 Setting Up the External WebCenter Domain Keystore

This section describes how to set up an external WebCenter domain used by a custom WebCenter application making WebCenter Spaces WebService calls.

This section contains the following subsections:

- [Section 23.8.3.7.1, "Creating the External WebCenter Domain Keystore"](#)
- [Section 23.8.3.7.2, "Configuring the Keystore Using WLST"](#)
- [Section 23.8.3.7.3, "Configuring the Keystore Using Fusion Middleware Control"](#)
- [Section 23.8.3.7.4, "Unconfiguring a Keystore Provider"](#)

23.8.3.7.1 Creating the External WebCenter Domain Keystore

To create the external WebCenter domain keystore:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, generate the keystore by importing the WebCenter domain's public certificate:

```
keytool -importcert -alias webcenter_public -file webcenter_public.cer
-keystore external_webcenter_custom.jks -storepass keystore_password
```

Where:

- `keystore_password` is the keystore password

Example 23–28 Importing the Certificate

```
keytool -importcert -alias webcenter_public -file webcenter_public.cer -keystore
external_webcenter_custom.jks -storepass welcome1
```

3. Using `keytool`, generate a key pair:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias external_
webcenter_custom -keypass key_password -keystore external_webcenter_custom.jks
-storepass keystore_password -validity days_valid
```

Where:

- *consumer_dname* is the name of the consumer (for example, `cn=external_webcenter_custom,dc=example,dc=com`)
- *key_password* is the password for the new public key, (for example, `welcome1`)
- *keystore_password* is the keystore password, (for example, `welcome1`)
- *days_valid* is the number of days for which the key password is valid (for example, `1064`).

Example 23–29 Generating the Keypair

```
keytool -genkeypair -keyalg RSA -dname "cn=external_webcenter_
custom,dc=example,dc=com" -alias external_webcenter_custom -keypass welcome1
-keystore external_webcenter_custom.jks -storepass welcome1 -validity 1064
```

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

4. Export the certificate containing the public key so that it can be imported into the WebCenter Spaces domain's keystore:

```
keytool -exportcert -v -alias external_webcenter_custom -keystore external_
webcenter_custom.jks -storepass keystore_password -rfc -file external_
webcenter_custom_public_key.cer
```

Where:

- *keystore_password* is the keystore password, (for example, `welcome1`)

Example 23–30 Exporting the Certificate Containing the Public Key

```
keytool -exportcert -v -alias external_webcenter_custom -keystore external_
webcenter_custom.jks -storepass welcome1 -rfc -file external_webcenter_custom_
public_key.cer
```

5. Import the certificate to the WebCenter domain with a different alias (choose **Yes** when prompted whether to overwrite the existing certificate with the alias `external_webcenter_custom_public_key`):

```
keytool -importcert -alias external_webcenter_custom_public_key -file external_
webcenter_custom_public_key.cer -keystore webcenter.jks -storepass keystore_
password
```

Where:

- *keystore_password* is the keystore password (for example, `welcome1`)

Example 23–31 Importing the Certificate

```
keytool -importcert -alias external_webcenter_custom_public_key -file external_
webcenter_custom_public_key.cer -keystore webcenter.jks -storepass welcome1
```

6. Continue by configuring the keystore using either WLST as described in [Section 23.8.3.7.2, "Configuring the Keystore Using WLST"](#), or using Fusion

Middleware Control as described in [Section 23.8.3.7.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

23.8.3.7.2 Configuring the Keystore Using WLST

After creating the external WebCenter domain keystore, configure the keystore service and update the credential store so that OWSM can read the keystore and keys correctly.

To configure the keystore service:

1. Go to the `<DOMAIN_HOME>/config/fmwconfig` directory, and open the file `jps-config.xml` in an editor.
2. Locate the `<serviceInstance` node for the keystore.provider Provider
3. Make sure that the `webcenter.jks` keystore file is copied to the `<DOMAIN_HOME>/config/fmwconfig` directory, and then specify the location as `./webcenter.jks`.
4. Use the following WLST commands to update the credential store:

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="owsm",
password="welcome1", desc="Keystore key")
createCred(map="oracle.wsm.security", key="enc-csf-key", user="external_
webcenter_custom", password="welcome1", desc="Encryption key")
createCred(map="oracle.wsm.security", key="sign-csf-key", user="external_
webcenter_custom", password="welcome1", desc="Signing key")
```

5. Restart all servers.

23.8.3.7.3 Configuring the Keystore Using Fusion Middleware Control

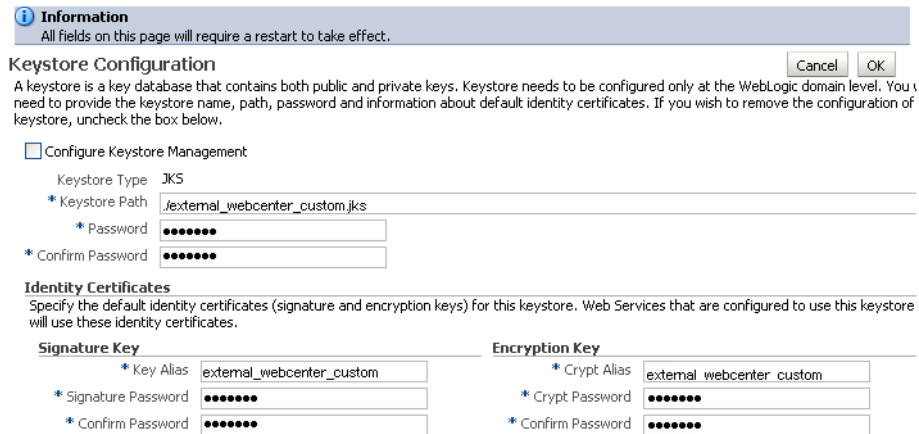

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider as described in [Section 23.8.3.7.4, "Unconfiguring a Keystore Provider."](#) Otherwise, continue with the steps below.

To configure the keystore provider:

1. Open Fusion Middleware Control and log into the WebCenter domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the WebLogic Domain node and click on the WebCenter domain (`webcenter` by default).
3. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.
4. Expand the Keystore section on the Security Provider Configuration page.
5. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23-173](#)).

Figure 23–173 Keystore Configuration Page

This screenshot shows the Keystore Configuration page.

6. Check **Configure Keystore Management** and use the following settings to specify the location of the keystore that contains the certificate and private key, and the signature key and encryption key aliases:
 - **Keystore Path:** `./external_webcenter_custom.jks`
 - **Password:** Enter and confirm the password for the keystore.
 - **Key Alias:** `external_webcenter_custom`
 - **Signature Password:** Enter and confirm the password for the signature key.
 - **Crypt Alias:** `external_webcenter_custom`
 - **Crypt Password:** Enter and confirm the password for the encryption key.
7. Click **OK** to save your settings.
8. Restart the Administration server for the domain.

23.8.3.7.4 Unconfiguring a Keystore Provider

If a keystore provider is already configured, you will first need to unconfigure the existing keystore provider before configuring a new provider. If a keystore provider is not already configured, continue with the steps to configure the keystore in [Section 23.8.3.7.3, "Configuring the Keystore Using Fusion Middleware Control."](#)

To unconfigure a keystore provider using Fusion Middleware Control:

1. Open Fusion Middleware Control and log into the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.
3. Expand the Keystore section on the Security Provider Configuration page.
4. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–174](#)).

Figure 23–174 Keystore Configuration Page

Information
All fields on this page will require a restart to take effect.

Keystore Configuration Cancel OK

A keystore is a key database that contains both public and private keys. Keystore needs to be configured only at the WebLogic domain level. You need to provide the keystore name, path, password and information about default identity certificates. If you wish to remove the configuration of keystore, uncheck the box below.

Configure Keystore Management

Keystore Type: JKS

* Keystore Path: /external_webcenter_custom.jks

* Password: [REDACTED]

* Confirm Password: [REDACTED]

Identity Certificates
Specify the default identity certificates (signature and encryption keys) for this keystore. Web Services that are configured to use this keystore will use these identity certificates.

<p>Signature Key</p> <p>* Key Alias: external_webcenter_custom</p> <p>* Signature Password: [REDACTED]</p> <p>* Confirm Password: [REDACTED]</p>	<p>Encryption Key</p> <p>* Crypt Alias: external_webcenter_custom</p> <p>* Crypt Password: [REDACTED]</p> <p>* Confirm Password: [REDACTED]</p>
---	--

5. Uncheck Configure Keystore Management.

6. Click OK.

23.8.3.7.5 Calling WebCenter Spaces WebServices

In your client project, where you are setting up the `GroupSpaceWSContext`, set the recipient key alias to be the same as the WebCenter Spaces certificate alias as shown below:

```
GroupSpaceWSContext context = new GroupSpaceWSContext();
context.setRecipientKeyAlias("webcenter_public");
```

23.8.4 Securing Oracle WebLogic Communication Services (OWLCS) with WS-Security

Follow the steps below to configure WS-Security for Oracle WebLogic Communication Services (OWLCS):

1. Provide the **policyURI** when creating the Instant Messaging and Presence (IMP) connection.

When you create the connection to the WS-Security enabled OWLCS server, you must provide the `policyURI`. The value of `policyURI` should be set to `oracle/wss11_saml_token_with_message_protection_client_policy`. If no `policyURI` is supplied, the application will use a non-secure connection. See also [Section 14.1, "What You Should Know About Instant Messaging and Presence Connections."](#)

2. Supply an alias name for the private key to the IMP connection.

Provide an additional property in the WebCenter IMP connection named `recipient.alias`. Set the value of this property to the alias under which to import the OWLCS certificate. Ensure that this value is unique and is not used already by some other service. If no alias name is supplied, the application uses the default value `webcenter_owlcs`. See also [Section 14.3, "Registering Instant Messaging and Presence Servers."](#)

3. Determine the private key in the OWLCS keystore (located on the OWLCS instance at `DOMAIN_HOME/config/fmwconfig`).

Use the following command to list the keystore contents:

```
keytool -list -v -keystore Serversidekeystore.jks -storepass password
```

Find the entry with the Entry type set to `keyEntry`. The alias name of this entry is the private key (`orakey` by default).

4. Export the private key from the OWLCS server keystore.

Use the following command to export `orakey` to a certificate file (for example, `orakey.cer`).

```
keytool -exportcert -v -alias orakey -keystore Serversidekeystore.jks
-storepass welcome -rfc -file orakey.cer
```

5. Determine the private key in the WebCenter keystore (on the WebCenter instance at `DOMAIN_HOME/config/fmwconfig`).

If no keystore is found, proceed to step 6. Otherwise, use the following command to list the keystore contents:

```
keytool -list -v -keystore default-keystore.jks -storepass welcome
```

Find the entry with Entry type set to `keyEntry` or `PrivateKeyEntry`. The alias name of this entry is the private key.

If no such entry is found, proceed to step 6. Otherwise, continue at step 7.

6. Generate a private key on WebCenter.

Go to `DOMAIN_HOME/config/fmwconfig` in your WebCenter installation and run the following command to add a key pair to the keystore. The command creates a keystore named `default-keystore.jks` if it doesn't already exist, and adds a new private key entry with alias `orasig` and the password set to `welcome1`. You can optionally change the alias, password and domain name command when you run the command.

```
keytool -genkeypair -keyalg RSA -dname "cn=consumer,dc=example,dc=com"
-alias orasig -keypass welcome1 -keystore default-keystore.jks
-storepass welcome1 -validity 360
```

7. Configure OWLCS on your WebCenter instance to use the private key.

Run the WLST `createCred` command substituting the values for `user` and `password` in the first two commands with your private key alias and password.

```
createCred(map='oracle.wsm.security', key='enc-csf-key', user='orasig',
password='welcome1', desc='EncryptionKey')
```

```
createCred(map='oracle.wsm.security', key='sign-csf-key', user='orasig',
password='welcome1', desc='SigningKey')
```

```
createCred(map='oracle.wsm.security', key='keystore-csf-key', user='owsm',
password='welcome1', desc='KeystoreKey')
```

8. Export the private key pair to a certificate.

Export the private key found in step 5 or created in step 6 to a certificate file using the following command:

```
keytool -exportcert -v -alias orasig -keystore default-keystore.jks -storepass
welcome1 -rfc -file orasig.cer
```

9. Import the certificate generated on the OWLCS Server to the WebCenter keystore.

Copy the certificate generated in step 4 to a temporary location on the WebCenter instance. Import the certificate in the WebCenter instance using the alias name from step 2.

Use the following command to import the certificate in the WebCenter keystore:

```
keytool -importcert -alias webcenter_owlcs -file orakey.cer -keystore
default-keystore.jks -storepass welcome1
```

10. Import the WebCenter certificate on the OWLCS instance.

Copy the certificate created in step 8 to a temporary location on the OWLCS instance. Go to `DOMAIN_HOME/config/fmwconfig` and import the certificate in the keystore under a meaningful alias (for example, `webcenter_key`) using the following command:

```
keytool -importcert -alias webcenter_key -file orasig.cer -keystore
Serversidekeystore.jks -storepass welcome
```

23.8.5 Securing a WSRP Producer with WS-Security

The following sections describe how to secure access to JSR-168 standards-based WSRP portlets from WebCenter applications:

- [Section 23.8.5.1, "Deploying the Producer"](#)
- [Section 23.8.5.2, "Attaching a Policy to the Producer Endpoint"](#)
- [Section 23.8.5.3, "Setting Up the Keystores"](#)

For a conceptual overview of securing WSRP producers, see "Securing Identity Propagation Through WSRP Producers with WS-Security" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

23.8.5.1 Deploying the Producer

Before you configure the producer for WS-Security, you must first deploy your standards-compliant portlet producer to an Oracle WebLogic managed server by performing the steps described in [Section 21.8, "Deploying Portlet Producer Applications."](#)

23.8.5.2 Attaching a Policy to the Producer Endpoint

This section describes how to attach a security policy to a WSRP producer endpoint. The following policies are supported for WSRP producers:

- Username token with password

```
wss10_username_token_with_message_protection_service_policy
```

This policy enforces message-level protection (message integrity and confidentiality) and authentication for inbound SOAP requests in accordance with the WS-Security 1.0 standard. It uses WS-Security's Basic 128 suite of asymmetric key technologies (specifically, RSA key mechanism for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption). The keystore is configured through the security configuration. Authentication is enforced using credentials in the WS-Security UsernameToken SOAP header. The Subject is established against the currently configured identity store.

- Username token without password

```
wss10_username_id_propagation_with_msg_protection_service_
policy
```

This policy enforces message level protection (message integrity and confidentiality) and identity propagation for inbound SOAP requests using mechanisms described by the WS-Security 1.0 standard. Message protection is provided using WS-Security's Basic 128 suite of asymmetric key technologies (specifically, RSA key mechanisms for confidentiality, SHA-1 hashing algorithm for integrity, and AES-128 bit encryption). Identity is set using the user name provided by the UsernameToken WS-Security SOAP header. The Subject is established against the currently configured identity store.

- SAML token

There are four SAML token policies:

- WSS 1.0 SAML token Policy:

`wss10_saml_token_service_policy`

This policy authenticates users using credentials provided in SAML tokens in the WS-Security SOAP header. The credentials in the SAML token are authenticated against a SAML login module. This policy can be applied to any SOAP-based endpoint.

–

- WSS 1.0 SAML token with message integrity:

`wss10_saml_token_with_message_integrity_service_policy`

This policy provides message-level integrity protection and SAML-based authentication for inbound SOAP requests in accordance with the WS-Security 1.0 standard. It uses WS-Security's Basic 128 suite of asymmetric key technologies, specifically RSA key mechanisms for message confidentiality, and SHA-1 hashing algorithm for message integrity.

- WSS 1.0 SAML token with message protection:

`wss10_saml_token_with_message_protection_service_policy`

This policy enforces message-level protection and SAML-based authentication for inbound SOAP requests in accordance with the WS-Security 1.0 standard. It uses WS-Security's Basic 128 suite of asymmetric key technologies, specifically RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption.

- WSS 1.1 SAML token with message protection:

`wss11_saml_token_with_message_protection_service_policy`

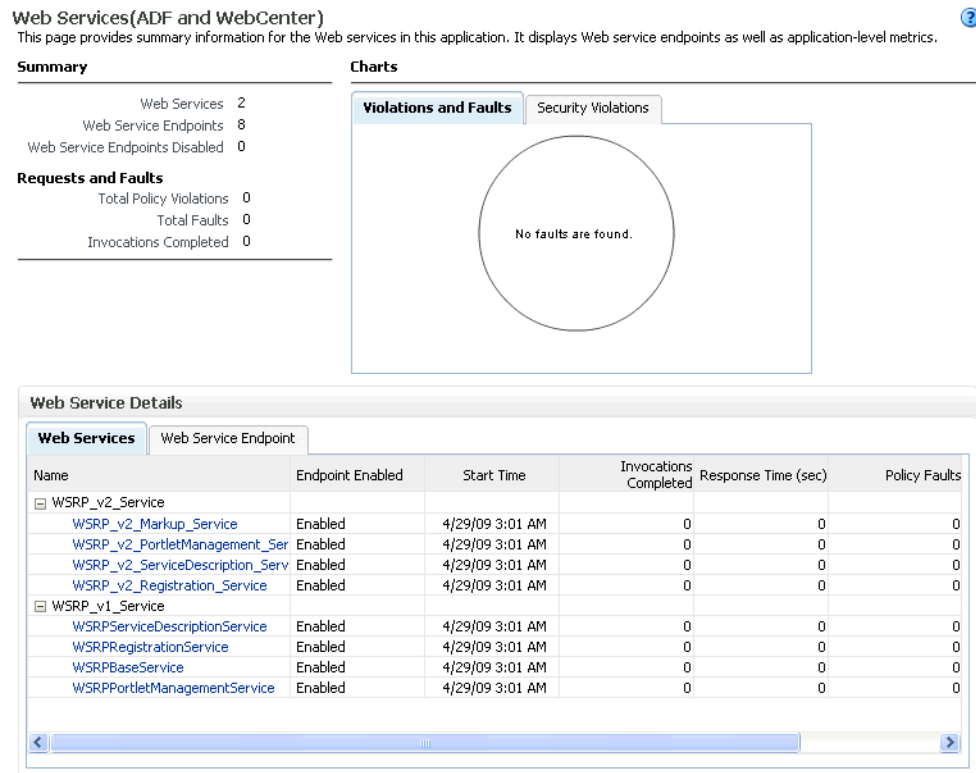

This policy enforces message-level protection (that is, message integrity and message confidentiality) and SAML-based authentication for inbound SOAP requests in accordance with the WS-Security 1.1 standard. Messages are protected using WS-Security's Basic 128 suite of symmetric key technologies, specifically RSA key mechanisms for message confidentiality, SHA-1 hashing algorithm for message integrity, and AES-128 bit encryption. The keystore is configured through the security configuration. It extracts the SAML token from the WS-Security binary security token, and uses those credentials to validate users against the configured identity store. This policy can be attached to any SOAP-based endpoint.

The keystore is configured through the security configuration. It extracts the SAML token from the WS-Security binary security token, and uses those credentials to validate users against the configured identity store.

To attach a policy to a producer endpoint

1. Open Fusion Middleware Control and log into the target domain.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the Application Deployments node, and click the producer to attach a policy to.
3. From the Application Deployment menu, select **Web Services**.
The Web Services Summary page for the producer displays (see [Figure 23–175](#)).

Figure 23–175 Web Services Summary Page

This screenshot shows the WebServices Summary page.

4. Open the Web Service Endpoint tab and click the endpoint to which to attach a policy.

Note: Only the markup service ports should be secured (WSRP_V2_Markup_Service and WSRP_V1_Markup_Service).

The Web Service Endpoints page for the producer displays (see [Figure 23–176](#)).

Figure 23–176 Web Service Endpoints Page

This screenshot shows the Attach/Detach Policy page with a policy selected.

9. When finished adding polices to attach to the producer endpoint, click **OK**.

23.8.5.3 Setting Up the Keystores

The steps to create and configure keystores for a WSRP producer depend on the topology of your WebCenter environment, and are covered in the following sections:

- [Section 23.8.1, "Configuring WS-Security for a Simple Topology"](#)
- [Section 23.8.2, "Configuring WS-Security for a Typical Topology"](#)
- [Section 23.8.3, "Configuring WS-Security for a Complex Topology"](#)

Please refer to these sections for more complete instructions for setting up the keystores, and other WS-Security aspects of configuring WSRP producers.

23.8.6 Securing WebCenter Spaces for Applications Consuming Spaces Client APIs with WS-Security

This section describes the administrator tasks required to configure WS-Security for WebCenter Spaces so that the communication between the an application exposing WebCenter Spaces APIs (the consumer) and WebCenter Spaces (the producer) is secure, and that the identity of the user invoking the APIs is protected.

You will need to create a Java keystore and update the credential store so that WebCenter Spaces can verify the authenticity of the SAML-based security tokens received from your application. You must then register this keystore and update the credential store. For information about the developer tasks for developing applications that consume WebCenter Spaces client APIs, see "How to Set Up Your Custom

WebCenter Application to Use the WebCenter Spaces APIs" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

This section includes the following subsections:

- [Section 23.8.6.1, "Generating the Keystores"](#)
- [Section 23.8.6.2, "Providing the Keystores and Keystore Information to the Application Developer"](#)
- [Section 23.8.6.3, "Registering the Keystores"](#)
- [Section 23.8.6.4, "Updating the Credential Stores"](#)

23.8.6.1 Generating the Keystores

Follow the steps below to generate Java keystores for the consumer (the custom WebCenter application) and producer (WebCenter Spaces).

To generate keystores for the consumer and producer:

1. Go to `JDK_HOME/jdk/bin` and open a command prompt.
2. Using `keytool`, generate a key pair:

```
keytool -genkeypair -keyalg RSA -dname "consumer_dname" -alias consumer_alias
-keypass key_password
-keystore keystore -storepass keystore_password -validity days_valid
```

Where:

- `consumer_dname` is the distinguished name of the consumer (for example, `cn=consumer, dc=example, dc=com`). The value could be anything but typically matches the distinguished name (DN) of the machine on which the keystore would reside.
- `consumer_alias` is the alias of the consumer (for example, `consumer`)
- `key_password` is the password for the new public key, (for example, `welcome1`)
- `keystore` is the keystore name, (for example, `consumer.jks`)
- `keystore_password` is the keystore password, (for example, `welcome1`)
- `days_valid` is the number of days for which the key password is valid (for example, `360`).

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (DSA) used by `keytool` for generating the key is incompatible with Oracle WebServices Security Manager requirements.

3. Export the public key for the consumer:

```
keytool -exportcert -v -alias consumer_alias -keystore keystore -storepass
keystore_password -rfc -file certificate_file
```

Where:

- `consumer_alias` is the alias of the consumer (for example, `consumer`)
- `keystore` is the keystore name, (for example, `consumer.jks`)

- *keystore_password* is the keystore password, (for example, *welcome1*)
- *certificate_file* is the file name for the certificate to export the key to (for example, *consumer.cer*)

4. Generate the producer keystore by importing the trusted certificate of the consumer:

```
keytool -importcert -alias consumer_alias -file certificate_file -keystore keystore -storepass keystore_password
```

Where:

- *consumer_alias* is the alias of the consumer
- *certificate_file* is the certificate file name
- *keystore* is the keystore name
- *keystore_password* is the keystore password

5. Generate the key pair for the producer:

```
keytool -genkeypair -keyalg RSA -dname "producer_dname"  
-alias producer_alias -keypass key_password  
-keystore keystore  
-storepass keystore_password -validity days_valid
```

Where:

- *producer_dname* is the name of the producer (for example, *cn=producer,dc=example,dc=com*)
- *producer_alias* is the alias of the producer (for example, *producer*)
- *key_password* is the password for the new public key, (for example, *welcome1*)
- *keystore* is the keystore name, (for example, *producer.jks*)
- *keystore_password* is the keystore password, (for example, *welcome1*)
- *days_valid* is the number of days for which the key password is valid (for example, *1024*)

Note: You must use the `-keyalg` parameter and specify `RSA` as its value as shown above as the default algorithm (`DSA`) used by `keytool` for generating the key will not work.

6. List the contents of the keystore:

```
keytool -list -v -keystore keystore_name -storepass password
```

Where:

- *keystore_name* is the name of the consumer keystore file (for example, *portal.jks*)
- *password* is the keystore password.

The keystore should now have two key entries.

7. Export the public key of the producer:

```
keytool -exportcert -v -alias producer_alias -keystore keystore -storepass
```

```
keystore_password -rfc -file certificate_file
```

Where:

- *producer_alias* is the alias of the producer (for example, *producer*)
- *keystore* is the keystore name (for example, *producer.jks*)
- *keystore_password* is the keystore password, (for example, *welcome1*)
- *certificate_file* is the certificate file name (for example, *producer.cer*)

8. Import the trusted certificate of the producer:

```
keytool -importcert -alias producer_alias -file certificate_file -keystore keystore_name -storepass keystore_password
```

Where:

- *producer_alias* is the alias of the producer (for example, *producer*)
- *certificate_file* is the file name or path for the producer's certificate file (for example, *../producer/producer.cer*)
- *keystore_name* is the keystore name (for example, *consumer.jks*)
- *keystore_password* is the keystore password, (for example, *welcome1*)

23.8.6.2 Providing the Keystores and Keystore Information to the Application Developer

Before registering the keystores, make sure that you have provided the following to the developer creating the application that will be consuming the WebCenter Spaces APIs.

- The consumer keystore to be used to secure the connection. This is a *.jks* file (for example, *consumer.jks*).
- The consumer public alias key stored in the keystore (for example, *consumer*).
- The password of the consumer public alias key (for example, *welcome1*).
- The producer public alias key stored in the consumer keystore (for example, *producer*). This is the alias used when importing the trusted certificate of the producer, and created in step 8 of [Section 23.8.6.1, "Generating the Keystores."](#)
- The consumer keystore password (for example, *welcome1*).

23.8.6.3 Registering the Keystores

After you have created the keystores, configure the keystore for WS-Security by performing the following steps. If a keystore provider is already configured, unconfigure the existing keystore provider before proceeding as described in [Section 23.8.1.1.4, "Unconfiguring a Keystore Provider Using Fusion Middleware Control."](#)

To register the keystore provider:

1. Copy the *producer.jks* file to the file system where your producer application is running (for example, *DOMAIN_HOME/config/fmwconfig*).
2. Log into Fusion Middleware Control.

For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)

3. In the Navigation pane, expand the WebLogic Domain node and click on the domain (for example, webcenter).
4. From the WebLogic Domain menu, select **Security -> Security Provider Configuration**.

The Security Provider Configuration page displays (see [Figure 23–180](#)).

Figure 23–180 Security Provider Configuration Page

WebLogic Domain Page Refreshed Dec 7, 2009 11:27:05 AM

Security Provider Configuration ⓘ
 Use this page to configure WebLogic Domain policy and credential store providers, keystore and login modules used by Web Services Manager.

Policy and Credential Store Providers
 Current policy and credential store providers are shown below. To change the current policy and credential providers use the Change Association button.

Provider Name	Provider Type	Location	Policy and Credential Store
polystore.ldap	LDAP	ldap://dadvmc0538.us.oracle.com:3060/cn=dadvm537_domain,cn	<input checked="" type="checkbox"/>

⊞ Identity Store Provider

Web Services Manager Authentication Providers
 You can configure the login modules and keystore for Web Services Manager authentication.

Login Modules
 The following table lists all configured login modules for Web Services Manager. Use this list to create, configure or delete a login module.

Name	Class	Control Flag	Description
saml.loginmodule	oracle.security.jps.internal.jaas.module.saml.JpsSAMLLoginModule	Required	SAML Login Module
krb5.loginmodule	com.sun.security.auth.module.Krb5LoginModule	Required	Kerberos Login Module
digest.authenticator.log	oracle.security.jps.internal.jaas.module.digest.DigestLoginModule	Required	Digest Authenticator Log
certificate.authenticator	oracle.security.jps.internal.jaas.module.x509.X509LoginModule	Required	X509 Certificate Login M
wss.digest.loginmodule	oracle.security.jps.internal.jaas.module.digest.WSSDigestLoginMc	Required	WSS Digest Login Modul
user.authentication.login	oracle.security.jps.internal.jaas.module.authentication.JpsUserAu	Required	User Authentication Log
user.assertion.loginmod	oracle.security.jps.internal.jaas.module.assertion.JpsUserAsserti	Required	User Assertion Login Mo

⊞ Keystore

⊞ Single Sign-On Provider

⊞ Advanced Properties

5. Expand the Keystore section on the Security Provider Configuration page.
6. Click **Configure**.

The Keystore Configuration page displays (see [Figure 23–181](#)).

Figure 23–181 Keystore Configuration Page

7. In the **Keystore Path** field, specify the location of the keystore that contains the certificate and private key that is used for signing some parts (security token and SOAP message body) of the SOAP message, and enter and confirm the keystore **Password**.
8. In the Signature Key section, enter `sign-csf-key` as the **Key Alias**, and enter and confirm the signature key **Password** (the value used for `<key_password>` above) for the new public key, (for example, `welcome1`).
9. In the Encryption Key section, enter `enc-csf-key` in the **Crypt Alias** field, and enter and confirm the encryption key **Password** (the value used for `<key_password>` above) for the new public key, (for example, `welcome1`).
10. Click **OK** to save your settings.
11. Restart the Administration server for the domain.

23.8.6.4 Updating the Credential Stores

Follow the steps below to update the credential stores from the command line using WLST, or using Fusion Middleware Control.

This section contains the following subsections:

- [Section 23.8.6.4.1, "Updating the Credential Store Using WLST"](#)
- [Section 23.8.6.4.2, "Updating the Credential Store Using Fusion Middleware Control"](#)

23.8.6.4.1 Updating the Credential Store Using WLST

Update the credential store using the WLST `createCred` command. Use the following example values to add the `keystore-csf-key`, `enc-csf-key`, and `sign-csf-key` encryption keys. Before running the command, be sure to back up the `wallet.sso` file.

Example 23–32 keystore-csf-key

```
createCred(map="oracle.wsm.security", key="keystore-csf-key", user="keystore-csf-key", password="welcome1", desc="Keystore Password")
```

Example 23–33 enc-csf-key

```
createCred(map="oracle.wsm.security",key="enc-csf-key",user="producer",password="welcome1",desc="Enc Password")
```

Example 23–34 sign-csf-key

```
createCred(map="oracle.wsm.security",key="sign-csf-key",user="producer",password="welcome1",desc="Enc Password")
```

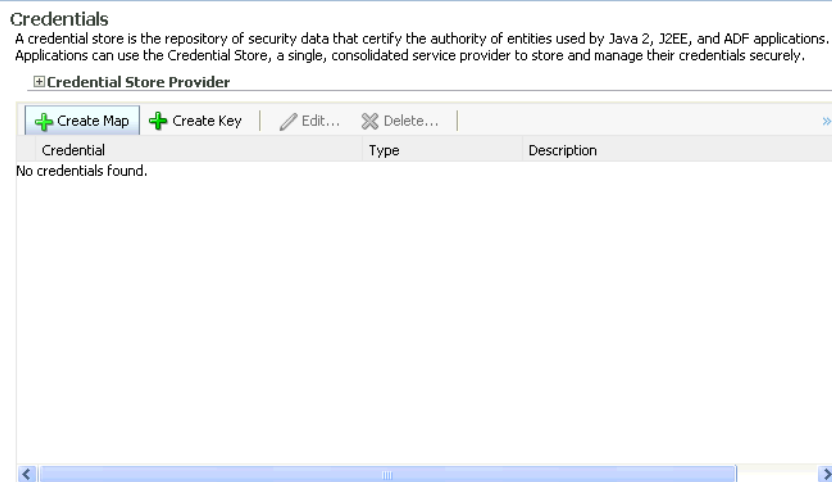

23.8.6.4.2 Updating the Credential Store Using Fusion Middleware Control

1. Log into Fusion Middleware Control.

For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)

2. In the Navigation pane, expand the WebLogic Domain node and click on the domain (for example, webcenter).
3. From the WebLogic Domain menu, select **Security -> Credentials**.

The Credentials page displays (see [Figure 23–182](#)).

Figure 23–182 Credentials Page

4. Click **Create Map**.
5. On the Create Map pop-up, enter `oracle.wsm.security` as the map name and click **OK**.
6. Click **Create Key**.
7. On the Create Key pop-up, select `oracle.wsm.security` as the map, enter `keystore-csf-key` as the **Key**, select `Password` as the **Type**, enter `keystore-csf-key` as the **User Name**, supply the **Password** (in this case, the keystore password of `producer.jks`) from when you created the keystores (for example, `welcome1`), enter an optional description, and click **OK**.
8. Click **Create Key**.
9. On the Create Key pop-up, select `oracle.wsm.security` as the map, enter `sign-csf-key` as the **Key**, select `Password` as the **Type**, enter the public key alias of the keystore used in the custom WebCenter application as the **User Name**,

enter the password of the public key used in the custom WebCenter application as the **Password**, enter an optional description, and click **OK**.

10. Click **Create Key**.
11. On the Create Key pop-up, select `oracle.wsm.security` as the map, enter `enc-csf-key` as the **Key**, select `Password` as the **Type**, enter the public key alias of the keystore used in the WebCenter instance (for example, `webcenter`) as the **User Name**, enter the password of the public key used in the custom WebCenter application as the **Password**, enter an optional description, and click **OK**.
12. Restart the Administration server and `WLS_Custom` or managed server on which the custom WebCenter application is hosted.

23.9 Securing a PDK-Java Producer

A shared key can be defined for message integrity protection and should be used with SSL. The steps to store a shared key as a password credential are:

- Define a shared key as a password credential in the credential store of the administration server instance. This can be done using either Fusion Middleware Control or WLST.
- Restart the web producer and access the test page. Confirm that the shared key has been picked up correctly by checking the application logs.

Note: Using a shared key provides only message integrity protection. For complete message protection SSL is required. For more information on securing PDK-Java portlets using SSL, see [Section 23.6.5, "Securing the WebCenter Spaces Connection to Portlet Producers with SSL."](#)

23.9.1 Defining a Shared Key as a Password Credential

You can define a shared key as a password credential in the credential store of the administration server instance using either Fusion Middleware Control or WLST commands.

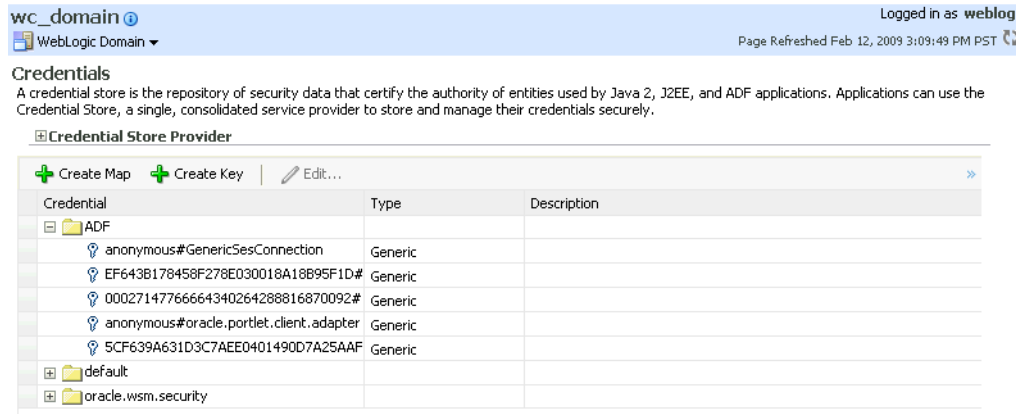

23.9.1.1 Defining a Shared Key Using Fusion Middleware Control

To define a shared key using Fusion Middleware Control:

1. Log into Fusion Middleware Control.
For information on logging into Fusion Middleware Control, see [Section 6, "Starting Enterprise Manager Fusion Middleware Control."](#)
2. In the Navigation pane, expand the WebLogic Domain node and click the target domain (for example, `wc_domain`).
3. From the WebLogic Domain menu, select **Security > Credentials**.

The Credentials pane displays (see [Figure 23-183](#)).

Figure 23–183 Credentials Pane

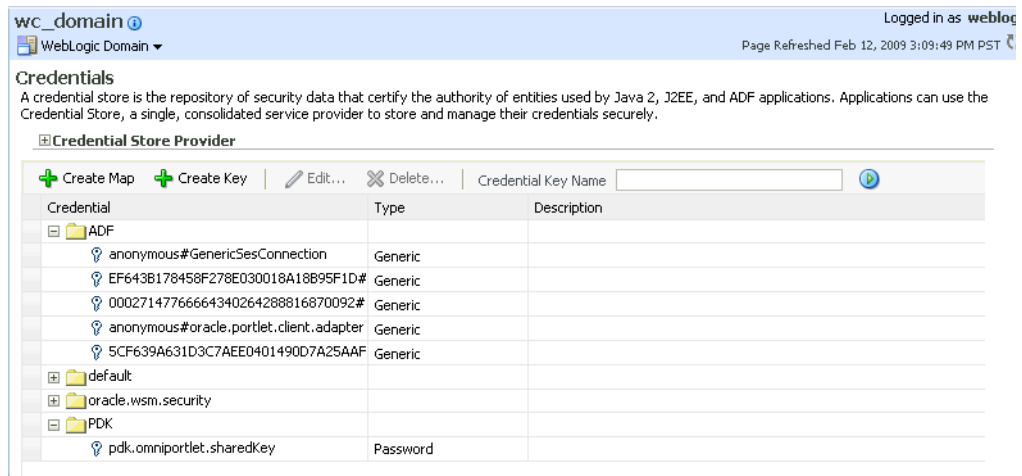

This screenshot shows the Fusion Middleware Control's Credentials pane.

4. Click **Create Map** and enter PDK as the **Map Name** and click **OK**.
5. Click **Create Key** and select the map (PDK) you just created.
6. Enter a **User Name** (this value is not used so it could be anything), a **Key** in the form `pdk.<service_id>.sharedKey` (where `<service_id>` is the name of the producer), and a 10 to 20 hexadecimal digit **Password** and click **OK**.

The new key is displayed in the Credential pane (see [Figure 23–184](#)).

Figure 23–184 Credentials Pane with New Shared Key

This screenshot shows the Fusion Middleware Control's Credential pane with a newly created shared key.

23.9.1.2 Defining a Shared Key Using WLST

You can also define a shared key using WLST:

1. Start WLST as described in [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands,"](#) and connect to the Administration Server instance for the target domain.

2. Connect to the Administration Server for the target domain with the following command:

```
connect('user_name','password','host_id:port')
```

Where:

- *user_name* is the name of the user account with which to access the Administration Server (for example, weblogic)
 - *password* is the password with which to access the Administration Server
 - *host_id* is the host ID of the Administration Server
 - *port* is the port number of the Administration Server (for example, 7001).
3. Add a shared key credential for a producer to the credential store using the WLST `createCred` command:

```
createCred(map='PDK', key='pdk.service_id.sharedKey.user_name', user='user_name', password='password')
```

Where:

- *service_id* is the name of the producer to create the key for (for example, `omniPortlet`)
- *user_name* is the name of the user. This value is not used so it could be anything.
- *password* is a 10 to 20 hexadecimal digit value.

For example:

```
createCred(map='PDK', key='pdk.omniPortlet.sharedKey', user='sharedKey', password='1234567890abc')
```

Note: After creating a credential, you can use the WLST `updateCred` command with the same parameters as above to update it.

4. Restart the producer.

Web producers pick up properties the first time they handle a request (for example, a browser test page request or when they are first registered), so producers should be restarted once a shared key credential has been set up.

23.10 Troubleshooting Security Configuration Issues

This section includes the following sub-sections:

- [Section 23.10.1, "Webcenter Spaces Does Not Find Users in LDAP Provider"](#)
- [Section 23.10.2, "Group Space Gets Created with Errors When Logged in as OID User"](#)
- [Section 23.10.3, "Users Cannot Do Self-Registration with WebCenter Spaces Configured with Active Directory"](#)

- [Section 23.10.4, "User Made Administrator Doesn't Have Administrator Privileges"](#)
- [Section 23.10.5, "OmniPortlet Producer Authorization Exception in SSO Environment"](#)

23.10.1 Webcenter Spaces Does Not Find Users in LDAP Provider

Problem

Weblogic Server was configured with an external LDAP provider. Users in the external LDAP can log into WebCenter Spaces, but when trying to assign administrator roles in WebCenter Spaces to a user from the external LDAP, no users are found.

Solution

Change the Control Flag for the `DefaultAuthenticator` Authentication Provider to `Sufficient` as described in [Section 23.3.1, "Reassociating the Identity Store with an External LDAP."](#) Restart the Administration Server and Managed Servers for the domain.

23.10.2 Group Space Gets Created with Errors When Logged in as OID User

Problem

When logged into WebCenter as an OID user (e.g., orcladmin), and trying to create a Group Space, the Group Space gets created but with errors. The error message appears as "No matching users were found with search string <login user>" is shown.

Solution

The following property is missing in the `jps-config.xml` file:

```
<property name="jps.user.principal.class.name"
value="weblogic.security.principal.WLSUserImpl" />
```

To fix this:

1. Edit `<MIDDLEWARE_HOME>/user_projects/domains/WebCenter/config/fmwconfig/jps-config.xml`.
2. Add this line in the general properties:

```
<property name="jps.user.principal.class.name"
value="weblogic.security.principal.WLSUserImpl" />
```
3. Restart the `WLS_Spaces` server.

23.10.3 Users Cannot Do Self-Registration with WebCenter Spaces Configured with Active Directory

Problem

Users cannot do self-registration with Active Directory after configuring WebCenter Spaces to use AD authenticator. When a user tries to self-register, the following error message appears:

"User not created. Either the user name or the password does not adhere to the registration policy or the identity store is unavailable. Specify the required user credentials or contact your administrator for assistance."

Solution

To fix the problem:

1. Set the user name attribute to `sAMAccountName` while configuring Active Directory in the WebLogic Administration Console.
2. Use the HTTPS port of the LDAP and enable the SSL checkbox while configuring Active Directory in the WebLogic Administration Console.

23.10.4 User Made Administrator Doesn't Have Administrator Privileges**Problem**

After logging in as `orcladmin` and making a user an administrator, after logging out and logging in as that user, the administrator link is still not available.

Solution

The problem is due to duplicate `cn` entries in the identity store. Since `cn` is mapped to the username attribute, it must be unique. Remove the duplicate from the identity store and the user should have the appropriate `privileges.cn`

23.10.5 OmniPortlet Producer Authorization Exception in SSO Environment**Problem**

OmniPortlet producer receives an authorization exception when it tries to store connection information in the Credential Store Framework (CSF) wallet when WebCenter is configured with SSO.

Solution

Grant the required permissions to `ssofilter.jar` by connecting to the Oracle WebCenter Administration Server using WLST (for more information, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#)) and running the following grant commands:

```
grantPermission(codeBaseURL="file:${oracle.home}/modules/oracle.ssofilter_11.1.1/ssofilter.jar",
permClass="oracle.security.jps.service.credstore.CredentialAccessPermission",
permTarget="context=SYSTEM,mapName=omniportlet_user,keyName=*",
permActions="*")

grantPermission(codeBaseURL="file:${oracle.home}/modules/oracle.ssofilter_11.1.1/ssofilter.jar",
permClass="oracle.security.jps.service.credstore.CredentialAccessPermission",
permTarget="context=SYSTEM,mapName=omniportlet_default,keyName=*",
permActions="*")

grantPermission(codeBaseURL="file:${oracle.home}/modules/oracle.ssofilter_11.1.1/ssofilter.jar",
permClass="oracle.security.jps.service.credstore.CredentialAccessPermission",
permTarget="context=SYSTEM,mapName=omniportlet_user,keyName=*",
permActions="*")
```

Monitoring Oracle WebCenter Performance

Fusion Middleware Control Console provides a Web-based user interface for monitoring the real-time performance of WebCenter applications, including any producers and portlets that WebCenter applications may use.

Performance monitoring helps administrators identify issues and performance bottlenecks in their environment. This chapter describes the range of performance metrics available for WebCenter applications and how to monitor them through Fusion Middleware Control. It also describes how to troubleshoot issues by analyzing information that is recorded in WebCenter diagnostic log files.

Administrators who monitor WebCenter applications regularly will learn to recognize trends as they develop and prevent performance problems in the future.

This chapter includes the following sections:

- [Section 24.1, "Understanding WebCenter Performance Metrics"](#)
- [Section 24.2, "Viewing Performance Information"](#)
- [Section 24.3, "Viewing and Configuring Log Information"](#)

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin`, `Operator`, or `Monitor` role through the Oracle WebLogic Server Administration Console). See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools"](#).

24.1 Understanding WebCenter Performance Metrics

Through Fusion Middleware Control, administrators can monitor the performance and availability of all the components and services that make up WebCenter applications, and the application as a whole.

To make best use of the information displayed it is important that you understand how performance metrics are calculated and what they mean. All WebCenter's performance metrics are listed and described here for your reference. Some applications (such as WebCenter Spaces) might use the full range of social networking, personal productivity, and collaboration service metrics listed, while others may only use one or two of these services.

This section includes the following subsections:

- [WebCenter Metric Collection: Recent History and Since Startup](#)
- [Common WebCenter Metrics](#)

- [Common WebCenter Performance Issues and Actions](#)
- [WebCenter Service-Specific Metrics](#)
- [WebCenter Service-Specific Performance Issues and Actions](#)
- [Group Space Metrics](#)

24.1.1 WebCenter Metric Collection: Recent History and Since Startup

Performance metrics are automatically enabled for Oracle WebCenter. In other words, you do not need to set options or perform any extra configuration to collect performance metrics. If you encounter a problem, such as, an application running slowly or hanging, you can view particular metrics to find out more information about the problem as Fusion Middleware Control provides real-time data.

The following metrics are collected for Oracle WebCenter:

- **Since Startup:** At any given time, real-time metrics are available for the duration for which the WebLogic Server hosting WebCenter applications is up and running. Real-time metrics that are collected or aggregated since the startup of the container are displayed for WebCenter as **Since Startup**. These metrics provide data aggregated over the lifetime of the WebLogic Server. The aggregated data enables you to understand overall system performance and compare the performance of recent requests shown in **Recent History**.

Note: Metric collection starts afresh after the container is restarted. Data collected before the restart becomes unavailable.

- **Recent History:** In addition to the **Since Startup** metrics, Oracle WebCenter metrics are also configured to capture performance data every five minutes. This metric data is used with the Since Startup metrics, and is made available as **Recent History** metrics.
- All metrics seen under Recent History are calculated using the recent metrics. For example, if a service is used for a short time, but it is not accessed at all for the last 15 minutes, then the Since Startup metrics for the service shows numbers greater than 0, while the Recent History metrics for that service are all zero. The Recent History metrics enable you to assess real-time performance of a live site based on data collected just from recent run-time access.

Typically, Recent History shows data for the most recent 10-15 minutes. However, there are situations when the data does not reflect the last 10-15 minutes:

- If the WebLogic Server has just started up, and has been running for less than 10-15 minutes, then Recent History shows data for the duration for which the server has been up and running.
- Metric collection stops temporarily if no metric requests are detected over a long period. The collection restarts when the client next requests metrics. If metric collection stops, then Recent History initially shows data for the period since metric collection stopped. As soon as the metric collection starts again, the data starts displaying metrics for the most recent 10-15 minutes.

While diagnosing a live site, you can navigate to the WebCenter metric pages and see the **Services Summary** section to identify services that are actively used and/or are taking longer than expected. Click the **Refresh** icon next to the time stamp to refresh metrics with live data. Then, click the particular service and repeat these steps to determine which specific operation in the service is taking a long time. If needed,

navigate to application pages that use the service and set the application to trigger the run-time metrics to get more data.

24.1.2 Common WebCenter Metrics

Fusion Middleware Control provides capabilities to monitor performance of WebCenter Services in the following ways:

- Services summary: Summary of performance metrics for each service used in a WebCenter application. [Table 24–1](#) lists services that use common performance metrics. [Table 24–2](#) describes service metrics.
- Most popular operations and response time for individual service operations. [Table 24–3](#) describes these metrics.
- Per operation metrics: Performance metrics for individual service operations. [Table 24–1](#) lists common performance metrics used to monitor performance of individual operations. [Table 24–3](#) describes these metrics.

Table 24–1 Common Performance Metrics

Service	Services Summary (Since Startup and Recent History)	Per Operation Metrics (Since Startup and Recent History)
Announcements	The performance metrics include: <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	The performance metrics include: <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)
BPEL Worklist	The performance metrics include: <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	Not applicable
Discussion Forums	The performance metrics include: <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	The performance metrics include: <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)

Table 24–1 (Cont.) Common Performance Metrics

Service	Services Summary (Since Startup and Recent History)	Per Operation Metrics (Since Startup and Recent History)
External Applications	The performance metrics include: <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	The performance metrics include: <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)
Events	The performance metrics include: <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	The performance metrics include: <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)
Import/Export	The performance metrics include: <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	The performance metrics include: <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)
Instant Messaging and Presence (IMP)	The performance metrics include: <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	The performance metrics include: <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)

Table 24–1 (Cont.) Common Performance Metrics

Service	Services Summary (Since Startup and Recent History)	Per Operation Metrics (Since Startup and Recent History)
Lists	<p>The performance metrics include:</p> <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	<p>The performance metrics include:</p> <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)
Mail	<p>The performance metrics include:</p> <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	<p>The performance metrics include:</p> <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)
Notes	<p>The performance metrics include:</p> <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	<p>The performance metrics include:</p> <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)
Pages	<p>The performance metrics include:</p> <ul style="list-style-type: none"> ■ Status ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) 	<p>The performance metrics include:</p> <ul style="list-style-type: none"> ■ Most Popular Operations ■ Response Time ■ Successful Invocations (%) ■ Invocations ■ Average Time (ms) ■ Maximum Time (ms) (Since Startup only)

Table 24–1 (Cont.) Common Performance Metrics

Service	Services Summary (Since Startup and Recent History)	Per Operation Metrics (Since Startup and Recent History)
Recent Activity	The performance metrics include: <ul style="list-style-type: none"> ▪ Status ▪ Successful Invocations (%) ▪ Invocations ▪ Average Time (ms) 	Not available
RSS	The performance metrics include: <ul style="list-style-type: none"> ▪ Status ▪ Successful Invocations (%) ▪ Invocations ▪ Average Time (ms) 	Not available
Search	The performance metrics include: <ul style="list-style-type: none"> ▪ Status ▪ Successful Invocations (%) ▪ Invocations ▪ Average Time (ms) 	The performance metrics include: <ul style="list-style-type: none"> ▪ Most Popular Operations ▪ Response Time ▪ Successful Invocations (%) ▪ Invocations ▪ Average Time (ms) ▪ Maximum Time (ms) (Since Startup only)

Table 24–2 describes metrics used for monitoring performance of all operations.

Table 24–2 Description of Common Metrics - Summary (All Operations)

Metric	Description
Status	The current status of the service: <ul style="list-style-type: none"> ▪ Up (Green Up Arrow) - Indicates that a service is up and running and the last operation was successful. ▪ Down (Red Down Arrow) - Indicates that a service is not currently available. The last operation was unsuccessful due to an unexpected error or exception. User errors, such as an authentication failure, do not change the status to Down. ▪ Unknown (Clock) - Indicates that a service cannot query the status of the WebCenter application for some reason.
Successful Invocations (%)	Percentage of a service invocations that succeeded. Successful Invocations (%) equals the number of successful invocations divided by the invocation count: <ul style="list-style-type: none"> - Since Startup - Recent History If Successful Invocations (%) is below 100%, check the diagnostic logs to establish why service requests are failing. See, Section 24.3, "Viewing and Configuring Log Information" .

Table 24–2 (Cont.) Description of Common Metrics - Summary (All Operations)

Metric	Description
Invocations	<p>This metric shows number of service invocations per minute:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>This metric provides data on how frequently a particular service is being invoked for processing of operations. Comparing this metric across services can help determine the most frequently used WebCenter Services in the application.</p>
Average Time (ms)	<p>The average time taken to process operations associated with a service. This metric can be used with the Invocations metric to assess the total time spent in processing service operations.</p> <ul style="list-style-type: none"> - Since Startup - Recent History

[Table 24–3](#) describes metrics used to monitor performance of each operation performed by a service or component.

Table 24–3 Description of Common Metrics - Per Operation

Metric	Description
Most Popular Operations	<p>The number of invocations per operation (displayed on a chart).</p> <p>The highest value on the chart indicates which operation is used the most.</p> <p>The lowest value indicates which operation is used the least.</p>
Response Time	<p>The average time to process operations associated with a service since the WebCenter application started up (displayed on a chart).</p> <p>The highest value on the chart indicates the worst performing operation.</p> <p>The lowest value indicates which operation is performing the best.</p>
Operation	<p>The operation being monitored. See also, Section 24.1.4, "WebCenter Service-Specific Metrics".</p>
Invocations	<p>The number of invocations, per operation:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>This metric provides data on how frequently a particular service is being invoked for processing of operations. Comparing this metric across services can help determine the most frequently used Web 2.0 Services in the application.</p>
Average Time (ms)	<p>The average time taken to process each operation:</p> <ul style="list-style-type: none"> - Since Startup - Recent History
Maximum Time (ms)	<p>The maximum time taken to process each operation.</p>

24.1.3 Common WebCenter Performance Issues and Actions

This section provides information on identifying generic performance-related issues.

If a metric is out-of-bounds, do the following:

- Check system resources, such as memory, CPU, network, external processes, or other factors.
 - Check other metrics to see if the problem is systemwide or only in a particular service.
 - If the issue is related to a particular service, then check if the back-end server is down or overloaded.
 - If the WebLogic Server has been running for a long time, compare the **Since Startup** metrics with the **Recent History** metrics to determine if performance has recently deteriorated, and if so, by how much.
 - Verify connection configuration information associated with the service to see if it is incorrect or no longer valid. See also, [Appendix A, "WebCenter Configuration."](#)
 - When the status of a service is *Down* or some operations do not work, then validate, test, and ping the back-end server through direct URLs. For details, refer to the "Testing Connection" section in the relevant chapter. For a list of chapters, see [Part IV, "Managing Services, Portlet Producers, and External Applications"](#)
- If a service is reconfigured, but the container is not restarted to pick up the changes, then the service becomes unavailable.

24.1.4 WebCenter Service-Specific Metrics

This section describes *per operation* metrics for all services and components. This section includes the following sub sections:

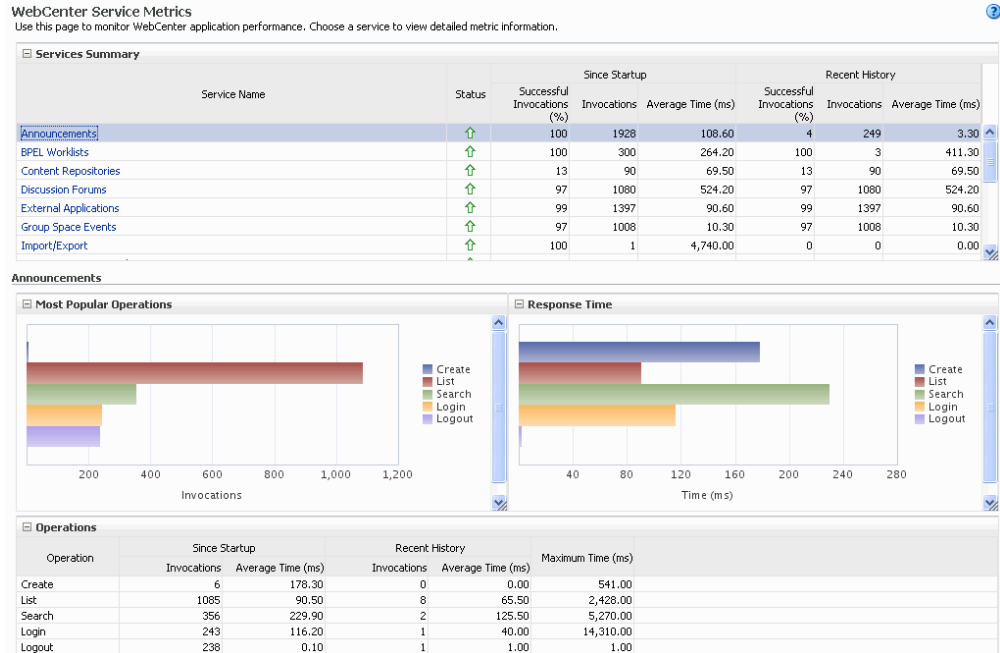

- [Announcements Metrics](#)
- [BPEL Worklist Metrics](#)
- [Content Repository \(Documents Service\) Metrics](#)
- [Discussions Metrics](#)
- [External Application Metrics](#)
- [Events Metrics](#)
- [Instant Messaging and Presence \(IMP\) Metrics](#)
- [Import and Export Metrics](#)
- [List Metrics](#)
- [Mail Metrics](#)
- [Note Metrics](#)
- [Page Metrics](#)
- [Portlet Producer Metrics](#)
- [Portlet Metrics](#)
- [RSS News Feed Metrics](#)
- [Recent Activity Metrics](#)
- [Search Metrics](#)

To access live performance metrics for your WebCenter application, see [Section 24.2, "Viewing Performance Information."](#)

24.1.4.1 Announcements Metrics

Performance metrics associated with the Announcements service (Figure 24–1) are described in Table 24–4 and Section 24.1.2, "Common WebCenter Metrics."

Figure 24–1 *Announcement Metrics*

To monitor these metrics through Fusion Middleware Control, see Section 24.2, "Viewing Performance Information."

Table 24–4 *Announcements Service - Operations Monitored*

Operation	Description	Performance Issues - User Action
Login	Logs a WebCenter user (accessing the Announcements service) into the discussions server that is hosting announcements.	For service-specific causes, see Section 24.1.5.1, "Announcements Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Logout	Logs a WebCenter user out of the discussions server that is hosting announcements.	For service-specific causes, see Section 24.1.5.1, "Announcements Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Search	Searches for terms within announcement text.	If Announcement searches are failing, verify that Announcement text contains the search terms. For other causes, see Section 24.1.5.1, "Announcements Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

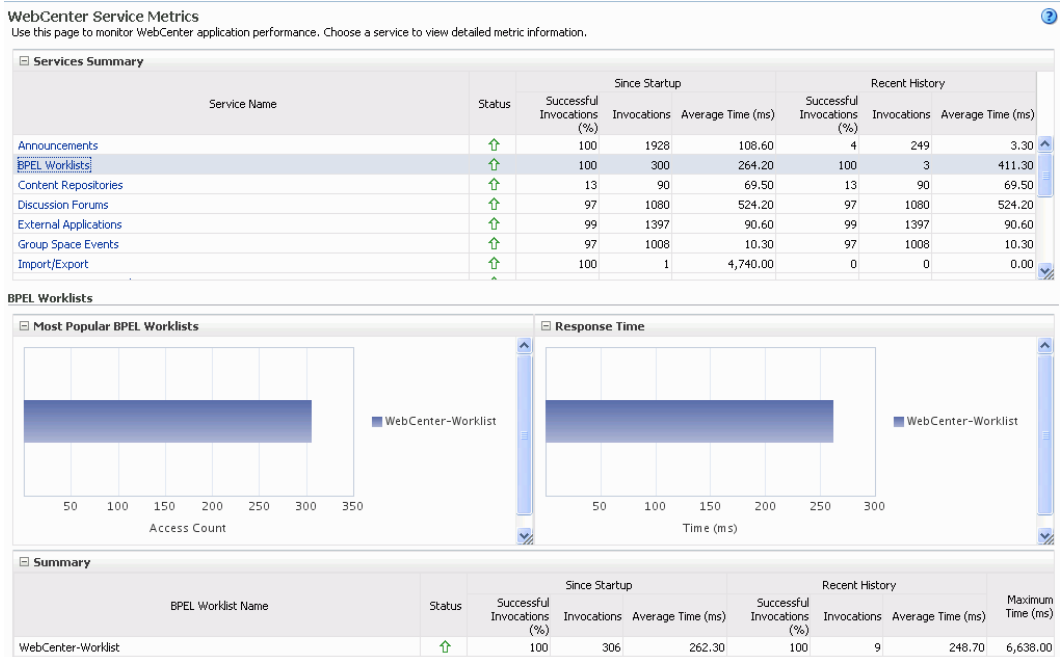

Table 24–4 (Cont.) Announcements Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Create	Creates an announcement.	For service-specific causes, see Section 24.1.5.1, "Announcements Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
List	Retrieves a list of announcements.	For service-specific causes, see Section 24.1.5.1, "Announcements Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.2 BPEL Worklist Metrics

Performance metrics associated with the BPEL Worklist service ([Figure 24–2](#)) are described in [Section 24.1.2, "Common WebCenter Metrics."](#)

Figure 24–2 BPEL Worklist Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

24.1.4.3 Content Repository (Documents Service) Metrics

Performance metrics associated with the Documents service ([Figure 24–3](#) and [Figure 24–4](#)) are described in the following tables:

- [Table 24–5, "Documents Service - Operations Monitored"](#)
- [Table 24–6, "Content Repository Metrics - Summary \(All Repositories\)"](#)
- [Table 24–7, "Content Repository Metrics - Operation Summary Per Repository"](#)

■ Table 24–8, "Content Repository Metrics - Operation Detail Per Repository"

Figure 24–3 Content Repository Metrics

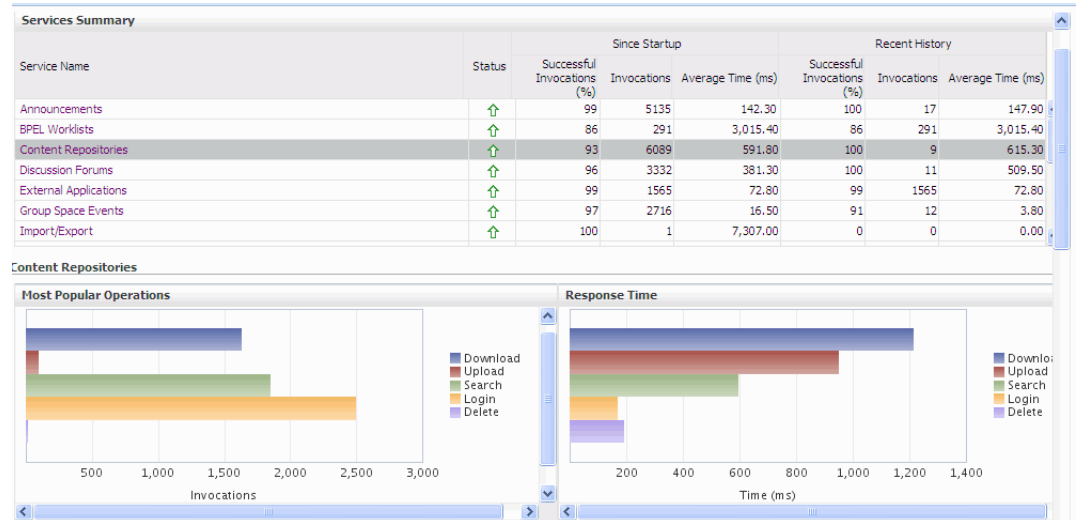

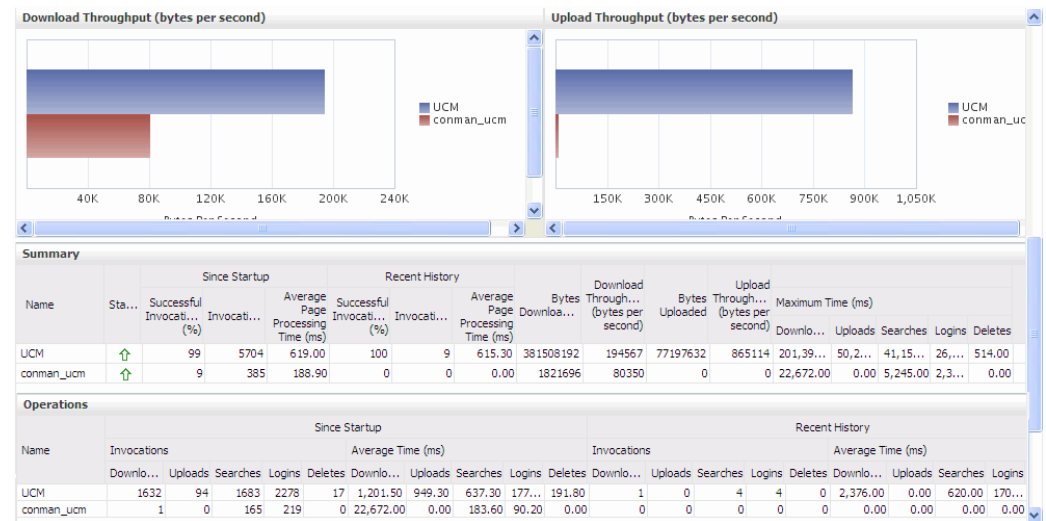

Figure 24–4 Content Repository Metrics - Per Operation

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–5 Documents Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Download	Downloads one or more documents from a content repository.	For service-specific causes, see Section 24.1.5.3, "Content Repository (Documents) Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

Table 24–5 (Cont.) Documents Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Upload	Uploads one or more documents to a content repository.	For service-specific causes, see Section 24.1.5.3, "Content Repository (Documents) Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Search	Searches for documents stored in a content repository.	For service-specific causes, see Section 24.1.5.3, "Content Repository (Documents) Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Login	Establishes a connection to the content repository and authenticates the user.	For service-specific causes, see Section 24.1.5.3, "Content Repository (Documents) Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Delete	Deletes one or more documents stored in a content repository.	For service-specific causes, see Section 24.1.5.3, "Content Repository (Documents) Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

Table 24–6 Content Repository Metrics - Summary (All Repositories)

Metric	Description
Status	<p>The current status of the Documents service:</p> <ul style="list-style-type: none"> ■ Up (Green Up Arrow) - Indicates that the Documents service is up and running and the last operation was successful. ■ Down (Red Down Arrow) - Indicates that the Documents service is not currently available or service requests are failing. This also indicates that the last operation was unsuccessful due to an unexpected error or exception. User errors, such as an authentication failure, do not change the status to Down. <p>If you are having problems with the Documents service, check the diagnostic logs to establish why this service is "Down". See, Section 24.3, "Viewing and Configuring Log Information."</p> <p>Some typical causes of failure include:</p> <ul style="list-style-type: none"> - Content repository is down or not responding. - Network connectivity issues exist between the application and one or more content repositories. - Connection configuration information associated with one or more content repositories is incorrect or no longer valid. <ul style="list-style-type: none"> ■ Clock - Unable to query the status of the service for some reason.

Table 24–6 (Cont.) Content Repository Metrics - Summary (All Repositories)

Metric	Description
Successful Invocations (%)	<p>The percentage of Documents service invocations that succeeded (Upload, Download, Search Login, Delete):</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>If Successful Invocations (%) is below 100%, check the diagnostic logs to establish why service requests are failing. See, Section 24.3, "Viewing and Configuring Log Information."</p>
Invocations	<p>The number of Documents service invocations per minute (Upload, Download, Search Login, Delete):</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>This metric provides data on how frequently a particular service is being invoked for processing of operations. Comparing this metric across services can help determine the most frequently used WebCenter Services in the application.</p>
Average Time (ms)	<p>The average time taken to process operations associated with the Documents service (Upload, Download, Search Login, Delete):</p> <ul style="list-style-type: none"> - Since Startup - Recent History

Invocations	<p>The number of Documents service invocations per minute (Upload, Download, Search, Login, Delete) for this content repository:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>This metric provides data on how frequently a particular service is being invoked for processing of operations. Comparing this metric across services can help determine the most frequently used WebCenter Services in the application.</p>
Average Page Processing Time (ms)	<p>The average time taken to process operations associated with the Documents service (Upload, Download, Search, Login, Delete) for this content repository:</p> <ul style="list-style-type: none"> - Since Startup - Recent History
Bytes Downloaded	<p>The volume of data that the Documents service has downloaded from this content repository.</p>
Download Throughput (bytes per second)	<p>The rate at which the Documents service downloads documents from this content repository.</p>
Bytes Uploaded	<p>The volume of data that the Documents service has uploaded from this content repository.</p>

Table 24–7 (Cont.) Content Repository Metrics - Operation Summary Per Repository

Metric	Description
Upload Throughput (bytes per second)	The rate at which the Documents service uploads documents from this content repository.
Maximum Time (ms)	The maximum time to process operations associated with the Documents service (Upload, Download, Search, Login, Delete) for this content repository.

Table 24–8 Content Repository Metrics - Operation Detail Per Repository

Metric	Description
Invocations	<p>The number of Documents service invocations per operation (Upload, Download, Search, Login, Delete):</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>This metric provides data on how frequently a particular service is being invoked for processing of operations. Comparing this metric across services can help determine the most frequently used WebCenter Services in the application.</p>
Average Processing Time (ms)	<p>The average time taken to process each operation associated with the Documents service (Upload, Download, Search, Login, Delete):</p> <ul style="list-style-type: none"> - Since Startup - Recent History

24.1.4.4 Discussions Metrics

Performance metrics associated with the Discussions service (Figure 24–5) are described in Table 24–9 and Section 24.1.2, "Common WebCenter Metrics."

Figure 24–5 Discussion Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–9 Discussions Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Login	Logs a WebCenter user (accessing the Discussions service) into the discussions server that is hosting discussions forums.	<p>For service-specific causes, see Section 24.1.5.4, "Discussions Service."</p> <p>For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."</p>
Logout	Logs a WebCenter user out of the discussions server that is hosting discussion forums.	<p>For service-specific causes, see Section 24.1.5.4, "Discussions Service."</p> <p>For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."</p>
Create Forum	Creates a discussion forum in the discussions server, under a specific category.	<p>If you are having problems creating forums, it may be due to:</p> <ul style="list-style-type: none"> ■ Category under which discussion forums must be created has been deleted. ■ User does not have permissions to create discussion forums. <p>For other service-specific causes, see Section 24.1.5.4, "Discussions Service."</p> <p>For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."</p>
Create Topic	Creates a topic in the discussions server, under a specific forum.	<p>If you are having problems creating forums, it may be due to:</p> <ul style="list-style-type: none"> ■ Discussion forum under which topics must be created has been deleted. ■ User does not have permissions to create topics. <p>For other service-specific causes, see Section 24.1.5.4, "Discussions Service."</p> <p>For information on common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."</p>

Table 24–9 (Cont.) Discussions Service - Operations Monitored

Operation	Description	Performance Issues - User Action
List Forums	Retrieves a list of forums, under a specific category, from the discussion server.	<p>If you are having problems creating forums, it may be due to:</p> <ul style="list-style-type: none"> ■ User does not have permissions to view forums in the category. ■ Category from which to fetch forums has been deleted. <p>For other service-specific causes, see Section 24.1.5.4, "Discussions Service."</p> <p>For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."</p>
List Topics	Retrieves a list of topics, under a specific forum, from the discussion server.	<p>If you are having problems creating forums, it may be due to:</p> <ul style="list-style-type: none"> ■ User does not have permissions to view topics in the forum. ■ Forum from which to fetch topics has been deleted. <p>For other service-specific causes, see Section 24.1.5.4, "Discussions Service."</p> <p>For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."</p>
Search	Searches for terms within discussion forum text, in the discussions server.	<p>If you are having problems creating forums, it may be due to:</p> <ul style="list-style-type: none"> ■ No topic/messages exist with the specified search term. ■ Category or forum in which the search term object resides has been deleted. <p>For other service-specific causes, see Section 24.1.5.4, "Discussions Service."</p> <p>For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."</p>

24.1.4.5 Events Metrics

Performance metrics associated with the Group Space Events and Personal Events services are described in [Table 24–10](#) and [Section 24.1.2, "Common WebCenter Metrics."](#)

Figure 24–6 Group Space Events Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–10 Events Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Create Event	Creates a group space or personal event in the WebCenter repository.	For service-specific causes, see Section 24.1.5.6, "Events Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Update Event	Updates a group space or personal event stored in the WebCenter repository.	For service-specific causes, see Section 24.1.5.6, "Events Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Delete Event	Deletes a group space or personal event in the WebCenter repository.	For service-specific causes, see Section 24.1.5.6, "Events Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
List Event	Retrieves a list of events from the WebCenter repository.	For service-specific causes, see Section 24.1.5.6, "Events Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

Table 24–10 (Cont.) Events Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Search Event	Searches for terms within event text.	For service-specific causes, see Section 24.1.5.6, "Events Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.6 External Application Metrics

Performance metrics associated with the External Application service are described in [Table 24–11](#) and [Section 24.1.2, "Common WebCenter Metrics."](#)

Figure 24–7 External Application Metrics

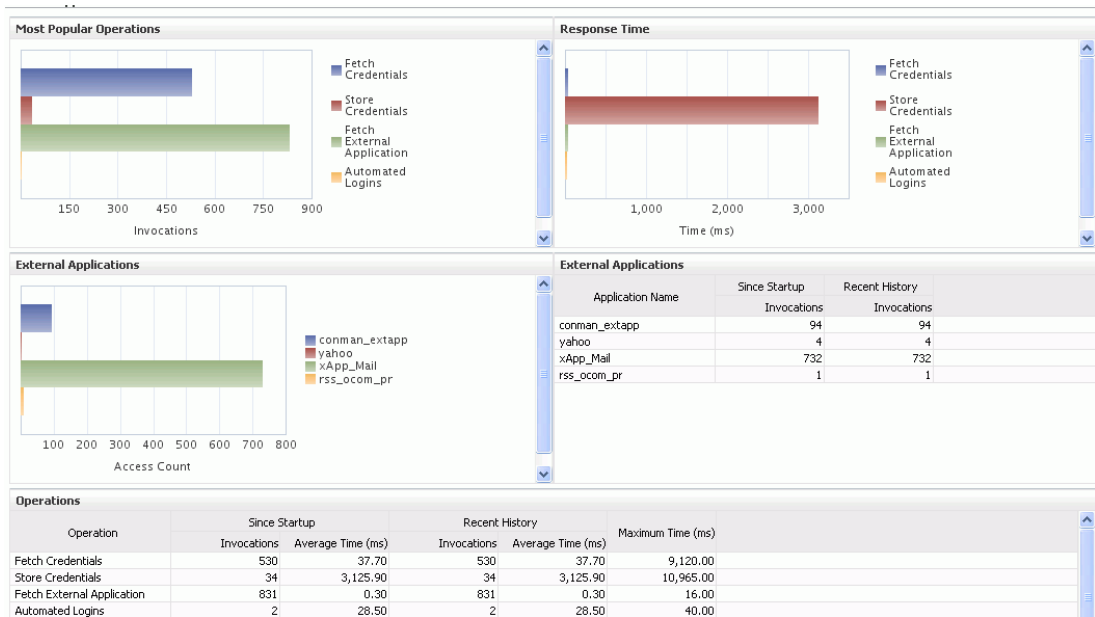

Figure 24–8 External Application Metrics - Per Operation

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–11 External Applications - Operations Monitored

Operation	Description	Performance Issues - User Action
Fetch Credentials	Retrieves credentials for an external application.	For service-specific causes, see Section 24.1.5.5, "External Applications Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Store Credentials	Stores user credentials for an external application.	For service-specific causes, see Section 24.1.5.5, "External Applications Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Fetch External Application	Retrieves an external application.	For service-specific causes, see Section 24.1.5.5, "External Applications Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Automated Logins	Logs a WebCenter user in to an external application (using the automated login feature).	For service-specific causes, see Section 24.1.5.5, "External Applications Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.7 Instant Messaging and Presence (IMP) Metrics

Performance metrics associated with the Instant Messaging and Presence (IMP) service (Figure 24–9) are described in Table 24–12 and Section 24.1.2, "Common WebCenter Metrics."

Figure 24–9 IMP Metrics

To monitor these metrics through Fusion Middleware Control, see Section 24.2, "Viewing Performance Information."

Table 24–12 Instant Messaging and Presence Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Get Presence	Retrieves user presence information from the IMP server.	For service-specific causes, see Section 24.1.5.7, "Instant Messaging and Presence (IMP) Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Login	Logs a WebCenter user (accessing the IMP service) into the IMP server.	For service-specific causes, see Section 24.1.5.7, "Instant Messaging and Presence (IMP) Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Logout	Logs a WebCenter user (accessing the IMP service) out of the IMP server.	For service-specific causes, see Section 24.1.5.7, "Instant Messaging and Presence (IMP) Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.8 Import and Export Metrics

Performance metrics associated with import and export services (Figure 24–10) are described in Table 24–13 and Section 24.1.2, "Common WebCenter Metrics." These metrics apply to WebCenter Spaces only.

Figure 24–10 Import/Export Metrics

WebCenter Service Metrics
Use this page to monitor WebCenter application performance. Choose a service to view detailed metric information.

Service Name	Status	Since Startup			Recent History		
		Successful Invocations (%)	Invocations	Average Time (ms)	Successful Invocations (%)	Invocations	Average Time (ms)
Announcements	↑	100	1928	108.60	4	249	3.30
BPEL Worklists	↑	100	300	264.20	100	3	411.30
Content Repositories	↑	13	90	69.50	13	90	69.50
Discussion Forums	↑	97	1080	524.20	97	1080	524.20
External Applications	↑	99	1397	90.60	99	1397	90.60
Group Space Events	↑	97	1008	10.30	97	1008	10.30
Import/Export	↑	100	1	4,740.00	0	0	0.00

Operations	Since Startup			Recent History			Maximum Time (ms)
	Successful Invocations (%)	Invocations	Average Time (ms)	Successful Invocations (%)	Invocations	Average Time (ms)	
Import	100	1	4,740.00	0	0	0.00	4,740.00

To monitor these metrics through Fusion Middleware Control, see Section 24.2, "Viewing Performance Information."

Table 24–13 Import/Export - Operations Monitored

Operation	Description	Performance Issues - User Action
Export	Exports an entire WebCenter application.	For service-specific causes, see Section 24.1.5.8, "Import and Export." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Import	Imports entire WebCenter application.	For service-specific causes, see Section 24.1.5.8, "Import and Export." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.9 List Metrics

(WebCenter Spaces only) Performance metrics associated with the List service (Figure 24–11) are described in Table 24–14 and Section 24.1.2, "Common WebCenter Metrics."

Figure 24–11 List Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–14 List service - Operations Monitored

Operation	Description	Performance Issues - User Action
Create List	Creates a list in the user session.	For service-specific causes, see Section 24.1.5.9, "Lists Service."
	The Save Data operation commits new lists to the MDS repository.	For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Copy List	Copies a list and its data in the user session.	For service-specific causes, see Section 24.1.5.9, "Lists Service."
	The Save Data operation commits copied lists and list data to the MDS repository and the WebCenter repository (the database where list data is stored).	For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Delete List	Deletes a list and its data in the user session.	For service-specific causes, see Section 24.1.5.9, "Lists Service."
	The Save Data operation commits list changes to the MDS repository and the WebCenter repository (the database where list data is stored).	For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

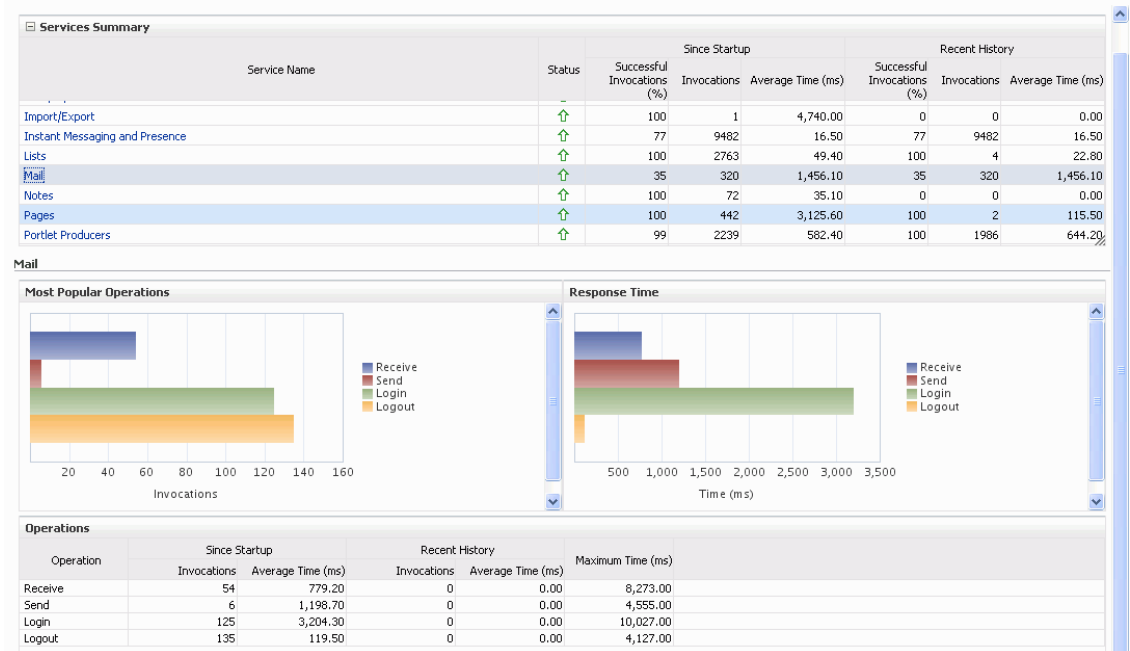

Table 24–14 (Cont.) List service - Operations Monitored

Operation	Description	Performance Issues - User Action
Create Row	Creates row of list data in the user session.	For service-specific causes, see Section 24.1.5.9, "Lists Service."
	The Save Data operation commits list data changes to the WebCenter repository (the database where list data is stored).	For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Update Row	Updates row of list data in the user session.	For service-specific causes, see Section 24.1.5.9, "Lists Service."
	The Save Data operation commits list data changes to the WebCenter repository (the database where list data is stored).	For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Delete Row	Deletes row of list data in the user session.	For service-specific causes, see Section 24.1.5.9, "Lists Service."
	The Save Data operation commits list data changes to the WebCenter repository (the database where list data is stored).	For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Search	Retrieves a list by its ID from the Metadata repository.	For service-specific causes, see Section 24.1.5.9, "Lists Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Save Data	Saves all changes to lists and list data (in the user session) to the Metadata Services repository and the WebCenter repository (the database where list information is stored).	For service-specific causes, see Section 24.1.5.9, "Lists Service."
		For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.10 Mail Metrics

Performance metrics associated with the Mail service ([Figure 24–12](#)) are described in [Table 24–15](#) and [Section 24.1.2, "Common WebCenter Metrics."](#)

Figure 24–12 Mail Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

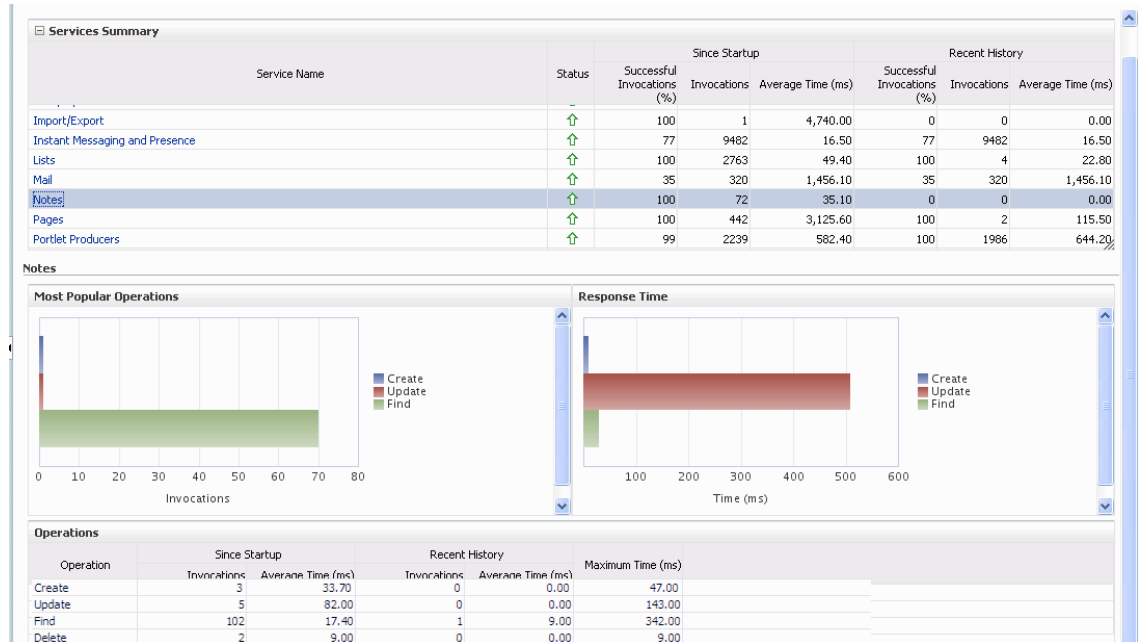

Table 24–15 Mail Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Login	Logs a WebCenter user into the mail server that is hosting mail services.	For service-specific causes, see Section 24.1.5.10, "Mail Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Logout	Logs a WebCenter user out of the mail server that is hosting mail services.	For service-specific causes, see Section 24.1.5.10, "Mail Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Receive	Receives a mail.	For service-specific causes, see Section 24.1.5.10, "Mail Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Send	Sends a mail.	For service-specific causes, see Section 24.1.5.10, "Mail Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Search	Searches for mail that contains a specific term.	For service-specific causes, see Section 24.1.5.10, "Mail Service." For information on common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.11 Note Metrics

Performance metrics associated with the Notes service (Figure 24–13) are described in Table 24–16 and Section 24.1.2, "Common WebCenter Metrics."

Figure 24–13 Notes Metrics

To monitor these metrics through Fusion Middleware Control, see Section 24.2, "Viewing Performance Information."

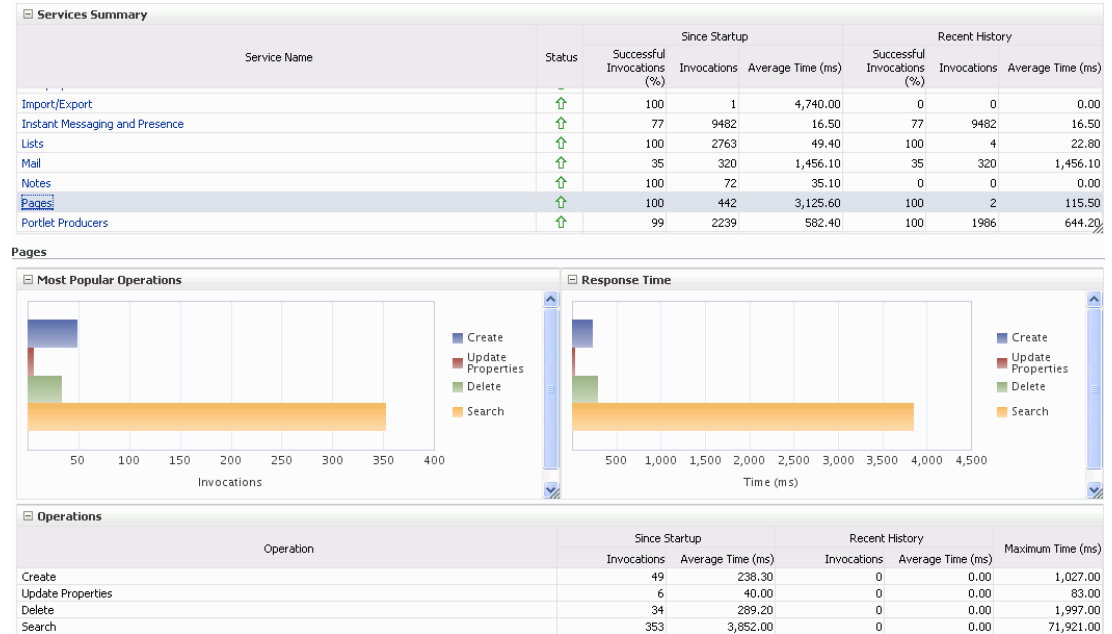

Table 24–16 Notes Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Create	Creates a personal note. The Save Changes operation commits new notes to the MDS repository.	For service-specific causes, see Section 24.1.5.11, "Notes Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Update	Updates a personal note. The Save Changes operation commits note updates to the MDS repository.	For service-specific causes, see Section 24.1.5.11, "Notes Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Find	Retrieves a note from the MDS repository.	For service-specific causes, see Section 24.1.5.11, "Notes Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Delete	Deletes a note from the MDS repository.	For service-specific causes, see Section 24.1.5.11, "Notes Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.12 Page Metrics

Performance metrics associated with the Page service (Figure 24–14) are described in Table 24–17 and Section 24.1.2, "Common WebCenter Metrics."

Figure 24–14 Page Metrics

To monitor these metrics through Fusion Middleware Control, see Section 24.2, "Viewing Performance Information."

Table 24–17 Page Service - Operations Monitored

Operation	Description	Performance Issues - User Action
Create	Creates a page in the WebCenter application.	For service-specific causes, see Section 24.1.5.12, "Page Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Copy	Copies a page.	For service-specific causes, see Section 24.1.5.12, "Page Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Delete	Deletes a page.	For service-specific causes, see Section 24.1.5.12, "Page Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."
Search	Searches for pages that contain a specific term.	For service-specific causes, see Section 24.1.5.12, "Page Service." For common causes, see Section 24.1.3, "Common WebCenter Performance Issues and Actions."

24.1.4.13 Portlet Producer Metrics

Performance metrics associated with the portlet producers (Figure 24–15) are described in the following tables:

- Table 24–18, "Portlet Producers - Summary"
- Table 24–19, "Portlet Producer - Detail"

Figure 24–15 Portlet Producer Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–18 Portlet Producers - Summary

Metric	Description
Status	<p>The current status of portlet producers used in the WebCenter application:</p> <ul style="list-style-type: none"> ■ Up (Green Up Arrow) - Indicates that all portlet producers are up and running. ■ Down (Red Down Arrow) - Indicates that the one or more portlet producers are currently unavailable. A producer instance might be down, or there could be some network connectivity issues. ■ Clock - Unable to query the status of the portlet producers for some reason.

Table 24–18 (Cont.) Portlet Producers - Summary

Metric	Description
Successful Invocations (%)	<p>The percentage of portlet producer invocations that succeeded:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>Any request that fails will impact availability. This includes WebCenter application-related failures such as timeouts and internal errors, and also client/server failures such as requests returned with response codes HTTP4xx or HTTP5xx, responses with a bad content type, and SOAP faults, where applicable.</p> <p>If Successful Invocations (%) is below 100%, check the diagnostic logs to establish why service requests are failing. See, Section 24.3, "Viewing and Configuring Log Information."</p>
Invocations	<p>The number of portlet producer invocations per minute:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>This metric measures each WebCenter application-related portlet request and therefore, due to cache hits, errors, or timeouts on the application, this total may be higher than the number of actual HTTP requests made to the producer server.</p>
Average Time (ms)	<p>The average time taken to make a portlet request, regardless of the result:</p> <ul style="list-style-type: none"> - Since Startup - Recent History

Table 24–19 Portlet Producer - Detail

Metric	Description
Most Popular Producers	<p>The number of invocations per producer (displayed on a chart).</p> <p>The highest value on the chart indicates which portlet producer is used the most.</p> <p>The lowest value indicates which portlet producer is used the least.</p>
Response Time	<p>The average time each portlet producer takes to process producer requests since the WebCenter application started up (displayed on a chart).</p> <p>The highest value on the chart indicates the worst performing portlet producer.</p> <p>The lowest value indicates which portlet producer is performing the best.</p>
Producer Name	<p>The name of the portlet producer being monitored.</p> <p>Click the name of a portlet producer to pop up more detailed information about each portlet that the application uses. See also Table 24–21, "Portlet - Detail".</p>

Table 24–19 (Cont.) Portlet Producer - Detail

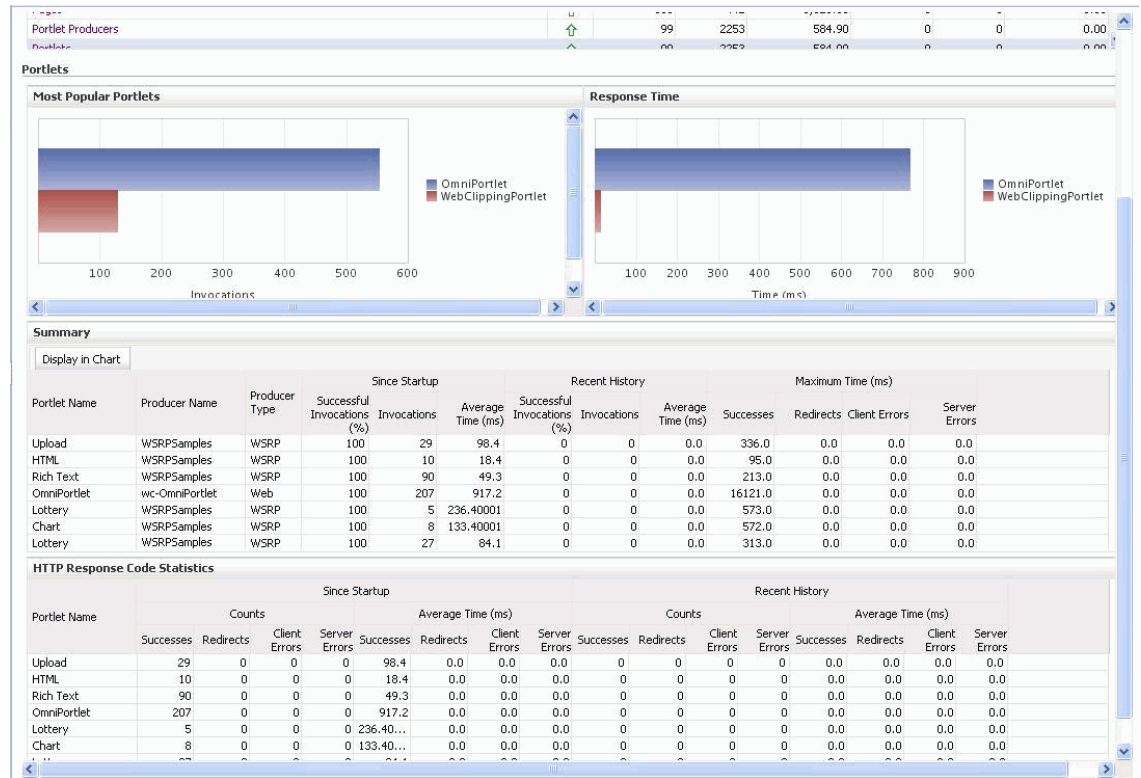

Metric	Description
Status	<p>The current status of each portlet producer:</p> <ul style="list-style-type: none"> ■ Up (Green Up Arrow) - Indicates that the portlet producer is up and running. ■ Down (Red Down Arrow) - Indicates that the portlet producer is currently unavailable. The producer instance might be down, or there could be some network connectivity issues. ■ Clock - Unable to query the status of portlet producer for some reason.
Producer Type	<p>The portlet producer type: Web or WSRP</p> <ul style="list-style-type: none"> ■ Web portlet producer - deployed to a J2EE application server, which is often remote and communicates through Simple Object Access Protocol (SOAP) over HTTP. ■ WSRP portlet producer - Web Services for Remote Portlets (WSRP) is a Web services standard that allows interoperability between a standards enabled container and any WSRP application.
Successful Invocations (%)	<p>The percentage of producer invocations that succeeded:</p> <ul style="list-style-type: none"> - Since Startup - Recent History
Invocations	<p>The number of invocations, per producer:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>By sorting the table on this column, you can find the most frequently accessed portlet producer in your WebCenter application.</p>
Average Time (ms)	<p>The average time taken to make a portlet request, regardless of the result:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>Use this metric to detect non-functional portlet producers. If you use this metric with the Invocations metric, then you can prioritize which producer to focus on.</p>
Maximum Time (ms)	<p>The maximum time taken to process producer requests:</p> <ul style="list-style-type: none"> - Successes - HTTP200xx response code - Re-directs - HTTP300xx response code - Client Errors - HTTP400xx response code - Server Errors - HTTP500xx response code

24.1.4.14 Portlet Metrics

Performance metrics associated with portlets (Figure 24–16) are described in the following tables:

- [Table 24–20, "Portlets - Summary"](#)
- [Table 24–21, "Portlet - Detail"](#)
- [Table 24–22, "Portlet - HTTP Response Code Statistics"](#)
- [Table 24–23, "HTTP Response Codes"](#)

Figure 24–16 Portlet Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–20 Portlets - Summary

Metric	Description
Status	<p>The current status of portlets used in the WebCenter application:</p> <ul style="list-style-type: none"> ■ Up (Green Up Arrow) - Indicates that all portlets are up and running. ■ Down (Red Down Arrow) - Indicates that the one or more portlets are currently unavailable. A producer instance might be down, or there could be some network connectivity issues. For other causes, see Section 24.1.5.13, "Portlets and Producers." ■ Clock - Unable to query the status of portlets for some reason.
Successful Invocations (%)	<p>The percentage of portlet invocations that succeeded:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>Any request that fails will impact availability. This includes WebCenter application-related failures such as timeouts and internal errors, and also client/server errors.</p> <p>If Successful Invocations (%) is below 100%, check the diagnostic logs to establish why service requests are failing. See, Section 24.3, "Viewing and Configuring Log Information."</p>

Table 24–20 (Cont.) Portlets - Summary

Metric	Description
Invocations	<p>The number of portlet invocations per minute:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>This metric measures each WebCenter application-related portlet request and therefore, due to cache hits, errors, or timeouts on the application, this total may be higher than the number of actual HTTP requests made to the portlet producer.</p>
Average Time (ms)	<p>The average time taken to process operations associated with portlets, regardless of the result:</p> <ul style="list-style-type: none"> - Since Startup - Recent History

Table 24–21 Portlet - Detail

Metric	Description
Most Popular Portlets	<p>The number of invocations per portlet (displayed on a chart). The highest value on the chart indicates which portlet is used the most. The lowest value indicates which portlet is used the least.</p>
Response Time	<p>The average time each portlet takes to process requests since the WebCenter application started up (displayed on a chart). The highest value on the chart indicates the worst performing portlet. The lowest value indicates which portlet is performing the best.</p>
Portlet Name	The name of the portlet being monitored.
Status	<p>The current status of each portlet:</p> <ul style="list-style-type: none"> ■ Up (Green Up Arrow) - Indicates that the portlet is up and running. ■ Down (Red Down Arrow) - Indicates that the portlet is currently unavailable. The producer instance might be down, or there could be some network connectivity issues.
Producer Name	The name of the portlet producer through which the portlet is accessed.
Producer Type	<p>The portlet producer type: Web or WSRP</p> <ul style="list-style-type: none"> ■ Web portlet producer - deployed to a J2EE application server, which is often remote and communicates through Simple Object Access Protocol (SOAP) over HTTP. ■ WSRP portlet producer - Web Services for Remote Portlets (WSRP) is a Web services standard that allows interoperability between a standards enabled container and any WSRP application.
Successful Invocations (%)	<p>The percentage of portlet invocations that succeeded:</p> <ul style="list-style-type: none"> - Since Startup - Recent History <p>If Successful Invocations (%) is below 100%, check the diagnostic logs to establish why service requests are failing. See, Section 24.3, "Viewing and Configuring Log Information."</p>

Table 24–21 (Cont.) Portlet - Detail

Metric	Description
Invocations	The number of invocations, per portlet: - Since Startup - Recent History By sorting the table on this column, you can find the most frequently accessed portlet in your WebCenter application.
Average Time (ms)	The average time each portlet takes to process requests, regardless of the result: - Since Startup - Recent History Use this metric to detect non-performant portlets. If you use this metric with the Invocations metric, then you can prioritize which portlet to focus on.
Maximum Time (ms)	The maximum time taken to process portlet requests: - Successes - HTTP200xx - Redirects - HTTP300xx - Client Errors - HTTP400xx - Server Errors - HTTP500xx The breakdown of performance statistics by HTTP response code can help you identify which factors are driving up the total average response time. For example, failures due to portlet producer timeouts would adversely affect the total average response time.

Table 24–22 Portlet - HTTP Response Code Statistics

Metric	Description
Portlet Name	The name of the portlet being monitored.
Invocations Count	The number of invocations, by type (HTTP response code):
- Successes	- Since Startup
- Redirects	- Recent History
- Client Errors	See also, Table 24–23, "HTTP Response Codes" .
- Server Errors	
Average Time (ms)	The average time each portlet takes to process requests:
- Successes	- Since Startup
- Redirects	- Recent History
- Client Errors	Use this metric to detect non-functional portlets. If you use this metric with the Invocations metric, then you can prioritize which portlet to focus on.
- Server Errors	

Table 24–23 HTTP Response Codes

HTTP Response and Error Code	Description
200 -Successful Requests	Portlet requests that return any HTTP2xx response code, or which were successful without requiring an HTTP request to the remote producer, for example, a cache hit.

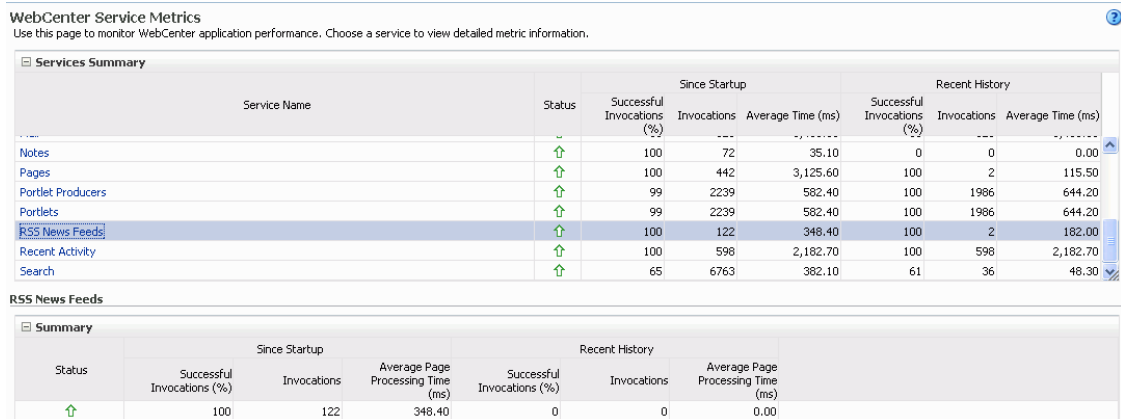

Table 24–23 (Cont.) HTTP Response Codes

HTTP Response and Error Code	Description
300 -Unresolved Redirections	Portlet requests that return any HTTP3xx response code.
400 -Unsuccessful Request Incomplete	Portlet requests that return any HTTP4xx response code.
500 -Unsuccessful Server Errors	Portlet requests that failed for any reason, including requests that return HTTP5xx response codes, or which failed due to a WebCenter application-related error, timeout, bad content type response, or SOAP fault.

24.1.4.15 RSS News Feed Metrics

Performance metrics associated with the RSS service (Figure 24–17) are described in Section 24.1.2, "Common WebCenter Metrics."

Figure 24–17 RSS News Feed Metrics

To monitor these metrics through Fusion Middleware Control, see Section 24.2, "Viewing Performance Information."

24.1.4.16 Recent Activity Metrics

Performance metrics associated with the Recent Activities service (Figure 24–18) are described in Section 24.1.2, "Common WebCenter Metrics."

Figure 24–18 Recent Activity Metrics

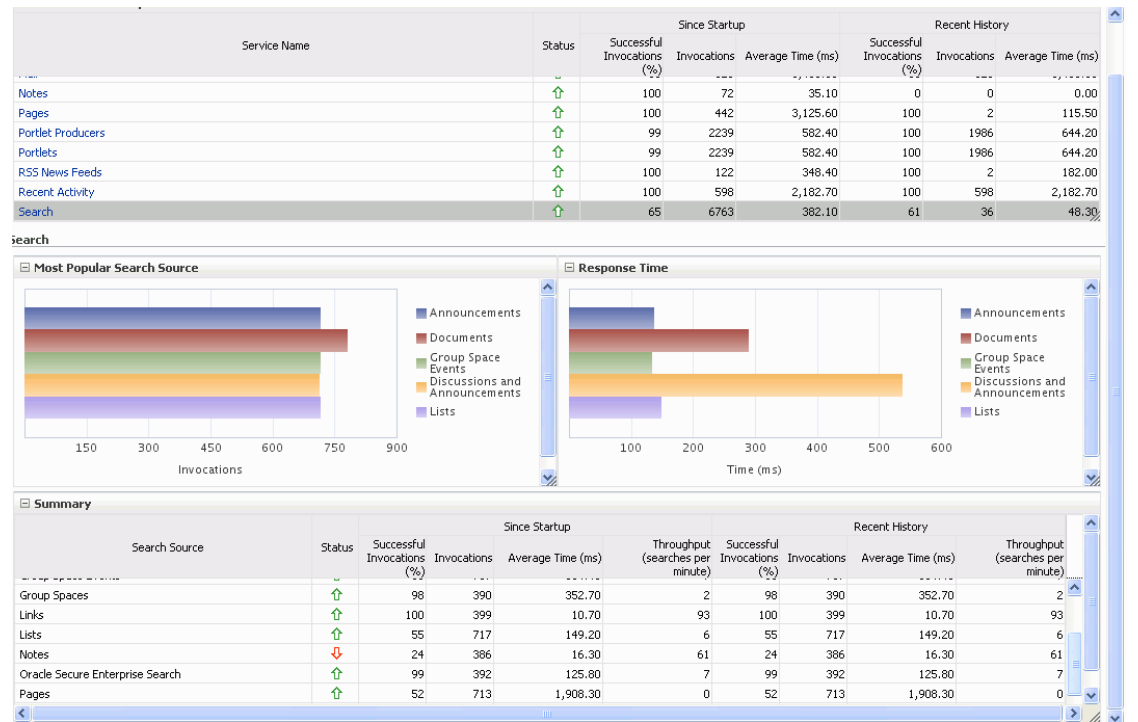

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

24.1.4.17 Search Metrics

Performance metrics associated with the Search service ([Figure 24–19](#)) are described in [Table 24–24](#) and [Section 24.1.2, "Common WebCenter Metrics."](#)

Figure 24–19 Search Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–24 Search Service - Search Sources

Operation	Description
Announcements	Announcement text is searched.

Table 24–24 (Cont.) Search Service - Search Sources

Operation	Description
Documents	Contents in files and folders are searched.
Discussion Forums	Forums and topics are searched.
Group Spaces	Contents saved in a group space, such as links, lists, notes, tags, and group space events are searched.
Group Space Events	Group space events are searched.
Links	Objects to which links have been created are searched (for example, announcements, discussion forum topics, documents, and events).
Lists	Information stored in lists is searched.
Notes	Notes text, such as reminders, is searched.
Oracle Secure Enterprise Search	Contents from the Document Library task flow, discussions, tag clouds, notes, and other WebCenter services are searched.
Pages	Contents added to application, personal, public, wiki, and blog pages are searched.

24.1.5 WebCenter Service-Specific Performance Issues and Actions

This section describes service-specific performance issues and user actions required to address those issue. This section includes the following sub sections:

Note: For information about tuning the performance of WebCenter Services, see [Appendix A, "WebCenter Configuration."](#)

- [Announcements Service](#)
- [BPEL Worklist Service](#)
- [Content Repository \(Documents\) Service](#)
- [Discussions Service](#)
- [External Applications Service](#)
- [Events Service](#)
- [Instant Messaging and Presence \(IMP\) Service](#)
- [Import and Export](#)
- [Lists Service](#)
- [Mail Service](#)
- [Notes Service](#)
- [Page Service](#)
- [Portlets and Producers](#)
- [RSS Service](#)
- [Recent Activities Service](#)
- [Search Service](#)

24.1.5.1 Announcements Service

If you are experiencing problems with the Announcements service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Discussions server is down or not responding.
- Network connectivity issues exist between the application and the Discussions server.
- Connection configuration information associated with the Announcements service is incorrect or no longer valid.

24.1.5.2 BPEL Worklist Service

If you are experiencing problems with the BPEL Worklist service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- BPEL server being queried is not available.
- Network connectivity issues exist between the application and the BPEL server.
- Connection configuration information associated with the Worklist service is incorrect or no longer valid.

24.1.5.3 Content Repository (Documents) Service

If you are experiencing problems with the Documents service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Also, do one of the following:

- For Oracle Content Server and Oracle Portal, verify that the back-end server is up and running.
- For Oracle Content Server, verify that the socket connection is open for the client for which the service is not functioning properly.
- For Oracle Portal, verify the status of the JDBC connection using Oracle WebLogic Administration Console.
- (Functional check) Check logs on the back-end server. For Oracle Content Server, go to Oracle Content Server > Administration > Log files > Content Server Logs. For Oracle Portal use Fusion Middleware Control.
- (Functional check) Search for log entries in which the module name starts with `oracle.vcr`, `oracle.webcenter.content`, `oracle.webcenter.doclib`, and `oracle.stellent`.

24.1.5.4 Discussions Service

If you are experiencing problems with the Discussions service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Discussions server is down or not responding.
- Network connectivity issues exist between the application and the discussions server.
- Connection configuration information associated with the Discussions service is incorrect or no longer valid.

24.1.5.5 External Applications Service

If you are experiencing problems with the External Applications service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Credential store is not configured for the application.
- Credential store that is configured, for example Oracle Internet Directory, is down or not responding.

24.1.5.6 Events Service

If you are experiencing problems with the Group Space Events or Personal Events service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- WebCenter repository is not available (the database where event information is stored).
- Network connectivity issues exist between the application and the WebCenter repository.
- Connection configuration information associated with the Group Space Events or Personal Events service is incorrect or no longer valid.

24.1.5.7 Instant Messaging and Presence (IMP) Service

If you are experiencing problems with the IMP service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Instant Messaging and Presence server is not available.
- Network connectivity issues exist between the application and the Instant Messaging and Presence server.
- Connection configuration information associated with the IMP service is incorrect or no longer valid.

24.1.5.8 Import and Export

If you are experiencing import and export problems and the status is **Down**, check the diagnostic logs to establish why this service is unavailable.

24.1.5.9 Lists Service

If you are experiencing problems with the Lists service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- MDS repository or WebCenter repository, in which the data of the Lists service is stored, is not available.
- Network connectivity issues exist between the application and the repository.
- Connection configuration information associated with the Lists service is incorrect or no longer valid.

24.1.5.10 Mail Service

If you are experiencing problems with the Mail service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Mail server is not available.
- Network connectivity issues exist between the application and the mail server.
- Connection configuration information associated with the Mail service is incorrect or no longer valid.

24.1.5.11 Notes Service

If you are experiencing problems with the Notes service, check if the MDS repository is unavailable or responding slowly (the repository where note information is stored).

24.1.5.12 Page Service

If you are experiencing problems with the Page service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- WebCenter repository is not available (the database where page information is stored).
- Network connectivity issues exist between the application and the WebCenter repository.

24.1.5.13 Portlets and Producers

If you are experiencing problems with a portlet producer and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Portlet producer server is down or not responding.
- Connection configuration information associated with the portlet producer is incorrect or no longer valid.
- Producer requests are timing out.
- There may be a problem with a particular producer, or the performance issue is due to a specific portlet(s) from that producer.

24.1.5.14 RSS Service

If you are experiencing problems with the RSS service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- The Search service is not available.
- A service being searched for recent activities has failed

Unable to Get Discussions Data

If you are experiencing performance issues, check the performance of the Discussions service.

Unable to Get Lists Data

If you are experiencing performance issues, check the performance of the Lists service.

Unable to Get Recent Activities Data

If you are experiencing performance issues, check the performance of the Recent Activity service.

24.1.5.15 Recent Activities Service

If you are facing problems with the Recent Activities service and the status is **Down**, check the diagnostic logs to establish why this service is unavailable. Some typical causes of failure include:

- Search Service is not available.
- A service being searched for recent activity has failed

24.1.5.16 Search Service

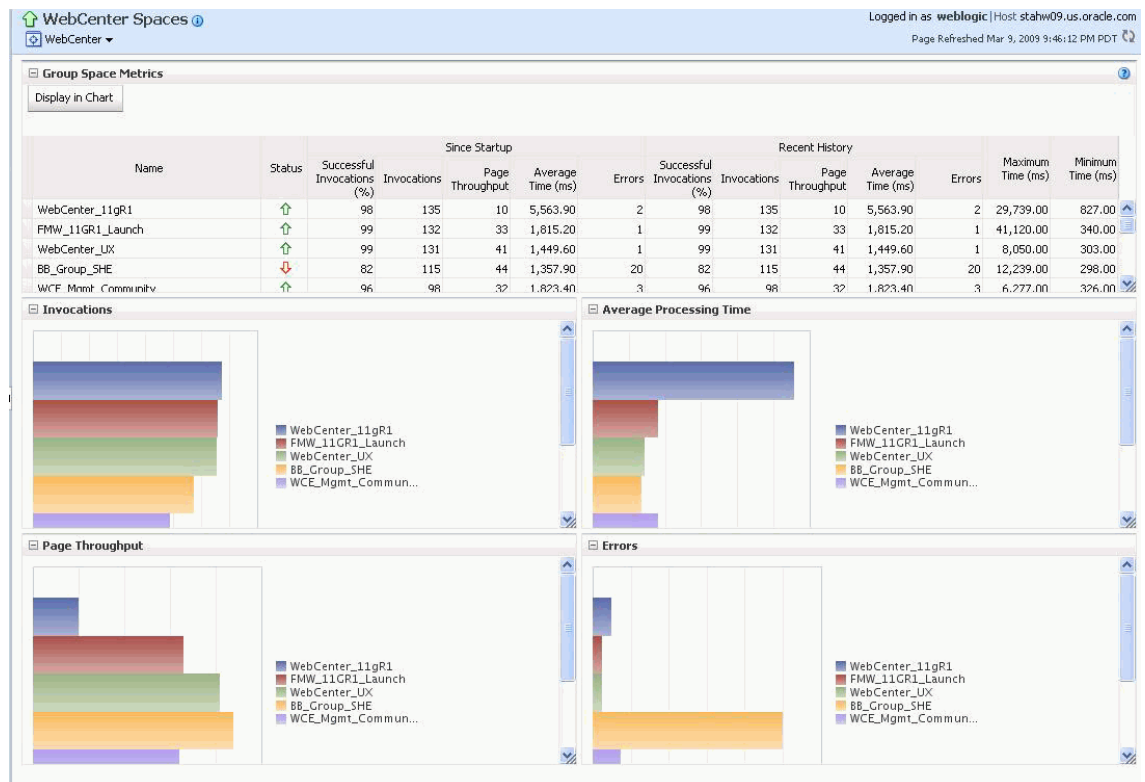

If you are facing problems with the Search service (a service executor) and the status is **Down**, check the diagnostic logs to establish why this executor is unavailable. Some typical causes of failure include:

- The repository of the executor is not available.
- Network connectivity issues exist between the application and the repository of the executor.
- Connection configuration information associated with the executor is incorrect or no longer valid.
- Content repositories being searched is currently unavailable.

24.1.6 Group Space Metrics

(WebCenter Spaces only) Performance metrics associated with group space activity (Figure 24–20) are described in Table 24–25 and Section 24.1.2, "Common WebCenter Metrics."

Figure 24–20 Group Space Metrics

To monitor these metrics through Fusion Middleware Control, see [Section 24.2, "Viewing Performance Information."](#)

Table 24–25 Group Space Metrics

Metric	Description
WebCenter Spaces URL	The WebCenter Spaces application being managed.
WebLogic Server	The WebLogic Server instance in which WebCenter Spaces is deployed.
J2EE Application	The name of the WebCenter Spaces application.
Group Space Page Response	The current average response time (in milliseconds) of group space pages.
Most Popular Group Spaces	Graph showing the most popular group spaces, that is, group spaces recording the most invocations. To compare a different set of group spaces, select one or more group spaces in the table, and then click Display in Chart .
Group Space Page Throughput	Graph showing the average number of pages processed per minute for each group space. To compare a different set of group spaces, select one or more group spaces in the table, and then click Display in Chart .
Group Space Page Response Time	Graph showing the average page response time (in milliseconds) per group space. To compare a different set of group spaces, select one or more group spaces in the table, and then click Display in Chart .
Status	The current status of each group space: <ul style="list-style-type: none"> ■ Up (Green Up Arrow) - Indicates that the last group space operation was successful. The group space is up and running. ■ Down (Red Down Arrow) - Indicates that the group space is not currently available or the last group space operation was unsuccessful due to an unexpected error or exception. User errors, such as an authentication failure, do not change the status to "Down".
Successful Invocations (%)	The percentage of group space invocations that succeeded: <ul style="list-style-type: none"> - Since Startup - Recent History <p>If Successful Invocations (%) is below 100%, check the diagnostic logs to establish why service requests are failing. See, Section 24.3, "Viewing and Configuring Log Information."</p>
Invocations	The number of group space invocations per minute: <ul style="list-style-type: none"> - Since Startup - Recent History
Page Throughput	The average number of pages processed per minute for each group space: <ul style="list-style-type: none"> - Since Startup - Recent History
Average Time (ms)	The average time (in ms) to display group space pages: <ul style="list-style-type: none"> - Since Startup - Recent History
Maximum Time (ms)	The maximum time taken to display a group space page.

Table 24–25 (Cont.) Group Space Metrics

Metric	Description
Minimum Time (ms)	The minimum time taken to display a group space page.

24.2 Viewing Performance Information

Fusion Middleware Control monitors a wide range of performance metrics for WebCenter applications. You can view performance data for all the dependent services, external applications, and portlet producers used by your WebCenter application.

This section includes the following sub sections:

- [Monitoring WebCenter Spaces](#)
- [Monitoring Custom WebCenter Applications](#)

24.2.1 Monitoring WebCenter Spaces

Administrators can monitor the performance and availability of all the components and services that make up WebCenter Spaces, and the application as a whole. These detailed metrics will help diagnose performance issues and, if monitored regularly, you will learn to recognize trends as they develop and prevent performance problems in the future.

Some key metrics display on the WebCenter Spaces home page. You can see at a glance which group spaces are the most popular, identify the best and worst performing group spaces and more. For details, see [Section 24.1.6, "Group Space Metrics"](#).

The WebCenter Spaces Home page also summarizes the status and performance of individual services, external applications, and any portlet producers that the application uses. When a service is **Down** or running slowly you can drill down to more detailed metrics to troubleshoot the problem, and take corrective action. For metric information, see [Section 24.1, "Understanding WebCenter Performance Metrics."](#)

To access performance metrics for WebCenter Spaces:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Spaces.

See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).

2. From the **WebCenter** menu, choose **Monitoring > Service Metrics**.

Use **Services Summary** at the top of the **WebCenter Service Metrics** page to quickly see which services are up and running, and to review individual and relative performances of those services used by WebCenter Spaces.

Statistics become available when a service, application, or portlet is accessed for the first time. If a service is not configured or has never been used it will not appear in the **Summary** table.

3. Click the name of a service to drill down to more detailed metrics.

To learn more about individual metrics, see [Section 24.1, "Understanding WebCenter Performance Metrics"](#).

To access performance summary for WebCenter Spaces:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Spaces.

See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).

2. From the **WebCenter** menu, choose **Monitoring > Performance Summary**.

Use the **Show Metric Palette** button at the top of the **Performance Summary** page to display the **Metric Palette**. This palette enables you to select metrics for services that are up and running, and to review live performances of individual services in graphical and tabular formats.

Statistics become available when a service, application, or portlet is accessed for the first time. If a service is not configured or has never been used it will not appear in the performance summary graphs and tables.

3. In the **Metric Palette**, expand a service folder and select the metric checkboxes to view the service performance in graphical or tabular format.

[Figure 24–21](#) shows the Performance Summary page and Metric Palette. In addition to WebCenter performance metrics, the Metric Palette also displays general performance metrics associated with any J2EE application, for example, ADF Application Pool metrics. To display the help content for any metric, right-click the required directory or any metric in the directory and select **Help**.

Figure 24–21 WebCenter Spaces - Performance Summary and Metric Palette

24.2.2 Monitoring Custom WebCenter Applications

Administrators can monitor the performance and availability of all the components and services that make up custom WebCenter applications, and the application as a whole. These detailed metrics will help diagnose performance issues and, if monitored regularly, you will learn to recognize trends as they develop and prevent performance problems in the future.

To access performance metrics for a custom WebCenter application:

1. In Fusion Middleware Control Console, navigate to the home page for custom WebCenter applications.

See [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

2. From the **Application Deployment** menu, choose **WebCenter > Service Metrics**.

Use the **Services Summary** at the top of the **WebCenter Service Metrics** page to quickly see which services are up and running, and to review individual and relative performances of all the services used by the WebCenter application.

Statistics become available when a service, application, or portlet is accessed for the first time. If a service is not configured or has never been used it will not appear in the Services Summary table.

3. Click the name of a service to drill down to more detailed metrics ([Figure 24–21](#)). To display the help content for any metric, right-click the required directory or any metric in the directory and select **Help**.

To learn more about individual metrics for each service, see [Section 24.1, "Understanding WebCenter Performance Metrics"](#).

To access performance summary for a custom WebCenter application:

1. In Fusion Middleware Control Console, navigate to the home page for custom WebCenter applications.

See [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

2. From the **Application Deployment** menu, choose **Performance Summary**.

Use the **Show Metric Palette** button at the top of the **Performance Summary** page to display the **Metric Palette**. This palette enables you to select metrics for services that are up and running, and to review live performances of individual services in graphical and tabular formats.

Statistics become available when a service, application, or portlet is accessed for the first time. If a service is not configured or has never been used it will not appear in the performance summary graphs and tables.

3. In the **Metric Palette**, expand a service folder and select the metric checkboxes to view the service performance in graphical or tabular format.

[Figure 24–22](#) shows the Performance Summary page and Metric Palette. In addition to WebCenter performance metrics, the Metric Palette also displays general performance metrics associated with any J2EE application, for example, ADF Application Pool metrics. To display the help content for any metric, right-click the required directory or any metric in the directory and select **Help**.

Figure 24–22 Custom WebCenter Application - Performance Summary and Metric Palette

24.3 Viewing and Configuring Log Information

All diagnostic information related to startup and shutdown information, errors, warning messages, access information on HTTP requests, and additional information get stored in log files. To learn how to find information about the cause of an error and its corrective action, see the chapter "Managing Log Files and Diagnostic Data" in *Oracle Fusion Middleware Administrator's Guide*. To learn how to enable diagnostic logging to identify issues, see the section "Configuring Settings for Log Files" in *Oracle Fusion Middleware Administrator's Guide*.

For WebCenter Spaces, the log file, `WLS_Spaces-diagnostic.log` is stored in the `DOMAIN_HOME/servers/WLS_Spaces/logs` directory.

For custom WebCenter applications, the log file is available in the `DOMAIN_HOME/servers/ServerName/logs` directory. The log file follows the naming convention of `ServerName-diagnostics.log`.

For example, for a managed server, `WLS_Custom`, the logs will be stored in the `DOMAIN_HOME/servers/WLS_Custom/logs`, and the log file name will be `WLS_Custom-diagnostics.log`.

This section includes the following sub sections:

- [WebCenter Spaces Logs](#)
- [Custom WebCenter Application Logs](#)

24.3.1 WebCenter Spaces Logs

To view log messages for WebCenter Spaces:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Spaces.

See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).

2. From the **WebCenter** menu, choose **Logs > View Log Messages**.
3. In the **Log Messages** page, search for warnings, errors, notifications, and so on.

To configure log files for WebCenter Spaces:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter Spaces.

See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).

2. From the **WebCenter** menu, choose **Logs > Log Configuration**.
3. In the **Log Configuration** page, in the **Log Files** tab, configure log settings.

For more information, see the section "Searching and Viewing Log Files" in *Oracle Fusion Middleware Administrator's Guide*.

24.3.2 Custom WebCenter Application Logs

To view log messages for custom WebCenter applications:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter applications.

See [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

2. From the **Application Deployment** menu, choose **Logs > View Log Messages**.
3. In the **Log Messages** page, search for warnings, errors, notifications, and so on.

To configure log files for custom WebCenter applications:

1. In Fusion Middleware Control Console, navigate to the home page for WebCenter applications.

See [Section 6.3, "Navigating to the Home Page for Custom WebCenter Applications"](#).

2. From the **Application Deployment** menu, choose **Logs > Log Configuration**.
3. In the **Log Configuration** page, in the **Log Files** tab, configure log settings.

For more information, see the section "Searching and Viewing Log Files" in *Oracle Fusion Middleware Administrator's Guide*.

Managing Export, Import, Backup, and Recovery of WebCenter

Oracle WebCenter stores data related to its configuration and content for the various feature areas in several locations. To facilitate disaster recovery and the full production lifecycle from development through staging and production, WebCenter provides a set of utilities that enable you to back up this data, move the data between WebCenter applications in staging and production environments. This chapter describes the backup, import, and export capabilities and tools available. It includes the following sections:

- [Section 25.1, "Exporting and Importing WebCenter Spaces for Data Migration"](#)
- [Section 25.2, "Exporting and Importing Custom WebCenter Applications for Data Migration"](#)
- [Section 25.3, "Backing Up and Recovering WebCenter Applications"](#)
- [Section 25.4, "Troubleshooting Import and Export Issues for WebCenter Spaces"](#)

To best plan the proper usage of these tools, record which WebCenter features your WebCenter applications are using: WebCenter Framework, WebCenter Spaces, Oracle WebCenter Discussions Server, Oracle WebCenter Wiki and Blog Server, and so on.

Audience

The content of this chapter is intended for Fusion Middleware administrators (users granted the `Admin` role through the Oracle WebLogic Server Administration Console) and WebCenter Spaces administrators (users granted the `WebCenter Spaces Administrator` role or a custom role that grants the `Application-Manage` permission).

See also, [Section 1.8, "Understanding Administrative Operations, Roles, and Tools"](#).

25.1 Exporting and Importing WebCenter Spaces for Data Migration

WebCenter Spaces provides a set of export and import utilities that enable you to back up or move content between WebCenter Spaces applications and stage or production environments. This section describes how to export and import the whole WebCenter Spaces application, and also individual group spaces and group space templates. It includes the following subsections:

- [Understanding WebCenter Spaces Export and Import](#)
- [Prerequisites for WebCenter Spaces Export and Import](#)

Migrating an entire WebCenter Spaces application:

- [Migrating Back-end Components for an Entire WebCenter Spaces Application](#)
- [Exporting an Entire WebCenter Spaces Application](#)
- [Importing an Entire WebCenter Spaces Application](#)

Migrating group spaces:

- [Prerequisites for Group Space Export and Import](#)
- [Migrating Back-end Components for Individual Group Spaces](#)
- [Exporting Group Spaces](#)
- [Importing Group Spaces](#)

Migrating group space templates:

- [Migrating Back-end Components for Group Space Templates](#)
- [Exporting Group Space Templates](#)
- [Importing Group Space Templates](#)

25.1.1 Understanding WebCenter Spaces Export and Import

Using export and import, Fusion Middleware administrators can migrate entire WebCenter Spaces applications between stage and production environments. This includes every personal space, group space, group space template, and also application and service customizations (applied to the application, pages, and task flows), application and service metadata (object definitions), and data, as outlined in [Figure 25–1](#).

Figure 25–1 Information Exported with WebCenter Spaces

Always Exported	Export Optional	Never Exported
MDS – Service Metadata <ul style="list-style-type: none"> • Announcements • Discussions • Documents • Events • Lists (Definitions) • Notes • Mail • Pages • Portlets • Recent Activities • Resource Catalog • RSS News Feeds • Search • Tags • Worklists MDS – Service Data <ul style="list-style-type: none"> • Notes MDS – Service Customizations <ul style="list-style-type: none"> • Portlets • Pages 	MDS – Task Flow Customizations <ul style="list-style-type: none"> • Documents: <ul style="list-style-type: none"> - Content Presenter - Document Library - Document List Viewer • Events - Events • Lists - List Viewer • Search - Saved Searches MDS – Application Customizations <ul style="list-style-type: none"> • WebCenter Spaces: <ul style="list-style-type: none"> ◦ WebCenter Administration* ◦ Group Space Settings WebCenter Repository – Service Data <ul style="list-style-type: none"> • Group Space Events • Links • Lists • Tags • People Connections: <ul style="list-style-type: none"> ◦ Default Settings for Profiles, Message Boards, Feedback, Connections, Activity Streams ◦ Activity Stream Task Flow Customizations Security Policy <ul style="list-style-type: none"> • policy-store.xml: <ul style="list-style-type: none"> ◦ Application policies ◦ Group space roles and permissions 	MDS – Service Personalizations <ul style="list-style-type: none"> • Pages • Task Flows** • Application External – Service Data <ul style="list-style-type: none"> • Documents • Announcements • Discussions • IMP • Mail • Personal Events • Wikis and Blogs • Worklists Application Artefacts <ul style="list-style-type: none"> • Icons • Skins • Images

* Except for People Connection Settings

** Except for Activity Stream Task Flow Customizations and Personalizations

This migration can be performed using Fusion Middleware Control Console or WLST commands. For details, see:

- [Exporting WebCenter Spaces Using Oracle Enterprise Manager Fusion Middleware Control](#)
- [Exporting WebCenter Spaces Using WLST](#)
- [Importing WebCenter Spaces Using Oracle Enterprise Manager Fusion Middleware Control](#)
- [Importing WebCenter Spaces Using WLST](#)

Group Space and Group Space Template Export and Import

WebCenter Spaces administrators can also export and import individual group spaces and group space templates, and their related objects, through WebCenter Spaces Administration and using WLST Commands.

The primary purpose of these export and import features is to enable cloning and migration of data. The export and import combination enables WebCenter Spaces administrators to:

- Move content between stage and production environments.
- Move content to remote instances.

For more detail, see.

- [Exporting Group Spaces](#)
- [Importing Group Spaces](#)
- [Exporting Group Space Templates](#)
- [Importing Group Space Templates](#)

Customizations and Personalizations

Some WebCenter Spaces customizations are optional on export, as noted in [Figure 25–1](#). If you want to migrate these customizations you must set the export option "Include Customizations". For more information, reference [Table 25–3](#), "WebCenter Spaces - Service Customizations" and [Table 25–4](#), "WebCenter Spaces - Application and Group Space Customizations" at the end of this chapter.

User personalizations are not migrated during export and import. For more information on customization and personalization and the difference between them, see "Customizing and Personalizing Page Content" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

25.1.2 Prerequisites for WebCenter Spaces Export and Import

The Oracle Database in which the application metadata or schema is stored must be up and running for the successful completion of the export and import operation.

All the back-end components must be migrated *before* you export or import a WebCenter Spaces application. For more information, refer to the next section, [Section 25.1.3, "Migrating Back-end Components for an Entire WebCenter Spaces Application"](#).

WebCenter Spaces is temporarily unavailable during import and export operations to prevent data conflicts. Any user who tries to login or access WebCenter Spaces pages will see an "application unavailable" page.

25.1.3 Migrating Back-end Components for an Entire WebCenter Spaces Application

Before migrating a WebCenter Spaces application, you must migrate all the back-end components that are used by the application. This section tells you how to migrate the Identity Store, Credential Store, Policy Store, Oracle WebCenter Discussions Server, Oracle WebCenter Wiki Server, Oracle Content Server, Oracle WebLogic Communications Server, and portlet producers.

The configured services in the target instance must be a superset of the services that are configured in the source instance. That is, the target must be configured with at least the same set of services that the source is configured with. If this is not the case, the import will fail.

This section includes the following sub-sections:

- [Exporting the LDAP Identity Store](#)

- [Importing the LDAP Identity Store](#)
- [Exporting and Importing the LDAP Credential Store](#)
- [Exporting and Importing the LDAP Policy Store](#)
- [Exporting and Importing a File-based Credential Store](#)
- [Exporting and Importing a File-based Policy Store](#)
- [Exporting Oracle WebCenter Discussions Server](#)
- [Importing Oracle WebCenter Discussions Server](#)
- [Exporting Oracle WebCenter Wiki Server](#)
- [Importing Oracle WebCenter Wiki Server](#)
- [Exporting Oracle Content Server](#)
- [Importing Oracle Content Server](#)
- [Exporting Oracle WebLogic Communications Server](#)
- [Importing Oracle WebLogic Communications Server](#)
- [Exporting Portlet Producers](#)
- [Importing Portlet Producers](#)

25.1.3.1 Exporting the LDAP Identity Store

To export users, groups, and passwords from an *external* identity store, use the `ldapsearch` command. This command creates an `ldif` file, which the `ldapadd` command uses during the import operation. The `ldapsearch` utility is located in the OID/IdM `IDM_ORACLE_HOME/bin` directory.

[Example 25–1](#) shows the `ldapsearch` command for exporting an LDAP identity store. Where `LDAP_OH/bin` is the OID/IdM `IDM_ORACLE_HOME/bin` directory:

Example 25–1 *ldapsearch* Command to Export LDAP Identity Store

```
LDAP_OH/bin/ldapsearch -h ldap_hostname -p ldap_port -D "cn=ldap_user" -w
password -b "cn=users,dc=example,dc=com"
-s subtree "objectclass=*" "*" orclguid -L > my_users.ldif
```

When exporting users, ensure that the command includes the `orclguid` attribute, for as shown in [Example 25–1](#).

To migrate groups, repeat the command with appropriate group base DN. For example: `-b "cn=groups,dc=example,dc=com"`

For detailed syntax and examples, see "ldapsearch" and "ldapaddmt" in *Oracle Fusion Middleware User Reference for Oracle Identity Management*.

For information on migrating an external LDAP identity store, refer to "Managing Directory Entries" and "Performing Bulk Operations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle Internet Directory*.

Note: To migrate users, groups, and passwords between two *embedded* LDAP servers, refer to "Exporting and Importing Information in the Embedded LDAP Server" in *Oracle Fusion Middleware Securing Oracle WebLogic Server*. Ensure that the command includes the `orclguid` attribute.

The source and target LDAP servers must both be the same type, that is, both embedded LDAP servers or both external LDAP servers. It is not possible, for example, to migrate users, groups, and passwords stored in an embedded LDAP server to an external LDAP server.

25.1.3.2 Importing the LDAP Identity Store

To import users and groups from another external identity store, use the `ldapaddmt` utility. The `ldapaddmt` utility is located in the OID/IdM `IDM_ORACLE_HOME/bin` directory.

[Example 25-2](#) shows how to run the `ldapaddmt` utility to import the `ldif` file. Where `LDAP_OH/bin` is the OID/IdM `IDM_ORACLE_HOME/bin` directory:

Example 25-2 *ldapaddmt* Utility to Import the *ldif* File

```
LDAP_OH/bin/ldapaddmt -h ldap_hostname -p ldap_port -D "cn=ldap_user" -w password
-c -r -f my_users.ldif
```

For detailed syntax and examples, see "ldapaddmt" in *Oracle Fusion Middleware User Reference for Oracle Identity Management*.

For information on migrating the LDAP identity store, refer to "Managing Directory Entries" and "Performing Bulk Operations" in the *Oracle Fusion Middleware Administrator's Guide for Oracle Internet Directory*.

Note: To import users, groups, and passwords from another embedded LDAP server, refer to "Exporting and Importing Information in the Embedded LDAP Server" in *Oracle Fusion Middleware Securing Oracle WebLogic Server*.

The source and target LDAP servers must both be the same type, that is, both embedded LDAP servers or both external LDAP servers. It is not possible, for example, to migrate users, groups, and passwords stored in an embedded LDAP server to an external LDAP server.

25.1.3.3 Exporting and Importing the LDAP Credential Store

To migrate your credential store to a different target, use the WLST command `migrateSecurityStore`. Before running this command you must specify details relating to your *source* credential store in a `jps-config.xml` file.

1. Create your own `jps-config.xml` (named `jps-config-cred.xml` in this example) and then specify the domain name, JPS root, and LDAP URL of the source credential store:
 - a. Create a copy of your target's `jps-config.xml` file, located at `DOMAIN_HOME/config/fmwconfig/jps-config.xml`, and name the copy `jps-config-cred.xml` as follows:

```
cp MW_HOME/user_projects/domains/my_domain/config/fmwconfig/jps-config.xml
MW_HOME/user_projects/domains/my_domain/config/fmwconfig/jps-config-cred.xml
```

1

, and name the copy `jps-config-cred.xml` as follows:

```
cp $MW_HOME/user_projects/domains/my_domain/config/fmwconfig/jps-config.xml
$MW_HOME/user_projects/domains/my_domain/config/fmwconfig/jps-config-cred.xml
```

- b. In the `jps-config-cred.xml` file, duplicate the following section:

```
<serviceInstance provider="ldap.credentialstore.provider"
name="credstore.ldap">
  ...
</serviceInstance>
```

The next few steps describes how to edit this new section to point to your *source* credential store. Once complete, `jps-config-cred.xml` file will contain both source and target information for the migration process.

- c. First, change the name of the new element to indicate that it contains *source* information. For example, change:

From: `name="credstore.ldap."`

To: `name="credstore.ldap.s"`

- d. Modify the domain name, JPS root, and LDAP URL values as appropriate. For example:

```
<serviceInstance provider="ldap.credentialstore.provider"
name="credstore.ldap.s">
  <property value="bootstrap"
name="bootstrap.security.principal.key"/>
  <property value="cn=my_domain"
name="oracle.security.jps.farm.name"/>
  <property value="cn=jpsroot_webcenter_mytest_to_prod"
name="oracle.security.jps.ldap.root.name"/>
  <property value="ldap:myhost:myport" name="ldap.url"/>
</serviceInstance>
```

- e. Since we're only concerned with the credential store, modify the `<jpsContext name="default">` element, removing references to the identity store and the policy store. For example:

```
<jpsContext name="default">
  <serviceInstanceRef ref="keystore"/>
  <serviceInstanceRef ref="audit"/>
  <serviceInstanceRef ref="credstore.ldap" />
</jpsContext>
```

- f. Duplicate the `<jpsContext>` element, and change the name in the new `<jpsContext>` element to "source". For example, change:

From: `<jpsContext name="default">`

To: `<jpsContext name="source">`

- g. Modify the credential store reference to point to the value specified in step c. For example:

```
<jpsContext name="source">
  <serviceInstanceRef ref="keystore"/>
  <serviceInstanceRef ref="audit"/>
  <serviceInstanceRef ref="credstore.ldap.s" />
```

```
</jpsContext>
```

2. Find the name of the source folder using the `ldapsearch` utility.

For example, enter:

```
LDAP_OH/bin/ldapsearch -h srcldap_hostname -p ldap_port -D "cn=ldap_user" -w password -b "" -s sub "cn=<application_name>-*"
```

Where `<application_name>` is the name of the source WebCenter application.

The folder name returned is named: `<application_name>-xxxx`

For WebCenter Spaces, `<application_name>` is always `webcenter`. If, for example, the source folder is named `webcenter-1646`, the following information might be returned:

```
cn=webcenter-1646,cn=CredentialStore,cn=my_domain, cn=JPSContext,
cn=jpsroot_webcenter_t2ptest
objectclass=top
objectclass=orclContainer
cn=webcenter-1646
```

3. Find the name of the destination folder using the `ldapsearch` utility.

For example, enter:

```
LDAP_OH/bin/ldapsearch -h dstldap_hostname -p ldap_port -D "cn=ldap_user" -w password -b "" -s sub "cn=<application_name>-*"
```

Where `<application_name>` is the name of the destination WebCenter application.

The folder name returned is named: `<application_name>-xxxx`

For WebCenter Spaces, `<application_name>` is always `webcenter`.

4. To import the credential store, run the WLST command `migrateSecurityStore`.

For example (Example 25-3):

Example 25-3 migrateSecurityStore - Credential Store

```
migrateSecurityStore(type="credStore",
configFile="/MW_HOME/user_projects/domains/my_domain/config/fmwconfig/jps-config-cred.xml",
src="source", dst="default", overWrite="true", srcFolder="<source folder>",
dstFolder="<destination folder>")
```

For detailed syntax and examples, see "migrateSecurityStore" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

25.1.3.4 Exporting and Importing the LDAP Policy Store

With WebCenter Spaces, there is no need for manual policy store migration because the WebCenter Spaces export/import commands migrate security policy data for you. For details, see [Section 25.1.4, "Exporting an Entire WebCenter Spaces Application"](#).

While Oracle does not recommend that you perform policy store migration manually for WebCenter Spaces, there may be circumstances where this is required. In such cases, use the WLST command `migrateSecurityStore` to perform the migration as described below.

For custom WebCenter applications, always use the `migrateSecurityStore` command to migrate security policy data.

Before running the `migrateSecurityStore` command you must specify details relating to your *source* policy store in a `jps-config.xml` file.

1. Create your own `jps-config.xml` (named `jps-config-policy.xml` in this example) and then specify the domain name, JPS root, and LDAP URL of the source policy store:

- a. Create a copy of your target's `jps-config.xml` file, located at `DOMAIN_HOME/config/fmwconfig/jps-config.xml`, and name the copy `jps-config-policy.xml` as follows:

```
cp MW_HOME/user_projects/domains/my_domain/config/fmwconfig/jps-config.xml
MW_HOME/user_projects/domains/my_domain/config/fmwconfig/jps-config-policy.xml
```

- b. In the `jps-config-policy.xml` file, duplicate the following section:

```
<serviceInstance provider="ldap.policystore.provider"
name="policystore.ldap">
  ...
</serviceInstance>
```

The next few steps describes how to edit this new section to point to your *source* policy store. Once complete, `jps-config-policy.xml` file will contain both source and target information for the migration process.

- c. First, change the name of the new element to indicate that it contains *source* information. For example, change:

From: `name="policystore.ldap."`

To: `name="policystore.ldap.s"`

- d. Modify the domain name, JPS root, and LDAP URL values as appropriate. For example:

```
<serviceInstance provider="ldap.policytore.provider"
name="policystore.ldap.s">
  <property value="bootstrap"
name="bootstrap.security.principal.key"/>
  <property value="cn=my_domain"
name="oracle.security.jps.farm.name"/>
  <property value="cn=jpsroot_webcenter_mytest_to_prod"
name="oracle.security.jps.ldap.root.name"/>
  <property value="ldap:myhost:myport" name="ldap.url"/>
</serviceInstance>
```

- e. Duplicate the `<jpsContext>` element, and change the name in the new `<jpsContext>` element to "source". For example, change:

From: `<jpsContext name="default">`

To: `<jpsContext name="source">`

- f. Modify the policy store reference to point to the value specified in step c, removing references to the identity store and the credential store. For example:

```
<jpsContext name="source">
  <serviceInstanceRef ref="keystore"/>
  <serviceInstanceRef ref="audit"/>
```

```

    <serviceInstanceRef ref="policystore.ldap.s"/>
  </jpsContext>

```

- g.** Modify the `<jpsContext name="default">` element, removing references to the identity store and the credential store. For example:

```

<jpsContext name="default">
  <serviceInstanceRef ref="keystore"/>
  <serviceInstanceRef ref="audit"/>
  <serviceInstanceRef ref="policystore.ldap"/>
</jpsContext>

```

- 2.** Find the full name of the source WebCenter application using the `ldapsearch` utility.

For example, enter:

```

LDAP_OH/bin/ldapsearch -h srcldap_hostname -p srcldap_port -D "cn=ldap_user"
-w password -b "" -s sub "orclapplicationcommonname=<application_name>*"

```

Where `<application_name>` is the name of the source WebCenter application.

The application name returned is: `<application_name>xxxx`

For WebCenter Spaces, `<application_name>` is always `webcenter`. If, for example, the full source application name is `webcenter#V2.0`, the following information might be returned:

```

cn=webcenter\#V2.0,cn=my_domain,cn=JPSContext,cn=jpsroot_webcenter_t2ptest
objectclass=top
objectclass=orclJavaApplicationEntity
orclapplicationcommonname=webcenter#V2.0
cn=webcenter#V2.0

```

- 3.** Find the full name of the destination WebCenter application using the `ldapsearch` utility.

For example, enter:

```

LDAP_OH/bin/ldapsearch -h dstldap_hostname -p dstldap_port -D "cn=ldap_user"
-w password -b "" -s sub "orclapplicationcommonname=<application_name>*"

```

Where `<application_name>` is the name of the destination WebCenter application.

The application name returned is: `<application_name>xxxx`

For WebCenter Spaces, `<application_name>` is always `webcenter`.

- 4.** To import the policy store, run the WLST command `migrateSecurityStore`.

For example ([Example 25-4](#)):

Example 25-4 migrateSecurityStore - Policy Store

```

migrateSecurityStore(type="appPolicies",
configFile="/MW_HOME/user_projects/domains/my_domain/config/fmwconfig/jps-config-policy.xml",
src="source",dst="default",overwrite="true", srcApp="<full application name>",
dstApp="<full application name>")

```

For detailed syntax and examples, see "migrateSecurityStore" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

25.1.3.5 Exporting and Importing a File-based Credential Store

To migrate a file-based credential store to a different target, use the WLST command `migrateSecurityStore`. Before running this command you must specify details relating to your *source* credential store in the target's `jps-config.xml` file.

1. Backup your target's `jps-config.xml` file located at `DOMAIN_HOME/config/fmwconfig/jps-config.xml`.
2. Add source and target information to the target's `jps-config.xml`:
 - a. Add the following section (above the closing `</serviceInstances>` tag) to point to the *source* credential store:

```
<serviceInstance name="sourcecredstore" provider="credstoressp"
location="/MW_HOME/user_projects/domains/base-domain/config/fmwconfig/.">
  <description>File Based Credential Store Service
Instance</description>
</serviceInstance>
```

Replace `/MW_HOME/user_projects/domains/base-domain` with the path to the source domain.

- b. Update the credential store reference to point to the value specified in step a. Add the following entries above the closing `</jpsContexts>` tag:

```
<jpsContext name="targetcredstore">
  <serviceInstanceRef ref="credstore"/>
</jpsContext>
<jpsContext name="sourcecredstore">
  <serviceInstanceRef ref="sourcecredstore"/>
</jpsContext>
```

3. Import the file-based credential store using the WLST command `migrateSecurityStore`.

For example (Example 25-5):

Example 25-5 `migrateSecurityStore` - Credential Store

```
migrateSecurityStore(type="credStore",
configFile="/MW_HOME/user_projects/domains/base-domain/config/fmwconfig/jps-config.xml", src="sourcecredstore", dst="targetcredstore")
```

Note that the `configFile` parameter maps to the `jps-config.xml` file in the target domain, and that the `src` and `dst` parameters map to the newly created `jpsContext` elements.

For detailed syntax and examples, see "migrateSecurityStore" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Output similar to the following displays and includes a WARNING that you can ignore:

```
{srcFolder=null, preserveAppRoleGuids=null, dst=targetcredstore, type=credStore,
dstFolder=null, resourceTypeFile=null, dstLdifFile=null, srcApp=null,
configFile=/scratch/product/target/user_projects/domains/domain4/config/fmwconfig/
jps-config.xml, dstApp=null, srcConfigFile=null, src=sourcecredstore,
overwrite=null, migrateIdStoreMapping=null, processPrivRole=null}
Oct 26, 2009 11:23:42 AM
oracle.security.jps.internal.tools.utility.destination.apibased.JpsDstCredential

credential with map webcenter-1111 and key
anonymous#oracle.portlet.client.adapter.adf.ADFPortletContainerExternalConfig
already exists.

```

25.1.3.6 Exporting and Importing a File-based Policy Store

With WebCenter Spaces, there is no need for manual policy store migration because the WebCenter Spaces export/import commands migrate security policy data for you. For details, see [Section 25.1.4, "Exporting an Entire WebCenter Spaces Application"](#).

While Oracle does not recommend that you perform policy store migration manually for WebCenter Spaces, there may be circumstances where this is required. In such cases, use the WLST command `migrateSecurityStore` to perform the migration as described below.

For custom WebCenter applications, always use the `migrateSecurityStore` command to migrate security policy data.

Before running the `migrateSecurityStore` command you must specify details relating to your *source* policy store in your target's `jps-config.xml` file.

1. Backup your target's `jps-config.xml` file located at `DOMAIN_HOME/config/fmwconfig/jps-config.xml`.
2. Add source and target information to the target's `jps-config.xml`:
 - a. Add the following section (above the closing `</serviceInstances>` tag) to point to the *source* policy store:

```

<serviceInstance name="srcpolicystore.xml"
provider="policystore.xml.provider"
location="/MW_HOME/user_projects/domains/base_domain/config/fmwconfig/system-jazn-data.xml">
  <description>File Based Policy Store Service Instance</description>
</serviceInstance>

```

Replace `/MW_HOME/user_projects/domains/base-domain` with the path to the source domain.

- b. Update the policy store reference to point to the value specified in step a. Add the following entries above the closing `</jpsContexts>` tag:

```

<jpsContext name="targetFileStore">
  <serviceInstanceRef ref="policystore.xml"/>
</jpsContext>
<jpsContext name="sourceFileStore">
  <serviceInstanceRef ref="srcpolicystore.xml"/>
</jpsContext>

```

3. Import the file-based credential store using the WLST command `migrateSecurityStore`.

For example ([Example 25–6](#)):

Example 25–6 `migrateSecurityStore` - Credential Store

```

migrateSecurityStore(type="appPolicies", srcApp="webcenter",
configFile="/MW_HOME/user_projects/domains/base_domain/config/fmwconfig/jps-config.xml", src="sourceFileStore", dst="targetFileStore", overwrite="true")

```

Note that the `configFile` parameter maps to the `jps-config.xml` file in the target domain, and that the `src` and `dst` parameters map to the newly created `jpsContext` elements.

For detailed syntax and examples, see "migrateSecurityStore" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Output similar to the following displays and includes a WARNING that you can ignore:

```
{srcFolder=null, dst=targetFileStore,
type=appPolicies, dstFolder=null, resourceTypeFile=null,
dstLdifFile=null, srcApp=webcenter,
configFile=/scratch/product/target/user_projects/domains/base_domain/config/fmwcon
fig/jps-config.xml,
dstApp=null, srcConfigFile=null, src=sourceFileStore, overWrite=true,
migrateIdStoreMapping=null, processPrivRole=null}Oct 26, 2009 4:14:42 AM

<init>
WARNING: No identity store associate with policy store found.
wls:/offline>
```

25.1.3.7 Exporting Oracle WebCenter Discussions Server

To export Oracle WebCenter Discussions Server, use the database export utility. For example, go to `WC_ORACLE_HOME/bin` of your database and run the command described in [Example 25-7](#).

Note: The Oracle Data Pump utility does not support LONG columns types that exist in the DISCUSSIONS schema. Therefore, Oracle recommends using Oracle Database Utilities. See also, the *Oracle Database Utilities* guide.

Example 25-7 Export Database Utility

```
DB_ORACLE_HOME/bin/expdp \ "sys/password@serviceid as sysdba"
OWNER=srcrcuprefix_DISCUSSIONS FILE=/tmp/df.dmp STATISTICS=none
```

where:

- `DB_ORACLE_HOME` is the directory in which the database for Oracle WebCenter Discussions Server schema is installed.
- `password` is the password for the system database user.
- `serviceid` is the service ID of the database connection.
- `OWNER` is the schema to be exported. This is the RCU suffix that was used during installation, `_DISCUSSIONS`, along with the user supplied prefix. For example, `DEV_DISCUSSIONS`.
- `FILE` contains the exported data.

25.1.3.8 Importing Oracle WebCenter Discussions Server

To import Oracle WebCenter Discussions Server, use the database import utility.

Note: The Oracle Data Pump utility does not support LONG columns types that exist in the DISCUSSIONS schema. Therefore Oracle recommends using Oracle Database Utilities. See also, the Oracle Database Utilities guide.

1. Shut down the target Oracle WebCenter Discussions Server.
2. Go to `DB_ORACLE_HOME/bin` of the database where Oracle WebCenter Discussions Server schema is installed, and connect to the database using sqlplus as sysdba:

```
DB_ORACLE_HOME/bin/sqlplus "sys/password@serviceid as sysdba"
```

3. Drop the target user:

```
drop user tgtrcuprefix_DISCUSSIONS cascade;
```

4. Create the target user:

```
create user tgtrcuprefix_DISCUSSIONS identified by password default tablespace  
tgtrcuprefix_IAS_DISCUSSIONS temporary tablespace name_IAS_TEMP;
```

5. Grant connect and resource to the user:

```
grant connect,resource to tgtrcuprefix_DISCUSSIONS;
```

6. Exit sqlplus.
7. Run the import tool as described in [Example 25–8](#).

Example 25–8 Database Import Utility

```
DB_ORACLE_HOME/bin/impdp \"sys/password@serviceid as sysdba\"  
FROMUSER=srcrcuprefix_DISCUSSIONS TOUSER=tgtrcuprefix_DISCUSSIONS FILE=/tmp/df.dmp  
STATISTICS=none
```

where:

- `DB_ORACLE_HOME` is the directory in which the database for Oracle WebCenter Discussions Server schema is installed.
- `password` is the password for the system database user.
- `serviceid` is the service ID of the database connection.
- `FROMUSER` is the exported schema.
- `TOUSER` is the imported schema. This is the RCU suffix that was used during installation, `_DISCUSSIONS`, along with the user supplied prefix. For example, `DEV_DISCUSSIONS`.
- `FILE` contains the data to be imported.

25.1.3.9 Exporting Oracle WebCenter Wiki Server

To export Oracle WebCenter Wiki Server, use the Data Pump export utility. For example, go to `ORACLE_HOME/bin` of your database and run the command described in [Example 25–9](#).

Note: The Oracle Data Pump utility does not support LONG columns types that exist in the WIKI schema. Therefore Oracle recommends using Oracle Database Utilities. See also, the Oracle Database Utilities guide.

Example 25–9 Data Pump Export Utility

```
DB_ORACLE_HOME/bin/expdp \"sys/password@serviceid as sysdba\"
OWNER=srcrcuprefix_WIKI FILE=/tmp/wiki.dmp STATISTICS=none
```

where:

- `DB_ORACLE_HOME` is the directory in which the database for Oracle WebCenter Wiki Server schema is installed.
- `password` is the password for the system database user.
- `serviceid` is the service ID of the database connection.
- `OWNER` is the schema to be exported. This is the RCU suffix that was used during installation, `_WIKI`, along with the user supplied prefix. For example, `DEV_WIKI`.
- `FILE` contains the exported data.

25.1.3.10 Importing Oracle WebCenter Wiki Server

To import Oracle WebCenter Wiki Server, use the Oracle Data Pump import utility.

Note: The Oracle Data Pump utility does not support LONG columns types that exist in the WIKI schema. Therefore, Oracle recommends using Oracle Database Utilities. See also, the Oracle Database Utilities guide.

1. Shut down the target Oracle WebCenter Wiki Server.
2. Go to `DB_ORACLE_HOME/bin` of the database where Oracle WebCenter Wiki Server schema is installed, and connect to the database using `sqlplus` as `sysdba`:

```
DB_ORACLE_HOME/bin/sqlplus \"sys/password@serviceid as sysdba\"
```

3. Drop the target user:

```
drop user tgtrcuprefix_WIKI cascade;
```

4. Create the target user:

```
create user tgtrcuprefix_WIKI identified by password default tablespace
tgtrcuprefix_WIKI temporary tablespace name_TEMP;
```

5. Grant connect and resource to the user:

```
grant connect,resource to tgtrcuprefix_WIKI;
```

6. Exit `sqlplus`.

7. Run the import tool as described in [Example 25–10](#).

Example 25–10 Database Import Utility

```
DB_ORACLE_HOME/bin/impdp \"sys/password@serviceid as sysdba\"
FROMUSER=srcrcuprefix_WIKI TOUSER=tgtrcuprefix_WIKI FILE=/tmp/wiki.dmp
```

STATISTICS=none

where:

- DB_ORACLE_HOME is the directory in which the database for Oracle WebCenter Wiki Server schema is installed.
- password is the password for the system database user.
- serviceid is the service ID of the database connection.
- FROMUSER is the exported schema.
- TOUSER is the imported schema. This is the RCU suffix that was used during installation, _WIKI, along with the user supplied prefix. For example, DEV_WIKI.
- FILE contains the data to be imported.

25.1.3.11 Exporting Oracle Content Server

First use Oracle Data Pump to export the Oracle Content Server schema, and then export the native (vault) and web-viewable (weblayout) files.

1. Export Oracle Content Server using the Oracle Data Pump export utility.

For example, go to *ORACLE_HOME*/bin of your database and run the command described in [Example 25–11](#).

Note: The Oracle Data Pump utility does not support LONG columns types that exist in the OCSERVER schema. Therefore, Oracle recommends using Oracle Database Utilities. See also, the *Oracle Database Utilities* guide.

Example 25–11 Data Pump Utility (Export)

```
DB_ORACLE_HOME/bin/expdp \"sys/password@serviceid as sysdba\"
OWNER=srcrcuprefix_OCSERVER FILE=/tmp/ucm.dmp STATISTICS=none
```

where:

- DB_ORACLE_HOME is the directory in which the database for Oracle Content Server schema is installed.
 - password is the password for system database user.
 - serviceid is the service ID of the database connection.
 - OWNER is the schema to be exported. This is the RCU suffix that was used during installation, _OCSERVER, along with the user supplied prefix. For example, DEV_OCSERVER.
 - FILE contains the exported data.
2. Export the native (vault) and web-viewable (weblayout) files:
 - **Vault files** - Tar up the <WC_ORACLE_HOME>/ucm/vault folder on the source system. For example:

```
tar cvf ucm_vault.tar WC_ORACLE_HOME/ucm/vault
```
 - **Weblayout files** - Tar up the <WC_ORACLE_HOME>/ucm/weblayout folder on the source system. For example:

```
tar cvf ucm_weblayout.tar WC_ORACLE_HOME/ucm/weblayout
```

3. Import the source `vault` and `weblayout` folder archives on the target system as follows:

- **Vault files** - Restore the `vault` folder. For example:

```
cd WC_ORACLE_HOME/ucm;
tar xvf ucm_vault.tar
```

- **Weblayout files** - Restore the `weblayout` folder. For example:

```
cd WC_ORACLE_HOME/ucm;
tar xvf ucm_weblayout.tar
```

25.1.3.12 Importing Oracle Content Server

First use Oracle Data Pump to import the source Oracle Content Server schema, and then import the source `vault` and `weblayout` folder archives.

1. Import Oracle Content Server using the Oracle Data Pump import utility.

For example, go to `ORACLE_HOME/bin` of your database and run the command described in [Example 25–12](#).

Note: The Oracle Data Pump utility does not support LONG columns types that exist in the OCSERVER schema. Therefore, Oracle recommends using Oracle Database Utilities. See also, the Oracle Database Utilities guide.

Example 25–12 Data Pump Utility (Import)

```
DB_ORACLE_HOME/bin/impdp \ "sys/password@serviceid as sysdba\"
FROMUSER=srcrcuprefix_OCSERVER TOUSER=tgtrcuprefix_OCSERVER FILE=/tmp/UCM.dmp
STATISTICS=none TRANSFORM=oid:n
```

where:

- `DB_ORACLE_HOME` is the directory in which the database for Oracle Content Server schema is installed.
 - `password` is the password for system database user.
 - `serviceid` is the service ID of the database connection.
 - `FROMUSER` is the exported schema.
 - `TOUSER` is the imported schema. This is the RCU suffix that was used during installation, `_OCSERVER`, along with the user supplied prefix. For example, `DEV_OCSERVER`.
 - `FILE` contains the data to be imported.
2. Import the source `vault` and `weblayout` folder archives on the target system as follows:

- **Vault files** - Restore the `vault` folder. For example:

```
cd WC_ORACLE_HOME/ucm;
tar xvf ucm_vault.tar
```

- **Weblayout files** - Restore the `weblayout` folder. For example:

```
cd WC_ORACLE_HOME/ucm;  
tar xvf ucm_weblayout.tar
```

After importing the Oracle Content Server, log in to WebCenter Spaces and open any imported group space. Verify that the Documents service is enabled in that group space and that imported group space folders are available as expected.

25.1.3.13 Exporting Oracle WebLogic Communications Server

For information on exporting Oracle WebLogic Communications Server, see *Oracle WebLogic Communication Services Administrator's Guide*.

25.1.3.14 Importing Oracle WebLogic Communications Server

For information on importing Oracle WebLogic Communications Server, see *Oracle WebLogic Communication Services Administrator's Guide*.

25.1.3.15 Exporting Portlet Producers

This step is only require to migrate entire producer metadata and not just the producer metadata associated with your WebCenter Spaces application. For information on how to export entire producer metadata, see the appendix "Portlet Preference Store Migration Utilities" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

25.1.3.16 Importing Portlet Producers

This step is only required to migrate entire producer metadata and not just the producer metadata associated with your WebCenter Spaces application. For information on how to import entire producer metadata, see the appendix "Portlet Preference Store Migration Utilities" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

25.1.4 Exporting an Entire WebCenter Spaces Application

This section describes how to export an entire WebCenter Spaces application using Oracle Enterprise Manager Fusion Middleware Control and WLST commands.

A WebCenter Spaces application is exported into a single export archive (.ear file). The EAR file contains a metadata archive (.mar file) and a single XML file containing the security policy information. You can save export archives to your local file system or to a remote server file system. For more information about what is exported, read [Section 25.1.1, "Understanding WebCenter Spaces Export and Import"](#).

WebCenter Spaces is temporarily unavailable during import and export operations to prevent data conflicts. Any user who tries to login or access WebCenter Spaces pages will see an "application unavailable" page.

The export process does not include data associated with external services, that is, Mail, Discussions, Announcements, Worklists, Wiki, Blogs, Personal Events, Instant Messaging and Presence (IMP), and Documents. To learn how to move data associated with these services, see [Section 25.1.3, "Migrating Back-end Components for an Entire WebCenter Spaces Application"](#).

If a shared identity store is not used and the users in both the export and import environment must be identical, then these users must also be migrated. Refer to [Section 25.1.3, "Migrating Back-end Components for an Entire WebCenter Spaces Application"](#).

Note: No icons, skins, images, out-of-the-box templates, or personalizations are exported. For more information on personalizations, see the section "Personalizing Your Page View" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

This section includes the following:

- [Section 25.1.4.1, "Exporting WebCenter Spaces Using Oracle Enterprise Manager Fusion Middleware Control"](#)
- [Section 25.1.4.2, "Exporting WebCenter Spaces Using WLST"](#)

25.1.4.1 Exporting WebCenter Spaces Using Oracle Enterprise Manager Fusion Middleware Control

Fusion Middleware administrators can export an entire WebCenter application using Fusion Middleware Control.

To export WebCenter Spaces:

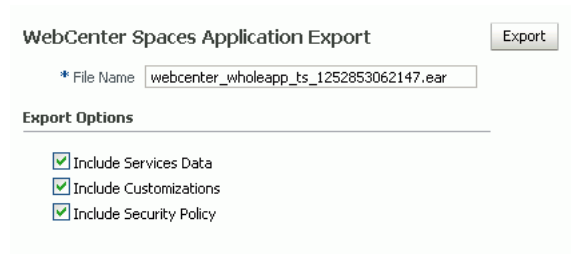

1. In Fusion Middleware Control, navigate to the home page for WebCenter Spaces. See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).
2. From the **WebCenter** menu, select **Application Export**, as shown in [Figure 25–2](#).

Figure 25–2 WebCenter Menu - Application Export Option

3. Change the **File Name** for the export archive or accept the default name. To ensure uniqueness, the default .ear filename contains a timestamp: `webcenter_wholeapp_ts_timestamp.ear`, as shown in [Figure 25–3](#).

Figure 25–3 Naming the Export Archive

4. Set export options as required. For details, see [Table 25–1](#).

Table 25–1 WebCenter Spaces Application Export Options

Field	Description
Include ServicesData	<p>Select to export data stored in the WebCenter repository for the following services: Activity Streams, Events, Feedback, Lists, Links, Message Boards, Connections, and Profiles. Note data stored in the MDS repository is exported too.</p> <p>Always re-export list data if source and target list definitions do not match. Mis-match only occurs when a list definition exists on the target and it is subsequently changed in the source.</p> <p>If the application selected for export contain a large amount of data, consider using the database export utilities to export (and import) the WebCenter schema data instead. For example:</p> <pre data-bbox="683 579 1360 659">DB_ORACLE_HOME/bin/expdp \"sys/password@serviceid as sysdba\" OWNER=srcrcuprefix_WEBCENTER FILE=/tmp/WCS.dmp STATISTICS=none</pre> <pre data-bbox="683 695 1325 806">DB_ORACLE_HOME/bin/impdp \"sys/password@serviceid as sysdba\" FROMUSER=srcrcuprefix_WEBCENTER TOUSER=tgtrcuprefix_WEBCENTER FILE=/tmp/WCS.dmp STATISTICS=none TRANSFORM=oid:n</pre> <p>For details, refer to the <i>Oracle Database Utilities</i> guide.</p> <p>Deselect this option if you do not want to export any data associated with lists, events, tags, links, connections, profiles, message boards, activity streams, and feedback. For example, when moving an application from a test environment to a stage or production environment the test data may no longer be required.</p> <p>Note: The export process does <i>not</i> export data associated with other, external services such as Mail, Discussions, Announcements, Worklists, Instant Messaging and Presence (IMP), Personal Events, and Documents. To learn how to move data associated with these services, see documentation for that product. See also, Section 25.1.3, "Migrating Back-end Components for an Entire WebCenter Spaces Application".</p>
Include Customizations	<p>Select to export application customizations. For information about which customizations are optional on export, see Table 25–3 and Table 25–4.</p> <p>If you deselect this option, WebCenter Spaces is exported without these application customizations.</p> <p>Portlet and page customizations are always exported. See also Figure 25–1, "Information Exported with WebCenter Spaces".</p>

Table 25–1 (Cont.) WebCenter Spaces Application Export Options

Field	Description
Include Security Policy	<p>Select to generate an XML file (<code>policy-store.xml</code>) listing:</p> <ul style="list-style-type: none"> ■ WebCenter Spaces application roles (and permissions assigned to each role). ■ WebCenter user role assignments. ■ Group space members (and their role assignments). <p>Deselect this option if you do not want to export user details, that is, users and their current role assignments. When you import an application without any user data, existing permissions (if any) are removed and the WebCenter Spaces administrator who is importing the application becomes the default moderator for any group spaces that are imported. This option is useful when exporting an application between a stage and production environment for the first time and where users added during the testing phase are no longer required.</p> <p>Tip: Always <i>select</i> this option when backing up WebCenter Spaces so that you can restore the application's security policy. If you deselect this option, no security policy will exist after the import/restore operation.</p>

5. Click **Export**.
6. In the Download dialog, as shown in [Figure 25–3](#), click **Export** to confirm that you want to go ahead.

Figure 25–4 Downloading an Export Archive

Progress information is displayed during the export process. The application being exported cannot be accessed during export operations.

7. When the export process is complete, specify a location for the export archive (.ear).

Figure 25–5 Saving an Export Archive

Select one of:

- **Download** - Saves the export EAR file to your local file system.
Your Browser will download and save the archive locally. The actual download location depends on your Browser set up.
- **Save to Server** - Saves the export EAR file to a server location.

When the Archive Location dialog box displays ([Figure 25–6](#)), enter a suitable path for **Server Location**, for example, `/tmp`, and then click **Save**. The name of the EAR is not required here.

Ensure that the server directory you specify has `write` permissions.

Figure 25–6 Saving Export Archives to a Server Location

8. Click **Close** to dismiss the Export window.

The export archive (.EAR) is saved to the specified location.

Check the diagnostic log file, `WLS_Spaces-diagnostics.log`, for any warnings or errors reported during the export process. To view the log file, choose the menu option **WebCenter > Logs > View Log Messages**. For details, see [Section 24.3, "Viewing and Configuring Log Information"](#). See also [Section 25.4, "Troubleshooting Import and Export Issues for WebCenter Spaces"](#).

25.1.4.2 Exporting WebCenter Spaces Using WLST

Use the WLST command `exportWebCenterApplication` to export WebCenter Spaces. For command syntax and examples, see "exportWebCenterApplication" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

WebCenter Spaces is temporarily unavailable during export operations to prevent data conflicts. Any user who tries to login or access WebCenter Spaces pages will see an "application unavailable" page.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

Note: No icons, skins, images, out-of-the-box templates, or personalizations are exported. For more information on personalizations, see the section "Personalizing Your Page View" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

25.1.5 Importing an Entire WebCenter Spaces Application

This section describes how to import an entire WebCenter Spaces application using Fusion Middleware Control and WLST commands.

Before importing WebCenter Spaces:

- Migrate the LDAP Identity Store, Credential Store, Policy Store, Oracle WebCenter Discussions Server, Oracle WebCenter Wiki Server, Oracle Content Server, Oracle WebLogic Communications Server, and portlet producers. See [Section 25.1.3, "Migrating Back-end Components for an Entire WebCenter Spaces Application"](#).

Personal pages are only migrated if the target and source applications both use the same LDAP Identity Store; this is because personal page assignments are per user GUID.

- Oracle also recommends that you backup the database schema, WebCenter repository, MDS, and your policy store. See [Section 25.3, "Backing Up and Recovering WebCenter Applications"](#).
- Check that all users assigned to the `Administrator` role exist in the target identity store. On import, users listed in the WebCenter Spaces security policy are checked against the identity store that is configured for the domain. If a user is not

found, any policies associated with that user are removed. See also, [Section 23.3.4, "Moving the Administrator Account to an External LDAP Server"](#).

WebCenter Spaces is temporarily unavailable during import and export operations to prevent data conflicts. Any user who tries to login or access WebCenter Spaces pages will see an "application unavailable" page.

This section includes the following:

- [Section 25.1.5.1, "Importing WebCenter Spaces Using Oracle Enterprise Manager Fusion Middleware Control"](#)
- [Section 25.1.5.2, "Importing WebCenter Spaces Using WLST"](#)

25.1.5.1 Importing WebCenter Spaces Using Oracle Enterprise Manager Fusion Middleware Control

Fusion Middleware administrators can import an entire WebCenter application using Fusion Middleware Control.

To import a WebCenter Spaces application using Fusion Middleware Control:

1. In Fusion Middleware Control, navigate to the home page for WebCenter Spaces. See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).
2. From the **WebCenter** menu, select **Application Import**.
3. In the WebCenter Spaces Application Import page, as shown in [Figure 25–7](#), specify the location of your WebCenter Spaces application archive (.ear). Select one of the following:
 - **Archive Located on Local File System** - Enter the **File System Location**. Alternatively, click **Browse** to locate the directory on the local file system where the .ear file is stored.
 - **Archive Located on Server File System** - Enter the **Server Location**. Any shared location accessible from this WebCenter Spaces application.

The .ear you select must contain an entire WebCenter Spaces application export—you cannot import individual group spaces from here. Refer to [Chapter 32, "Exporting and Importing Group Spaces"](#) for more information.

Figure 25–7 WebCenter Spaces Application Import Page

WebCenter Spaces Application Import Import

Archive Location

Select to import a WebCenter archive (.EAR) located on the local file system.

Archive File Name

Select to import an WebCenter archive (.EAR) located on the server where your WebCenter application is running.

Archive File Name

4. Click **Import**.
5. In the WebCenter Spaces Application Import dialog, as shown in [Figure 25–8](#), click **Import**.

Figure 25–8 WebCenter Spaces Application Import dialog

Once the import is complete, a success message displays.

6. Restart the managed server on which the newly imported WebCenter Spaces application is deployed.

In a cluster environment, restart each managed server in the cluster. See also, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments"](#).

7. Initiate the Oracle Secure Enterprise Search crawler to index newly imported data. See also, *Oracle Secure Enterprise Search Administrator's Guide*.

25.1.5.2 Importing WebCenter Spaces Using WLST

Use the WLST command `importWebCenterApplication` to import a WebCenter Spaces. For command syntax and examples, see "importWebCenterApplication" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

Note: After import:

- Restart the managed server on which the newly imported WebCenter Spaces application is deployed. In a cluster environment, restart each managed server in the cluster. See also, see [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments"](#).
 - Initiate the Oracle Secure Enterprise Search crawler to index newly imported data.
-
-

25.1.6 Prerequisites for Group Space Export and Import

To export one or more group spaces, the WebCenter Spaces application which contains the group spaces must be up and running, and all the group spaces you want to export must be offline to prevent data conflicts. See, [Section 31.3.1, "Taking Any Group Space Offline"](#).

Group space data associated with some back-end components, specifically Oracle WebCenter Discussions Server and Oracle WebCenter Wiki Server, must be migrated *after* you export or import group spaces. See next section, [Section 25.1.7, "Migrating Back-end Components for Individual Group Spaces"](#).

Note: The simultaneous export or import of large numbers of group spaces is not recommended as, depending on server configuration, it may affect system performance. If a serious deterioration in performance is observed, break the export or import down into several smaller groups.

25.1.7 Migrating Back-end Components for Individual Group Spaces

When migrating one or more group spaces, you must also migrate the back-end components used by the group space. This section tells you how.

This section includes the following sub sections:

- [Exporting Discussions for a Group Space](#)
- [Importing Discussions for a Group Space](#)
- [Exporting Wikis and Blogs for a Group Space](#)
- [Importing Wikis and Blogs for a Group Space](#)
- [Exporting Documents for a Group Space](#)
- [Importing Documents for a Group Space](#)

You must import the group spaces on to the target *before* importing these back-end components.

25.1.7.1 Exporting Discussions for a Group Space

Use the Oracle WebCenter Discussions Server Admin Console to export discussions associated with a particular group space.

Group space discussions are exported to an .xml file, and saved to a .zip file in the DOMAIN_HOME/config/fmwconfig/servers/<target_server_name>/owc_discussions_11.1.1.2.0/data/ directory.

Where DOMAIN_HOME is the path to the Oracle WebLogic Server domain. For example, MW_HOME/user_projects/domains/my_domain/config/fmwconfig/servers/WLS_Services/owc_discussions_11.1.1.2.0/data/.

Before importing group space discussions on the target system, the target group space must exist. See [Section 25.1.9.1, "Importing Group Spaces Using WebCenter Spaces"](#).

To export group space discussions:

1. Login to the Oracle WebCenter Discussions Server Admin Console.

You can login directly if you know the console's URL. For example:
`http://example.com:8890/owc_discussions/admin`

Alternatively, login through WebCenter Spaces as follows:

- a. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)
- b. Click the **Administration** link at the top of the application.
- c. Click the **Group Spaces** tab.
- d. From the **Actions** menu, choose **Edit Group Space**, for the group space you want to export.
- e. Click the **Services** tab, then **Discussions**.
- f. Note down the **Forum Name/ID** or **Category Name/ID** associated with this group space.

Oracle WebCenter Discussions Server generates discussion category and forum IDs sequentially. If this ID exists on the target system, the imported forum (or category) will be assigned a new, unique ID, and therefore you must reconfigure the imported group space, to point to the new ID. For details, see [Section 25.1.9.1, "Importing Group Spaces Using WebCenter Spaces"](#) - Step 11.

- g. Click **Forum Administration**, and login to the Admin Console.
2. In the Admin Console, select the **System** menu and choose **XML Export & Import** in the sidebar.
3. Select **Data Export**.
4. Set the following options (Figure 25–9):

- a. **Export Options** - Select **Custom Options**, and select all the check boxes.
- b. **Export Content** - Select **Export Specific Content**, and select the name of the forum or category required.

Note: Group spaces that support multiple forums will use a category to store discussions. Other group spaces use a single forum.

- c. **Export location, Export filename, Export file encoding** - Keep the default values.

Figure 25–9 Exporting Group Space Discussions

The screenshot displays the 'XML Export' configuration page in the Jive Forums Admin Console. The page is titled 'XML Export' and includes a warning: 'Use the options below to export data from the system. Note, exporting data from your system will likely cause a lot of database load and VM activity. Because of this, its best to export data at off-peak hours.'

The configuration is organized into several sections:

- Export Options:**
 - Standard Options - All users, groups, permissions are exported.
 - Custom Options - Pick what to export:
 - Export global properties
 - Export users
 - Export groups
 - Export permissions
 - Export Attachments
- Export Content:**
 - Export all content
 - Export no content
 - Export specific content:
 - Forums:**
 - qsp0
 - qsp0-Announcements
 - group1-Announcements
 - Categories:**
 - WebCenter
 - WebCenter + Finance/Project
 - Export private messages
- Export Location:**
 - Save file to jiveHome data dir: oracle/product/jive/jive_forums_silver_5_5_20_oracle/jiveHome/data
 - Send output to browser
- Export Filename:**
 - Standard Filename: 2009-04-22-0330.xml (date stamp filename)
 - Custom Filename:
- Export File Encoding:**
 - System default encoding (UTF-8)
 - Unicode (UTF-8)
 - Pick a supported encoding:
 - UTF-8

5. Click **Start Export**.

6. Once complete, copy the .zip file (that contains the export .xml file) from the MW_HOME/user_projects/domains/my_domain/config/fmwconfig/servers/<server_name>/owc_discussions_11.1.1.2.0/data directory to same location on the target discussions server.

For example,

```
MW_HOME/user_projects/domains/my_domain/config/fmwconfig/servers/WLS_Services/owc_discussions_11.1.1.2.0/data.
```

Before importing group space discussions on the target system, the group space you are migrating must exist on the target. See [Section 25.1.9.1, "Importing Group Spaces Using WebCenter Spaces"](#).

25.1.7.2 Importing Discussions for a Group Space

Use the Oracle WebCenter Discussions Server Admin Console to import group space discussions exported from another WebCenter Spaces application.

Ensure that the associated group space exists on the target before you import the group space discussion data. See [Section 25.1.8.1, "Exporting Group Spaces Using WebCenter Spaces"](#).

Note: Oracle WebCenter Discussions Server generates discussion category and forum IDs sequentially. Therefore, when importing discussion data between two targets (or source to target), there is a chance that the same IDs will exist on both systems. When ID clashes occur, the imported forum (or category) is assigned a new, unique ID and therefore you must reconfigure the group space to point to the new ID. See Step 11 below for details.

To import group space discussions:

1. Login to the Oracle WebCenter Discussions Server Admin Console.
You can login directly if you know the console's URL. For example:
`http://example.com:8890/owc_discussions/admin`
Alternatively, login through WebCenter Spaces as follows:
 - a. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)
 - b. Click the **Administration** link at the top of the application.
 - c. Click the **Group Spaces** tab.
 - d. From the **Actions** menu, choose **Edit Group Space**, for the group space you want to export.
 - e. Click the **Service** tab, then **Discussions**.
 - f. Click **Forum Administration**, and login to the Admin Console.
2. In the Admin Console, select the **System** menu and then choose **XML Export & Import** in the sidebar.
3. Select **Data Import**.
4. Choose the appropriate group space export file from the list available ([Figure 25-10](#)).

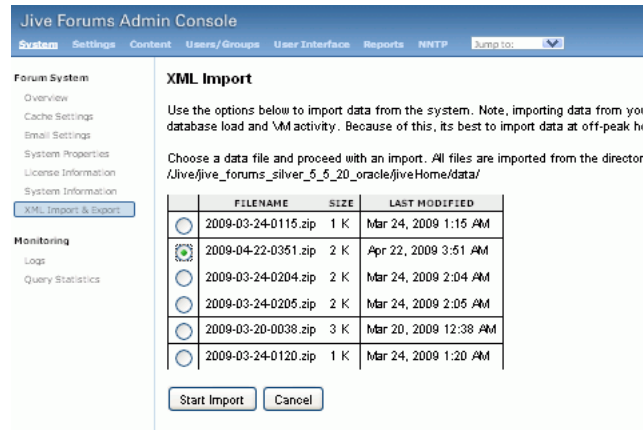

If the file you want is not listed, copy the export .zip file from the source directory

DOMAIN_HOME/config/fmwconfig/servers/<target_server_name>/owc_discussions_11.1.1.2.0/data/ to same location on this target. See also, [Section 25.1.7.1, "Exporting Discussions for a Group Space"](#).

Where DOMAIN_HOME is the path to the Oracle WebLogic Server domain. For example,

MW_HOME/user_projects/domains/my_domain/config/fmwconfig/servers/WLS_Services/owc_discussions_11.1.1.2.0/data/.

Figure 25–10 Importing Group Space Discussions

5. Click **Start Import**.

On import, the group space discussions data is copied to the discussions server. In the next step you will reassociate the group space you migrated earlier with this newly imported data.

6. Select the **Content** menu, and then choose **Content Summary** in the sidebar.

All the categories and forums in the system are listed here.

7. Select **WebCenter**, and then click the **Move** button for the newly imported forum or category.

8. Select the root category for the target WebCenter Spaces application, and click **Move Categories**.

The Category Summary page shows the new location.

9. Click **Permissions** in the sidebar.

10. Deselect all the permissions for the User Types: **Anyone** and **Registered Users**, and click **Save Changes** (Figure 25–11).

Category List » Philatelists
Edit category permissions to set the permissions policies that the category will use.

Permissions are either additive or negative. Additive permissions () are permissions that should be 'added' to the permissions retrieved from parent categories and those that are globally set, while negative permissions () are permissions that should be revoked or removed from permissions retrieved from parent categories and those that are globally set. For more information about permissions, please read the administrator guide distributed with this product or click the help icon above.

Note: Checkboxes on this page have three states (). Click a checkbox repeatedly to rotate through all three states.

Permissions Summary

Permission Summary	Grant New Permissions	Read Forum	Rate Message	Create Thread	Create Message	Create Attachment	Create Poll	Vote in Poll	Create Announce	Remove
User Types										
Anyone *		<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Registered Users *		<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Users										
monica		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Groups										
No group permissions.										

11. In WebCenter Space, navigate to the group space's Discussions Forum Settings tab, to reassociate the group space with the discussion data that you just imported:
 - a. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)
 - b. Click the **Administration** link at the top of the application.
 - c. Click the **Group Spaces** tab.
 - d. From the **Actions** menu, choose **Edit Group Space**, for the group space you want to export.
 - e. Click the **Services** tab, then **Discussions**.
 - f. Click the **Search** icon besides Category ID or Forum ID, and choose the imported category (or forum) from the list.
 - g. Click **Apply**.

25.1.7.3 Exporting Wikis and Blogs for a Group Space

Use Oracle Data Pump utilities and the group space export script (`owc_wiki_export.sql`) to export wikis and blogs associated with a particular group space.

See Also: For more information, see "Oracle Data Pump" in *Oracle Database Utilities*.

During the export process, wikis and blogs stored on Oracle WebCenter Wiki schema are exported to the data pump directory (the `WC_PUMP_DIR` directory in the example below.)

Before you start, you must copy the group space export script provided with Oracle WebCenter (`WC_ORACLE_HOME/wikiserver/owc_wiki/WEB-INF/classes/owc_wiki_export.sql`) to the computer where you run SQL. If you ran the script previously, be

sure to remove the dump file `WCWIKI_EXPDP.dmp` from the `WC_PUMP_DIR` directory before running the script again.

To export group space wikis and blogs:

1. Copy the group space export script from
`/WC_ORACLE_HOME/wikiserver/owc_wiki/WEB-INF/classes/owc_wiki_export.sql` to the computer where you run SQL, for example, `/myscripts/`.

2. Go to `ORACLE_HOME/bin` of your database where the Oracle WebCenter Wiki schema is installed, and connect to the database using `sqlplus` as the schema owner:

```
DB_ORACLE_HOME/bin/sqlplus "<srcrcuprefix>_WIKI/password@dbhost"
```

3. Create the data pump directory (`data_pump_dir`):

```
SQL> create or replace directory WC_PUMP_DIR as
'<full_path_to_existing_directory_on_the_file_system>';
```

For example:

```
SQL> create or replace directory WC_PUMP_DIR as '/tmp/wikiData/';
```

4. Grant the Oracle WebCenter Wiki schema (`srcrcuprefix_WIKI`) read/write access to the data pump directory.

For example:

```
SQL> grant read, write on directory WC_PUMP_DIR to srcrcuprefix_WIKI;
```

5. Run `owc_wiki_export.sql`:

For example, if you copied the script to a directory called `/myscripts/`:

```
SQL> connect
srcrcuprefix_WIKI/password@//dbhost:dbport/service
SQL> @/myscripts/owc_wiki_export.sql
```

6. When prompted, enter the wiki domain associated with the group space.

`WCWIKI_EXPDP.dmp` is created in the `WC_PUMP_DIR`. For example, `/tmp/wikiData/`.

25.1.7.4 Importing Wikis and Blogs for a Group Space

Use Oracle Data Pump utilities and the group space import script (`owc_wiki_import.sql`) to import group space wikis and blogs, exported from another WebCenter Spaces application.

See Also: For more information, see "Oracle Data Pump" in *Oracle Database Utilities*.

Before you start, you must copy the group space import script provided with Oracle WebCenter

(`WC_ORACLE_HOME/wikiserver/owc_wiki/WEB-INF/classes/owc_wiki_import.sql`) to the computer where you run SQL. If the source and target databases are different, you must edit this script, as described below.

The import script will import the data based on the domain name, so make sure the same domain name does not exist in the target schema before running the script. Also ensure that the associated group space exists on the target before you import the

group space wikis and blogs. See [Section 25.1.8.1, "Exporting Group Spaces Using WebCenter Spaces"](#).

To import group space wikis and blogs:

1. Copy the group space import script from `WC_ORACLE_HOME/wikiserver/owc_wiki/WEB-INF/classes/owc_wiki_import.sql` to the computer where you run SQL, for example, `/myscripts/`.

2. Copy the exported file, for example `WCWIKI_EXPDP.dmp`, to an appropriate directory on the target system.

For example:

```
SQL> cp /testserver/tmp/wikiData/WCWIKI_EXPDP.dmp
/productionserver/tmp/wikiDataTarget/WCWIKI_EXPDP.dmp
```

3. Go to `ORACLE_HOME/bin` of your database where Oracle WebCenter Wiki schema is installed, and connect to the database using `sqlplus` as the schema owner:

```
DB_ORACLE_HOME/bin/sqlplus "<tgtrcuprefix>_WIKI/password@dbhost"
```

4. Grant the Oracle WebCenter Wiki schema (`tgtrcuprefix_WIKI`) read/write access to the data pump directory.

For example:

```
SQL> grant read, write on directory WC_PUMP_DIR to tgtrcuprefix_WIKI;
```

5. Create the `data_pump_dir`:

```
SQL> create or replace directory WC_PUMP_DIR as
'<full_path_to_existing_directory_on_the_file_system>';
```

For example:

```
SQL> create or replace directory WC_PUMP_DIR as
'/tmp/wikiDataTarget/';
```

6. If the source and target databases are different, edit the import script `/myscripts/owc_wiki_import.sql` as follows:

```
DBMS_DATAPUMP.METADATA_REMAP(dp_handle, 'REMAP_SCHEMA', 'SOURCE
_WIKI_SCHEMA', 'TARGET_WIKI_SCHEMA');
```

- a. **SOURCE_WIKI_SCHEMA** - replace with the source schema where you ran `owc_wiki_export.sql`

- b. **TARGET_WIKI_SCHEMA** - replace with the target schema where you will run `owc_wiki_import.sql`

7. Run `owc_wiki_import.sql`:

For example, if you copied the script to a directory called `/myscripts/`:

```
SQL> connect
tgtrcuprefix_WIKI/password@//dbhost:dbport/service
SQL> @/myscripts/owc_wiki_import.sql
```

25.1.7.5 Exporting Documents for a Group Space

After importing a group space you can use WebDAV to upload group space documents stored in Oracle Content Server to the new target; there is no need to export the content first.

25.1.7.6 Importing Documents for a Group Space

Before migrating group space documents to a new target you must enable the Documents service in the imported group space. Once the service is enabled, you can use WebDAV to upload group space documents onto the target system.

When dragging and dropping content to the target system, **do not** drag the group space folder to the target; you must only drag and drop content that is stored under the group space folder.

WebDAV is enabled on Oracle Content Server out-of-the-box. If you do not know the WebDAV URL for the Oracle Content Server that is used to store group space and personal space documents, contact your Fusion Middleware Administrator. If the base URL for that Oracle Content Server is

`http://<host>:<port>/<relative_web_root>`, the WebDAV root URL will be `http://<host>:<port>/<relative_web_root>/idcplg/webdav`.

Note: Depending on the WebDAV client you use, all properties may not be copied over (for example, document descriptions, checkin and checkout status, and versions may not be carried across).

To set up the target group space and import documents from another group space:

1. In WebCenter Spaces, enable the Documents service in the imported group space:
 - a. Login to the WebCenter Spaces application that contains the imported group space.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator."](#)
 - b. Click the **Administration** link at the top of the application.
 - c. Click the **Group Spaces** tab.
 - d. From the **Actions** menu, choose **Edit Group Space**, for the imported group space.
 - e. Click the **Services** tab.
 - f. Select the check box next to **Documents** to enable this service, and then click **Apply**.
 - g. Click **OK** to dismiss the warning about permission configuration requirements.
 - h. Click the **Roles** tab, and assign appropriate **Documents** permissions to each group space role.
 - i. Click **Apply** to save.
2. Using WebDAV (for Oracle Content Server), drag and drop content from the folder belonging to the source group space to the empty folder assigned to the target group space.

25.1.8 Exporting Group Spaces

Administrators can export one or more group spaces using WebCenter Spaces and WLST commands.

Group space information is exported into a single export archive (.ear file). The EAR file contains a metadata archive (.mar file) and a single XML file containing the

security policy information. You can save export group space archives to your local file system or to a remote server file system.

For more information about what is exported, see [Section 25.1.1, "Understanding WebCenter Spaces Export and Import"](#).

The export process does not include data associated with external group space services, such as, Discussions, Announcements, Wiki, Blogs, and Documents. To learn how to move data associated with these services, see [Section 25.1.7, "Migrating Back-end Components for Individual Group Spaces"](#).

Groups spaces are locked during an export operation to prevent simultaneous imports/exports of the same group space. If someone else is exporting a particular group space, all subsequent attempts to export (or import) the same group space are blocked.

Note: No icons, skins, images, or personalizations are exported. For information on personalizations, see the section "Personalizing Your Page View" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

This section includes the following:

- [Section 25.1.8.1, "Exporting Group Spaces Using WebCenter Spaces"](#)
- [Section 25.1.8.2, "Exporting Group Spaces Using WLST"](#)

If you want to export an entire WebCenter Spaces application, see [Section 25.1.4, "Exporting an Entire WebCenter Spaces Application"](#).

25.1.8.1 Exporting Group Spaces Using WebCenter Spaces

WebCenter Spaces administrators can export one or more group spaces from WebCenter Spaces administration pages. For details, see [Section 32.1, "Exporting Group Spaces"](#).

25.1.8.2 Exporting Group Spaces Using WLST

Use the WLST command `exportGroupSpaces` to export one or more group spaces. For command syntax and examples, see "exportGroupSpaces" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

25.1.9 Importing Group Spaces

Administrators can import a group space archive (.EAR) using WebCenter Spaces and WLST commands.

On import, *all* group spaces included in the archive are created or re-created on the target application. Existing group spaces are deleted then replaced, and new group spaces are created.

If you intend to import group spaces with names identical to those available on the target application, ensure that those group spaces are offline in the target application. It is not possible to overwrite a group space, on import, if it is online. For details, see "Taking a Group Space Offline" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Groups spaces are locked during an import operation to prevent simultaneous imports/exports of the same group space. If someone else is importing a particular group space, all subsequent attempts to import (or export) the same group space are blocked.

All group spaces must have a security policy. When you import a brand new group space you must ensure that the group space's security policy is included in the export archive. Existing group spaces have a security policy in place so, in this case, it's up to you whether to overwrite the security information on import or maintain the existing security policy.

When you import a group space (with security), security policy updates do not apply immediately. Any user logged in to WebCenter Spaces must log out and log back in to adopt the new group space security policy.

If data migration is important, group space documents, discussions, and wikis and blogs can be migrated for individual group spaces. For details, see [Section 25.1.7, "Migrating Back-end Components for Individual Group Spaces"](#).

This section includes the following:

- [Section 25.1.9.1, "Importing Group Spaces Using WebCenter Spaces"](#)
- [Section 25.1.9.2, "Importing Group Spaces Using WLST"](#)

After importing one or more group spaces, consider initiating an Oracle Secure Enterprise Search crawl to index the newly imported data.

25.1.9.1 Importing Group Spaces Using WebCenter Spaces

WebCenter Spaces administrators can import a group space archive (.EAR) into another WebCenter Spaces application. For details, see [Section 32.2, "Importing Group Spaces"](#).

25.1.9.2 Importing Group Spaces Using WLST

Use the WLST command `importGroupSpaces` to import one or more group spaces. For command syntax and examples, see "importGroupSpaces" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

25.1.10 Migrating Back-end Components for Group Space Templates

Group space templates do not contain any *data* so there is no need to migrate back-end component data when exporting and importing group space templates.

You must, however, migrate the group space template's folder (on Oracle Content Server) to the target instance as described below. If you do not, the Documents service is not enabled in any group space that you create, using this template.

Importing the Back-end Folder for a Group Space Template

Use WebDAV (for Oracle Content Server), to drag and drop the folder belonging to the source group space template to the target instance.

WebDAV is enabled on Oracle Content Server out-of-the-box. If you do not know the WebDAV URL for the Oracle Content Server that WebCenter Spaces uses, contact your Fusion Middleware Administrator. If the base URL for that Oracle Content Server is `http://<host>:<port>/<relative_web_root>`, the WebDAV root URL will be `http://<host>:<port>/<relative_web_root>/idcplg/webdav`.

25.1.11 Exporting Group Space Templates

Administrators can export group space templates and import them into other WebCenter Spaces applications. Out-of-the-box templates, such as the Group Project and Community of Interest templates, cannot be exported.

While export and import utilities are primarily used to move information between WebCenter Spaces applications, the group space template export feature is also useful as a backup service, and for sharing and exchanging templates with others.

Group space template information is exported into a single export archive (.EAR file). The EAR file contains a metadata archive (.MAR file) and a single XML file containing group space security policy information.

Group space templates include pages, metadata, security information such as custom roles, and service information only; no data, such as documents, discussion threads, and list data, is stored with the template.

You can save export archives to your local file system or to a remote server file system.

This section includes the following:

- [Section 25.1.11.1, "Exporting Group Space Templates Using WebCenter Spaces"](#)
- [Section 25.1.11.2, "Exporting Group Space Templates Using WLST"](#)

See also, [Section 25.1.8, "Exporting Group Spaces"](#).

25.1.11.1 Exporting Group Space Templates Using WebCenter Spaces

WebCenter Spaces administrators can export one or more group space templates from WebCenter Spaces administration pages. For details, see [Section 32.3, "Exporting Group Space Templates"](#).

25.1.11.2 Exporting Group Space Templates Using WLST

Use the WLST command `exportGroupSpaceTemplates` to export one or more group space templates. For command syntax and examples, see "exportGroupSpaceTemplates" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

25.1.12 Importing Group Space Templates

Administrators can import a group space template archive (.EAR) into another WebCenter Spaces application.

On import, *all* group space templates included in the archive are re-created on the target application. If a group space template exists on the target, then it is deleted and replaced. If a group space template does not exist, then it is created.

Newly imported group space templates are not immediately available for general use. You must publish the imported templates to make them available to everyone. See [Section 31.5.3, "Publishing and Hiding Group Space Templates"](#).

This section includes the following:

- [Section 25.1.12.1, "Importing Group Space Templates Using WebCenter Spaces"](#)
- [Section 25.1.12.2, "Importing Group Space Templates Using WLST"](#)

See also, [Section 25.1.9, "Importing Group Spaces"](#).

25.1.12.1 Importing Group Space Templates Using WebCenter Spaces

WebCenter Spaces administrators can import one or more group space templates from WebCenter Spaces administration pages. For details, see [Section 32.4, "Importing Group Space Templates"](#)

25.1.12.2 Importing Group Space Templates Using WLST

Use the WLST command `importGroupSpaces` to import one or more group space templates. For command syntax and examples, see "importGroupSpaces" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

25.2 Exporting and Importing Custom WebCenter Applications for Data Migration

This section describes how to export and import metadata and customizations of a custom WebCenter application developed with Oracle WebCenter Framework.

It includes the following sections:

- [Understanding Custom WebCenter Application Export and Import](#)
- [Prerequisites for Custom WebCenter Application Export and Import](#)
- [Exporting Portlet Client Metadata \(Custom WebCenter Applications\)](#)
- [Importing Portlet Client Metadata \(Custom WebCenter Applications\)](#)
- [Exporting WebCenter Services Metadata and Data \(Custom WebCenter Applications\)](#)
- [Importing WebCenter Services Metadata and Data \(Custom WebCenter Applications\)](#)
- [Migrating Security for Custom WebCenter Applications](#)
- [Migrating Data \(Custom WebCenter Applications\)](#)

25.2.1 Understanding Custom WebCenter Application Export and Import

Several migration tools are available to export and import custom WebCenter applications, their connections and customizations (that is, customizations applied to an application, pages, and portlets) between stage and production environments ([Figure 25–12](#)).

Figure 25–12 WebCenter Application Export and Import

Table 25–2 lists available migration tools and their capabilities. All customizations listed in Table 25–2 are migrated with custom WebCenter applications.

Table 25–2 Custom WebCenter Application Migration Tools

Migration Tools	Capabilities
Portlet Client WLST Commands	Enable export and import of portlet client metadata, and producer customizations and personalizations.
MDS WLST Commands	Enables export and import of: <ul style="list-style-type: none"> WebCenter application metadata including customizations made to pages and WebCenter services Data stored in the <code>connections.xml</code> and <code>adf-config.xml</code> documents
Migration WLST Commands	Enables export and import of security policies, including roles and mapping of users and roles.
Oracle Database Utilities	Enables export and import of WebCenter application data. For information, see the part "Oracle Data Pump" in the <i>Oracle Database Utilities</i> guide.

25.2.2 Prerequisites for Custom WebCenter Application Export and Import

Before exporting or importing metadata and customizations for a custom WebCenter application, ensure the following:

- The Oracle Database in which the application metadata and schema is stored is up and running.
- The target instance is configured with the same set of services as the source instance. Additional services can be configured in the target, if required, but minimally, service configuration in the source and target must match.
- The `jps.policystore.removal` parameter is set to `OFF` in your application's `weblogic-application.xml` so that policies are migrated on import:

```
<application-param>
  <param-name>jps.policystore.removal</param-name>
  <param-value>OFF</param-value>
</application-param>
```

If this option is not set, no policy information is imported. In some instances you may not want to migrate policy data, for example, when migrating from a test environment to a production environment where test data is not required. You should note, however, that pages created on the source instance at runtime will not display on the target instance because no page grants will exist on the target.

25.2.3 Exporting Portlet Client Metadata (Custom WebCenter Applications)

To export portlet client metadata and producer customizations and personalizations, for a custom WebCenter application, use the WLST command `exportPortletClientMetadata`. This command is run on the entire application, and therefore, it exports metadata of all the producers stored in an application. You cannot opt to export metadata for specific producers.

Note: Both the portlet producer and individual portlets must include an `<allow-export>` tag that is set to `true`. If this tag is not set, the portlet producer (and the portlets) are excluded from the export process. For details, refer to "How to Implement Export/Import of Customizations (WSRP 2.0)" in the Oracle WebCenter Framework Developer's Guide.

For detailed syntax and examples, see "exportPortletClientMetadata" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For information on how to run WLST commands, see [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#)

For information on how to import portlet client metadata associated with all applications, see "Portlet Preference Store Migration Utilities" in *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

25.2.4 Importing Portlet Client Metadata (Custom WebCenter Applications)

This section describes how to import portlet client metadata and producer customizations and personalizations, for a custom WebCenter application, using the WLST command `importPortletClientMetadata`.

Prerequisites:

- The Oracle Database in which the application metadata or schema is stored and the portlet producers must be up and running.
- Both the portlet producer and individual portlets must include an `<allow-import>` tag that is set to `true`. If the tag is not set, the portlet producer (and the portlets) are excluded from the import process. For details, refer to "How to Implement Export/Import of Customizations (WSRP 2.0)" in the *Oracle Fusion Middleware Developer's Guide for Oracle WebCenter*.

To import portlet client metadata:

1. Start the WebLogic Scripting Tool (WLST) located at `WC_ORACLE_HOME/common/bin`.

On UNIX, start WLST using `wlst.sh`.

On Windows, use `wlst.cmd`.

See also, [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

2. Run the WLST command `deleteMetadata` to delete the metadata under `/oracle/adf/portlet`.

```
deleteMetadata(application='application', server='server', docs='docs')
```

where:

- `application`: Name of the WebCenter application (for example, `sampleApp`)
- `server`: Name of the managed server (for example, `portletConsumer`).
- `docs`: List of comma separated fully qualified document name(s) or document name patterns (such as `*` and `**` patterns).

For example:

```
deleteMetadata(application='sampleApp', server='WLS_CustomApp',
docs='/oracle/adf/portlet/**')
```

For detailed syntax and examples, see "deleteMetadata" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

3. Run the WLST command `importPortletClientMetadata`:

```
importPortletClientMetadata(appName, fileName, server, applicationVersion)
```

where:

- `appName`: Name of the WebCenter application (for example, `sampleApp`).
- `fileName`: Name of the exported EAR file containing the portlet client metadata (for example, `export.ear`).
- `server`: Name of the managed server (for example, `portletConsumer`).
- `applicationVersion`: Version number of the deployed application, if multiple versions of the application is deployed.

For detailed syntax and examples, see "importPortletClientMetadata" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*. See also the chapter "Metadata Services (MDS) Custom WLST Commands" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

25.2.5 Exporting WebCenter Services Metadata and Data (Custom WebCenter Applications)

The metadata created by WebCenter services is stored in the Oracle metadata store (MDS). This section describes the transfer of the base documents and their customizations using WLST. For detailed information about MDS, see the chapter "Managing the Oracle Metadata Repository" in *Oracle Fusion Middleware Administrator's Guide*.

Customizations listed in [Table 25–3](#) are also exported when WebCenter applications are migrated between stage and production environments.

1. Start the WebLogic Scripting Tool (WLST) located at `WC_ORACLE_HOME/common/bin`.

On UNIX, start WLST is called `wlst.sh`.

On Windows, use `wlst.cmd`.

See also, [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

2. Run the WLST command `exportMetadata`:

```
exportMetadata(application, server, toLocation, docs, [restrictCustTo],  
[excludeAllCust], [excludeBaseDocs], [excludeExtendedMetadata], [fromLabel],  
[toLabel], [applicationVersion])
```

For example:

```
exportMetadata(application='sampleApp', server='WLS_CustomApp',  
toLocation='/tmp/myrepos', docs='/oracle/webcenter/**')
```

For detailed syntax and examples, see "exportMetadata" in Oracle Fusion Middleware WebLogic Scripting Tool Command Reference.

Note: In this example, "docs='/oracle/webcenter/**'" will export the required documents for all WebCenter services storing metadata in MDS.

The "docs='/oracle/webcenter/**'" command *does not* export portlet customizations and personalizations or changes to configuration files such as `connections.xml` and `adf-config.xml`. To export portlet metadata, run the WLST command `exportPortletClientMetadata`. To export configuration file updates that are stored in MDS, run the WLST command `exportMetadata` with "docs='META-INF/mdssys/cust/adfshare/adfshare/**'".

Where:

- `application`: Application name for which the metadata is to be exported (for example, `sampleApp`).
- `server`: Target server on which this application is deployed (for example, `WLS_CustomApp`).
- `toLocation`: Target directory to which documents selected from the source partition are to be transferred. The `toLocation` parameter can be used as a temporary file system for transferring metadata from one server to another.
- `docs`: List of comma separated fully qualified document name(s) and/or document name patterns (* and ** patterns).
- `restrictCustTo`: List of customization layer names. This list is used to restrict the export of customization documents that match the specified customization layers. This option is ignored if the `excludeAllCust` option is also specified.
- `excludeAllCust`: Specifies whether to export all customization documents. This option overrides the `restrictCustTo` option.
- `excludeBaseDocs`: Specifies whether to export base documents.
- `excludeExtendedMetadata`: Specifies whether to export the Extended Metadata documents.
- `fromLabel`: If specified, transfers the documents from the source partition that is associated with this label.
- `toLabel`: If specified, works with the `fromLabel` variable to transfers the delta between `fromLabel` to `toLabel` from the source partition.
- `applicationVersion`: Application version in case multiple versions of the same application are deployed.

The metadata for WebCenter services, which consists of base and customization documents, are stored in the following paths:

- **Announcements:** /oracle/webcenter/collab/announcement/**
- **Documents:** /oracle/webcenter/doclib/** and /oracle/webcenter/doclib/view/jsf/fragments/**
- **Discussions:** /oracle/webcenter/collab/forum/**
- **General Settings:** /oracle/webcenter/generalsettings/**
- **Group Space**
Events: /oracle/webcenter/collab/calendar/community/**
- **Lists:** /oracle/webcenter/list/** and /oracle/webcenter/list/view/jsf/regions/**
- **Mail:** /oracle/webcenter/collab/mail/**
- **Notes:** /oracle/webcenter/note/**
- **Page:** /oracle/webcenter/page/** and /pageDefs/**
- **Recent Activity:** /oracle/webcenter/recentactivity/**
- **RSS News Feed:** oracle/webcenter/rss/**
- **Links:** /oracle/webcenter/relationship/**
- **Scope:** /oracle/webcenter/framework/scope/**
- **Search:** /oracle/webcenter/search/**
- **Tags:** /oracle/webcenter/tagging/**
- **adf-config.xml, connections.xml:**
/META-INF/mdssys/cust/adfshare/adfshare/**

Configuration file updates are not stored under the /oracle/webcenter/ directory alongside WebCenter services. To export customizations associated with these files, run `exportMetadata` again with `"docs='META-INF/mdssys/cust/adfshare/adfshare'"`.

25.2.6 Importing WebCenter Services Metadata and Data (Custom WebCenter Applications)

To import custom WebCenter application metadata and customizations:

1. Start the WebLogic Scripting Tool (WLST) located at `WC_ORACLE_HOME/common/bin`.

On UNIX, start WLST using `wlst.sh`.

On Windows, use `wlst.cmd`.

See also, [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands"](#).

2. Run the WLST command `importMetadata`:

```
importMetadata( application, server, fromLocation, docs, [restrictCustTo],
[excludeAllCust], [excludeBaseDocs], [excludeExtendedMetadata],
[cancelOnException], [applicationVersion])
```

For example:

```
importMetadata(application='sampleApp', server='WLS_CustomApp',
fromLocation='/tmp/myrepos', docs='/**')
```

Where:

- **application:** Application name for which the metadata is be imported (for example, `sampleApp`).
- **server:** Name of the target server on which this application is deployed (for example, `WLS_CustomApp`).
- **fromLocation:** Source directory from where documents are selected for the transfer. The `fromLocation` parameter can be used as a temporary file system location for transferring metadata from one server to another.
- **docs:** List of comma separated fully qualified document name(s) and/or document name patterns (* and ** patterns).
- **restrictCustTo:** List of customization layer names. This list is used to restrict the import of customization documents that match the specified customization layers. This option is ignored if the `excludeAllCust` option is also specified.
- **excludeAllCust:** Specifies whether to import all customization documents. This option overrides the `restrictCustTo` option.
- **excludeBaseDocs:** Specifies whether to import base documents.
- **excludeExtendedMetadata:** Specifies whether to import the Extended Metadata documents.
- **cancelOnException:** Whether to terminate the import operation when an exception is encountered. On termination, the delete is rolled back if supported by the target store.
- **applicationVersion:** Application version in case multiple versions of the same application are deployed.

For detailed syntax and examples, see "importMetadata" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

25.2.7 Migrating Security for Custom WebCenter Applications

Security migration involves moving the identity store, credential store, and policy store, from one WebCenter application to another. The process is the same for all WebCenter applications so, for custom WebCenter applications, you can follow the same instructions provided for WebCenter Spaces:

- [Exporting the LDAP Identity Store](#)
- [Importing the LDAP Identity Store](#)
- [Exporting and Importing the LDAP Credential Store](#)
- [Exporting and Importing the LDAP Policy Store](#)

25.2.8 Migrating Data (Custom WebCenter Applications)

To export the custom WebCenter application data, use the export and import database utilities. This section includes the following sub sections:

- [Exporting Data \(Custom WebCenter Applications\)](#)
- [Importing Data \(Custom WebCenter Applications\)](#)

25.2.8.1 Exporting Data (Custom WebCenter Applications)

To export the custom WebCenter application data, use the Oracle Data Pump export utility. For example, go to `DB_ORACLE_HOME/bin` of the database and run the command described in [Example 25–13](#).

See Also: For more information, see "Oracle Data Pump" in the *Oracle Database Utilities* guide.

Example 25–13 Data Pump Utility (Export)

```
DB_ORACLE_HOME/bin/expdp \"sys/password@serviceid as sysdba\"
OWNER=srcrcuprefix_WEBCENTER FILE=/tmp/wc.dmp STATISTICS=none
```

where:

- `DB_ORACLE_HOME` is the directory in which the database for the Oracle WebCenter schema is installed.
- `password` is the password for system database user.
- `serviceid` is the service ID of the database connection.
- `OWNER` is the schema to be exported. This is the RCU suffix that was used during installation along with the suffix `_WEBCENTER`. For example, `DEV_WEBCENTER`.
- `FILE` contains the exported data.

25.2.8.2 Importing Data (Custom WebCenter Applications)

To import data for custom WebCenter applications, use the Oracle Data Pump import utility. For example, go to `DB_ORACLE_HOME/bin` of the database and run the command described in [Example 25–14](#).

See Also: For more information, see "Oracle Data Pump" in the *Oracle Database Utilities* guide.

Example 25–14 Data Pump Utility (Import)

```
DB_ORACLE_HOME/bin/impdp \"sys/password@serviceid as sysdba\"
FROMUSER=srcrcuprefix_WEBCENTER TOUSER=tgtrcuprefix_WEBCENTER FILE=/tmp/wc.dmp
STATISTICS=none TRANSFORM=oid:n
```

where:

- `DB_ORACLE_HOME` is the directory in which the database for the Oracle WebCenter schema is installed.
- `password` is the password for system database user.
- `serviceid` is the service ID of the database connection.
- `FROMUSER` is the exported schema.
- `TOUSER` is the imported schema. This is the RCU suffix that was used during installation, `_WEBCENTER`, along with the user supplied prefix. For example, `DEV_WEBCENTER`.
- `FILE` contains the data to be imported.

25.3 Backing Up and Recovering WebCenter Applications

To recover data from disasters, such as the loss of database hardware, inadvertent removal of data from file or database, it is important to back up WebCenter

applications on a frequent basis. The frequency of backup depends on how often the underlying information stored by WebCenter changes in a particular customer application, and how much time and amount of information could acceptably be lost. Incremental or partial backups may be applied where the data is critical to the business and must be restored due to a failure.

Backup and recovery of WebCenter components can be managed through database export and import utilities, and various other tools. For more information, see "Part IV Advanced Administration: Backup and Recovery" in *Oracle Fusion Middleware Administrator's Guide*.

25.4 Troubleshooting Import and Export Issues for WebCenter Spaces

This section contains the following subsections:

- [Section 25.4.1, "ResourceLimitException Issue"](#)
- [Section 25.4.3, "Page or Group Space Not Found Messages After Import"](#)
- [Section 25.4.4, "Group Space Import Archive Exceeds Maximum Upload File Size"](#)
- [Section 25.4.5, "Lists Not Imported Properly"](#)

25.4.1 ResourceLimitException Issue

Problem

The `ResourceLimitException` error displays when you try to export all group spaces or an entire WebCenter Spaces application:

```
Weblogic.common.resourcepool.ResourceLimitException
```

Solution

Increase the maximum capacity in the JDBC connection pool. To reconfigure the connection pool, log in to the WLS Administration Console. From **Services**, select **Data Sources**, **JDBC**, and then the **Connection Pool** tab.

25.4.2 Exporting and Importing Group Spaces in Multibyte Languages

Problem

On Linux, group space export or import fails for one or more group spaces created in multibyte languages due to naming restrictions. Group space names are restricted to alphanumeric and space characters ("a" through "z", "A" through "Z", "0" through "9", and the single-byte space character, which WebCenter Spaces replaces with "_" (underscore)). If any other characters are used in the group space name, export or import fails.

Solution

Enforce the naming restriction on the server on which Oracle WebCenter is deployed. To do this, set the environment variable `LC_ALL` set to `utf-8`.

25.4.3 Page or Group Space Not Found Messages After Import

Problem

When users first log in to WebCenter Spaces after an import operation they may see a "Page not found" or "Group space not found" message if the page or group space they last visited no longer exists. Such messages display because "last accessed" page information is retained during an import operation.

Solution

No action required. Users will not see the message the next time they log in.

25.4.4 Group Space Import Archive Exceeds Maximum Upload File Size

Problem

There is a file size limitation uploading content to WebCenter Spaces. If your export archive exceeds the maximum upload size then the import operation through WebCenter Spaces administration will fail.

Solution

Import the group space archive using WLST. For details, see [Section 25.1.9.2, "Importing Group Spaces Using WLST"](#).

Alternatively, modify the content repository upload parameter in `web.xml`. The default maximum upload size is 2 GB. See also, ["Editing web.xml" in Appendix A, "WebCenter Configuration"](#).

25.4.5 Lists Not Imported Properly

Problem

Lists are not importing properly due to list definition differences in the source and target systems.

Solution

Consider exporting and importing list data. This ensures that list data is consistent with the list definitions being imported.

If you choose to import without data, the list data in the target system is migrated to be consistent with the imported list definitions. If a list column data type is changed, the column values are converted from the target data type to the imported data type, if possible, otherwise the value is deleted. If a list column is removed during import, the column values are deleted.

25.4.6 Exporting WebCenter Spaces Customizations

When you export WebCenter Spaces you can choose whether certain application customizations are included in the export archive or whether to exclude them, using the option "Include Customizations". [Table 25-3](#) highlights those services and task flows that store customizations, and which are optional on migration. [Table 25-4](#) lists all the application and group space customizations which are optional on export.

Note: User personalizations are never migrated during export and import. For more information on customization and personalization and the difference between them, see "Customizing and Personalizing Page Content" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Table 25–3 WebCenter Spaces - Service Customizations

Part VI

Application Administration for Oracle WebCenter Spaces

Part VI contains the following chapters:

- [Chapter 26, "Accessing WebCenter Spaces Administration Pages"](#)
- [Chapter 27, "Customizing WebCenter Spaces"](#)
- [Chapter 28, "Managing Users and Roles for WebCenter Spaces"](#)
- [Chapter 29, "Managing Pages in WebCenter Spaces"](#)
- [Chapter 30, "Making Applications Available in WebCenter Spaces"](#)
- [Chapter 31, "Managing Group Spaces in WebCenter Spaces"](#)
- [Chapter 32, "Exporting and Importing Group Spaces"](#)

Accessing WebCenter Spaces Administration Pages

This chapter describes how to access administration pages in the WebCenter Spaces application. It contains the following subsections:

- [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#)
- [Section 26.2, "WebCenter Spaces Administration Pages"](#)

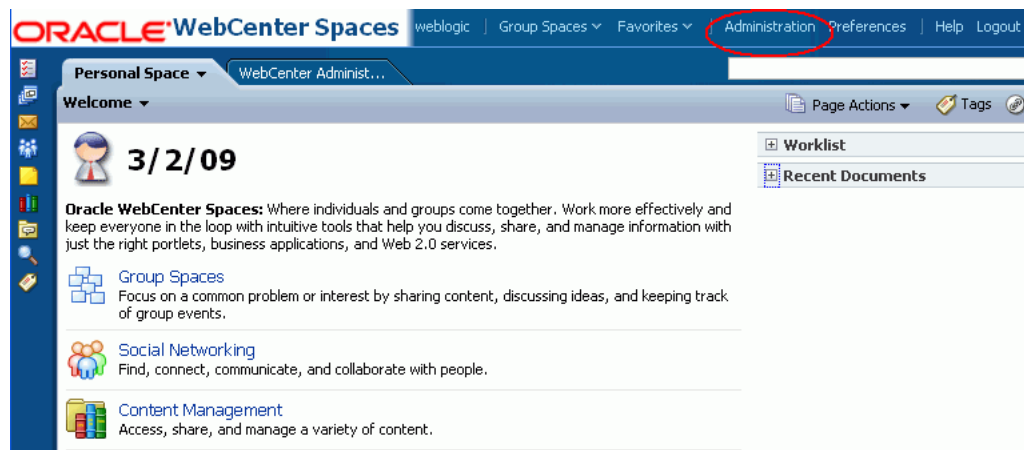

Audience

The content of this chapter is intended for WebCenter Spaces administrators. Users granted the WebCenter Spaces Administrator role or a custom role that grants the Application-Manage permission).

26.1 Logging into WebCenter Spaces as an Administrator

WebCenter users with administrative privileges will see an **Administration** link at the top of the application when they log in ([Figure 26-1](#)).

Figure 26-1 Administration Link

The **Administration** link provides access to administration and application settings for WebCenter Spaces. For more detail, see [Section 26.2, "WebCenter Spaces Administration Pages"](#).

Note: If you do not see this link, you do not have administrative privileges. Ask your WebCenter Spaces Administrator to check the permissions assigned to your role.

WebCenter Spaces administrators may assign administrative privileges to other users, if required. For more information, see [Section 28.2.4, "Giving a User Administrative Privileges"](#).

To log in to WebCenter Spaces.

1. Open WebCenter Spaces using the following URL:

`http://host:port/webcenter`

If you do not know which host or port to use, ask your systems administrator. See also, "Managing Ports" in *Oracle Fusion Middleware Administrator's Guide*.

If you have access to Fusion Middleware Control, this information is available on the WebCenter Space home page. See [Section 6.2, "Navigating to the Home Page for WebCenter Spaces"](#).

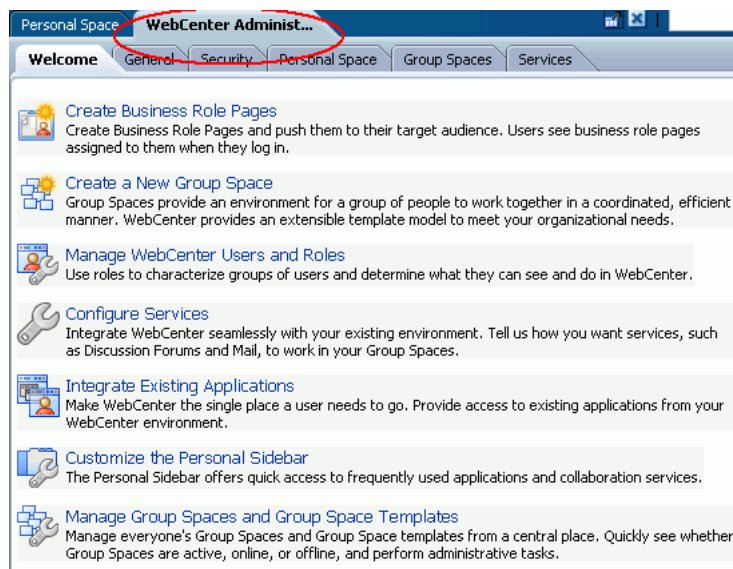

2. Enter your user name in the **User Name** field and your password in the **Password** field.
3. Click **Login**.

Check that you can see the **Administration** link at the top of the application ([Figure 26-1](#)).

26.2 WebCenter Spaces Administration Pages

There are six WebCenter Administration pages—Welcome, General, Security, Personal Space, Group Spaces, and Services ([Figure 26-2](#)):

Figure 26-2 WebCenter Administration Pages

Administrators can perform all their administrative duties from here:

Administration Page	Description
Welcome	This page is a convenient launching pad for some common administrative tasks. Click a task link to navigate to the appropriate page.
General	<p>Use this page to customize WebCenter Spaces. For example, you can specify a default language, application name, and so on. For more information, see:</p> <ul style="list-style-type: none"> Chapter 27, Naming Your WebCenter Chapter 27, Changing the WebCenter Logo Chapter 27, Applying Look and Feel Using Skins Chapter 27, Choosing the Default Display Language Chapter 27, Customizing Copyright and Privacy Statements Chapter 27, Customizing the Online Help Link Chapter 27, Enabling and Disabling Personal Spaces Chapter 28, Allowing Self-Registration Chapter 29, Customizing the Self-Registration Page Chapter 29, Customizing the Login Page
Security	<p>Use this page to manage WebCenter users and roles. For more information, see:</p> <ul style="list-style-type: none"> Chapter 28, Managing Users and Roles for WebCenter Spaces
Personal Space	<p>Use this page to manage pages for personal spaces and WebCenter Spaces, and to customize everyone's sidebar. For more information, see:</p> <ul style="list-style-type: none"> Chapter 29, "Managing Pages in WebCenter Spaces" Chapter 27, Customizing the Sidebar
Group Spaces	<p>Use this page to manage group spaces and group space templates. For more information, see:</p> <ul style="list-style-type: none"> Chapter 31, Managing Group Spaces in WebCenter Spaces Chapter 31, Managing Group Space Templates
Services	<p>Use this page to set application-wide properties for discussion forums, announcements, mail, and people connection components such as activity streams, personal profiles, connections, messages boards, and feedback. For more information, see:</p> <ul style="list-style-type: none"> Configuring Discussions Options for WebCenter Spaces Configuring Mail Options for WebCenter Spaces Chapter 16, Configuring the People Connections Service in WebCenter Spaces

Customizing WebCenter Spaces

This chapter describes how to customize WebCenter Spaces for your target audience. You must login to WebCenter Spaces with administrative privileges to set any of the application-wide properties described here.

This chapter includes the following sections:

- [Section 27.1, "Naming Your WebCenter"](#)
- [Section 27.2, "Customizing the Online Help Link"](#)
- [Section 27.3, "Customizing the Sidebar"](#)
- [Section 27.4, "Changing the WebCenter Logo"](#)
- [Section 27.5, "Applying Look and Feel Using Skins"](#)
- [Section 27.6, "Applying Site Templates"](#)
- [Section 27.7, "Customizing Copyright and Privacy Statements"](#)
- [Section 27.8, "Choosing the Default Display Language"](#)
- [Section 27.9, "Enabling and Disabling WebCenter Services"](#)
- [Section 27.10, "Enabling and Disabling Personal Spaces"](#)
- [Section 27.11, "Publishing the WebDAV URL"](#)
- [Section 27.12, "Making New Page Styles Available"](#)
- [Section 27.13, "Customizing the Oracle Composer Catalog and Deploying New Task Flows"](#)

Audience

The content of this chapter is intended for WebCenter Spaces administrators. Users granted the WebCenter Spaces Administrator role or a custom role that grants the Application-Manage permission).

27.1 Naming Your WebCenter

Out-of-the-box, the application name *WebCenter Spaces* appears in the banner (see [Figure 27-1](#)). If you prefer, you can change the name to better suit your target audience. For example, you might want to display your company name here or the name of a department within your company.

Figure 27-1 Naming Your WebCenter

Note: You can change the logo that displays next to the application name too. See [Section 27.4, "Changing the WebCenter Logo"](#).

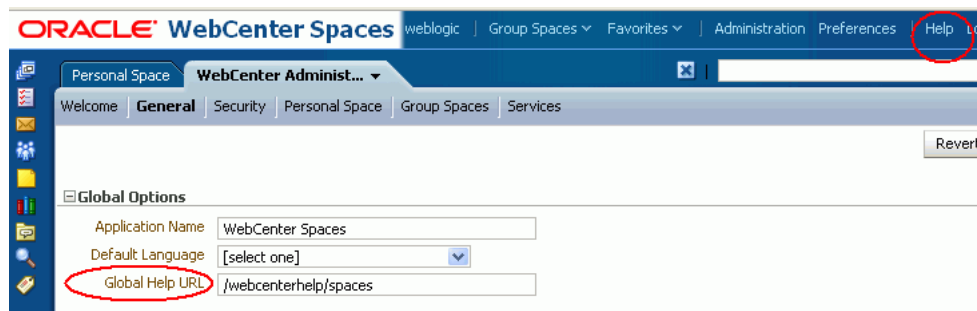

To change the name of your WebCenter Spaces application:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. In the **Application Name** field, enter the new name.
Alphanumeric characters are allowed and also spaces, underscores (_) and dashes (-). For example, Finance Department - My Corporation.
5. Click **Apply**.

27.2 Customizing the Online Help Link

Online help for WebCenter Spaces displays when you click the Help link located at the top of the application (see [Figure 27-2](#)). Out-of-the-box, this Help link opens Oracle's built-in help. If you want, you can write online help specifically aimed at your end-users and redirect the Help link to a different help location.

Figure 27-2 Customizing the Help Link

When you customize the Help link, built-in help for WebCenter Spaces is still available through help buttons, help icons, and so on.

To customize the main Help link for WebCenter Spaces:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. In the **Global Help URL** field, enter the location of your help ([Figure 27-2](#)).

Ensure that you enter a fully qualified URL in the format:

```
http://host:port/helplocation
```

For example:

```
http://myhost:8888/myhelp
```

The default Global Help URL is `/webcenterhelp/spaces`. This URL opens Oracle Help for the Web (OHW) and displays Oracle's built-in help for WebCenter Spaces.

Note: If you leave the Global Help URL field blank, the Help link is not displayed.

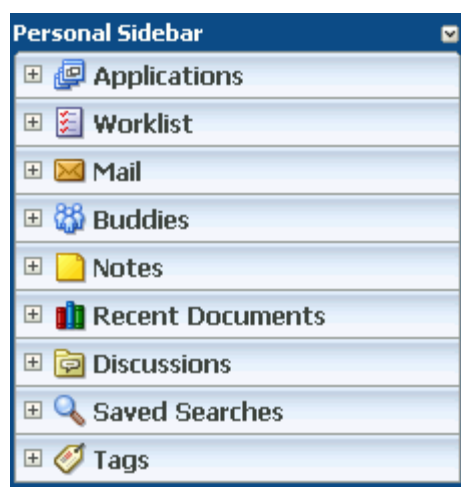

5. Click **Apply**.

Click **Help** at the top of the application to check the custom help opens correctly.

27.3 Customizing the Sidebar

The Sidebar in WebCenter Spaces offers users quick access to personal services such as mail, worklist assignments, personal contacts, and more. Out-of-the-box, the Sidebar will offer the full range of WebCenter services that are available and WebCenter users can hide any services they do not use or require.

Figure 27-3 *The Sidebar*

The Sidebar is configurable. WebCenter Spaces administrators can customize the default sidebar for all users as follows:

- [Hiding and Showing Task Flows in the Sidebar](#)

- [Locking Sidebar Content](#)

27.3.1 Hiding and Showing Task Flows in the Sidebar

Administrators can choose which services are available through the sidebar and the order they are displayed. If some services are not in use or not yet configured you can hide them.

If you want to hide the entire sidebar, hide all available services.

To hide or show services on the sidebar:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Personal Space** tab.
4. Click the **Sidebar** tab.
5. Set the **Display** option ([Figure 27-4](#)):
 - Click the gray cross to show an item on the sidebar (cross changes to check mark).
 - Click the green check mark to hide an item on the sidebar (check mark changes to cross).

Figure 27-4 Customizing the Sidebar

Sidebar Resources	Display	Allow Personalization	Change Order	Description
Applications	✓	✓	▲ ▼	Applications
Worklist	✓	✓	▲ ▼	Worklist
Mail	✓	✓	▲ ▼	Personal mail inbox
Buddies	✓	✕	▲ ▼	Buddies
Notes	✓	✓	▲ ▼	Personal notes
Recent Documents	✓	✓	▲ ▼	Recent Documents
Discussions	✓	✓	▲ ▼	Discussion forums
Saved Searches	✓	✓	▲ ▼	Saved searches
Tags	✓	✓	▲ ▼	Personal tags

6. Use the **Move Up** and **Move Down** arrows to change the display order.

Any changes you make immediately impact everyone's personal sidebar.

27.3.2 Locking Sidebar Content

Users can personalize their sidebar, that is, display sidebar panes when they require them and hide sidebar panes that they do not need or use. Sidebar personalization is useful for hiding non-essential services but might prove less desirable for sidebar content that is critical for user productivity. By locking individual panes on the sidebar, WebCenter Spaces administrators can control which resources always display and which resources never display.

To lock sidebar content:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Personal Space** tab.
4. Click the **Sidebar** tab.
5. Set **Allow Personalization** ([Figure 27-5](#)):
 - Click the gray cross to allow user personalization (cross changes to check mark).
 - Click the green check mark to prevent user personalization (check mark changes to cross).

Figure 27-5 Controlling Sidebar Personalization

Any changes you make immediately impact everyone's personal sidebar.

27.4 Changing the WebCenter Logo

One way to apply corporate branding to WebCenter Spaces, is to add your company logo to the top left corner of the application ([Figure 27-6](#)). If your company's logo is not suitable, any graphic that brings visual interest can be used.

Note: You can change the application name that displays next to the logo too. See [Section 27.1, "Naming Your WebCenter"](#).

The logo you specify will resize automatically, according to the application skin.

Figure 27–6 Changing the WebCenter Logo

To change the WebCenter logo:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. Click **Browse** for the **Application Logo** property.
The File Upload dialog box opens.
5. Select the logo you want to use.
6. Click **Apply** to save.

The logo is uploaded to the WebCenter Spaces image directory (`/webcenter/images`) and the new logo immediately appears in the top left corner of the application banner.

27.5 Applying Look and Feel Using Skins

As WebCenter Spaces Administrator, you may customize the appearance of WebCenter Spaces for all users by changing its skin. A skin changes the way the user interface appears, but does not change the application's behavior. A selection of built-in skins are provided with WebCenter Spaces. Alternatively, create skins of your own and brand the application according to your corporate image.

This section includes the following subsections:

- [Section 27.5.1, "What You Should Know About Application Skins"](#)
- [Section 27.5.2, "Selecting a Skin"](#)
- [Section 27.5.3, "Making New Skins Available to WebCenter Spaces"](#)

27.5.1 What You Should Know About Application Skins

The look and feel of WebCenter Spaces is driven by an ADF Faces skin. A skin in ADF Faces is a global style sheet for the entire application. Every component in WebCenter Spaces will automatically use the styles described by this skin. ADF Faces skins are based on the Cascading Style Sheet specification, and use CSS 3.0 syntax.

Out-of-the-box, WebCenter Spaces uses the *Deep Sea* skin. In addition, WebCenter Spaces provides several built-in skins, with names such as *Storm* and *Midnight*, so that you can experiment with some different look and feels. For details, see [Section 27.5.2, "Selecting a Skin"](#).

If none of the built-in skins suit your requirements or you want to apply a look and feel that reflects your corporate brand, you may provide your own ADF Faces skin and apply it to WebCenter Spaces. For details, see [Section 27.5.3, "Making New Skins Available to WebCenter Spaces"](#).

27.5.2 Selecting a Skin

To apply a different skin to your WebCenter Spaces application:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. Choose an **Application Skin** from the list provided.

The skin list provided is generated from a file called `trinidad-skins.xml`. To add skins to this file, read [Section 27.5.3, "Making New Skins Available to WebCenter Spaces"](#).

5. Click **Apply**.

The selected skin is immediately applied to WebCenter Spaces.

27.5.3 Making New Skins Available to WebCenter Spaces

If none of the built-in skins suit your requirements or you want to apply a look and feel that reflects your corporate brand, you may provide your own ADF Faces skin and apply it to WebCenter Spaces.

Custom skin deployment typically takes place before the WebCenter Spaces application goes live or during scheduled maintenance periods. As well as providing the skin file (.css) and all supporting images, you must register the skin in a `trinidad-skins.xml` file, build and deploy a customized WebCenter Spaces .WAR file, and restart WebCenter Spaces. For more information, refer to the white paper "*Extending WebCenter Spaces*" available on the Oracle Technology Network (http://www.oracle.com/technology/products/webcenter/pdf/owcs_r11_extend_spaces_wp.pdf).

27.6 Applying Site Templates

In WebCenter Spaces, site templates define the structure of WebCenter pages, and also the content. Every page, whether displayed in a personal space or a group space, is displayed within a site template.

For example, a typical site template might define areas such as the global tool bar, the sidebar, the footer, and so on ([Figure 27-7](#)).

Out-of-the-box site templates include:

- **Default** - Normal WebCenter Spaces view with global tool bar, the sidebar, the footer, and so on.
- **Maximized** - Displays personal spaces and group spaces in full-screen mode to occupy the entire screen; all other WebCenter Spaces components are hidden.

Figure 27-7 Out-of-the-Box Site Templates

Administrators can define the site template that is applied to:

- Everyone's personal space
- New group spaces, by default

Group space moderators can override the default selection in their group space but users cannot override the site template applied to their personal space. See [Section 27.6.1, "Choosing the Default Site Templates for Personal Spaces and Group Spaces"](#).

Users can view any page with any one of these site templates by appending a URL parameter called `wc.chromeLevel` to the page's URL.

- **Default Site Template -**
`http://host.com/webcenter/spaces/mygroup/page/Contacts?wc.chromeLevel=default`
- **Maximized Site Template -**
`http://host.com/webcenter/spaces/mygroup/page/Contacts?wc.chromeLevel=gsDefault`

Site templates are defined in XML files. If you want to exclude certain content or display different content within these template areas you can modify any of the out-of-the-box site templates through JDeveloper or you can create new site templates of your own. You can also customize the site template list, such that your users only see site templates that you want them to use. See [Section 27.6.2, "Making New Site Templates Available to WebCenter Spaces"](#).

27.6.1 Choosing the Default Site Templates for Personal Spaces and Group Spaces

To select the site template that is used to display personal spaces and a default site template for group spaces:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. Choose a **Site Template for Personal Space** from the list provided.

The site template you select is applied to everyone's personal space.

Note: If you choose the **Maximized** option, users will not have access to My Group Spaces, user preference settings, favorites, or the Sidebar.

To add your own site templates to this list, read [Section 27.6.2, "Making New Site Templates Available to WebCenter Spaces"](#).

5. Choose a **Default Site Template for Group Spaces** from the list provided.

The site template you select is applied to all new group spaces. Group space moderators choose a different site template for their group space if required.

To add your own site templates to this list, read [Section 27.6.2, "Making New Site Templates Available to WebCenter Spaces"](#).

6. Click **Apply**.

27.6.2 Making New Site Templates Available to WebCenter Spaces

If the out-of-the-box site template set does not suit your requirements, you may provide your own template set for WebCenter Spaces. You can modify any of the out-of-the-box site templates through JDeveloper, you can create new site templates of your own, and you can customize the list of templates on offer inside WebCenter Spaces.

Site template customization typically takes place before the WebCenter Spaces application goes live or during scheduled maintenance periods as you must build and deploy a customized WebCenter Spaces .WAR file that contains your site templates, and restart WebCenter Spaces. For more information, refer to the white paper "[Extending WebCenter Spaces](#)" available on the Oracle Technology Network (http://www.oracle.com/technology/products/webcenter/pdf/owcs_r11_extend_spaces_wp.pdf).

27.7 Customizing Copyright and Privacy Statements

Administrators can customize or hide copyright and privacy statements for WebCenter Spaces. If displayed, the copyright and privacy URL appear in the application's page footer ([Figure 27-8](#)):

- Copyright - Displays a copyright statement for the entire application.
- Privacy URL - Links to a document that contains a privacy policy for the entire application.

Figure 27–8 Customizing the Copyright and Privacy URL

Individual group spaces may provide their own copyright and privacy statements. See "Customizing Copyright and Privacy Statements" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

To customize or hide copyright and privacy statements:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. Do one of the following:
 - Select **Display Page Footer** to display copyright and privacy information at the bottom of the application.
 - Deselect **Display Page Footer** to hide the page footer. No legal notices will display.
5. If you have chosen to display legal notices:
 - **Copyright** - Enter a suitable copyright statement for the WebCenter Spaces application. If no copyright information is required, leave this field blank.
 - **Privacy URL** - Specify the location of the application's privacy policy. Enter a fully qualified URL. If no privacy information is required, leave this field blank.
6. Click **Apply** to save.

New settings immediately display in the page footer.

27.8 Choosing the Default Display Language

WebCenter Spaces provides run-time translations for 27 languages and 100 different locales.

Table 27–1 Languages Available for WebCenter Spaces

A to Fi	Fr to No	P to T
Arabic	French	Polish
Brazilian Portuguese	German	Portuguese
Chinese (Simplified)	Greek	Romanian
Chinese (Traditional)	Hebrew	Russian
Czech	Hungarian	Slovak
Danish	Italian	Spanish
Dutch	Japanese	Swedish
English	Korean	Thai
Finnish	Norwegian	Turkish

Table 27–1 lists all the languages available to WebCenter Spaces out-of-the-box. Your WebCenter Spaces administrator can reduce the number of available languages exposed in WebCenter Spaces by modifying the `supported-languages.xml` file, as described in the white paper "Extending WebCenter Spaces" available on the Oracle Technology Network (<http://webcenter.oracle.com>).

When a new language setting is specified, application content is translated, including links, field labels, display text, message text, and dialog boxes. However, information that users add to WebCenter Spaces such as announcements, documents, discussion forum content, and the like, is not translated. All user supplied content displays only in the language used by its author.

It is the administrator's job to choose a default *application display language* for WebCenter Spaces. When picking the default language, consider which language suits the majority of people using the application. The first time a user logs in to WebCenter Space the default language displays but individuals can personalize their display language through user preferences.

The default application display language only applies when users log in to WebCenter Spaces. All public pages, such as the welcome page and login page, display in the *browser language*.

WebCenter Spaces provides a language switcher on the welcome, login, and self registration pages to accommodate anyone whose native language is not the browser language. The language switcher sets the *session language cookie* which overrides the browser language and any default display language you may define for the application. The session language is retained for the life of the session cookie. When a user clears browser cookies—deliberately—the session language is also cleared and the browser language (unauthenticated) and default display language (authenticated) become active again.

To summarize, the order of precedence for WebCenter Spaces display language settings from weakest to strongest is as follows:

- **Browser setting** - your Browser documentation will describe how to change the browser's language.
- **Application setting** - see instructions below.
- **User preference setting** - see "Setting a User Preference Display Language" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

- **Session setting** - see "Setting a Session Display Language" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.
- **Group space setting** - see "Setting a Group Space Display Language" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

To select the default application display language for WebCenter Spaces:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. Choose a **Default Language**.
5. Click **Apply**.

The new language is effective immediately.

27.9 Enabling and Disabling WebCenter Services

In WebCenter Spaces, a series of WebCenter services expose social networking and personal productivity features through various task flows ([Table 27-2](#)):

Table 27-2 WebCenter Services

Services A to M	Services N to W
Announcements ¹	Notes ²
Blog ¹	Page ²
Discussion ¹	People Connections ²
Documents ¹	RSS ²
Events ¹	Recent Activities ²
Instant Messaging and Presence (IMP) ¹	Search ¹
Links ²	Tags ²
Lists ²	Wiki ¹
Mail ¹	Worklist ¹

¹ Connection to external back-end required.

² Connection to WebCenter repository and MDS repository required (databases where notes, events, links, lists, pages, and tags are stored).

Some WebCenter services¹, such as Mail, require an external back-end server. The Fusion Middleware Administrator is responsible for managing connections to all external servers and also maintains the WebCenter and MDS repositories² where application data, specific to WebCenter Spaces, is stored. See also [Chapter 3, "Maintaining WebCenter Spaces"](#).

When a service, such as Mail, is available in WebCenter Spaces:

- Associated task flows display in the resource catalog.
- Existing task flows function as expected.

- (Group space services only) Moderators choose whether to enable or disable the service in their group spaces—using the *Group Space Settings - Services* page.

When a back-end server is not configured, intentionally or otherwise, WebCenter Spaces cannot offer features or functionality related to that service:

- Associated task flows are not available in the resource catalog.
- Existing task flows display a message indicating that the service is currently unavailable.
- (Group space services only) Service is not listed, as available, to group space moderators —on *Group Space Settings - Services* page.

Reporting Temporary Issues with WebCenter Services

When a service is temporarily unavailable, report the issue to the Fusion Middleware Administrator. The Fusion Middleware Administrator can use Fusion Middleware Control to investigate, diagnose, and solve issues with WebCenter services. See also, [Section 24.2.1, "Monitoring WebCenter Spaces"](#).

Hiding Task Flows Belonging to Disabled Services

Most WebCenter Services are optional. If you decide not to offer a particular service in WebCenter Spaces, temporarily or permanently, consider removing any associated task flows that display, by default, out-of-the-box.

Oracle recommends that you hide disabled services in the sidebar too. See, [Section 27.3, "Customizing the Sidebar"](#).

Enabling and Disabling Services for a Single Group Space

Group space moderators can enable or disable available WebCenter services within their group spaces. See, "Enabling and Disabling Services Available to a Group Space" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

27.10 Enabling and Disabling Personal Spaces

Personal spaces are optional in WebCenter Spaces—it is not mandatory to provide users with a private work area where they can store personal content and perform personal tasks. Users can fully participate in group space collaboration projects without a personal space.

Users who do not have a personal space are presented with My Group Spaces when they login. No personal productivity tools are available (such as the personal sidebar, favorites links, and so on) and users cannot create personal pages or see personal pages that other users might share.

The `Application-View` permission controls which users have their own personal space. Administrators can disable personal spaces for everyone using WebCenter Spaces or specific users only. Use the table in step 5 to determine which permission settings you require.

To enable or disable user access to personal spaces:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Security** tab.

4. Click the **Roles** tab.
5. Select or clear the **Application-View** check box as follows:

Role	Select Application-View	Clear Application-View
Spaces-User	Everyone has a personal space.	Users do not have a personal space unless you grant them another role that specifies otherwise.
Any Custom Role	Users assigned any custom role have a personal space.	Users with this role do not have a personal space. ¹
Administrator	Users assigned this role have a personal space.	Users with this role do not have a personal space. ¹
Public-User	Unauthenticated users can see personal pages/content marked public.	Unauthenticated users only see the login page.

¹ Assumes the Application-View permission is disabled for the Spaces-User and the Public-User.

6. Click **Apply** to save.

New permissions are effective immediately.

27.11 Publishing the WebDAV URL

WebCenter Spaces uses an Oracle Content Server to store group space and personal space documents. WebDAV (Web-Based Distributed Authoring and Versioning), which allows users to look at their content repository using their Windows Explorer, can be used with Oracle Content Server and hence with WebCenter Spaces content.

Using WebDAV, WebCenter users can seamlessly drag and drop content, files, and folders back and forth between their desktop and their personal and group spaces. Users will not know the WebCenter Spaces WebDAV URL for unless you publish this information—maybe in a document or on a business role page that everyone can access.

Contact your Fusion Middleware Administrator to find out the URL for the Oracle Content Server that WebCenter Spaces is using to store group space and personal space documents. If the base URL for that Oracle Content Server is `http://<host>:<port>/<relative_web_root>`, the WebDAV root URL will be `http://<host>:<port>/<relative_web_root>/idcplg/webdav`.

27.12 Making New Page Styles Available

WebCenter Spaces offers eight page styles out-of-the-box (Figure 27-9).

Figure 27–9 Standard Page Styles

Some page styles come prepopulated with a selection of useful task flows. Others include properties that suggest a particular use for the page. For example, the Web page style includes a configurable property for specifying a URL. See "WebCenter Seeded Page Styles" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

If the built-in page styles do not suit your requirements or you want to offer a different set of page styles, you may create page styles of your own (defined in .jspx files) and deploy them to WebCenter Spaces.

Custom page style deployment typically takes place before the WebCenter Spaces application goes live or during scheduled maintenance periods as you must build and deploy a customized WebCenter Spaces .WAR file that contains your new page style files (.jspx), and restart WebCenter Spaces. For more information, refer to the white paper "Extending WebCenter Spaces" available on the Oracle Technology Network (http://www.oracle.com/technology/products/webcenter/pdf/owcs_r11_extend_spaces_wp.pdf).

27.13 Customizing the Oracle Composer Catalog and Deploying New Task Flows

In WebCenter Spaces, the Oracle Composer's catalog provides access to page content, such as task flows and portlets, and page layout components, such as images, content boxes, hyperlinks, and the like. The catalog presents available resources in a series of folders and subfolders and the content on offer changes dynamically depending on which services are currently available. For example, in a particular group space, mail-related task flows will display in the group space catalog when mail services are available but will not display if the back-end mail server is not yet configured or the Mail service has been disabled by the group space moderator.

WebCenter Spaces provides two catalogs out-of-the-box—a personal space catalog and a group space catalog. Each catalog contains a default set of task flows. Should you need to add new task flows, remove task flows, or reorganize the folder hierarchy to better suit your audience you can make a copy, and customize each catalog through JDeveloper.

Catalog customizations and new task flow deployment typically take place before the WebCenter Spaces application goes live or during scheduled maintenance periods as

you must build and deploy a customized WebCenter Spaces .WAR file that includes your custom catalogs and custom task flows, and restart WebCenter Spaces. For more information, refer to the white paper "*Extending WebCenter Spaces*" available on the Oracle Technology Network (http://www.oracle.com/technology/products/webcenter/pdf/owcs_r11_extend_spaces_wp.pdf).

Managing Users and Roles for WebCenter Spaces

This chapter describes how to manage users, roles, and permissions in WebCenter Spaces. It includes the following sections:

- [Section 28.1, "Understanding Users, Roles, and Permissions"](#)
- [Section 28.2, "Managing Users"](#)
- [Section 28.3, "Managing Application Roles and Permissions"](#)
- [Section 28.4, "Allowing Self-Registration"](#)

Audience

The content of this chapter is intended for WebCenter Spaces administrators. Users granted the WebCenter Spaces Administrator role or a custom role that grants the Application-Manage permission).

Refer to [Chapter 23, "Managing Security"](#) if you are a Fusion Middleware Administrator responsible for security-sensitive administrative duties that require configuration through Fusion Middleware Control or WLST.

28.1 Understanding Users, Roles, and Permissions

Read this section to understand more about WebCenter users, application roles, and permissions granted to WebCenter users working in their personal space. It includes the following subsections:

- [Section 28.1.1, "Understanding Users"](#)
- [Section 28.1.2, "Understanding Application Roles"](#)
- [Section 28.1.3, "Understanding Application Permissions"](#)
- [Section 28.1.4, "Understanding Discussions Server Role and Permission Mapping"](#)
- [Section 28.1.5, "Understanding Group Space Roles and Permissions"](#)

When a WebCenter user becomes a member of a group space, a different set of roles and responsibilities apply. See "What You Should Know About Group Space Roles and Permissions" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

28.1.1 Understanding Users

A WebCenter user is an member of WebCenter Spaces—provisioned directly from an existing identity store. See also, [Section 23.3, "Configuring the Identity Store"](#).

All users in the identity store are assigned minimal WebCenter Spaces privileges through the `Spaces-User` role. The only exception is the Fusion Middleware Administrator (`weblogic`). Out-of-the-box, the Fusion Middleware Administrator is the only user assigned full administrative privileges through the `Administrator` role. For more information, read the next section [Section 28.1.2.1, "Default Application Roles"](#).

It is the Fusion Middleware Administrator's job to assign each WebCenter user an appropriate application role. Alternatively, the Fusion Middleware Administrator may choose to assign the `Administrator` role to another user and delegate this responsibility.

Table 28–1 Default Administrator in WebCenter Spaces

User	Description
Fusion Middleware Administrator (<code>weblogic</code>)	Administrator for the entire application server, sometimes referred to as the super administrator. This user can manage any application on the server, including WebCenter Spaces.

WebCenter Spaces supports self-registration. When new WebCenter users self-register, they create their own login and password and a new user account is created in the identity store. See also, [Section 28.4, "Allowing Self-Registration"](#).

28.1.2 Understanding Application Roles

Application roles control the level of access a user has to information and services in WebCenter Spaces. Specifically, application roles determine what a user can see and do in their *personal space*.

Application role assignment is the responsibility of the WebCenter Spaces administrator. Administrators can assign users a default application role or create additional, custom roles specific to their WebCenter Spaces application. For more detail, see:

- [Default Application Roles](#)
- [Custom Application Roles](#)

Application roles only apply while a user is working within their personal space. Within a particular group space a different set of roles and permissions apply and it is the group space moderator's responsibility to determine suitable role assignments for each of its members. See also "Managing Group Space Roles and Permissions" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Note: Application roles and permissions defined within WebCenter Spaces are stored in its *policy store* and, consequently, apply to this WebCenter Spaces application only. Enterprise roles are different; enterprise roles are stored within the application's *identity store* and do not imply any permissions within WebCenter Spaces.

28.1.2.1 Default Application Roles

WebCenter Spaces provides several default application roles that cannot be deleted ([Table 28–2](#)).

Table 28–2 Default Application Roles for WebCenter Spaces

Application Role	Description	Modify?
Administrator	<p>Users with the Administrator role can set application-wide properties for WebCenter Spaces, create business role pages, configure defaults for discussion forums, mail, and people connection services, and perform other administrative duties such as editing the login page and the self-registration page.</p> <p>Administrators can also manage users and roles for WebCenter Spaces, delegate or revoke privileges to/from other users, manage group spaces and group space templates, and also import and export group space information.</p> <p>Out-of-the-box, the Fusion Middleware Administrator is the only user assigned full WebCenter Spaces administrative privileges through the Administrator role.</p>	<p>Yes*</p> <p>*Except for Application permissions which are read-only</p>
Spaces-User	<p>Authenticated users of WebCenter Spaces are granted the Spaces-User role. After logging in, users assigned with this role have access to their own personal space, pages that they create, and public pages. These users can also view public group spaces, create group spaces, and create group space templates.</p> <p>This role inherits permissions from the Public_User role.</p> <p>In WebCenter Spaces, the Spaces-User role is equivalent to the authenticated-user role.</p>	Yes
Public-User	<p>Anyone with access to WebCenter Spaces who is not logged in, is granted the Public_User role. Such users are anonymous, unidentified, and can see public content only.</p> <p>In WebCenter Spaces, the Public-User role is equivalent to the anonymous-role.</p>	Yes

28.1.2.2 Custom Application Roles

Custom application roles (sometimes known as user-defined roles) are specific to your WebCenter Spaces application. When setting up WebCenter Spaces, it is the WebCenter Spaces administrator's job to identify which application roles are required, choose suitable role names, and define the responsibilities of each role.

For example, an education environment might require roles such as Teacher, Student, and Guest. While roles such as Finance, Sales, Human Resources, and Support would be more appropriate for a corporate environment.

To learn how to set up applications roles for WebCenter users, see [Section 28.3.2, "Defining Application Roles."](#)

28.1.3 Understanding Application Permissions

Every application role has specific, defined capabilities known as permissions. These permissions allow individuals to perform specific actions in their personal space. Permissions are categorized as follows and listed individually in the subsequent tables:

- Application
- Group Spaces

- Group Space Templates
- Pages
- Discussions
- Links
- People Connections

With a particular category, the `Manage` permission (such as `Group Spaces-Manage`) contains all other permissions (for example, `Group Spaces-Configure` and `Group Spaces-View`). No permission, except `Manage`, inherits privileges from other permissions.

Table 28–3 Application Permissions in WebCenter Spaces

Category	Application Permissions
Application	<p>Manage - Enables access to all <i>WebCenter Spaces Administration</i> pages: General, Security, Personal Space, Group Spaces, and Services. Through these pages, users can manage application security (users/roles), set application-wide properties, create business role pages, manage everyone's personal pages, view group spaces accessible to them, as well as export/import group spaces and group space templates.</p> <p>Some administrative tasks are exclusive to the out-of-the-box <code>Administrator</code> role and cannot be performed by granting the <code>Application-Manage</code> permission. These tasks include editing the login page, the self-registration page, and profile gallery pages, as well as the ability to manage <i>all</i> group spaces and group space templates.</p> <p>Configure - Same as the <code>Application-Manage</code> permission but excludes security privileges. Users with this permission cannot access the Security page.</p> <p>View - Enables users to view the WebCenter Spaces application.</p>
Group Spaces	<p>Manage - Enables access to the group space <i>Settings</i> page (General, Roles, Members, Pages, Services, Custom Attributes). Through these pages users can manage group space membership, assign permissions and roles, manage, delete, and export group spaces, set group space properties, and manage service availability.</p> <p>Configure - Same as the <code>Group Spaces-Manage</code> permission but excludes security privileges. Users with this permission cannot access the Roles and Members pages unless they are a group space moderator.</p> <p>View - View group spaces.</p> <p>Create -Create group spaces.</p>
Group Space Templates	<p>Manage - Enables users to manage and delete any group space templates that is accessible to them.</p> <p>View - Enables user to view group space template information and create group spaces based on a template.</p> <p>Create - Users can create group space templates.</p>

Table 28–3 (Cont.) Application Permissions in WebCenter Spaces

Category	Application Permissions
Pages	<p>Manage - Edit properties of a personal page, set personal page permissions, and all other page actions.</p> <p>Delete - Delete a personal page.</p> <p>Edit - Add or edit personal page content, rearrange content, and set page parameters and properties.</p> <p>Personalize - Personalize your view of a personal page by adding, editing, or removing content.</p> <p>View - View a personal page.</p> <p>Create - Create or design a new personal page.</p> <p>These permissions do not apply to group space pages. Group space page permissions are granted on a per group space-basis by the group space moderator.</p>
Discussions	<p>Manage - Manage categories, forums, and topics on the back-end discussions server. Set discussion forum properties for all group spaces. See also, Section 28.1.4, "Understanding Discussions Server Role and Permission Mapping".</p>
Links	<p>Manage - Create and delete links between objects, and manage link permissions.</p> <p>Delete - Delete a link between two objects.</p> <p>Create - Create links between objects.</p>
People Connections	<p>Manage -Manage application-wide settings for People Connection services.</p> <p>Edit -Edit content associated with People Connection services.</p> <p>Share -Share content associated with People Connection services with others.</p>

28.1.4 Understanding Discussions Server Role and Permission Mapping

WebCenter Spaces uses *application roles* to manage user permissions in personal spaces and *group space roles* to manage user permissions with a group space. On the Oracle WebCenter Discussions server, a different set of roles and permissions apply.

Users who are working with discussions and announcements in WebCenter Spaces automatically map to the appropriate Oracle WebCenter Discussions server role, see [Table 28–4](#) and [Table 28–5](#).

Table 28–4 Discussions Server Roles and Permissions - Application

Discussion Server Role	Discussion Server Permissions	WebCenter Spaces Equivalent Application Permission
Administrator	Category Admin	Discussions-Manage Create, read, update and delete sub categories, forums and topics inside the category for which permissions are granted.

Table 28–5 Discussions Server Roles and Permissions - For Group Spaces

Discussion Server Role	Discussion Server Permissions	WebCenter Spaces Equivalent Group Space Permissions
Moderator	Category Admin Forum Admin	<ul style="list-style-type: none"> ▪ Discussions-Manage Create, read, update and delete forums and topics. ▪ Announcements-Manage Create, read, update and delete announcements.
	Read Forum Create Thread Create Message Create Announcement	<ul style="list-style-type: none"> ▪ Discussions-Edit Create and reply to topics. ▪ Announcements-Edit Create and edit announcements.
	Read Forum	<ul style="list-style-type: none"> ▪ Discussions-View View forums and topics. ▪ Announcements-View View announcements.

Any user assigned the Application-Discussions-Manage permission in WebCenter Spaces is automatically added to Oracle WebCenter Discussions and assigned the Administrator role with the Category Admin permission. Out-of-the box, WebCenter Spaces assigns the Application-Discussions-Manage permission to the Administrator role only, as shown in [Figure 28–1](#).

Figure 28–1 Application Roles - Default Discussion Permissions

Permissions	Roles		
	Administrator	Spaces-User	Public-User
Discussions Manage	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Similarly, in group spaces, any member assigned the Discussions-Manage, Discussions-Edit, or Discussion-View permission is granted the corresponding permissions on the Oracle WebCenter Discussions server. Out-of-the box, discussion and announcement permissions for the default group space roles Moderator, Participant, and Viewer, are as shown in [Figure 28–2](#).

Figure 28–2 Group Space Roles - Default Discussion Permissions

Manage Group Space Roles

Group space roles determine what your members can see and do in the group space. Select or clear the check boxes to configure role permissions or click Create Role to define a new role for this group space.

Permissions	Roles		
	Moderator	Participant	Viewer
Announcements			
Manage	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Edit	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
View	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Discussions			
Manage	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Edit	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
View	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

28.1.5 Understanding Group Space Roles and Permissions

Application roles and permissions only apply when users are working in their personal space. Within a particular group space, a different set of roles and permissions apply and it is the group space moderator's responsibility to determine suitable role assignments for each of its members. For details, see "Managing Group Space Roles and Permissions" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

28.2 Managing Users

Administrators must ensure that all WebCenter users have appropriate permissions. To get permissions, users must be assigned to an appropriate application role.

This section tells you how to assign roles and contains the following subsections:

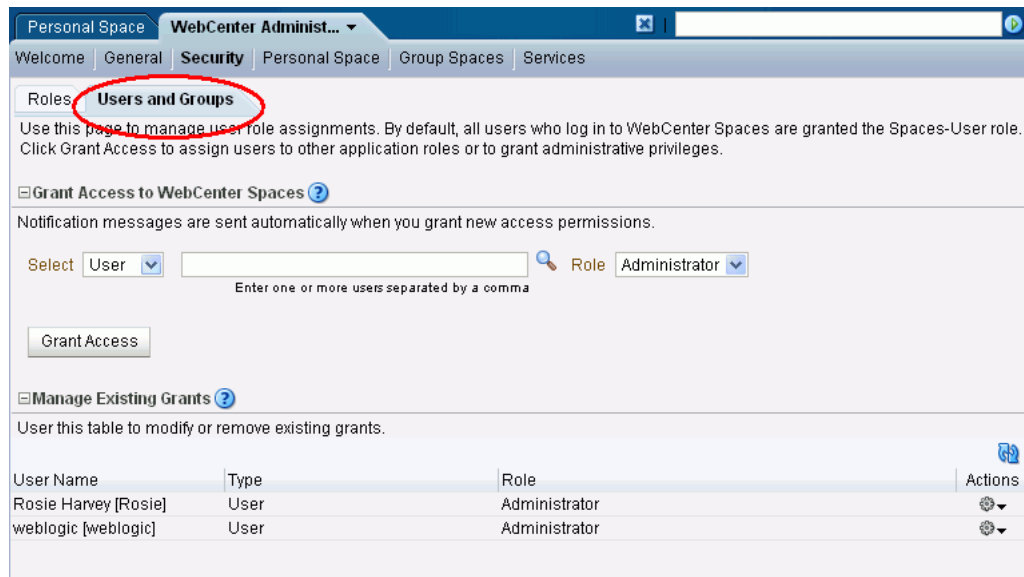

- [Section 28.2.1, "What You Need to Know About Managing Users"](#)
- [Section 28.2.2, "Assigning Users \(and Groups\) to Roles"](#)
- [Section 28.2.3, "Assigning a User to a Different Role"](#)
- [Section 28.2.4, "Giving a User Administrative Privileges"](#)
- [Section 28.2.5, "Revoking Application Roles"](#)
- [Section 28.2.6, "Adding or Removing Users"](#)

28.2.1 What You Need to Know About Managing Users

From the *Users and Groups* page ([Figure 28–3](#)), administrators can manage application roles for all the users who have access to WebCenter Spaces, that is, all users defined in the identity store. From here, you can change user role assignments, grant administrative privileges, and revoke user permissions.

Only users granted special (nondefault) application privileges appear in this table. Initially, all users in the WebCenter Spaces identity store are assigned minimal privileges through the `Spaces-User` role. Users with the default `Spaces-User` role are not listed here.

See also, [Section 23.3, "Configuring the Identity Store"](#).

Figure 28–3 WebCenter Administration - Users Page

28.2.2 Assigning Users (and Groups) to Roles

Initially, all users in the WebCenter Spaces identity store are assigned minimal privileges through the Spaces-User role. You can assign individual users (or multiple users in the same enterprise group) to a different application role through WebCenter Spaces Administration.

Updates in your back-end identity store, such as new users or someone leaving an enterprise group, are automatically reflected in WebCenter Spaces. Initially, when you assign an enterprise group to a WebCenter Spaces role, everyone in the enterprise group is granted that role. If someone moves out of the group, the role is revoked. If someone joins the group, they are granted the role.

Note: For WebCenter Spaces to properly maintain enterprise group-to-role mappings, the back-end discussions server and content server must support enterprise groups. If either back-end server does not support enterprise groups, users belonging to enterprise groups are individually added to WebCenter Spaces roles and subsequent group updates in the identity store are not reflected in WebCenter Spaces. This can quickly become a maintenance issue, especially when enterprise groups contain large number of users. Oracle WebCenter Discussion Server and Oracle Universal Content Management versions provided with Oracle WebCenter 11.1.1.2.0 support enterprise groups but previous versions may not.

To assign a user (or a group of users) to a different application role:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Security** tab.
4. Click the **Users and Groups** tab ([Figure 28–3](#)).

This page lists WebCenter users to which additional roles are defined.

5. Choose **User** or **Group** from the drop down.

Select **User** to grant permissions to one or more users defined in the identity store. Select **Group** to grant permissions to groups of users.

6. If you know the exact name of the user or group, enter the name in the box provided, separating multiple names with a comma.

If you are not sure of the name you can search your identity store:

- a. Click the **Find** icon (Figure 28-4).

Figure 28-4 Find Icon

The Find User (or Find Group) dialog box opens (Figure 28-5).

Figure 28-5 Finding Users and Groups in the identity store

- b. Enter two or more characters that appear in the name you are looking for.
- c. Click the **Search** icon.

Users (or groups) matching your search criteria display in the **Select User** dialog box. The search is case-sensitive.

- d. Select one or more names from the list.

To assign roles to multiple users or groups, multi-select all the names required. **Ctrl-Click** rows to select multiple names.

Note: Nested enterprise groups must be added explicitly. Groups that are nested within a group hierarchy do not automatically inherit the same permissions as the parent group.

- e. Click **OK**.

The names that you select are display on the **User and Groups** tab.

7. To assign a role, select a **Role** from the drop down (Figure 28-6).

Figure 28–6 Assigning a User Role

Select an appropriate role for the selected users (or groups). Only choose **Administrator** to assign full, administrative privileges for WebCenter Spaces.

If the role you want is not listed, create a new role that meets your requirements (see [Section 28.3.2, "Defining Application Roles"](#)).

When no role is selected, the user assumes the `Spaces-User` role. See [Section 28.1.2.1, "Default Application Roles"](#).

8. Click Grant Access.

User's names and new role assignment display in the table.

28.2.3 Assigning a User to a Different Role

From time to time, a user's role in WebCenter Spaces may change. For example, a user may move out of sales into the finance department and in this instance, the user's role assignment may change from *Sales* to *Finance*.

Note: You cannot modify your own role or the Fusion Middleware Administrator's role. See [Section 28.1.2, "Understanding Application Roles"](#).

To assign a user to a different role:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Security** tab.
4. Click the **Users and Groups** tab.
5. In the **Manage Existing Grants** table, scroll down to the user you want.

Only users with nondefault role assignments are listed in the table. If the user you want is not listed, grant the role required as described in [Section 28.2.2, "Assigning Users \(and Groups\) to Roles"](#).

6. Click the **Actions** icon, then choose **Change Role** from the drop down list.

The Change Role dialog box opens ([Figure 28–7](#)).

Figure 28–7 Changing a User's Application Role

7. Select roles as follows:

- Select **Administrator** to assign full, administrative privileges for WebCenter Spaces.
- Select select one or more roles from the list available.

If the role you want is not listed, create a new role that meets your requirements (see [Section 28.3.2, "Defining Application Roles"](#)).

At least one role must be selected. To revoke all role assignments, reverting user permissions to the default Spaces-User role, see [Section 28.2.5, "Revoking Application Roles"](#).

8. Click **OK**.

New role assignments display in the table.

28.2.4 Giving a User Administrative Privileges

It is easy to give a user full, administrative privileges for WebCenter Spaces through the `Administrator` role. Administrators have the highest privilege level and can view and modify anything in WebCenter Spaces so take care when assigning the `Administrator` role.

Some administrative tasks are exclusive to the `Administrator` role and cannot be performed by granting the `Application-Manage` permission. These tasks include editing the login page, the self-registration page, and profile gallery pages.

To give a user administrative privileges:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Security** tab.
4. Click the **Users and Groups** tab.

The `Role` column indicates which users already have full administrative privileges through the `Administrator` role.

5. In the **Manage Existing Grants** table, scroll down to the user you want.

Only users with nondefault role assignments are listed in the table. If the user you want is not listed, follow steps in [Section 28.2.2, "Assigning Users \(and Groups\) to Roles"](#) to grant the Administrator role.

6. Click the **Actions** icon, then choose **Change Role** from the drop down list.
The Change Role dialog box opens ([Figure 28–7](#)).

Figure 28–8 Changing a User's Application Role

7. Select **Administrator** to assign full, administrative privileges for WebCenter Spaces.
8. Select **OK**.

The new role assignment displays in the table.

28.2.5 Revoking Application Roles

It is easy to revoke application role assignments that no longer apply. You can revoke roles individually or revoke all application roles assigned to a particular user at once.

Revoking all a user's application roles does not remove that user from the identity store and the user still has access to WebCenter Spaces through the default Spaces-User role.

Note: You cannot revoke your own role assignments or the Fusion Middleware Administrator's role. See [Section 28.1.2, "Understanding Application Roles"](#).

To revoke application roles:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Security** tab.
4. Click the **Users and Groups** tab.
5. In the **Manage Existing Grants** table, scroll down to the user you want.
6. Click the **Actions** icon:

- Choose **Change Role** icon to revoke one or more, specific application roles. See also [Section 28.2.3, "Assigning a User to a Different Role"](#).
- Choose **Delete Role Assignments** to revoke all roles assigned to that user, and then click **Delete** when asked for confirmation.

Access for that user is revoked immediately.

When you delete all the roles assigned to a particular user, the user is no longer listed on the Users page. The user remains in the identity store and still has access to WebCenter Spaces through the Spaces-User role. See [Section 28.1.2.1, "Default Application Roles"](#).

28.2.6 Adding or Removing Users

WebCenter Spaces administrators cannot add new user data directly to the WebCenter Spaces identity store or remove user credentials. Identity store management is the responsibility of the systems administrator and takes place through the WLS Administration Console or directly into embedded LDAP identity stores using LDAP commands. See also, [Section 23.3.3, "Adding Users to the Identity Store"](#).

WebCenter Spaces administrators can, however, enable self-registration for the application. Through self-registration, invited and uninvited users can create their own login and password for WebCenter Spaces. A user who self registers is immediately and automatically granted access to WebCenter Spaces and a new user account is created in the identity store. See also, [Chapter 28.4, "Allowing Self-Registration"](#).

28.3 Managing Application Roles and Permissions

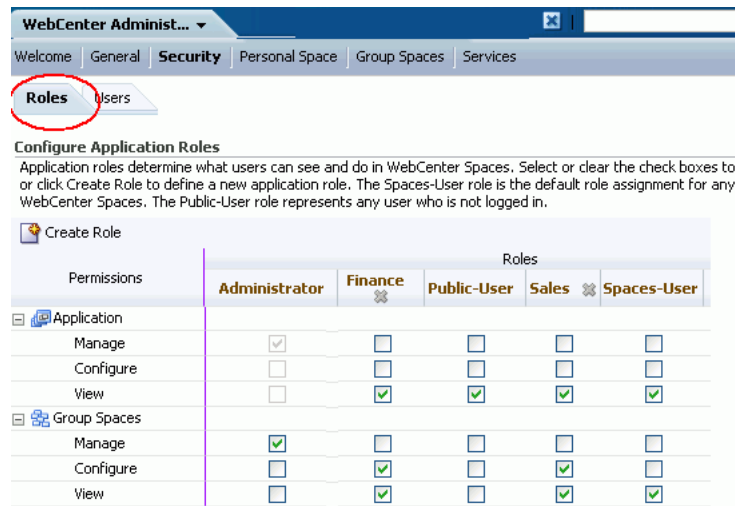

WebCenter Spaces uses application roles to manage permissions for users working in their *personal space*. This section tells you how to manage application roles, and their permissions from WebCenter Administration pages. It contains the following subsections:

- [Section 28.3.1, "What You Need to Know About Application Roles and Permissions"](#)
- [Section 28.3.2, "Defining Application Roles"](#)
- [Section 28.3.3, "Modifying Application Role Permissions"](#)
- [Section 28.3.4, "Granting Permissions to the Public-User"](#)
- [Section 28.3.5, "Granting Permissions to the Spaces-User"](#)
- [Section 28.3.6, "Deleting Application Roles"](#)

28.3.1 What You Need to Know About Application Roles and Permissions

From the Roles page ([Figure 28-9](#)), administrators can manage application roles and permissions. From here, you can edit the permissions assigned to an application role, create new application roles, or delete unused roles.

Figure 28–9 WebCenter Administration - Roles Page

Application roles apply when a user is working within their personal space. A different set of roles and permissions apply when a user is working within a particular group space. It is the group space moderator's responsibility to determine suitable role assignments for each of its group space members. See also "Managing Group Space Roles and Permissions" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

WebCenter Spaces provides several default application roles. You cannot delete default application roles but you can modify the default permission assignments for each role. For more information, see [Section 28.1, "Understanding Users, Roles, and Permissions"](#).

28.3.2 Defining Application Roles

Use roles to characterize groups of WebCenter users and determine what they can see and do in their personal spaces.

When defining application roles, use self-descriptive role names and try to keep the role policy as simple as possible. Choose as few roles as you can, while maintaining an effective policy.

Take care to assign appropriate access rights when assigning permissions for new roles. Do not allow users to perform more actions than are necessary for the role but at the same time, try not to inadvertently restrict them from activities they must perform. In some cases, users might fall into multiple roles.

To define a new application role:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Security** tab.
4. Click the **Roles** tab.
Current application roles for WebCenter Spaces display as columns in the table.
5. Click **Create Role** to define a new role for WebCenter users.

Figure 28–10 Creating a New Role

6. Enter a suitable name for the role.
Ensure the role names that are self-descriptive. Make it as obvious as possible which users should belong to which roles. Role names cannot include special characters or whitespace.
7. (Optional) Choose a **Template Role**.
The new role inherits permissions from the template role. You can modify these permissions in the next step.
Choose **Administrator** to create a role that inherits full, administrative privileges. Conversely, choose `Public-User` to create a role that *typically* provides minimal privileges. Alternatively, choose a custom application role to be your template.
8. Click **OK**.
The new role appears as a column in the table. The permissions list shows which actions users with this role can perform.
9. To modify user permissions for the role, select or clear each permission check box.
10. Click **Apply** to save any changes that you make to the role's permissions.

28.3.3 Modifying Application Role Permissions

Administrators can modify the permissions associated with application roles at any time. Application permissions are described in [Section 28.1.3, "Understanding Application Permissions"](#).

Application role permissions allow individuals to perform specific actions in their personal space. With a particular category, the `Manage` permission (such as `Group Spaces-Manage`) contains all other permissions (for example, `Group Spaces-Configure` and `Group Spaces-View`).

Note: Application permissions cannot be modified for the `Administrator` role. See also [Section 28.1.2.1, "Default Application Roles"](#).

To change the permissions assigned to a role:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Security** tab.
4. Click the **Roles** tab.
5. Select or clear **Permissions** check boxes to enable or disable permissions for a role.

6. Click **Apply** to save.

The new permissions are effective immediately.

28.3.4 Granting Permissions to the Public-User

Anyone who is not logged in to WebCenter Spaces assumes the `Public-User` role. Out-of-the-box, the `Public-User` role is granted minimal privileges, that is, the `Application-View` permissions only.

Caution: Take care when granting permissions to the `Public-User` role. Avoid granting administrative permissions such as `Application-Manage`, `Application-Configure`, other `Manage` permissions, or any permission that might be considered unnecessary.

Granting the Application-View Permission

The `Application-View` permission allows unauthenticated users to see public WebCenter Spaces application pages, such as the welcome page, and also content that individual WebCenter users choose to make public.

When `Application-View` permissions are granted to the `Public-User` role:

- Ensure that your WebCenter users understand that any personal page or personal content they choose to make public will become accessible to unauthenticated users outside of the WebCenter Spaces community, that is, anyone with Web access.
- Consider customizing the default welcome page that displays to public users before they login. See [Section 29.3.1, "Customizing the Public Welcome Page"](#).

If you do not want unauthenticated users to see WebCenter Spaces content that is marked 'public', do not grant the `Application-View` permission to the `Public-User` role. When public access is disabled, public content cannot be seen by unauthenticated users. Also, the welcome page for WebCenter Spaces is not displayed; public users are directed straight to a login page. Administrators may customize the default login page, if required. See [Section 29.3.2, "Customizing the Login Page"](#).

Granting Other Permissions

Be careful when assigning permissions to the `Public-User` role. For security reasons, Oracle recommend that you limit what anonymous users can see and do in WebCenter Spaces.

28.3.5 Granting Permissions to the Spaces-User

Anyone who is logged in to WebCenter Spaces assumes the `Spaces-User` role. Out-of-the-box, the `Spaces-User` role is granted minimal privileges, that is, the `Application-View`, `Group Space-Create`, `Group Space Templates-Create`, `Pages-Create`, `Profiles-Edit` permissions only.

Note that the `Spaces-User` role always inherits permissions from the `Public-User` role.

28.3.6 Deleting Application Roles

When an application role is no longer required you should remove it from WebCenter Spaces. This helps maintain a valid role list, and prevents inappropriate role assignment.

Application roles are deleted even when users are still assigned to the them. As you cannot delete any default roles, WebCenter users will always have the `Spaces-User` role.

Note: Default roles cannot be deleted (`Administrator`, `Spaces-User`, `Public-User`). See [Section 28.1.2.1, "Default Application Roles"](#).

To delete an application role:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Security** tab.
4. Click the **Roles** tab.
5. Select the Delete Role icon next to the role you want to delete ([Figure 28–11](#)).

Figure 28–11 *Deleting an Application Role*

6. Click **OK** to confirm that you want to delete the role.

The role is removed from the table. Any users assigned to this role only, assume the default `Spaces-User` role and do not display on the Users tab.

28.4 Allowing Self-Registration

Self-registration allows users to create their own login and password for WebCenter Spaces. A user who self registers is immediately and automatically granted access to WebCenter Spaces and a new user account is created in the application's identity store.

When *anyone* is allowed to self-register, that is any public user, a Register link or Register button displays below the WebCenter Spaces login form. To enable this feature, see [Section 28.4.2, "Enabling Anyone to Self-Register"](#).

Self-registration by invitation is allowed too. This feature allows group space moderators to send out membership invitations to people who are not currently registered with WebCenter Spaces but might be interested in their group space. Before accessing the group space, invitees must create an account with WebCenter Spaces and their account details are added to the application's identity store. When the group space moderator approves their subscription request they will gain access to the group space. See [Section 28.4.1, "Enabling Self-Registration By Invitation-Only"](#).

Note: If self-registration is not enabled in WebCenter Spaces, identity store management takes place through the WLS Administration Console (or directly into embedded LDAP identity stores using LDAP commands) and is the responsibility of your systems administrator. See also, [Section 23.3.3, "Adding Users to the Identity Store"](#).

A self-registration page is supplied out-of-the-box. Users with the Administrator role can add new components to the page and change the page layout if required. See [Section 29.3.3, "Customizing the Self-Registration Page"](#).

The self-registration page provided with WebCenter Spaces offers to send a "user name reminder email" to anyone who tries to register using an existing email address. This feature only works if public credentials are defined for the external application that is providing authentication for the Mail service. If users experience issues with this feature, ask your Fusion Middleware Administrator to check the mail server connection and its associated external application connection are configured correctly and that public credentials are defined. See also, [Section 15.3, "Registering Mail Servers"](#).

28.4.1 Enabling Self-Registration By Invitation-Only

Out-of-the-box, only existing WebCenter users are candidates for group space membership. While this might meet the needs of most WebCenter Spaces applications it is likely that some group spaces will want to recruit members outside of the WebCenter Spaces community.

The WebCenter Spaces administrator can extend group space membership to users outside of WebCenter Spaces by allowing them to self-register on an *invitation-only* basis. When this facility is enabled, group space moderators can invite anyone to join their group space by sending them a customizable invitation by mail. The invitation includes a secure, self-registration URL which the invited party clicks to accept group space membership.

New members recruited in this way must create an account with WebCenter Spaces before gaining access to the group space. Users who self-register by invitation are added to the identity store, and to the group space member list.

Note: Users who self-register by invitation will be assigned the default application role too—`Spaces-User`. Out-of-the box, users with the `Spaces-User` role have access to their own personal space, pages that they create, and public pages. They are also allowed to view public group spaces, join any group space that allows self-subscription, and create group spaces of their own. When you enable self-registration, consider modifying `Spaces-User` permissions to suit your exact requirements. See also, [Section 28.3.3, "Modifying Application Role Permissions"](#).

To allow external users to join group spaces:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. Select **Allow Self-Registration Through Invitations** ([Figure 28–12](#)).

When you deselect this option, only existing WebCenter users are candidates for group space membership.

Figure 28–12 Allowing Self-Registration Through Invitations

5. Click **Apply**.

Group space moderators may invite non-WebCenter users to become members of their group space. See "Inviting a Non-WebCenter Spaces User" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

28.4.2 Enabling Anyone to Self-Register

When *anyone* is allowed to self-register, that is any public user, a Register link displays in the top right corner of the application or a Register button displays below the WebCenter Spaces login form ([Figure 28–13](#)).

Figure 28–13 Self-Registration Available on Login Form

New users must create an account before gaining access to the WebCenter Spaces application.

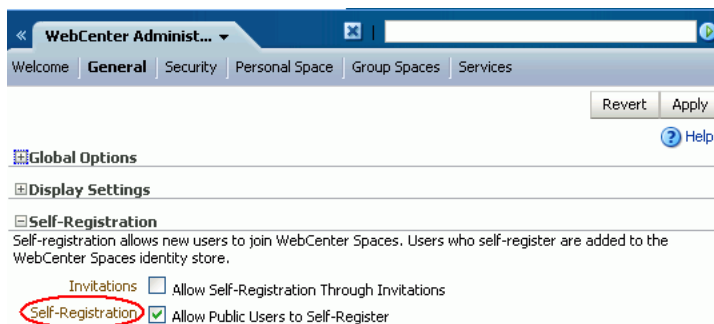

Users who self-register are added directly to the WebCenter Spaces identity store and assigned the `Spaces-User` application role. Out-of-the-box, users with `Spaces-User` role have access to their own personal space, pages that they create, and public pages. They are also allowed to view public group spaces, join any group space that allows self-subscription, and create group spaces of their own. If you enable self-registration, consider modifying `Spaces-User` permissions to suit your exact requirements. See [Section 28.3.3, "Modifying Application Role Permissions"](#).

To allow anyone to self-register with WebCenter Spaces:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **General** tab.
4. Select **Allow Public Users to Self-Register** ([Figure 28–14](#)).

When you deselect this option, public users cannot self-register with WebCenter Spaces. You still enable self-registration on an invitation-only basis if you want. See [Section 28.4.1, "Enabling Self-Registration By Invitation-Only"](#).

Figure 28–14 Allowing Self-Registration Through Invitations

5. Click **Apply**.

See also, "Registering Yourself with WebCenter Spaces" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

28.5 Troubleshooting Issues with Users and Roles

For WebCenter Spaces to properly maintain enterprise group-to-role mappings, the back-end discussions server and content server must support enterprise groups. Oracle WebCenter Discussion Server and Oracle Universal Content Management versions provided with Oracle WebCenter 11.1.1.2.0 support enterprise groups but previous versions may not.

If a back-end server does not support enterprise groups, users belonging to enterprise groups are individually added to WebCenter Spaces roles and subsequent group updates in the identity store are not reflected in WebCenter Spaces. This can quickly become a maintenance issue, especially when enterprise groups contain large number of users.

An error message displays if a new back-end server that does not support enterprise groups is enabled in WebCenter Spaces where enterprise group-to-role assignments exist. In this instance, delete all the enterprise group-to-role assignments and reassign roles to individual users instead.

Managing Pages in WebCenter Spaces

This chapter describes how to manage personal pages and business role pages, and how to set up WebCenter Spaces for the public user. It includes the following sections:

- [Section 29.1, "Managing Business Role Pages"](#)
- [Section 29.2, "Managing Personal Pages"](#)
- [Section 29.3, "Setting Up the Public User Experience"](#)

Audience

The contents of this chapter is intended for WebCenter Spaces application administrators. Application administrators are users who are granted the WebCenter Spaces Administrator role or a custom role that grants the Application-Manage permission.

29.1 Managing Business Role Pages

- [Section 29.1.1, "What You Should Know About Business Role Pages"](#)
- [Section 29.1.2, "Creating a Business Role Page"](#)
- [Section 29.1.3, "Specifying the Target Audience for Business Role Pages"](#)
- [Section 29.1.4, "Choosing a Default Display Order for Business Role Pages"](#)
- [Section 29.1.5, "Editing a Business Role Page"](#)
- [Section 29.1.6, "Copying a Business Role Page"](#)
- [Section 29.1.7, "Deleting a Business Role Page"](#)

29.1.1 What You Should Know About Business Role Pages

One way a business role page differs from a shared personal page is that a business role page is *pushed* to all the users to whom it is assigned. When users log in, they see their assigned business role pages as tabs in their personal spaces.

In contrast, when users share a personal page, the shared page is not presented automatically in the views of those users with whom it is shared. Instead, users discover shared personal pages through the Manage Pages dialog.

See Also: For information about sharing pages, see "Setting and Revoking Page Access Permissions" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Business role pages provide an efficient way to roll out pages to a common audience. For example, if everyone in the HR department must access a Hiring Status page, the administrator can assign the Hiring Status business role page to the department's role (HR_ORG). In an instant, the business role page is pushed to every user assigned to the HR_ORG role.

If an individual user, who is not part of the HR_ORG role, wants to see the page, the application administrator can grant access to this user.

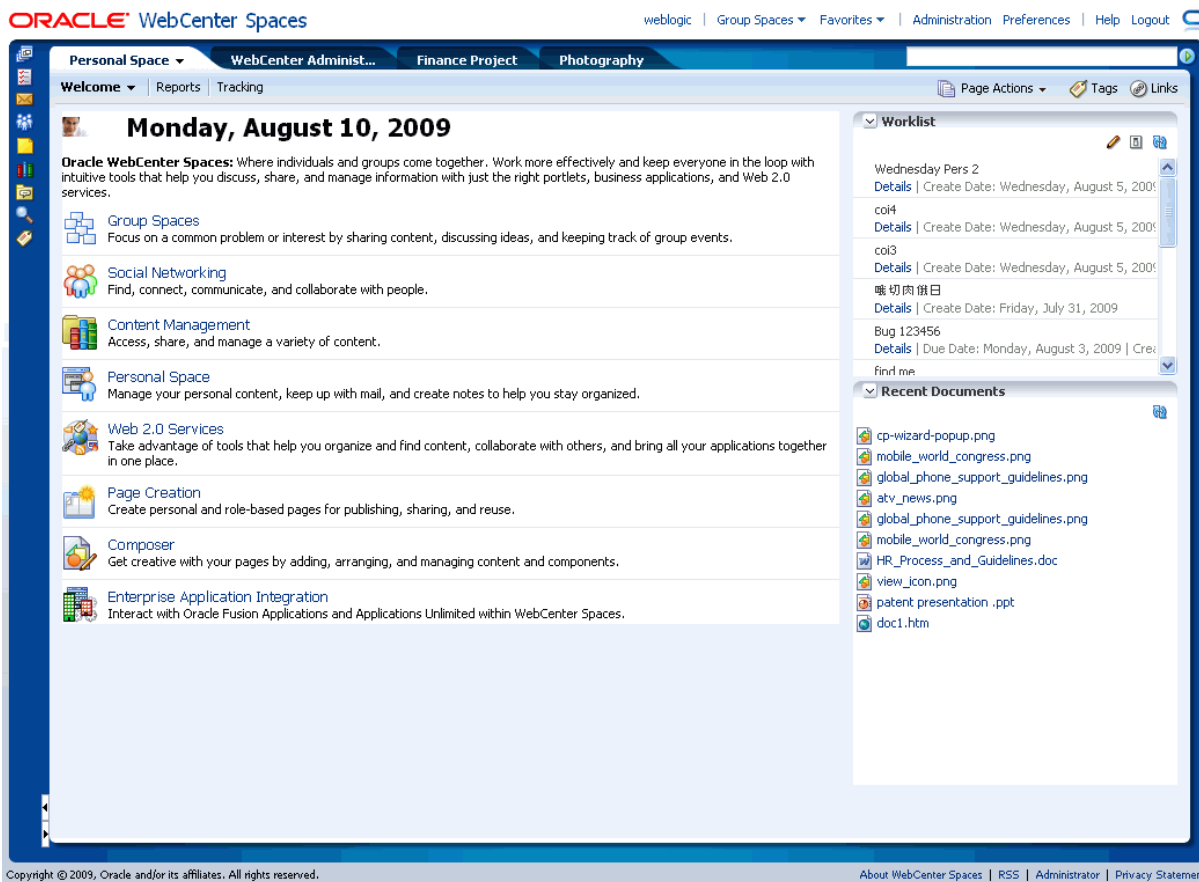

Only a WebCenter Spaces administrator can create a business role page (for more information, see [Section 29.1.2, "Creating a Business Role Page"](#)). From the WebCenter Administration page, administrators can view and edit business role pages, set up page defaults, copy pages, delete pages, manage page security, and manage group spaces.

Other users can edit, copy, and delete business role pages, and change page permissions, but only if a WebCenter Spaces administrator grants them the privilege to do so (for more information, see [Section 29.1.3, "Specifying the Target Audience for Business Role Pages"](#)).

Default Welcome Page

Out-of-the-box, WebCenter Spaces provides a business role page named *Welcome* ([Figure 29-1](#)).

Figure 29-1 The Out-of-the-Box Business Role Page "Welcome"

All users, including the application administrator, see this page in their application view. By default, it appears as the first page in everyone's personal space. As the application administrator, you can edit page content, change the page position, hide the page from everyone, or grant custom permissions as described in this chapter; however, you cannot delete the default Welcome page.

29.1.2 Creating a Business Role Page

To create a new business role page and push it out to a target audience:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.

All WebCenter Spaces pages are listed here, including existing business role pages ([Figure 29–2](#)).

Figure 29–2 Viewing Business Role Pages

The screenshot shows the Oracle WebCenter Spaces Administration interface. The top navigation bar includes the Oracle logo, 'WebCenter Spaces', and links for 'weblogic', 'Group Spaces', 'Favorites', 'Administration', 'Preferences', 'Help', and 'Logout'. The main content area is titled 'Manage Personal Pages' and contains a table of pages. The table is organized into two sections: 'Business Role Page' and 'Personal Page'.

Name	Reorder	Created By	Last Modified	Actions
Business Role Page

At the bottom of the page, there is a footer with the text: 'Copyright © 2009, Oracle and/or its affiliates. All rights reserved.' and links for 'About WebCenter Spaces', 'RSS', 'Administrator', and 'Privacy Statement'.

4. Click **Create New Business Role Page**.
5. Enter a name for the page (**Page Name**), and then choose a **Scheme, Background Color, and Style**.

The page creation options that you see in this dialog are the same as the page creation options you set for personal pages.

See Also: For information about page creation options, see "Creating Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

For information about setting up page creation defaults, see [Section 29.2.2, "Setting Up a Default Look and Feel for Personal Pages."](#)

6. Click **Create**.

An empty page opens with your chosen look and feel.

Later, you can add content to the page (see "Working with Page Content" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*). The next section ([Section 29.1.3](#)) steps you through setting access permissions for the business role page.

7. Next steps:

- Add content to the page, for details, see "Working with Page Content" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.
- Define the page audience, see [Section 29.1.3, "Specifying the Target Audience for Business Role Pages."](#)
- Choose the page display order, see [Section 29.1.4, "Choosing a Default Display Order for Business Role Pages."](#)

29.1.3 Specifying the Target Audience for Business Role Pages

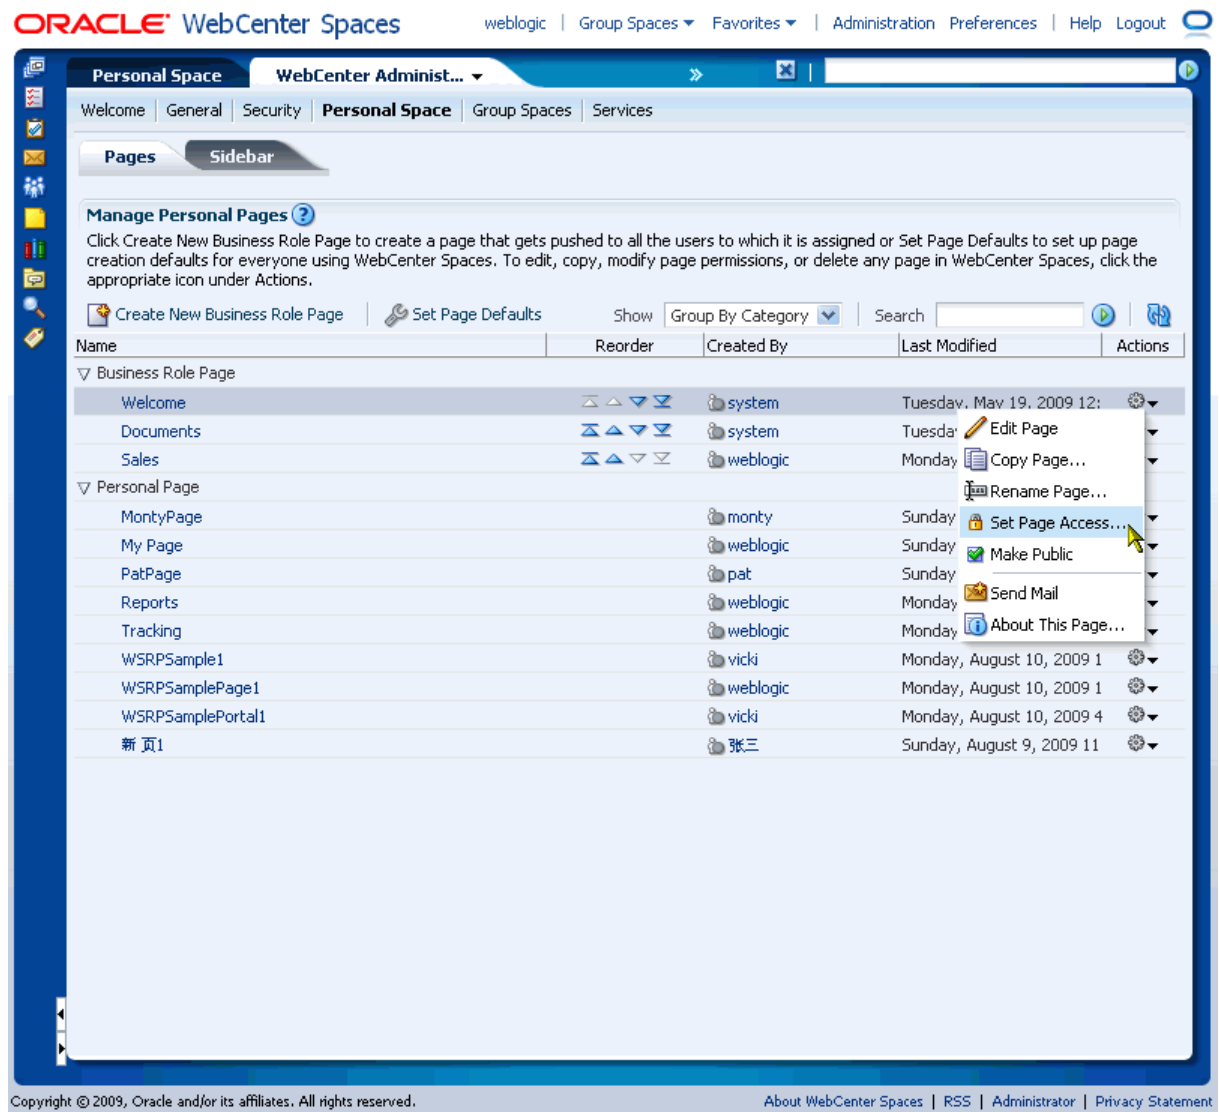

The target audience for business role pages may change from time to time. For example, you may want the whole sales team to see a page originally designed for a product development team. Or you may want to provide access to the Marketing department's page to a sales team member. Or you may want to provide additional access privileges, such as the *Edit Page* privilege, to a selected department member.

Administrators can configure page permissions in two places—through WebCenter Administration pages (described below) or through the Manage Pages dialog (see "Setting and Revoking Page Access Permissions" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*).

To add or change user permissions for a business role page:

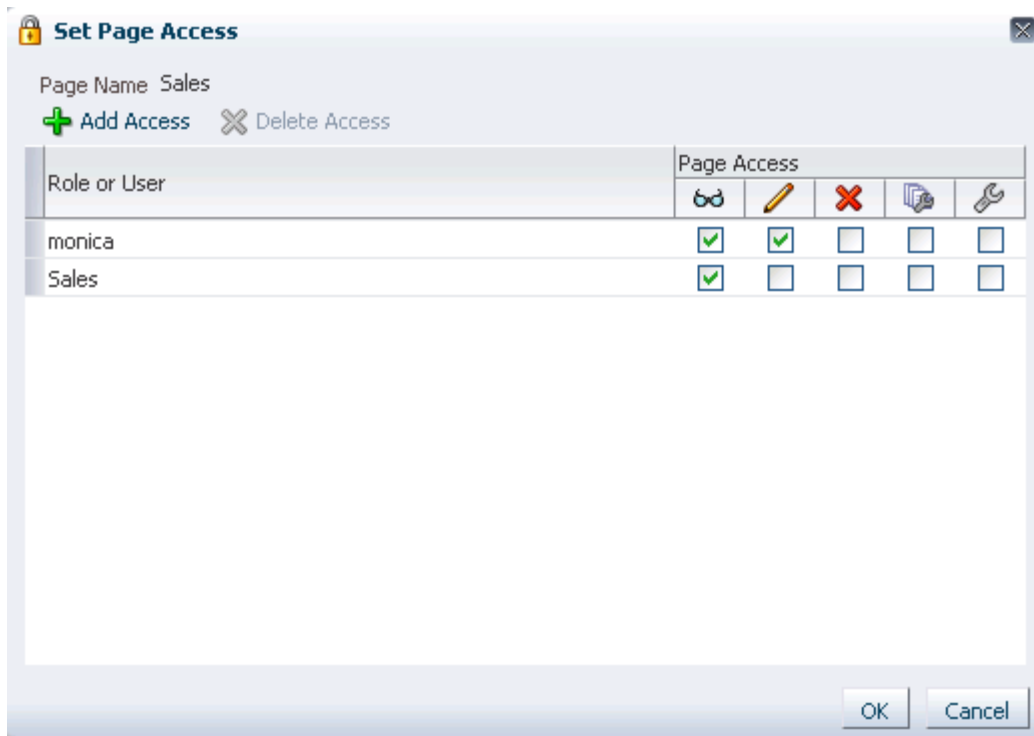

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, choose **Group By Category**.
The **Business Role Page** section lists every business role page in WebCenter Spaces.
5. Click the **Actions** icon for the business role page for which you are setting access, and select **Set Page Access** from the resulting context menu ([Figure 29–3](#)).

Figure 29–3 Setting Access Permissions for a Business Role Pages

The Set Page Access dialog opens (Figure 29–4).

Figure 29–4 Setting Page Access

6. Set access permissions:
 - To grant access to additional users and roles, click **Add Access**, and then make your selections. Follow steps 7 and 8.
 - To modify the permissions assigned to a current user or role, select or deselect the appropriate permission checkboxes. For details, see step 9.
 - To revoke access to the pages, highlight the user or the role, and then click **Delete Access**.
7. Click **Add Access**.
The Add Access dialog opens (Figure 29–5).

Figure 29–5 The Add Access Dialog

8. Identify the users who should see this business role page in their personal space.

Note: To provide access to public users, search for and select `anonymous-role`.

Choose from all available users, enterprise groups, enterprise roles, and application roles. Use the Search feature to search your identity store:

- a. In the **Search** field, enter two or more characters.

The search is not case-sensitive.

- b. Click the **Search** icon.

Users, groups, and roles matching your search criteria appear in the **Add User** dialog.

- c. Select one or multiple names from the list.

Ctrl-Click to select multiple users.

- d. Click **Select**.

The results of your selection appear in the Set Page Access dialog. By default, selected users have the *View Page* permission.

9. For each user name, group, or application role, select one or more checkboxes to grant page privileges:

- **View Page**—Users can view the page but cannot perform any actions on the page.
- **Edit Page**—Users can edit the page. This includes adding, rearranging, and deleting content, and changing the page scheme.
- **Delete Page**—Users can delete the page.
- **Manage Page**—Users have full access rights to the page. These users can edit the page, revise the page layout, set additional access privileges for other users, and all other page privileges.
- **Personalize Page**—Users can change their personal view of the page. Such changes do not affect any other user's view of the page.

Note: To revoke a privilege, deselect the checkbox.

For more information, see [Section 28.1.3, "Understanding Application Permissions."](#)

10. Click **OK** to save your changes.

The page is pushed to its target audience, who sees it in their personal space the next time they log in to WebCenter Spaces.

29.1.4 Choosing a Default Display Order for Business Role Pages

If you present business role pages in a logical order, the page content is more accessible and easier for users to navigate. As administrator, you can determine the initial order in which business role pages are presented to their intended audience.

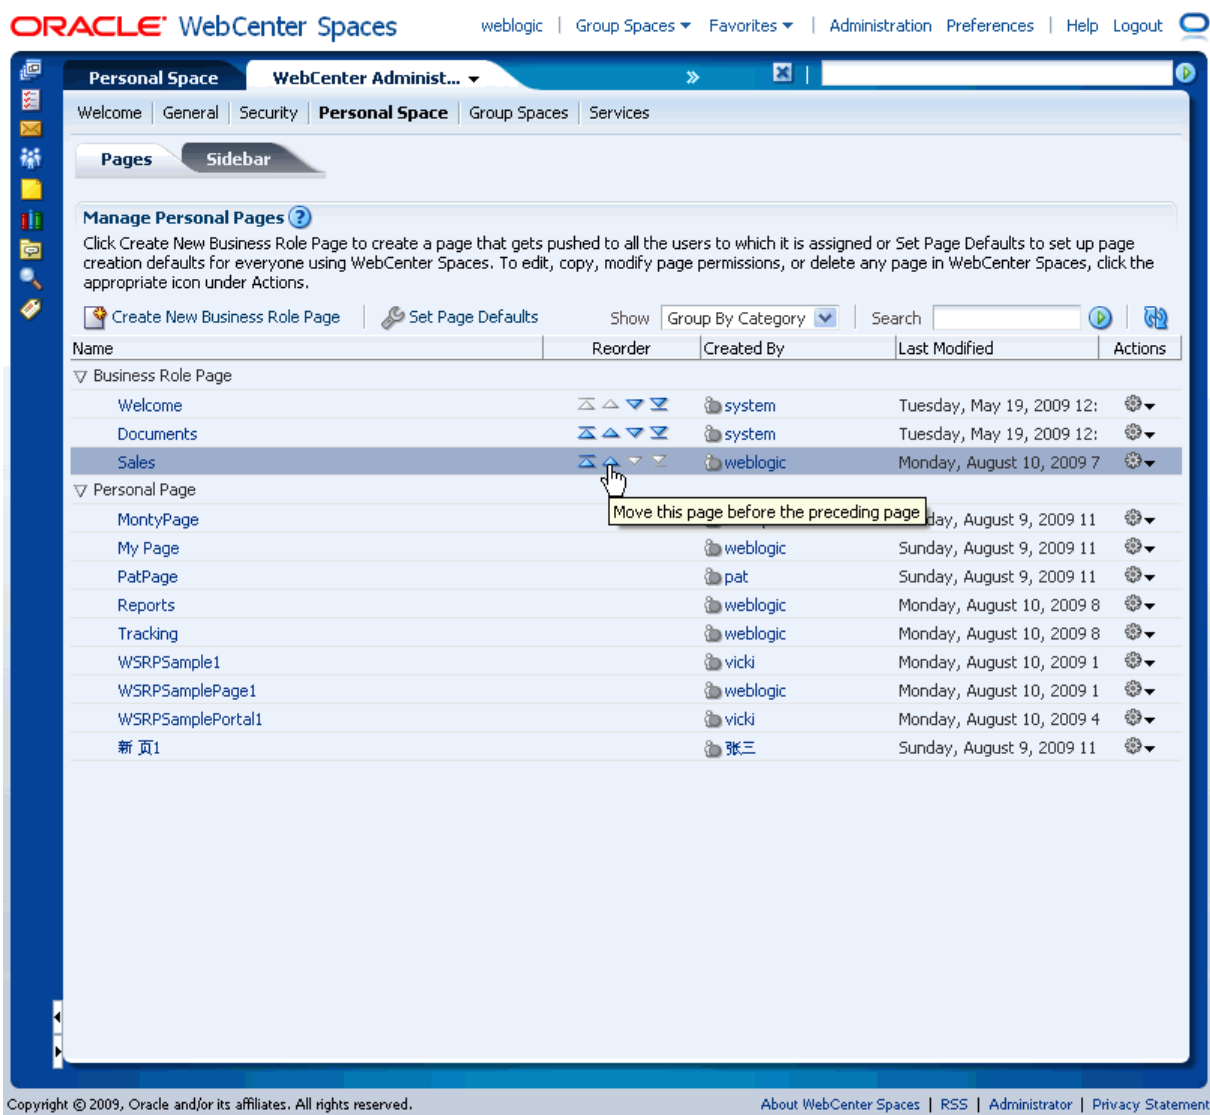

Individual users can change the initial display order you specify through the Manage Pages dialog. Additionally, they can hide the business role pages they do not use.

See Also: For information about changing the display order of pages, see "Changing the Order of Pages Through the Manage Pages Dialog." For information about hiding pages, see "Hiding, Showing, Opening, and Closing Pages." You can find this information in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

To change the display order of all business role pages:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, choose **Group By Category**.
The **Business Role Page** section lists every business role page in WebCenter Spaces.
5. Click the arrows in the **Reorder** column to change the default display order ([Figure 29–6](#)).

Figure 29–6 Choosing a Default Display Order for Business Role Pages

Alternatively, drag and drop pages into the correct position.

29.1.5 Editing a Business Role Page

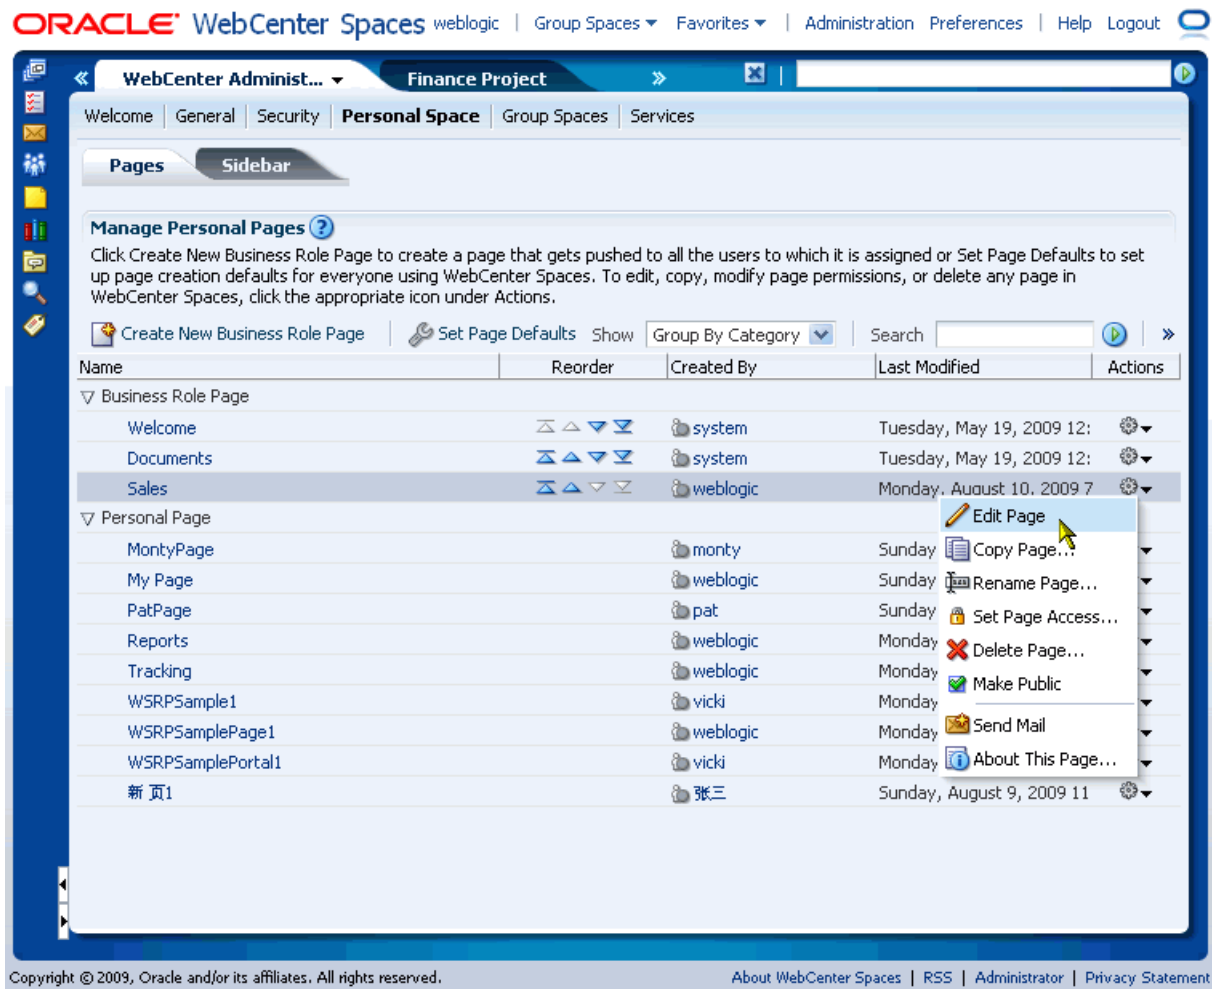

Anyone granted the `Edit Page` permission on a business role page can edit that page. For these users, the editing process is the same as for regular pages (for more information, see "Editing Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*).

Administrators also have the option of initiating an edit of a business role page from WebCenter Administration pages.

To edit a business role page through WebCenter Administration:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, choose **Group By Category**.
The **Business Role Page** section lists every business role page in WebCenter Spaces.
5. Click the **Actions** icon for the page you want to edit, and select **Edit Page** from the resulting context menu ([Figure 29-7](#)).

Figure 29–7 Editing Business Role Pages

The page opens in edit mode in Oracle Composer (for more information, see "Editing Pages" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*).

6. Edit the page, and click **Save** and then **Close** when you have finished.

29.1.6 Copying a Business Role Page

When you copy a business role page, you can save it as another business role page or as a personal page. If you create another business role page, you must set access on the new page because access permissions from the original page are not copied (for more information, see [Section 29.1.3, "Specifying the Target Audience for Business Role Pages"](#)).

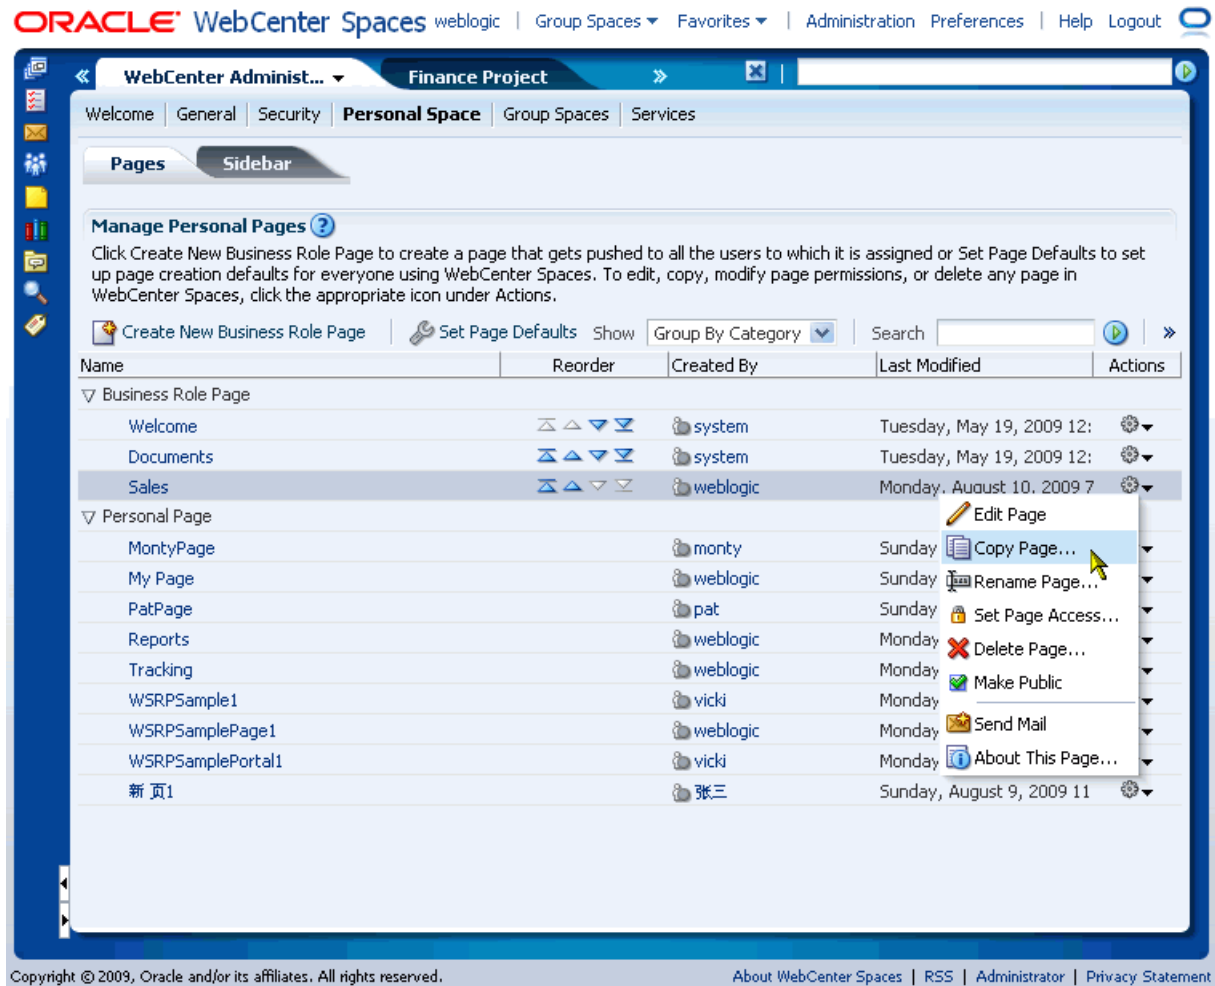

To copy a business role page:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, choose **Group By Category**.

The **Business Role Page** section lists every business role page in WebCenter Spaces.

5. Click the **Actions** icon for the page you want to copy, and select **Copy Page** from the resulting context menu (Figure 29–8).

Figure 29–8 Copying a Business Role Page

6. Enter a name for the new page (Figure 29–9).

Figure 29–9 Naming the New Page

7. Do one of the following:

- Select **Copy as a Business Role Page** if you intend to push the copy out to a group of people with a similar job role.
 - Deselect **Copy as a Business Role Page** if you intend to expose the copy only in your own application view.
8. Click **OK**.

The new page opens in edit mode in Oracle Composer (for more information, see "Editing Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*).

29.1.7 Deleting a Business Role Page

Once a business role page is removed from WebCenter Spaces, it cannot be recovered. Deleted pages are permanently removed, and users previously assigned that page no longer see it in their view.

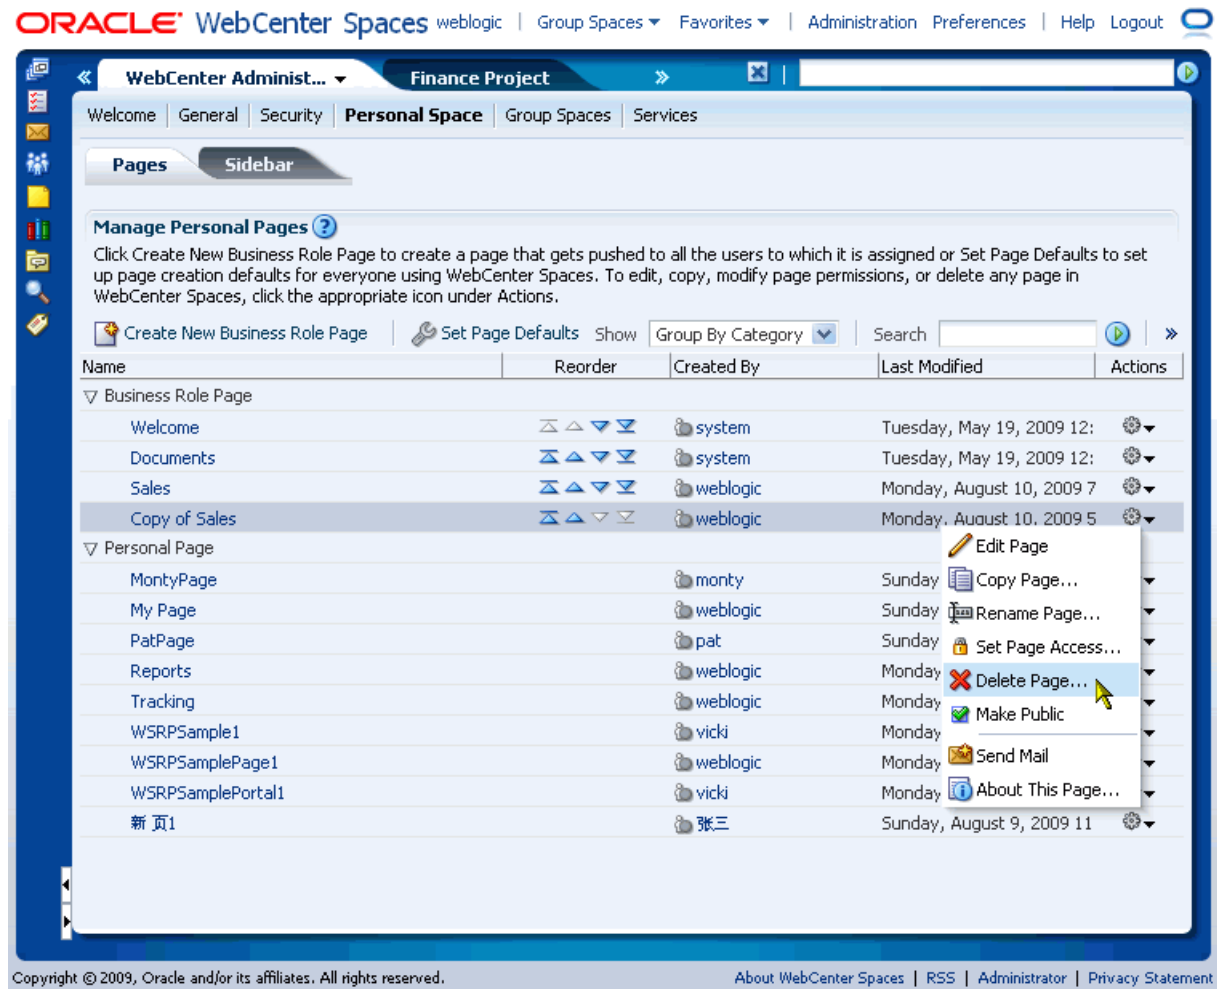

Anyone granted the `Delete Page` permission on a business role page can delete it. For these users, the process is the same as deleting regular pages (for more information, see "Deleting Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*).

Administrators have the option of deleting business role pages from the WebCenter Administration page.

To delete a business role page through WebCenter Administration:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, choose **Group By Category**.
The **Business Role Page** section lists every business role page in WebCenter Spaces.
5. Click the **Actions** icon for the page you want to delete, and select **Delete Page** from the resulting context menu ([Figure 29-10](#)).

Figure 29–10 Deleting Business Role Pages

- In the resulting dialog, click **Delete** to confirm your intention to delete the page.

29.2 Managing Personal Pages

This section describes how to manage personal pages in WebCenter Spaces. It includes the following sections:

- Section 29.2.1, "What You Should Know About Personal Page Management"
- Section 29.2.2, "Setting Up a Default Look and Feel for Personal Pages"
- Section 29.2.3, "Editing Personal Pages with Administrative Privileges"
- Section 29.2.4, "Changing Access Permissions for a Personal Page"
- Section 29.2.5, "Copying a Personal Page"
- Section 29.2.6, "Deleting a Personal Page"

29.2.1 What You Should Know About Personal Page Management

In WebCenter Spaces, application administrators can access everyone's personal pages from one, central place: the **WebCenter Administration** page. From here, administrators can view and edit personal pages, set up personal page creation

defaults, and copy and delete personal pages. Administrators can also manage page security and modify public page settings.

While individuals are primarily responsible for managing content and pages in their own personal space, it is important that administrators also have access.

Administrators may be required to clean up or manage personal data when owners experience difficulties with their personal pages or leave the organization.

29.2.2 Setting Up a Default Look and Feel for Personal Pages

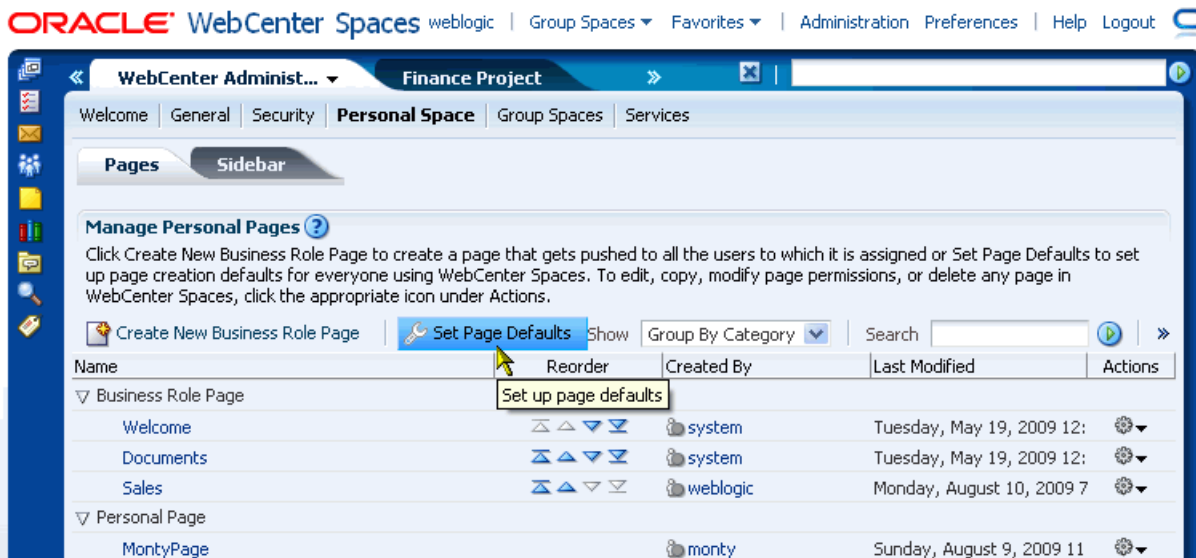

Administrators can use WebCenter Spaces to set up a default look and feel for personal and business role pages. Use this feature to simplify page creation for first-time users or to steer users toward a particular page scheme and style. Individuals may override these settings through the Manage Pages dialog associated with their personal space. For more information, see "Setting Page Creation Defaults for Your Personal Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Page defaults apply to personal pages and business role pages only. Defaults for pages created within the context of a group space are controlled by the group space moderator. For more information, see "Managing Group Space Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

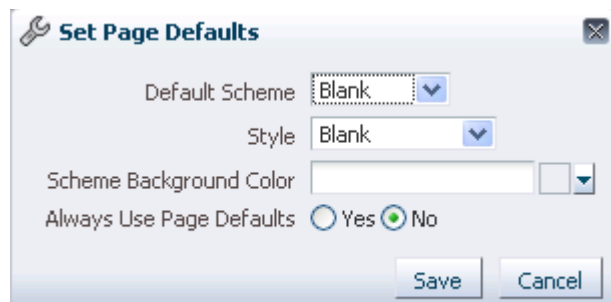

To set up a default look and feel for personal pages (including business role pages):

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Click **Set Page Defaults** (Figure 29–11).

Figure 29–11 Setting Page Defaults For Everyone

The **Set Page Defaults** dialog opens (Figure 29–12):

Figure 29–12 Set Page Defaults Dialog

5. In the **Set Page Defaults** dialog, select a default scheme for all new personal pages and business role pages from the **Default Scheme** drop-down menu.

The Default Scheme drop-down menu provides a selection of background color and images. For illustrations of listed schemes, see "Introducing Default Page Schemes and Styles" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

6. Select a layout for the page structure from the **Style** drop-down menu.

For illustrations of listed styles, see "Introducing Default Page Schemes and Styles" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

7. Select an **Always Use Page Defaults** option to specify when to apply these page defaults:

Choose from:

- **Yes** - Personal pages and business role pages are automatically created with the defaults that you select here. The Create Page dialog does not open when users create personal pages. Instead, the page is created immediately. If page owners want to use different schemes or layouts, they can edit page properties through Oracle Composer.

See Also: For information about Oracle Composer, see "Introducing Oracle Composer" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*; for information about changing a page scheme or style through Oracle Composer, see "Changing the Page Scheme and Scheme Background Color" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*

- **No** - The scheme and style defaults you specify here are presented as default selections when a user creates a personal page or an administrator creates a business role page. Page owners can override your selections before they create the page.

Experienced users may decide to override the defaults that you pick here by setting up page defaults of their own. For more information, see "Setting Page Creation Defaults for Your Personal Pages" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

8. Click **Save**.

29.2.3 Editing Personal Pages with Administrative Privileges

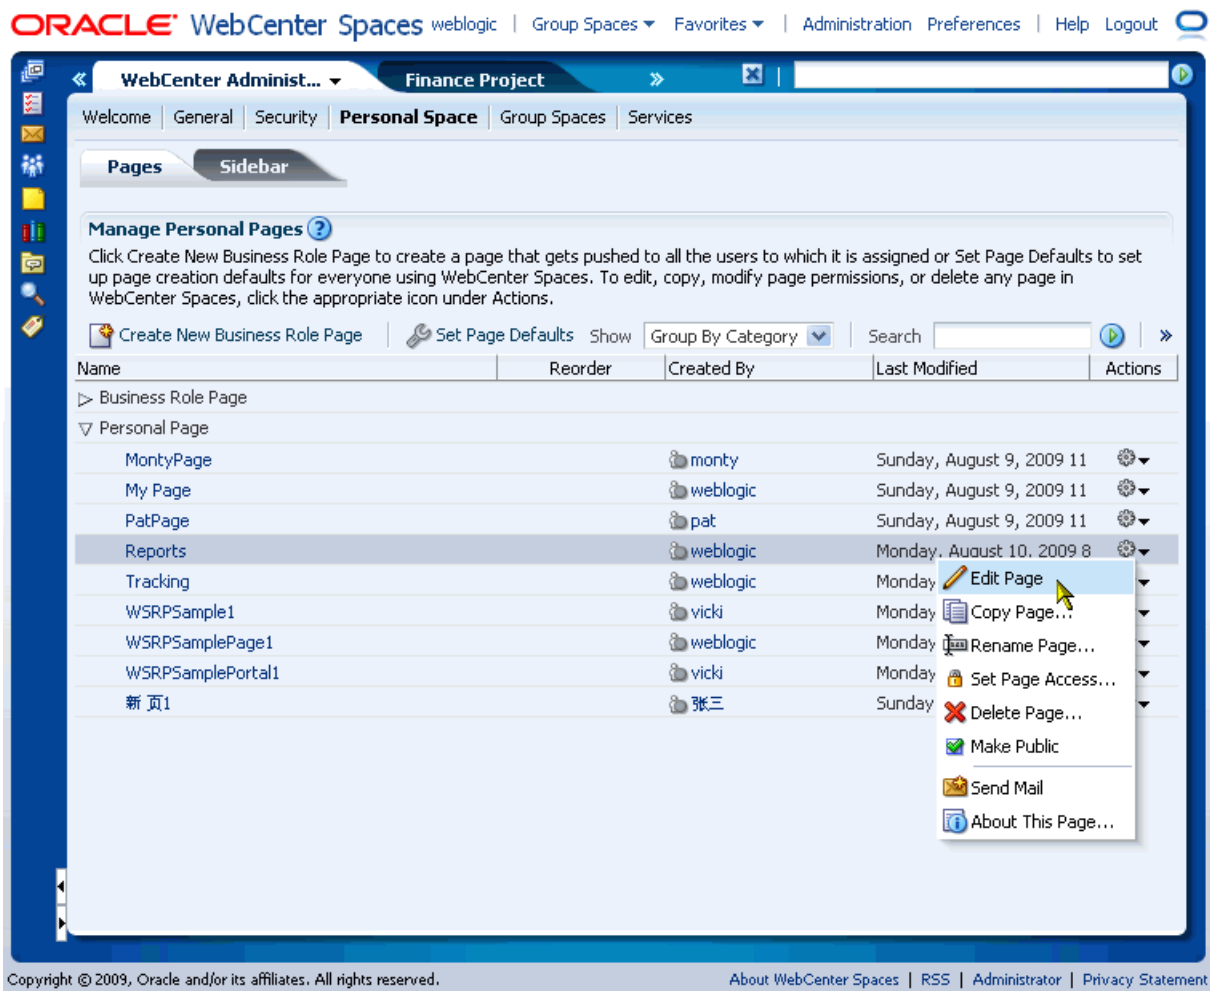

Administrators are authorized to view and modify any page in a personal space, including other people's personal pages. Individuals are primarily responsible for

editing content and pages in their own personal spaces, but, occasionally, administrators may be required to clean up or edit personal data.

To edit a personal page as the WebCenter Spaces administrator:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, select **Group By Category**.
The **Personal Page** section lists every personal page in WebCenter Spaces.
5. Click the **Actions** icon for the page you want to edit, and select **Edit Page** from the resulting context menu ([Figure 29-13](#)).

Figure 29-13 *Editing Personal Pages*

The page opens in Oracle Composer.

See Also: To find out more about editing a page through Oracle Composer, see the following chapters in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*:

- "Introducing Oracle Composer"
- "Creating, Editing, and Deleting Pages"
- "Working with Page Content"

6. Update the page, and click **Save** and then **Close** when you have finished.

29.2.4 Changing Access Permissions for a Personal Page

Administrators are authorized to view and manage security for any page in WebCenter Spaces. This includes personal pages. Page owners normally determine who can see their pages, but, occasionally, when a page owner is not available, the administrator may be required to make changes.

Administrators can configure page permissions in two places: through WebCenter Administration pages, as described here, or through their Manage Pages dialog in the same way as regular users.

See Also: For information about changing page access permissions through the Manage Pages dialog, see "Setting and Revoking Page Access Permissions" in the *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

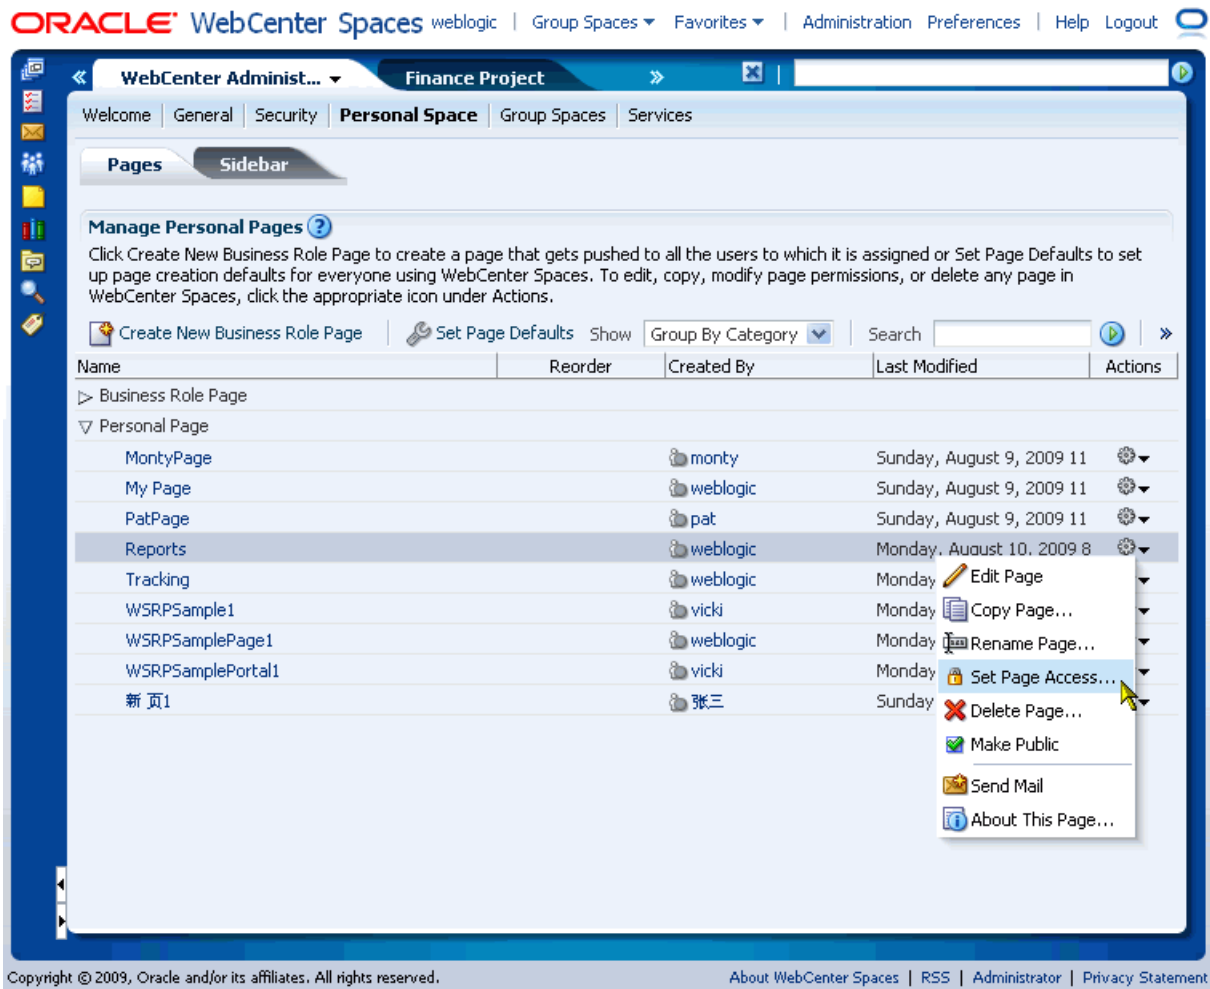

To change access permissions for a personal page as the WebCenter Spaces administrator:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, choose **Group By Category**.

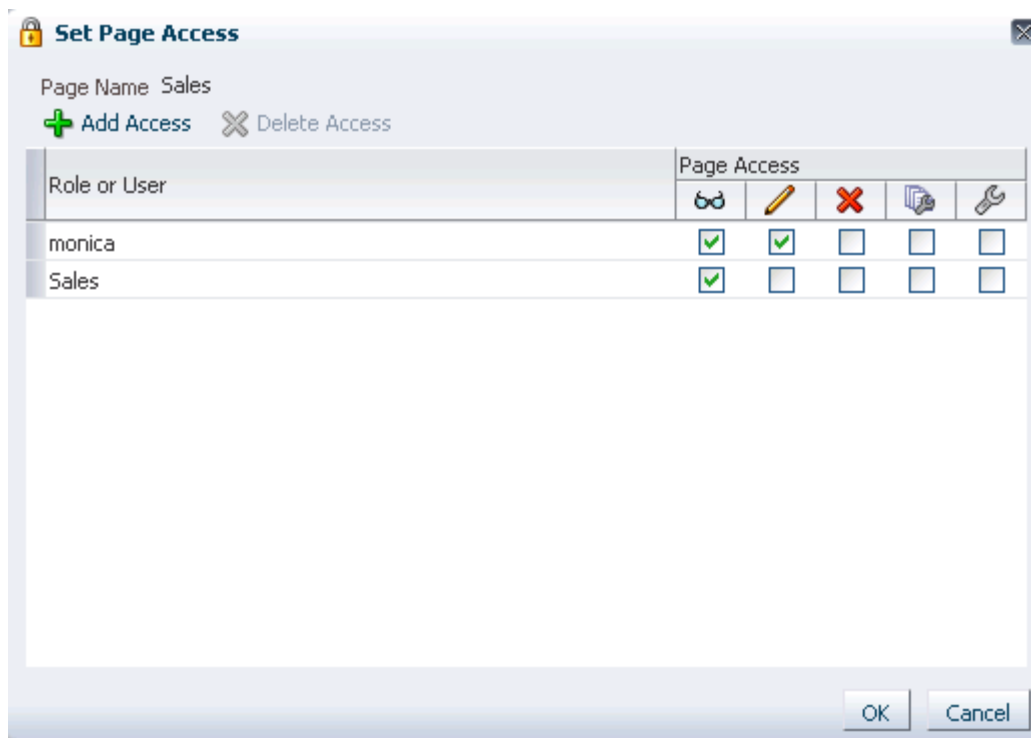

The **Personal Page** section lists every personal page in WebCenter Spaces.

5. Click the **Actions** icon for the page on which to set access, and select **Set Page Access** from the resulting context menu ([Figure 29-14](#)).

Figure 29–14 Editing Page Access

The Set Page Access dialog opens (Figure 29–15).

Figure 29–15 Set Page Access Dialog

6. To grant access to users and roles, click **Add Access**.
The Add Access dialog opens (Figure 29–5).

Figure 29–16 Add Access Dialog

7. Identify the users to enable to access this page in their personal space.
Choose from all available users, enterprise groups, enterprise roles, and application roles. Use the Search feature to search your identity store:
 - a. In the **Search** field, enter two or more characters.
The search is not case sensitive.
 - b. Click the **Search** icon.
Users, groups, and roles matching your search criteria appear in the **Add Access** dialog.
 - c. Select one or more names from the list.
Ctrl-Click to select multiple users.

d. **Click Select.**

The results of your selection appear in the Set Page Access dialog. By default, users have the *View Page* permission on the page.

8. To modify the permissions assigned to a current user or role, select or deselect the appropriate permission checkboxes:
- **View Page**—The selected user or role can access the page for viewing, but cannot perform any actions on the page.
 - **Delete Page**—The selected user or role can delete the page.
 - **Manage Page**—The selected user or role has full access rights to the page. The user can edit the page, revise the page layout, set additional access privileges for other users, and all other page privileges.
 - **Edit Page**—The selected user or role can edit the page. This includes adding, rearranging, and deleting content.
 - **Personalize**—The selected user or role can personalize the page. Personalizations are changes made to a page in view mode. Such changes do not affect any other user's view of the page.

Note: You can revoke privileges by taking the same steps and deselecting one or multiple privileges for a listed user or role.

For more information, see [Section 28.1.3, "Understanding Application Permissions."](#)

- To revoke access to the page, select the user or role and click **Delete Access**.
9. Click **OK**.

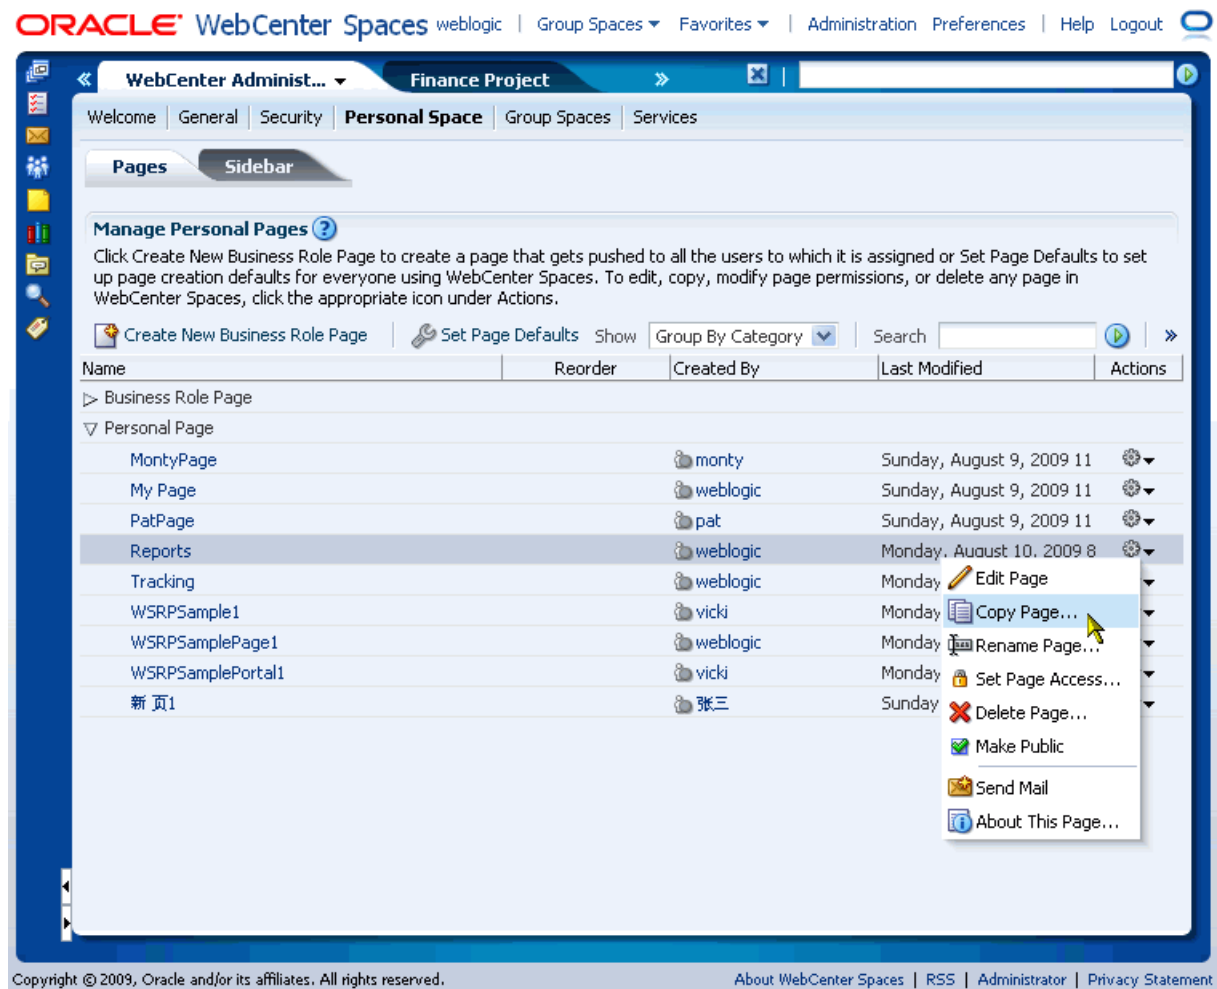

29.2.5 Copying a Personal Page

Administrators are authorized to copy any page in WebCenter Spaces. This includes other users' personal pages. When you copy a personal page as an administrator, you can save it as a business role page to be pushed to other users or as a personal page in your own personal space. If you create another business role page, you must set access on the new page because access permissions from the original page are not copied. For more information, see [Section 29.1.1, "What You Should Know About Business Role Pages."](#)

To copy a personal page as an administrator:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, choose **Group By Category**.
The **Personal Page** section lists every personal page in WebCenter Spaces.
5. Click the **Actions** icon for the page you want to copy, and select **Copy Page** from the resulting context menu ([Figure 29-17](#)).

Figure 29–17 Copy Page Option on an Actions Menu

6. Enter a name for the new page (Figure 29–18).

Figure 29–18 Copy Page Dialog

7. Do one of the following:
 - Select **Copy as a Business Role Page** if you intend to push the page out to a group of people with a similar job role.
 - Deselect **Copy as a Business Role Page** if you intend to expose the copy only in your own application view.
8. Click **OK**.

The new page opens in edit mode in Oracle Composer (for more information, see "Editing Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*).

29.2.6 Deleting a Personal Page

Once a personal page is removed from WebCenter Spaces it cannot be recovered. Deleted pages are permanently removed. Administrators are authorized to delete any page in WebCenter Spaces, including personal pages.

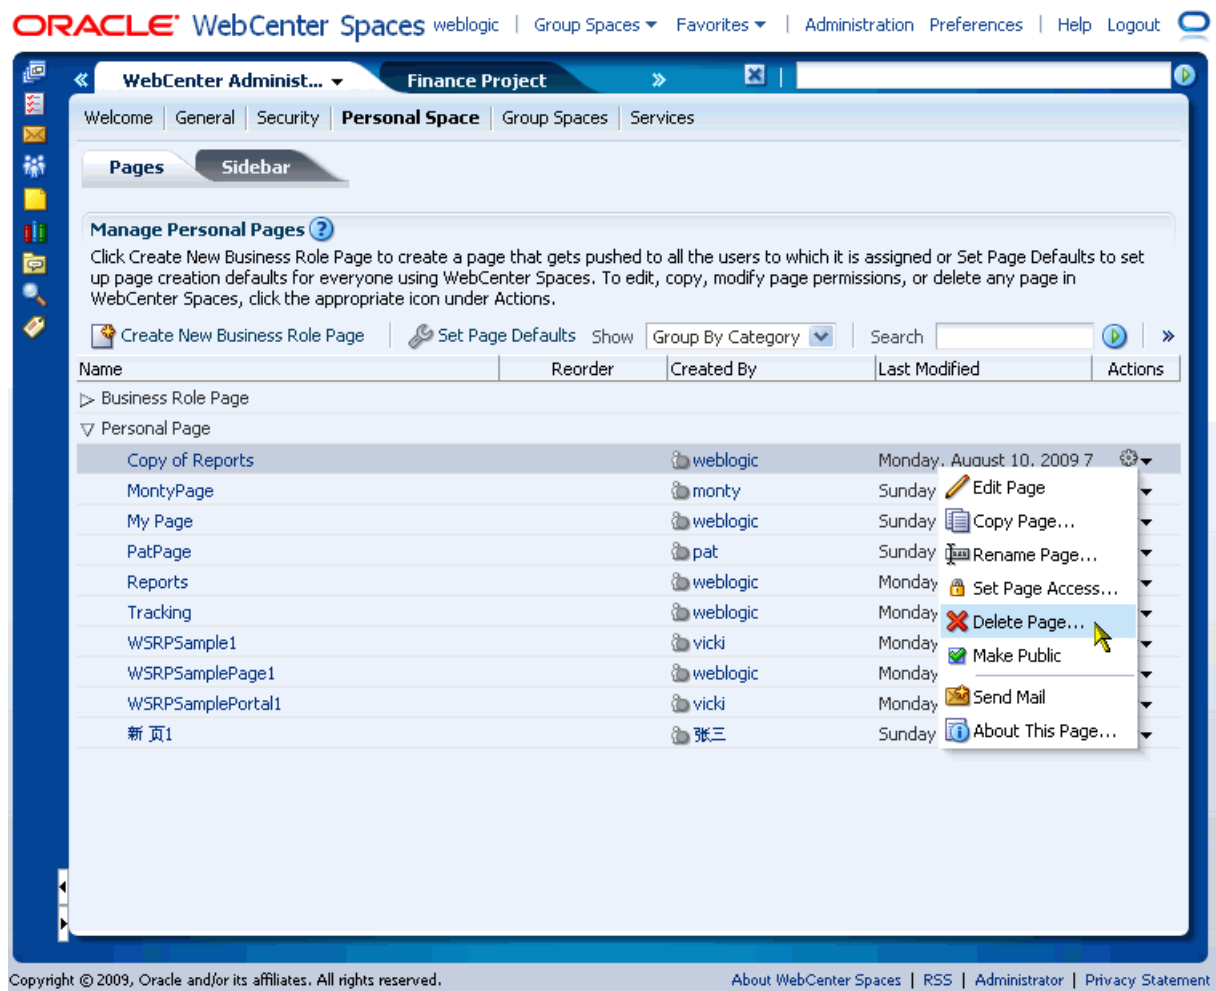

Anyone granted the `Delete Page` permission on a personal page can delete it. For these users, the process is the same as deleting regular pages (see "Deleting Pages" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*).

Administrators also have the option of deleting personal pages from the WebCenter Administration page.

To delete a personal page through WebCenter Administration:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **Personal Space** tab to bring it forward.
3. Click the **Pages** tab to bring it forward.
4. Optionally, from the **Show** drop-down menu, choose **Group By Category**.
The **Personal Page** section lists every personal page in WebCenter Spaces.
5. Click the **Actions** icon for the page you want to delete, and select **Delete Page** from the resulting context menu ([Figure 29-19](#)).

Figure 29–19 Delete Page Option on an Actions Menu

- In the resulting dialog, click **Delete** to confirm your intention to delete the page. Deleted pages are permanently removed. You cannot recover a deleted page.

29.3 Setting Up the Public User Experience

By default, when users who are not logged in (also called *unauthenticated* or *public* users) access the WebCenter Spaces home page they see the public Welcome page. The Welcome page appears because it is a business role page assigned to the *anonymous-role*—that is, it is a public page. Other public pages provided out-of-the-box include the Login page and the Self-Registration page.

Administrators can customize default public pages and disable public access. This section provides information about performing these actions. It includes the following subsections:

- Section 29.3.1, "Customizing the Public Welcome Page"
- Section 29.3.2, "Customizing the Login Page"
- Section 29.3.3, "Customizing the Self-Registration Page"
- Section 29.3.4, "Preventing Public Users From Seeing Personal or Business Role Pages"

29.3.1 Customizing the Public Welcome Page

The *public* Welcome page (Figure 29–20) is shown when public users access the WebCenter Spaces home page. The purpose of the public Welcome page is to provide information and enable user login. If you decide to disable public access to all application pages, the public Welcome page is not shown and users are directed to the Login page. For more information, see Section 28.3.4, "Granting Permissions to the Public-User."

Figure 29–20 Public Welcome Page

Administrators cannot change security settings for the public Welcome page provided with WebCenter Spaces.

If you want to exclude or change content on the public Welcome page, you must customize the default page through Oracle JDeveloper, deploy a customized WebCenter Spaces .WAR file containing your page, and restart WebCenter Spaces. Therefore, custom page deployment typically takes place *before* the WebCenter Spaces application goes live or during scheduled maintenance periods. For more information, refer to the white paper "Extending WebCenter Spaces" available on the Oracle Technology Network (http://www.oracle.com/technology/products/webcenter/pdf/owcs_r11_extend_spaces_wp.pdf).

Note: The public Welcome page differs from the out-of-the-box business role page, also called *Welcome*, that everyone sees in their personal space when they are logged in to WebCenter Spaces. Unlike the public Welcome page, you can modify the business role Welcome page using Oracle Composer. For more information, see Section 29.1.1, "What You Should Know About Business Role Pages."

29.3.2 Customizing the Login Page

Users with the Administrator role can customize certain aspects of the default Login page through Oracle Composer. Administrators cannot edit or delete input fields and buttons on the page, but they can add new components and change the page layout.

Figure 29–21 shows the Login page that is supplied out-of-the-box.

Figure 29–21 Default Login Page

To view and customize the Login page through WebCenter Administration:

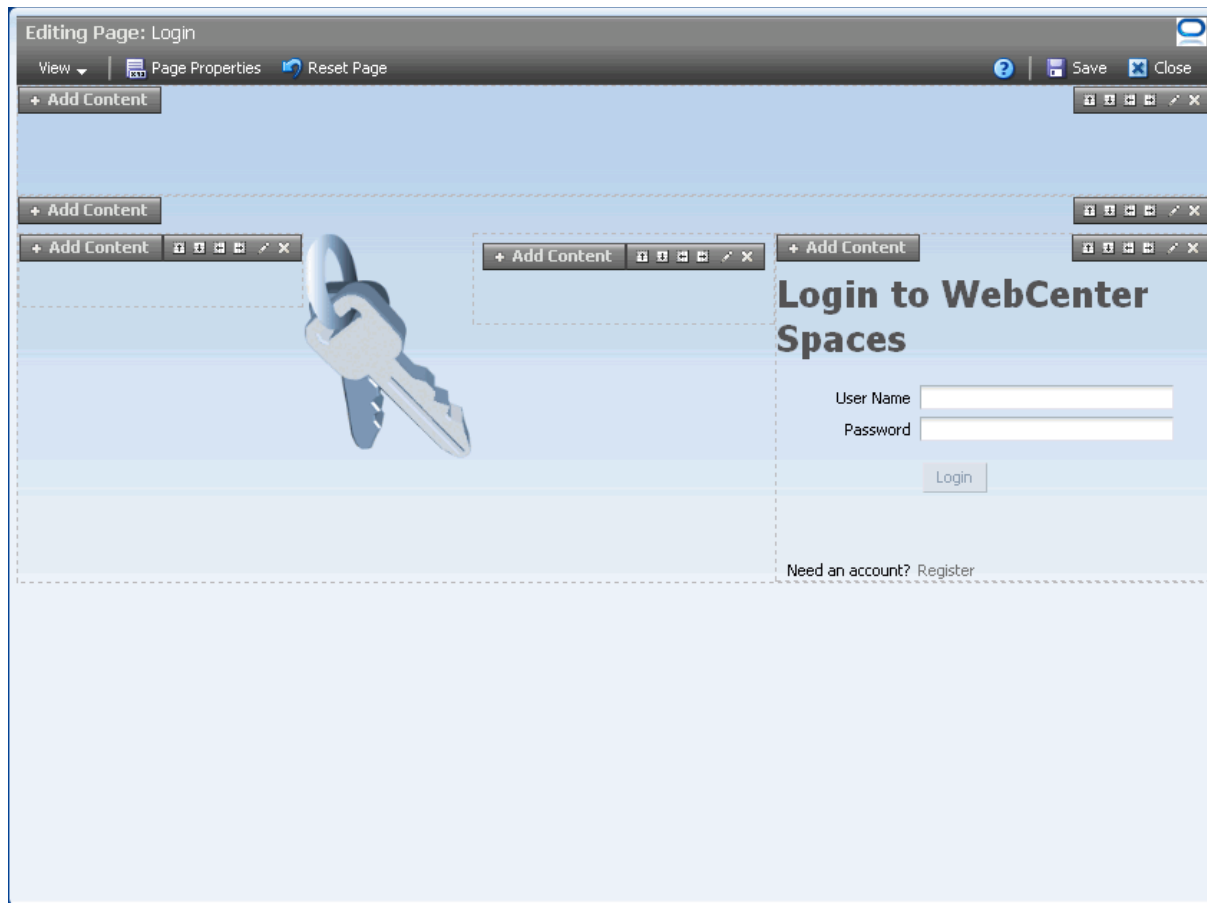

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **General** tab to bring it forward.
3. In the **Global Pages** section, click the **Edit** icon associated with the Login page ([Figure 29–22](#)) to open the page in Oracle Composer.

Figure 29–22 Edit Icon for Login Page

Alternatively, click **View** to see how the current page appears.

4. In Oracle Composer, add new components and change the page layout as required ([Figure 29–23](#)).

Figure 29–23 Customizing the Login Page

5. Click **Save** to save your changes, and then click **Close** to exit Oracle Composer.

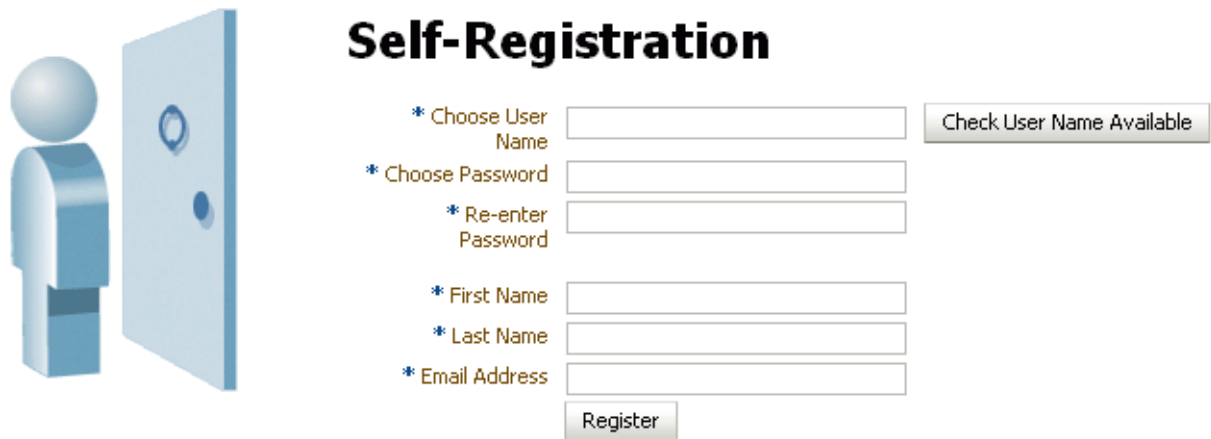

Tip: To remove all of your customizations and revert back to the default Login page, follow steps 1 and 2 in this section, and then click **Restore Default** next to **Login Page** (Figure 29–22).

29.3.3 Customizing the Self-Registration Page

The Self-Registration page enables anyone with web access to register with WebCenter Spaces. For more information about self-registration, see [Section 28.4, "Allowing Self-Registration."](#)

Figure 29–24 shows the default Self-Registration page that is supplied out-of-the-box.

Figure 29–24 Default Self-Registration Page

Self-Registration

* Choose User Name

* Choose Password

* Re-enter Password

* First Name

* Last Name

* Email Address

Users with the `Administrator` role can customize certain aspects of this page through Oracle Composer. Administrators cannot edit or delete input fields and buttons on the page, but they can add new components and change the page layout. For example, as the administrator, you might want to add some text to the page to describe your password policy.

To view and customize the Self-Registration page through WebCenter Administration:

1. Log in to WebCenter Spaces with administrative privileges as described in [Section 26.1](#), and click the **Administration** link at the top of the application.
2. Click the **General** tab to bring it forward.
3. In the **Global Pages** section, click the **Edit** icon associated with the Self-Registration page to open it in Oracle Composer ([Figure 29–25](#)).

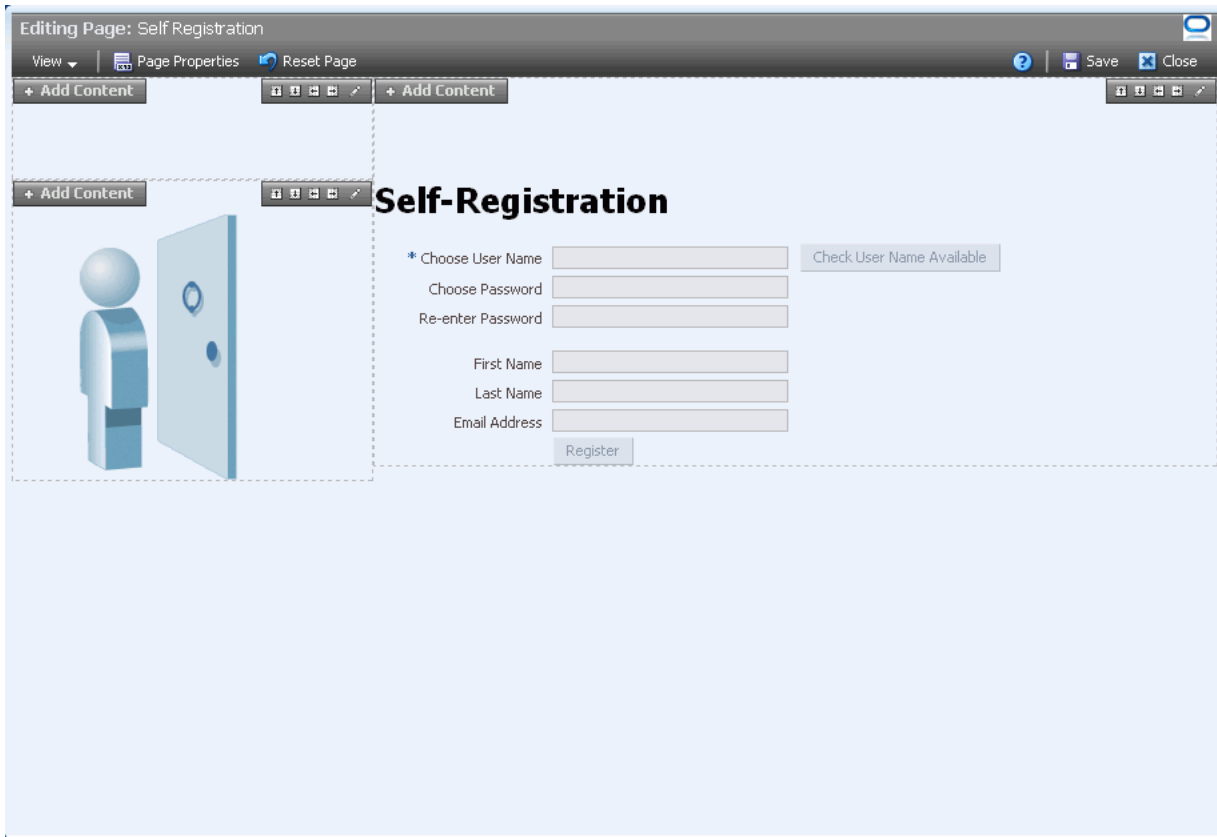

Figure 29–25 Edit Icon for Self-Registration Page

Alternatively, click **View** to see how the current page appears.

4. Add new components and change the page layout as required ([Figure 29–26](#)).

Figure 29–26 Customizing the Self-Registration Page

5. Click **Save** to save your changes, and then click **Close** to exit Oracle Composer.

Tip: To remove all of your customizations and revert back to the default page, follow steps 1 and 2 in this section, and then click **Restore Default** next to **Self-Registration Page** (Figure 29–25).

29.3.4 Preventing Public Users From Seeing Personal or Business Role Pages

For security reasons, you may not want WebCenter Spaces users to share their personal pages with public users. You can restrict public access by disabling the `Application-View` permission for all public users. For more information, see [Section 28.3.4, "Granting Permissions to the Public-User."](#)

Making Applications Available in WebCenter Spaces

The Applications pane in the Sidebar provides offers WebCenter users quick access to applications they use the most. It is the WebCenter Spaces administrator's job to manage the content of the Applications pane. You control the range of applications available, the way they are presented, and how they are launched.

This section includes the following subsections:

- [Section 30.1, "What You Should Know About the Applications Pane"](#)
- [Section 30.2, "Making an Application Available to WebCenter Users"](#)
- [Section 30.3, "Editing Links in the Applications Pane"](#)
- [Section 30.4, "Arranging the Applications List"](#)
- [Section 30.5, "Locking Applications Displayed in the Applications Pane"](#)
- [Section 30.6, "Removing Links from the Applications Pane"](#)

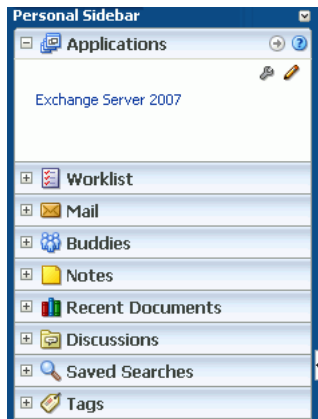

Providing they are not locked, individual WebCenter users may hide links to applications if they do not need them. See "Hiding and Showing Task Flows in the Sidebar" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Audience

The content of this chapter is intended for WebCenter Spaces administrators. Users granted the WebCenter Spaces Administrator role or a custom role that grants the Application-Manage permission).

30.1 What You Should Know About the Applications Pane

WebCenter Spaces offers users centralized access to frequently-used Web applications from the Sidebar. The WebCenter Spaces administrator manages the range of applications available, the way they are presented, and how they are launched from the Applications pane ([Figure 30-1](#)).

Figure 30–1 Sidebar - Applications Pane

WebCenter users need not know nor care about where the information comes from, they simply click a link to launch their day-to-day applications, and if necessary, supply their user name and password information. WebCenter users may hide links that they do not use but they cannot add links of their own.

The Applications pane can launch different types of application:

- **External Applications** - Web-based, external applications that perform their own user authentication. WebCenter administrators must register external applications through the Oracle Enterprise Manager Fusion Middleware Control Console before exposing them in WebCenter Spaces. For more information, see [Section 22.2.1, "Registering External Applications Using Fusion Middleware Control"](#).
- **WebCenter Task Flows** - Built-in task flows specific to WebCenter Spaces. A range of WebCenter task flows are available out-of-the-box including Document Library Viewer, Discussions Viewer, and more. Any of these can be launched directly from the Applications pane.

For more information, see [Section 30.2, "Making an Application Available to WebCenter Users"](#).

30.2 Making an Application Available to WebCenter Users

The Applications pane can display links to external applications registered through Fusion Middleware Control Console and also links to any of the built-in WebCenter task flows. When you expose an application through this pane, the application becomes available to every WebCenter user.

Some WebCenter users may not want to see all the applications offered through the Applications pane. If this is the case, individuals may personalize their view to show only those applications they must access.

To make an application available to WebCenter users:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. In the Sidebar, click the Edit icon for the Applications pane ([Figure 30–2](#)).
If you do not have administrative privileges you will not see this icon.

Figure 30–2 Applications Pane - Edit Icon

When you edit the Applications pane, every WebCenter user will see your changes.

Note: For information about the Sidebar, see "Working with the WebCenter Spaces Sidebar" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

3. To add a link to an application, select the folder where you want the link to appear, and then click the green Add icon (Figure 30–3).

To add a new folder, click the New icon. To create a subfolder, expand the parent folder first. [Section 22.2, "Registering External Applications"](#)

Figure 30–3 Editing the Applications Pane

4. Navigate to the external application or task flow you require, and click its associated **Add** link (Figure 30–4).

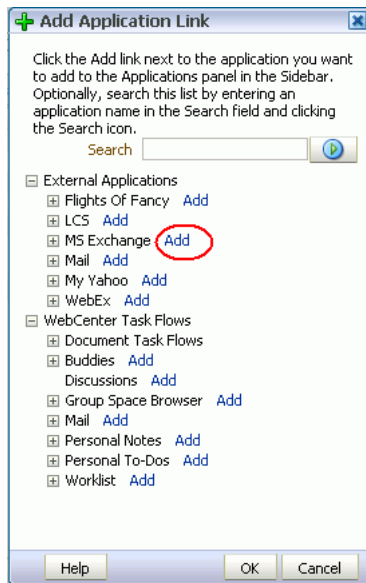

- To navigate to a previously registered external application, expand the **External Applications** node, and then expand the required application.

Only registered external applications which have a *Login URL* defined appear in this list. If the application you want is not listed, ask your WebCenter administrator to register the application for you. See also [Section 22.2, "Registering External Applications"](#).

- To navigate to a task flow, expand the **WebCenter Task Flows** node. If necessary, expand one or more subfolders to access the required task flow.

If you are not sure of the exact name, enter a full or partial search term in the **Search** box, and then click **Find** to search for the application. Application names matching your search criteria are displayed.

Figure 30–4 Choosing an Application

An information message displays indicating whether the application link was successful.

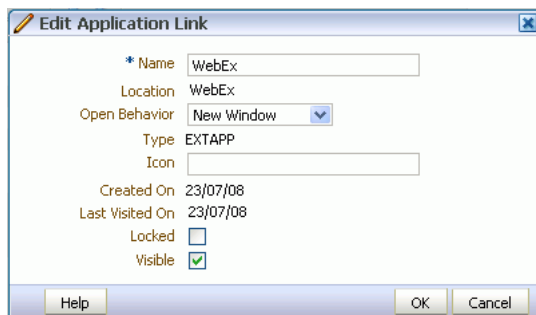

5. Click **OK** to dismiss the message box.
6. To add another application, repeat steps 4 and 5.
7. Click **OK** to return to the Edit Applications dialog box.

The selected application(s) appears within your chosen folder. From here, you can change the display name for the application link and set other display-related properties.

8. To edit link details for an application, highlight the row in the table and then click the Edit icon.

The Edit Application Link dialog box opens (Figure 30–5).

Figure 30–5 Editing Application Links

9. Edit the link display properties, as required.

For details, see [Table 30–1, " Application Link Properties"](#):

Table 30–1 Application Link Properties

Property	Description
Name	Enter the link text that WebCenter users will click to launch the application.
Location	(Read-only) Displays the internal name for the application or task flow.
Open Behavior	Choose how the application displays when users click the link: <ul style="list-style-type: none"> ■ WebCenter Tab - Application displays as a tab in WebCenter Spaces, and the application displays there. The current WebCenter Spaces context is maintained. ■ New Window - Application opens in a new browser window. The current WebCenter Spaces context is maintained. This is the default selection. ■ Current Window - Application opens in the current browser window (in place of WebCenter Spaces).
Type	(Read-only) Displays the link type: EXTAPP - External application or TASKFLOW - WebCenter task flow
Icon	Associate an icon with the application. Enter a full qualified URL or a relative URL that specifies the location of a valid icon. The icon displays alongside the link in the Sidebar. For best results, choose an icon that is 16 x 16 pixels.
Created On	Shows when the link was created.
Last Visited On	Shows the last time a user clicked the link. If a link is not used very often or at all, you might consider removing it from the Applications pane.
Locked	Indicate whether WebCenter users are allowed to show/hide the link. Select Locked to prevent users from showing/hiding the link. Deselect Locked to let the user decide whether the link displays in their personal view. Individuals users can show or hide the link depending of whether they need access to the application from the Sidebar.
Visible	Indicate whether WebCenter users see a link to this application in the Applications pane. Select Visible to show the link. Deselect Visible to hide the link.

10. Click **OK** to save.

11. Click **Close** to dismiss the Edit Application Link dialog box.

New or updated links appear in the Applications pane. Click the link to test that it works correctly.

30.3 Editing Links in the Applications Pane

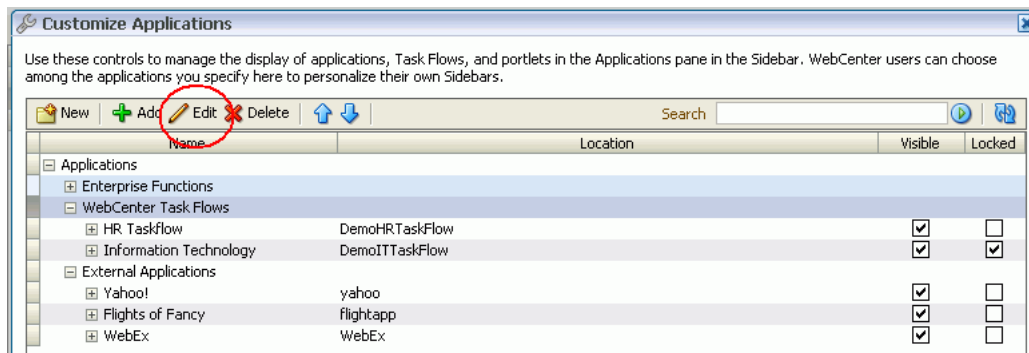

To edit a link displayed in the Applications pane:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. In the Sidebar, click the Edit icon for the Applications pane.

Note: When you edit the Applications pane, every WebCenter user sees your changes.

3. Select an application link by highlighting the row in the table.
4. Click the Edit icon (Figure 30–6).

Figure 30–6 Editing Application Links

5. Edit the link properties, as required. For details, see [Table 30–1, "Application Link Properties"](#).
6. Click OK to save.
7. Click Close to dismiss the Edit Applications dialog box.

30.4 Arranging the Applications List

As WebCenter Spaces administrator, you choose the display order of links in the Applications pane. You can also organize your application links into a hierarchy by creating sub folders. These sub folders, which can represent topic areas, can be nested into other sub folders (Figure 30–7).

Figure 30–7 Arranging the Applications List

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. In the Sidebar, click the Edit icon for the Applications pane.

Note: When you edit the Applications pane, every WebCenter user sees your changes.

3. Reorganize your applications. For example:
 - **Rearrange the display order.** Select an application or a folder, and then click the Move Up and Move Down icons until it appears in the correct place. When you move a folder, everything under the folder moves with it.
Alternatively, drag and drop an application to the correct position.
 - **Create a new folder or sub folder.** Select a parent folder (if required), click the New Folder icon, enter a suitable **Name**, and then click **Create**.
 - **Rename a folder.** Click the **Display Name** and edit the folder name in place.
4. Click **Close** to save.

30.5 Locking Applications Displayed in the Applications Pane

WebCenter Spaces administrators can lock links displayed in the Applications pane. When you lock a link, WebCenter users are not allowed to show/hide the link.

Unlock links to let the user decide whether the link displays in their personal view. Individuals users can show or hide the link depending of whether they need access to the application from the Sidebar.

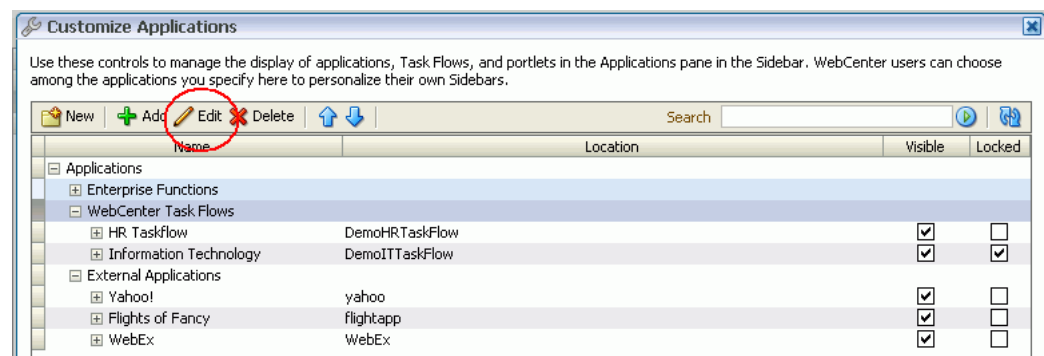

To lock an application link:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. In the Sidebar, click the Edit icon for the Applications pane.

Note: When you edit the Applications pane, every WebCenter user will see your changes.

3. Select the required application by highlighting the row in the table.
4. Click the Edit icon ([Figure 30–8](#)).

Figure 30–8 Editing Application Links

5. To lock the application, select **Locked**.

6. Click **OK** to save.
7. Click **Close** to dismiss the Edit Applications dialog box.

30.6 Removing Links from the Applications Pane

When application links are no longer required, WebCenter Spaces administrators can remove them from the Applications pane.

Removing links is permanent. If a link might be useful in the future, consider hiding the link instead (by deselecting the **Visible** property). For details, see [Section 30.3, "Editing Links in the Applications Pane"](#).

To permanently remove an application link:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. In the Sidebar, click the Edit icon for the Applications pane.

Note: When you edit the Applications pane, every WebCenter user will see your changes.

3. Select the required application (or application folder) by highlighting the row in the table.
4. To remove the application link, click the Delete icon.
When you delete a folder, you delete the folder and all the applications displayed in the folder.
5. Click **Delete** to confirm.
6. Click **Close** to dismiss the Edit Applications dialog box.

Managing Group Spaces in WebCenter Spaces

This chapter describes how a WebCenter Spaces administrator with `Group Spaces-Manage` or `Group Space Templates-Manage` permissions can manage everyone's group spaces and group space templates in WebCenter Spaces. It includes the following sections:

- [Section 31.1, "What You Should Know About Group Space Management"](#)
- [Section 31.2, "Viewing Group Space Information"](#)
- [Section 31.3, "Changing the Status of a Group Space"](#)
- [Section 31.4, "Enabling and Disabling Services"](#)
- [Section 31.5, "Managing Group Space Templates"](#)
- [Section 31.6, "Troubleshooting"](#)

For more information about exporting and importing group space information, see [Chapter 32, "Exporting and Importing Group Spaces"](#).

Audience

This chapter is intended for WebCenter Spaces administrators (users granted the `WebCenter Spaces Administrator` role or a custom role that grants the `Application-Manage` permission).

31.1 What You Should Know About Group Space Management

WebCenter Spaces administrators with `Group Spaces-Manage` or `Group Space Templates-Manage` permissions can manage any group space or group space template on the **WebCenter Administration > Group Spaces** page ([Figure 31-1](#)). From here, you can take any group space temporarily offline and close down any group spaces deemed inactive. Administrators can rename and edit any group space, as well as delete group spaces when they are no longer required.

Group space moderators do not have access to this page. While group space moderators may perform *some* of these tasks for group spaces that they own through group space administration, the WebCenter Spaces administrator can manage all of them.

The **Group Spaces** administration page offers import and export services, too. For more information, see [Chapter 32, "Exporting and Importing Group Spaces"](#).

Figure 31–1 WebCenter Administration - Group Spaces

31.2 Viewing Group Space Information

WebCenter Spaces administrators can view and manage any group space on the **WebCenter Administration > Group Spaces** page. From here, you can quickly see whether group spaces are active, online, offline, who created the group space (the group space moderator), and the date on which group spaces were created.

The **Actions** icon menu offers additional options for editing, renaming, and deleting group spaces, and if you select **About Group Space** you can access useful information such as the group's space direct URL and internal ID (Figure 31–2).

Figure 31–2 About Group Space

By default, group spaces are listed alphabetically. To view the information sorted by a different column, click the sort icon for the column. Sort icons appear when you hover the mouse cursor over the column header.

To display the group space administration page:

1. Log in to WebCenter Spaces with administrative privileges.
See Section 26.1, "Logging into WebCenter Spaces as an Administrator".
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Group Spaces** subtab.

31.3 Changing the Status of a Group Space

WebCenter Spaces administrators can change the status of any group space. This section describes the steps to perform the following tasks:

- Section 31.3.1, "Taking Any Group Space Offline"

- [Section 31.3.2, "Bringing Any Group Space Back Online"](#)
- [Section 31.3.3, "Closing Any Group Space"](#)
- [Section 31.3.4, "Reactivating Any Group Space"](#)
- [Section 31.3.5, "Deleting a Group Space"](#)

31.3.1 Taking Any Group Space Offline

When a group space is offline, members of the group space who do not have Group Spaces-Manage permission are unable to access the group space. If members try to access the group space, they will see the *Group Space Unavailable* page. See also "Customizing the Group Space Unavailable Page" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

Administrators and group space members with Group Spaces-Manage permission can access a group space that is offline. So if, for example, an administrator who notices inappropriate content can take a group space offline, fix the content, and bring it back online later.

To permanently close down a group space that is not being used any more, see [Section 31.3.3, "Closing Any Group Space"](#).

To take a group space offline:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Group Spaces** subtab.
5. On the **Group Spaces** page, select the group space you require by highlighting the row in the table.
6. From the **Change State** dropdown list, select **Offline** ([Figure 31-3](#)).

Figure 31-3 Taking a Group Space Offline

7. Click **Save**.

31.3.2 Bringing Any Group Space Back Online

To bring any group space back online:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.

3. Click the **Group Spaces** tab.
4. Click the **Group Spaces** subtab.
5. On the **Group Spaces** page, select the required group space by highlighting the row in the table.
6. From the **Change State** dropdown list, select **Online** (Figure 31–4).

Figure 31–4 Bringing a Group Space Online

7. Click **Save**.

31.3.3 Closing Any Group Space

A WebCenter Spaces administrator can close any group space that is no longer being used. When you close a group space, the content is archived. The group space is removed from everyone's **Group Spaces** menu to avoid clutter, but its content remains accessible and searchable to those who may want to reference it.

Current members may still access the group space through My Group Spaces. See "Viewing Available Group Spaces" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

If you want to close down a group space temporarily, take the group space offline instead. See [Section 31.3.1, "Taking Any Group Space Offline"](#).

To close a group space:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Group Spaces** subtab.
5. On the **Group Spaces** page, select the required group space by highlighting the row in the table.
6. From the **Change Status** dropdown list, select **Closed** (Figure 31–5).

Figure 31–5 Closing a Group Space

7. Click **Save**.

31.3.4 Reactivating Any Group Space

WebCenter Spaces administrators and group space moderators may close a group space if it is no longer being used. If you want to reopen a group space, you can do so.

To reactivate a group space:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Group Spaces** subtab.
5. On the **Group Spaces** page, select the required group space by highlighting the row in the table.
6. From the **Change Status** dropdown list, select **Active** ([Figure 31-6](#)).

Figure 31-6 *Activating a Group Space*

7. Click **Save**.

31.3.5 Deleting a Group Space

WebCenter Spaces administrators with the `Group Spaces-Manage` permission can delete any group space. Once a group space is removed from WebCenter Spaces, it cannot be recovered. Group spaces are permanently removed and current members will no longer see the group space in their view.

Most group space data is deleted too; the exceptions are group space discussions, announcements, wikis, and blogs, which remain on the associated back-end servers.

You cannot delete a group space while the moderator is editing group space settings, but there are no other restrictions.

To delete a group space that is no longer required:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Group Spaces** subtab.
5. On the **Group Spaces** page, select the required group space by highlighting the row in the table.

Ctrl-Click rows to select more than one.

- Click the **Actions** icon for the page, and choose **Delete** (Figure 31–7).

Figure 31–7 Deleting a Group Space

- Click **Delete** to confirm that you want to delete the group space(s).

If the delete process fails for any reason, the group space is not removed from the administrator's **Group Spaces** tab; this sometimes happens when a back-end server cannot be contacted. If the administrator clicks **Delete** again from here, the group space will be removed.

31.4 Enabling and Disabling Services

WebCenter Spaces services, such as Discussions and Mail, are configured by your Fusion Middleware Administrator through Fusion Middleware Control or using the WLST command-line tool. New services automatically become available in WebCenter Spaces when the application starts up—no additional configuration is required inside WebCenter Spaces. Likewise, there is no facility to disable services for the entire application as the Fusion Middleware Administrator takes care of this through Fusion Middleware Control. See [Section 2, "Getting WebCenter Spaces Up and Running"](#).

You can enable and disable services for individual group spaces inside the WebCenter Spaces application: Announcements, Discussions, Documents, Group Space Events, Instant Messaging and Presence, Lists, and Mail. In most cases, the group space moderator will manage service requirements for their own group space, but WebCenter Spaces administrators can also perform this task if required to do so. For details, see "Enabling and Disabling Services Available to a Group Space" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

31.5 Managing Group Space Templates

WebCenter Spaces administrators with the Group Space Templates-Manage permission can review, publish, hide, and delete any group space template. This section describes how to perform these tasks:

- Section 31.5.1, "What You Should Know About Managing Group Space Templates"
- Section 31.5.2, "Viewing Group Space Templates"

- [Section 31.5.3, "Publishing and Hiding Group Space Templates"](#)
- [Section 31.5.4, "Deleting a Group Space Template"](#)

31.5.1 What You Should Know About Managing Group Space Templates

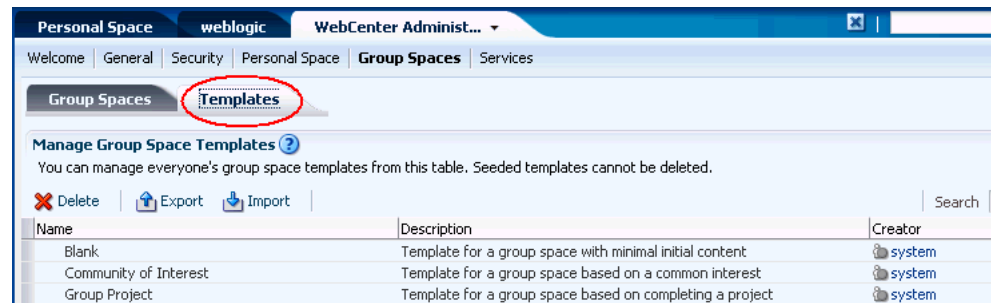

Several group space templates are provided out-of-the-box: Group Project, Community of Interest, and Blank. In addition to these, users with the Group Spaces-Create permission can create customized templates from group spaces and share them with other users. For more information, see "What You Should Know About Group Space Templates" and "Creating Your Own Group Space Templates" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

WebCenter administrators with the Group Space Templates-Manage permission can manage *every* group space template from the **WebCenter Administration > Templates** page ([Figure 31-8](#)). You can see which group space templates are currently available and delete group space templates when they are no longer required. You can also publish templates—making them available to everyone—or restrict them to private use only.

It is important to keep the template list up to date and valid. Anyone who creates a group space will see public templates as well as their own private templates.

The **Templates** page provides import and export services, too. For more information, see [Chapter 32, "Exporting and Importing Group Spaces"](#).

Figure 31-8 WebCenter Administration - Templates Page

31.5.2 Viewing Group Space Templates

WebCenter Spaces administrators with the Group Space Templates-Manage permission can view and manage any group space through the **WebCenter Administration > Templates** page. From here, you can quickly see who created each group space template (the group space moderator), and the date on which it was created. The **Actions** menu offers additional options for deleting group space templates, and you can publish and hide templates from here, too.

By default, group space templates are listed alphabetically. To view the information sorted by a different column, click the sort icon for the column. Sort icons appear when you hover the mouse cursor over the column header.

To see a list of every group space template in WebCenter Spaces, together with their description, creator, and other useful information:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.

3. Click the **Group Spaces** tab.
4. Click the **Templates** subtab.

31.5.3 Publishing and Hiding Group Space Templates

While WebCenter Spaces can accommodate any number of templates, a limited number of templates is sometimes more effective. The WebCenter Spaces administrator or users granted the `Group Space Templates - Manage` permission can maintain the template list on the **WebCenter Administration > Group Spaces > Templates** page. To view the **WebCenter Administration > Group Spaces > Templates** page, a user must additionally be granted `Application-Configure` permission by the WebCenter Spaces administrator.

To publish or hide a group space template:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Templates** subtab.
5. On the **Templates** page, from the **Actions** menu, choose:
 - **Publish Group Space Template** to share the template with everyone.
 - **Make Group Space Template Private** to remove the template from the group space template list. The template owner can use the template, but nobody else will see it.
6. Confirm your selection.

Note: The seeded (out-of-the-box) templates can be made private and published by the WebCenter Spaces administrator or users granted the `Group Space Templates - Manage` permission. If made private, they cannot be seen on the **My Group Spaces > Templates** page; they can only be seen on the **WebCenter Administration > Group Spaces > Templates** page.

31.5.4 Deleting a Group Space Template

WebCenter Spaces administrators with the `Group Space Templates-Manage` permission can delete any group space template except the seeded (out-of-the-box) templates: Blank, Community of Interest, Group Project.

To delete a group space template that is no longer required:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Templates** subtab.
5. On the **Templates** page, select the required template by highlighting the row in the table.

Ctrl-Click rows to select more than one template.

6. Click the **Delete** icon (Figure 31–9) or choose **Delete Group Space Template** from the **Actions** menu.

Figure 31–9 Deleting a Group Space Template

7. Click **Yes** to confirm that you want to delete the selected template(s).

31.6 Troubleshooting

This section includes troubleshooting information in the following sections:

- [Section 31.6.1, "Troubleshooting WebCenter Spaces Workflows"](#)
- [Section 31.6.2, "Troubleshooting Service Provisioning Issues"](#)

31.6.1 Troubleshooting WebCenter Spaces Workflows

If you experience issues with WebCenter Spaces workflows, review the following sections:

- [Section 31.6.1.1, "Validating the WebCenter Workflow Configuration"](#)
- [Section 31.6.1.2, "Troubleshooting Issues with WebCenter Spaces Workflows"](#)

31.6.1.1 Validating the WebCenter Workflow Configuration

The *Oracle Fusion Middleware Installation Guide for Oracle WebCenter* describes how to install and configure WebCenter Spaces workflows. For details, see "Back-End Requirements for WebCenter Spaces Workflows". You can validate the workflow configuration as follows:

1. Log in to WebCenter Spaces.
2. Create a group space and then navigate to the **Members** tab (group space settings).
3. Invite a new member with any role (say `User2`).
4. Log out, and then log in to WebCenter Spaces as `User2`.
5. Expand **Worklist** in the sidebar.
6. Open the invite notification and click the **Accept** button.
7. Open **My Group Spaces**.

If the WebCenter Spaces workflows are working properly, the newly created group space appears in **My Group Spaces** for `User2`. If the group space is not listed, there is some issue with the configuration.

31.6.1.2 Troubleshooting Issues with WebCenter Spaces Workflows

If WebCenter Spaces workflows are not working properly, follow these steps to help troubleshoot the issue:

1. Check that WebCenter Spaces workflows are deployed on the Oracle SOA server:
 - a. Log in to Fusion Middleware Control.
 - b. Check that **WebCenterWorklistDetailApp.ear** is deployed.
 - c. Verify that **sca_CommunityWorkflows_rev1.0.jar** is deployed.

See "Oracle SOA Server - Workflow Deployment" in *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

2. Ensure the Web Service connection between the Oracle SOA server and WebCenter Spaces is secure:

- a. Check the alias in the keystore file on the Oracle SOA server.

For example, use the following command to list the content of the keystore file on the Oracle SOA server:

```
keytool -list -v -keystore bpel.jks -storepass <password>
```

There should be an entry with:

```
Alias name: webcenter_spaces_ws
```

See "Oracle SOA and Oracle WebCenter - WS-Security Configuration" in *Oracle Fusion Middleware Installation Guide for Oracle WebCenter*.

- b. Verify that the credential stores for both WebCenter Spaces and Oracle SOA server are configured correctly.

See "Updating the Credential Stores" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter*.

- c. Check that keystores exist at both ends of the connection, for example:

- webcenter.jks (copied to WebCenter Spaces end)
- bpel.jks (copied to Oracle SOA server end)

For example, the following commands generate `webcenter.jks` and `bpel.jks`:

```
keytool -genkeypair -keyalg RSA -dname
"cn=webcenter,dc=us,dc=oracle,dc=com" -alias webcenter -keypass mypassword
-keystore webcenter.jks -storepass mypassword -validity 360
keytool -exportcert -v -alias webcenter -keystore webcenter.jks -storepass
mypassword -rfc -file webcenter.cer
keytool -importcert -alias webcenter_spaces_ws -file webcenter.cer
-keystore bpel.jks -storepass mypassword
keytool -genkeypair -keyalg RSA -dname "cn=bpel,dc=us,dc=oracle,dc=com"
-alias bpel -keypass mypassword -keystore bpel.jks -storepass mypassword
-validity 360
keytool -exportcert -v -alias bpel -keystore bpel.jks -storepass mypassword
-rfc -file bpel.cer
keytool -importcert -alias bpel -file bpel.cer -keystore webcenter.jks
-storepass mypassword
```

See "Generating the Keystores" in the *Oracle Fusion Middleware Administrator's Guide for Oracle WebCenter*.

- d. Configure role members for the `BPMWorkflowAdmin` application role in Oracle SOA server (`soa-infra`).

When associating the domain with an identity store that does not contain the user `weblogic`, you must assign some other valid user to the application role `BPMWorkflowAdmin`. Use WLST commands to do this from the SOA Oracle home, for example, to assign a user named "monty" that exists in LDAP:

```
cd $SOA_ORACLE_HOME/common/bin/
wlst.sh

connect('<admin username>', '<admin password>',
'mysoahost.us.oracle.com:7001')
revokeAppRole(appStripe="soa-infra", appRoleName="BPMWorkflowAdmin",
principalClass="oracle.security.jps.service.policystore.ApplicationRole",
principalName="SOAAdmin")
grantAppRole(appStripe="soa-infra", appRoleName="BPMWorkflowAdmin",
principalClass="weblogic.security.principal.WLSUserImpl",
principalName="monty")
```

See "Security Commands" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

31.6.2 Troubleshooting Service Provisioning Issues

When you create a group space, an error similar to the following may display if provisioning a service exceeds the time allowed:

```
Group space created with the following warning(s) : Issues were faced while
provisioning the service(s) - List Service. Check the group space services
settings page if these services have been provisioned.
```

When a group space is created, services are provisioned in parallel in multiple threads. If provisioning a service exceeds the specified timeout, the thread is interrupted. The timeout may be exceeded due to time needed to copy the metadata when the latency between the midtier and the database is too high, network issues, database performance issues, and so on.

To check if the issue is due to exceeding the timeout, search the log file for a message similar to the following:

```
[2009-10-19T08:43:22.659+00:00] [WLS_Spaces] [WARNING] []
[oracle.webcenter.webcenterapp] [tid: [ACTIVE].ExecuteThread: '0' for queue:
'weblogic.kernel.Default (self-tuning)'] [userId: weblogic] [ecid:
0000IHfxTHMDScx_TtCCyc1Ar22000002f,0] [APP: webcenter] Concurr: The thread is
timed out in 5000 milisec. for oracle.webcenter.list:Execution timedout[[
  queued :   13 ms
  suspended :    0 ms
  running : 5787 ms
  timeout : 5000 ms
  service : oracle.webcenter.community
  resource : oracle.webcenter.list
  source : oracle.webcenter.concurrent.RunnableTask@43c4d1
           (oracle.webcenter.concurrent.RunnableTask)
  submission : 3
]]
```

In this case, the running time of 5787 ms exceeded the timeout of 5000 ms.

If possible, the root cause of the timeout should be addressed; for example, resolve networking or database performance issues. Once this is done, the group space can be created again and the error should not be encountered. If the performance cannot be improved and the error persists, the timeout value may be increased for the service encountering the error. For more information, see [Section A.5.5, "Configuring Concurrency Management."](#)

Exporting and Importing Group Spaces

Oracle WebCenter provides a set of export and import utilities that enable you to back up or move group space information between WebCenter applications, and stage or production environments. This chapter describes how to export and import group spaces and group space templates through WebCenter Spaces administration page. It includes the following sections:

- [Section 32.1, "Exporting Group Spaces"](#)
- [Section 32.2, "Importing Group Spaces"](#)
- [Section 32.3, "Exporting Group Space Templates"](#)
- [Section 32.4, "Importing Group Space Templates"](#)

Fusion Middleware Administrators can also export/import group spaces and group space templates using WLST commands. To find out more about these WLST commands, how to migrate the back-end data associated with group spaces, and also how to export an entire WebCenter Spaces application, see [Section 25.1, "Exporting and Importing WebCenter Spaces for Data Migration"](#).

Audience

The content of this chapter is intended for WebCenter Spaces administrators. Users granted the WebCenter Spaces Administrator role or a custom role that grants the Application-Manage permission).

32.1 Exporting Group Spaces

WebCenter Spaces administrators can export group spaces and import them into other WebCenter Spaces applications. Group spaces must be taken offline, even if only temporarily, to prevent data conflicts during the export process. See, [Section 31.3.1, "Taking Any Group Space Offline"](#).

Group space information is exported into a single export archive (.ear file). The EAR file contains a metadata archive (.mar file) and, optionally, a single XML file containing group space security policy information. You can save export archives to your local file system or to a remote server file system.

For more information about what is exported, read [Section 25.1.1, "Understanding WebCenter Spaces Export and Import"](#)

The export process does not include data associated with external services such as Mail, Discussions, Announcements, Wikis, Blogs, Instant Messaging and Presence, Personal Event, and Documents, as all this data is stored on external servers. To learn how to move data associated with these services, refer to documentation for that

product. See also, [Section 25.1.7, "Migrating Back-end Components for Individual Group Spaces"](#).

Note: No icons, skins, images, out-of-the-box templates, or personalizations are exported. Personalizations are changes that individuals make to their personal view of a group space. See also, "Personalizing Your Page View" in *Oracle Fusion Middleware User's Guide for Oracle WebCenter*.

WebCenter Spaces administrators can export group spaces through WebCenter Spaces Administration as described here. Fusion Middleware administrators can also export group spaces using WLST commands. For details, see [Section 25.1.9.2, "Importing Group Spaces Using WLST"](#).

You can also export group space templates but this is a separate process. You cannot export group spaces and group space templates into a single archive. For details, see [Section 32.3, "Exporting Group Space Templates"](#).

To export one or more group spaces using WebCenter Spaces:

1. Log in to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Group Spaces** subtab.
5. Select the group space required by highlighting the row in the table.

To select multiple group spaces, **Ctrl-click** or **Shft-click** multiple rows.

Ensure that all the group spaces you select are *offline*. Group spaces must be taken offline, even if only temporarily, to prevent data conflicts during the export process. Unsaved changes are not exported. See also [Section 31.3.1, "Taking Any Group Space Offline"](#).

Note: Members with the Group Space-Manage permission should avoid editing group spaces that are taken offline during the export process.

6. Click **Export** in the toolbar.

The Export Group Spaces dialog box opens ([Figure 32-1](#)).

Figure 32–1 Exporting Group Spaces

7. Change the **Export Archive Name** or accept the default name.

To ensure uniqueness, the default .ear filename contains a timestamp:
webcenter_spaces_ts_<timestamp>.ear

8. Set export options as required. For details, see [Table 32–1](#):

Table 32–1 Group Space Export Options

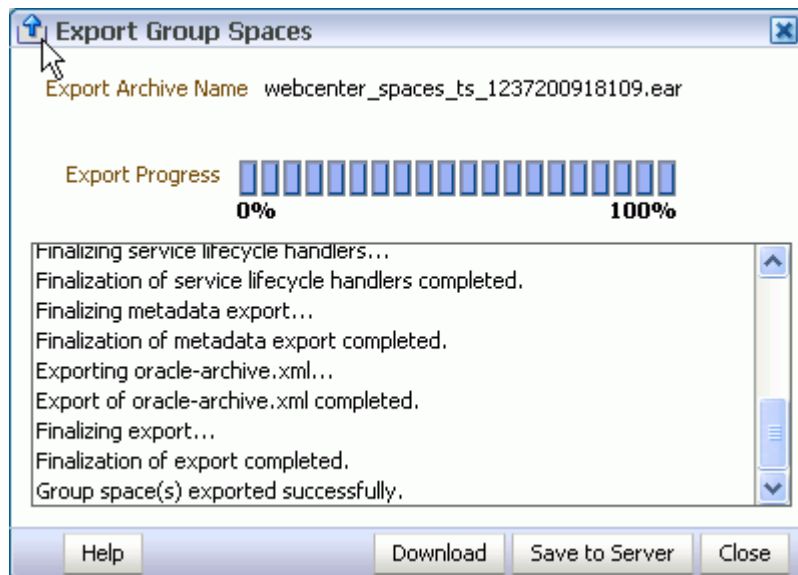

Field	Description
Include Services Data	<p>Select to export the following</p> <ul style="list-style-type: none"> ■ Data stored in the WebCenter repository for the following services: Group Space Events, Lists, Links, Tags, People Connections ■ Default settings for Profiles, Message Boards, Feedback, Connections, Activity Streams ■ Activity Stream Task Flow Customizations <p>If the group spaces selected for export contain a large amount of data, consider using the database export utilities to move the WebCenter schema data instead. For example:</p> <pre>DB_ORACLE_HOME/bin/expdp \"sys/password@serviceid as sysdba\" OWNER=srcrcuprefix_WEBCENTER FILE=/tmp/WCS.dmp STATISTICS=none</pre> <pre>DB_ORACLE_HOME/bin/impdp \"sys/password@serviceid as sysdba\" FROMUSER=srcrcuprefix_WEBCENTER TOUSER=tgtrcuprefix_WEBCENTER FILE=/tmp/WCS.dmp STATISTICS=none TRANSFORM=oid:n</pre> <p>For details, refer to the <i>Oracle Database Utilities</i> guide.</p> <p>Deselect this option if you do not want to export any data associated with lists, events, tags, links, and people connection services. For example, when moving a group space from a test environment to a stage or production environment where test data is not required.</p>
Include Customizations	<p>Select to export group space customizations. For information about which customizations are optional on export, see Table 25–3 and Table 25–4.</p> <p>If you deselect this option, WebCenter Spaces is exported without these group space customizations.</p> <p>Portlet and page customizations are always exported. See also Figure 25–1, "Information Exported with WebCenter Spaces".</p>

Table 32–1 (Cont.) Group Space Export Options

Field	Description
Include Security Policy	<p>Select to migrate security information with the group space.</p> <p>When selected, an XML file is generated (<code>policy-store.xml</code>) containing the following security related information:</p> <ul style="list-style-type: none"> Group space roles (and permissions assigned to each role). Group space members (and member role assignments). <p>Deselect this option if you do not want to export group space security information. This option is useful when exporting group spaces between a stage and production environments, where:</p> <ul style="list-style-type: none"> Members used during testing are not required in the production environment. The group space exists on the production instance and you do not want to overwrite the security information. <p>Note: When exporting a brand new group space, always select (check) this option as you cannot import a new group space without a security policy.</p>

9. Click **Start Export**.

Progress information is displayed during the export process (Figure 32–2).

Figure 32–2 Exporting Group Spaces In Progress

10. When the export process is complete, specify a location for the export archive (.ear). Select one of:

- Download** - Saves the export EAR file to your local file system.
 Your Browser downloads and save the archive locally. The actual download location depends on your Browser set up.
- Save to Server** - Saves the export .ear file to a server location.

When the Save to Server dialog box displays (Figure 32–3), enter a suitable path in **Server Location**, for example, `/tmp`, and then click **Save**. Ensure that the server directory you specify has `write` permissions.

Figure 32–3 Saving Group Space Export Archives to a Server Location

11. Click **Close** to dismiss the Export Group Spaces window.

The export archive (.ear) is saved to the specified location.

32.2 Importing Group Spaces

WebCenter Spaces administrators can import a group space archive (.ear) into another WebCenter Spaces application.

On import, *all* group spaces included in the archive are created or re-created on the target application. Existing group spaces are deleted then replaced, and new group spaces are created.

All group spaces need a security policy to work properly so, when you import a brand new group space for the first time, you must ensure that the group space's security policy is included in the export archive. Existing group spaces have a security policy in place so in this case, it's up to you whether to overwrite the security information on import or maintain the existing security policy.

If data migration is important, group space documents, discussions, and wikis and blogs can be migrated for individual group spaces. For details, see [Section 25.1.7, "Migrating Back-end Components for Individual Group Spaces"](#).

WebCenter Spaces administrators can import group spaces through WebCenter Spaces Administration as described here. Fusion Middleware administrators can also import group spaces using WLST commands. For details, see [Section 25.1.9.2, "Importing Group Spaces Using WLST"](#)

To import one or more group spaces:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Group Spaces** subtab.

Remember to take existing group spaces offline, before attempting to import a new version. For details, see [Section 31.3.1, "Taking Any Group Space Offline"](#).

5. Click **Import** in the toolbar.

The Import Group Spaces dialog box opens (Figure 32–4).

Figure 32–4 Importing Group Spaces

6. Specify the location of your group space archive (.ear). Select one of:
 - **Archive Located on Local File System** - Enter the **File System Location**. Alternatively, click **Browse** to locate the directory on the local file system where the .ear file is stored.
 - **Archive Located on Server File System** - Enter the path, including the archive filename, in **Server Location**. For example, /tmp/MyGroupSpaceExport.ear. You can specify any shared location accessible from this WebCenter Spaces application.
7. Click **Import**.

If you try to import group spaces that exist in the target WebCenter Space application, you must confirm whether you want to overwrite them. To delete existing group spaces and replace them with imported versions, answer **Yes**. Answer **No** to cancel the import process.

If the import process detects a conflict between the group spaces you are trying to import and those which exist on the target, a message displays to help you resolve the issue. For example, conflict messages display if a group space on the target application has the same name but a different GUID to a group space you are trying to import. In this instance you could change the name of the source group space and create a new export archive, or rename the conflicting group space in the target application and import the same archive.

An information message displays when all group spaces import successfully.

8. Click **Close** to dismiss the Import Group Space window.

Imported group spaces are *offline* initially because, mostly, some additional work is required before they are ready for general use. For example, you may want to migrate data associated with back-end components. For details, see:

[Section 25.1.7.2, "Importing Discussions for a Group Space"](#)

[Section 25.1.7.4, "Importing Wikis and Blogs for a Group Space"](#)

[Section 25.1.7.5, "Exporting Documents for a Group Space"](#)

Once content and membership details are finalized you may bring the group space online, see [Section 31–4, "Bringing a Group Space Online"](#).

32.3 Exporting Group Space Templates

WebCenter Spaces administrators can export group space templates and import them into other WebCenter Spaces applications. Out-of-the-box templates, such as the Group Project and Community of Interest templates, cannot be exported.

While export and import utilities are primarily used to move information between WebCenter Spaces applications, the group space template export feature is also useful as a backup service, and for sharing and exchanging templates with others.

Group space template information is exported into a single export archive (.ear file). The EAR file contains a metadata archive (.MAR file) and a single XML file containing group space security policy information.

Group space templates include pages, metadata, security information such as custom roles, and service information only; no data, such as documents, discussion threads, and list data, is stored with the template.

You can save export archives to your local file system or to a remote server file system.

WebCenter Spaces administrators can export group space templates through WebCenter Spaces Administration as described here. Fusion Middleware administrators can also export group space templates using WLST commands. For details, see [Section 25.1.11.2, "Exporting Group Space Templates Using WLST"](#),

Note: You can also export group space information but this is a separate process. For details, see [Section 32.1, "Exporting Group Spaces"](#). You cannot export group spaces and group space templates into a single archive.

To export one or more group spaces templates using WebCenter Spaces:

1. Login to WebCenter Spaces with administrative privileges.
See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).
2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Templates** subtab.
5. Select the group space templates required by highlighting the row in the table.
To select multiple group space templates, **Ctrl-click** the document rows.
6. Click **Export** on the toolbar.

The Export Group Space Template dialog box opens ([Figure 32–5](#)).

Figure 32–5 Exporting Group Space Templates

7. Change the **Export Archive Name** or accept the default name.
To ensure uniqueness, the default .ear filename contains a timestamp:
webcenter_templates_ts_<timestamp>.ear
8. Click **Start Export**.
Progress information is displayed during the export process ([Figure 32–6](#)).

Figure 32–6 Exporting Group Space Templates In Progress

9. When the export process is complete, specify a location for the export archive (.ear). Select one of:
 - **Download** - Saves the export EAR file to your local file system.
Your Browser downloads and save the archive locally. The actual download location depends on your Browser set up.
 - **Save to Server** - Saves the export .ear file to a server location. For example, /tmp. Ensure that there are write permissions on the server directory that you specify.

After clicking **Save to Server**, enter the **Server Location** and then click **Save**.

10. Click **Close** to dismiss the Export Group Space Templates window.

The export archive (.ear) is saved to the specified location.

32.4 Importing Group Space Templates

WebCenter Spaces administrators can import a group space template archive (.ear) into another WebCenter Spaces application.

On import, *all* group space templates included in the archive are re-created on the target application. If a group space template exists on the target, then it is deleted and replaced. If a group space template does not exist, then it is created.

Newly imported group space templates are not immediately available for general use. You must publish the imported templates to make them available to everyone. See [Section 31.5.3, "Publishing and Hiding Group Space Templates"](#).

WebCenter Spaces administrators can import group space templates through WebCenter Spaces Administration as described here. Fusion Middleware administrators can also import group space templates using WLST commands. For details, see [Section 25.1.11.2, "Exporting Group Space Templates Using WLST"](#).

To import one or more group space templates using WebCenter Spaces:

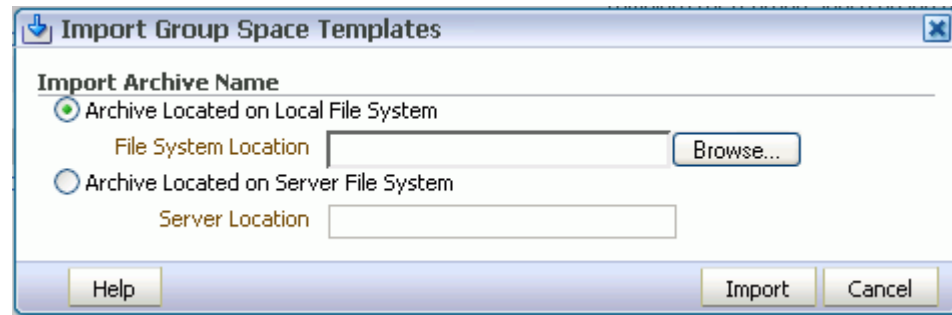

1. Login to WebCenter Spaces with administrative privileges.

See [Section 26.1, "Logging into WebCenter Spaces as an Administrator"](#).

2. Click the **Administration** link at the top of the application.
3. Click the **Group Spaces** tab.
4. Click the **Templates** subtab.
5. Click **Import** on the toolbar.

The Import Group Space Templates dialog box opens ([Figure 32-7](#)).

Figure 32-7 Importing Group Space Templates

6. Specify the location of your group space template archive (.ear). Select one of:
 - **Archive Located on Local File System** - Enter the **File System Location**. Alternatively, click **Browse** to locate the directory on the local file system where the .EAR file is stored.
 - **Archive Located on Server File System** - Enter the **Server Location**. Any shared location accessible from this WebCenter Spaces application.

7. Click **Import**.

If you try to import a group space template that exists in the WebCenter Spaces application, you must confirm whether you want to continue. To delete existing group space templates and replace them with imported versions, answer **Yes**. Answer **No** to cancel the import process.

An information message displays when all templates import successfully.

8. Click **Close** to dismiss the Import Group Space Templates window.

Newly imported group space templates are not immediately available for general use. You must publish the imported templates to make them available to everyone. See [Section 31.5.3, "Publishing and Hiding Group Space Templates"](#).

32.5 Troubleshooting Group Space Import and Export Issues

This section contains the following subsections:

- [Section 32.5.1, "ResourceLimitException Issue"](#)
- [Section 32.5.2, "Group Space Blocked After Unsuccessful Export or Import"](#)
- [Section 32.5.3, "Page or Group Space Not Found Message After Import"](#)
- [Section 32.5.4, "Group Space Import Archive Exceeds Maximum Upload File Size"](#)
- [Section 32.5.5, "Maximum Number of Group Spaces Exceeded on Export"](#)
- [Section 32.5.6, "Lists Not Imported Properly"](#)

32.5.1 ResourceLimitException Issue

This section provides the solution to resolve the `ResourceLimitException` issue which occurs during export.

Problem

In WebCenter Spaces, you try to export all group spaces or entire application and the following error displays:

```
Weblogic.common.resourcepool.ResourceLimitException
```

Solution

You must increase the maximum capacity in the JDBC connection pool. To reconfigure the connection pool, log in to the WLS Administration Console. From **Services**, select **Data Sources**, **JDBC**, and then the **Connection Pool** tab.

32.5.2 Group Space Blocked After Unsuccessful Export or Import

If an error occurs during a group space export/import operation, some group space(s) may appear blocked. To unblock a group space, bring the group space back online temporarily, and then take the group space offline again to complete the export/import operation. Switching between the online and offline modes will unblock the group space.

32.5.3 Page or Group Space Not Found Message After Import

When users first login to WebCenter Spaces after an import operation they may see a "Page not found" or "Group space not found" message if the page or group space they last visited no longer exists. Last accessed page information is retained during import operations which is why these messages display sometimes.

32.5.4 Group Space Import Archive Exceeds Maximum Upload File Size

Problem

There is a file size limitation uploading content to WebCenter Spaces. If your export archive exceeds the maximum upload size then the import operation through WebCenter Spaces administration will fail.

Solution

Import the group space archive using WLST. See [Section 25.1.9.2, "Importing Group Spaces Using WLST"](#).

Alternatively, modify the content repository upload parameter in `web.xml`. The default maximum upload size is 20 MB. See also, [Editing web.xml](#).

32.5.5 Maximum Number of Group Spaces Exceeded on Export

Problem

The maximum number of group spaces that you can export must be less than or equal to 80% of the connection pool size specified for the MDS Data Source.

Solution

Export fewer group spaces or modify the connection pool setting. For details, see [Section A.4.2, "Setting JDBC Data Source"](#).

32.5.6 Lists Not Imported Properly

Problem

Lists are not importing properly due to list definition differences in the source and target systems.

Solution

Consider exporting and importing list data. This ensures that list data is consistent with the list definitions being imported.

If you choose to import without data, the list data in the target system is migrated to be consistent with the imported list definitions. If a list column data type is changed, the column values are converted from the target data type to the imported data type, if possible, otherwise the value is deleted. If a list column is removed during import, the column values are deleted. .

WebCenter Configuration

The main configuration files for Oracle WebCenter applications are `adf-config.xml` and `connections.xml`. This appendix describes both these files, how to locate them in a WebCenter application deployment, and also when to configure these files and which tools to use. Other configuration files, such as `web.xml`, are described here too. See also, [Section 1.3.5, "Oracle WebCenter Configuration Considerations."](#)

This appendix also outlines how to tune configuration properties for the operating system on which WebCenter applications are installed, WebCenter applications, and their back-end components.

This appendix includes the following sections:

- [Section A.1, "Configuration Files"](#)
 - [Section A.1.1, "adf-config.xml and connections.xml"](#)
 - [Section A.1.2, "web.xml"](#)
- [Section A.2, "Cluster Configuration"](#)
- [Section A.3, "Configuration Tools"](#)
- [Section A.4, "Tuning Environment Configuration"](#)
- [Section A.5, "Tuning WebCenter Application Configuration"](#)
- [Section A.6, "Tuning Back-End Component Configuration"](#)
- [Section A.7, "Troubleshooting WebCenter Application Configuration Issues"](#)
- [Section A.8, "Troubleshooting WLST Command Issues"](#)

A.1 Configuration Files

`adf-config.xml`, `connections.xml`, and `web.xml` are used to configure WebCenter applications and their back-end services. This section describes how WebCenter applications use each file and the location of these files post deployment. This section includes the following sub sections:

- [adf-config.xml and connections.xml](#)
- [web.xml](#)

A.1.1 adf-config.xml and connections.xml

`adf-config.xml` and `connections.xml` both store design time configuration information, such as the discussions server, mail server, or Oracle Content Server that is used by the WebCenter application in the development environment:

- **adf-config.xml** - Stores application-level settings, such as the which discussions server or mail server the WebCenter application is currently using.

See also, *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

- **connections.xml** - Stores connection details for WebCenter services.

See also, *Oracle Fusion Middleware Fusion Developer's Guide for Oracle Application Development Framework*.

After you deploy a WebCenter application to a production environment, you can use Fusion Middleware Control or WLST commands to reconfigure some properties to meet your production requirements. For example, you can modify connection details to point to production server instances.

Any configuration changes that you make, post deployment, are stored as *customizations* in the WebCenter application's Oracle Metadata Services (MDS) repository. MDS uses the original deployed versions of `adf-config.xml` and `connections.xml` as base documents and stores all subsequent customizations separately into MDS using a single customization layer.

When a WebCenter application starts up, customizations stored in MDS are applied to the appropriate base documents and the WebCenter application uses the merged documents (base documents with customizations) as the final set of configuration properties.

For information on MDS customizations, see "Understanding the MDS Repository" in *Oracle Fusion Middleware Administrator's Guide*.

Locating Base Documents

`adf-config.xml` and `connections.xml` are both located in the `/META-INF` folder for your application. In a WebCenter application deployment (.ear), you will find the base documents of these files under:

```
DOMAIN_HOME/servers/server_name
```

For example, if the `DOMAIN_HOME` is `MW_HOME/wlshome/`
`/domains/wc_domain/`, both configuration files are located under
`MW_HOME/wlshome/user_projects/domains/wc_domain/servers/WLS_Spaces`.

To determine the exact location, search for the configuration file under this folder. For example, enter the following at a command prompt:

```
> cd  
MW_HOME/wlshome/user_projects/domains/wc_domain/servers/WLS_Spaces  
  
> find . -name adf-config.xml
```

A sample response, for this particular example, is as follows:

```
./tmp/_WL_user/webcenter/8gco54/adf/META-INF/adf-config.xml
```

You can locate `connections.xml` in a similar way.

Reviewing Post Deployment Customizations in MDS

Post deployment, always use Fusion Middleware Control or WLST commands to review the latest configuration or make configuration changes. In Fusion Middleware Control you will mostly use WebCenter application configuration screens but a useful Systems MBean Browser is also available for reviewing configuration settings. These tools always show you the current configuration so, typically, there is no need for you

to examine or change the content of base documents or MDS customization data for files such as `adf-config.xml` and `connections.xml`.

At times it might be useful to 'see' the information in MDS. If for any reason you must extract or examine configuration file customizations that are stored in MDS, use the WLST command `exportMetadata`.

See also: For detailed syntax and examples, see "exportMetadata" in *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

For example, to determine MDS customizations for `connections.xml` in WebCenter Spaces, where application name is always `webcenter`, the managed server is always `WLS_Spaces`, and the file name and location is always `/META-INF/mdssys/cust/adfshare/adfshare/connections.xml.xml`, you might specify:

```
exportMetadata(application='webcenter', server='WLS_Spaces',
toLocation='/tmp/mydata',
docs='/META-INF/mdssys/cust/adfshare/adfshare/connections.xml.xml')
```

And similarly, to determine MDS customizations for `adf-config.xml`:

```
exportMetadata(application='webcenter', server='WLS_Spaces',
toLocation='/tmp/mydata',
docs='/META-INF/mdssys/cust/adfshare/adfshare/adf-config.xml.xml')
```

You choose where to save file customizations by specifying `toLocation`. If, for example, `toLocation` is set to `/tmp/mydata`, then the requested file is saved to `/tmp/mydata/META-INF/mdssys/cust/adfshare/adfshare`.

If no customizations exist for the requested file, then nothing is saved to the specified location—previously extracted customizations at the same location are not overwritten.

Handling Configuration Conflicts

MDS customizations use references to elements in the base document to call out which elements must be inserted/deleted/replaced, and at what location. If an element is inadvertently removed from a future redeployment and MDS contains a reference to that element, then the WebCenter application's configuration appears corrupt. You are unlikely to face this problem but should a previously deployed application appear corrupt after making changes to `adf-config.xml` or `connections.xml` you have the following options:

- Delete MDS customizations for `adf-config.xml` or `connections.xml`, deploy the new EAR file, and reconfigure your application from scratch using Fusion Middleware Control or WLST.
See below for detailed steps, "[Deleting MDS Customizations for adf-config.xml or connections.xml](#)".
- Redeploy the EAR file on a new partition or a partition where older customizations are deleted. In either case, all data previously stored in MDS for the application is lost, including any customizations for `adf-config.xml` or `connections.xml`, and all user personalizations. You must reconfigure your application from scratch too, using Fusion Middleware Control or WLST.

See also, "deleteMetadata" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

Deleting MDS Customizations for `adf-config.xml` or `connections.xml`

1. Delete customizations for `connections.xml`, using WLST. For example:

```
deleteMetadata(application='webcenter', server='WLS_Spaces',
docs='/META-INF/mdssys/cust/adfshare/adfshare/connections.xml.xml')
```

2. Delete customizations for `adf-config.xml`, using WLST. For example:

```
deleteMetadata (application='webcenter', server='WLS_Spaces',
docs='/META-INF/mdssys/cust/adfshare/adfshare/adf-config.xml.xml')
```

3. Restart the WebCenter application.
4. Reconfigure your application from scratch using Fusion Middleware Control or WLST.

A.1.2 web.xml

`web.xml` is a standard J2EE application deployment descriptor file and it is located in the `/META-INF` directory for your application. Typical run-time settings in `web.xml` include initialization parameters, custom tag library locations, and security settings.

Unlike `connections.xml` and `adf-config.xml`, `web.xml` does *not* store post deployment customizations in MDS.

Locating web.xml

To determine the exact location of `web.xml` in a particular WebCenter application deployment, search for the configuration file under:

```
DOMAIN_HOME/servers/server_name
```

For example, if the `DOMAIN_HOME` is

```
MW_HOME/wlshome/user_projects/domains/wc_domain/, web.xml is located under
```

```
MW_HOME/wlshome/user_projects/domains/wc_domain/servers/WLS_Spaces.
```

For example, enter the following at a command prompt:

```
> cd
MW_HOME/wlshome/user_projects/domains/wc_domain/servers/WLS_Spaces
> find . -name web.xml
```

A sample response, for this particular example, is as follows:

```
./tmp/_WL_user/webcenter/8gco54/adf/META-INF/web.xml
```

Editing web.xml

You cannot use Fusion Middleware Control or WLST to modify `web.xml` in an existing WebCenter application deployment. If you must modify settings in `web.xml` you will have to do so manually, as described in [Appendix A.3.2, "Editing Configuration Files Manually"](#).

There are several instances where you might be required to modify `web.xml`, for example, if you must change:

- **Content repository upload parameters:** `UPLOAD_MAX_MEMORY`, `UPLOAD_MAX_DISK_SPACE`, and `UPLOAD_TEMP_DIR`. For details, see [Section 11.9, "Changing the Maximum File Upload Size"](#).
- **Time after which HTTP sessions expire.** For details, see [Appendix A.5.1, "Setting HTTP Session Timeout"](#).
- **JSP page timeout value.** For details, see [Appendix A.5.2, "Setting JSP Page Timeout"](#).

A.2 Cluster Configuration

All post deployment configuration through Fusion Middleware Control, WLST, or the Systems MBean Browser is stored as customizations in the MDS repository. In a cluster environment, all configuration changes are visible to all nodes in the cluster. To effect configuration changes that are not dynamic, all nodes in the cluster must be restarted. See also [Section 8.2, "Starting and Stopping Managed Servers for WebCenter Application Deployments"](#).

In WebCenter applications most configuration changes that you make, through Fusion Middleware Control or using WLST, are not dynamic. For example, when you add or modify connection details for Web services (Announcements, Discussions, Documents, Mail, Instant Messaging and Presence, Search, Worklists) you must restart the application's managed server.

There are several exceptions; portlet producer and external application registration is dynamic. Any new portlet producers and external applications that you register are immediately available in your WebCenter application and any changes that you make to existing connections take effect immediately too.

If you edit configuration file manually in a cluster environment, then you must ensure that identical changes are made in each cluster member so that the overall cluster configuration remains synchronized.

A.3 Configuration Tools

Oracle offers a range of tools for configuring WebCenter application deployments. This section outline which tools are available and in case you cannot use these tools, describes how to edit configuration files manually.

Note: Most of the WebCenter configuration parameters are immutable and cannot be changed at run time unless otherwise specified.

This section includes the following sub sections:

- [Configuration Through Fusion Middleware Control, WLST Commands, and System MBeans Browser](#)
- [Editing Configuration Files Manually](#)

A.3.1 Configuration Through Fusion Middleware Control, WLST Commands, and System MBeans Browser

Post deployment, always use Fusion Middleware Control or WLST commands to review the latest configuration or make configuration changes. In Fusion Middleware Control you will mostly use WebCenter application configuration screens but a useful

Systems MBean Browser is also available for reviewing and modifying configuration settings.

For more information about these tools, read:

- [Oracle Enterprise Manager Fusion Middleware Control Console](#)
- [Oracle WebLogic Scripting Tool \(WLST\)](#)
- Oracle System MBean Browser

These tools always show you the current configuration so, typically, there is no need for you to examine or manually change the content of configuration files or MDS customization data for files such as `adf-config.xml` or `connections.xml`.

If you must edit these files directly, to set concurrency options for example, follow instructions in [Appendix A.3.2, "Editing Configuration Files Manually"](#) carefully.

A.3.2 Editing Configuration Files Manually

A few configuration settings, such as those stored in `web.xml`, are not exposed through MBeans, and therefore, you cannot use Fusion Middleware Control, WLST commands, or the System MBeans Browser for post deployment configuration.

If you must modify these settings, Oracle recommends that you re-create the WebCenter application deployment `.ear` file with the desired configuration, and redeploy the application. Sometimes this is not feasible or desirable—maybe you do not have access to the `.ear` file, or perhaps you must configure properties uniquely based on where the file is deployed—in this case, follow the manual steps below, using WLST:

1. Prevent the Weblogic Server from re-staging the WebCenter application, except at deployment time. From the WLST shell, type:

```
connect()
edit()
startEdit()
cd("DeploymentConfiguration/<domain_name>")
cmo.setRestageOnlyOnRedeploy(true)
activate()
```

2. Open the configuration file in a text editor and modify configuration properties manually, as required.

Read [Locating Base Documents](#) to find out how to determine the exact location of `adf-config.xml`, `connections.xml`, or `web.xml`.

3. Restart the managed server on which the WebCenter application is deployed.

See, "Starting and Stopping WebLogic Managed Servers Using the Command Line" in the *Oracle Fusion Middleware Administrator's Guide*.

Caution: If you redeploy the WebCenter application in the future you must edit the configuration file again.

A.4 Tuning Environment Configuration

This section describes how to tune the operating system on which WebCenter applications are deployed. It provides information on configuring system limit, JDBC data source, and JRockit virtual machine (JVM) arguments.

A.4.1 Setting System Limit

To run a WebCenter application at moderate load, set the `open-files-limit` to 4096. If you encounter errors, such as **running out of file descriptors**, then increase the system limit.

For example, on Linux, you can use this command:

```
ulimit -n 8192
```

Refer to your operating system documentation to find out how to change this system limit.

A.4.2 Setting JDBC Data Source

The following data source settings are recommended for MDSDS and WebCenterDS. These settings can be adjusted depending on the application's usage pattern and load.

```
<jdbc-connection-pool-params>
  <initial-capacity>10</initial-capacity>
  <max-capacity>200</max-capacity>
  <capacity-increment>1</capacity-increment>
  <shrink-frequency-seconds>0</shrink-frequency-seconds>
  <highest-num-waiters>2147483647</highest-num-waiters>

<connection-creation-retry-frequency-seconds>0</connection-creation-retry-frequency-seconds>

<connection-reserve-timeout-seconds>60</connection-reserve-timeout-seconds>
  <test-frequency-seconds>0</test-frequency-seconds>
  <test-connections-on-reserve>true</test-connections-on-reserve>

<ignore-in-use-connections-enabled>true</ignore-in-use-connections-enabled>

<inactive-connection-timeout-seconds>0</inactive-connection-timeout-seconds>
  <test-table-name>SQL SELECT 1 FROM DUAL</test-table-name>
  <login-delay-seconds>0</login-delay-seconds>
  <statement-cache-size>50</statement-cache-size>
  <statement-cache-type>LRU</statement-cache-type>
  <remove-infected-connections>true</remove-infected-connections>

<seconds-to-trust-an-idle-pool-connection>60</seconds-to-trust-an-idle-pool-connection>
  <statement-timeout>-1</statement-timeout>
  <pinned-to-thread>>false</pinned-to-thread>
</jdbc-connection-pool-params>
```

To edit JDBC data source settings:

1. Login to WebLogic Server Administration Console.
2. From the Home page, select **Summary of JDBC Data Sources, Settings for mds-SpacesDS**, and then the **Connection Pool** tab.
3. Edit properties, as required.

See also "Configuring JDBC Data Sources" in *Oracle Fusion Middleware Configuring and Managing JDBC for Oracle WebLogic Server*.

A.4.3 Setting JRockit Virtual Machine (JVM) Arguments

JVM arguments are set in the `setDomainEnv.sh` file.

- **WebLogic Server production mode:** To enable WebLogic Server production mode through WebLogic Administration Console, see *Oracle Fusion Middleware Configuring Server Environments for Oracle WebLogic Server*. The parameter is:

```
-Dweblogic.ProductionModeEnabled=true
```

- **Heap size:** If the system is overloaded, that is, garbage is collected or out of memory error occurs frequently, then increase the heap size as appropriate to your system's available physical memory. The parameter is:

```
-Xms2048M -Xmx2048M -Xns512M
```

- **Memory size:** Default memory sizes for custom WebCenter applications are set as follows:

```
-Xmx512M -XX:PermSize=128M -XX:MaxPermSize512M
```

This is an out-of-the-box setting.

- **Garbage collector behavior:** To maximize throughput in an application, set the following JVM option for the application's garbage collector behavior:

```
-Xgcprio:throughput -Djrockit.codegen.newlockmatching=true
```

This is an out-of-the-box setting.

- **Security:** The following JVM arguments improve performance of WebCenter application's security layer. These are out-of-box settings.

```
-DUSE_JAAS=false -Djps.policystore.hybrid.mode=false  
-Djps.combiner.optimize.lazyeval=true  
-Djps.combiner.optimize=true -Djps.auth=ACC
```

- **Log output:** This option reduces the log output in some WebCenter application-dependent components. This is an out-of-box setting:

```
-Djbo.debugoutput=silent
```

A.5 Tuning WebCenter Application Configuration

This section describes parameters that enable administrators to tune performance of WebCenter applications.

This section includes the following:

- [Setting HTTP Session Timeout](#)
- [Setting JSP Page Timeout](#)
- [Setting ADF Client State Token](#)
- [Setting MDS Cache Size and Purge Rate](#)
- [Configuring Concurrency Management](#)
- [Configuring CRUD APIs \(Create, Read, Update and Delete\)](#)

A.5.1 Setting HTTP Session Timeout

To manage over resource usage, adjust the session timeout value, in minutes, in the `web.xml` file.

If you must modify this property, post deployment, you must edit `web.xml` manually. See [Appendix A.3.2, "Editing Configuration Files Manually"](#).

The following is a sample snippet of `web.xml`:

```
<session-config>
  <session-timeout>
    45
  </session-timeout>
</session-config>
```

A.5.2 Setting JSP Page Timeout

You can specify an integer value, in seconds, after which any JSP page will be removed from memory if it has not been requested in the `web.xml` file. This frees up resources in situations where some pages are called infrequently.

Increasing the value reduces user response time, and decreasing it reduces application memory footprint. The default value is 0, for no timeout.

If you must modify this property, post deployment, you must edit `web.xml` manually. See [Appendix A.3.2, "Editing Configuration Files Manually."](#)

The following is a sample snippet of `web.xml`:

```
<servlet>
  <servlet-name>
    oraclejsp
  <init-param>
    <param-name>
      jsp_timeout
    </param-name>
    <param-value>
      600
    </param-value>
  </init-param>
```

A.5.3 Setting ADF Client State Token

Through this setting, you can control the number of pages users can navigate using the browser Back button without losing information. To reduce CPU and memory usage, you can decrease the value in the `web.xml` file.

If you must modify this property, post deployment, you must edit `web.xml` manually. See [Appendix A.3.2, "Editing Configuration Files Manually."](#)

The following is a sample snippet of `web.xml`:

```
<context-param>
  <param-name>
    org.apache.myfaces.trinidad.CLIENT_STATE_MAX_TOKENS
  </param-name>
  <param-value>
    3
  </param-value>
</context-param>
```

A.5.4 Setting MDS Cache Size and Purge Rate

The default MDS cache size is 100MB. If you encounter the error message, **JOC region full**, then you can increase the MDS cache size in the `adf-config.xml` file.

Post deployment, modify these properties through the System MBeans Browser. For more information, see the section "Changing MDS Configuration Attributes for Deployed Applications" in *Oracle Fusion Middleware Administrator's Guide*.

The following is a sample snippet of `adf-config.xml`:

```
<cache-config>
<max-size-kb>150000</max-size-kb>
</cache-config>
```

MDS purges old version of metadata automatically every hour. If excessive metadata is accumulated and each purge is very expensive, reduce this interval in the `adf-config.xml` file.

The following is a sample snippet of `adf-config.xml`:

```
<auto-purge seconds-to-live="3600"/>
```

A.5.5 Configuring Concurrency Management

Concurrency management includes global settings that impact entire WebCenter and service- and resource-specific settings that only impact a particular service.

You can define deployment-specific overrides or additional configuration in the `adf-config.xml` file. For example, you can specify resource-specific (producers) values that are appropriate for a particular deployment.

If you must modify these properties, post deployment, you must edit `adf-config.xml` manually. See [Appendix A.3.2, "Editing Configuration Files Manually."](#)

The following describes the format of the global, service, and resource entries in `adf-config.xml`:

```
<concurrent:adf-service-config
  xmlns="http://xmlns.oracle.com/webcenter/concurrent/config">
  <global
    queueSize="SIZE"
    poolCoreSize="SIZE"
    poolMaxSize="SIZE"
    poolKeepAlivePeriod="TIMEPERIOD"
    timeoutMinPeriod="TIMEPERIOD"
    timeoutMaxPeriod="TIMEPERIOD"
    timeoutDefaultPeriod="TIMEPERIOD"
    timeoutMonitorFrequency="TIMEPERIOD"
    hangMonitorFrequency="TIMEPERIOD"
    hangAcceptableStopPeriod="TIMEPERIOD" />
  <service
    service="SERVICENAME"
    timeoutMinPeriod="TIMEPERIOD"
    timeoutMaxPeriod="TIMEPERIOD"
    timeoutDefaultPeriod="TIMEPERIOD" />
  <resource
    service="SERVICENAME"
    resource="RESOURCENAME"
    timeoutMinPeriod="TIMEPERIOD"
    timeoutMaxPeriod="TIMEPERIOD"
    timeoutDefaultPeriod="TIMEPERIOD" />
</concurrent:adf-service-config>
```

Where:

SIZE: A positive integer. For example: 20.

TIMEPERIOD: Any positive integer followed by a suffix indicating the time unit, which must be one of: `ms` for milliseconds, `s` for seconds, `m` for minutes, or `h` for hours. For example: `50ms`, `10s`, `3m`, or `1h`. The following are examples of default settings for

different services. These settings are overwritten with any service-specific configurations in `connections.xml` or `adf-config.xml` files:

```
<concurrent:adf-service-config
  xmlns="http://xmlns.oracle.com/webcenter/concurrent/config">
  <resource service="oracle.webcenter.community"
    resource="oracle.webcenter.doclib"
    timeoutMinPeriod="2s" timeoutMaxPeriod="10s" timeoutDefaultPeriod="5s"/>
  <resource service="oracle.webcenter.community"
    resource="oracle.webcenter.collab.calendar.community"
    timeoutMinPeriod="2s" timeoutMaxPeriod="10s" timeoutDefaultPeriod="5s"/>
  <resource service="oracle.webcenter.community"
    resource="oracle.webcenter.collab.rtc"
    timeoutMinPeriod="2s" timeoutMaxPeriod="10s" timeoutDefaultPeriod="5s"/>
  <resource service="oracle.webcenter.community"
    resource="oracle.webcenter.list"
    timeoutMinPeriod="2s" timeoutMaxPeriod="10s" timeoutDefaultPeriod="5s"/>
  <resource service="oracle.webcenter.community"
    resource="oracle.webcenter.collab.tasks"
    timeoutMinPeriod="2s" timeoutMaxPeriod="10s" timeoutDefaultPeriod="5s"/>
</concurrent:adf-service-config>
```

Note: All of the attributes except `service` and `resource` are optional, and therefore, for example, the following tags are valid:

```
<global queueSize="20"/>
<resource service="foo" resource="bar" timeoutMaxPeriod="5s"/>
```

A.5.6 Configuring CRUD APIs (Create, Read, Update and Delete)

CRUD API configuration for WebCenter update is defined in the `adf-config.xml` file. You can adjust the timeout to manage overall resource usage.

If you must modify these properties, post deployment, you must edit `adf-config.xml` manually. See [Appendix A.3.2, "Editing Configuration Files Manually."](#)

The following is a sample snippet of `adf-config.xml`:

```
<!-- The following entry configures the timeout for Webcenter Application CRUD
APIs -->
<concurrent:service service="oracle.webcenter.community" timeoutMinPeriod="100ms"
timeoutMaxPeriod="4s" timeoutDefaultPeriod="2s"/>
<!-- Webcenter Application configuration END -->
```

A.6 Tuning Back-End Component Configuration

This section describes performance configuration for back-end services used by WebCenter applications. Performance of back-end servers, for example, Worklists, Oracle Content Server, and so on, should be tuned as described in guidelines for those back-ends.

This section includes the following sub sections:

- [Tuning Performance of the Announcements Service](#)
- [Tuning Performance of the Discussions Service](#)
- [Tuning Performance of the Instant Messaging and Presence \(IMP\) Service](#)
- [Tuning Performance of the Mail Service](#)

- [Tuning Performance of the RSS News Feed Service](#)
- [Tuning Performance of the Search Service](#)
- [Tuning Performance of WSRP Producers](#)
- [Tuning Performance of Oracle PDK-Java Producers](#)
- [Tuning Performance of OmniPortlet](#)
- [Tuning Performance of the Portlet Service](#)
- [Configuring Portlet Cache Size](#)
- [Configuring Portlet Timeout](#)

A.6.1 Tuning Performance of the Announcements Service

To manage overall resource usage for the Announcements service, you can tune the Connection Timeout property:

- Default: 10 seconds
- Minimum: 0 seconds
- Maximum: 45 seconds

Post deployment, modify the Connection Timeout property through Fusion Middleware Control or using WLST. For details, see:

- [Section 12.5.1, "Modifying Discussions Server Connection Details Using Fusion Middleware Control"](#)
- [Section 12.5.2, "Modifying Discussions Server Connection Details Using WLST"](#)

The following is a sample snippet of `connections.xml`:

```
<Reference name="Jive-7777"
className="oracle.adf.mbean.share.connection.webcenter.Announcement.
AnnouncementConnection">
<Factory
className="oracle.adf.mbean.share.connection.webcenter.forum.ForumConnectionFactory" />
    <StringRefAddr addrType="connection.time.out">
        <Contents>5</Contents>
    </StringRefAddr>
</RefAddresses>
</Reference>
```

A.6.2 Tuning Performance of the Discussions Service

To manage overall resource usage for the Discussions service, you can tune the Connection Timeout property:

- Default: 10 seconds
- Minimum: 0 seconds
- Maximum: 45 seconds

Post deployment, modify the Connection Timeout property through Fusion Middleware Control or using WLST. For details, see:

- [Section 12.5.1, "Modifying Discussions Server Connection Details Using Fusion Middleware Control"](#)
- [Section 12.5.2, "Modifying Discussions Server Connection Details Using WLST"](#)

The following is a sample snippet of `connections.xml`:

```
<Reference name="Jive-7777"
className="oracle.adf.mbean.share.connection.webcenter.forum.ForumConnection">
  <Factory
className="oracle.adf.mbean.share.connection.webcenter.forum.ForumConnectionFactory" />
  <RefAddresses>
    <StringRefAddr addrType="forum.url">
      <Contents>http://[machine]:[port]/owc_discussions_5520</Contents>
      <StringRefAddr addrType="connection.time.out">
        <Contents>5</Contents>
      </StringRefAddr>
    </RefAddresses>
  </Reference>
```

A.6.3 Tuning Performance of the Instant Messaging and Presence (IMP) Service

To manage overall resource usage for the IMP service, you can tune the Connection Timeout property:

- Default: 10 seconds
- Minimum: 0 seconds
- Maximum: 45 seconds

Post deployment, modify the Connection Timeout property through Fusion Middleware Control or using WLST. For details, see:

- [Section 14.5.1, "Modifying Instant Messaging and Presence Connections Details Using Fusion Middleware Control"](#)
- [Section 12.5.2, "Modifying Discussions Server Connection Details Using WLST"](#)

The following is a sample snippet of `connections.xml`:

```
<Reference name="IMPService-OWLCS"
className="oracle.adf.mbean.share.connection.webcenter.rtc.RtcConnection">
  <Factory
className="oracle.adf.mbean.share.connection.webcenter.rtc.RtcConnectionFactory" />
  <RefAddresses>
    <StringRefAddr addrType="connection.time.out">
      <Contents>5</Contents>
    </StringRefAddr>
  </RefAddresses>
</Reference>
```

A.6.4 Tuning Performance of the Mail Service

To manage overall resource usage for the Mail service, you can tune the Connection Timeout property:

- Default: 10 seconds
- Minimum: 0 seconds
- Maximum: 45 seconds

Post deployment, modify the Connection Timeout property through Fusion Middleware Control or using WLST. For details, see:

- [Section 15.5.1, "Modifying Mail Server Connection Details Using Fusion Middleware Control"](#)

- [Section 15.5.2, "Modifying Mail Server Connection Details Using WLST"](#)

The following is a sample snippet of `connections.xml`:

```
<Reference name="MailConnection"
className="oracle.adf.mbean.share.connection.webcenter.mail.MailConnection">
  <StringRefAddr addrType="connection.time.out">
    <Contents>5</Contents>
  </StringRefAddr>
</Reference>
```

A.6.5 Tuning Performance of the RSS News Feed Service

To manage overall resource usage for the RSS News Feed service, you can adjust the refresh interval and timeout in the `adf-config.xml` file.

If you must modify these properties, post deployment, use the System MBeans Browser.

The following is a sample snippet of `adf-config.xml`:

```
<rssC:adf-rss-config>
  <rssC:RefreshSecs>3600</rssC:RefreshSecs>
  <rssC:TimeoutSecs>3</rssC:TimeoutSecs>
  <rssC:Configured>true</rssC:Configured>
</rssC:adf-rss-config>
```

A.6.6 Tuning Performance of the Search Service

To manage overall resource usage and user response time for searching, you can adjust the number of saved searches displayed, the number of results displayed, and these timeout values:

- `prepareTimeoutMs` - Maximum time that a service is allowed to initialize a search (in ms).
- `timeoutMs` - Maximum time that a service is allowed to execute a search (in ms).
- `showAllTimeoutMs` - Maximum time that a service is allowed to display search all results (in ms).

Post deployment, modify timeout properties through Fusion Middleware Control or using WLST. For details, see:

- [Section 18.3.3.1, "Modifying Oracle SES Connection Details Using Fusion Middleware Control"](#)
- [Section 18.3.3.2, "Modifying Oracle SES Connection Details Using WLST"](#)

The following is a sample snippet of `adf-config.xml`:

```
<searchC:adf-search-config
xmlns="http://xmlns.oracle.com/webcenter/search/config">
  <display-properties>
    <common numSavedSearches="25" />
    <region-specific>
      <usage id="simpleSearchResultUIMetadata" numServiceRows="5" />
      <usage id="searchResultUIMetadata" numServiceRows="5" />
      <usage id="localToolbarRegion" numServiceRows="5" />
    </region-specific>
  </display-properties>
  <execution-properties prepareTimeoutMs="1000" timeoutMs="3000"
showAllTimeoutMs="20000" />
</execution-properties>
```

```
</searchC:adf-search-config>
```

A.6.7 Tuning Performance of WSRP Producers

To manage overall resource usage for a WSRP producer, you can tune the Connection Timeout property:

- Default: 30000 ms
- Minimum: 5000 ms
- Maximum: 60000 ms

Post deployment, modify the Connection Timeout property through Fusion Middleware Control or using WLST. For details, see:

- [Section 21.6.1, "Editing Producer Registration Details Using Fusion Middleware Control"](#)
- [Section 21.6.2, "Editing Producer Registration Details Using WLST"](#)

The following is a sample snippet of `connections.xml`:

```
<wsrpproducerconnection producerName="wc-RichText"
wsConnection="wc-RichText-wsconn" timeout="30"/>
  <wsrpproducerconnection producerName="wc-WSRPTools"
wsConnection="wc-WSRPTools-wsconn" timeout="30"/>
```

A.6.8 Tuning Performance of Oracle PDK-Java Producers

To manage overall resource usage for a Web producer, you can tune the Connection Timeout property:

- Default: 30000 ms
- Minimum: 5000 ms
- Maximum: 60000 ms

Post deployment, modify the Connection Timeout property through Fusion Middleware Control or using WLST. For details, see:

- [Section 21.6.1, "Editing Producer Registration Details Using Fusion Middleware Control"](#)
- [Section 21.6.2, "Editing Producer Registration Details Using WLST"](#)

The following is a sample snippet of `connections.xml`:

```
<webproducerconnection producerName="wc-WebClipping"
urlConnection="wc-WebClipping-urlconn" timeout="10000" establishSession="true"
mapUser="false"/>
```

A.6.9 Tuning Performance of OmniPortlet

To manage overall resource usage for OmniPortlets, you can tune the Connection Timeout property:

- Default: 30000 ms
- Minimum: 5000 ms
- Maximum: 60000 ms

Post deployment, modify the Connection Timeout property through Fusion Middleware Control or using WLST. For details, see:

- [Section 21.6.1, "Editing Producer Registration Details Using Fusion Middleware Control"](#)
- [Section 21.6.2, "Editing Producer Registration Details Using WLST"](#)

The following is a sample snippet of `connections.xml`:

```
<webproducerconnection producerName="wc-OmniPortlet"
urlConnection="wc-OmniPortlet-urlconn" timeout="10000" establishSession="false"
mapUser="false"/>
```

A.6.10 Tuning Performance of the Portlet Service

To manage overall resource usage and user response time, you can remove unnecessary locale support, modify portlet timeout and cache size in the `adf-config.xml` file.

For the Portlet service, 28 supported locales are defined out-of-the-box. You can remove the locales that are unnecessary for your application.

If you must modify these properties, post deployment, you must edit `adf-config.xml` manually. See [Appendix A.3.2, "Editing Configuration Files Manually."](#)

The following is a sample snippet of `adf-config.xml`:

```
<portletC:adf-portlet-config xmlns="http://xmlns.oracle.com/adf/portlet/config">
  <supportedLocales>
    <value>es</value>
    <value>ko</value>
    <value>ru</value>
    <value>ar</value>
    <value>fi</value>
    <value>nl</value>
    <value>sk</value>
    <value>cs</value>
    <value>fr</value>
    <value>no</value>
    <value>sv</value>
    <value>da</value>
    <value>hu</value>
    <value>pl</value>
    <value>th</value>
    <value>de</value>
    <value>it</value>
    <value>pt</value>
    <value>tr</value>
    <value>el</value>
    <value>iw</value>
    <value>pt_BR</value>
    <value>zh_CN</value>
    <value>en</value>
    <value>ja</value>
    <value>ro</value>
    <value>zh_TW</value>
  </supportedLocales>
  <defaultTimeout>20</defaultTimeout>
  <minimumTimeout>1</minimumTimeout>
  <maximumTimeout>60</maximumTimeout>
  <parallelPoolSize>10</parallelPoolSize>
  <parallelQueueSize>20</parallelQueueSize>
  <cacheSettings enabled="true">
```

```

        <maxSize>10000000</maxSize>
    </cacheSettings>
</portletC:adf-portlet-config>

```

A.6.11 Configuring Portlet Cache Size

You can modify the portlet cache size in the `adf-config.xml` file. The default portlet cache size is set to 10 MB.

If you must modify these properties, post deployment, you must edit `adf-config.xml` manually. See [Appendix A.3.2, "Editing Configuration Files Manually."](#)

The following is a sample snippet of `adf-config.xml`:

```

<adf-portlet-config>
    ....
    <supportedLocales>
    <cacheSettings enabled="true">
    <maxSize>10000000</maxSize>
    </cacheSettings>
</adf-portlet-config>

```

A.6.12 Configuring Portlet Timeout

You can modify the portlet timeout value in the `adf-portlet-config` element of the `adf-config.xml` file. Default: 10 seconds, minimum: 0.1 seconds, maximum: 60 seconds.

If you must modify these properties, post deployment, you must edit `adf-config.xml` manually. See [Appendix A.3.2, "Editing Configuration Files Manually."](#)

The following is a sample snippet of `adf-config.xml`:

```

<adf-portlet-config>
    ....
    <defaultTimeout>5</defaultTimeout>
    <minimumTimeout>2</minimumTimeout>
    <maximumTimeout>100</maximumTimeout>
</adf-portlet-config>

```

A.7 Troubleshooting WebCenter Application Configuration Issues

This section includes the following sub sections:

- [WebCenter Does Not Display in the Application Deployment Menu in Fusion Middleware Control](#)
- [Configuration Options Unavailable](#)
- [Configuration Performed in One Application Reflects in Another](#)
- [WebCenter Spaces Logs Indicate Too Many Open Files](#)

A.7.1 WebCenter Does Not Display in the Application Deployment Menu in Fusion Middleware Control

Problem

After logging into Fusion Middleware Control, you cannot find the **WebCenter** option in the **Application Deployment** menu.

Solution

Ensure the following:

- Deployed application is an ADF application.
The **WebCenter** option does not display for applications that are not developed using ADF.
- Deployed application is up and running.
- Deployed application contains accurate information about the MDS repository and partition, and the MDS repository is accessible to the application. To verify this information, check the `metadata-store-usages` section in the `adf-config.xml` file. For information on MDS, see "Understanding the MDS Repository" in *Oracle Fusion Middleware Administrator's Guide*.
- Application is packaged with required artifacts to support configuration:
 - `adf-jndi-config` name space is configured in the application's `adf-config.xml` file. This is provisioned at design time. The following is an example (the text in **bold**) of the `adf-jndi-config` name space:

```
<adf-config xmlns="http://xmlns.oracle.com/adf/config"
  xmlns:jndiC="http://xmlns.oracle.com/adf/jndi/config"
  xmlns:ns2="http://xmlns.oracle.com/mds/config"
  xmlns:ns3="http://xmlns.oracle.com/adf/mds/config">
  ...
  ...
</adf-config>
```

- `MDSBackingStore` is configured in the application's `adf-config.xml` file. This is provisioned at design time. This section can exist anywhere in the upper `adf-config` element, for instance, after the end tag of `adf-mds-config`. For example, see the text in **bold** in the following snippet:

```
<jndiC:adf-jndi-config>
  <jndiC:ConnectionsJndiContext
initialContextFactoryClass="oracle.adf.share.jndi.InitialContextFactoryImpl
  "
backingStoreURL="META-INF/connections.xml"
  backingStoreClass="oracle.adf.share.jndi.MDSBackingStore">
  <jndiC:contextEnv value="true" name="cache_application_scope"/>
  </jndiC:ConnectionsJndiContext>
</jndiC:adf-jndi-config>
```

- Appropriate listeners exist in the `web.xml` file to register the MBeans. This is provisioned at design time. For example, see the text in **bold** in the following snippet of the `web.xml` file:

```
<listener>
  <description>ADF Config MBeans</description>
  <display-name>ADF Config MBeans</display-name>
```

```

<listener-class>oracle.adf.mbean.share.config.ADFConfigLifecycleCallBa</1
listener-class>
</listener>
<listener>
  <description>ADF Connection MBeans</description>
  <display-name>ADF Connection MBeans</display-name>

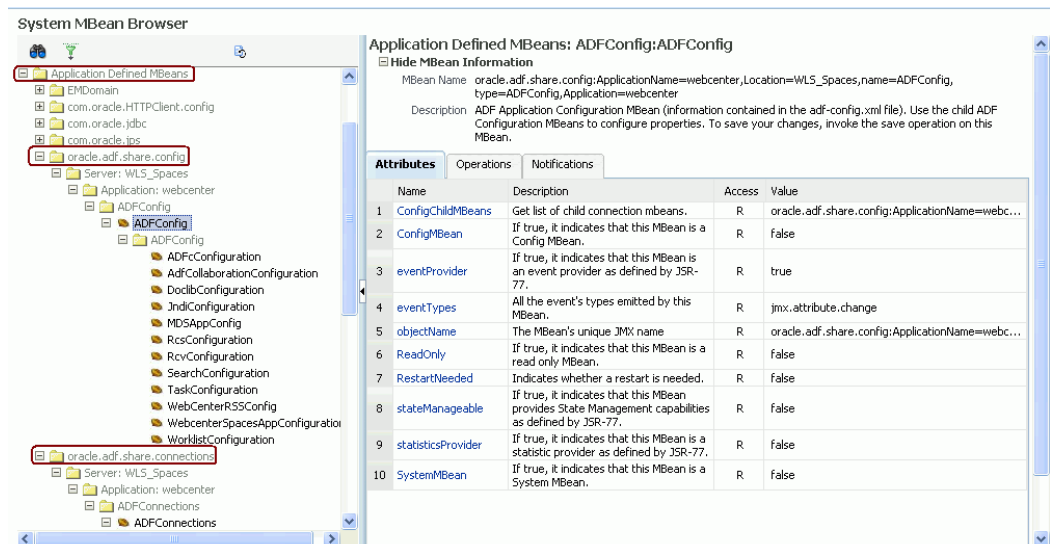

<listener-class>oracle.adf.mbean.share.connection.ADFConnectionLifeCycleCa
lBack</listener-class>
</listener>

```

- MBeans is registered for the WebCenter application. To verify this:
 1. In Fusion Middleware Control, from the **Application Deployment** menu, select **System MBean Browser**.
 2. Locate connection MBeans for your application under **Application Defined MBeans > oracle.adf.mbean.share.connection**.
 3. Similarly, locate `adf-config` MBeans for your application under **Application Defined MBeans > oracle.adf.mbean.share.config**. [Figure A-1](#) shows how the Application Defined MBeans section looks in Fusion Middleware Control.

If your application consumes producers, then locate the **Producer Manager** Mbean.

Figure A-1 Application Defined MBeans

- Check the application's diagnostic logs, analyze messages for the modules `oracle.adf.mbean.share.connection` and `oracle.adf.mbean.share.config`, and determine what must be done.

A.7.2 Configuration Options Unavailable

Problem

When you try to configure an application in Fusion Middleware Control, the following message displays:

Configuration options currently unavailable. The application `application_name`

might be down, did not start-up properly, or is incorrectly packaged. Check the log files for further details.

Solution

For information on how to resolve this issue, see [Section A.7.1, "WebCenter Does Not Display in the Application Deployment Menu in Fusion Middleware Control."](#)

A.7.3 Configuration Performed in One Application Reflects in Another

Problem

You configured a WebCenter application, but those configurations also show in another application.

Solution

This happens when multiple applications share the MDS partition in the same schema. To resolve this problem, deploy these applications again and ensure that each application uses its own MDS schema and partition combination. For information about creating a MDS repository or configuring an existing WebCenter application to use a different MDS repository or partition, see section "Managing the Oracle Metadata Repository" in *Oracle Fusion Middleware Administrator's Guide*.

A.7.4 WebCenter Spaces Logs Indicate Too Many Open Files

Problem

WebCenter Spaces is inaccessible or displaying error messages and the diagnostic log files indicates that there is an issue with 'too many open files'.

Solution

Do the following:

- Check the number of file handles configured on each of the back-end servers, primarily the database, and increase appropriately.
- If the problem persists after increasing the file handles, check the value of `fs.file-max` in the `/etc/sysctl.conf` file and increase the value appropriately.

A.8 Troubleshooting WLST Command Issues

This section includes the following sub sections:

- [None of the WLST Commands Work](#)
- [WLST Commands Do Not Work for a Particular Service](#)
- [A Connection with the Name Connection_Name Already Exists](#)
- [WLST Shell is Not Connected to the Oracle WebLogic Managed Server Instance](#)
- [Application with the Same Name Already Exists in a Domain](#)
- [Application with the Same Name Already Exists on a Managed Server](#)
- [Already in Domain Runtime Tree Message Displays](#)

A.8.1 None of the WLST Commands Work

Problem

You are unable to run any WLST commands.

Solution

Ensure the following:

- No files other than Python are stored in the WLST source directory: `WC_ORACLE_HOME/common/bin/wlst`. This directory must contain files with the `.py` extension only.

The default set of files in this location contain legal Python files from Oracle. It is possible that a user copied some non-python script to this directory, for example, a backup file or a test python file with syntax errors.

- `webcenter-wlst.jar` is located at `WC_ORACLE_HOME/common/bin/wlst/lib`.

A.8.2 WLST Commands Do Not Work for a Particular Service

Problem

You are unable to run WLST commands for a particular service, and therefore, you cannot configure that service.

Solution

First, run generic non-WebCenter commands, for example, `listApplications()` and `displayMetricTableNames()` to verify whether these commands work. If generic commands do not work, then apply the solution described in [Section A.8.1, "None of the WLST Commands Work."](#)

If generic commands work, then run test commands to check WebCenter-specific commands for syntax errors. Run the appropriate WLST check command (see [Table A-1](#)).

See also, [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

Table A-1 File Names and WLST Commands for WebCenter Service

Service Name	File Name	WLST Command
Discussions and Announcements	ForumWLST.py	fcpcCheck()
Documents	DoclibWLST.py	doclibCheck()
External Applications	ExtAppWLST.py	extCheck()
Group Space Events	CommunityWLST.py	ceCheck()
Instant Messaging and Presence	ImpWLST.py	rtcCheck()
Mail	MailWLST.py	mailCheck()
Producer Help	ProducerHelperWLST.py	producerHelperCheck()
WSRP Producers	WsrpWLST.py	wsrpCheck()
PDK Producers	PdkWLST.py	pdkCheck()

Table A-1 (Cont.) File Names and WLST Commands for WebCenter Service

Service Name	File Name	WLST Command
RSS News Feed	RSSWLST.py	rssCheck()
Search	SesWLST.py	sesCheck()
Worklist	BpelWLST.py	bpelCheck()
WebCenter Spaces and SOA	WebCenterSpacesSOAWLST.py	spaceCheck()
Export/Import - WebCenter application	LifecycleWLST.py	lifecycleCheck()
Export/Import - Group Spaces and Template	ExtImpWLST.py	expimpCheck()
WebCenter Help	WebCenterWLSTHelper.py	basicCheck()

A.8.3 A Connection with the Name `Connection_Name` Already Exists

Problem

You are unable to create a connection with the name `connection_name`. The following message displays:

```
A connection with name Connection_Name already exists.
```

Solution

Connection names are unique across WebCenter applications. This error occurs when you try to create a connection with a name that is in use. Ensure that you use a unique name for your connection.

A.8.4 WLST Shell is Not Connected to the Oracle WebLogic Managed Server Instance

Problem

The WLST shell is not connected to the managed server on which you want to run WLST commands.

Solution

Run the following command to connect the WLST shell to the managed server:

```
connect(username, password, serverhost:serverport)
```

See also, [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

A.8.5 Application with the Same Name Already Exists in a Domain

Problem

You are unable to register a producer application. The following message displays:

```
Another application named "YourApplicationName" exists. Specify the Server on which your application is deployed. Use: server="YourServerName".
```

Solution

There are multiple applications with the same name in the domain in which you are trying to register your application. This usually happens in a cluster environment,

where the same application is deployed to multiple managed servers. If this is the case, specify the name of the server in which you are trying to register this application. For example, run the `registerWSRPProducer` WLST command with the `server` argument:

```
registerWSRPProducer(appName='myApp', name='MyWSRPSamples',
url='http://host:port/application_name/portlets/wsrp2?WSDL', server=server_name)
```

For command syntax and examples, see "registerWSRPProducer" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

See also, [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

A.8.6 Application with the Same Name Already Exists on a Managed Server

Problem

You are unable to register a producer application. The following message displays:

```
Another application named "application_name" exists on the server
managedServerName.
```

Solution

There are multiple applications with the same name on the managed server in which you are trying to register your application. This usually happens when applications are assigned different versions. If this is the case, specify the version of the application you want to register. For example, run the `registerWSRPProducer` WLST command with the arguments `server` and `applicationVersion`:

```
registerWSRPProducer(appName='myApp', name='MyWSRPSamples',
url='http://host:port/application_name/portlets/wsrp2?WSDL',
server=server_name applicationVersion=version of the application)
```

For command syntax and examples, see "registerWSRPProducer" in the *Oracle Fusion Middleware WebLogic Scripting Tool Command Reference*.

See also, [Section 1.12.3.1, "Running Oracle WebLogic Scripting Tool \(WLST\) Commands."](#)

A.8.7 Already in Domain Runtime Tree Message Displays

Problem

While running a WLST command, the following message displays:

```
Already in Domain Runtime Tree
```

Solution

None required. This is for information only.

Glossary

About mode

A **portlet mode** that typically displays information such as copyright, version, and author of the portlet.

Activity Stream

In the **People Connections service**, a feature for viewing the application activities tracked for you and other users.

ADF

Application Development Framework. A range of technologies aimed at making **Java EE** application development faster and simpler for developers while at the same time taking advantage of proven software patterns to ensure that the developed application is scalable, performant, and the like.

ad hoc filtering

In the **Lists service**, temporary, personal filtering of list data.

administrator

In WebCenter Spaces there are two types of administrator:

- Fusion Middleware administrator: Also referred to as systems administrator. A user with complete administrative capabilities. This administrator can perform the complete range of security-sensitive administrative duties, and all installation, configuration, and audit tasks.
- WebCenter Spaces administrator: A WebCenter Spaces user who is responsible for customizing WebCenter Spaces out of the box, managing and granting application roles, and maintaining the application when it is in use.

Ajax

A combination of asynchronous JavaScript, dynamic HTML (DHTML), XML, and XMLHttpRequest communication channel that allows requests to be made to the server without fully re-rendering the page. Ajax allows rich client-like applications to use standard internet technologies.

Announcements service

A WebCenter service that offers a quick, convenient way to create and widely distribute messages instantly or at a specific time.

API

Application Programming Interface. A set of exposed data structures and functions that an application can use to invoke services on an application object, such as a [portlet](#).

Application Development Framework

See [ADF](#).

application lifecycle

The process of creating and testing an application in a design time environment, deploying it to a production system, and then performing routine maintenance, such as monitoring performance and migrating customization data. The lifecycle of an application also includes performing further enhancements, restaging, and then redeploying the application to the production system.

Application Programming Interface

See [API](#).

application role

Roles that are specific to a particular application and are stored in an application-specific stripe of the policy store.

application skin

Specifies the WebCenter Spaces application background color, screen fonts, and, with some skins, the shapes and images used for application buttons and icons. The WebCenter Spaces administrator chooses the default application skin. WebCenter users may change the application skin on the General tab of the Preferences dialog.

Applications pane

An area of the WebCenter Spaces Sidebar that provides convenient access to your frequently used applications.

authenticated user

A user who is logged into a [custom WebCenter application](#). Credentials of this user are verified against the identity store. By default, an authenticated user can access public information. To access secured information, such as pages and [portlets](#), this user must be authorized through the policy and credential store.

Contrast with [public users](#), who are not logged in, and can access public content only.

authentication

Identification of a user through an identity management system. You can require ADF authentication to enforce credentials for users to access the WebCenter application only (all ADF resources in the application remain accessible), or authentication *and* authorization to enforce credentials for users to access the WebCenter application and any ADF resources that have been secured in the application.

authorization

The policies that define the access rights of an individual or group to a secured resource. This resource may be a page or component within a page.

authorized user

An individual who has access to a secured resource. For non-public resources, this individual is also an [authenticated user](#).

Blog service

A WebCenter service for integrating blogs into WebCenter applications.

blog page

A page that provides a personal record of an individual user's experience and opinions. There are two kinds of blog: personal blogs are written by an individual; group blogs are written by several users.

Box layout component

An Oracle Composer layout component. A container that enables the placement of content on a WebCenter Spaces page. In Oracle Composer, a Box is rendered as a rectangle comprised of dashed lines. For designers of custom WebCenter applications, this is the runtime equivalent of a Panel Customizable component.

BPEL

Business Process Execution Language. An XML-based markup language for composing a set of discrete Web services into an end-to-end process flow.

business role page

A page, created by the WebCenter Spaces administrator, specifically provided for a given role in an organization. Business role pages provide a targeted environment for users of a particular role, by delivering information that is timely and relevant to individual roles without the noise of irrelevant information from other lines of business. Business role pages appear in the personal spaces of users classified under the specified role.

caching

The act of storing frequently accessed information, typically Web pages, in a location where it can be accessed quickly to avoid frequent content generation.

See also [expiry-based caching](#) and [validation-based caching](#).

calendar overlay

The ability to display multiple calendars in a single Events task flow.

Change Mode Button component

A component provided in the Oracle Composer tag library that lets users change from the View mode of a page to Edit mode, in which they can edit the page using Oracle Composer.

Change Mode Link component

A component provided in the Oracle Composer tag library that lets users change from the View mode of a page to Edit mode, in which they can edit the page using Oracle Composer.

check out/check in

A mechanism that enables a user to lock information, by checking it out, so that other users cannot modify that same piece of information. This prevents users from overwriting each other's changes. After making modifications, the user releases it by checking it back in, making it available again for other users to modify.

chrome

Visual elements surrounding a portlet or task flow that provide an access point for actions, such as those on the Actions menu and those embedded in the chrome itself, such as the minimize icon or resize handles.

Community of Interest group space

A group space created using the Community of Interest template. This type of group space provides an optimal structure for supporting communities of people, joining together to learn more about a subject area through the sharing of expertise, ideas, and content.

component

An individual piece of an application, for example, a task flow, portlet, page, or layout element such as a box or image.

Component Catalog

A dialog, accessed from Oracle Composer, that provides access to all the content you can add to a WebCenter application page.

component developer

The developer who builds components (such as portlets, [JavaServer Faces](#) components, and Web services).

Component Properties

A dialog, accessed from Oracle Composer, that provides access to a component's parameters, display options, style settings, and associated events.

Connections

In the [People Connections service](#), a feature for establishing a social network with other application users.

container

An application program or subsystem in which the program building block, known as a component, is run.

content integration services

Services provided by [Oracle WebCenter](#) to enable developers to display content from a [content repository](#), such as by creating [data controls](#).

Content Presenter

A feature of the [Documents service](#) that enables end users to select and search content items and then display those items using available display templates. Oracle WebCenter provides out-of-the-box templates for displaying single and multiple content items on your pages. You can also define custom templates for the content that you want to display in your [custom WebCenter application](#), or for selection by end users at runtime.

content repository

A specialized storage and management mechanism, such as author-based versioning, full textual searching, content categorization and attribution, and is optimized for storing unstructured information, which differentiates it from a data repository.

content repository data control

A **data control** sourced through a content repository. In a **custom WebCenter application**, you can create content repository data controls for the following content repositories: **Oracle Portal**, **Oracle Universal Content Management**, and third-party repositories supporting the Java Content Repository (JCR) standard, or your local file system.

credential provisioning page

A **JSF** (* .jspx) page used for authenticating to an **external application**. At runtime, the Credential Provisioning page displays login data fields consisting of the data fields specified through external application registration. Login information is passed to the producer, which in turn passes the login values to the external application. The application provides the producer with the requested portlets.

After authentication, the user's login credentials are preserved in a **credential store**, which subsequently supplies that information at future sessions. Unless his information changes, the user supplies his credentials only one time.

credential store

Provides storage for login credentials for its associated domain. It also preserves the login credentials that a user provides for authentication to an **external application**. Credential store is usually combined with the policy store as a single logical store.

Although the credentials stored in the credential store are used during subsequent logins for authentication, the main function of this store is to provide authorization for those accounts.

CSS

Cascading Style Sheet. A simple mechanism for ensuring a consistent look and feel or adding style, such as fonts, colors, and spacing, to Web documents.

custom action

Icons or menu items that are displayed on the header or in the Actions item of a Show Detail Frame component that surrounds a task flow. These actions can control actions defined in the task flow itself, enabling task flows to represent internal actions as options on the chrome.

custom attribute

Specifies group space information in addition to that provided by the built-in attributes. Custom attributes can be used to determine the content of the components in a group space based on the parameter passed in. For example, a component can display data for a specific customer by passing in the customer ID. A custom attribute is simply a name value pair ; for example customerId=400, orderId=11, userName=Smith, and so on. Custom attributes are stored within the group space template.

custom page

Any page created by a user rather than one provided out of the box.

custom resource catalog

A resource catalog that has been customized to control the components that are visible to specific users.

Contrast with **default resource catalog**.

custom role

A user role, created by an administrator or a group space moderator, to meet a specific personal space or group space requirement.

custom WebCenter application

A custom WebCenter application is built on top of the ADF using the [WebCenter Extension for Oracle JDeveloper](#). This application combines Web content, portlets, content integration, and collaborative services for the end user. Developers and administrators can create a [custom WebCenter application](#) based on their roles and skill levels in the organization. See [WebCenter application](#).

Customize mode

A [portlet mode](#) that enables users to set the default values for portlet preferences for all users.

customizable component

A WebCenter component that can be added to a page at runtime to enable end users to perform personalizations such as move, minimize, restore, or remove on content within those components. Customizable components are the [Panel Customizable component](#) and the [Show Detail Frame component](#).

customization

An update that affects all users.

data control

A mechanism that provides an abstraction of the business service's data model. The ADF data controls provide a consistent mechanism for clients and Web application controllers to access data objects, collections, methods, and operations.

See also [content repository data control](#).

default language (application-level)

A display language specified by the WebCenter Spaces administrator that is used when users log in to WebCenter Spaces. The WebCenter Spaces administrator sets the application-level default language on the General tab of the Administration page. Individual users can set their own user-level default language on the General tab of the Preferences dialog.

default language (user preference)

A display language specified by a user that is used when that user logs in to WebCenter Spaces. The user preference language selection lasts until you specify a different default language. It can be overridden by a session language, but returns as the default when the session cookie is purged or expires and can be overridden temporarily by the session language. The user sets the user-level default language on the General tab of the Preferences dialog.

default resource catalog

The resource catalog that is provided by default for an application. It contains all of the Oracle ADF components and portlets available to the application.

Contrast with [custom resource catalog](#).

Default Server

See [Integrated WLS](#).

deployment profile

A file used in application deployment that specifies the following types of information:

- The source files, deployment descriptors, and other auxiliary files that are packages
- The type and name of the archive file to be created
- Dependency information
- Platform-specific instructions
- Other information

[Oracle WebCenter Services](#) provides a special deployment profile, the [custom WebCenter application](#) WAR deployment profile, that includes an option to export project metadata.

Design view (JDeveloper)

A view, in [Oracle JDeveloper](#), that provides a WYSIWYG representation of a file.

See also [Source view \(JDeveloper\)](#).

Design view (WebCenter Spaces)

A view, in [Oracle Composer](#), that provides a WYSIWYG representation of a page and its components.

See also [Source view \(WebCenter Spaces\)](#).

discoverable group space

A group space that can be found by anyone logged into WebCenter Spaces, for example through a search. A group space is made discoverable when the group space moderator enables the Discoverable setting. Discoverable group spaces are listed in My Group Spaces; users wishing to join the group space can request membership through self-subscription (if enabled) or by contacting the group space moderator.

Discussions service

A WebCenter service that provides a means of creating and participating in text-based discussions with members of a particular group space.

display language

Controls the language in which application user interface elements, such as buttons, field labels, and screen text, are rendered in the browser. The order of precedence for WebCenter application display language settings from weakest to strongest is: browser setting, application setting, user preference setting, session setting, group space setting.

Document List Viewer task flow

A Documents service task flow that exposes a list of documents and optionally folders defined by the listing of a specific folder or the results of a document search. Include on a page by selecting All Documents, Group Space Documents, or Personal Documents from the Oracle Composer catalog.

Document Manager task flow

A Documents service task flow that exposes all the folders and files available from the default content repository connection and default folder. Include on a page by

selecting Documents from the Oracle Composer catalog. Use to create, upload, and manage library content; to manage file versions; and to check files out and in.

Documents page

A predefined page provided in every WebCenter Spaces group and personal space that includes the [Document Manager task flow](#) for managing content.

Documents service

A WebCenter service that provides features for accessing, adding, and managing files; creating and managing file folders; configuring file and folder properties; and searching file and folder content.

domain

Any tree or subtree within the Domain Name System (DNS) namespace. Domain most commonly refers to a group of computers whose host names share a common suffix, the domain name.

dynamically-generated page

A page that displays as the result of a user action, such as a search or a click on a tag. As the name suggests, dynamically-generated pages are not stored, but rather are created as and when needed.

EAR

Enterprise Archive file. A [Java EE](#) archive file that is used in deploying applications on a [Java EE](#) application server. [custom WebCenter applications](#) are deployed using both a generic EAR file containing the application and the respective runtime customization and a targeted EAR file containing only the application for deployment to the application server. EAR files simplify application deployment by reducing the possibility of errors when moving an application from development to test, and test to production.

See also [WAR](#).

ECMA-262 specification

A standardization of scripting programming languages, such as [ECMAScript](#) and JavaScript.

ECMAScript

A scripting programming language, standardized by Ecma International according to the [ECMA-262 specification](#). Frequently referred to as JavaScript or JScript, which are both extensions of the ECMA-262 specification.

Edit Defaults mode

([JSR 168](#) portlets only.) A [portlet mode](#) that enables personalization of a JSR 168 portlet. Edit Defaults mode is a display mode for the JSR 168 portlet's properties. In a [custom WebCenter application](#), the Edit Defaults mode displays on the portlet's Actions menu as the Customize command.

See also [Edit mode](#).

Edit mode

A [portlet mode](#) that enables personalization of the portlet for each user, for each instance.

See also [Edit Defaults mode](#).

edit mode

A view mode that enables users to modify the content, style, and layout of a page. Access edit mode by choosing Edit Page from the Page Actions menu.

EL

Expression Language. Provides a short-hand way of working with Web application data by providing operators for retrieving and manipulating application data residing in a **Java EE** Web container. In a **custom WebCenter application**, EL expressions are encapsulated in the characters "#{ and }" and typically come in the form #{object.data} where *object* represents any Java object or **ADF** component placed in the **Java EE** Web container's page, request, session, or application's scope.

Enterprise Archive file

See [EAR](#).

enterprise mashup

An application that enables users to bring all sorts of content and services together in a single place.

Events service

A WebCenter service that provides group calendars, which you can use to schedule meetings, appointments, and so on. You can integrate the Events service with a Microsoft Exchange Server to provide personal calendars for individual users. This service is available only in WebCenter Spaces, and not in custom WebCenter applications.

expiry-based caching

A **caching** method that uses a retention period to specify how long the item is valid in the cache before a refresh is required. When there is a request for the item beyond the retention period, it is refreshed in the cache.

See also [validation-based caching](#).

Expression Language

See [EL](#).

external application

Applications that do not delegate authentication to the single sign-on server. Instead, they display HTML login forms that ask for application user names and passwords. At the first login, users can choose to have the single sign-on server retrieve these credentials for them. Thereafter, they are logged in to these applications transparently.

farm

A collection of components managed by Fusion Middleware Control. A farm can contain a Managed Server domain and other Oracle Fusion Middleware system components that are installed, configured, and running on the domain.

favorites

A personal list of links to favorite WebCenter Spaces pages and external Web sites.

Federated Portal Adapter

See [FPA](#).

Feedback

In the [People Connections service](#), a feature for posting feedback for and receiving feedback from other application users.

FOD

Fusion Order Demo. An enterprise application built using Oracle Fusion Middleware, including Oracle WebCenter, used to provide examples of WebCenter functionality.

FPA

Federated Portal Adapter. A component of [Oracle Portal](#) that enables Oracle Portal instances to share their database portlets through the Web portlet interface. Using the FPA, Oracle Portal database portlets, including PL/SQL portlets, Portlet Builder portlets, and page portlets can be made available for use in WebCenter applications.

Full Screen Mode (WebCenter Spaces)

A view mode that opens the group space to occupy the entire screen, thus maximizing the display space. The Sidebar is not displayed in Full Screen Mode.

Full Screen mode (Portlets)

([PDK-Java](#) portlets only.) A [portlet mode](#) that provides more content than can be shown in the portlet when it is sharing a page with other portlets.

Fusion Middleware Control

A browser-based management application that is deployed when you install Oracle WebCenter. From Fusion Middleware Control, you can monitor and administer a [farm](#) (such as Oracle WebCenter).

Fusion Order Demo (FOD)

See [FOD](#).

Group Project group space

A group space created using the Group Project template. This type of group space provides an optimal structure for supporting a core project team where each member might come from a different department but all members contribute toward meeting a common goal.

group space

A work area within WebCenter Spaces that supports a group of people of any size that is organized around an area of interest or a common goal.

group space icon

An image displayed alongside group space names on the Group Spaces page in My Group Spaces to help other users with identification and location.

group space logo

An image displayed on the group space Home page to provide a visual identity for the group space. Group space logos also display alongside the group space name at the top of the page in Full Screen Mode.

group space member

A user who is participating in a group space. Members can be added or invited to a group space, or they can subscribe to a group space themselves if self-registration is enabled.

group space owner

A user who initially created a group space. The group space owner is automatically also a moderator of the group space.

group space template

A starting point for group space creation. WebCenter Spaces includes three templates to get you started: Group Project, Community of Interest, and Blank, but you can turn any group space into a template to use it as the starting point for other similar group spaces.

Group Space Unavailable page

A predefined page that displays when a group space member tries to open a group space that is temporarily offline. Moderators can customize this page.

HA

High Availability. A collection of solutions to ensure that your applications meet the required availability to achieve your business goals, eliminating single points of failure with no or minimal outage in service.

Help mode

A [portlet mode](#) that displays usage information about the functionality of the portlet.

High Availability

See [HA](#).

HTML Markup layout component

An Oracle Composer layout component. A simple HTML component that renders raw HTML and JavaScript mark-up inline on the page.

Hyperlink layout component

An Oracle Composer layout component. A link to an internal or external Web page. For designers of custom WebCenter applications, this is the runtime equivalent of a Go Link component.

IDE

Integrated Development Environment. A visual application development tool containing editors, debuggers, screen painters, object browsers, and the like. [Oracle JDeveloper](#) is an example of an IDE.

Identity Propagation

For a custom WebCenter application and associated content repositories, selecting this option allows propagation of current user's identity across the application and processes. The propagated identity is verified on the receiver's side, and then it is used to make decisions such as assigning role based access control.

Image layout component

An Oracle Composer layout component. An illustration that can include a hyperlink. For designers of custom WebCenter applications, this is the runtime equivalent of an Image Link component.

IMP service

See [Instant Messaging and Presence service](#).

initialization parameters

The parameters initialized upon the start-up of a standard JSR 168 portlet. Initialization parameters provide an alternative to JNDI (Java Naming and Directory Interface) variables. Use initialization parameters instead of JNDI to configure the behavior of all of the different components of the portlet—for example, servlets and other portlets—in a compatible way. In [Oracle WebCenter](#), initialization parameters are entered into the `portlet.xml` file.

Instant Messaging and Presence service

A WebCenter service that enables users to observe the presence status of other authenticated users and provides instant access to interaction options, such as instant messages, emails, and phone calls.

Integrated Development Environment

See [IDE](#).

Integrated WLS

Integrated WebLogic Server. A WLS instance used as a platform for pretesting WebCenter application deployments on a local computer. Integrated WLS also contains preconfigured portlet producers and several useful prebuilt portlets.

JAAS

Java Authentication and Authorization Service (JAAS) is a Java package that enables applications to authenticate and enforce access controls upon users. JAAS is designed to complement Java 2 security and implements a Java version of the standard Pluggable Authentication Module (PAM) framework. This enables an application to remain independent from the authentication service, and supports the use of custom authentication modules.

JAAS extends the access control architecture of the Java 2 Security Model to support subject-based authorization. It also supports declarative security settings, in deployment descriptors, instead of being limited to code-based security settings.

Java Authentication and Authorization Service

See [JAAS](#).

Java Content Repository

See [JCR 1.0](#).

Java EE

Also known as Java EE 5. Java Enterprise Edition 5 Platform. A platform that enables application developers to develop, deploy, and manage multitier, server-centric, enterprise-level applications. The Java EE platform offers a multitiered distributed application model, integrated XML-based data interchange, a unified security model, and flexible transaction control. You can build your own Java EE portlets and expose them through Web producers.

Java Enterprise Edition 5 Platform

See [Java EE](#).

Java Portlet Specification

Standardizes how components for portal servers are to be developed. This specification defines a common portlet [API](#) and infrastructure that provides facilities for personalization, presentation, and security. Portlets using this [API](#) and adhering to

the specification are product-agnostic, and can be deployed to any portal product that conforms to the specification. See also [JSR 168](#).

Java Specification Request

See [JSR 168](#).

JavaServer Faces

See [JSF](#).

JavaServer Page

See [JSP](#).

JCR 1.0

Java Content Repository 1.0. Also known as JSR 170. It proposes a standard access and interaction [API](#) for content repositories, much like JDBC does for databases.

JDeveloper

See [Oracle JDeveloper](#).

JSF

JavaServer Faces. A standard Java framework for building Web applications. It simplifies development by providing a component-centric approach to developing Java Web user interfaces. JSF offers rich and robust [APIs](#) that provide programming flexibility and ensures that applications are well designed with greater maintainability by integrating the Model-View-Controller ([MVC](#)) design pattern into its architecture. As JSF is a Java standard developed through Java Community Process, development tools like [Oracle JDeveloper](#) are fully empowered to provide easy to use, visual, and productive development environments for JSF.

JSF JSP

JavaServer Faces JavaServer Page. JSF JSPs differ from plain JSPs through their support of [Oracle ADF Faces](#) components for the user interface and JSF technology for page navigation. JSF JSP pages leverage the advantages of the Oracle [Application Development Framework](#) (Oracle ADF) by using the ADF Model binding capabilities for the components in the pages.

JSP

JavaServer Page. An extension to servlet functionality that provides a simple programmatic interface to Web pages. JSPs are HTML pages with special tags and embedded Java code that is executed on the Web or application server. JSPs provide dynamic functionality to HTML pages. They are actually compiled into servlets when first requested and run in the servlet container.

See also [JSP tags](#).

JSP tags

Tags that can be embedded in [JSPs](#) to enclose Java code. These tags use the `<jsp:` syntax and enclose action elements in the JSP with `begin` and `end` tags similar to XML elements.

JSR 168

Java Specification Request (JSR) 168. Defines a set of [APIs](#) for building standards-based portlets using Java. Portlets built to this specification can be rendered

to a portal locally or deployed to a WSRP container for rendering portlets remotely. For more information, see <http://jcp.org/en/jsr/detail?id=168>.

JSR 170

See [JCR 1.0](#)

JSR 301

See [Oracle JSF Portlet Bridge](#).

keystore

A file that provides information about available public and private keys that are used for authentication and data integrity. User certificates and the trust points needed to validate the certificates of peers are also stored securely in the keystore

layout box

A container that enables placement of content on a WebCenter Spaces page.

layout component

An object for enhancing the usefulness and appearance of a given page. Layout components include layout boxes, a rich text editor, images, hyperlinks, and so on.

Layout Customizable component

A component provided in the Oracle Composer tag library that enables users to select from a set of predefined layouts (for example, two column, three column, two row, and so on) and apply it to the page. Users can apply these layouts to a particular area of the page or to the entire page.

LDAP

Lightweight Directory Access Protocol. A standard, extensible directory access protocol. It is a common language that LDAP clients and servers use to communicate. The framework of design conventions supporting industry-standard directory products, such as the Oracle Internet Directory.

lifecycle

See [application lifecycle](#).

Lightweight Directory Access Protocol (LDAP)

See [LDAP](#).

Links service

A WebCenter service that provides a means of creating a bidirectional association between two objects, thus setting up easy access between those objects.

List Manager

A task flow of the Lists service that provides access to all the tools for creating and revising lists and list content and to all of a group space's current lists.

Lists page

A predefined page that displays the group space's current lists.

Lists service

A WebCenter service for creating, publishing, and managing lists. Uses for lists include tracking issues, capturing project milestones, publishing project assignments,

and so on. This service is available only in WebCenter Spaces, and not in custom WebCenter applications.

Lists Viewer

A task flow of the Lists service that provides a means of placing a particular list on a group space page.

Mail service

A WebCenter service for exposing familiar email functionality in WebCenter applications.

Managed Server

In a production environment, a Managed Server hosts applications and the resources needed by those applications. A domain, which is a logically related group of Oracle WebLogic Server resources, can have any number of Managed Servers. An Administration Server manages these servers.

mashup

A Web application that enables end users to pull information from different sources to create a personalized application that exactly meets their individual requirements.

MBean Browser

A set of MBean browsers in Fusion Middleware Control. MBeans browsers enable the administrator to browse the MBeans for an Oracle WebLogic Server or for a selected application as well as perform specific monitoring and configuration tasks.

MDS

Oracle Metadata Services. A core technology of the [Application Development Framework](#). MDS provides a unified architecture for defining and using metadata in an extensible and customizable manner.

MDS repository

An application server and Oracle relational database that keep metadata in these areas: a file-based repository data, dictionary tables (accessed by built-in functions) and a metadata registry. One of the primary uses of MDS is to store customizations and persisted personalization for Oracle applications

Message Board

In the [People Connections service](#), a feature for posting messages to and receiving messages from other application users.

Model-View-Controller

See [MVC](#).

moderator

A WebCenter Spaces user who is responsible for managing a particular group space. A group space moderator can add and remove members, invite new members, enable self registration, provide and update group space metadata, and manage the services available to the group space.

Movable Box layout component

An Oracle Composer layout component. A container that enables the placement of content on a WebCenter Spaces page and also enables the container (rather than just

the content) to be moved around on the page. For designers of custom WebCenter applications, this is the runtime equivalent of Show Detail Frame component.

MVC

Model-View-Controller. A classic design pattern often used by applications that need the ability to maintain multiple views of the same data. The MVC pattern hinges on a clean separation of objects into one of three categories: models for maintaining data, views for displaying all or a portion of the data, and controllers for handling events that affect the model or views. Because of this separation, multiple views and controllers can interface with the same model. Even new types of views and controllers that never existed before, such as portlets, can interface with a model without forcing a change in the model design.

My Group Spaces page

A predefined page that displays a list of all the group spaces and group space templates available to the currently logged in user. This includes group spaces of which the user is a member, group spaces marked as discoverable, and group spaces that are public and available to everyone.

navigation parameter

Parameters in a [WSRP](#) container that map to the render parameters with the same name in [JSR 168](#) portlet code. Navigation parameters are exposed by the portlet to the consumer. The consumer stores and manages parameter values and sends them on every invocation to the portlet. Navigation parameters are a WSRP version 2 feature.

Notes service

A WebCenter service that provides useful features for writing personal notes and reminders. This service is available only in WebCenter Spaces, and not in custom WebCenter applications.

OAM

See [Oracle Access Manager \(OAM\)](#).

OHS

See [Oracle HTTP Server \(OHS\)](#).

OmniPortlet

A component of [Oracle WebCenter](#) that enables you to inject portal-like capabilities, such as portlets, content integration, and customization, into your [Oracle ADF Faces](#) applications.

Oracle Access Manager (OAM)

Part of Oracle's enterprise class suite of products for identity management and security, Oracle Access Manager provides a wide range of identity administration and security functions, including several single sign-on options for WebCenter Spaces and WebCenter custom applications. OAM is the recommended single sign-on solution for Oracle WebCenter 11g installations.

Oracle ADF Faces

Oracle [ADF Faces](#) is a rich set of user interface components based on the new [JavaServer Faces JSR \(JSR 127\)](#). Oracle ADF Faces provide various user interface components with built-in functionality, such as data tables, hierarchical tables, and color and date pickers, that can be customized and reused in an application.

Oracle Composer

A seamlessly integrated environment for populating, revising, and configuring WebCenter application pages. It enables users to easily build or revise page layout and content. It also provides the means of adding different components, such as task flows, portlets, content, and other objects, onto a page and then linking those components for a more relevant or personalized view of the information.

Oracle Content Server

A content repository for building secure business libraries with check in and check out, revision control, and automated publishing in web-ready formats. Current information is available to authorized users anytime, anywhere.

Oracle Content Server is a component of Oracle Universal Content Management.

Oracle WebCenter Discussions

Enables integration of discussion forums and announcements into WebCenter application.

Oracle Enterprise Manager

A component that enables administrators to manage Oracle Fusion Middleware services through a single environment. The Fusion Middleware administrator uses Enterprise Manager to configure, manage, and monitor WebCenter applications.

Oracle HTTP Server (OHS)

Software that processes Web transactions that use the Hypertext Transfer Protocol (HTTP). Oracle uses HTTP software developed by the Apache Group.

Oracle Internet Directory

Oracle's LDAP V3 compliant LDAP server. It is used as a repository for provisioning users and groups. By default, the [Oracle Single Sign-On \(OSSO\)](#) authenticates user credentials against Oracle Internet Directory information about dispersed users and network resources. Oracle Internet Directory combines LDAP version 3 with the high performance, scalability, robustness, and availability of the Oracle database.

Oracle JDeveloper

Oracle JDeveloper is an integrated development environment ([IDE](#)) for building applications and Web services using the latest industry standards for Java, XML, and SQL. Developers can use Oracle JDeveloper to create Java portlets.

Oracle JSF Portlet Bridge

Based on and conforming to JSR 301, the Oracle JSF Portlet Bridge enables application developers to expose a JSF application or task flow as a JSR 168 portlet for consumption in another application.

Oracle Metadata Services

See [MDS](#).

Oracle Portal

A component used for the development, deployment, administration, and configuration of enterprise class [portals](#). Oracle Portal incorporates a portal building framework with self-service publishing features to enable you to create and manage information accessed within your portal.

Oracle SES

Oracle Secure Enterprise Search (SES) provides easy-to-use search for public and secure data. It is included with [Oracle WebCenter](#). You can override the default search adapters in WebCenter Spaces and use Oracle SES, which provides unified ranking results. The results are listed together, instead of being clustered into separate sections for Documents, Discussions, and so on, with the most relevant items appearing first.

Oracle Single Sign-On (OSSO)

A component that enables users to log in to all features of the Oracle Fusion Middleware product suite, and to other Web applications, using a single user name and password.

Oracle SOA Suite

A middleware component of Oracle Fusion Middleware. Oracle SOA Suite enables services to be created, managed, and orchestrated into SOA composite applications. Composites enable you to easily assemble multiple technology components into one SOA composite application. Oracle SOA Suite plugs into heterogeneous infrastructures and enables enterprises to incrementally adopt SOA.

Oracle Technology Network

See [OTN](#).

Oracle Universal Content Management

A consolidated content management application that provides multisite Web content management, document management, digital asset management and records management.

Oracle WebCenter

A suite of services that enables you to build custom WebCenter applications. Oracle WebCenter reduces the front-end labor historically required to bring necessary business components to the user by capitalizing on the notion of Service Oriented Architecture (SOA). The suite includes a wide range of plug-and-play products, tools, and services that make it easy to build the applications your users need. Oracle WebCenter includes:

- [Oracle WebCenter Services](#)
- [Oracle WebCenter Framework](#)
- [content integration services](#)
- [ADF](#)
- [Oracle SES](#)
- [Oracle WebCenter Discussions](#)
- Mobile Services
- Portlet Pack

Oracle WebCenter Framework

A set of features provided by [Oracle WebCenter](#) that augments the Java Server Faces (JSF) environment by providing additional integration and run-time customization options. It is the basis of Oracle WebCenter and supports the creation and execution of context-rich applications, which can come in the form of human interaction, files and

documents, or a clear representation of where the user is within a complex work process. It includes such features as:

- Portlet support
- [content integration services](#)
- [Oracle JSF Portlet Bridge](#)
- Search framework
- customizable components

Oracle WebCenter Services

A suite of services included in [Oracle WebCenter](#) that enables you to enhance your [Oracle ADF Faces](#) applications with WebCenter application capabilities, such as portlets, content integration, and customization. Includes design time extensions to [Oracle JDeveloper](#) to help to build [custom WebCenter applications](#). The services include:

- [Oracle Universal Content Management](#)
- [Oracle SES](#)
- [Oracle WebCenter Discussions](#)
- communication services

Oracle WebLogic Server Administration Console

A browser-based, graphical user interface to manage a WebLogic Server domain. Use to:

- Configure, start, and stop WebLogic Server instances
- Configure WebLogic Server clusters
- Configure WebLogic Server services, such as database connectivity (JDBC) and messaging (JMS)
- Configure security parameters, including creating and managing users, groups, and roles
- Configure and deploy your applications
- Monitor server and application performance
- View server and domain log files
- View application deployment descriptors
- Edit selected run-time application deployment descriptor elements

Oracle WebCenter Wiki and Blog Server

Supports integration of wikis and blogs into WebCenter applications. It also supports features that enable application users to create their own wikis and blogs.

OTN

Oracle Technology Network. The online Oracle technical community that provides a variety of technical resources for building Oracle-based applications. You can access OTN at <http://www.oracle.com/technology/>.

Page Customizable component

A component provided in the Oracle Composer tag library that defines the editable area of a page at runtime. Within this area, users can edit properties for a component, add content to the page, arrange content, and so on.

page parameter

A parameter associated with a page that can be used to store values that can then be passed to the components on the page. It also enables your page to take values through its URL. Page parameters are defined using the `<parameter>` tag at the top of your `PageDef.xml`. You can bind page parameters to your [page variables](#).

Page Properties

A dialog, accessed from Oracle Composer, that provides access to a page's display options, security settings and parameters.

page scheme

Determines the background image used in the page. WebCenter Spaces provides several default page schemes and an option for specifying a custom page scheme.

Page service

A service for creating new pages and task flows in your application at runtime.

page style

Determines the initial page structure, for example one column or two column. Some default page styles also include the task flows, components, and page properties useful for a particular purpose. For example, a page created using the Text page style includes a Text layout component.

page variable

A variable that binds your public portlet parameter to the page. Page variables are defined within the `<variableIterator>` of your `PageDef.xml`. One page variable can be bound to multiple public portlet parameters.

Panel Customizable component

A component provided in the Oracle Composer tag library that provides a container region for a group of Oracle ADF components and portlets that are customizable at runtime. Any Show Detail Frame components and portlets added as child components to a Panel Customizable component can be moved or maximized with the Panel Customizable component.

parameter

A variable that controls the default behavior of task flow content and facilitates the wiring of a task flow to page parameters and page definition variables.

participant

A WebCenter Spaces user who can manipulate the content of a group space. A participant can upload and share documents, initiate and take part in chats with other members, create discussion topics, modify due dates of tasks assigned to them, create new or view existing lists.

PDK-Java

Java Portlet Developer Kit. The development framework used to build and integrate Web content and applications with [Oracle WebCenter](#). It includes toolkits, samples,

and technical articles that help make portal development simple. You can take existing Java [servlets](#), [JSPs](#), URL-accessible content and Web services and turn them into [portlet](#)s. It is typically used by external developers and vendors to create portlets and services.

People Connections service

A WebCenter service that provides social networking tools for creating, interacting with, and tracking the activities of one's enterprise connections.

See also, [Activity Stream](#), [Connections](#), [Feedback](#), [Message Board](#), and [Profile](#).

personalization

An update that affects only the user who made it.

personal page

A page created by a user in his or her personal space. Personal pages are viewable by other users only if specifically granted access by the user who created the page.

personal profile

A page that displays a user's personal information such as email address, phone number, office location, department, manager, direct reports, and so on.

See also, [Profile](#).

personal space

A work area within WebCenter Spaces that provides individual users with a private space for storing personal content, keeping notes, viewing and responding to assignments, maintaining a list of online buddies, and performing many other tasks relevant to their unique working day. Users can also extend this environment by creating additional personal pages and custom content.

portal

A common interface (that is, a Web page) that provides a personalized, single point of interaction with Web-based applications and information relevant to individual users or class of users.

Portal Developer Kit

See [PDK-Java](#).

portlet

A reusable Web component that can draw content from many different sources. Portlets can display excerpts of other Web sites, generate summaries of key information, perform searches, and access assembled collections of information from a variety of data sources. Because different portlets can be placed on a common page, the user receives a single-source experience, even though the content may be derived from multiple sources. Portlet resources include the many prebuilt portlets available out of the box from many sources, programmatic portlets built through WebCenter's JSR 168 and PDK-Java Portlet wizards, and through other portlet building tools.

portlet mode

The ways by which a [portlet](#) can be called to display information. These methods include:

- [Shared Screen mode](#) or [View mode](#)
- [Edit mode](#) or [Edit Defaults mode](#)

- [Customize mode](#)
- [Help mode](#)
- [About mode](#)
- [Full Screen mode \(Portlets\)](#) or [Show Details Page mode](#)

Portlet Producer Application template

An application template, provided by JDeveloper, for creating an application with the recommended projects and technology scopes required for developing portlets. The Portlet Producer Application template consists of a single project scoped for portlet creation (Portlets).

See also [WebCenter Application template](#).

predefined page

A page created by WebCenter Spaces to perform a specific function. Examples of predefined pages include, Welcome pages, Search pages and Documents pages.

Predeployment Tool

A utility for [custom WebCenter applications](#) that helps you configure your target system with the new producer registrations you have added to your application in Oracle JDeveloper. You must run this utility before deploying your application. You can also use this utility after deployment to migrate metadata from stage to production, such as for exporting and importing your customizations. This tool also enables you to define the [MDS](#) repository location to allow run-time customizations to be migrated.

pretty URL

A shortened version of a page's URL that hides the complexity of the real Web address.

private parameter

A portlet parameter that is known only to the portlet itself and has no connection to the page on which the portlet resides.

Contrast with [public parameter](#).

producer

A producer communication link between portlet consumers (such as a [custom WebCenter application](#) or a [portal](#)). When a consumer application renders a portlet, it calls the producer of that portlet, which in turn executes the portlet and returns the results in the form of portlet content. A producer can contain one or more portlets. A portlet can be contained by only one producer.

[Oracle WebCenter](#) supports two types of producers:

- Oracle [PDK-Java](#) producers: Deployed to a [Java EE](#) application server, which is often remote and communicates through Simple Object Access Protocol (SOAP) over HTTP.
- [Web Services for Remote Portlets](#) (WSRP): A Web services standard that enables the plug-and-play of visual, user-facing Web services with portals or other intermediary Web applications. Being a standard, WSRP enables interoperability between a standards-enabled container based on a particular language (such as [JSR 168](#), .NET, Perl) and any WSRP portal. A portlet (regardless of language)

deployed to a WSRP-enabled container can be rendered in any application that supports this standard.

Profile

In the [People Connections service](#), a feature for viewing and managing information about yourself, such as your contact information, manager, and direct reports, and for viewing this information about other application users.

programmatically portlets

Portlets constructed in a non-declarative manner using [APIs](#). Also referred to as *hand-* or *manually coded* portlets.

public group space

A group space that is available to all users, even those who are not logged in to WebCenter Spaces.

public page

A page within WebCenter Spaces that is available to all users, even those who are not logged in to WebCenter Spaces.

public parameter

A portlet parameter that is known to the page and bound to it by way of a page variable.

Contrast with [private parameter](#).

public user

A user who can access, but is not logged into, a [WebCenter application](#). A public user can view any page that has been marked as public, but cannot personalize or edit any content, or view pages that have any form of access control.

Contrast with [authenticated user](#).

Recent Activities service

A WebCenter service that provides a means of tracking recent activities in a WebCenter application.

Recent Documents task flow

A Documents service task flow that exposes the files most recently modified in some way. Include on a page by selecting Recent Documents from the Oracle Composer catalog.

resize handle

A user interface element in a task flow chrome increasing or decreasing the height of the task flow.

Resource Action Handling framework

Enables services that expose custom resources to be viewed, searched, and tagged.

Resource Catalog

A catalog that provides a federated view of one or more otherwise unrelated repositories in a unified search and browse user interface. Resources are created and published in their source repository and are then exposed to the developer in JDeveloper's Resource Palette and to the end user in the Resource Catalog Viewer.

Resource catalogs can contain layout components, Oracle ADF components, portlets, service task flows, and documents.

Resource Index

The starting point for accessing WebCenter REST APIs. Sending a GET request to the Resource Index URI returns a list of links to entry points for all available services.

resource type

Defines the type of resource that a WebCenter REST API link identifies. Use resource types to determine the response bodies for GET requests and allowable request bodies for POST and PUT. Also use `resourceType` attributes on entities to uniquely identify their type.

REST APIs

Oracle WebCenter provides a set of web-based REST (REpresentational State Transfer) APIs for retrieving and modifying server data dynamically from the client. REST APIs are available for [Discussions service](#), [Lists service](#), [People Connections service](#), and [WebCenter Spaces](#).

Reverse Proxy Server

A server process that hides the physical location of internal servers by exposing the servers as a single public site. Requests to the public site are routed to the appropriate internal server.

Rich Text portlet

A portlet, based on the [WSRP](#) standard, offering browser-based rich text editing at runtime on a deployed Oracle ADF [JavaServer Faces](#) JSP.

RSS service

A WebCenter service that provides a means of publishing content from other services as news feeds. The RSS service supports both RSS 2.0 and Atom 1.0 formats.

Search page

A predefined page for running searches, creating and managing saved searches, and viewing and refining search results.

Search service

A WebCenter service that enables the discovery of information and people in a WebCenter application, returning only the results users are authorized to see

Secure Enterprise Search

See [Oracle SES](#).

secured application page

A page created by a user that has not been made available to public users.

Self-Registration page

A predefined page where users can register with WebCenter Spaces, thus creating themselves an identity store login account. Administrators can customize certain aspects of this page.

Self-Subscription page

A predefined page where users can register to become members of a group space. Moderators can customize certain aspects of this page.

service ID

In Expression Language, the string that identifies a particular service. For example, the string `oracle.webcenter.collab.announcement` is the service ID for the Announcements service.

A PDK-Java producer's unique identifier. PDK-Java enables you to deploy multiple producers under a single adapter servlet. Different producers are identified by their unique service IDs. A service ID is required only when a service ID/producer name is not appended to the URL endpoint.

Service Oriented Architecture

See [SOA](#).

servlet

A Java program that usually runs on a [Web server](#), extending the Web server's functionality. HTTP servlets take client HTTP requests, generate dynamic content (such as through querying a database), and provide an HTTP response.

session language

A display language specified by the user that remains in effect for the life of the session cookie (usually from the time the user logs on until logging off). If the user clears browser cookies, the display language reverts to the user-level default language, if specified, then to the application-level default language set by the WebCenter Spaces administrator. Set the session language in the Change Language pop-up, accessible from the Welcome page.

Shared Screen mode

A [portlet mode](#) that renders the body of the portlet and enables you to display a portlet on a page that can contain other portlets. Every portlet must have at least a Shared Screen mode.

See also [View mode](#).

Show Detail Frame component

A component provided in the Oracle Composer tag library that renders a border or chrome around the child component. It provides a header with an Actions menu and thereby provides user interface (UI) controls to customize the display of the child component. However, to customize the display of the child component, the Show Detail Frame component must be included inside a Panel Customizable component.

Show Details Page mode

A [portlet mode](#) that provides full-browser display of the portlet. For example, a portlet in [Show Page mode](#) could be limited to displaying only the ten most recently submitted expense reports, while the same portlet in Show Details Page mode could show all submissions.

Contrast with [Show Page mode](#).

show modes

Types of [portlet modes](#) encompassing [Show Page mode](#) and [Show Details Page mode](#).

Show Page mode

A [portlet mode](#) that provides a smaller portlet display to allow space for additional portlets and other objects in the browser window. For example, a portlet in Show Page mode could be limited to displaying only the ten most recently submitted expense reports, while the same portlet in Show Details Page mode could show all submissions.

Contrast with [Show Details Page mode](#).

Sidebar

A panel in WebCenter Spaces that provides quick access to tools and information essential to personal productivity, including mail, personal contacts, and so on.

skin

A style sheet based on the CSS 3.0 syntax specified in one place for an entire application. Instead of providing a style sheet for each component, or inserting a style sheet on each page, you can create one skin for the entire application.

SOA

Service Oriented Architecture. A design methodology aimed at maximizing the reuse of application services.

Source view (JDeveloper)

A view, in [Oracle JDeveloper](#), that provides a way to directly edit the source code of a file.

Source view (WebCenter Spaces)

A view, in Oracle Composer, that provides a selectable structural representation of a page and its components.

See also [Design view \(WebCenter Spaces\)](#).

struts

A development framework for Java servlet applications based upon the [MVC](#) design paradigm.

style properties

Used to override the style information from the skin CSS to set specific instances of component display.

Tags service

A WebCenter service that enables users to apply their own terms to application objects, making it possible to search for those objects using personally meaningful terms.

task flow

A set of ADF Controller activities, control flow rules, and managed beans that interact to allow a user to complete a task. Task flows provide a modular approach for defining control flow in an application. Instead of representing an application as a single JSF page flow, developers can break it up into a collection of reusable task flows.

task flow header

An area at the top of a task flow that displays the task flow name and various tools for interacting with the task flow.

template

See [group space template](#).

Text layout component

An Oracle Composer layout component. A rich text editor for providing static page text. For designers of custom WebCenter applications, this is the runtime equivalent of a Rich Text Editor component.

Unauthorized Access page

A predefined page that displays when someone tries to open a page without access permissions. Moderators can customize the default content of this page.

URL parameter

See [private parameter](#).

validation-based caching

A [caching](#) method that uses a validation check to determine if the cached item is still valid.

Contrast with [expiry-based caching](#).

viewer

A WebCenter Spaces user who can look at the information in a group space but cannot contribute any of their own.

View mode

(JSR 168 portlets only.) A [portlet mode](#) that enables you to display a JSR 168 portlet on a page that can contain other portlets. It is the only required mode for JSR 168 portlets.

See also [Shared Screen mode](#).

WAR

Web application archive file. This file is used in deploying applications on a [Java EE](#) application server. WAR files encapsulate in a single module all of the components necessary to run an application. WAR files typically contain an application's [servlet](#), [JSP](#), and [JSF JSP](#) components.

See also [EAR](#).

Web 2.0

Technologies, such as wiki, RSS, and blogs, that enable the construction of highly interactive Web applications.

See also [WebCenter service](#).

Web Application Archive file

See [WAR](#).

Web clipping

A feature that enables page designers to collect Web content into a single centralized portal. It can be used to consolidate content from hundreds of different Web sites scattered throughout a large organization.

Web Clipping portlet

A browser-based declarative tool that enables you to integrate any Web application with your **custom WebCenter application**. It is designed to give you quick integration by leveraging the Web application's existing user interface. You can drag and drop Web Clipping portlets on to a *.jspx page.

Web Page layout component

An Oracle Composer layout component. A means of embedding another Web site, wiki, or blog within the context of a WebCenter Spaces page. For designers of custom WebCenter applications, this is the equivalent of an Inline Frame component.

Web server

A program that delivers Web pages.

Web Services for Remote Portlets

See [WSRP](#).

WebCenter

See [Oracle WebCenter](#).

WebCenter application

WebCenter applications encompass both **custom WebCenter applications** and **WebCenter Spaces**.

WebCenter application administrator

The administrator responsible for maintaining the **WebCenter application**. For example, in WebCenter Spaces, the administrator performs tasks such as implementing the branding for the WebCenter application, making new content available, modifying pages, and granting and revoking privileges.

Contrast with systems administrator who has administrative rights for entire Fusion Middleware functions. The Fusion Middleware administrator is also responsible for deploying, setting up, and configuring the WebCenter application, and performing on-going administrative tasks for the WebCenter application and other WebCenter components through Fusion Middleware Control.

WebCenter application developer

The developer who plans, builds, and maintains a **custom WebCenter application** using the Oracle Application Development Framework, [Oracle JDeveloper](#), and [Oracle WebCenter](#).

WebCenter application end user

The WebCenter application end user is the runtime user of the **WebCenter application**, who accesses pages, portlets, and content, and personalizes portlets (assuming the appropriate privileges).

WebCenter Application template

An application template, provided by JDeveloper, for creating an application with the recommended projects and technology scopes required for developing a WebCenter

application. The WebCenter Application template consists of a project for the data model (Model) and a project for consuming portlets, components, and data controllers (ViewController).

See also [Portlet Producer Application template](#).

WebCenter Extension for Oracle JDeveloper

An extension available through the Oracle JDeveloper Update Wizard that installs the necessary libraries, templates, wizards, and dialogs needed to build and deploy [custom WebCenter applications](#) in [Oracle JDeveloper](#).

WebCenter Framework

See [Oracle WebCenter Framework](#).

WebCenter Services

Expose social networking and personal productivity features through various services, such as, [Announcements service](#), [Blog service](#), [Discussions service](#), [Documents service](#), [Events service](#), [IMP service](#), [Links service](#), [Lists service](#), [Notes service](#), and so on.

WebCenter Spaces

A Web-based application that offers the very latest technology for social networking, communication, collaboration, and personal productivity. WebCenter Spaces uses services and applications to bring everything together that users require to exchange ideas with others, keep track of personal and work-related tasks, interact with critical applications, and zero in on projects and interests; all within a single integrated environment.

WebCenter Spaces is a [WebCenter application](#).

WebCenter Spaces application administrator

See [administrator](#).

WebCenter Spaces RSS reader

An RSS reader provided with WebCenter Spaces that incorporates public news feeds from external sources onto application pages. This RSS reader is available only in WebCenter Spaces, and not in custom WebCenter applications.

WebCenter systems administrator

See [administrator](#).

WebCenter service

A service that provides Web 2.0 functionality in support of personal and team objectives. WebCenter provides the following services:

- [Announcements service](#)
- [Blog service](#)
- [Discussions service](#)
- [Documents service](#)
- [Events service](#)
- [Instant Messaging and Presence service](#)
- [Links service](#)

- [Lists service](#)
- [Mail service](#)
- [Notes service](#)
- [People Connections service](#)
- [Recent Activities service](#)
- [RSS service](#)
- [Search service](#)
- [Tags service](#)
- [Wiki service](#)
- [Worklist service](#)

WebLogic Server

See [WLS](#).

Welcome page

There are two types of Welcome page:

- **Public Welcome page:** A predefined page that users encounter before logging in to WebCenter Spaces.
- **Personal Welcome page:** A predefined page that introduces users to their personal space.

wiki page

A page that provides in-place editing using HTML or a simple mark-up language. Any user with sufficient privileges can add, revise, and remove wiki content.

Wiki service

A WebCenter service for integrating wiki pages in WebCenter applications.

WLS

WebLogic Server. A scalable, enterprise-ready Java Platform, Enterprise Edition (Java EE) application server. The WebLogic Server infrastructure supports the deployment of many types of distributed applications and is an ideal foundation for building applications based on Service Oriented Architectures (SOA).

See also [Integrated WLS](#)

WLST

WebLogic Scripting Tool. A command line tool for managing Oracle Fusion Middleware components, such as Oracle WebCenter.

Worklist service

A WebCenter service that provides access to notifications, alerts, and BPEL tasks assigned to the current user.

WSRP

Web Services for Remote Portlets (WSRP) is a Web services standard that allows the plug-and-play of visual, user-facing Web services with portals or other intermediary Web applications. Being a standard, WSRP enables interoperability between a standards-enabled container based on a particular language (such as [JSR 168](#), .NET,

Perl) and any WSRP portal. A portlet (regardless of language) deployed to a WSRP-enabled container can be rendered on any portal that supports this standard.

XSL

Extensible Stylesheet Language (XSL) is the language used within style sheets to transform or render XML documents.
