**JBO-25031: View row for view object {0} is missing entity row for {1}.**

**Cause:** The client attempted to access an attribute of a view which is mapped to an entity row, but the corresponding entity row is null. **Level:** 1

**Type:** ERROR

**Impact:** Programmatic

**JBO-25034: Row with handle {1} is not found in rowset {0}.**

**Cause:** The client attempted to locate a row with a stale row handle. This error might be raised if the client tries to take a row out of one query collection and use its handle to find a row in another query collection. Note that if the client calls `executeQuery` on a rowset, it might receive a new query collection. Thus, this error might occur if the client retrieves a row from a rowset, takes its row handle, calls `executeQuery`, and then tries to locate the row using the saved handle. This exception might also be raised if a row reference is used across transaction boundaries and the row handle has become stale and hence the corresponding row cannot be found.

**Action:** Make sure that the row handle is not stale. One approach is to find the row again using its primary key before attempting to act on the row.

**JBO-25035: The application module passivation store is invalid.**

**Cause:** An application attempted to change an application module's passivation store after it had been initialized. The passivation store (Database, File or Memory) can only be initialized once. If the customer application logic has not specified a passivation store when the serialization framework is invoked, the passivation store is initialized by the framework.

**Action:** Check the client application logic for invocations of `ApplicationModuleImpl.setStoreForPassiveState` which are invoked after the application module passivation store has been initialized.

**Cause:** This row set is a detail in a master-detail relationship, but it is missing a master row set iterator. Most likely, this occurred because a master row set iterator was removed through a call to `removeMasterRowSetIterator()` and has not been replaced with an appropriate one.

**Action:** Call `setMasterRowSetIterator()` to provide a valid master row set iterator.

**JBO-25038: Value {2} passed as parameter {1} to method {0} is invalid.**

**Cause:** An attempt was made to invoke a business components method with an invalid parameter value.

**Action:** Refer to the documentation of error message JBO-25006 (EXC\_INVALID\_PARAMETER) for more information. The difference between this error message and EXC\_INVALID\_PARAMETER is that this version does not include an explanation. In general, Oracle recommends using JBO-25006 instead of JBO-25038.

**JBO-25042: Row of trans post listener handle {0} not found in list.**

**Cause:** Entity row of the given handle is not found in transaction post listener list. Most likely cause of this error is as follows: the user requests certain operation. The operation tries to get access to the row in database. This fails for whatever reason (this exception's detail might have further information). The system tries to fix the problem at the entity level. It looks for the entity row in the transaction post listener list. The specified row is not found.

**Action:** Look at the details and see if the cause can be determined from them. Check to see if concurrent updates to database could have caused the problem.

**JBO-25051: Row of range index {1} is not found in RowSetIterator {0}.**

**Cause:** The client has attempted to locate a row with a range index, but the Row Set Iterator's range does not have a row at the index. It might be that the range index is too big ( $\geq$  the range size), or that the range is at the bottom and the range index is beyond the last row of the Row Set. Or, the Row Set might have been reset because of operations like rollback and clear-cache. Hence, the range is empty and no row is found

**Action:** Make sure that the row set iterator is open and has rows in its range. Also, make sure that the range index falls between the first and the last row of the range.

**Cause:** This View Object is not Entity based, and its ManageRowsByKey flag is true. Yet, its key definition is empty. Restated, the user has asked for the View rows to be managed by keys, but the key definition is empty (which would produce empty keys for all rows).

**Action:** In order to manage EO-less View Object by key, a meaningful (non-empty) key definition must be supplied.

**JBO-25068: Entity {0} has a base EO {1} with no discriminator, but base EO has rows in its cache. Cannot populate both caches.**

**Cause:** An attempt was made to create a new instance of an Entity Row. However, this Entity Definition is a subclass Entity Definition with no discriminator, and a base EO has a row already instantiated. A conflict exists because nothing discriminates this Entity from the base Entity.

**JBO-25069: Row definition {0} has two sibling subclasses defs, {1} and {2}, but no discriminator to distinguish them.**

**Cause:** Two sibling subclasses of a Row Definition are found, but the Row Definition has no discriminator. This condition is disallowed because when a row is either retrieved or created, the framework cannot determine the correct row class. That is, the hierarchy forks without a discriminator. The only situation whether subclassing is allowed without discriminator is when the tree is straight lined and only one of the classes in the hierarchy line is used to instantiate rows.

**JBO-25085: The value being set for attribute {0} does not match the value derived from list binding {1}**

---

**Cause:** An attribute value being set does not match the attribute value derived from a list binding. This typically happens in the following situations. First, suppose the user sets values for Deptno from 10 to 20 and Dname from ABC to DEF. If a list binding is triggered by Deptno and if it sets Dname to XYZ, the result is an inconsistent state where DEF does not match XYZ. In this situation, this exception is thrown. Second, suppose there is an EmpDept view object with Emp and Dept entity bases. Suppose Dept is reference and read-only and there is a list binding on Dept.Dname whose derived attribute is Emp.Deptno. If the user selects a new Dept through the dept name, a new Dept entity row is brought in (because a new Emp.Deptno is chosen). After this, the framework checks to make sure that the Dname coming from the new entity row matches the original selection from the list binding. If they do not match, this exception is thrown.

**Action:** Make sure the list binding definition and attribute set values end up in a consistent result (i.e., the derived values from the list binding match the row's attribute values).

**JBO-25222: Unable to create application module.**

**Cause:** The application module was typically not created for one of the following reasons: 1. Business components deployed in local mode were not found on the

classpath. 2. Unresolved classes existed on the server. 3. Java2 permissions were not granted. 4. Java pool size was too small.

**Action:** Depending on the cause, chose from the following actions: If business components are deployed in local mode, they might not be on the classpath. <br>If this is the cause of the error, the exception will usually be followed by a different exception, JBO-25002: NoDefException. If this occurs, try the following: Make a library for the business components. Add the library to the client's project properties. Include the library on the 'libraries' page when creating a deployment profile for the client (whether the client was a web application or a command-line application). Copy the library with the client to the target platform (whether the client was a web application or a command-line application). Include all the copied files (including the library) when setting the classpath on the target platform. There might be unresolved classes on the server. Try the following procedure to resolve any unresolved classes on the database. In the System Navigator, right-click the JDBC connection used to deploy the Business Components project. Choose Invoke SQLPlus from the context menu. Copy and paste the following SQLPlus script into the SQLPlus window. set termout off set echo off set heading off set pages 999 set linesize 2000 set feedback off select 'alter java class "' || replace(dbms\_java.longname(object\_name),'/','') || '" resolve;' from user\_objects where object\_type='JAVA CLASS' and status = 'INVALID' spool C:\temp\resolve.sql / spool off set echo on set termout on @C:\temp\resolve.sql There might be missing Java2 permissions. If this is the cause of the error, there will be permissions errors in the database trace file. To correct the problem, see the help topic 'Granting Permissions on a Business Components EJB' for information on granting Java2 permissions. Note: The location of the database trace file varies from installation to installation, but in a default Windows NT installation, the file will be in the directory ORACLE\_HOME\admin\orcl\udump and will have the form orclnnnn.trc. The Java pool size might be too small Business Components for Java deployed as EJBs work best with a Java pool size of at least 50MB. **Cause:** A problem is found in resolving a view link definition or an association. In case of a view link, this error might be caused by the fact that the source or destination view object cannot be found. Or, if the view link ends have attribute names, this error might indicate that the named attributes cannot be found. **JBO-26013: Naming Exception occurred while looking up the object "{0}".**

**Cause:** Meta object name passed for lookup is invalid.

**JBO-26029: Could not find and load the type map class {0}**

**Cause:** Custom type map class could not be found and loaded.

**Action:** Make sure that the named class is reachable from the CLASSPATH. If jbo.TypeMapEntries property is specified, make sure that the property value is correct. Also, though unlikely, this might be caused by an improper implementation of SQLBuilder where it is returning an incorrect value for type map class name. **Impact:** Programmatic

**JBO-26031: Association end {0} of assoc {1} invalid for entity base {2} in view object {3}.**

**Cause:** Problem in secondary entity base definition in view definition. The named entity base is supposed to use the named entity association end to join it with another entity base, but, when resolved with the association definition, the association end does not resolve to the same entity. For example, suppose one builds a view object with Dept and Emp. Emp is supposed to join with Dept using the EmpEnd of the DeptEmp association. For such a view definition, the framework verifies that EmpEnd indeed is from Emp entity. If EmpEnd was from another entity, say Person (or Dept), it would not be correct to use that association end to perform join.

**Action:** Most commonly, this is caused by incorrect information in the view object XML file. Make sure that the association end for the named entity usage is not pointing at the wrong end of association.

For example, consider the following scenario: 1. cookie 1 releases an ApplicationModule with the managed state option 2. cookie 2 targets that ApplicationModule for recycling 3. Before cookie 2 has passivated the ApplicationModule state for cookie 1, cookie 1 requests another ApplicationModule In this instance the ApplicationPool could throw an unavailable exception.
