**Cause:** An ampersand (&) appears in the SELECT statement by itself. The possible causes of this error include the following: Case 1: A lexical reference either left out the name of the column or parameter altogether or there is a space between the ampersand and the name of the column or parameter. Case 2: An ampersand was accidentally typed in the SELECT statement.

**Action:** Take the following actions to correct this error: If Case 1: Verify that the column or parameter name immediately follows the ampersand with no spaces in between. If Case 2: Delete the ampersand.

**REP-00305: Reference {0} cannot be used as a lexical parameter because it is not a character value.**

**Cause:** An invalid lexical reference appears in the SELECT statement. Lexical references can only be made to parameters or columns containing character data. The possible causes of this error include the following: Case 1: The wrong column or parameter was referenced. Case 2: The reference should be a bind reference, not a lexical reference. Case 3: The parameter or column referenced was created with a non-character data type.

---

**Action:** Take the following actions to correct this error: If Case 1: Change the name that follows the ampersand (&) so it references a parameter or column with a data type of Character. **Level:** 1

**Type:** ERROR

**Impact:** Other

**REP-00306: The name {0} is not a valid parameter name.**

**Cause:** In making reference to a parameter, an attempt was made to create a parameter with an invalid name. In this case, Oracle Reports Builder could not create the parameter because the name supplied was not a valid name.

**Action:** Check the naming conventions for data model objects and rules for parameter names. Rename the parameter and change the name in the bind reference.

Case 2: An attempt was made to pass the value of a column to Forms Runtime or Graphics Runtime as a parameter, but the column's data type (for example, LONG, LONG RAW, ROWID) is not supported for that operation.

**Action:** Do not attempt to display or pass this column's value.

**Level:** 1

**Type:** ERROR

**Impact:** Other

**REP-00309: The specified database cannot connect after three attempts. Access denied.**

**Cause:** Case 1: Some part of the logon string entered was incorrect. After three failed attempts, Oracle Reports Builder displays a dialog box with this message. Case 2: The NLS\_LANG environment variable value may be invalid.

---

**Action:** Case 1: Accept the dialog box. Confirm the logon information with the system administrator, if necessary. Go back into Oracle Reports Builder and try connecting to Oracle again. If the problem persists, the system administrator may need to create a new Oracle logon. Case 2: Verify the NLS\_LANG value is valid.

**REP-01307: Summary column {0} has an invalid product order.**

---

**Cause:** The possible causes of this error include: Case 1: A summary exists that is not a running summary (that is, its Reset At is not Report), but its Product Order is not a subset of the source column's product order. The source column of the summary must be at least as frequent as the summary, which means that the summary's Product Order should be some subset of the source column's Product Order. **REP-01319: Implicit anchoring algorithm cannot uniquely identify the anchoring object {0}. Arbitrarily choosing {1}.**

**Cause:** The specified object (object1) is in the "push path" of two objects and it is equidistant from both objects. As a result, Oracle Reports Builder cannot use its normal criteria (shortest distance) to determine the implicit anchor. In the absence of its normal criteria, Oracle Reports Builder randomly creates an implicit anchor to the specified object (object2). **REP-01340: Passed-in columns do not match report definition {0}.**

**Cause:** Another component (for example, Oracle Forms) passed a query to Oracle Reports Builder and there is a mismatch between the columns passed and the columns expected by Oracle Reports Builder. Possible causes of this error include: Case 1: Oracle Reports Builder was expecting more or fewer columns than the number that was actually passed by the calling application. Case 2: The parameter list of the calling application described a column differently than what Oracle Reports Builder expected. For example, if the report's query selects a character column and the calling application assigns that column a date data type, this error is raised.

**TOP-00038: Identity map constructor failed because an invalid identity map was specified.**

**Cause:** The identity map constructor failed because an invalid identity map was specified. The identity map class given in the descriptor cannot be instantiated. The exception is a Java exception that is raised by a Java reflection when TopLink instantiates the identity map class. TopLink wraps only the Java exception.

**TOP-00043: Missing class for indicator field value [{0}] of type [{1}].**

**Cause:** TopLink is missing the class for indicator field value classFieldValue of type type. There was no class entry found in the inheritance policy for the indicator field value that was read from the database. It is likely that the method addClassIndicator(Class class, Object typeValue) was not called for the field value. The class and typeValue are stored in a hash table, and later the class is extracted from the hash table by passing typeValue as a key. Because Integer(1) is not equivalent to Float(1), this exception occurs when the type of typeValue is incorrectly specified.

**Action:** Verify the descriptor.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00044: Missing class indicator field from database row [{0}].**

**Cause:** The class indicator field is missing from the database row that was read from the database. This is performed in the inheritance model where after reading rows from the database, child domain objects are to be constructed depending upon the type indicator values.

**TOP-00047: The multiple table primary key mapping must be specified when a custom multiple table join is used.**

**Cause:** The multiple table primary key mapping is not specified when a custom multiple table join is used. If multiple tables are specified in the descriptor and the join expression is customized, then the primary keys for all the tables must be specified. If the primary keys are not specified, then the exception occurs.

**Action:** Call the method `addMultipleTablePrimaryKeyFieldName(String fieldNameInPrimaryTable, String fieldNameInSecondaryTable)` on the descriptor to set the primary keys.

**Level:** 1

**Type:** ERROR

**Impact:** Configuration

**TOP-00048: Multiple writable mappings exist for the field [{0}]. Only one may be defined as writable, all others must be specified read-only.**

**Cause:** Multiple writable mappings for the field `fieldName` are defined in the descriptor. Exactly one must be defined as writable; the others must be specified as read-only. When multiple write mappings are defined for the field, TopLink is unable to choose the appropriate mapping for writing the value of the field in the database row. Therefore, the exception is raised during the validation process of descriptors. The most common cause of this problem is when the field has direct-to-field mapping, as well as one-to-one mapping. In this case, the one-to-one mapping must either be read-only or a target foreign key reference.

**Action:** Make one of those mappings read-only.

A map container policy represents the way to handle an indexed collection of objects.
