Usage Notes

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`.

CREATESTORAGEPREF Procedure

This procedure creates a `BASIC_STORAGE` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTORAGEPREF;
```

Usage Notes

- The name of the storage preference can be modified; see the `StoragePref` configuration setting.
- A tablespace can be specified for the tables and indexes comprising the `CONTEXT` index; see the `IndexTablespace` configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The `I_INDEX_CLAUSE` uses key compression.

CREATEWORLDLISTPREF Procedure

This procedure creates a wordlist preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEWORDLISTPREF;
```

Usage Notes

- The name of the wordlist preference can be modified; see the `WordlistPref` configuration setting. No other configuration settings are provided.
- `FUZZY_MATCH` and `STEMMER` attributes are set to `AUTO` (auto-language detection)

DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.DROPPREFERENCES;
```

153

DBMS_XDBZ

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- Using DBMS_XDBZ
  - Constants
- Summary of DBMS_XDBZ Subprograms

See Also: *Oracle XML DB Developer's Guide*

Using DBMS_XDBZ

This section contains topics which relate to using the `DBMS_XDBZ` package.

- Constants on page 153-3

Constants

The DBMS_XDBZ package uses the constants shown in following tables.

- DBMS_XDBZ Constants - Name Format on page 153-3
- DBMS_XDBZ Constants - Enable Option on page 153-3
- DBMS_XDBZ Constants - Enable Option Exercised on page 153-3

Table 153–1 DBMS_XDBZ Constants - Name Format

Constant	Type	Value	Description
NAME_FORMAT_SHORT	PLS_INTEGER	1	DB user name or LDAP nickname
NAME_FORMAT_DISTINGUISHED	PLS_INTEGER	2	LDAP distinguished name

Table 153–2 DBMS_XDBZ Constants - Enable Option

Constant	Type	Value	Description
ENABLE_CONTENTS	PLS_INTEGER	1	Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

Table 153–3 DBMS_XDBZ Constants - Enable Option Exercised

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedurewas called with hierarchy_type as ENABLE_CONTENTS
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

Summary of DBMS_XDBZ Subprograms

Table 153–4 DBMS_XDBZ Package Subprograms

Method	Description
DISABLE_HIERARCHY Procedure on page 153-5	Disables repository support for the specified `XMLTYPE` table or view
ENABLE_HIERARCHY Procedure on page 153-6	Enables repository support for the specified `XMLType` table or view
GET_ACLOID Function on page 153-7	Retrieves the ACL Object ID for the specified resource
GET_USERID Function on page 153-8	Retrieves the user ID for the specified user
IS_HIERARCHY_ENABLED Function on page 153-9	Determines if repository support for the specified `XMLType` table or view is enabled
PURGELDAPCACHE Function on page 153-10	Purges the LDAP nickname cache

DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(
   object_schema IN VARCHAR2,
   object_name   IN VARCHAR2);
```

Parameters

Table 153–5 DISABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view

ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular `XMLType` table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(
   object_schema   IN   VARCHAR2,
   object_name     IN   VARCHAR2,
   hierarchy_type  IN   PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 153–6 ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
`object_schema`	The schema name of the `XMLType` table or view
`object_name`	The name of the `XMLType` table or view
`hierarchy_type`	How to enable the hierarchy. ■ `ENABLE_CONTENTS` - enable hierarchy for contents, that is, this table will store contents of resources in the repository ■ `ENABLE_RESMETADATA` - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.

GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
   aclpath   IN   VARCHAR2,
   acloid    OUT  RAW)
 RETURN BOOLEAN;
```

Parameters

Table 153–7 GET_ACLOID Function Parameters

Parameter	Description
`aclpath`	ACL resource path for the repository
`acloid`	The returned Object ID

Return Values

Returns `TRUE` if successful.

GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
   username IN  VARCHAR2,
   userid   OUT RAW,
   format   IN  BINARY_INTEGER := NAME_FORMAT_SHORT)
 RETURN BOOLEAN;
```

Parameters

Table 153–8 GET_USERID Function Parameters

Parameter	Description
username	Name of the database or LDAP user.
userid	Return parameter for the matching user id.
format	Format of the specified user name; valid options are: ■ DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname ■ DBMS_XDBZ.NAME_FORMAT_DISTINGUISHIED -- LDAP distinguished name.

Return Values

Returns TRUE if successful.

IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
   object_schema    IN  VARCHAR2,
   object_name      IN  VARCHAR2,
   hierarchy_type   IN  PLS_INTEGER := IS_ENABLED_CONTENTS)
 RETURN BOOLEAN;
```

Parameters

Table 153–9 IS_HIERARCHY_ENABLED Function Parameters

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view
hierarchy_type	The type of hierarchy to check for. ■ IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedurewas called with hierarchy_type as ENABLE_CONTENTS ■ IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

Return Values

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.

PURGELDAPCACHE Function

This function purges the LDAP nickname cache. Returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE
 RETURN BOOLEAN;
```

154

DBMS_XEVENT

The DBMS_XEVENTpackage provides event-related types and supporting subprograms.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

This chapter contains the following topics:

- Using DBMS_XEVENT
  - Constants
- Subprogram Groups
  - `XDBEvent` Type Subprograms
  - `XDBRepositoryEvent` Type Subprograms
  - `XDBHandlerList` Type Subprograms
  - `XDBHandler` Type Subprograms
  - `XDBPath` Type Subprograms
  - `XDBLink` Type Subprograms
- Summary of DBMS_XEVENT Subprograms

Using DBMS_XEVENT

- Constants

Constants

The DBMS_XEVENT package uses the constants shown in Table 154–1:

Table 154–1 DBMS_XEVENT Constants

Name	Type	Value	Description
RENDER_EVENT	PLS_INTEGER	1	
PRE_CREATE_EVENT	PLS_INTEGER	2	
POST_CREATE_EVENT	PLS_INTEGER	3	
PRE_DELETE_EVENT	PLS_INTEGER	4	
POST_DELETE_EVENT	PLS_INTEGER	5	
PRE_UPDATE_EVENT	PLS_INTEGER	6	
POST_UPDATE_EVENT	PLS_INTEGER	7	
PRE_LOCK_EVENT	PLS_INTEGER	8	
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

Subprogram Groups

- XDBEvent Type Subprograms
- XDBRepositoryEvent Type Subprograms
- XDBHandlerList Type Subprograms
- XDBHandler Type Subprograms
- XDBPath Type Subprograms
- XDBLink Type Subprograms

XDBEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBEvent type.

Table 154–2 XDBEvent Subprograms

Subprogram	Description
GETCURRENTUSER Function on page 154-18	Returns the name of the user executing the operation that triggers the event
GETEVENT Function on page 154-19	Returns a value identifying the triggering event
ISNULL Functions on page 154-46	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 154–3 XDBRepositoryEvent Subprograms

Subprogram	Description
GETAPPLICATIONDATA Function on page 154-16	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler
GETHANDLERLIST Function on page 154-21	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler
GETINTERFACE Function on page 154-22	Returns the top-level interface used to initiate the operation that triggered the event
GETLINK Function on page 154-24	Returns an `XDBLink` object for the target resource
GETLOCK Function on page 154-26	Returns the lock object corresponding to the current operation
GETOLDRESOURCE Function on page 154-30	Returns the original `XDBResource` object before the operation was executed
GETOPENACCESSMODE Function on page 154-31	Returns the access mode for the open operation
GETOPENDENYMODE Function on page 154-32	Returns the deny mode for the open operation
GETOUTPUTSTREAM Function on page 154-33	Returns the output BLOB in which the handler can write the rendered data
GETPARAMETER Function on page 154-34	Returns the value of a request or session-specific parameter
GETPARENT Function on page 154-35	Returns the resource object corresponding to a parent folder of the target resource
GETPATH Function on page 154-39	Returns the `XDBPath` object representing the path of the resource for which the event was fired
GETRESOURCE Function on page 154-40	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource
GETUPDATEBYTECOUNT Function on page 154-43	If the current operation is a byte-range write, returns the byte count
GETUPDATEBYTEOFFSET Function on page 154-44	If the current operation is a byte-range write, function returns the byte offset at which the range begins
GETXDBEVENT Function on page 154-45	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type
ISNULL Functions on page 154-46	Returns `TRUE` if input argument is `NULL`
SETRENDERPATH Procedure on page 154-49	Specifies the path of the resource that contains the rendered contents

Table 154–3 (Cont.) XDBRepositoryEvent Subprograms

Subprogram	Description
SETRENDERSTREAM Procedure on page 154-50	sets the BLOB from which the rendered contents can be read

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

Table 154–4 XDBHandlerList Subprograms

Subprogram	Description
CLEAR Procedure on page 154-15	Clears the handler list
GETFIRST Function on page 154-20	Returns the first handler in the list
GETNAME Function on page 154-28	Returns the next handler in the list
ISNULL Functions on page 154-46	Returns `TRUE` if input argument is `NULL`
REMOVE Procedure on page 154-48	Removes the specified handler from the handler list

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

Table 154–5 XDBHandler Type Subprograms

Subprogram	Description
GETLANGUAGE Function on page 154-23	Returns the implementation language of the handler
GETSCHEMA Function on page 154-41	Returns the schema of the handler's source
GETSOURCE Function on page 154-42	Returns the name of the Java class, PL/SQL package or object type implementing the handler
ISNULL Functions on page 154-46	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 154–6 XDBPath Type Subprograms

Subprogram	Description
GETNAME Function on page 154-28	Returns the string representation of the path
GETPARENTPATH Function on page 154-38	Returns the parent's path
ISNULL Functions on page 154-46	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 154–7 XDBLink Type Subprograms

Subprogram	Description
GETCHILDOID Function on page 154-17	Returns the OID of the resource to which the link is pointing
GETPARENTNAME Function on page 154-36	Returns the link's parent folder's name
GETPARENTOID Function on page 154-37	Returns the link's parent folder's OID
ISNULL Functions on page 154-46	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

Summary of DBMS_XEVENT Subprograms

Table 154–8 DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
CLEAR Procedure on page 154-15	Clears the handler list	XDBHandlerList Type Subprograms on page 154-8
GETAPPLICATIONDATA Function on page 154-16	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler	XDBRepositoryEvent Type Subprograms on page 154-6
GETCHILDOID Function on page 154-17	Returns the OID of the resource to which the link is pointing	XDBLink Type Subprograms on page 154-11
GETCURRENTUSER Function on page 154-18	Returns the name of the user executing the operation that triggers the event	XDBEvent Type Subprograms on page 154-5
GETEVENT Function on page 154-19	Returns a value identifying the triggering event	XDBEvent Type Subprograms on page 154-5
GETFIRST Function on page 154-20	Returns the first handler in the list	XDBHandlerList Type Subprograms on page 154-8
GETHANDLERLIST Function on page 154-21	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler	XDBRepositoryEvent Type Subprograms on page 154-6
GETINTERFACE Function on page 154-22	Returns the top-level interface used to initiate the operation that triggered the event	XDBRepositoryEvent Type Subprograms on page 154-6
GETLANGUAGE Function on page 154-23	Returns the implementation language of the handler	XDBHandler Type Subprograms on page 154-9
GETLINK Function on page 154-24	Returns an `XDBLink` object for the target resource	XDBRepositoryEvent Type Subprograms on page 154-6
GETLOCK Function on page 154-26	Returns the lock object corresponding to the current operation	XDBRepositoryEvent Type Subprograms on page 154-5
GETNAME Function on page 154-28	Returns the string representation of the path	XDBPath Type Subprograms on page 154-10
GETNAME Function on page 154-28	Returns the next handler in the list	XDBHandlerList Type Subprograms on page 154-8
GETOLDRESOURCE Function on page 154-30	Returns the original `XDBResource` object before the operation was executed	XDBRepositoryEvent Type Subprograms on page 154-5

Table 154–8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETOPENACCESSMODE Function on page 154-31	Returns the access mode for the open operation	XDBRepositoryEvent Type Subprograms on page 154-5
GETOPENDENYMODE Function on page 154-32	Returns the deny mode for the open operation	XDBRepositoryEvent Type Subprograms on page 154-5
GETOUTPUTSTREAM Function on page 154-33	Returns the output BLOB in which the handler can write the rendered data	XDBRepositoryEvent Type Subprograms on page 154-5
GETPARAMETER Function on page 154-34	Returns the value of a request or session-specific parameter	XDBRepositoryEvent Type Subprograms on page 154-5
GETPARENT Function on page 154-35	Returns the resource object corresponding to a parent folder of the target resource	XDBRepositoryEvent Type Subprograms on page 154-5
GETPARENTNAME Function on page 154-36	Returns the link's parent folder's name	XDBLink Type Subprograms on page 154-11
GETPARENTOID Function on page 154-37	Returns the link's parent folder's OID	XDBLink Type Subprograms on page 154-11
GETPARENTNAME Function on page 154-36	Returns the parent's path	XDBPath Type Subprograms on page 154-10
GETPATH Function on page 154-39	Returns the `XDBPath` object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms on page 154-5
GETRESOURCE Function on page 154-40	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms on page 154-5
GETSCHEMA Function on page 154-41	Returns the schema of the handler's source	XDBHandler Type Subprograms on page 154-9
GETSOURCE Function on page 154-42	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms on page 154-9
GETUPDATEBYTECOUNT Function on page 154-43	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms on page 154-5
GETUPDATEBYTEOFFSET Function on page 154-44	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms on page 154-5
GETXDBEVENT Function on page 154-45	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type	XDBRepositoryEvent Type Subprograms on page 154-5

Table 154–8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
ISNULL Functions on page 154-46	Returns `TRUE` if input argument is `NULL`	XDBEvent Type Subprograms on page 154-5 XDBRepositoryEvent Type Subprograms on page 154-6 XDBHandlerList Type Subprograms on page 154-8 XDBHandler Type Subprograms on page 154-9 XDBPath Type Subprograms on page 154-10
REMOVE Procedure on page 154-48	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms on page 154-8
SETRENDERPATH Procedure on page 154-49	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms on page 154-5
SETRENDERSTREAM Procedure on page 154-50	sets the `BLOB` from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms on page 154-5

CLEAR Procedure

this procedure clears the handler list.

> **See Also:** XDBHandlerList Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (
    hl       IN OUT   XDBHandlerList);
```

Parameters

Table 154–9 CLEAR Procedure Parameters

Parameter	Description
hl	Handler list

GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (
    ev   IN   XDBRepositoryEvent)
  RETURN XMLType;
```

Parameters

Table 154–10 GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETCHILDOID Function

This function returns the OID of the resource to which the link is pointing.

> **See Also:** XDBLink Type Subprograms on page 154-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 154–11 GETCHILDOID Function Parameters

Parameter	Description
link	Link

GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:** XDBEvent Type Subprograms on page 154-5 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (
    ev   IN   XDBEvent)
  RETURN VARCHAR2;
```

Parameters

Table 154–12 GETCURRENTUSER Function Parameters

Parameter	Description
ev	Event of XDBEvent type

GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:** XDBEvent Type Subprograms on page 154-5 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (
    ev   IN   XDBEvent)
  RETURN XDBEventID;
```

Parameters

Table 154–13 GETEVENT Function Parameters

Parameter	Description
ev	Event of XDBEvent type

GETFIRST Function

This function returns the first handler in the list.

> **See Also:** XDBHandlerList Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 154–14 GETFIRST Function Parameters

Parameter	Description
hl	Handler list

GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler. The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBHandlerList;
```

Parameters

Table 154–15 GETHANDLERLIST Function Parameters

Parameter	Description
`ev`	Event of XDBRepositoryEvent type

GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (
    ev   IN   XDBRepositoryEvent)
  RETURN VARCHAR2;
```

Parameters

Table 154–16 GETINTERFACE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:** XDBHandler Type Subprograms on page 154-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 154–17 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

GETLINK Function

This function returns an `XDBLink` object for the target resource. For a link* or unlink* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLink;
```

Parameters

Table 154–18 GETLINK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLINKNAME Function

This function returns the name of the link.

> **See Also:** XDBLink Type Subprograms on page 154-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 154–19 GETLINKNAME Function Parameters

Parameter	Description
link	Link

GETLOCK Function

This function returns the lock object corresponding to the current operation.I t is only valid for lock and unlock events.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK  (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLock;
```

Parameters

Table 154–20 GETLOCK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:** XDBHandler Type Subprograms on page 154-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 154–21 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

GETNAME Function

This function returns the string representation of the path.

> **See Also:** XDBPath Type Subprograms on page 154-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path   IN   XDBPath)
  RETURN VARCHAR2;
```

Parameters

Table 154–22 GETNAME Function Parameters

Parameter	Description
path	Path

GETNEXT Function

This function returns the next handler in the list.

> **See Also:** XDBHandlerList Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 154–23 GETNEXT Function Parameters

Parameter	Description
hl	Handler list

GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed. This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 154–24 GETOLDRESOURCE Function Parameters

Parameter	Description
`ev`	Event of XDBRepositoryEvent type

GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 154–25 GETOPENACCESSMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)

GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 154–26 GETOPENDENYMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (
    ev   IN   XDBRepositoryEvent)
  RETURN BLOB;
```

Parameters

Table 154–27 GETOUTPUTSTREAM Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (
    ev   IN   XDBRepositoryEvent,
    key  IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 154–28 GETPARAMETER Function Parameters

Parameter	Description
`ev`	Event of XDBRepositoryEvent type
`key`	Supported parameters: ▪ `ACCEPT` ▪ `ACCEPT-LANGUAGE` ▪ `ACCEPT-CHARSET` ▪ `ACCEPT_ENCODING`

GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link's parent folder.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 154–29 GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETPARENTNAME Function

This function returns the link's parent folder's name.

> **See Also:** XDBLink Type Subprograms on page 154-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 154–30 GETPARENTNAME Function Parameters

Parameter	Description
`link`	Link

GETPARENTOID Function

This function returns the link's parent folder's OID.

> **See Also:** XDBLink Type Subprograms on page 154-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 154–31 GETPARENTOID Function Parameters

Parameter	Description
link	Link

GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a NULL is returned.

> **See Also:** XDBPath Type Subprograms on page 154-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (
    path   IN   XDBPath,
   level   IN   INTEGER)
  RETURN XDBPath;
```

Parameters

Table 154–32 GETPARENTPATH Function Parameters

Parameter	Description
path	Path
level	Number of levels up the hierarchy

GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBPath;
```

Parameters

Table 154–33 GETPATH Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 154–34 GETRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETSCHEMA Function

This function returns the schema of the handler's source.

> **See Also:** XDBHandler Type Subprograms on page 154-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 154–35 GETSCHEMA Function Parameters

Parameter	Description
handler	Handler

GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

> **See Also:** XDBHandler Type Subprograms on page 154-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 154–36 GETSOURCE Function Parameters

Parameter	Description
handler	Handler

GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the function returns the byte count. It is only valid for the inconsistent-update event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 154–37 GETUPDATEBYTECOUNT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 154–38 GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBETEVENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBEvent;
```

Parameters

Table 154–39 GETXDBEVENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

See Also:

- XDBEvent Type Subprograms on page 154-5 for other subprograms in this group
- XDBRepositoryEvent Type Subprograms on page 154-6 for other subprograms in this group

- XDBHandler Type Subprograms on page 154-9 for other subprograms in this group
- XDBPath Type Subprograms on page 154-10 for other subprograms in this group
- XDBLink Type Subprograms on page 154-11 for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
    ev          IN   XDBEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    ev          IN   XDBRepositoryEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    hl          IN   XDBHandlerList)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    handler     IN   XDBHandler)
  RETURN BOOLEAN;
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    path        IN   XDBPath)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    link        IN   XDBLink)
  RETURN BOOLEAN;
```

Parameters

Table 154–40 ISNULL Function Parameters

Parameter	Description
`ev`	Event of specified type
`hl`	Handler list

Table 154–40 (Cont.) ISNULL Function Parameters

Parameter	Description
handler	Handler
path	Path

REMOVE Procedure

This procedure removes the specified handler from the handler list.

> **See Also:** XDBHandlerList Type Subprograms on page 154-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (
    hl       IN OUT   XDBHandlerList,
    handler  IN       XDBHandler);
```

Parameters

Table 154–41 REMOVE Procedure Parameters

Parameter	Description
hl	Handler list
handler	Handler

SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents. This should not be called after the stream returned by GETOUTPUTSTREAM Function is written to or after the SETRENDERSTREAM Procedure is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev     IN   XDBRepositoryEvent,
    path   IN   VARCHAR2);
```

Parameters

Table 154–42 SETRENDERPATH Procedure Parameters

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read. This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (
    ev    IN   XDBRepositoryEvent,
    istr  IN   BLOB);
```

Parameters

Table 154–43 SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

155

DBMS_XMLDOM

The DBMS_XMLDOM package is used to access XMLType objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

Using DBMS_XMLDOM

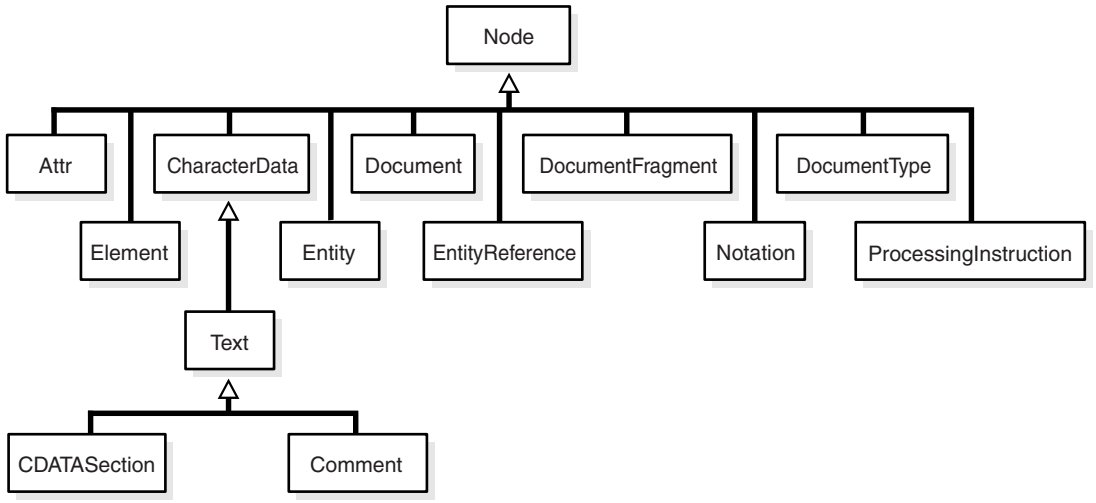
- Overview
- Constants
- Types
- Exceptions
- Subprogram Groups

Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

Note:

- Before database startup, the read-from and write-to directories in the `initialization.ORA` file must be specified; for example: `UTL_FILE_DIR=/mypath/insidemypath`.
- Read-from and write-to files must be on the server file system.



With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform APPENDCHILD Function on a `DOMNode n`, the APPENDCHILD FunctionPL/SQL function on page 155-40 is provided.
- To perform `setAttribute` on a `DOMElement elem`SETATTRIBUTE Procedures, use PL/SQL procedure on page 155-137.

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see Figure 155–1). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `make`*`XXX`* functions, where `DOM`*`XXX`* is the desired DOM type.

Figure 155–1 Inheritance Diagram for DOM Types

The implementation of this interface follows the REC-DOM-Level-1-19981001.

Constants

Defined constants of DBMS_XMLDOM are listed in Table 155–1.

Table 155–1 Defined Constants for DBMS_XMLDOM

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDataSection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

Types

The following types for DBMS_XMLDOM.DOMTYPE are defined in Table 155–2:

Table 155–2 XDB_XMLDOM Types

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDataSection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

Exceptions

The exceptions listed in Table 155–3 are defined for DBMS_XMLDOM:

Table 155–3 Exceptions for DBMS_XMLDOM

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- DOMNode Subprograms on page 155-10
- DOMAttr Subprograms on page 155-12
- DOMCDataSection Subprograms on page 155-13
- DOMCharacterData Subprograms on page 155-14
- DOMComment Subprograms on page 155-15
- DOMDocument Subprograms on page 155-16
- DOMDocumentFragment Subprograms on page 155-18
- DOMDocumentType Subprograms on page 155-19
- DOMElement Subprograms on page 155-20
- DOMEntity Subprograms on page 155-21
- DOMEntityReference Subprograms on page 155-22
- DOMImplementation Subprograms on page 155-23
- DOMNamedNodeMap Subprograms on page 155-24
- DOMNodeList Subprograms on page 155-25
- DOMNotation Subprograms on page 155-26
- DOMProcessingInstruction Subprograms on page 155-27
- DOMText Subprograms on page 155-28

DOMNode Subprograms

Table 155–4 Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
ADOPTNODE Function on page 155-39	Adopts a node from another document.
APPENDCHILD Function on page 155-40	Appends a new child to the node.
CLONENODE Function on page 155-42	Clones the node.
FREENODE Procedure on page 155-57	Frees all resources associated with the node.
GETATTRIBUTES Function on page 155-60	Retrieves the attributes of the node.
GETCHILDNODES Function on page 155-61	Retrieves the children of the node.
GETEXPANDEDNAME Procedure and Functions on page 155-68	Retrieves the expanded name of the node.
GETFIRSTCHILD Function on page 155-69	Retrieves the first child of the node.
GETLASTCHILD Function on page 155-71	Retrieves the last child of the node.
GETLOCALNAME Procedure and Functions on page 155-73	Retrieves the local part of the qualified name.
GETNAMESPACE Procedure and Functions on page 155-76	Retrieves the node's namespace URI.
GETNEXTSIBLING Function on page 155-77	Retrieves the next sibling of the node.
GETNODENAME Function on page 155-79	Retrieves the Name of the Node.
GETNODETYPE Function on page 155-78	Retrieves the Type of the node.
GETNODEVALUE Function on page 155-80	Retrieves the Value of the Node.
GETNODEVALUEASBINARYSTREAM Function & Procedure on page 155-81	Retrieves Node Value as binary stream.
GETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 155-82	Retrieves Node Value as character stream.
GETOWNERDOCUMENT Function on page 155-86	Retrieves the owner document of the node.
GETPARENTNODE Function on page 155-88	Retrieves the parent of this node.
GETPREFIX Function on page 155-89	Retrieves the namespace prefix.
GETPREVIOUSSIBLING Function on page 155-90	Retrieves the previous sibling of the node.
GETSCHEMANODE Function on page 155-93	Retrieves the associated schema URI.
HASATTRIBUTES Function on page 155-102	Tests if the node has attributes.
HASCHILDNODES Function on page 155-103	Tests if the node has child nodes.
IMPORTNODE Function on page 155-105	Imports a node from another document.
INSERTBEFORE Function on page 155-106	Inserts a child before the reference child.
ISNULL Functions on page 155-108	Tests if the node is `NULL`
MAKEATTR Function on page 155-112	Casts the node to an Attribute.
MAKECDATASECTION Function on page 155-113	Casts the node to a CData Section.

Table 155–4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
MAKECHARACTERDATA Function on page 155-114	Casts the node to Character Data.
MAKECOMMENT Function on page 155-115	Casts the node to a Comment.
MAKEDOCUMENT Function on page 155-116	Casts the node to a DOM Document.
MAKEDOCUMENTFRAGMENT Function on page 155-117	Casts the node to a DOM Document Fragment.
MAKEDOCUMENTTYPE Function on page 155-118	Casts the node to a DOM Document Type.
MAKEELEMENT Function on page 155-119	Casts the node to a DOM Element.
MAKEENTITY Function on page 155-120	Casts the node to a DOM Entity.
MAKEENTITYREFERENCE Function on page 155-121	Casts the node to a DOM Entity Reference.
MAKENOTATION Function on page 155-125	Casts the node to a DOM Notation.
MAKEPROCESSINGINSTRUCTION Function on page 155-126	Casts the node to a DOM Processing Instruction.
MAKETEXT Function on page 155-127	Casts the node to a DOM Text.
REMOVECHILD Function on page 155-132	Removes a specified child from a node.
REPLACECHILD Function on page 155-134	Replaces the old child with a new child.
SETNODEVALUE Procedure on page 155-142	Sets the Value of the node.
SETNODEVALUEASBINARYSTREAM Function & Procedure on page 155-143	Sets the Node Value as binary stream.
SETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 155-144	Sets the Node Value as a character stream
SETPREFIX Procedure on page 155-145	Sets the namespace prefix.
USEBINARYSTREAM Function on page 155-151	Establishes that the stream is valid.
WRITETOBUFFER Procedures on page 155-152	Writes the contents of the node to a buffer.
WRITETOCLOB Procedures on page 155-153	Writes the contents of the node to a `CLOB`.
WRITETOFILE Procedures on page 155-154	Writes the contents of the node to a file.

DOMAttr Subprograms

Table 155–5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

Method	Description
GETEXPANDEDNAME Procedure and Functions on page 155-68	Retrieves the expanded name of the attribute.
GETLOCALNAME Procedure and Functions on page 155-73	Retrieves the local name of the attribute.
GETNAME Functions on page 155-74	Retrieves the name of the attribute.
GETNAMESPACE Procedure and Functions on page 155-76	Retrieves the NS URI of the attribute.
GETOWNERELEMENT Function on page 155-87	Retrieves the Element node, parent of the attribute.
GETQUALIFIEDNAME Functions on page 155-92	Retrieves the Qualified Name of the attribute.
GETSPECIFIED Function on page 155-94	Tests if attribute was specified in the element.
GETVALUE Function on page 155-98	Retrieves the value of the attribute.
ISNULL Functions on page 155-108	Tests if the Attribute node is `NULL`.
MAKENODE Functions on page 155-122	Casts the Attribute to a node.
SETVALUE Procedure on page 155-147	Sets the value of the attribute.

DOMCDataSection Subprograms

Table 155–6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 155-108	Tests if the `CDataSection` is `NULL`.
MAKENODE Functions on page 155-122	Casts the `CDatasection` to a node.

DOMCharacterData Subprograms

Table 155–7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
APPENDDATA Procedure on page 155-41	Appends the given data to the node data.
DELETEDATA Procedure on page 155-52	Deletes the data from the given offSets.
GETDATA Functions on page 155-63	Retrieves the data of the node.
GETLENGTH Functions on page 155-72	Retrieves the length of the data.
INSERTDATA Procedure on page 155-107	Inserts the data in the node at the given offSets.
ISNULL Functions on page 155-108	Tests if the CharacterData is `NULL`.
MAKENODE Functions on page 155-122	Casts the CharacterData to a node.
REPLACEDATA Procedure on page 155-135	Changes a range of characters in the node.
SETDATA Procedures on page 155-139	Sets the data to the node.
SUBSTRINGDATA Function on page 155-150	Retrieves the substring of the data.

DOMComment Subprograms

Table 155–8 Summary of DOMComment Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 155-108	Tests if the comment is `NULL`.
MAKENODE Functions on page 155-122	Casts the Comment to a node.

DOMDocument Subprograms

Table 155–9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEATTRIBUTE Functions on page 155-43	Creates an Attribute.
CREATECDATASECTION Function on page 155-44	Creates a `CDataSection` node.
CREATECOMMENT Function on page 155-45	Creates a Comment node.
CREATEDOCUMENT Function on page 155-46	Creates a new Document.
CREATEDOCUMENTFRAGMENT Function on page 155-47	Creates a new Document Fragment.
CREATEELEMENT Functions on page 155-48	Creates a new Element.
CREATEENTITYREFERENCE Function on page 155-49	Creates an Entity reference.
CREATEPROCESSINGINSTRUCTION Function on page 155-50	Creates a Processing Instruction.
CREATETEXTNODE Function on page 155-51	Creates a Text node.
FREEDOCFRAG Procedure on page 155-55	Frees the document fragment.
FREEDOCUMENT Procedure on page 155-56	Frees the document.
GETDOCTYPE Function on page 155-64	Retrieves the DTD of the document.
GETDOCUMENTELEMENT Function on page 155-65	Retrieves the root element of the document.
GETELEMENTSBYTAGNAME Functions on page 155-66	Retrieves the elements in the by tag name.
GETIMPLEMENTATION Function on page 155-70	Retrieves the DOM implementation.
GETSTANDALONE Function on page 155-95	Retrieves the standalone property of the document.
GETVERSION Function on page 155-99	Retrieves the version of the document.
GETXMLTYPE Function on page 155-100	Retrieves the `XMLType` associated with the DOM Document.
ISNULL Functions on page 155-108	Tests if the document is `NULL`.
MAKENODE Functions on page 155-122	Casts the document to a node.
NEWDOMDOCUMENT Functions on page 155-128	Creates a new document.
SETDOCTYPE Procedure on page 155-140	Sets the DTD of the document.
SETSTANDALONE Procedure on page 155-146	Sets the standalone property of the document.
SETVERSION Procedure on page 155-148	Sets the version of the document.
WRITETOBUFFER Procedures on page 155-152	Writes the document to a buffer.
WRITETOCLOB Procedures on page 155-153	Writes the document to a `CLOB`.

Table 155–9 (Cont.) Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
WRITETOFILE Procedures on page 155-154	Writes the document to a file.

DOMDocumentFragment Subprograms

Table 155–10 Summary of DOMDocumentFragment Subprograms; DBMS_XMLDOM

Method	Description
FREEDOCFRAG Procedure on page 155-55	Frees the specified document fragment.
ISNULL Functions on page 155-108	Tests if the DocumentFragment is `NULL`.
MAKENODE Functions on page 155-122	Casts the Document Fragment to a node.
WRITETOBUFFER Procedures on page 155-152	Writes the contents of a document fragment into a buffer.

DOMDocumentType Subprograms

Table 155–11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
FINDENTITY Function on page 155-53	Finds the specified entity in the document type.
FINDNOTATION Function on page 155-54	Finds the specified notation in the document type.
GETENTITIES Function on page 155-67	Retrieves the nodemap of entities in the Document type.
GETNAME Functions on page 155-74	Retrieves the name of the Document type.
GETNOTATIONS Function on page 155-84	Retrieves the nodemap of the notations in the Document type.
GETPUBLICID Functions on page 155-91	Retrieves the public ID of the document type.
GETSYSTEMID Functions on page 155-96	Retrieves the system ID of the document type.
ISNULL Functions on page 155-108	Tests if the Document Type is `NULL`.
MAKENODE Functions on page 155-122	Casts the document type to a node.

DOMElement Subprograms

Table 155–12 Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
GETATTRIBUTE Functions on page 155-58	Retrieves the attribute node by name.
GETATTRIBUTENODE Functions on page 155-59	Retrieves the attribute node by name.
GETCHILDRENBYTAGNAME Functions on page 155-62	Retrieves children of the element by tag name.
GETELEMENTSBYTAGNAME Functions on page 155-66	Retrieves elements in the subtree by tagname.
GETEXPANDEDNAME Procedure and Functions on page 155-68	Retrieves the expanded name of the element.
GETLOCALNAME Procedure and Functions on page 155-73	Retrieves the local name of the element.
GETNAMESPACE Procedure and Functions on page 155-76	Retrieves the NS URI of the element.
GETQUALIFIEDNAME Functions on page 155-92	Retrieves the qualified name of the element.
GETTAGNAME Function on page 155-97	Retrieves the Tag name of the element.
HASATTRIBUTE Functions on page 155-101	Tests if an attribute exists .
ISNULL Functions on page 155-108	Tests if the Element is `NULL`.
MAKENODE Functions on page 155-122	Casts the Element to a node.
NORMALIZE Procedure on page 155-129	Normalizes the text children of the element.
REMOVEATTRIBUTE Procedures on page 155-130	Removes the attribute specified by the name.
REMOVEATTRIBUTENODE Function on page 155-131	Removes the attribute node in the element.
RESOLVENAMESPACEPREFIX Function on page 155-136	Resolve the prefix to a namespace URI.
SETATTRIBUTE Procedures on page 155-137	Sets the attribute specified by the name.
SETATTRIBUTENODE Functions on page 155-138	Sets the attribute node in the element.

DOMEntity Subprograms

Table 155–13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONNAME Function on page 155-83	Retrieves the notation name of the entity.
GETPUBLICID Functions on page 155-91	Retrieves the public Id of the entity.
GETSYSTEMID Functions on page 155-96	Retrieves the system Id of the entity.
ISNULL Functions on page 155-108	Tests if the Entity is `NULL`.
MAKENODE Functions on page 155-122	Casts the Entity to a node.

DOMEntityReference Subprograms

Table 155–14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 155-108	Tests if the `DOMEntityReference` is `NULL`.
MAKENODE Functions on page 155-122	Casts the `DOMEntityReference` to `NULL`.

DOMImplementation Subprograms

Table 155–15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 155-108	Tests if the `DOMImplementation` node is `NULL`.
HASFEATURE Function on page 155-104	Tests if the `DOMImplementation` implements a feature.

DOMNamedNodeMap Subprograms

Table 155–16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions on page 155-72	Retrieves the number of items in the map.
GETNAMEDITEM Function on page 155-75	Retrieves the item specified by the name.
ISNULL Functions on page 155-108	Tests if the `NamedNodeMap` is `NULL`.
ITEM Functions on page 155-111	Retrieves the item given the index in the map.
REMOVENAMEDITEM Function on page 155-133	Removes the item specified by name.
SETNAMEDITEM Function on page 155-141	Sets the item in the map specified by the name.

DOMNodeList Subprograms

Table 155–17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions on page 155-72	Retrieves the number of items in the list.
ISNULL Functions on page 155-108	Tests if the `NodeList` is `NULL`.
ITEM Functions on page 155-111	Retrieves the item given the index in the `NodeList`.

DOMNotation Subprograms

Table 155–18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

Method	Description
GETPUBLICID Functions on page 155-91	Retrieves the public Id of the notation.
GETSYSTEMID Functions on page 155-96	Retrieves the system Id of the notation.
ISNULL Functions on page 155-108	Tests if the Notation is `NULL`.
MAKENODE Functions on page 155-122	Casts the notation to a node.

DOMProcessingInstruction Subprograms

Table 155–19 Summary of DOMProcessingInstruction Subprograms; DBMS_XMLDOM

Method	Description
GETDATA Functions on page 155-63	Retrieves the data of the processing instruction.
GETTARGET Function on page 155-85	Retrieves the target of the processing instruction.
ISNULL Functions on page 155-108	Tests if the Processing Instruction is `NULL`.
MAKENODE Functions on page 155-122	Casts the Processing Instruction to a node.
SETDATA Procedures on page 155-139	Sets the data of the processing instruction.

DOMText Subprograms

Table 155–20 Summary of DOMText Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 155-108	Tests if the text is `NULL`.
MAKENODE Functions on page 155-122	Casts the text to a node.
SPLITTEXT Function on page 155-149	Splits the contents of the text node into 2 text nodes.

Summary of DBMS_XMLDOM Subprograms

Table 155–21 Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ADOPTNODE Function on page 155-39	Adopts a node from another document	DOMNode Subprograms on page 155-10
APPENDCHILD Function on page 155-40	Appends a new child to the node	DOMNode Subprograms on page 155-10
APPENDDATA Procedure on page 155-41	Appends the given data to the node data	DOMCharacterData Subprograms on page 155-14
CLONENODE Function on page 155-42	Clones the node	DOMNode Subprograms on page 155-10
CREATEATTRIBUTE Functions on page 155-43	Creates an Attribute	DOMDocument Subprograms on page 155-16
CREATECDATASECTION Function on page 155-44	Creates a `CDataSection` node	DOMDocument Subprograms on page 155-16
CREATECOMMENT Function on page 155-45	Creates a Comment node	DOMDocument Subprograms on page 155-16
CREATEDOCUMENT Function on page 155-46	Creates a new Document	DOMDocument Subprograms on page 155-16
CREATEDOCUMENTFRAGMENT Function on page 155-47	Creates a new Document Fragment	DOMDocument Subprograms on page 155-16
CREATEELEMENT Functions on page 155-48	Creates a new Element	DOMDocument Subprograms on page 155-16
CREATEENTITYREFERENCE Function on page 155-49	Creates an Entity reference	DOMDocument Subprograms on page 155-16
CREATEPROCESSINGINSTRUCTION Function on page 155-50	Creates a Processing Instruction	DOMDocument Subprograms on page 155-16
CREATETEXTNODE Function on page 155-51	Creates a Text node	DOMDocument Subprograms on page 155-16
DELETEDATA Procedure on page 155-52	Deletes the data from the given offSets	DOMCharacterData Subprograms on page 155-14
FINDENTITY Function on page 155-53	Finds the specified entity in the document type	DOMDocumentType Subprograms on page 155-19
FINDNOTATION Function on page 155-54	Finds the specified notation in the document type	DOMDocumentType Subprograms on page 155-19

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
FREEDOCFRAG Procedure on page 155-55	Frees the document fragment	DOMDocument Subprograms on page 155-16 and DOMDocumentFragment Subprograms on page 155-18
FREEDOCUMENT Procedure on page 155-56	Frees the document	DOMDocument Subprograms on page 155-16
FREENODE Procedure on page 155-57	Frees all resources associated with the node	DOMNode Subprograms on page 155-10
GETATTRIBUTE Functions on page 155-58	Retrieves the attribute node by name	DOMElement Subprograms on page 155-20
GETATTRIBUTENODE Functions on page 155-59	Retrieves the attribute node by name	DOMElement Subprograms on page 155-20
GETATTRIBUTES Function on page 155-60	Retrieves the attributes of the node	DOMNode Subprograms on page 155-10
GETCHILDNODES Function on page 155-61	Retrieves the children of the node	DOMNode Subprograms on page 155-10
GETCHILDRENBYTAGNAME Functions on page 155-62	Retrieves children of the element by tag name	DOMCharacterData Subprograms on page 155-14
GETDATA Functions on page 155-63	Retrieves ■ the data of the node ■ the data of the processing instruction	■ DOMCharacterData Subprograms on page 155-14 ■ DOMProcessingInstruction Subprograms on page 155-27
GETDOCTYPE Function on page 155-64	Retrieves the DTD of the document	DOMDocument Subprograms on page 155-16
GETDOCUMENTELEMENT Function on page 155-65	Retrieves the root element of the document	DOMDocument Subprograms on page 155-16
GETELEMENTSBYTAGNAME Functions on page 155-66	Retrieves ■ the elements in the by tag name ■ elements in the subtree by tagname	■ DOMDocument Subprograms on page 155-16 ■ DOMElement Subprograms on page 155-20
GETENTITIES Function on page 155-67	Retrieves the nodemap of entities in the Document type	DOMDocumentType Subprograms on page 155-19

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETEXPANDEDNAME Procedure and Functions on page 155-68	Retrieves ▪ the expanded name of the node ▪ the expanded name of the attribute ▪ the expanded name of the element	▪ DOMNode Subprograms on page 155-10 ▪ DOMAttr Subprograms on page 155-12 ▪ DOMElement Subprograms on page 155-20
GETFIRSTCHILD Function on page 155-69	Retrieves the first child of the node	DOMNode Subprograms on page 155-10
GETIMPLEMENTATION Function on page 155-70	Retrieves the DOM implementation	DOMDocument Subprograms on page 155-16
GETLASTCHILD Function on page 155-71	Retrieves the last child of the node	DOMNode Subprograms on page 155-10
GETLENGTH Functions on page 155-72	Retrieves ▪ the length of the data ▪ the number of items in the map ▪ the number of items in the list	▪ DOMCharacterData Subprograms on page 155-14 ▪ DOMNamedNodeMap Subprograms on page 155-24 ▪ DOMNodeList Subprograms on page 155-25
GETLOCALNAME Procedure and Functions on page 155-73	Retrieves ▪ the local part of the qualified name ▪ the local name of the attribute ▪ the local name of the element	▪ DOMNode Subprograms on page 155-10 ▪ DOMAttr Subprograms on page 155-12 ▪ DOMElement Subprograms on page 155-20
GETNAME Functions on page 155-74	Retrieves ▪ the name of the attribute ▪ the name of the Document type	▪ DOMAttr Subprograms on page 155-12 ▪ DOMDocumentType Subprograms on page 155-19
GETNAMEDITEM Function on page 155-75	Retrieves ▪ an item specified by name ▪ and namespace URI on page 155-24)	▪ DOMNamedNodeMap Subprograms on page 155-24 ▪ DOMNamedNodeMap Subprograms

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETNAMESPACE Procedure and Functions on page 155-76	Retrieves ■ the node's namespace URI ■ the NS URI of the attribute ■ the NS URI of the element	■ DOMNode Subprograms on page 155-10 ■ DOMAttr Subprograms on page 155-12 ■ DOMElement Subprograms on page 155-20
GETNEXTSIBLING Function on page 155-77	Retrieves the next sibling of the node	DOMNode Subprograms on page 155-10
GETNODENAME Function on page 155-79	Retrieves the Name of the Node	DOMNode Subprograms on page 155-10
GETNODETYPE Function on page 155-78	Retrieves the Type of the node	DOMNode Subprograms on page 155-10
GETNODEVALUE Function on page 155-80	Retrieves the Value of the Node	DOMNode Subprograms on page 155-10
GETNODEVALUEASBINARYSTREAM Function & Procedure on page 155-81	Retrieves the Node Value as bianry stream	DOMNode Subprograms on page 155-10
GETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 155-82	Retrieves the Node Value as character stream	DOMNode Subprograms on page 155-10
GETNOTATIONNAME Function on page 155-83	Retrieves the notation name of the entity	DOMEntity Subprograms on page 155-21
GETNOTATIONS Function on page 155-84	Retrieves the nodemap of the notations in the Document type	DOMDocumentType Subprograms on page 155-19
GETTARGET Function on page 155-85	Retrieves the target of the processing instruction	DOMProcessingInstruction Subprograms on page 155-27
GETOWNERDOCUMENT Function on page 155-86	Retrieves the owner document of the node	DOMNode Subprograms on page 155-10
GETOWNERELEMENT Function on page 155-87	Retrieves the Element node, parent of the attribute	DOMAttr Subprograms on page 155-12
GETPARENTNODE Function on page 155-88	Retrieves the parent of this node	DOMNode Subprograms on page 155-10
GETPREFIX Function on page 155-89	Retrieves the namespace prefix)	DOMNode Subprograms on page 155-10
GETPREVIOUSSIBLING Function on page 155-90	Retrieves the previous sibling of the node	DOMNode Subprograms on page 155-10
GETPUBLICID Functions on page 155-91	Retrieves ■ the public ID of the document type ■ the public Id of the entity ■ the public Id of the notation	■ DOMDocumentType Subprograms on page 155-19 ■ DOMEntity Subprograms on page 155-21 ■ DOMNotation Subprograms on page 155-26

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETQUALIFIEDNAME Functions on page 155-92	Retrieves ▪ the Qualified Name of the attribute ▪ the qualified name of the element	▪ DOMAttr Subprograms on page 155-12 ▪ DOMElement Subprograms on page 155-20
GETSCHEMANODE Function on page 155-93	Retrieves the associated schema URI	DOMNode Subprograms on page 155-10
GETSPECIFIED Function on page 155-94	Tests if attribute was specified in the element.	DOMAttr Subprograms on page 155-12
GETSTANDALONE Function on page 155-95	Retrieves the standalone property of the document	DOMDocument Subprograms on page 155-16
GETSYSTEMID Functions on page 155-96	Retrieves ▪ the system ID of the document type ▪ the system Id of the entity ▪ the system Id of the notation	▪ DOMDocumentType Subprograms on page 155-19 ▪ DOMEntity Subprograms on page 155-21 ▪ DOMNotation Subprograms on page 155-26
GETTAGNAME Function on page 155-97	Retrieves the Tag name of the element	DOMElement Subprograms on page 155-20
GETVALUE Function on page 155-98	Retrieves the value of the attribute	DOMAttr Subprograms on page 155-12
GETVERSION Function on page 155-99	Retrieves the version of the document	DOMDocument Subprograms on page 155-16)
GETXMLTYPE Function on page 155-100	Retrieves the `XMLType` associated with the DOM Document	DOMDocument Subprograms on page 155-16
HASATTRIBUTES Function on page 155-102	Tests if the node has attributes	DOMNode Subprograms on page 155-10
HASATTRIBUTE Functions on page 155-101	Tests if an attribute exists	DOMElement Subprograms on page 155-20
HASCHILDNODES Function on page 155-103	Tests if the node has child nodes	DOMNode Subprograms on page 155-10
HASFEATURE Function on page 155-104	Tests if the `DOMImplementation` implements a feature	DOMImplementation Subprograms on page 155-23
IMPORTNODE Function on page 155-105	Imports a node from another document	DOMNode Subprograms on page 155-10
INSERTBEFORE Function on page 155-106	Inserts a child before the reference child	DOMNode Subprograms on page 155-10
INSERTDATA Procedure on page 155-107	Inserts the data in the node at the given offSets	DOMCharacterData Subprograms on page 155-14

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ISNULL Functions on page 155-108	Tests ■ if the node is NULL ■ if the Attribute node is NULL ■ if the CDataSection is NULL ■ if the CharacterData is NULL ■ if the comment is NULL ■ if the document is NULL ■ if the DocumentFragment is NULL ■ if the Document Type is NULL ■ if the Element is NULL ■ if the Entity is NULL ■ if the DOMEntityReference is NULL ■ if the DOMImplementation node is NULL ■ if the NamedNodeMap is NULL ■ if the NodeList is NULL ■ if the Notation is NULL ■ if the Processing Instruction is NULL ■ if the text is NULL	■ DOMNode Subprograms on page 155-10 ■ DOMAttr Subprograms on page 155-12 ■ DOMCDataSection Subprograms on page 155-13 ■ DOMCharacterData Subprograms on page 155-14 ■ DOMComment Subprograms on page 155-15 ■ DOMDocument Subprograms on page 155-16 ■ DOMDocumentFragment Subprograms on page 155-18 ■ DOMDocumentType Subprograms on page 155-19 ■ DOMElement Subprograms on page 155-20 ■ DOMEntity Subprograms on page 155-21 ■ DOMEntityReference Subprograms on page 155-22 ■ DOMImplementation Subprograms on page 155-23 ■ DOMNamedNodeMap Subprograms on page 155-24 ■ DOMNodeList Subprograms on page 155-25 ■ DOMNotation Subprograms on page 155-26 ■ DOMProcessingInstruction Subprograms on page 155-27 ■ DOMText Subprograms on page 155-28

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ITEM Functions on page 155-111	Retrieves ▪ the item given the index in the map ▪ the item given the index in the `NodeList`	▪ DOMNamedNodeMap Subprograms on page 155-24 ▪ DOMNodeList Subprograms on page 155-25
MAKEATTR Function on page 155-112	Casts the node to an Attribute	DOMNode Subprograms on page 155-10
MAKECDATASECTION Function on page 155-113	Casts the node to a CData Section	DOMNode Subprograms on page 155-10
MAKECHARACTERDATA Function on page 155-114	Casts the node to Character Data	DOMNode Subprograms on page 155-10
MAKECOMMENT Function on page 155-115	Casts the node to a Comment	DOMNode Subprograms on page 155-10
MAKEDOCUMENT Function on page 155-116	Casts the node to a DOM Document	DOMNode Subprograms on page 155-10
MAKEDOCUMENTFRAGMENT Function on page 155-117	Casts the node to a DOM Document Fragment	DOMNode Subprograms on page 155-10)
MAKEDOCUMENTTYPE Function on page 155-118	Casts the node to a DOM Document Type	DOMNode Subprograms on page 155-10
MAKEELEMENT Function on page 155-119	Casts the node to a DOM ElemenT	DOMNode Subprograms on page 155-10
MAKEENTITY Function on page 155-120	Casts the node to a DOM Entity	DOMNode Subprograms on page 155-10
MAKEENTITYREFERENCE Function on page 155-121	Casts the node to a DOM Entity Reference	DOMNode Subprograms on page 155-10

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
MAKENODE Functions on page 155-122	Casts ■ the Attribute to a node ■ the `CDatasection` to a node ■ the CharacterData to a node ■ the Comment to a node ■ the document to a node ■ the Document Fragment to a node ■ the document type to a node ■ the Element to a node ■ the Entity to a node ■ ■ the `DOMEntityReference` to `NULL` ■ the notation to a node ■ the Processing Instruction to a node ■ the text to a node	■ DOMAttr Subprograms on page 155-12 ■ DOMCDataSection Subprograms on page 155-13 ■ DOMCharacterData Subprograms on page 155-14 ■ DOMComment Subprograms on page 155-15 ■ DOMDocument Subprograms on page 16 ■ DOMDocumentFragment Subprograms on page 155-18 ■ DOMDocumentType Subprograms on page 155-19 ■ DOMElement Subprograms on page 155-20 ■ DOMEntity Subprograms on page 155-21 ■ DOMEntityReference Subprograms on page 155-22 ■ DOMNotation Subprograms on page 155-26 ■ DOMProcessingInstruction Subprograms on page 155-27 ■ DOMText Subprograms on page 155-28
MAKENOTATION Function on page 155-125	Casts the node to a DOM Notation	DOMNode Subprograms on page 155-10
MAKEPROCESSINGINSTRUCTION Function on page 155-126	Casts the node to a DOM Processing Instruction	DOMNode Subprograms on page 155-10
MAKETEXT Function on page 155-127	Casts the node to a DOM Text	DOMNode Subprograms on page 155-10
NEWDOMDOCUMENT Functions on page 155-128	Creates a new document	DOMDocument Subprograms on page 155-16
NORMALIZE Procedure on page 155-129	Normalizes the text children of the element	DOMElement Subprograms on page 155-20

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
REMOVEATTRIBUTE Procedures on page 155-130	Removes the attribute specified by the name	DOMElement Subprograms on page 155-20
REMOVEATTRIBUTENODE Function on page 155-131	Removes the attribute node in the element	DOMElement Subprograms on page 155-20
REMOVECHILD Function on page 155-132	Removes a specified child from a node	DOMNode Subprograms on page 155-10
REMOVENAMEDITEM Function on page 155-133	Removes the item specified by name	DOMNamedNodeMap Subprograms on page 155-24
REPLACECHILD Function on page 155-134	Replaces the old child with a new child	DOMNode Subprograms on page 155-10
REPLACEDATA Procedure on page 155-135	Changes a range of characters in the node	DOMCharacterData Subprograms on page 155-14
RESOLVENAMESPACEPREFIX Function on page 155-136	Resolve the prefix to a namespace URI	DOMElement Subprograms on page 155-20
SETATTRIBUTE Procedures on page 155-137	Sets the attribute specified by the name	DOMElement Subprograms on page 155-20
SETATTRIBUTENODE Functions on page 155-138	Sets the attribute node in the element	DOMElement Subprograms on page 155-20
SETDATA Procedures on page 155-139	Sets ▪ the data to the node ▪ the data of the processing instruction	▪ DOMCharacterData Subprograms on page 155-14 ▪ DOMProcessingInstruction Subprograms on page 155-27
SETDOCTYPE Procedure on page 155-140	Sets the DTD of the document.	DOMDocument Subprograms on page 155-16
SETNAMEDITEM Function on page 155-141	Sets the item in the map specified by the name	DOMNamedNodeMap Subprograms on page 155-24
SETNODEVALUE Procedure on page 155-142	Sets the Value of the node	DOMNode Subprograms on page 155-10
SETNODEVALUEASBINARYSTREAM Function & Procedure on page 155-143	Sets the Node Value as a binary stream	DOMNode Subprograms on page 155-10
SETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 155-144	Sets the Node Value as a character stream	DOMNode Subprograms on page 155-10
SETPREFIX Procedure on page 155-145	Sets the namespace prefix	DOMNode Subprograms on page 155-10
SETSTANDALONE Procedure on page 155-146	Sets the standalone property of the document	DOMDocument Subprograms on page 155-16

Table 155–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
SETVALUE Procedure on page 155-147	Sets the value of the attribute	DOMAttr Subprograms on page 155-12
SETVERSION Procedure on page 155-148	Sets the version of the document	DOMDocument Subprograms on page 155-16
SPLITTEXT Function on page 155-149	Splits the contents of the text node into 2 text nodes	DOMText Subprograms on page 155-28
SUBSTRINGDATA Function on page 155-150	Retrieves the substring of the data	DOMCharacterData Subprograms on page 155-14
USEBINARYSTREAM Function on page 155-151	Estrablishes that the stream is valid for use	DOMNode Subprograms on page 155-10
WRITETOBUFFER Procedures on page 155-152	Writes ■ the contents of the node to a buffer ■ the document to a buffer ■ the contents of a document fragment into a buffer	■ DOMNode Subprograms on page 155-10 ■ DOMDocument Subprograms on page 155-16 ■ DOMDocumentFragment Subprograms on page 155-18
WRITETOCLOB Procedures on page 155-153	Writes ■ the contents of the node to a `CLOB` ■ the document to a `CLOB`	■ DOMNode Subprograms on page 155-10 ■ DOMDocument Subprograms on page 155-16
WRITETOFILE Procedures on page 155-154	Writes ■ the contents of the node to a file ■ the document to a file	■ DOMNode Subprograms on page 155-10 ■ DOMDocument Subprograms on page 155-16

ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

> **See Also:** DOMNode Subprograms on page 155-10 for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE(
   doc            IN   DOMDocument,
   importedNode   IN   DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 155–22 ADOPTNODE Function Parameters

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.APPENDCHILD(
   n          IN    DOMNode,
   newchild   IN    DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 155–23 APPENDCHILD Function Parameters

Parameter	Description
`n`	`DOMNode`
`newchild`	The child to be appended to the list of children of node `n`

APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also: DOMCharacterData Subprograms on page 155-14

Syntax

```
DBMS_XMLDOM.APPENDDATA(
   cd      IN    DOMCHARACTERDATA,
   arg     IN    VARCHAR2);
```

Parameters

Table 155–24 APPENDDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
arg	The data to append to the existing data

CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.CLONENODE(
   n       IN    DOMNODE,
   deep    IN    BOOLEAN)
 RETURN DOMNODE;
```

Parameters

Table 155–25 CLONENODE Function Parameters

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.

CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

See Also: DOMDocument Subprograms on page 155-16

Syntax

Creates a DOMATTR with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc      IN    DOMDOCUMENT,
   name     IN    VARCHAR2)
 RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc      IN    DOMDOCUMENT,
   qname     IN    VARCHAR2,
   ns       IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 155–26 CREATEATTRIBUTE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
qname	New attribute qualified name
ns	Namespace

CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(
   doc      IN      DOMDOCUMENT,
   data     IN      VARCHAR2)
 RETURN DOMCDATASECTION;
```

Parameters

Table 155–27 CREATECDATASECTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMCDATASECTION node

CREATECOMMENT Function

This function creates a DOMCOMMENT node.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.CREATECOMMENT(
   doc      IN      DOMDOCUMENT,
   data     IN      VARCHAR2)
 RETURN DOMCOMMENT;
```

Parameters

Table 155–28 CREATECOMMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMComment node

CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(
   namespaceURI      IN     VARCHAR2,
   qualifiedName     IN     VARCHAR2,
   doctype           IN     DOMTYPE := NULL)
 RETURN DOMDOCUMENT;
```

Parameters

Table 155–29 CREATEDOCUMENT Function Parameters

Parameter	Description
namespaceURI	Namespace URI
qualifiedName	Root element name
doctype	Document type

CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT(
   doc       IN      DOMDOCUMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 155–30 CREATEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
doc	DOMDocument

CREATEELEMENT Functions

This function creates a DOMELEMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

Creates a DOMElement with specified name:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN      DOMDOCUMENT,
   tagName     IN      VARCHAR2)
 RETURN DOMELEMENT;
```

Creates a DOMElement with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN     DOMDOCUMENT,
   tagName     IN     VARCHAR2,
   ns          IN     VARCHAR2)
 RETURN DOMELEMENT;
```

Parameters

Table 155–31 CREATEELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(
   doc         IN     DOMDOCUMENT,
   name        IN     VARCHAR2)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 155–32 CREATEENTITYREFERENCE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
   doc        IN      DOMDocument,
   target     IN      VARCHAR2,
   data       IN      VARCHAR2)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 155–33 CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
target	Target of the new processing instruction
data	Content data of the new processing instruction

CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
   doc      IN     DOMDocument,
   data     IN     VARCHAR2)
 RETURN DOMTEXT;
```

Parameters

Table 155–34 CREATETEXTNODE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 155-14

Syntax

```
DBMS_XMLDOM.DELETEDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER);
```

Parameters

Table 155–35 DELETEDATA PROCEDURE Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

FINDENTITY Function

This function finds an entity in the given DTD, and returns that entity if found.

See Also: DOMDocumentType Subprograms on page 155-19

Syntax

```
DBMS_XMLDOM.FINDENTITY(
   dt      IN     DOMDOCUMENTTYPE,
   name    IN     VARCHAR2,
   par     IN     BOOLEAN)
 RETURN  DOMENTITY;
```

Parameters

Table 155–36 FINDENTITY Function Parameters

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

FINDNOTATION Function

This function finds the notation in the given DTD, and returns it, if found.

See Also: DOMDocumentType Subprograms on page 155-19

Syntax

```
DBMS_XMLDOM.FINDNOTATION(
   dt         IN     DOMDocumentType,
   name       IN     VARCHAR2)
 RETURN DOMNOTATION;
```

Parameters

Table 155–37 FINDNOTATION Function Parameters

Parameter	Description
dt	The DTD
name	The notation to find

FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

> **See Also:** DOMDocument Subprograms on page 155-16 and DOMDocumentFragment Subprograms on page 155-18

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(
   df     IN     DOMDOCUMENTFRAGMENT);
```

Parameters

Table 155–38 FREEDOCFRAG Procedure Parameters

Parameter	Description
df	DOM document fragment

FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(
   doc      IN      DOMDOCUMENT);
```

Parameters

Table 155–39 FREEDOCUMENT Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT

FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.FREENODE(
   n       IN      DOMNODE);
```

Parameters

Table 155–40 FREENODE Procedure Parameters

Parameter	Description
n	DOMNODE

GETATTRIBUTE Functions

This function returns the value of a DOMELEMENT's attribute by name.

See Also: DOMElement Subprograms on page 155-20

Syntax

Returns the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem       IN      DOMELEMENT,
   name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Returns the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem      IN     DOMELEMENT,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 155–41 GETATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

See Also: DOMElement Subprograms on page 155-20

Syntax

Returns an attribute node from the DOMELEMENT by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2)
 RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 155–42 GETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

GETATTRIBUTES Function

This function retrieves a NAMEDNODEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES(
   n       IN       DOMNode)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 155–43 GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

GETCHILDNODES Function

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(
   n      IN    DOMNode)
 RETURN DOMNodeList;
```

Parameters

Table 155–44 GETCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

GETCHILDRENBYTAGNAME Functions

This function returns the children of the DOMELEMENT.

See Also: DOMElement Subprograms on page 155-20

Syntax

Returns children of the DOMELEMENT given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem      IN      DOMElement,
   name      IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns children of the DOMELEMENT given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem      IN      DOMElement,
   name      IN      VARCHAR2,
   ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 155–45 GETCHILDRENBYTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Tag name
ns	Namespace

GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 155-14):

```
DBMS_XMLDOM.GETDATA(
   cd      IN    DOMCHARACTERDATA)
 RETURN VARCHAR2;
```

Returns the content data of the `DOMProcessingInstruction` (See Also: DOMProcessingInstruction Subprograms on page 155-27):

```
DBMS_XMLDOM.GETDATA(
   pi      IN    DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 155–46 GETDATA Function Parameters

Parameter	Description
`cd`	`DOMCHARACTERDATA`
`pi`	The `DOMPROCESSINGINSTRUCTION`

GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.GETDOCTYPE(
   doc       IN     DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 155–47 GETDOCTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT(
   doc       IN       DOMDOCUMENT)
 RETURN DOMELEMENT;
```

Parameters

Table 155–48 GETDOCUMENTELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a DOMNODELIST of all the elements with a given tagname (See Also: DOMDocument Subprograms on page 155-16):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   doc          IN      DOMDOCUMENT,
   tagname      IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name (See Also: DOMElement Subprograms on page 155-20):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem       IN     DOMELEMENT,
   name       IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: DOMElement Subprograms on page 155-20):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem       IN     DOMELEMENT,
   name       IN     VARCHAR2,
   ns         IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Parameters

Table 155–49 GETELEMENTSBYTAGNAME Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The DOMELEMENT
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

See Also: DOMDocumentType Subprograms on page 155-19

Syntax

```
DBMS_XMLDOM.GETENTITIES(
   dt       IN     DOMDocumentType)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 155–50 GETENTITIES Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the `Node` if is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: DOMNode Subprograms on page 155-10)

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   n        IN       DOMNODE
   data     OUT      VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: DOMAttr Subprograms on page 155-12):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   a        IN      DOMAttr)
 RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: DOMElement Subprograms on page 155-20):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   elem       IN    DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 155–51 GETEXPANDEDNAME Procedure and Function Parameters

Parameter	Description
`n`	`DOMNODE`
`data`	Returned expanded name of the `Node`
`a`	`DOMATTR`
`elem`	`DOMELEMENT`

GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(
   n      IN      DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 155–52 GETFIRSTCHILD Function Parameters

Parameter	Description
n	DOMNODE

GETIMPLEMENTATION Function

This function returns the DOMIMPLEMENTATION object that handles this DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(
   doc      IN     DOMDOCUMENT)
 RETURN DOMIMPLEMENTATION;
```

Parameters

Table 155–53 GETIMPLEMENTATION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETLASTCHILD(
   n      IN   DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 155–54 GETLASTCHILD Function Parameters

Parameter	Description
n	DOMNODE

GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms on page 155-14):

```
DBMS_XMLDOM.GETLENGTH(
   cd      IN      DOMCHARACTERDATA)
 RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNamedNodeMap Subprograms on page 155-24):

```
DBMS_XMLDOM.GETLENGTH(
   nnm       IN      DOMNAMEDNODEMAP)
 RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNodeList Subprograms on page 155-25):

```
DBMS_XMLDOM.GETLENGTH(
   nl      IN     DOMNODELIST)
 RETURN NUMBER;
```

Parameters

Table 155–55 GETLENGTH Function Parameters

Parameter	Description
`cd`	`DOMCHARACTERDATA`
`nnm`	`DOMNAMEDNODEMAP`
`nl`	`DOMNODELIST`

GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: DOMNode Subprograms on page 155-10):

```
DBMS_XMLDOM.GETLOCALNAME(
   n       IN     DOMNODE,
   data    OUT    VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: DOMAttr Subprograms on page 155-12):

```
DBMS_XMLDOM.GETLOCALNAME(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: DOMElement Subprograms on page 155-20)

```
DBMS_XMLDOM.GETLOCALNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 155–56 GETLOCALNAME Procedure and Function Parameters

Parameter	Description
`n`	`DOMNode`
`data`	Returned local name.
`a`	`DOMAttr`.
`elem`	`DOMElement`.

GETNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the name of this attribute (See Also: DOMAttr Subprograms on page 155-12):

```
DBMS_XMLDOM.GETNAME(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: DOMDocumentType Subprograms on page 155-19):

```
DBMS_XMLDOM.GETNAME(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Parameters

Table 155–57 GETNAME Function Parameters

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

GETNAMEDITEM Function

This function retrieves a node specified by name.

See Also: DOMNamedNodeMap Subprograms on page 155-24

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2)
 RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2,
   ns     IN  VARCHAR2)
 RETURN DOMNODE;
```

Parameters

Table 155–58 GETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms on page 155-10):

```
DBMS_XMLDOM.GETNAMESPACE(
   n       IN     DOMNODE,
   data    OUT    VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: DOMAttr Subprograms on page 155-12):

```
DBMS_XMLDOM.GETNAMESPACE(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: DOMElement Subprograms on page 155-20):

```
DBMS_XMLDOM.GETNAMESPACE(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 155–59 GETNAMESPACE Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns `NULL`.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(
   n       IN     DOMNODE)
 RETURN DOMNode;
```

Parameters

Table 155–60 GETNEXTSIBLING Function Parameters

Parameter	Description
n	DOMNODE

GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETNODETYPE(
   n        IN      DOMNODE)
 RETURN NUMBER;
```

Parameters

Table 155–61 GETNODETYPE Function Parameters

Parameter	Description
n	DOMNODE

GETNODENAME Function

This function gets the name of the node depending on its type.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETNODENAME(
   n        IN     DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 155–62 GETNODENAME Function Parameters

Parameter	Description
n	DOMNODE

GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETNODEVALUE(
   n        IN     DOMNODE)
 RETURN VARCHAR2;*
```

Parameters

Table 155–63 GETNODEVALUE Function Parameters

Parameter	Description
n	DOMNODE

GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 155-10

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node data type must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The data type of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 155–64 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 155-10

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n         IN     DOMNODE)
 RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n         IN   DOMNODE,
   value     IN   SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 155–65 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
`n`	`DOMNODE`
`value`	`CHARACTEROUTPUTSTREAM`

GETNOTATIONNAME Function

This function returns the notation name of the `DOMENTITY`.

See Also: DOMEntity Subprograms on page 155-21

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(
   ent        IN     DOMENTITY)
 RETURN VARCHAR2;
```

Parameters

Table 155–66 GETNOTATIONNAME Function Parameters

Parameter	Description
ent	DOMENTITY

GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

See Also: DOMDocumentType Subprograms on page 155-19

Syntax

```
DBMS_XMLDOM.GETNOTATIONS(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 155–67 GETNOTATIONS Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

See Also: DOMProcessingInstruction Subprograms on page 155-27

Syntax

```
DBMS_XMLDOM.GETTARGET(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 155–68 GETTARGET Function Parameters

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
   n        IN     DOMNODE)
 RETURN DOMDOCUMENT;
```

Parameters

Table 155–69 GETOWNERDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE

GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also: DOMAttr Subprograms on page 155-12

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(
   a        IN     DOMATTR)
 RETURN DOMElement;
```

Parameters

Table 155–70 GETOWNERELEMENT Function Parameters

Parameter	Description
a	Attribute

GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETPARENTNODE(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 155–71 GETPARENTNODE Function Parameters

Parameter	Description
n	DOMNODE

GETPREFIX Function

This function retrieves the namespace prefix of the node.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETPREFIX(
   n        IN     DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 155–72 GETPREFIX Function Parameters

Parameter	Description
n	DOMNODE

GETPREVIOUSSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns `NULL`.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETPREVIOUSSIBLING(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 155–73 GETPREVIOUSSIBLING Function Parameters

Parameter	Description
n	DOMNODE

GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the given DTD (See Also: DOMDocumentType Subprograms on page 155-19):

```
DBMS_XMLDOM.GETPUBLICID(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the public identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 155-21):

```
DBMS_XMLDOM.GETPUBLICID(
   ent       IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 155-26):

```
DBMS_XMLDOM.GETPUBLICID(
   n         IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 155–74 GETPUBLICID Function Parameters

Parameter	Description
dt	The DTD
ent	DOMENTITY
n	DOMNOTATION

GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the DOMATTR (See Also: DOMAttr Subprograms on page 155-12):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   a         IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the qualified name of the DOMElement (See Also: DOMElement Subprograms on page 155-20):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   elem      IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 155–75 GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 155–76 GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

GETSPECIFIED Function

If this attribute was explicitly given a value in the original document, this is true; otherwise, it is false.

See Also: DOMAttr Subprograms on page 155-12

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(
   a       IN     DOMATTR)
 RETURN BOOLEAN;
```

Parameters

Table 155–77 GETSPECIFIED Function Parameters

Parameter	Description
a	DOMATTR

GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.GETSTANDALONE(
   doc        IN      DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 155–78 GETSTANDALONE Function Parameters

Parameter	Description
doc	DOMDOCUMENT.

GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the given DTD (See Also: DOMDocumentType Subprograms on page 155-19):

```
DBMS_XMLDOM.GETSYSTEMID(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 155-21):

```
DBMS_XMLDOM.GETSYSTEMID(
   ent      IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 155-26):

```
DBMS_XMLDOM.GETSYSTEMID(
   n        IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 155–79 GETSYSTEMID Function Parameters

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

GETTAGNAME Function

This function returns the name of the DOMELEMENT.

See Also: DOMElement Subprograms on page 155-20

Syntax

```
DBMS_XMLDOM.GETTAGNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 155–80 GETTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT

GETVALUE Function

This function retrieves the value of the attribute.

See Also: DOMAttr Subprograms on page 155-12

Syntax

```
DBMS_XMLDOM.GETVALUE(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Parameters

Table 155–81 GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

GETVERSION Function

This function returns the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.GETVERSION(
   doc        IN     DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 155–82 GETVERSION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.GETXMLTYPE(
   doc        IN     DOMDOCUMENT)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 155–83 GETXMLTYPE Function Parameters

Parameter	Description
`doc`	`DOMDOCUMENT`

HASATTRIBUTE Functions

Verifies whether an attribute has been defined for DOMELEMENT, or has a default value.

See Also: DOMElement Subprograms on page 155-20

Syntax

Verifies whether an attribute with the specified name has been defined for DOMElement:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem     IN  DOMELEMENT,
   name     IN  VARCHAR2)
 RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for DOMELEMENT; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem     IN  DOMELEMENT,
   name     IN  VARCHAR2,
   ns       IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 155–84 HASATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES(
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 155–85 HASATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

HASCHILDNODES Function

This function determines whether this node has any children.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.HASCHILDNODES(
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 155–86 HASCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

See Also: DOMImplementation Subprograms on page 155-23

Syntax

```
DBMS_XMLDOM.HASFEATURE(
   di       IN     DOMIMPLEMENTATION,
   feature  IN     VARCHAR2,
   version  IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 155–87 HASFEATURE Function Parameters

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.IMPORTNODE(
   doc             IN  DOMDOCUMENT,
   importedNode    IN  DOMNODE,
   deep            IN  BOOLEAN)
  RETURN DOMNODE;
```

Parameters

Table 155–88 IMPORTNODE Function Parameters

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. ■ If this value is TRUE, the entire subtree of the node will be imported with the node. ■ If this value is FALSE, only the node itself will be imported.

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.INSERTBEFORE(
   n          IN     DOMNODE,
   newchild   IN     DOMNODE,
   refchild   IN     DOMNODE)
  RETURN DOMNode;
```

Parameters

Table 155–89 INSERTBEFORE Function Parameters

Parameter	Description
`n`	`DOMNODE`
`newChild`	The child to be inserted in the `DOMNODE`
`refChild`	The reference node before which the `newchild` is to be inserted

INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also: DOMCharacterData Subprograms on page 155-14

Syntax

```
DBMS_XMLDOM.INSERTDATA(
   cd       IN     DOMCHARACTERDATA,
   offset   IN     NUMBER,
   arg      IN     VARCHAR2);
```

Parameters

Table 155–90 INSERTDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the given DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms on page 155-10):

```
DBMS_XMLDOM.ISNULL(
  n         IN     DOMNODE)
 RETURN BOOLEAN;
```

Checks that the given DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms on page 155-12):

```
DBMS_XMLDOM.ISNULL(
   a        IN     DOMATTR)
 RETURN BOOLEAN;
```

Checks that the given DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCDataSection Subprograms on page 155-13):

```
DBMS_XMLDOM.ISNULL(
   cds      IN     DOMCDATASECTION)
 RETURN BOOLEAN;
```

Checks that the given DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCharacterData Subprograms on page 155-14):

```
DBMS_XMLDOM.ISNULL(
   cd       IN     DOMCHARACTERDATA)
 RETURN BOOLEAN;
```

Checks that the given DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMComment Subprograms on page 155-15):

```
DBMS_XMLDOM.ISNULL(
   com       IN     DOMCOMMENT)
 RETURN BOOLEAN;
```

Checks that the given DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocument Subprograms on page 155-16):

```
DBMS_XMLDOM.ISNULL(
   doc       IN     DOMDOCUMENT)
 RETURN BOOLEAN;
```

Checks that the given DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentFragment Subprograms on page 155-18):

```
DBMS_XMLDOM.ISNULL(
   df       IN     DOMDOCUMENTFRAGMENT)
 RETURN BOOLEAN;
```

Checks that the given DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentType Subprograms on page 155-19):

```
DBMS_XMLDOM.ISNULL(
   dt       IN     DOMDOCUMENTTYPE)
```

```
 RETURN BOOLEAN;
```

Checks that the given DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMElement Subprograms on page 155-20):

```
DBMS_XMLDOM.ISNULL(
   elem     IN     DOMELEMENT)
 RETURN BOOLEAN;
```

Checks that the given DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntity Subprograms on page 155-21):

```
DBMS_XMLDOM.ISNULL(
   ent       IN     DOMENTITY)
 RETURN BOOLEAN;
```

Checks that the given DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntityReference Subprograms on page 155-22):

```
DBMS_XMLDOM.ISNULL(
   EREF       IN     DOMENTITYREFERENCE)
 RETURN BOOLEAN;
```

Checks that the DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: DOMImplementation Subprograms on page 155-23):

```
DBMS_XMLDOM.ISNULL(
   di       IN     DOMIMPLEMENTATION)
 RETURN BOOLEAN;
```

Checks that the given DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNamedNodeMap Subprograms on page 155-24):

```
DBMS_XMLDOM.ISNULL(
   nnm       IN     DOMNAMEDNODEMAP)
 RETURN BOOLEAN;
```

Checks that the given DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNodeList Subprograms on page 155-25):

```
DBMS_XMLDOM.ISNULL(
   nl       IN     DOMNODELIST)
 RETURN BOOLEAN;
```

Checks that the given DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms on page 155-26):

```
DBMS_XMLDOM.ISNULL(
   n       IN     DOMNOTATION)
 RETURN BOOLEAN;
```

Checks that the given DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is (See Also: DOMProcessingInstruction Subprograms on page 155-27):

```
DBMS_XMLDOM.ISNULL(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN BOOLEAN;
```

Checks that the given DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms on page 155-28):

```
DBMS_XMLDOM.ISNULL(
   t       IN     DOMTEXT)
```

```
RETURN BOOLEAN;
```

Parameters

Table 155–91 ISNULL Function Parameters

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: DOMNamedNodeMap Subprograms on page 155-24):

```
DBMS_XMLDOM.ITEM(
   nnm       IN     DOMNAMEDNODEMAP,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If index is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: DOMNodeList Subprograms on page 155-25):

```
DBMS_XMLDOM.ITEM(
   nl        IN     DOMNODELIST,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Parameters

Table 155–92 ITEM Function Parameters

Parameter	Description
`nnm`	`DOMNAMEDNODEMAP`
`index`	The index in the node map at which the item is to be retrieved
`nl`	`DOMNODELIST`
`index`	The index in the `NodeList` used to retrieve the item

MAKEATTR Function

This function casts a given DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKEATTR(
   n        IN     DOMNODE)
 RETURN DOMATTR;
```

Parameters

Table 155–93 MAKEATTR Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECDATASECTION Function

This function casts a given DOMNODE to a DOMCDATASECTION.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION(
   n        IN     DOMNODE)
 RETURN DOMCDATASECTION;
```

Parameters

Table 155–94 MAKECDATASECTION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECHARACTERDATA Function

This function casts a given DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA(
   n       IN     DOMNode)
 RETURN DOMCharacterData;
```

Parameters

Table 155–95 MAKECHARACTERDATA Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECOMMENT Function

This function casts a given DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKECOMMENT(
   n        IN      DOMNODE)
 RETURN DOMCOMMENT;
```

Parameters

Table 155–96 MAKECOMMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENT Function

This function casts a given DOMNODE to a DOMDOCUMENT, and returns the DOMDOCUMENT.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT(
   n        IN     DOMNODE)
 RETURN DOMDocument;
```

Parameters

Table 155–97 MAKEDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENTFRAGMENT Function

This function casts a given DOMNODE to a DOMDOCUMENTFRAGMENT, and returns the DOMDOCUMENTFRAGMENT.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
   n        IN     DOMNODE)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 155–98 MAKEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENTTYPE Function

This function casts a given DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE(
   n        IN     DOMNODE)
 RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 155–99 MAKEDOCUMENTTYPE Function Parameters

Parameter	Description
n	DOMNODE to cast.

MAKEELEMENT Function

This function casts a given DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKEELEMENT(
   n        IN     DOMNODE)
 RETURN DOMELEMENT;
```

Parameters

Table 155–100 MAKEELEMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEENTITY Function

This function casts a given DOMNODE to a DOMENTITY, and returns the DOMENTITY.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKEENTITY(
   n        IN     DOMNODE)
 RETURN DOMENTITY;
```

Parameters

Table 155–101 MAKEENTITY Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEENTITYREFERENCE Function

This function casts a given DOMNODE to a DOMENTITYREFERENCE, and returns the DOMENTITYREFERENCE.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(
   n       IN     DOMNODE)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 155–102 MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts given DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: DOMAttr Subprograms on page 155-12):

```
DBMS_XMLDOM.MAKENODE(
   a         IN     DOMATTR)
 RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: DOMCDataSection Subprograms on page 155-13):

```
DBMS_XMLDOM.MAKENODE(
   cds       IN     DOMCDATASECTION)
 RETURN DOMNODE;
```

Casts the given DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: DOMCharacterData Subprograms on page 155-14):

```
DBMS_XMLDOM.MAKENODE(
   cd        IN     DOMCHARACTERDATA)
 RETURN DOMNODE;
```

Casts the given DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMComment Subprograms on page 155-15):

```
DBMS_XMLDOM.MAKENODE(
   com       IN     DOMCOMMENT)
 RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocument Subprograms on page 155-16):

```
DBMS_XMLDOM.MAKENODE(
   doc       IN     DOMDOCUMENT)
 RETURN DOMNODE;
```

Casts the given DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentFragment Subprograms on page 155-18):

```
DBMS_XMLDOM.MAKENODE(
   df        IN     DOMDOCUMENTFRAGMENT)
 RETURN DOMNode;
```

Casts the given DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentType Subprograms on page 155-19):

```
DBMS_XMLDOM.MAKENODE(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN DOMNODE;
```

Casts the given DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMElement Subprograms on page 155-20):

```
DBMS_XMLDOM.MAKENODE(
   elem        IN     DOMELEMENT)
```

```
 RETURN DOMNODE;
```

Casts given DOMENTITY to a DOMNODE, and returns that DOMNODE (See Also: DOMEntity Subprograms on page 155-21):

```
DBMS_XMLDOM.MAKENODE(
   ent       IN     DOMENTITY)
 RETURN DOMNODE;
```

Casts the DOMENTITYREFERENCE to a DOMNODE, and returns that DOMNODE (See Also: DOMEntityReference Subprograms on page 155-22):

```
DBMS_XMLDOM.MAKENODE(
   eref       IN     DOMENTITYREFERENCE)
 RETURN DOMNODE;
```

Casts the DOMNOTATION to a DOMNODE, and returns that DOMNODE (See Also: DOMNotation Subprograms on page 155-26):

```
DBMS_XMLDOM.MAKENODE(
   n       IN     DOMNOTATION)
 RETURN DOMNODE;
```

Casts the DOMPROCESSINGINSTRUCTION to a DOMNODE, and returns the DOMNODE (See Also: DOMProcessingInstruction Subprograms on page 155-27):

```
DBMS_XMLDOM.MAKENODE(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN DOMNODE;
```

Casts the DOMTEXT to a DOMNODE, and returns that DOMNODE (See Also: DOMText Subprograms on page 155-28):

```
DBMS_XMLDOM.MAKENODE(
   t       IN     DOMTEXT)
 RETURN DOMNODE;
```

Parameters

Table 155–103 MAKENODE Function Parameters

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast

Table 155–103 (Cont.) MAKENODE Function Parameters

Parameter	Description
t	DOMTEXT to cast

MAKENOTATION Function

This function casts a given DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKENOTATION(
   n       IN     DOMNODE)
 RETURN DOMNOTATION;
```

Parameters

Table 155–104 MAKENOTATION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEPROCESSINGINSTRUCTION Function

This function casts a given DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
   n        IN     DOMNODE)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 155–105 MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKETEXT Function

This function casts a given DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.MAKETEXT(
   n        IN     DOMNODE)
 RETURN DOMTEXT;
```

Parameters

Table 155–106 MAKETEXT Function Parameters

Parameter	Description
n	DOMNODE to cast

NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

See Also: DOMDocument Subprograms on page 155-16

Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   xmldoc    IN SYS.XMLTYPE)
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   cl       IN    CLOB)
 RETURN DOMDOCUMENT;
```

Parameters

Table 155–107 NEWDOMDOCUMENT Function Parameters

Parameter	Description
xmldoc	XMLType source for the DOMDOCUMENT
cl	CLOB source for the DOMDOCUMENT

NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

See Also: DOMElement Subprograms on page 155-20

Syntax

```
DBMS_XMLDOM.NORMALIZE(
   elem       IN     DOMELEMENT);
```

Parameters

Table 155–108 NORMALIZE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT

REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

See Also: DOMElement Subprograms on page 155-20

Syntax

Removes the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2);
```

Removes the value of a DOMELEMENT's attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2,
   ns       IN    VARCHAR2);
```

Parameters

Table 155–109 REMOVEATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the DOMELEMENT. The method returns the removed node.

See Also: DOMElement Subprograms on page 155-20

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
   elem       IN     DOMELEMENT,
   oldAttr    IN     DOMATTR)
  RETURN DOMAttr;
```

Parameters

Table 155–110 REMOVEATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT.
oldAttr	The old DOMATTR.

REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.REMOVECHILD(
   n          IN     DOMNode,
   oldchild   IN     DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 155–111 REMOVECHILD Function Parameters

Parameter	Description
`n`	`DOMNODE`
`oldCHild`	The child of the node `n` to be removed

REMOVENAMEDITEM Function

This function removes from the map a node specified by name, and returns this node. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also: DOMNamedNodeMap Subprograms on page 155-24

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2)
 RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2,
   ns       IN     VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 155–112 REMOVENAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node. If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.REPLACECHILD(
   n           IN     DOMNode,
   newchild    IN     DOMNode,
   oldchild    IN     DOMNode)
 RETURN DOMNode;
```

Parameters

Table 155–113 REPLACECHILD Function Parameters

Parameter	Description
`n`	`DOMNode`
`newchild`	The new child which is to replace the old child
`oldchild`	The child of the node n which is to be replaced

REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 155-14

Syntax

```
DBMS_XMLDOM.REPLACEDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER,
   arg       IN     VARCHAR2);
```

Parameters

Table 155–114 REPLACEDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

RESOLVENAMESPACEPREFIX Function

This function resolves the given namespace prefix, and returns the resolved namespace.

See Also: DOMElement Subprograms on page 155-20

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
   elem       IN     DOMELEMENT,
   prefix     IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 155–115 RESOLVENAMESPACEPREFIX Function Parameters

Parameter	Description
`elem`	The `DOMELEMENT`
`prefix`	Namespace prefix

SETATTRIBUTE Procedures

Sets the value of a DOMELEMENT's attribute by name.

See Also: DOMElement Subprograms on page 155-20

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem    IN  DOMELEMENT,
   name    IN  VARCHAR2,
   value   IN  VARCHAR2);
```

Sets the value of a DOMElement's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem    IN  DOMELEMENT,
   name    IN  VARCHAR2,
   value   IN  VARCHAR2,
   ns      IN  VARCHAR2);
```

Parameters

Table 155–116 SETATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
value	Attribute value
ns	Namespace

SETATTRIBUTENODE Functions

Adds a new attribute node to the DOMELEMENT.

See Also: DOMElement Subprograms on page 155-20

Syntax

Adds a new attribute node to the DOMELEMENT:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR)
 RETURN DOMATTR;
```

Adds a new attribute node to the DOMElement; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR,
   ns        IN  VARCHAR2)
 RETURN DOMATTR;
```

Parameters

Table 155–117 SETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
newAttr	The new DOMATTR
ns	The namespace

SETDATA Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 155-14):

```
DBMS_XMLDOM.SETDATA(
   cd       IN     DOMCHARACTERDATA,
   data     IN     VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: DOMProcessingInstruction Subprograms on page 155-14):

```
DBMS_XMLDOM.SETDATA(
   pi       IN     DOMPROCESSINGINSTRUCTION,
   data     IN     VARCHAR2);
```

Parameters

Table 155–118 SETDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the given name, system id and public id and sets it in the document. This DTD can later be retrieved using the GETDOCTYPE Function.

Syntax

```
DBMS_XMLDOM.SETDOCTYPE(
  doc     IN   DOMDocument,
  name    IN   VARCHAR2,
  sysid   IN   VARCHAR2,
  pubid   IN   VARCHAR2);
```

Parameters

Table 155–119 SETDOCTYPE Procedure Parameters

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

SETNAMEDITEM Function

This function adds a node using its NodeName attribute. If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, NULL is returned.

As the NodeName attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also: DOMNamedNodeMap Subprograms on page 155-24

Syntax

Adds a node using its NodeName attribute:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm      IN     DOMNAMEDNODEMAP,
   arg      IN     DOMNODE)
 RETURN DOMNode;
```

Adds a node using its NodeName attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm      IN     DOMNAMEDNODEMAP,
   arg       IN    DOMNODE,
   ns       IN     VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 155–120 SETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
arg	The Node to be added using its NodeName attribute
ns	Namespace

SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.SETNODEVALUE(
   n         IN     DOMNODE,
   nodeValue IN     VARCHAR2);
```

Parameters

Table 155–121 SETNODEVALUE Procedure Parameters

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 155-10

Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The data type of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The data type of the node must be `RAW` or BLOB – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 155–122 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 155-10

Syntax

This function returns an instance of the PL/SQL XMLCHARACTEROUTPUTSTREAM type into which the caller can write the node value. The data type of the node can be any valid XDB data type. If the type is not character or CLOB, the character data written to the stream is converted to the node data type. If the data type of the node is character or CLOB, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n         IN     DOMNODE)
 RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of SYS.UTL_CHARACTERINPUTSTREAM from which XDB reads to populate the node. The data type of the node may be any valid type supported by XDB. If a non-character data type, the character data read from the stream is converted to the data type of the node. If the data type of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n         IN   DOMNODE,
   value     IN   SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 155–123 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the given value.

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.SETPREFIX(
   n       IN     DOMNODE,
   prefix  IN     VARCHAR2);
```

Parameters

Table 155–124 SETPREFIX Procedure Parameters

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.SETSTANDALONE(
   doc          IN     DOMDOCUMENT,
   newvalue     IN     VARCHAR2);
```

Parameters

Table 155–125 SETSTANDALONE Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

SETVALUE Procedure

This procedure sets the value of the attribute.

See Also: DOMAttr Subprograms on page 155-12

Syntax

```
DBMS_XMLDOM.SETVALUE(
   a       IN     DOMATTR,
   value   IN     VARCHAR2);
```

Parameters

Table 155–126 SETVALUE Procedure Parameters

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 155-16

Syntax

```
DBMS_XMLDOM.SETVERSION(
   doc         IN     DOMDOCUMENT,
   version     IN     VARCHAR2);
```

Parameters

Table 155–127 SETVERSION Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

See Also: DOMText Subprograms on page 155-28

Syntax

```
DBMS_XMLDOM.SPLITTEXT(
   t        IN     DOMTEXT,
   offset   IN     NUMBER)
 RETURN DOMText;
```

Parameters

Table 155–128 SPLITTEXT Function Parameters

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

SUBSTRINGDATA Function

This function extracts a range of data from the node.

See Also: DOMCharacterData Subprograms on page 155-14

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA(
   cd         IN     DOMCHARACTERDATA,
   offset     IN     NUMBER,
   cnt        IN     NUMBER)
 RETURN VARCHAR2;
```

Parameters

Table 155–129 SUBSTRINGDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

USEBINARYSTREAM Function

This function returns TRUE if the data type of the node is RAW or BLOB so that the node value may be read or written using an UTL_BINARYINPUTSTREAM or UTL_BINARYOUTPUTSTREAM. If a value of FALSE is returned, the node value may only be accessed via an UTL_CHARACTERINPUTSTREAM or UTL_CHARACTEROUTPUTSTREAM..

See Also: DOMNode Subprograms on page 155-10

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM   (
   n         IN      DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 155–130 USEBINARYSTREAM Function Parameters

Parameter	Description
n	DOMNODE

WRITETOBUFFER Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: DOMNode Subprograms on page 155-10):

```
DBMS_XMLDOM.WRITETOBUFFER(
   n        IN      DOMNODE,
   buffer   IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: DOMDocument Subprograms on page 155-16):

```
DBMS_XMLDOM.WRITETOBUFFER(
   doc       IN      DOMDOCUMENT,
   buffer    IN OUT  VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: DOMDocumentFragment Subprograms on page 155-18):

```
DBMS_XMLDOM.WRITETOBUFFER(
   df        IN      DOMDOCUMENTFRAGMENT,
   buffer    IN OUT  VARCHAR2);
```

Parameters

Table 155–131 WRITETOBUFFER Procedure Parameters

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

WRITETOCLOB Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified CLOB using the database character set (See Also: DOMNode Subprograms on page 155-10):

```
DBMS_XMLDOM.WRITETOCLOB(
   n       IN      DOMNODE,
   cl      IN OUT  CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: DOMDocument Subprograms on page 155-16):

```
DBMS_XMLDOM.WRITETOCLOB(
   doc     IN      DOMDOCUMENT,
   cl      IN OUT  CLOB);
```

Parameters

Table 155–132 WRITETOCLOB Procedure Parameters

Parameter	Description
n	DOMNODE
cl	CLOB to which to write
doc	DOMDOCUMENT

WRITETOFILE Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the given character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2,
   charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc        IN   DOMDOCUMENT,
   filename   IN   VARCHAR2);
```

Writes an XML document to a specified file using given character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc       IN   DOMDOCUMENT,
   fileName  IN   VARCHAR2,
   charset   IN   VARCHAR2);
```

Parameters

Table 155–133 WRITETOFILE Procedure Parameters

Parameter	Description
`n`	`DOMNODE`
`fileName`	File to which to write
`charset`	Given character set
`doc`	`DOMDOCUMENT`
`charset`	Character set

156

DBMS_XMLGEN

The DBMS_XMLGEN package converts the results of a SQL query to a canonical XML format. The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a CLOB. This package is similar to the DBMS_XMLQUERY package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- Summary of DBMS_XMLGEN Subprograms

> **See Also:** *Oracle XML DB Developer's Guide*, for more information on XML support and on examples of using DBMS_XMLGEN

Summary of DBMS_XMLGEN Subprograms

Table 156–1 Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
CLOSECONTEXT Procedure on page 156-3	Closes the context and releases all resources
CONVERT Functions on page 156-4	Converts the XML into the escaped or unescaped XML equivalent
GETNUMROWSPROCESSED Function on page 156-5	Gets the number of SQL rows that were processed in the last call to GETXML Functions
GETXML Functions on page 156-6	Gets the XML document
GETXMLTYPE Functions on page 156-7	Gets the XML document and returns it as `XMLType`
NEWCONTEXT Functions on page 156-8	Creates a new context handle
RESTARTQUERY Procedure on page 156-9	Restarts the query to start fetching from the beginning
SETCONVERTSPECIALCHARS Procedure on page 156-10	Sets whether special characters such as `$`, which are non-XML characters, should be converted or not to their escaped representation
SETMAXROWS Procedure on page 156-11	Sets the maximum number of rows to be fetched each time
SETNULLHANDLING Procedure on page 156-12	Sets `NULL` handling options
SETROWSETTAG Procedure on page 156-13	Sets the name of the element enclosing the entire result
SETROWTAG Procedure on page 156-14	Sets the name of the element enclosing each row of the result
SETSKIPROWS Procedure on page 156-15	Sets the number of rows to skip every time before generating the XML.
USEITEMTAGSFORCOLL Procedure on page 156-16	Forces the use of the collection column name appended with the tag `_ITEM` for collection elements
USENULLATTRIBUTEINDICATOR Procedure on page 156-17	Specified weather to use an XML attribute to indicate `NULL`ness, or to do it by omitting the inclusion of the particular entity in the XML document.

CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
   ctx  IN ctxHandle);
```

Parameters

Table 156–2 CLOSECONTEXT Procedure Parameters

Parameter	Description
ctx	The context handle to close.

CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
   xmlData IN VARCHAR2,
   flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
   xmlData IN CLOB,
   flag    IN NUMBER := ENTITY_ENCODE)
 RETURN CLOB;
```

Parameters

Table 156–3 CONVERT Function Parameters

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is <. Unescaping is the reverse transformation.

GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML. Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (
   ctx     IN    ctxHandle)
RETURN NUMBER;
```

Parameters

Table 156–4 GETNUMROWSPROCESSED Function Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 156-8.

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of GETXML Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this GETXML Functionscall is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   tmpclob      IN OUT NCOPY CLOB,
   dtdOrSchema  IN number := NONE)
 RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_ LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_ LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Parameters

Table 156–5 GETXML Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
tmpclob	The CLOB to which the XML document is appended.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

Usage Notes

When the rows indicated by the SETSKIPROWS Procedure call are skipped, the maximum number of rows as specified by the SETMAXROWS Procedure call (or the entire result if not specified) is fetched and converted to XML. Use the GETNUMROWSPROCESSED Function to check if any rows were retrieved.

GETXMLTYPE Functions

This function gets the XML document and returns it as an XMLTYPE. XMLTYPE operations can be performed on the results.

This function is overloaded.

Syntax

Generates the XML document and returns it as a sys.XMLType:

```
DBMS_XMLGEN.GETXMLTYPE (
   ctx           IN ctxhandle,
   dtdOrSchema   IN number := NONE)
 RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a sys.XMLType:

```
DBMS_XMLGEN.GETXMLTYPE (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN sys.XMLType
```

Parameters

Table 156–6 GETXMLTYPE Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

NEWCONTEXT Functions

This function generates and returns a new context handle. This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (
      query     IN VARCHAR2)
 RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (
   queryString  IN SYS_REFCURSOR)
 RETURN ctxHandle;
```

Parameters

Table 156–7 NEWCONTEXT Function Parameters

Parameter	Description
`query`	The query, in the form of a `VARCHAR`, the result of which must be converted to XML.
`queryString`	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row. It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
ctx  IN ctxHandle);
```

Parameters

Table 156–8 RESTARTQUERY Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the current query.

SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to `<`. The default is to perform conversions. This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, `"`, `'`, which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
ctx   IN ctxHandle,
conv  IN BOOLEAN);
```

Parameters

Table 156–9 SETCONVERTSPECIALCHARS Procedure Parameters

Parameter	Description
`ctx`	The context handle obtained from one of the NEWCONTEXT Functions call on page 156-8.
`conv`	`TRUE` indicates that conversion is needed.

SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invokation of the GETXML Functions call. It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxrows` parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (
ctx      IN ctxHandle,
maxRows  IN NUMBER);
```

Parameters

Table 156–10 SETMAXROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`maxRows`	The maximum number of rows to get for each call to GETXML Functions

SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the flag parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
ctx  IN ctx,
flag IN NUMBER);
```

Parameters

Table 156–11 SETNULLHANDLING Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the query executed.
flag	The NULL handling option set. ■ DROP_NULLS CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements. ■ NULL_ATTR CONSTANT NUMBER:= 1; Sets xsi:nil="true". ■ EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for example, <foo/>.

SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
ctx            IN ctxHandle,
rowSetTagName  IN VARCHAR2);
```

Parameters

Table 156–12 SETROWSETTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 156-8.
rowSetTagName	The name of the document element. Passing `NULL` indicates that you do not want the `ROWSET` element present.

Usage Notes

The user can set the `rowSetTag` to `NULL` to suppress the printing of this element. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output . This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is `ROW`.

Syntax

```
DBMS_XMLGEN.SETROWTAG (
ctx         IN ctxHandle,
rowTagName  IN VARCHAR2);
```

Parameters

Table 156–13 SETROWTAG Procedure Parameters

Parameter	Description
`ctx`	The context handle obtained from the NEWCONTEXT Functions call on page 156-8.
`rowTagName`	The name of the `ROW` element. Passing `NULL` indicates that you do not want the `ROW` element present.

Usage Notes

The user can set the name of the element to `NULL` to suppress the `ROW` element itself. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility. For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function on page 156-5.

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
ctx       IN ctxHandle,
skipRows  IN NUMBER);
```

Parameters

Table 156–14 SETSKIPROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`skipRows`	The number of rows to skip for each call to `getXML`.

USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
   ctx  IN ctxHandle);
```

Parameters

Table 156–15 USEITEMTAGSFORCOLL Procedure Parameters

Parameter	Description
ctx	The context handle.

Usage Notes

Using this procedure, you can override the default to use the name of the column with the _ITEM tag appended to it. If there is a collection of NUMBER, the default tag name for the collection elements is NUMBER.

USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. It is used as a shortcut for the SETNULLHANDLING Procedure .

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
ctx       IN   ctxType,
attrind   IN   BOOLEAN := TRUE);
```

Parameters

Table 156–16 USENULLATTRIBUTEINDICATOR Procedure Parameters

Parameter	Description
ctx	Context handle.
attrind	Use attribute to indicate NULL?

157

DBMS_XMLINDEX

The DBMS_XMLINDEX package provides an interface to implement asychronous indexing .

> **See Also:** *Oracle XML DB Developer's Guide* for more information about "XMLIndex"

This chapter contains the following topics:

- Using DBMS_XMLINDEX
  - Overview
- Summary of DBMS_XMLINDEX Subprograms

Using DBMS_XMLINDEX

- Overview

Overview

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a convenient time, for example to a time when the load on the database is low. Thus a mechanism for asynchronous index maintenance is provided.

Summary of DBMS_XMLINDEX Subprograms

This table list the package subprograms in alphabetical order.

Table 157–1 DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATEDATEINDEX Procedure on page 157-5	Creates a secondary index for date values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`
CREATENUMBERINDEX Procedure on page 157-6	Creates a secondary index for number values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`
SYNCINDEX Procedure on page 157-7	Synchronizes the index manually

CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2,
   date_index_clause  IN   VARCHAR2);

DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 157–2 CREATEDATEINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   num_index_name     IN   VARCHAR2,
   num_index_clause   IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 157–3 CREATENUMBERINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
num_index_name	Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
num_index_clause	Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.

SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex. It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
   xml_index_schema      IN VARCHAR2,
   xml_index_name        IN VARCHAR2);
```

Parameters

Table 157–4 SYNCINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_schema_name	Name of the XMLIndex

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI');
```

158

DBMS_XMLPARSER

Using DBMS_XMLPARSER, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- Summary of DBMS_XMLPARSER Subprograms

See Also: *Oracle XML DB Developer's Guide*

Summary of DBMS_XMLPARSER Subprograms

Table 158–1 DBMS_XMLPARSER Package Subprograms

Method	Description
FREEPARSER on page 158-3	Frees a parser object.
GETDOCTYPE on page 158-4	Gets parsed DTD.
GETDOCUMENT on page 158-5	Gets DOM document.
GETRELEASEVERSION on page 158-5	Returns the release version of Oracle XML Parser for PL/SQL.
GETVALIDATIONMODE on page 158-7	Returns validation mode.
NEWPARSER on page 158-8	Returns a new parser instance
PARSE on page 158-9	Parses XML stored in the given url/file.
PARSEBUFFER on page 158-10	Parses XML stored in the given buffer
PARSECLOB on page 158-10	Parses XML stored in the given clob
PARSEDTD on page 158-12	Parses DTD stored in the given url/file
PARSEDTDBUFFER on page 158-13	Parses DTD stored in the given buffer
PARSEDTDCLOB on page 158-14	Parses DTD stored in the given clob
SETBASEDIR on page 158-15	Sets base directory used to resolve relative URLs.
SETDOCTYPE on page 158-16	Sets DTD.
SETERRORLOG on page 158-17	Sets errors to be sent to the specified file
SETPRESERVEWHITESPACE on page 158-18	Sets white space preserve mode
SETVALIDATIONMODE on page 158-19	Sets validation mode.
SHOWWARNINGS on page 158-20	Turns warnings on or off.

FREEPARSER

Frees a parser object.

Syntax

```
PROCEDURE freeParser(
    p Parser);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETDOCTYPE

Returns the parsed DTD; this function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(
p Parser)
RETURN DOMDocumentType;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETDOCUMENT

Returns the document node of a DOM tree document built by the parser; this function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT(
p Parser)
RETURN DOMDocument;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETRELEASEVERSION

Returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion
RETURN VARCHAR2;
```

GETVALIDATIONMODE

Retrieves validation mode; `TRUE` for validating, `FALSE` otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE(
p Parser)
RETURN BOOLEAN;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

NEWPARSER

Returns a new parser instance. This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser
RETURN Parser;
```

PARSE

Parses XML stored in the given URL or file. An application error is raised if parsing fails. There are several versions of this method.

Syntax	Description

`FUNCTION parse(`
`  url VARCHAR2)`
`RETURN DOMDocument;`
	Returns the built DOM Document.
	This is meant to be used when the default parser behavior is acceptable and just a url/file needs to be parsed.

`PROCEDURE parse(`
`  p  Parser,`
`  url  VARCHAR2);`
	Any changes to the default parser behavior should be effected before calling this procedure.

Parameter	IN / OUT	Description
`url`	`(IN)`	Complete path of the url/file to be parsed.
`p`	`(IN)`	Parser instance.

PARSEBUFFER

Parses XML stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER(
p   Parser,
doc VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

PARSECLOB

Parses XML stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB(
p   Parser,
doc CLOB);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

PARSEDTD

Parses the DTD stored in the given URL or file. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(
p     Parser,
url   VARCHAR2,
root  VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

PARSEDTDBUFFER

Parses the DTD stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(
p    Parser,
dtd  VARCHAR2,
root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

PARSEDTDCLOB

Parses the DTD stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDCLOB(
p    Parser,
dtd  CLOB,
root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

SETBASEDIR

Sets base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(
p   Parser,
dir VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

SETDOCTYPE

Sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(
p   Parser,
dtd DOMDocumentType);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

SETERRORLOG

Sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(
p        Parser,
fileName VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

SETPRESERVEWHITESPACE

Sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

SETVALIDATIONMODE

Sets validation mode.

Syntax

```
PROCEDURE setValidationMode(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

SHOWWARNINGS

Turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

159

DBMS_XMLQUERY

DBMS_XMLQUERY provides database-to-XMLType functionality. Whenever possible, use DBMS_XMLGEN, a built-in package in C, instead of DBMS_XMLQUERY.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XMLQUERY
  - Constants
  - Types
- Summary of DBMS_XMLQUERY Subprograms

Using DBMS_XMLQUERY

- Constants
- Types

Constants

Table 159–1 Constants of DBMS_XMLQUERY

Constant	Description
DB_ENCODING	Used to signal that the DB character encoding is to be used.
DEFAULT_ ROWSETTAG	The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.
DEFAULT_ERRORTAG	The default tag to enclose raised errors -- ERROR.
DEFAULT_ ROWIDATTR	The default name for the cardinality attribute of XML elements corresponding to db.records -- NUM
DEFAULT_ROWTAG	The default tag name for the element corresponding to db. records -- ROW
DEFAULT_DATE_ FORMAT	Default date mask --'MM/dd/yyyy HH:mm:ss'
ALL_ROWS	Indicates that all rows are needed in the output.
NONE	Used to specifies that the output should not contain any XML metadata (for example, no DTD).
DTD	Used to specify that the generation of the DTD is desired.
SCHEMA	Used to specify that the generation of the XML Schema is desired.
LOWER_CASE	Use lower case tag names.
UPPER_CASE	Use upper case tag names.

Types

Table 159–2 Types of DBMS_XMLQUERY

Type	Description
`ctxType`	The type of the query context handle. This is the return type of NEWCONTEXT

Summary of DBMS_XMLQUERY Subprograms

Table 159–3 DBMS_XMLQUERY Package Subprograms

Method	Description
CLOSECONTEXT on page 159-7	Closes or deallocates a particular query context.
GETDTD on page 159-8	Generates the DTD.
GETEXCEPTIONCONTENT on page 159-9	Returns the thrown exception's error code and error message.
GETNUMROWSPROCESSED on page 159-10	Returns the number of rows processed for the query.
GETVERSION on page 159-11	Prints the version of the XSU in use.
GETXML on page 159-12	Generates the XML document.
NEWCONTEXT on page 159-13	Creates a query context and it returns the context handle.
PROPAGATEORIGINALEXCEPTION on page 159-14	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.
REMOVEXSLTPARAM on page 159-15	Removes a particular top-level stylesheet parameter.
SETBINDVALUE on page 159-16	Sets a value for a particular bind name.
SETCOLLIDATTRNAME on page 159-17	Sets the name of the id attribute of the collection element's separator tag.
SETDATAHEADER on page 159-17	Sets the XML data header.
SETDATEFORMAT on page 159-19	Sets the format of the generated dates in the XML document.
SETENCODINGTAG on page 159-20	Sets the encoding processing instruction in the XML document.
SETERRORTAG on page 159-21	Sets the tag to be used to enclose the XML error documents.
SETMAXROWS on page 159-22	Sets the maximum number of rows to be converted to XML.
SETMETAHEADER on page 159-23	Sets the XML meta header.
SETRAISEEXCEPTION on page 159-24	Tells the XSU to throw the raised exceptions.
SETRAISENOROWSEXCEPTION on page 159-25	Tells the XSU to throw or not to throw an `OracleXMLNoRowsException` in the case when for one reason or another, the XML document generated is empty.
SETROWIDATTRNAME on page 159-26	Sets the name of the id attribute of the row enclosing tag.
SETROWIDATTRVALUE on page 159-27	Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.
SETROWSETTAG on page 159-28	Sets the tag to be used to enclose the XML dataset.
SETROWTAG on page 159-29	Sets the tag to be used to enclose the XML element.
SETSKIPROWS on page 159-30	Sets the number of rows to skip.

Table 159–3 (Cont.) DBMS_XMLQUERY Package Subprograms

Method	Description
SETSQLTOXMLNAMEESCAPING on page 159-31	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETSTYLESHEETHEADER on page 159-32	Sets the stylesheet header.
SETTAGCASE on page 159-33	Specified the case of the generated XML tags.
SETXSLT on page 159-34	Registers a stylesheet to be applied to generated XML.
SETXSLTPARAM on page 159-35	Sets the value of a top-level stylesheet parameter.
USENULLATTRIBUTEINDICATOR on page 159-36	Specifies weather to use an XML attribute to indicate `NULL`ness.
USETYPEFORCOLLELEMTAG on page 159-37	Tells the XSU to use the collection element's type name as the collection element tag name.

CLOSECONTEXT

Closes or deallocates a particular query context

Syntax

```
PROCEDURE CLOSECONTEXT(
ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

Syntax	Description

`FUNCTION GETDTD(`
`ctxHdl IN ctxType,`
`withVer IN BOOLEAN := false)`
`RETURN CLOB;`
	Function that generates the DTD based on the SQL query used to initialize the context.

`PROCEDURE GETDTD(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB,`
`withVer IN BOOLEAN := false);`
	Procedure that generates the DTD based on the SQL query used to initialize the context; specifies the output `CLOB` for XML document result.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`withVer`	`(IN)`	Generate the version information? `TRUE` for yes .
`xDoc`	`(IN)`	`CLOB` into which to write the generated XML document.

GETEXCEPTIONCONTENT

Returns the thrown exception's SQL error code and error message through the procedure's `OUT` parameters. This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

Syntax

```
PROCEDURE GETEXCEPTIONCONTENT(
ctxHdl IN ctxType,
errNo OUT NUMBER,
errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`errNo`	`(OUT)`	Error number.
`errMsg`	`(OUT)`	Error message.

GETNUMROWSPROCESSED

Return the number of rows processed for the query.

Syntax

```
FUNCTION GETNUMROWSPROCESSED(
ctxHdl IN ctxType)
RETURN NUMBER;
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

GETVERSION

Prints the version of the XSU in use.

Syntax

```
PROCEDURE GETVERSION();
```

GETXML

Creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context doesn't have to be explicitly opened or closed. The options are described in the following table.

Syntax	Description

`FUNCTION GETXML(`
`sqlQuery IN VARCHAR2,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function uses a SQL query in string form.

`FUNCTION GETXML(`
`sqlQuery IN CLOB,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function uses a SQL query in `CLOB` form.

`FUNCTION GETXML(`
`ctxHdl IN ctxType,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function generates the XML document based on a SQL query used to initialize the context.

`PROCEDURE GETXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB,`
`metaType IN NUMBER := NONE);`
	This procedure generates the XML document based on the SQL query used to initialize the context.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`metaType`	`(IN)`	XML metadata type (`NONE`, `DTD`, or `SCHEMA`).
`sqlQuery`	`(IN)`	SQL query.
`xDoc`	`(IN)`	`CLOB` into which to write the generated XML document.

NEWCONTEXT

Creates a query context and it returns the context handle. The options are described in the following table.

Syntax	Description

`FUNCTION NEWCONTEXT(`
`  sqlQuery IN VARCHAR2)`
`RETURN ctxType;`
	Creates a query context from a string.

`FUNCTION NEWCONTEXT(`
`  sqlQuery IN CLOB)`
`RETURN ctxType;`
	Creates a query context from a `CLOB`.

Parameter	IN / OUT	Description
`sqlQuery`	`(IN)`	SQL query, the results of which to convert to XML.

PROPAGATEORIGINALEXCEPTION

Specifies whether to throw every original exception raised or to wrap it in an `OracleXMLSQLException`.

Syntax

```
PROCEDURE PROPAGATEORIGINALEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	`TRUE` if want to propagate original exception, `FALSE` to wrap in `OracleXMLException`.

REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE REMOVEXSLTPARAM(
ctxHdl IN ctxType,
name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.

SETBINDVALUE

Sets a value for a particular bind name.

Syntax

```
PROCEDURE SETBINDVALUE(
ctxHdl IN ctxType,
bindName IN VARCHAR2,
bindValue IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
bindName	(IN)	Bind name.
bindValue	(IN)	Bind value.

SETCOLLIDATTRNAME

Sets the name of the id attribute of the collection element's separator tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETCOLLIDATTRNAME(
ctxHdl IN ctxType,
attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`attrName`	`(IN)`	Attribute name.

SETDATAHEADER

Sets the XML data header. The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the `rowset`. The two entities are enclosed by the `docTag` argument. The last data header specified is used. Passing in `NULL` for the `header` parameter unsets the data header.

Syntax

```
PROCEDURE SETDATAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null,
tag IN VARCHAR2 := null);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`header`	`(IN)`	Header.
`tag`	`(IN)`	Tag used to enclose the data header and the rowset.

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to `NULL` or an empty string sets the default mask -- `DEFAULT_DATE_FORMAT`.

Syntax

```
PROCEDURE SETDATEFORMAT(
ctxHdl IN ctxType,
mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`mask`	`(IN)`	The date mask.

SETENCODINGTAG

Sets the encoding processing instruction in the XML document.

Syntax

```
PROCEDURE SETENCODINGTAG(
ctxHdl IN ctxType,
enc IN VARCHAR2 := DB_ENCODING);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
enc	(IN)	The encoding to use.

SETERRORTAG

Sets the tag to be used to enclose the XML error documents.

Syntax

```
PROCEDURE SETERRORTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETMAXROWS

Sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

Syntax

```
PROCEDURE SETMAXROWS (
ctxHdl IN ctxType,
rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to generate.

SETMETAHEADER

Sets the XML meta header. When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `header` parameter unsets the meta header.

Syntax

```
PROCEDURE SETMETAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`Header`	`(IN)`	Header.

SETRAISEEXCEPTION

Specifies whether to throw raised exceptions. If this call isn't made or if `FALSE` is passed to the `flag` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

Syntax

```
PROCEDURE SETRAISEEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN:=true);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Throw raised exceptions? `TRUE` for yes, otherwise `FALSE`.

SETRAISENOROWSEXCEPTION

Specifies whether to throw an `OracleXMLNoRowsException` when the generated XML document is empty. By default, the exception is not thrown.

Syntax

```
PROCEDURE SETRAISENOROWSEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN:=false);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Throws an `OracleXMLNoRowsException` if set to `TRUE`.

SETROWIDATTRNAME

Sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETROWIDATTRNAME(
ctxHdl IN ctxType,
attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`attrName`	`(IN)`	Attribute name.

SETROWIDATTRVALUE

Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

Syntax

```
PROCEDURE SETROWIDATTRVALUE(
ctxHdl IN ctxType,
colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`colName`	`(IN)`	Column whose value is to be assigned to the row id attribute.

SETROWSETTAG

Sets the tag to be used to enclose the XML dataset.

Syntax

```
PROCEDURE SETROWSETTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETROWTAG

Sets the tag to be used to enclose the XML element corresponding to a `db.record`.

Syntax

```
PROCEDURE SETROWTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`tag`	`(IN)`	Tag name.

SETSKIPROWS

Sets the number of rows to skip. By default, 0 rows are skipped.

Syntax

```
PROCEDURE SETSKIPROWS(
ctxHdl IN ctxType,
rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to skip.

SETSQLTOXMLNAMEESCAPING

This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE SETSQLTOXMLNAMEESCAPING(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping? TRUE for yes, otherwise FALSE.

SETSTYLESHEETHEADER

Sets the stylesheet header (the stylesheet processing instructions) in the generated XML document. Passing `NULL` for the `uri` argument will unset the stylesheet header and the stylesheet type.

Syntax

```
PROCEDURE SETSTYLESHEETHEADER(
ctxHdl IN ctxType,
uri IN VARCHAR2,
type IN VARCHAR2 := 'text/xsl');
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	Stylesheet URI.
`type`	`(IN)`	Stylesheet type; defaults to "`text/xsl`".

SETTAGCASE

Specifies the case of the generated XML tags.

Syntax

```
PROCEDURE SETTAGCASE(
ctxHdl IN ctxType,
tCase IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tCase	(IN)	The tag's case: ■ 0 for as are ■ 1 for lower case ■ 2 for upper case

SETXSLT

Registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. The options are described in the following table. Passing `NULL` for the `uri` argument or an empty string for the `stylesheet` argument will unset the stylesheet header and type.

Syntax	Description
`PROCEDURE SETXSLT( ctxHdl IN ctxType, uri IN VARCHAR2, ref IN VARCHAR2 := null);`	To un-register the stylesheet pass in a null for the uri.
`PROCEDURE SETXSLT( ctxHdl IN ctxType, stylesheet CLOB, ref IN VARCHAR2 := null);`	To un-register the stylesheet pass in a null or an empty string for the stylesheet.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	Stylesheet URI.
`stylesheet`	`(IN)`	Stylesheet.
`ref`	`(IN)`	URL to include, imported and external entities.

SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE SETXSLTPARAM(
ctxHdl IN ctxType,
name IN VARCHAR2,
value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.
value	(IN)	Value to be assigned to the stylesheet parameter.

USENULLATTRIBUTEINDICATOR

Specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

Syntax

```
PROCEDURE SETNULLATTRIBUTEINDICATOR(
ctxHdl IN ctxType,
flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Sets attribute to NULL if TRUE, omits from XML document if FALSE.

USETYPEFORCOLLELEMTAG

Specifies whether to use the collection element's type name as its element tag name. By default, the tag name for elements of a collection is the collection's tag name followed by `_item`.

Syntax

```
PROCEDURE USETYPEFORCOLLELEMTAG(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Turn on use of the type name?

160

DBMS_XMLSAVE

DBMS_XMLSAVE provides XML to database-type functionality.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XMLSAVE
  - Constants
  - Types
- Summary of DBMS_XMLSAVE Subprograms

Using DBMS_XMLSAVE

- Constants
- Types

Constants

Table 160–1 Constants of DBMS_XMLSAVE

Constant	Description
DEFAULT_ROWTAG	The default tag name for the element corresponding to database records -- ROW
DEFAULT_DATE_ FORMAT	Default date mask:'MM/dd/yyyy HH:mm:ss'
MATCH_CASE	Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.
IGNORE_CASE	Used to specify that when mapping XML elements to database. entities the XSU should be case insensitive.

Types

Table 160–2 Types of DBMS_XMLSAVE

Type	Description
`ctxType`	The type of the query context handle. The type of the query context handle. This the return type of NEWCONTEXT.

Summary of DBMS_XMLSAVE Subprograms

Table 160–3 DBMS_XMLSAVE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST on page 160-6	Clears the key column list.
CLEARUPDATECOLUMNLIST on page 160-7	Clears the update column list.
CLOSECONTEXT on page 160-8	It closes/deallocates a particular save context.
DELETEXML on page 160-9	Deletes records specified by data from the XML document, from the table specified at the context creation time.
GETEXCEPTIONCONTENT on page 160-10	Via its arguments, this method returns the thrown exception's error code and error message.
INSERTXML on page 160-11	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT on page 160-12	Creates a save context, and returns the context handle.
PROPAGATEORIGINALEXCEPTION on page 160-13	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.
REMOVEXSLTPARAM on page 160-14	Removes the value of a top-level stylesheet parameter
SETBATCHSIZE on page 160-15	Changes the batch size used during DML operations.
SETCOMMITBATCH on page 160-17	Sets the commit batch size.
SETDATEFORMAT on page 160-17	Sets the format of the generated dates in the XML document.
SETIGNORECASE on page 160-18	The XSU does mapping of XML elements to database.
SETKEYCOLUMN on page 160-19	This methods adds a column to the key column list.
SETPRESERVEWHITESPACE on page 160-20	Tells the XSU whether to preserve whitespace or not.
SETROWTAG on page 160-21	Names the tag used in the XML document to enclose the XML elements corresponding to database.
SETSQLTOXMLNAMEESCAPING on page 160-22	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETUPDATECOLUMN on page 160-23	Adds a column to the update column list.
SETXSLT on page 160-24	Registers a XSL transform to be applied to the XML to be saved.
SETXSLTPARAM on page 160-25	Sets the value of a top-level stylesheet parameter.
UPDATEXML on page 160-26	Updates the table given the XML document.

CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted. The options are described in the following table.

Syntax	Description

`FUNCTION deleteXML(`
`ctxHdl IN ctxPType,`
`xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Uses a `VARCHAR2` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB)`
`RETURN NUMBER;`
	Uses a `CLOB` type for the `xDoc` parameter.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code. This is to get around the fact that the JVM throws an exception on top of whatever exception was raised; thus, rendering PL/SQL unable to access the original exception.

Syntax

```
PROCEDURE getExceptionContent(
   ctxHdl IN ctxType,
   errNo OUT NUMBER,
   errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(IN)	Error number.
errMsg	(IN)	Error message.

INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

Syntax	Description
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `VARCHAR2`.
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```
FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

PROPAGATEORIGINALEXCEPTION

Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.

Syntax

```
PROCEDURE propagateOriginalException(
   ctxHdl IN ctxType,
   flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Propagate the original exception? 0=`FALSE`, 1=`TRUE`.

REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter.

Syntax

```
PROCEDURE removeXSLTParam(
   ctxHdl IN ctxType,
   name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.

SETBATCHSIZE

Changes the batch size used during DML operations. When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

Syntax

```
PROCEDURE setBatchSize(
   ctxHdl IN ctxType,
   batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Batch size.

SETCOMMITBATCH

Sets the commit batch size. The commit batch size refers to the number or records inserted after which a commit should follow. If `batchSize` is less than `1` or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is `0`.

Syntax

```
PROCEDURE setCommitBatch(
   ctxHdl IN ctxType,
   batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`batchSize`	`(IN)`	Commit batch size.

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format patern, the date mask, should conform to the requirements of the class `java.text.SimpleDateFormat`. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

Syntax

```
PROCEDURE setDateFormat(
   ctxHdl IN ctxType,
   mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`mask`	`(IN)`	Syntax of the date format pattern..

SETIGNORECASE

The XSU does mapping of XML elements to db columns/attributes based on the element names (XML tags). This function tells the XSU to do this match case insensitive.

Syntax

```
PROCEDURE setIgnoreCase(
   ctxHdl IN ctxType,
   flag IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.

SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

Syntax

```
PROCEDURE setKeyColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

SETPRESERVEWHITESPACE

Tells the XSU whether or not to preserve whitespace.

Syntax

```
PROCEDURE setPreserveWhitespace(
   ctxHdl IN ctxType,
   flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Should XSU preserve whitespace?

SETROWTAG

Names the tag used in the XML document to enclose the XML elements corresponding to db. records.

Syntax

```
PROCEDURE setRowTag(
   ctxHdl IN ctxType,
   tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETSQLTOXMLNAMEESCAPING

Turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE setSQLToXMLNameEscaping(
   ctxHdl IN ctxType,
   flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping?

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax

```
PROCEDURE setUpdateColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

SETXSLT

Registers an XSL transform to be applied to the XML to be saved. If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

Syntax	Description
`PROCEDURE setXSLT( ctxHdl IN ctxType, uri IN VARCHAR2, ref IN VARCHAR2 := null);`	Passes in the stylesheet through a URI.
`PROCEDURE setXSLT( ctxHdl IN ctxType, stylesheet IN CLOB, ref IN VARCHAR2 := null);`	Passes in the stylesheet through a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	URI to the stylesheet to register.
`ref`	`(IN)`	URL for include, import, and external entities.
`stylesheet`	`(IN)`	`CLOB` containing the stylesheet to register .

SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

Syntax

```
PROCEDURE setXSLTParam(
   ctxHdl IN ctxType,
   name IN VARCHAR2,
   value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.
value	(IN)	Parameter value as an XPath expression

UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description
`FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `VARCHAR2`.
`FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

161

DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas. It is created by script dbmsxsch.sql during Oracle database installation.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XMLSCHEMA
  - Overview
  - Constants
  - Views
  - Operational Notes
- Summary of DBMS_XMLSCHEMA Subprograms

Using DBMS_XMLSCHEMA

This section contains topics which relate to using the `DBMS_XMLSCHEMA` package.

- Overview
- Constants
- Views
- Operational Notes

Overview

This package provides subprograms to

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

Constants

The DBMS_XMLSCHEMA package uses the constants shown in following tables.

- DBMS_XMLSCHEMA Constants - Delete Option
- DBMS_XMLSCHEMA Constants - Enable Hierarchy
- DBMS_XMLSCHEMA Constants - Register CSID

Table 161–1 DBMS_XMLSCHEMA Constants - Delete Option

Constant	Type	Value	Description
DELETE_RESTRICT	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
DELETE_INVALIDATE	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
DELETE_CASCADE	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if gentypes argument was set to TRUE during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
DELETE_CASCADE_FORCE	NUMBER	4	This option is similar to DELETE_CASCADE except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

Table 161–2 DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_NONE	PLS_INTEGER	1	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will not be called on any tables created while registering that schema
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS

Table 161–2 (Cont.) DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_ RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_ type as DBMS_XDBZ.ENABLE_ RESMETADATA. Users should pass in DBMS_ XMLSCHEMA.ENABLE_ RESMETADATA for schemas they intend to use as resource metadata tables.

Table 161–3 DBMS_XMLSCHEMA Constants - Register CSID

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_ RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

Views

The DBMS_XMLSCHEMA package uses the views shown in Table 161–4. The columns of these views are described in detail in the *Oracle Database Reference.*

Table 161–4 Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
USER_XML_SCHEMAS	All registered XML Schemas owned by the user
ALL_XML_SCHEMAS	All registered XML Schemas usable by the current user
DBA_XML_SCHEMAS	All registered XML Schemas in the database
DBA_XML_TABLES	All XMLType tables in the system
USER_XML_TABLES	All XMLType tables owned by the current user
ALL_XML_TABLES	All XMLType tables usable by the current user
DBA_XML_TAB_COLS	All XMLType table columns in the system
USER_XML_TAB_COLS	All XMLType table columns in tables owned by the current user
ALL_XML_TAB_COLS	All XMLType table columns in tables usable by the current user
DBA_XML_VIEWS	All XMLType views in the system
USER_XML_VIEWS	All XMlType views owned by the current user
ALL_XML_VIEWS	All XMLType views usable by the current user
DBA_XML_VIEW_COLS	All XMLType view columns in the system
USER_XML_VIEW_COLS	All XMLType view columns in views owned by the current user
ALL_XML_VIEW_COLS	All XMLType view columns in views usable by the current user

Operational Notes

Guidelines for Using In-Place XML Schema Evolution

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

Summary of DBMS_XMLSCHEMA Subprograms

Table 161–5 DBMS_XMLSCHEMA Package Subprograms

Method	Description
COMPILESCHEMA Procedure on page 161-9	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
COPYEVOLVE Procedure on page 161-10	Evolves registered schemas so that existing XML instances remain valid
DELETESCHEMA Procedure on page 161-12	Removes the schema from the database
GENERATEBEAN Procedure on page 161-13	Generates the Java bean code corresponding to a registered XML schema
GENERATESCHEMA Function on page 161-14	Generates an XML schema from an oracle type name
GENERATESCHEMAS Function on page 161-15	Generates several XML schemas from an oracle type name
INPLACEEVOLVE Procedure on page 161-16	Evolves registered schemas by propagating schema changes to object types and tables
PURGESCHEMA Procedure on page 161-18	Removes the XML schema
REGISTERSCHEMA Procedures on page 161-19	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
REGISTERURI Procedure on page 161-23	Registers an XML schema specified by a URI name

COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(
   schemaurl IN VARCHAR2);
```

Parameters

Table 161–6 COMPILESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema

COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

See Also:

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE(
   schemaurls       IN  XDB$STRUBG_LIST_T,
   newschemas       IN  XMLSequenceType,
   transforms       IN  XMLSequenceType :=NULL,
   preserveolddocs  IN  BOOLEAN :=FALSE,
   maptablename     IN  VARCHAR2 :=NULL,
   generatetables   IN  BOOLEAN :=TRUE,
   force            IN  BOOLEAN :=FALSE,
   schemaowners     IN  XDB$STRING_LIST_T :=NULL
   parallelDegree   IN  PLS_INTEGER := 0,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 161–7 COPYEVOLVE Procedure Parameters

Parameter	Description
`schemaurls`	`VARRAY` of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the `FORCE` parameter is `TRUE`, URLs should be in the order of dependency.
`newschemas`	`VARRAY` of new schema documents. Should be specified in same order as the corresponding URLs.
`transforms`	`VARRAY` of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.

Table 161–7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.
maptabname	Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: ■ SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms ■ SCHEMA_OWNER -VARCHAR2(30) - Owner of the schema ■ ELEMENT_NAME - VARCHAR2(256)- Element to which this table conforms ■ TAB_NAME - VARCHAR2(65) - Qualified table name: *<owner_name>.<table_name>* ■ COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables) ■ TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table.
generatetables	Default is TRUE, and new tables will be generated. If FALSE: ■ new tables will not be generated after registration of new schemas ■ preserveolddocs must be TRUE ■ maptablename must be non-NULL
force	Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.
schemaowners	VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.
paralleldegree	Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.
options	Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.

Usage Notes

You should back up all schemas and documents prior to invocation because COPYEVOLVE Procedure deletes all conforming documents prior to implementing the schema evolution.

DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA(
   schemaurl      IN  VARCHAR2,
   delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

> **See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 161–8 DELETESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema to be deleted
`delete_option`	Delete options: ■ `DELETE_RESTRICT` - Schema deletion fails if there are any tables or schemas that depend on this schema ■ `DELETE_INVALIDATE` - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. ■ `DELETE_CASCADE` - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. ■ `DELETE_CASCADE_FORCE` - Similar to `DELETE_CASCADE` except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.

Exceptions

Table 161–9 DELETESCHEMA Procedure Exceptions

Exception	Description
`ORA-31001`	Invalid resource handle or path name

GENERATEBEAN Procedure

This procedure can be used to generate the Java bean code corresponding to a registered XML schema.

Syntax

```
DBMS_XMLSCHEMA.GENERATEBEAN(
   schemaurl  IN  VARCHAR2);
```

Parameters

Table 161–10 GENERATEBEAN Procedure Parameters

Parameter	Description
schemaurl	Name identifying a registered XML schema

Exceptions

Table 161–11 GENERATEBEAN Procedure Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

Usage Notes

Note that there is also an option to generate the beans as part of the registration procedure itself (see the genbean parameter of the REGISTERSCHEMA Procedures on page 161-19).

GENERATESCHEMA Function

This function generates XML schema(s) from an Oracle type name. It inlines all in one schema (`XMLType`).

> **See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMA(
   schemaname    IN  VARCHAR2,
   typename      IN  VARCHAR2,
   elementname   IN  VARCHAR2 := NULL,
   recurse       IN  BOOLEAN  := TRUE,
   annotate      IN  BOOLEAN  := TRUE,
   embedcoll     IN  BOOLEAN  := TRUE)
RETURN SYS.XMLTYPE;
```

Parameters

Table 161–12 GENERATESCHEMA Function Parameters

Parameter	Description
`schemaname`	Name of the database schema containing the type
`typename`	Name of the Oracle type
`elementname`	The name of the top level element in the XML Schema. Defaults to `typename`.
`recurse`	Whether or not to also generate schema for all types referred to by the type specified
`annotate`	Whether or not to put the SQL annotations in the XML Schema
`embedcoll`	Determines whether the collections should be embedded in the type which refers to them, or create a `complextype`. Cannot be `FALSE` if annotations are turned on

Exceptions

Table 161–13 GENERATESCHEMA Procedure Exceptions

Exception	Description
`ORA-31001`	Invalid resource handle or path name

GENERATESCHEMAS Function

This function generates XML schema(s) from an Oracle type name. It returns a collection of XMLTypes, one XML Schema document for each database schema.

> **See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMAS(
   schemaname   IN  VARCHAR2,
   typename     IN  VARCHAR2,
   elementname  IN  VARCHAR2 := NULL,
   schemaurl    IN  VARCHAR2 := NULL,
   annotate     IN  BOOLEAN := TRUE,
   embedcoll    IN  BOOLEAN := TRUE )
 RETURN SYS.XMLTYPE;
```

Parameters

Table 161–14 GENERATESCHEMAS Procedure Parameters

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema defaults to typeName
schemaurl	Specifies base URL where schemas will be stored, needed by top level schema for import statement
annotate	Whether or not to put the SQL annotations in the XML Schema
embedcoll	Determines whether the collections be embedded in the type which refers to them, or create a complextype. Cannot be FALSE if annotations are turned on

Exceptions

Table 161–15 GENERATESCHEMAS Procedure Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(
   schemaURL    IN   VARCHAR2,
   diffXML      IN   XMLType,
   flags        IN   NUMBER);
```

Parameters

Table 161–16 INPLACEEVOLVE Procedure Parameters

Parameter	Description
schemaurl	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.
flags	The following bits may be set in this parameter to control the behavior of this procedure: ■ INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. ■ INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition: ■ Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new. ■ Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.

- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the REGISTERSCHEMA Procedures and the REGISTERURI Procedure at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

PURGESCHEMA Procedure

This procedure removes the XML schema.

> **See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(
   schemaid   IN  RAW);
```

Parameters

Table 161–17 PURGESCHEMA Procedure Parameters

Parameter	Description
`schemaid`	ID of the schema to be purged

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

> **See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a VARCHAR2:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  VARCHAR2,
    local            IN  BOOLEAN := TRUE,
    gentypes         IN  BOOLEAN := TRUE,
    genbean          IN  BOOLEAN := FALSE,
    gentables        IN  BOOLEAN := TRUE,
    force            IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
```

```
   schemadoc        IN  BLOB,
   local            IN  BOOLEAN := TRUE,
   genTypes         IN  BOOLEAN := TRUE,
   genBean          IN  BOOLEAN := FASLE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB` and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BLOB,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `CLOB`

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  CLOB,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as an `XMLTYPE`.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  SYS.XMLTYPE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  SYS.URIType,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
```

```
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 161–18 REGSITERSCHEMA Procedure Parameters

Parameter	Description
schemaurl	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside schemalocation attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? ■ By default, all schemas are registered as local schemas, under /sys/schemas/<username>/... ■ If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... You need write privileges on the directory to be able to register a schema as global.
gentypes	Determines whether the schema compiler generates object types. By default, TRUE. If you use binary XML, you must be set gentypes to FALSE.
genbean	Determines whether the schema compiler generates Java beans. By default, FALSE.
gentables	Determines whether the schema compiler generates default tables. By default, TRUE
force	If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.
enablehierarchy	■ ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema ■ ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default. ■ ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 161–18 (Cont.) REGSITERSCHEMA Procedure Parameters

Parameter	Description
`options`	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a `BITOR` of the desired bits. Possible bits: ■ `REGISTER_NODOCID` - this will suppress the creation of the `DOCID` column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the `DOCID` column) ■ `REGISTER_BINARYXML` - Register the schema for Binary XML ■ `REGISTER_NT_AS_IOT` - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI(
   schemaurl      IN  VARCHAR2,
   schemadocuri   IN  VARCHAR2,
   local          IN  BOOLEAN := TRUE,
   gentypes       IN  BOOLEAN := TRUE,
   genbean        IN  BOOLEAN := FALSE,
   gentables      IN  BOOLEAN := TRUE,
   force          IN  BOOLEAN := FALSE,
   owner          IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 161–19 REGISTERURI Procedure Parameters

Parameter	Description
schemaurl	Uniquely identifies the schema document. Can be used inside schemaLocation attribute of XML Schema import element.
schemadocuri	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a URIType instance using the urifactory - and invokes the REGISTERSCHEMA Procedures function.
local	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under /sys/schemas/ <username>/... If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... The user needs write privileges on the directory to register a global schema.
gentypes	Determines whether the compiler generate object types. By default, TRUE.
genbean	Determines whether the compiler generate Java beans. By default, FALSE.
gentables	Determines whether the compiler generate default tables. TRUE by default.
force	TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.

Table 161–19 (Cont.) REGISTERURI Procedure Parameters

Parameter	Description
`options`	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a `BITOR` of the desired bits. Possible bits: ▪ `REGISTER_NODOCID` - this will suppress the creation of the `DOCID` column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the `DOCID` column)

162

DBMS_XMLSTORE

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

- Using DBMS_XMLSTORE
  - Types
- Summary of DBMS_XMLSTORE Subprograms

Using DBMS_XMLSTORE

- Types

Types

Table 162–1 Types of DBMS_XMLSTORE

Type	Description
`ctxType`	The type of the query context handle. This is the return type of NEWCONTEXT.

Summary of DBMS_XMLSTORE Subprograms

Table 162–2 DBMS_XMLSTORE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST on page 162-5	Clears the key column list.
CLEARUPDATECOLUMNLIST on page 162-6	Clears the update column list.
CLOSECONTEXT on page 162-7	It closes/deallocates a particular save context.
DELETEXML on page 162-8	Deletes records specified by data from the XML document, from the table specified at the context creation time.
INSERTXML on page 162-9	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT on page 162-10	Creates a save context, and returns the context handle.
SETKEYCOLUMN on page 162-11	This method adds a column to the key column list.
SETROWTAG on page 162-12	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
SETUPDATECOLUMN on page 162-13	Adds a column to the "update column list".
UPDATEXML on page 162-14	Updates the table given the XML document.

CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax	Description

`FUNCTION deleteXML(`
`ctxHdl IN ctxPType,`
`xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Uses a `VARCHAR2` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB)`
`RETURN NUMBER;`
	Uses a `CLOB` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`ctxHdl IN ctxType,`
`xDoc IN XMLType)`
`RETURN NUMBER;`
	Uses an `XMLType` type for the `xDoc` parameter.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for insertXML to DBMS_XMLSTORE which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless SETUPDATECOLUMN is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax	Description
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;`	Passes in the xDoc parameter as a VARCHAR2.
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;`	Passes in the xDoc parameter as a CLOB.
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;`	Passes in the xDoc parameter as an XMLType.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```
FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

SETROWTAG

Names the tag used in the XML document, to enclose the XML elements corresponding to databse records.

Syntax

```
PROCEDURE setRowTag(
   ctxHdl IN ctxType,
   tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for INSERTXML to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`colName`	`(IN)`	Column to be added to the update column list.

UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description

`FUNCTION updateXML(`
`ctxHdl IN ctxType,`
`xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `VARCHAR2`.

`FUNCTION updateXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `CLOB`.

`FUNCTION updateXML(`
`ctxHdl IN ctxType,`
`xDoc IN XMLType)`
`RETURN NUMBER;`
	Passes in the `xDoc` parameter as a `XMLType`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

163

DBMS_XMLTRANSLATIONS

The DBMS_XMLTRANSLATIONS package provides an interface to perform translations so that strings can be searched or displayed in various languages.

> **See Also:** For more information, see the *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

- Summary of DBMS_XMLTRANSLATIONS Subprograms

Summary of DBMS_XMLTRANSLATIONS Subprograms

Table 163–1 DBMS_XMLSTORE Package Subprograms

Method	Description
DISABLETRANSLATION Procedure on page 163-3	Disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values
ENABLETRANSLATION Procedure on page 163-4	Enables translations in the current session
EXTRACTXLIFF Function & Procedure on page 163-5	Extracts the translations in `XLIFF` format from either an `XMLTYPE` or a resource in the XDB Repository
GETBASEDOCUMENT Function on page 163-8	Returns the base document with all the translations
MERGEXLIFF Functions on page 163-9	Merges the translations in `XLIFF` format into either an `XMLTYPE` or a resource in the XDB Repository
SETSOURCELANG Function on page 163-12	Sets the source language to a particular language at the specified XPATH
TRANSLATEXML Function on page 163-14	Returns the document in the specified language
UPDATETRANSLATION Function on page 163-3	Updates the translation in a particular language at the specified `XPATH`

DISABLETRANSLATION Procedure

This procedure disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values.

Syntax

```
DBMS_XMLTRANSLATIONS.DISABLETRANSLATION;
```

ENABLETRANSLATION Procedure

This procedure enables translations in the current session. This is the default behavior.

Syntax

```
DBMS_XMLTRANSLATIONS.ENABLETRANSLATION;
```

EXTRACTXLIFF Function & Procedure

This function and procedure extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
   abspath   IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 163–2 EXTRACTXLIFF Function Parameters

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be extracted
xpath	XPATH at which specifies the location of the element that needs to be translated. If no XPATH is specified, the entire document is processed.
namespace	Namespace
abspath	Absolute path of the resource from which the XLIFF is to be extracted

Return Values

The translations in the XLIFF format

Examples

Extracting the Translation from an XMLTYPE

Let doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <title xml:lang="es">
        Security Class Example - ES
```

```
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

Let the xpath = `'/securityClass/title'`. The output of `EXTRACTXLIFF` will be as follows:

```
<xliff version='1.1'>
  <file original='' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

Extracting the Translation from a Resource

Let the resource `'/public/security.xml'` =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
        <title>
            iStore Purchase Order Approver
        </title>
        <privilegeRef name="is:privilege1"/>
        <privilegeRef name="oa:submitPO"/>
        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en">
            secondary privilege
        </title>
        <title xml:lang="fr" xdb:srclang="true">
            secondary privilege - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
```

```
    </privilege>
    </privlist>
</securityClass>
```

And let XPATH = '', then the extracted XLIFF is

```
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
  <file original='/public/security.xml' source-language='fr' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/privilege[@name="privilege2"/title'>
        <source>secondary privilege - FR</source>
        <alt-trans>
          <target xml:lang='en'>secondary privilege</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

GETBASEDOCUMENT Function

This function returns the base document with all the translations.

Syntax

```
DBMS_XMLTRANSLATIONS.GETBASEDOCUMENT(
   doc    IN  XMLTYPE)
 RETURN XMLTYPE;
```

Parameters

Table 163–3 GETBASEDOCUMENT Function Parameters

Parameter	Description
doc	Input XMLTYPE

Return Values

The XMLTYPE which contains the base document with all the translations

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

For the above document, this subprogram will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

MERGEXLIFF Functions

This function merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
   doc       IN  XMLTYPE,
   xliff     IN  XMLTYPE)
 RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.MERGEXLIFF(
   xliff     IN  XMLTYPE);
```

Parameters

Table 163–4 MERGEXLIFF Function & Procedure Parameters

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be merged
xliff	Translations in the XLIFF format

Return Values

The result of merging 'xliff' into 'doc' at 'xpath'

Examples

Merge Translations into an XMLTYPE

Consider the following input XMLTYPE:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
        <title>
            iStore Purchase Order Approver
        </title>
        <privilegeRef name="is:privilege1"/>
        <privilegeRef name="oa:submitPO"/>
```

```
        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en">
            secondary privilege
        </title>
        <title xml:lang="fr" xdb:srclang="true">
            secondary privilege - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
    </privilege>
    </privlist>
</securityClass>
```

Let the input XLIFF be as follows:

```
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example Modified</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example Mod - FR</target>
          <target xml:lang='es'>Security Class Example Mod - ES</target>
        </alt-trans>
      </trans-unit>
      <trans-unit id='/securityClass/privilege[@name="privilege2"/title'>
        <source>secondary privilege modified</source>
        <alt-trans>
          <target xml:lang='fr'>secondary privilege mod - FR</target>
        </alt-trans>
      </trans-unit>
    </body>
</xliff>
```

The output of merge will be as follows:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example Modified
    </title>
    <title xml:lang="es">
        Security Class Example Mod - ES
    </title>
    <title xml:lang="fr">
        Security Class Example Mod - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
        <title>
            iStore Purchase Order Approver
        </title>
```

```
        <privilegeRef name="is:privilege1"/>
        <privilegeRef name="oa:submitPO"/>
        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en" xdb:srclang="true">
            secondary privilege modified
        </title>
        <title xml:lang="fr">
            secondary privilege mod - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
    </privilege>
    </privlist>
</securityClass>
```

Merge XLIFF Translations into a Resource

If the input document in the above example were to be stored in the repository at `'/public/security.xml'`, then merging the above `XLIFF` will have the same effect.

SETSOURCELANG Function

This function sets the source language to a particular language at the specified XPATH.

Syntax

```
DBMS_XMLTRANSLATIONS.SETSOURCELANG (
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   lang      IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 163–5 SETSOURCELANG Function Parameters

Parameter	Description
doc	XMLTYPE for which the source language is to be set
xpath	XPATH at which the source language is to be set
lang	Source language
namespace	Namespace

Return Values

The updated document

Examples

For example, if doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

the statement

```
setSourceLang ( doc, '/securityClass/title', 'fr' )
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
```

```
    <name>
        securityClassExample
    </name>
    <title xml:lang="en">
        Security Class Example
    </title>
    <title xml:lang="fr" xdb:srclang="true">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML Function

This function returns the document in the specified language.

Syntax

```
DBMS_XMLTRANSLATIONS.TRANSLATEXML(
   doc    IN  XMLTYPE,
   lang   IN  VARCHAR2)
 RETURN XMLTYPE;
```

Parameters

Table 163–6 TRANSLATEXML Function Parameters

Parameter	Description
doc	Input XMLTYPE
lang	Language

Return Values

The XMLTYPE which contains the document in the specified language

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML (doc, 'fr') will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

UPDATETRANSLATION Function

This function updates the translation in a particular language at the specified XPATH.

Syntax

```
DBMS_XMLTRANSLATIONS.UPDATETRANSLATION(
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   lang      IN  VARCHAR2,
   value     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 163–7 UPDATETRANSLATION Function Parameters

Parameter	Description
doc	XMLTYPE for which the translation is to be updated
xpath	XPATH at which the translation is to be updated
lang	Language for which the translation is to be updated
value	New translation
namespace	Namespace

Return Values

The updated document

Examples

For example,

```
updateTranslation ( doc, '/securityClass/title/text()', 'fr', 'Oracle' );
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Oracle
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

164

DBMS_XPLAN

The DBMS_XPLAN package provides an easy way to display the output of the EXPLAIN PLAN command in several, predefined formats. You can also use the DBMS_XPLAN package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the V$SQL_PLAN and V$SQL_PLAN_STATISTICS_ALL fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the EXPLAIN PLAN command, the AWR, and SQL tuning set, see *Oracle Database Performance Tuning Guide*.
- For more information on the V$SQL_PLAN and V$SQL_PLAN_STATISTICS fixed views, see *Oracle Database Reference.*

- Examples

Overview

The DBMS_XPLAN package supplies five table functions:

- DISPLAY - to format and display the contents of a plan table.
- DISPLAY_AWR - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- DISPLAY_CURSOR - to format and display the contents of the execution plan of any loaded cursor.
- DISPLAY_SQL_PLAN_BASELINE - to display one or more execution plans for the SQL statement identified by SQL handle
- DISPLAY_SQLSET - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function DISPLAY_CURSOR requires to have select privileges on the following fixed views: VSQL_PLAN, VSESSION and V$SQL_PLAN_STATISTICS_ALL.

Using the DISPLAY_AWR Function requires the user to have SELECT privileges on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE.

Using the DISPLAY_SQLSET Functionrequires the user to have the SELECT privilege on ALL_SQLSET_STATEMENTS and ALL_SQLSET_PLANS.

Using DISPLAY_SQL_PLAN_BASELINE Function the user requires the user to have the SELECT privilege on DBA_SQL_PLAN_BASELINES.

All these privileges are automatically granted as part of the SELECT_CATALOG role.

Examples

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename='benoit';
```

Display the plan using the DBMS_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

```
Plan hash value: 3693697075
--------------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
--------------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  1 |  HASH JOIN         |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    37 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    80 |     3  (34)| 00:00:01 |
--------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."ENAME"='benoit')

15 rows selected.
```

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function DISPLAY_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename  FROM  emp e, dept d
   WHERE   e.deptno = d.deptno
   AND   e.empno=7369;

ENAME
----------
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

This query produces the following output:

```
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0
-------------------------------------------------------------------
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369

--------------------------------------------------------------------------------
```

```
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |       |       |            |          |
|*  1 |  HASH JOIN         |      |     1 |    16 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    13 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    12 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."EMPNO"=7369)

21 rows selected.
```

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';

SQL_ID         CHILD_NUMBER
----------     ------------------------------
gwp663cqh5qbf   0
```

Display the execution plan for the cursor:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR(('gwp663cqh5qbf',0));

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
-------------------------------------------------------
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);

-------------------------------------------------------------------------------
| Id  | Operation           | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------
|   0 | SELECT STATEMENT    |      |       |       |     7 (100)|          |
|   1 |  SORT GROUP BY      |      |     4 |    64 |     7  (43)| 00:00:01 |
|*  2 |   HASH JOIN         |      |    14 |   224 |     6  (34)| 00:00:01 |
|   3 |    TABLE ACCESS FULL| DEPT |     4 |    44 |     3  (34)| 00:00:01 |
|   4 |    TABLE ACCESS FULL| EMP  |    14 |    70 |     3  (34)| 00:00:01 |
-------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to the get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, table(DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number)) t WHERE
sql_text LIKE '%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and `display_cursor` table functions. In Displaying a Plan Table Using DBMS_XPLAN.DISPLAY on page 164-5, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename    ='hermann'
   ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
Plan hash value: 3693697345
```

```
-------------------------------------------------------------------------------------------------------------
| Id | Operation          | Name    | Rows | Bytes | Cost (%CPU)| Time     | TQ    |INOUT |PQ Distrib   |
-------------------------------------------------------------------------------------------------------------
| 0  | SELECT STATEMENT   |         | 1    | 117   | 6 (50)     | 00:00:01 |       |      |             |
| 1  | PX COORDINATOR     |         |      |       |            |          |       |      |             |

| 8  | PX SEND HASH       |:TQ10001 | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | P->P | HASH        |
| 9  | PX BLOCK ITERATOR  |         | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | PCWC |             |
|* 10| TABLE ACCESS FULL  | EMP     | 1    | 87    | 2 (50)     | 00:00:01 | Q1,01 | PCWP |             |
| 11 | BUFFER SORT        |         |      |       |            |          | Q1,02 | PCWC |             |
| 12 | PX RECEIVE         |         | 4    | 120   | 3 (34)     | 00:00:01 | Q1,02 | PCWP |             |
| 13 | PX SEND HASH       |:TQ10000 | 4    | 120   | 3 (34)     | 00:00:01 |       | S->P | HASH        |
| 14 | TABLE ACCESS FULL  | DEPT    | 4    | 120   | 3 (34)     | 00:00:01 |       |      |             |
-------------------------------------------------------------------------------------------------------------
Predicate Information (identified by operation id):
---------------------------------------------------
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
---------------------------------------------------
```

When the query is parallel, information related to parallelism is reported: table queue number (`TQ` column), table queue type (`INOUT`) and table queue distribution method (`PQ Distrib`).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle will use a global temporary table to store any plan information for individual users and will preserve its content

throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

Summary of DBMS_XPLAN Subprograms

Table 164–1 DBMS_XPLAN Package Subprograms

Subprogram	Description
DISPLAY Function on page 164-10	Displays the contents of the plan table
DISPLAY_AWR Function on page 164-13	Displays the contents of an execution plan stored in the AWR
DISPLAY_CURSOR Function on page 164-16	Displays the execution plan of any cursor in the cursor cache
DISPLAY_SQL_PLAN_BASELINE Function on page 164-19	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
DISPLAY_SQLSET Function on page 164-21	Displays the execution plan of a given statement stored in a SQL tuning set

DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(
   table_name    IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
   statement_id  IN  VARCHAR2  DEFAULT  NULL,
   format        IN  VARCHAR2  DEFAULT  'TYPICAL',
   filter_preds  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 164–2 DISPLAY Function Parameters

Parameter	Description
`table_name`	Specifies the table name where the plan is stored. This parameter defaults to `PLAN_TABLE`, which is the default plan table for the `EXPLAIN PLAN` command. If `NULL` is specified it also defaults to `PLAN_TABLE`.
`statement_id`	Specifies the `statement_id` of the plan to be displayed. This parameter defaults to `NULL`, which is the default when the `EXPLAIN PLAN` command is executed without a `set statement_id` clause.If no `statement_id` is specified, the function will show you the plan of the most recent explained statement.

Table 164–2 (Cont.) DISPLAY Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information. If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).

Table 164–2 (Cont.) DISPLAY Function Parameters

Parameter	Description
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **WARNING** under Usage Notes)

Usage Notes

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

WARNING: Application developers should expose the filter_preds parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, filter_preds can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last EXPLAIN PLAN command stored in the plan table:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as statement_id='foo':

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```

DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR(
   sql_id            IN      VARCHAR2,
   plan_hash_value   IN      NUMBER DEFAULT NULL,
   db_id             IN      NUMBER DEFAULT NULL,
   format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

Table 164–3 DISPLAY_AWR Table Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.
plan_hash_value	Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function will return all stored execution plans for a given SQL_ID.
db_id	Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database will be used, as shown in V$DATABASE.
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).

Table 164–3 (Cont.) DISPLAY_AWR Table Function Parameters

Parameter	Description
	For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT privilege on DBA_HIST_SQL_PLAN. DBA_HIST_SQLTEXT, and V$DATABASE, otherwise it will show an appropriate error message.
- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
    (DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null,  'ALL' )) tf
 WHERE ht.sql_text like '%TOTO%';
```

DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as. I/O, memory and timing) can be reported (based on the V$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
   sql_id        IN  VARCHAR2  DEFAULT  NULL,
   child_number  IN  NUMBER    DEFAULT  NULL,
   format        IN  VARCHAR2  DEFAULT  'TYPICAL');
```

Parameters

Table 164–4 DISPLAY_CURSOR Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V$SQL or V$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session will be displayed.
child_number	Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).

Table 164–4 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
	Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan ■ IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format will show IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. ■ MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ■ ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' ■ LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. The following two formats are deprecated but supported for backward compatibility: ■ RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. ■ RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_CURSOR functionality, the calling user must have SELECT privilege on the fixed views V$SQL_PLAN_STATISTICS_ALL, V$SQL and V$SQL_PLAN, otherwise it will show an appropriate error message.
- Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
```

DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
   sql_handle      IN VARCHAR2 := NULL,
   plan_name       IN VARCHAR2 := NULL,
   format          IN VARCHAR2 := 'TYPICAL')
 RETURN dbms_xplan_type_table;
```

Parameters

Table 164–5 DISPLAY_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
`sql_handle`	SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed.
`plan_name`	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
`format`	Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case.

Return Values

A PL/SQL type table

Usage Notes

This procedure uses plan information stored in the plan baseline to explain and display the plans.It is possible that the plan_id stored in the SQL management base may not match with the `plan_id` of the generated plan. A mismatch between stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and will be bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle 'SYS_SQL_ b1d49f6074ab95af' using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
  FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(
                'SYS_SQL_b1d49f6074ab95af')) t;
```

Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
```

```
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
      WHERE sql_text like '%HR2%') pb,
     TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
                                                'BASIC')) t;
```

DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   plan_hash_value  IN NUMBER := NULL,
   format           IN  VARCHAR2  := 'TYPICAL',
   sqlset_owner     IN  VARCHAR2  := NULL)
  RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

Parameters

Table 164–6 DISPLAY_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the SQL Tuning Set
sql_id	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function DBMS_SQLTUNE.SELECT_SQLSET
plan_hash_value	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).

Table 164–6 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
	For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as `PARTITION`) or logical additions to the base plan table output (such as `PREDICATE`). Format keywords must be separated by either a comma or a space: ■ `ROWS` - if relevant, shows the number of rows estimated by the optimizer ■ `BYTES` - if relevant, shows the number of bytes estimated by the optimizer ■ `COST` - if relevant, shows optimizer cost information ■ `PARTITION` - if relevant, shows partition pruning information ■ `PARALLEL` - if relevant, shows PX information (distribution method and table queue information) ■ `PREDICATE` - if relevant, shows the predicate section ■ `PROJECTION` -if relevant, shows the projection section ■ `ALIAS` - if relevant, shows the "Query Block Name / Object Alias" section ■ `REMOTE` - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ `NOTE` - if relevant, shows the note section of the explain plan ■ `IOSTATS` - assuming that basic plan statistics are collected when SQL statements are executed (either by using the `gather_plan_statistics` hint or by setting the parameter statistics_level to ALL), this format will show IO statistics for `ALL` (or only for the `LAST` as shown below) executions of the cursor. ■ `MEMSTATS` - Assuming that PGA memory management is enabled (that is, `pga_aggregate_target` parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ■ `ALLSTATS` - A shortcut for `'IOSTATS MEMSTATS'` ■ `LAST` - By default, plan statistics are shown for all executions of the cursor. The keyword `LAST` can be specified to see only the statistics for the last execution. The following two formats are deprecated but supported for backward compatibility: ■ `RUNSTATS_TOT` - Same as `IOSTATS`, that is, displays IO statistics for all executions of the specified cursor. ■ `RUNSTATS_LAST` - Same as `IOSTATS LAST`, that is, displays the runtime statistics for the last execution of the cursor Format keywords can be prefixed by the sign '`-`' to exclude the specified information. For example, '`-PROJECTION`' excludes projection information.
`sqlset_owner`	The owner of the SQL tuning set. The default is the current user.

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use '`ALL -PROJECTION -NOTE`' to display everything except the projection and note sections.
- Use '`TYPICAL PROJECTION`' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply '`PROJECTION`' is equivalent.
- Use '`-BYTES -COST -PREDICATE`' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use '`BASIC ROWS`' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID '`gwp663cqh5qbf`' and `PLAN HASH 3693697075` in the SQL Tuning Set called '`OLTP_optimization_0405`":

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
       'OLTP_optimization_0405','gwp663cqh5qbf', 3693697075));
```

To display all execution plans of the SQL ID '`atfwcg8anrykp`' stored in the SQL tuning set:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

165

DBMS_XSLPROCESSOR

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- Using DBMS_XSLPROCESSOR
  - Overview
- Summary of DBMS_XSLPROCESSOR Subprograms

See Also:

- *Oracle XML DB Developer's Guide*

Using DBMS_XSLPROCESSOR

This section contains topics which relate to using the `DBMS_XSLPROCESSOR` package.

- Overview on page 165-3

Overview

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

Summary of DBMS_XSLPROCESSOR Subprograms

Table 165–1 DBMS_XSLPROCESSOR Package Subprograms

Method	Description
CLOB2FILE Procedure on page 165-5	Writes content of a `CLOB` into a file
FREEPROCESSOR Procedure on page 165-6	Frees a processor object
FREESTYLESHEET Procedure on page 165-7	Frees a stylesheet object
NEWPROCESSOR Function on page 165-7	Returns a new processor instance
NEWSTYLESHEET Functions on page 165-9	Creates a new stylesheet from input and reference URLs
PROCESSXSL Functions and Procedures on page 165-10	Transforms an input XML document
READ2CLOB Function on page 165-12	Reads content of the file into a `CLOB`
REMOVEPARAM Procedure on page 165-13	Removes a top-level stylesheet parameter
RESETPARAMS Procedure on page 165-14	Resets the top-level stylesheet parameters
SELECTNODES Function on page 165-15	Selects nodes from a DOM tree that match a pattern
SELECTSINGLENODE Function on page 165-16	Selects the first node from the tree that matches a pattern
SETERRORLOG Procedure on page 165-17	Sets errors to be sent to the specified file
SETPARAM Procedure on page 165-18	Sets a top-level parameter in the stylesheet
SHOWWARNINGS Procedure on page 165-19	Turns warnings on or off
TRANSFORMNODE Function on page 165-20	Transforms a node in a DOM tree using a stylesheet
VALUEOF Function and Procedure on page 165-21	Gets the value of the first node that matches a pattern

CLOB2FILE Procedure

This procedure writes content of a CLOB into a file.

Syntax

```
DBMS_XSLPROCESSOR.CLOB2FILE(
  cl          IN  CLOB;
  flocation   IN  VARCHAR2,
  fname       IN  VARCHAR2,
  csid        IN  NUMBER:=0);
```

Parameters

Table 165–2 CLOB2FILE Procedure Parameters

Parameter	Description
CLOB	File directory
flocation	File directory
fname	File name
csid	Character set id of the file ■ Must be a valid Oracle id; otherwise returns an error ■ If 0, content of the output file will be in the database character set

FREEPROCESSOR Procedure

This procedure Frees a `Processor` object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
  p  IN  Processor);
```

Parameters

Table 165–3 FREEPROCESSOR Procedure Parameters

Parameter	Description
p	Processor

FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(
  ss  IN  Stylesheet);
```

Parameters

Table 165–4 FREESTYLESHEET Procedure Parameters

Parameter	Description
`ss`	Stylesheet

NEWPROCESSOR Function

This function returns a new `Processor` instance. The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR
 RETURN Processor;
```

NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance. The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   xmldoc  IN   DOMDOCUMENT,
   ref     IN   VARCHAR2)
 RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   inp    IN   VARCHAR2,
   ref    IN   VARCHAR2)
 RETURN Stylesheet;
```

Parameters

Table 165–5 NEWSTYLESHEET Function Parameters

Parameter	Description
`xmldoc`	`DOMDocument` to use for construction
`inp`	Input URL to use for construction
`ref`	Reference URL

PROCESSXSL Functions and Procedures

This function transforms input XMLDocument. Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p      IN   Processor,
   ss     IN   Stylesheet,
   xmldoc IN   DOMDOCUMENT),
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN   Stylesheet,
   url   IN   VARCHAR2,
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN  Stylesheet,
   clb   IN  CLOB)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
   p           IN    Processor,
   ss          IN    Stylesheet,
   xmldoc      IN    DOMDOCUMENT,
   dir         IN    VARCHAR2,
   fileName    IN    VARCHAR2);
```

Transforms input XMLDocument using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   url        IN    VARCHAR2,
   dir        IN    VARCHAR2,
   fileName   IN    VARCHAR2);
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN      Processor,
```

```
   ss         IN      Stylesheet,
   xmldoc     IN      DOMDOCUMENT,
   cl         IN OUT  CLOB);
```

Transforms input XMLDocument using given DOMDOCUMENTFRAGMENT and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p         IN    Processor,
   ss        IN    Stylesheet,
   xmldf     IN    DOMDOCUMENTFRAGMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p         IN    Processor,
   ss        IN    Stylesheet,
   xmldf     IN    DOMDOCUMENTFRAGMENT,
   dir       IN    VARCHAR2,
   filename  IN    VARCHAR2);
```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN       Processor,
   ss         IN       Stylesheet,
   xmldf      IN       DOMDOCUMENTFRAGMENT,
   buf        IN OUT   VARCHAR2);
```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN      Processor,
   ss         IN      Stylesheet,
   xmldf      IN      DOMDOCUMENTFRAGMENT,
   cl         IN OUT  CLOB);
```

Parameters

Table 165–6 PROCESSXSL Function and Procedure Parameters

Parameter	Description
p	Processor instance
ss	Stylesheet instance
xmldoc	XML document being transformed
url	URL for the information being transformed
clb	CLOB containing information to be transformed
dir	Directory where processing output file is saved
filename	Processing output file
cl	CLOB to which the processing output is saved
xmldf	XMLDocumentFragment being transformed

READ2CLOB Function

This function reads content of a file into a CLOB.

Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB(
   flocation     IN   VARCHAR2,
   fname         IN   VARCHAR2,
   csid          IN   NUMBER:=0)
 RETURN CLOB;
```

Parameters

Table 165–7 READ2CLOB Function Parameters

Parameter	Description
flocation	File directory
fname	File name
csid	Character set id of the file ■ Must be a valid Oracle id; otherwise returns an error ■ If 0, input file is assumed to be in the database character set

REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(
   ss     IN  Stylesheet,
   name   IN  VARCHAR2);
```

Parameters

Table 165–8 REMOVEPARAM Procedure Parameters

Parameter	Description
ss	`Stylesheet` instance
name	Name of the parameter

RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
   ss  IN   Stylesheet);
```

Parameters

Table 165–9 RESETPARAMS Procedure Parameters

Parameter	Description
ss	Stylesheet instance

SELECTNODES Function

This function selects nodes which match the suplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 165–10 SELECTNODES Function Parameters

Parameter	Description
`n`	Root `DOMNode` of the tree
`pattern`	Pattern to use
`namespace`	Namespace declared

SELECTSINGLENODE Function

This function selects the first node from the tree that match the suplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 165–11

Parameter	Description
`n`	Root `DOMNode` of the tree
`pattern`	Pattern to use
`namespace`	Namespace declared

SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

> **Note:** This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
   p         IN   Processor,
   fileName  IN   VARCHAR2);
```

Parameters

Table 165–12 SETERRORLOG Procedure Parameters

Parameter	Description
`p`	`Processor` instance
`fileName`	Complete path of the file to use as the error log

SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet. The parameter value must be a valid `XPath` expression. Literal string values must be quoted.

Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
   ss      IN   Stylesheet,
   name    IN   VARCHAR2,
   value   IN   VARCHAR2);
```

Parameters

Table 165–13 SETPARAM Procedure Parameters

Parameter	Description
`ss`	`Stylesheet` instance
`name`	Name of the parameter
`value`	Value of the parameter

SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(
   p     IN   Processor,
   yes   IN   BOOLEAN);
```

Parameters

Table 165–14 SHOWWARNINGS Procedure Parameters

Parameter	Description
p	Processor instance
yes	Mode to set: TRUE to show warnings, FALSE otherwise

TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(
   n    IN  DOMNODE,
   ss   IN  Stylesheet)
 RETURN DOMDocumentFragment;
```

Parameters

Table 165–15 TRANSFORMNODE Function Parameters

Parameter	Description
`n`	`DOMNode` to transform
`ss`	Stylesheet to use

VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  namespace   IN    VARCHAR2 := NULL)
 RETURN VARCHAR2;

DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  val         OUT   VARCHAR2,
  namespace   IN    VARCHAR2 := NULL);
```

Parameters

Table 165–16 VALUEOF Function and Procedure Parameters

Parameter	Description
n	Node whose value is being retrieved
pattern	Pattern to use
val	Retrieved value
namespace	Namespace to use

166

DEBUG_EXTPROC

The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- Using DEBUG_EXTPROC
  - Security Model
  - Operational Notes
  - Rules and Limits
- Summary of DEBUG_EXTPROC Subprograms

Using DEBUG_EXTPROC

- Security Model
- Operational Notes
- Rules and Limits

Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

Operational Notes

To install the package, run the script DBGEXTP.SQL.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package DEBUG_EXTPROC

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

> **Note:** These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.
- Execute procedure DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT to startup the extproc agent in this session; for example, execute DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

Rules and Limits

Note: `DEBUG_EXTPROC` works only on platforms with debuggers that can attach to a running process.

Summary of DEBUG_EXTPROC Subprograms

Table 166–1 DEBUG_EXTPROC Package Subprograms

Subprogram	Description
STARTUP_EXTPROC_AGENT Procedure on page 166-7	Starts up the extproc agent process in the session

STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session.This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

167

HTF

The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the HTF.ANCHOR function generates the HTML anchor tag, <A>.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

This chapter contains the following topics:

- Using HTF
  - Operational Notes
  - Rules and Limits
  - Examples
- Summary of Tags
- Summary of HTF Subprograms

Using HTF

- Operational Notes
- Rules and Limits
- Examples

Operational Notes

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.`PRINT` function. It then prints its parameters to the generated web page.

Rules and Limits

If you use values of the LONG data type in functions such as `HTF.PRINT`, `HTF.PRN`, `HTF.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the `LONG` data is used. The `LONG` data is bound to a `VARCHAR2` data type in the function.

Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
   HTP.P (HTF.HTMLOPEN); -- generates <HTML>
   HTP.P (HTF.HEADOPEN); -- generates <HEAD>
   HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
   HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
   HTP.P (HTF.BODYOPEN); -- generates <BODY>
   HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
   HTP.P (HTF.BODYCLOSE); -- generates </BODY>
   HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

Summary of Tags

HTML, HEAD, and BODY Tags

HTMLOPEN Function, HTMLCLOSE Function - generate <HTML> and </HTML>

HEADOPEN Function, HEADCLOSE Function - generate <HEAD> and </HEAD>

BODYOPEN Function, BODYCLOSE Function - generate <BODY> and </BODY>

Comment Tag

COMMENT Function - generates <!-- and -->

http://www.w3.org.BASE Function - generates <BASE>

LINKREL Function - generates <LINK> with the REL attribute

LINKREV Function - generates <LINK> with the REV attribute

TITLE Function - generates <TITLE>

META Function - generates <META>

SCRIPT Function - generates <SCRIPT>

STYLE Function - generates <STYLE>

ISINDEX Function - generates <ISINDEX>

Applet Tags

APPLETOPEN Function, APPLETCLOSE Function - generate <APPLET> and </APPLET>

PARAM Function - generates <PARAM>

List Tags

OLISTOPEN Function, OLISTCLOSE Function - generate <OL> and </OL>

ULISTOPEN Function, ULISTCLOSE Function - generate <UL> and </UL>

DLISTOPEN Function, DLISTCLOSE Function- generate <DL> and </DL>

DLISTTERM Function - generates <DT>

DLISTDEF Function - generates <DD>

DIRLISTOPEN Function, DIRLISTCLOSE Function - generate <DIR> and </DIR>

LISTHEADER Function - generates <LH>

LISTINGOPEN Function, LISTINGCLOSE Function - generate <LISTING> and </LISTING>

MENULISTOPEN Function - generate <MENU> and </MENU>

LISTITEM Function - generates <LI>

Form Tags

FORMOPEN Function, FORMCLOSE Function - generate <FORM> and </FORM>

FORMCHECKBOX Function - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Function - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Function - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Function - generates <INPUT TYPE="PASSWORD">

FORMRADIO Function - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Function, FORMSELECTCLOSE Function - generate <SELECT> and </SELECT>

FORMSELECTOPTION Function - generates <OPTION>

FORMTEXT Function - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Function - generate <TEXTAREA>

FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Function - generates <INPUT TYPE="RESET">

FORMSUBMIT Function - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Function, TABLECLOSE Function - generate <TABLE> and </TABLE>

TABLECAPTION Function - generates <CAPTION>

TABLEROWOPEN Function, TABLEROWCLOSE Function - generate <TR> and </TR>

TABLEHEADER Function - generates <TH>

TABLEDATA Function - generates <TD>

IMG, HR, and A Tags

HR Function, LINE Function - generate <HR>

IMG Function, IMG2 Function - generate <IMG>

ANCHOR Function, ANCHOR2 Function - generate <A>

MAPOPEN Function, MAPCLOSE Function - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Function - generates heading tags (<H1> to <H6>)

PARA Function, PARAGRAPH Function - generate <P>

PRN Functions, PRINT Functions - generate any text that is passed in

PRN Functions, S Function - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Function, PRECLOSE Function - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Function - generates <DIV>

NL Function, BR Function - generate

NOBR Function - generates <NOBR>

WBR Function - generates <WBR>

PLAINTEXT Function - generates <PLAINTEXT>

ADDRESS Function - generates <ADDRESS>

MAILTO Function - generates <A> with the MAILTO attribute

AREA Function - generates <AREA>

BGSOUND Function - generates <BGSOUND>

Character Formatting Tags

BASEFONT Function - generates <BASEFONT>

BIG Function - generates <BIG>

BOLD Function - generates <B>

CENTER Function - generates <CENTER> and </CENTER>

CENTEROPEN Function, CENTERCLOSE Function - generate <CENTER> and </CENTER>

CITE Function - generates <CITE>

CODE Function - generates <CODE>

DFN Function - generates <DFN>

EM Function, EMPHASIS Function - generate <EM>

FONTOPEN Function, FONTCLOSE Function - generate <FONT> and </FONT>

ITALIC Function - generates <I>

KBD Function, KEYBOARD Function - generate <KBD> and </KBD>

S Function - generates <S>

SAMPLE Function - generates <SAMP>

SMALL Function - generates <SMALL>

STRIKE Function - generates <STRIKE>

STRONG Function - generates <STRONG>

SUB Function - generates <SUB>

SUP Function - generates <SUP>

TELETYPE Function - generates <TT>

UNDERLINE Function - generates <U>

VARIABLE Function - generates <VAR>

Frame Tags

FRAME Function - generates <FRAME>

FRAMESETOPEN Function, FRAMESETCLOSE Function - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Function, NOFRAMESCLOSE Function - generate <NOFRAMES> and </NOFRAMES>

Summary of HTF Subprograms

Table 167–1 HTF Package Subprograms

Subprogram	Description
ADDRESS Function on page 167-15	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Function on page 167-16	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Function on page 167-17	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Function on page 167-18	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Function on page 167-19	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Function on page 167-20	Generates the <AREA> tag, which defines a client-side image map
BASE Function on page 167-21	Generates the <BASE> tag which records the URL of the document
BASEFONT Function on page 167-22	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Function on page 167-23	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Function on page 167-24	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Function on page 167-25	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Function on page 167-26	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Function on page 167-27	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Function on page 167-28	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Function on page 167-29	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Function on page 167-30	Generates the tag which begins a new line of text
CENTER Function on page 167-31	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Function on page 167-32	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Function on page 167-33	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Function on page 167-34	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Function on page 167-35	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically

Table 167–1 (Cont.) HTF Package Subprograms

Subprogram	Description
COMMENT Function on page 167-36	Generates This function generates the comment tags <!-- ctext -->
DFN Function on page 167-37	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Function on page 167-38	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Function on page 167-39	Generates the <DIR> which starts a directory list section
DIV Function on page 167-40	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Function on page 167-41	Generates the </DL> tag which ends a definition list
DLISTDEF Function on page 167-42	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Function on page 167-43	Generates the <DL> tag which starts a definition list
DLISTTERM Function on page 167-44	Generates the <DT> tag which defines a term in a definition list <DL>
EM Function on page 167-45	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Function on page 167-46	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Function on page 167-47	Replaces characters that have special meaning in HTML with their escape sequences
ESCAPE_URL Function on page 167-48	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
FONTCLOSE Function on page 167-50	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Function on page 167-50	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMAT_CELL Function on page 167-51	formats column values inside an HTML table using the TABLEDATA Function
FORMCHECKBOX Function on page 167-52	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Function on page 167-53	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMFILE Function on page 167-54	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Function on page 167-55	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Function on page 167-56	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMOPEN Function on page 167-57	Generates the <FORM> tag which marks the beginning of a form section in an HTML document

Table 167–1 (Cont.) HTF Package Subprograms

Subprogram	Description
FORMPASSWORD Function on page 167-58	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Function on page 167-59	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Function on page 167-60	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Function on page 167-61	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Function on page 167-62	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Function on page 167-63	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Function on page 167-64	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Function on page 167-65	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Function on page 167-66	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Function on page 167-67	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Function on page 167-68	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Function on page 167-69	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Function on page 167-70	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Function on page 167-71	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Function on page 167-72	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Function on page 167-73	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Function on page 167-74	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Function on page 167-75	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Function on page 167-76	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Function on page 167-77	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Function on page 167-79	Generates the </HTML> tag which marks the end of an HTML document

Table 167–1 (Cont.) HTF Package Subprograms

Subprogram	Description
HTMLOPEN Function on page 167-79	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Function on page 167-80	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Function on page 167-81	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Function on page 167-82	Creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program
ITALIC Function on page 167-83	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Function on page 167-84	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Function on page 167-85	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Function on page 167-86	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Function on page 167-87	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Function on page 167-88	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Function on page 167-89	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Function on page 167-90	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Function on page 167-91	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Function on page 167-92	Generates the <LI> tag, which indicates a list item
MAILTO Function on page 167-93	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Function on page 167-94	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Function on page 167-95	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Function on page 167-96	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Function on page 167-97	Generates the <MENU> tag which create a list that presents one line for each item
META Function on page 167-98	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers

Table 167–1 (Cont.) HTF Package Subprograms

Subprogram	Description
NL Function on page 167-86	Generates the tag which begins a new line of text
NOBR Function on page 167-100	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Function on page 167-101	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Function on page 167-102	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Function on page 167-103	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Function on page 167-104	Generates the <OL> tag which marks the beginning of an ordered list
PARA Function on page 167-105	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Function on page 167-106	Adds attributes to the <P> tag
PARAM Function on page 167-107	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Function on page 167-108	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Function on page 167-109	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Function on page 167-110	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Functions on page 167-111	Generates the specified parameter as a string terminated with the \n newline character
PRN Functions on page 167-112	Generates the specified parameter as a string
S Function on page 167-113	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Function on page 167-114	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Function on page 167-115	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Function on page 167-116	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Function on page 167-117	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Function on page 167-118	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Function on page 167-119	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page

Table 167–1 (Cont.) HTF Package Subprograms

Subprogram	Description
SUB Function on page 167-120	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Function on page 167-121	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Function on page 167-122	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Function on page 167-123	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Function on page 167-124	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Function on page 167-125	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Function on page 167-126	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Function on page 167-127	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Function on page 167-128	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Function on page 167-129	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Function on page 167-130	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Function on page 167-131	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Function on page 167-132	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Function on page 167-133	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Function on page 167-134	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Function on page 167-135	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (
   cvalue          IN       VARCHAR2
   cnowrap         IN       VARCHAR2   DEFAULT NULL
   cclear          IN       VARCHAR2   DEFAULT NULL
   cattributes     IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 167–2 ADDRESS Function Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

ANCHOR Function

This function and the ANCHOR2 Function functions generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR2 Function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 167–3 ANCHOR Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

ANCHOR2 Function

This function and the ANCHOR Function generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this functions provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 167–4 ANCHOR2 Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

APPLETCLOSE Function

This function closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using APPLETOPEN Function on page 167-19

Syntax

```
HTF.APPLETCLOSE
 RETURN VARCHAR2;
```

APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Function on page 167-18 which generates the </APPLET> tag.

Syntax

```
HTF.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–5 APPLETOPEN Function Parameters

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Function function on page 167-107.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

AREA Function

This function generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–6 AREA Function Parameters

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

BASE Function

This function generates the <BASE> tag which records the URL of the document.

Syntax

```
HTF.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–7 BASE Function Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTF.BASEFONT (
   nsize    IN    INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 167–8 BASEFONT Function Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–9 BGSOUND Function Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTF.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–10 BIG Function Parameters

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Function.

Syntax

```
HTF.BLOCKQUOTECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BLOCKQUOTE>
```

BLOCKQUOTEOPEN Function

This function generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```
HTF.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–11 BLOCKQUOTEOPEN Function Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

BODYCLOSE Function

This function generates the </BODY> tag which marks the end of a body section of an HTML document.You mark the beginning of a body section by means of the BODYOPEN Function.

Syntax

```
HTF.BODYCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BODY>
```

BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

```
HTF.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–12 BODYOPEN Function Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
  RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–13 BOLD Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<B cattributes>ctext</B>
```

BR Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the NL Function.

Syntax

```
HTF.BR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–14 BR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

CENTER Function

This function generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 167–15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This function generates

```
<CENTER>ctext</CENTER>
```

CENTERCLOSE Function

This function generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a of a section of text to center by means of the CENTEROPEN Function.

Syntax

```
HTF.CENTERCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```

CENTEROPEN Function

This function generates the <CENTER> tag which mark the beginning of a section of text to center.You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Function.

Syntax

```
HTF.CENTEROPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<CENTER>
```

CITE Function

This function generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–16 CITE Function Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

CODE Function

This function generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–17 CODE Function Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (
   ctext           IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 167–18 COMMENT Function Parameters

Parameter	Description
ctext	The comment.

Examples

This function generates

```
<!-- ctext -->
```

DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 167–19 DFN Function Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This function generates

```
<DFN>ctext</DFN>
```

DIRLISTCLOSE Function

This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

```
HTF.DIRLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
</DIR>
```

DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```
HTF.DIRLISTOPEN
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
<DIR>
```

DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–20 DIV Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTF.DLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
</DL>
```

DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTF.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–21 DLISTDEF Function Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```
HTF.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–22 DLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

DLISTTERM Function

This function generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTF.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–23 DLISTTERM Function Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

EM Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Function.

Syntax

```
HTF.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–24 EM Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

EMPHASIS Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EM Function.

Syntax

```
HTF.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–25 EMPHASIS Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- `&` to `&`
- `"` to `&quot:`
- `<` to `<`
- `>` to `>`

This function performs the same operation as HTP. PRINTS Procedure and HTP. PS Procedure.

Syntax

```
HTF.ESCAPE_SC(
     ctext          IN       VARCHAR2);
```

Parameters

Table 167–26 ESCAPE_SC Procedure Parameters

Parameter	Description
`ctext`	The text string to convert.

ESCAPE_URL Function

This function replaces characters that have special meaning in HTML and HTTP with their escape sequences. The following characters are converted:

- `&` to `&`
- `"` to `&quot:`
- `<` to `<`
- `>` to `>`
- `%` to `&25`

Syntax

```
HTF.ESCAPE_URL(
     p_url          IN       VARCHAR2);
```

Parameters

Table 167–27 ESCAPE_URL Procedure Parameters

Parameter	Description
`p_url`	The string to convert.

FONTCLOSE Function

This function generates the</FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Function.

Syntax

```
HTF.FONTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

</FONT>

FONTOPEN Function

This function generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Function.

Syntax

```
HTF.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–28 FONTOPEN Function Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(
   columnValue          IN       VARCHAR2
   format_numbers       IN       VARCHAR2   DEFAULT NULL
 RETURN VARCHAR2;
```

Parameters

Table 167–29 FORMAT_CELL Function Parameters

Parameter	Description
columnValue	The value that needs to be formatted in an HTML table.
format_numbers	The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.

Examples

This function generates

```
<TD >columnValue</TD>
```

FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–30 FORMCHECKBOX Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMCLOSE Function

This function generates the </FORM> tag which marks the end of a form section in an HTML document.You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```
HTF.FORMCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FORM>
```

FORMFILE Function

This function generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–31 FORMFILE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–32 FORMHIDDEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

FORMIMAGE Function

This function generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTF.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–33 FORMIMAGE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```
HTF.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–34 FORMOPEN Function Parameters

Parameter	Description
curl	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–35 FORMPASSWORD Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

FORMRADIO Function

This function generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–36 FORMRADIO Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMRESET Function

This function generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–37 FORMRESET Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

FORMSELECTCLOSE Function

This function generates the </SELECT> tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Function.

FORMSELECTOPEN Function

This function generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTOPEN(
   cname          IN       VARCHAR2,
   cprompt        IN       VARCHAR2   DEFAULT NULL,
   nsize          IN       INTEGER    DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–38 FORMSELECTOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

FORMSELECTOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELECTOPTION(
   cvalue         IN       VARCHAR2,
   cselected      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–39 FORMSELECTOPTION Function Parameters

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Function.

FORMSUBMIT Function

This function generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–40 FORMSUBMIT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

FORMTEXT Function

This function generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–41 FORMTEXT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

FORMTEXTAREA Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Function which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–42 FORMTEXTAREA Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–43 FORMTEXTAREA2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

Syntax

```
HTF.FORMTEXTAREACLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```

FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–44 FORMTEXTAREAOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–45 FORMTEXTAREAOPEN2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

FRAME Function

This function generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTF.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–46 FRAME Function Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTF.FRAMESETCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

FRAMESETOPEN Function

This function generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```
HTF.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–47 FRAMESETOPEN Function Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

HEADCLOSE Function

This function generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

```
HTF.HEADCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HEAD>
```

HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTF.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–48 HEADER Function Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTF.header (1,'Overview')
  RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```
HTF.HEADOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```

HR Function

This function generates the <HR> tag, which generates a line in the HTML document.This subprogram performs the same operation as the LINE Function.

Syntax

```
HTF.HR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–49 HR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Function to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HTML>
```

HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Function to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```

IMG Function

This function generates the <IMG> tag which directs the browser to load an image onto the HTML page. The IMG2 Function performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTF.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–50 IMG Function Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The IMG Function performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTF.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–51 IMG2 Function Parameters

Parameter	Description
`curl`	The value for the SRC attribute.
`calign`	The value for the `ALIGN` attribute.
`calt`	The value for the `ALT` attribute which specifies alternative text to display if the browser does not support images.
`cismap`	If the value for this parameter is not `NULL`, the `ISMAP` attribute is added to the tag. The attribute indicates that the image is an imagemap.
`cusemap`	The value for the `USEMAP` attribute which specifies a client-side image map.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program.

Syntax

```
HTF.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–52 ISINDEX Function Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

ITALIC Function

This function generates

the <I> and

</I> tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–53 ITALIC Function Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<I cattributes>ctext</I>
```

KBD Function

This function generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```
HTF.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–54 KBD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

KEYBOARD Function

This function generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Function.

Syntax

```
HTF.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–55 KEYBOARD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

LINE Function

This function generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Function.

Syntax

```
HTF.LINE(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–56 LINE Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–57 LINKREL Function Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–58 LINKREV Function Parameters

Parameter	Description
crev	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

LISTHEADER Function

This function generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–59 LISTHEADER Function Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LH cattributes>ctext</LH>
```

LISTINGCLOSE Function

This function generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

Syntax

```
HTF.LISTINGCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```

LISTINGOPEN Function

This function generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.

Syntax

```
HTF.LISTINGOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```

LISTITEM Function

This function generates the <LI> tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–60 LISTITEM Function Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–61 MAILTO Function Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

MAPCLOSE Function

This function generates the </MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

```
HTF.MAPCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MAP>
```

MAPOPEN Function

This function generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

Syntax

```
HTF.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–62 MAPOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

MENULISTCLOSE Function

This function generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MENU>
```

MENULISTOPEN Function

This function generates the <MENU> tag which create a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Function.The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```

META Function

This function generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 167–63 META Function Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

NL Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the BR Function.

Syntax

```
HTF.NL(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–64 NL Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

NOBR Function

This function generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR(
ctext        IN        VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 167–65 NOBR Function Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This function generates

```
<NOBR>ctext</NOBR>
```

NOFRAMESCLOSE Function

This function generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</NOFRAMES>
```

NOFRAMESOPEN Function

This function generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```

OLISTCLOSE Function

This function generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</OL>
```

OLISTOPEN Function

This function generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–66 OLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Function.

Syntax

```
HTF.PARA
  RETURN VARCHAR2;
```

Examples

This function generates

```
<P>
```

PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

Syntax

```
HTF.PARAGRAPH(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–67 PARAGRAPH Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Function to begin the invocation. Use one PARAM Function for each desired name-value pair, and use APPLETCLOSE Function to end the applet invocation.

Syntax

```
HTF.PARAM(
   cname           IN       VARCHAR2
   cvalue          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 167–68 PARAM Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

PLAINTEXT Function

This function generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–69 PLAINTEXT Function Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

PRECLOSE Function

This function generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Function.

Syntax

```
HTF.PRECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</PRE>
```

PREOPEN Function

This function generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.

Syntax

```
HTF.PREOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwidth         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–70 PREOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character. The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRINT (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRINT (
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 167–71 PRINT Function Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These functions do not have function equivalents.

PRN Functions

These functions generate the specified parameter as a string. Unlike the PRINT Functions the string is not terminated with the \n newline character.

Syntax

```
HTF.PRN (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRN (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRN (
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 167–72 PRN Function Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These functions do not have function equivalents.

S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Function.

Syntax

```
HTF.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–73 S Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<S cattributes>ctext</S>
```

SAMPLE Function

This function generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–74 SAMPLE Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

SCRIPT Function

This function generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–75 SCRIPT Function Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

SMALL Function

This function generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–76 SMALL Function Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

STRIKE Function

This function generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Function.

Syntax

```
STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–77 STRIKE Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

STRONG Function

This function generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```
HTF.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–78 STRONG Function Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

STYLE Function

This function generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE(
   cstyle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 167–79 STYLE Function Parameters

Parameter	Description
cstyle	The the style information to include.

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

SUB Function

This function generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–80 SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

SUP Function

This function generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–81 SUP Function Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

TABLECAPTION Function

This function generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–82 TABLECAPTION Function Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Function on page 167-126.

Syntax

```
HTF.TABLECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–83 TABLEDATA Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
   cvalue          IN       VARCHAR2   DEFAULT NULL,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   crowspan        IN       VARCHAR2   DEFAULT NULL,
   ccolspan        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–84 TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Function.

Syntax

```
HTF.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–85 TABLEOPEN Function Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Function.

Syntax

```
HTF.TABLEROWCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Function.

Syntax

```
HTF.TABLEROWOPEN(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cvalign        IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–86 TABLEROWOPEN Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–87 TELETYPE Function Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TT cattributes>ctext</TT>
```

TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(
   ctitle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 167–88 TITLE Function Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

ULISTCLOSE Function

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cdingbat        IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–89 ULISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–90 UNDERLINE Function Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<U cattributes>ctext</U>
```

VARIABLE Function

This function generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 167–91 VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

WBR Function

This function generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR
  RETURN VARCHAR2;
```

Examples

This function generates

```
<WBR>
```

168

HTP

The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, <A>.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

This chapter contains the following topics:

- Using HTP
  - Operational Notes
  - Rules and Limits
  - Examples
- Summary of Tags
- Summary of HTP Subprograms

Using HTP

- Operational Notes
- Rules and Limits
- Examples

Operational Notes

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.`PRINT` procedure. It then prints its parameters to the generated web page.

Rules and Limits

If you use values of the LONG data type in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the procedure.

Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN;           -- generates <HTML>
    HTP.HEADOPEN;           -- generates <HEAD>
    HTP.TITLE('Hello');     -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE;          -- generates </HEAD>
    HTP.BODYOPEN;           -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE;          -- generates </BODY>
    HTP.HTMLCLOSE;          -- generates </HTML>
END;
```

Summary of Tags

HTML, HEAD, and BODY Tags

HTMLOPEN Procedure, HTMLCLOSE Procedure - generate <HTML> and </HTML>

HEADOPEN Procedure, HEADCLOSE Procedure - generate <HEAD> and </HEAD>

BODYOPEN Procedure, BODYCLOSE Procedure - generate <BODY> and </BODY>

Comment Tag

COMMENT Procedure - generates <!-- and -->

Tags in the <HEAD> Area

BASE Procedure - generates <BASE>

LINKREL Procedure - generates <LINK> with the REL attribute

LINKREV Procedure - generates <LINK> with the REV attribute

TITLE Procedure - generates <TITLE>

META Procedure - generates <META>

SCRIPT Procedure - generates <SCRIPT>

STYLE Procedure - generates <STYLE>

ISINDEX Procedure - generates <ISINDEX>

Applet Tags

APPLETOPEN Procedure, APPLETCLOSE Procedure - generate <APPLET> and </APPLET>

PARAM Procedure - generates <PARAM>

List Tags

OLISTOPEN Procedure, OLISTCLOSE Procedure - generate <OL> and </OL>

ULISTOPEN Procedure, ULISTCLOSE Procedure - generate <UL> and </UL>

DLISTOPEN Procedure, DLISTCLOSE Procedure- generate <DL> and </DL>

DLISTTERM Procedure - generates <DT>

DLISTDEF Procedure - generates <DD>

DIRLISTOPEN Procedure, DIRLISTCLOSE Procedure - generate <DIR> and </DIR>

LISTHEADER Procedure - generates <LH>

LISTINGOPEN Procedure, LISTINGCLOSE Procedure - generate <LISTING> and </LISTING>

MENULISTOPEN Procedure - generate <MENU> and </MENU>

LISTITEM Procedure - generates <LI>

Form Tags

FORMOPEN Procedure, FORMCLOSE Procedure - generate <FORM> and </FORM>

FORMCHECKBOX Procedure - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Procedure - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Procedure - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Procedure - generates <INPUT TYPE="PASSWORD">

FORMRADIO Procedure - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate <SELECT> and </SELECT>

FORMSELECTOPTION Procedure - generates <OPTION>

FORMTEXT Procedure - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Procedure - generate <TEXTAREA>

FORMTEXTAREAOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Procedure - generates <INPUT TYPE="RESET">

FORMSUBMIT Procedure - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Procedure, TABLECLOSE Procedure - generate <TABLE> and </TABLE>

TABLECAPTION Procedure - generates <CAPTION>

TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate <TR> and </TR>

TABLEHEADER Procedure - generates <TH>

TABLEDATA Procedure - generates <TD>

IMG, HR, and A Tags

HR Procedure, LINE Procedure - generate <HR>

IMG Procedure, IMG2 Procedure - generate <IMG>

ANCHOR Procedure, ANCHOR2 Procedure - generate <A>

MAPOPEN Procedure, MAPCLOSE Procedure - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Procedure - generates heading tags (<H1> to <H6>)

PARA Procedure, PARAGRAPH Procedure - generate <P>

PRN Procedures, PRINT Procedures - generate any text that is passed in

PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Procedure, PRECLOSE Procedure - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Procedure - generates <DIV>

NL Procedure, BR Procedure - generate

NOBR Procedure - generates <NOBR>

WBR Procedure - generates <WBR>

PLAINTEXT Procedure - generates <PLAINTEXT>

ADDRESS Procedure - generates <ADDRESS>

MAILTO Procedure - generates <A> with the MAILTO attribute

AREA Procedure - generates <AREA>

BGSOUND Procedure - generates <BGSOUND>

Character Formatting Tags

BASEFONT Procedure - generates <BASEFONT>

BIG Procedure - generates <BIG>

BOLD Procedure - generates <B>

CENTER Procedure - generates <CENTER> and </CENTER>

CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>

CITE Procedure - generates <CITE>

CODE Procedure - generates <CODE>

DFN Procedure - generates <DFN>

EM Procedure, EMPHASIS Procedure - generate <EM>

FONTOPEN Procedure, FONTCLOSE Procedure - generate <FONT> and </FONT>

ITALIC Procedure - generates <I>

KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>

S Procedure - generates <S>

SAMPLE Procedure - generates <SAMP>

SMALL Procedure - generates <SMALL>

STRIKE Procedure - generates <STRIKE>

STRONG Procedure - generates <STRONG>

SUB Procedure - generates <SUB>

SUP Procedure - generates <SUP>

TELETYPE Procedure - generates <TT>

UNDERLINE Procedure - generates <U>

VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>

FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>

Summary of HTP Subprograms

Table 168–1 HTP Package Subprograms

Subprogram	Description
ADDRESS Procedure on page 168-16	Generate s the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Procedure on page 168-17	Generate s the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Procedure on page 168-18	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Procedure on page 168-19	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Procedure on page 168-20	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Procedure on page 168-21	Generates the <AREA> tag, which defines a client-side image map
BASE Procedure on page 168-22	Generates the <BASE> tag which records the URL of the document
BASEFONT Procedure on page 168-23	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Procedure on page 168-24	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Procedure on page 168-25	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Procedure on page 168-26	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Procedure on page 168-27	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Procedure on page 168-28	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Procedure on page 168-29	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Procedure on page 168-30	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Procedure on page 168-31	Generates the tag which begins a new line of text
CENTER Procedure on page 168-32	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page

Table 168–1 (Cont.) HTP Package Subprograms

Subprogram	Description
CENTERCLOSE Procedure on page 168-33	Generates the `</CENTER>` tag which marks the end of a section of text to center
CENTEROPEN Procedure on page 168-34	Generates the `<CENTER>` tag which mark the beginning of a section of text to center
CITE Procedure on page 168-35	Generates the `<CITE>` and `</CITE>` tags which direct the browser to render the text as a citation
CODE Procedure on page 168-36	Generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Procedure on page 168-37	Generates This procedure generates the comment tags `<!-- ctext -->`
DFN Procedure on page 168-38	Generates the `<DFN>` and `</DFN>` tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Procedure on page 168-39	Generates the `</DIR>` tag which ends a directory list section
DIRLISTOPEN Procedure on page 168-40	Generates the `<DIR>` which starts a directory list section
DIV Procedure on page 168-41	Generates the `<DIV>` tag which creates document divisions
DLISTCLOSE Procedure on page 168-42	Generates the `</DL>` tag which ends a definition list
DLISTDEF Procedure on page 168-43	Generates the `<DD>` tag, which inserts definitions of terms
DLISTOPEN Procedure on page 168-44	Generates the `<DL>` tag which starts a definition list
DLISTTERM Procedure on page 168-45	Generates the `<DT>` tag which defines a term in a definition list `<DL>`
EM Procedure on page 168-46	Generates the `<EM>` and `</EM>` tags, which define text to be emphasized
EMPHASIS Procedure on page 168-47	Generates the `<EM>` and `</EM>` tags, which define text to be emphasized
ESCAPE_SC Procedure on page 168-48	Replaces characters that have special meaning in HTML with their escape sequences
FONTCLOSE Procedure on page 168-49	Generates the `</FONT>` tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Procedure on page 168-50	Generates the `<FONT>` which marks the beginning of section of text with the specified font characteristics
FORMCHECKBOX Procedure on page 168-51	Generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form
FORMCLOSE Procedure on page 168-52	Generates the `</FORM>` tag which marks the end of a form section in an HTML document
FORMOPEN Procedure on page 168-53	Generates the `<FORM>` tag which marks the beginning of a form section in an HTML document

Table 168–1 (Cont.) HTP Package Subprograms

Subprogram	Description
FORMFILE Procedure on page 168-54	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Procedure on page 168-55	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Procedure on page 168-56	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMPASSWORD Procedure on page 168-57	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Procedure on page 168-58	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Procedure on page 168-59	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Procedure on page 168-60	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Procedure on page 168-61	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Procedure on page 168-62	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Procedure on page 168-63	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Procedure on page 168-64	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Procedure on page 168-65	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Procedure on page 168-66	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Procedure on page 168-67	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Procedure on page 168-68	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Procedure on page 168-69	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Procedure on page 168-70	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Procedure on page 168-71	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Procedure on page 168-72	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Procedure on page 168-73	Generates the </HEAD> tag which marks the end of an HTML document head section

Table 168–1 (Cont.) HTP Package Subprograms

Subprogram	Description
HEADER Procedure on page 168-74	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Procedure on page 168-75	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Procedure on page 168-76	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Procedure on page 168-77	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Procedure on page 168-78	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Procedure on page 168-79	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Procedure on page 168-80	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Procedure on page 168-81	Creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program
ITALIC Procedure on page 168-82	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Procedure on page 168-83	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Procedure on page 168-84	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Procedure on page 168-85	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Procedure on page 168-86	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Procedure on page 168-87	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Procedure on page 168-88	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Procedure on page 168-89	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Procedure on page 168-90	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Procedure on page 168-91	Generates the <LI> tag, which indicates a list item
MAILTO Procedure on page 168-92	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument

Table 168–1 (Cont.) HTP Package Subprograms

Subprogram	Description
MAPCLOSE Procedure on page 168-93	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Procedure on page 168-94	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Procedure on page 168-95	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Procedure on page 168-96	Generates the <MENU> tag which create a list that presents one line for each item
META Procedure on page 168-97	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Procedure on page 168-98	Generates the tag which begins a new line of text
NOBR Procedure on page 168-99	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Procedure on page 168-100	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Procedure on page 168-101	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Procedure on page 168-102	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Procedure on page 168-103	Generates the <OL> tag which marks the beginning of an ordered list
PARA Procedure on page 168-104	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Procedure on page 168-105	Adds attributes to the <P> tag
PARAM Procedure on page 168-106	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Procedure on page 168-107	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Procedure on page 168-108	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Procedure on page 168-109	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Procedures on page 168-110	Generates the specified parameter as a string terminated with the \n newline character
PRINTS Procedure on page 168-111	Generates a string and replaces the following characters with the corresponding escape sequence
PRN Procedures on page 168-112	Generates the specified parameter as a string
PS Procedure on page 168-113	Generates a string and replaces the following characters with the corresponding escape sequence.
S Procedure on page 168-114	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type

Table 168–1 (Cont.) HTP Package Subprograms

Subprogram	Description
SAMPLE Procedure on page 168-115	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Procedure on page 168-116	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Procedure on page 168-117	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Procedure on page 168-118	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Procedure on page 168-119	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Procedure on page 168-120	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Procedure on page 168-121	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Procedure on page 168-122	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Procedure on page 168-123	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Procedure on page 168-124	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Procedure on page 168-125	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Procedure on page 168-126	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Procedure on page 168-127	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Procedure on page 168-128	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Procedure on page 168-129	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Procedure on page 168-130	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Procedure on page 168-131	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Procedure on page 168-132	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Procedure on page 168-133	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Procedure on page 168-134	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline

Table 168–1 (Cont.) HTP Package Subprograms

Subprogram	Description
VARIABLE Procedure on page 168-135	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Procedure on page 168-136	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (
   cvalue         IN       VARCHAR2
   cnowrap        IN       VARCHAR2   DEFAULT NULL
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–2 ADDRESS Procedure Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

ANCHOR Procedure

This procedure and the ANCHOR2 Procedure procedures generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR2 Procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–3 ANCHOR Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

ANCHOR2 Procedure

This procedure and the ANCHOR Procedure generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this procedures provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–4 ANCHOR2 Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

APPLETCLOSE Procedure

This procedure closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using APPLETOPEN Procedure.

Syntax

```
HTP.APPLETCLOSE;
```

APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Procedure which generates the </APPLET> tag.

Syntax

```
HTP.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–5 APPLETOPEN Procedure Parameters

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Procedure procedure.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–6 AREA Procedure Parameters

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–7 BASE Procedure Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

BASEFONT Procedure

This procedure generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (
   nsize    IN    INTEGER);
```

Parameters

Table 168–8 BASEFONT Procedure Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–9 BGSOUND Procedure Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

BIG Procedure

This procedure generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–10 BIG Procedure Parameters

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<BIG *cattributes*>*ctext*</BIG>

BLOCKQUOTECLOSE Procedure

This procedure generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Procedure.

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

```
</BLOCKQUOTE>
```

BLOCKQUOTEOPEN Procedure

This procedure generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Procedure.

Syntax

```
HTP.BLOCKQUOTEOPEN (
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–11 BLOCKQUOTEOPEN Procedure Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

BODYCLOSE Procedure

This procedure generates the </BODY> tag which marks the end of a body section of an HTML document.You mark the beginning of a body section by means of the BODYOPEN Procedure.

Syntax

```
HTP.BODYCLOSE;
```

Examples

This procedure generates

```
</BODY>
```

BODYOPEN Procedure

This procedure generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Procedure.

Syntax

```
HTP.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–12 BODYOPEN Procedure Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

BOLD Procedure

This procedure generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–13 BOLD Procedure Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<B cattributes>ctext</B>
```

BR Procedure

This procedure generates the <BR> tag which begins a new line of text. It performs the same operation as the NL Procedure.

Syntax

```
HTP.BR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–14 BR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

CENTER Procedure

This procedure generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (
   ctext           IN       VARCHAR2);
```

Parameters

Table 168–15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

CENTERCLOSE Procedure

This procedure generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a of a section of text to center by means of the CENTEROPEN Procedure.

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

CENTEROPEN Procedure

This procedure generates the <CENTER> tag which mark the beginning of a section of text to center.You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Procedure.

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```

CITE Procedure

This procedure generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–16 CITE Procedure Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

CODE Procedure

This procedure generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–17 CODE Procedure Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (
   ctext           IN       VARCHAR2);
```

Parameters

Table 168–18 COMMENT Procedure Parameters

Parameter	Description
`ctext`	The comment.

Examples

This procedure generates

```
<!-- ctext -->
```

DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (
   ctext           IN       VARCHAR2);
```

Parameters

Table 168–19 DFN Procedure Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This procedure generates

```
<DFN>ctext</DFN>
```

DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

```
HTP.DIRLISTCLOSE;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
</DIR>
```

DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

```
HTP.DIRLISTOPEN;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
<DIR>
```

DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–20 DIV Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

DLISTCLOSE Procedure

This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

Syntax

```
HTP.DLISTCLOSE;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
</DL>
```

DLISTDEF Procedure

This procedure generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTP.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–21 DLISTDEF Procedure Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

Syntax

```
HTP.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–22 DLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTP.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–23 DLISTERM Procedure Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Procedure.

Syntax

```
HTP.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–24 EM Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

EMPHASIS Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EM Procedure.

Syntax

```
HTP.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–25 EMPHASIS Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- `&` to `&`
- `"` to `&quot:`
- `<` to `<`
- `>` to `>`

This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```
HTP.ESCAPE_SC(
     ctext          IN       VARCHAR2);
```

Parameters

Table 168–26 ESCAPE_SC Procedure Parameters

Parameter	Description
`ctext`	The text string to convert.

FONTCLOSE Procedure

This procedure generates the</FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Procedure.

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```

FONTOPEN Procedure

This procedure generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Procedure.

Syntax

```
HTP.FONTOPEN(
   ccolor         IN       VARCHAR2   DEFAULT NULL,
   cface          IN       VARCHAR2   DEFAULT NULL,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–27 FONTOPEN Procedure Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMCHECKBOX Procedure

This procedure generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–28 FORMCHECKBOX Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMCLOSE Procedure

This procedure generates the </FORM> tag which marks the end of a form section in an HTML document.You mark the beginning of the form section by means of the FORMOPEN Procedure.

Syntax

```
HTP.FORMCLOSE;
```

Examples

This procedure generates

```
</FORM>
```

FORMOPEN Procedure

This procedure generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

```
HTP.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–29 FORMOPEN Procedure Parameters

Parameter	Description
curl	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

FORMFILE Procedure

This procedure generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–30 FORMFILE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

FORMHIDDEN Procedure

This procedure generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–31 FORMHIDDEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

FORMIMAGE Procedure

This procedure generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTP.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–32 FORMIMAGE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–33 FORMPASSWORD Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

FORMRADIO Procedure

This procedure generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–34 FORMRADIO Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMRESET Procedure

This procedure generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTP.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–35 FORMRESET Procedure Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

FORMSELECTCLOSE Procedure

This procedure generates the </SELECT> tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Procedure.

FORMSELECTOPEN Procedure

This procedure generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
FORMSELECTOPEN(
   cname          IN       VARCHAR2,
   cprompt        IN       VARCHAR2   DEFAULT NULL,
   nsize          IN       INTEGER    DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–36 FORMSELECTOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

FORMSELECTOPTION Procedure

This procedure generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION(
   cvalue         IN       VARCHAR2,
   cselected      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–37 FORMSELECTOPTION Procedure Parameters

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Procedure.

FORMSUBMIT Procedure

This procedure generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cvalue        IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–38 FORMSUBMIT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

FORMTEXT Procedure

This procedure generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–39 FORMTEXT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign      , IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–40 FORMTEXTAREA Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

FORMTEXTAREA2 Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–41 FORMTEXTAREA2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

```
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```
</TEXTAREA>
```

FORMTEXTAREAOPEN Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–42 FORMTEXTAREAOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–43 FORMTEXTAREAOPEN2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

FRAME Procedure

This procedure generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTP.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–44 FRAME Procedure Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```

FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```
HTP.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–45 FRAMESETOPEN Procedure Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

HEADCLOSE Procedure

This procedure generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Procedure.

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

HEADER Procedure

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTP.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–46 HEADER Procedure Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTP.header (1,'Overview');
```

produces:

```
<H1>Overview</H1>
```

HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Procedure.

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```

HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.This subprogram performs the same operation as the LINE Procedure.

Syntax

```
HTP.HR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–47 HR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

HTMLCLOSE Procedure

This procedure generates the `</HTML>` tag which marks the end of an HTML document. You use the HTMLOPEN Procedure to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Procedure to mark the end of the an HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

IMG Procedure

This procedure generates the <IMG> tag which directs the browser to load an image onto the HTML page. The IMG2 Procedure performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTP.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2
DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–48 IMG Procedure Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The IMG Procedure performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTP.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2
DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–49 IMG2 Procedure Parameters

Parameter	Description
`curl`	The value for the SRC attribute.
`calign`	The value for the `ALIGN` attribute.
`calt`	The value for the `ALT` attribute which specifies alternative text to display if the browser does not support images.
`cismap`	If the value for this parameter is not `NULL`, the `ISMAP` attribute is added to the tag. The attribute indicates that the image is an imagemap.
`cusemap`	The value for the `USEMAP` attribute which specifies a client-side image map.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL);
```

Parameters

Table 168–50 ISINDEX Procedure Parameters

Parameter	Description
`cprompt`	The value for the `PROMPT` attribute.
`curl`	The value for the `HREF` attribute.

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–51 ITALIC Procedure Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<I cattributes>ctext</I>
```

KBD Procedure

This procedure generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Procedure.

Syntax

```
HTP.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–52 KBD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Procedure.

Syntax

```
HTP.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–53 KEYBOARD Procedure Parameters

Parameter	Description
`ctext`	The text to be rendered in monospace.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Procedure.

Syntax

```
HTP.LINE(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–54 LINE Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Procedure. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–55 LINKREL Procedure Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

LINKREV Procedure

This procedure generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–56 LINKREV Procedure Parameters

Parameter	Description
crel	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

LISTHEADER Procedure

This procedure generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–57 LISTHEADER Procedure Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

LISTINGCLOSE Procedure

This procedure generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

```
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```
</LISTING>
```

LISTINGOPEN Procedure

This procedure generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```

LISTITEM Procedure

This procedure generates the <LI> tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–58 LISTITEM Procedure Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–59 MAILTO Procedure Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

MAPCLOSE Procedure

This procedure generates the </MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

```
HTP.MAPCLOSE;
```

Examples

This procedure generates

```
</MAP>
```

MAPOPEN Procedure

This procedure generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```
HTP.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–60 MAPOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTCLOSE;
```

Examples

This procedure generates

```
</MENU>
```

MENULISTOPEN Procedure

This procedure generates the <MENU> tag which create a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Procedure.The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```
<MENU>
```

META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2);
```

Parameters

Table 168–61 META Procedure Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

NL Procedure

This procedure generates the <BR> tag which begins a new line of text. It performs the same operation as the BR Procedure.

Syntax

```
HTP.NL(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–62 NL Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

NOBR Procedure

This procedure generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR(
ctext        IN        VARCHAR2);
```

Parameters

Table 168–63 NOBR Procedure Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

NOFRAMESCLOSE Procedure

This procedure generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates

```
</NOFRAMES>
```

NOFRAMESOPEN Procedure

This procedure generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```
<NOFRAMES>
```

OLISTCLOSE Procedure

This procedure generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```
</OL>
```

OLISTOPEN Procedure

This procedure generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–64 OLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Procedure.

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```

PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the PARA Procedure.

Syntax

```
HTP.PARAGRAPH(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–65 PARAGRAPH Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```
HTP.PARAM(
   cname          IN       VARCHAR2
   cvalue         IN       VARCHAR2);
```

Parameters

Table 168–66 PARAM Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

PLAINTEXT Procedure

This procedure generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–67 PLAINTEXT Procedure Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

PRECLOSE Procedure

This procedure generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Procedure.

Syntax

```
HTP.PRECLOSE;
```

Examples

This procedure generates

```
</PRE>
```

PREOPEN Procedure

This procedure generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Procedure.

Syntax

```
HTP.PREOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwidth          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–68 PREOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character. The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
   cbuf      IN       VARCHAR2);

HTP.PRINT (
   dbuf      IN       DATE);

HTP.PRINT (
   nbuf      IN       NUMBER);
```

Parameters

Table 168–69 PRINT Procedure Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

PRINTS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `<`
- `>` to `>`
- `"` to `"`
- `&` to `&`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PRINTS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 168–70 PRINTS Procedure Parameters

Parameter	Description
`ctext`	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 168-3 for the HTF implementation).

PRN Procedures

These procedures generate the specified parameter as a string. Unlike the PRINT Procedures the string is not terminated with the `\n` newline character.

Syntax

```
HTP.PRN (
   cbuf       IN       VARCHAR2);

HTP.PRN (
   dbuf       IN       DATE);

HTP.PRN (
   nbuf       IN       NUMBER);
```

Parameters

Table 168–71 PRN Procedure Parameters

Parameter	Description
`cbuf`	The string to generate (not terminated by a newline).
`dbuf`	The string to generate (not terminated by a newline).
`nbuf`	The string to generate (not terminated by a newline).

Usage Notes

These procedures do not have function equivalents.

PS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 168–72 PS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 168-3 for the HTF implementation).

S Procedure

This procedure generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Procedure.

Syntax

```
HTP.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–73 S Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<S cattributes>ctext</S>
```

SAMPLE Procedure

This procedure generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–74 SAMPLE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

SCRIPT Procedure

This procedure generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–75 SCRIPT Procedure Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

SMALL Procedure

This procedure generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–76 SMALL Procedure Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

STRIKE Procedure

This procedure generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Procedure.

Syntax

```
HTP.STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–77 STRIKE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

STRONG Procedure

This procedure generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```
HTP.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–78 STRONG Procedure Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

STYLE Procedure

This procedure generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(
   cstyle          IN       VARCHAR2);
```

Parameters

Table 168–79 STYLE Procedure Parameters

Parameter	Description
cstyle	The the style information to include.

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

SUB Procedure

This procedure generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTP.SUB(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–80 SUB Procedure Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

SUP Procedure

This procedure generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–81 SUP Procedure Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

TABLECAPTION Procedure

This procedure generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTP.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–82 TABLECAPTION Procedure Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTP.TABLEDATA(
   cvalue          IN       VARCHAR2   DEFAULT NULL,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   crowspan        IN       VARCHAR2   DEFAULT NULL,
   ccolspan        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–83 TABLEDATA Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

TABLEHEADER Procedure

This procedure generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–84 TABLEHEADER Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```
HTP.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–85 TABLEOPEN Procedure Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

TABLEROWCLOSE Procedure

This procedure generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

```
HTP.TABLEROWOPEN(
   calign          IN       VARCHAR2   DEFAULT NULL,
   cvalign         IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–86 TABLEROWOPEN Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

TELETYPE Procedure

This procedure generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–87 TELETYPE Procedure Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

TITLE Procedure

This procedure generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTP.TITLE(
   ctitle          IN       VARCHAR2);
```

Parameters

Table 168–88 TITLE Procedure Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

ULISTCLOSE Procedure

This procedure generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

ULISTOPEN Procedure

This procedure generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cdingbat        IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–89 ULISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–90 UNDERLINE Procedure Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<U cattributes>ctext</U>
```

VARIABLE Procedure

This procedure generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 168–91 VARIABLE Procedure Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<VAR *cattributes*>*ctext*</VAR>

WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```

169

ORD_DICOM

This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content. These include content such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia `ORD_DICOM` package provides functions and procedures to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- Documentation of ORD_DICOM

Documentation of ORD_DICOM

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DICOM` in the *Oracle Multimedia DICOM Developer's Guide*.

170

ORD_DICOM_ADMIN

This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia `ORD_DICOM_ADMIN` package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

- Documentation of ORD_DICOM_ADMIN

Documentation of ORD_DICOM_ADMIN

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DICOM_ADMIN` in the *Oracle Multimedia DICOM Developer's Guide*.

171

OWA_CACHE

The `OWA_CACHE` package provides an interface that enables the `PL/SQL Gateway` cache to improve the performance of PL/SQL web applications.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

The chapter contains the following topics:

- Using OWA_CACHE
  - Constants
- Summary of OWA_CACHE Subprograms

Using OWA_CACHE

- Constants

Constants

- `system_level CONSTANT VARCHAR(6) := 'SYSTEM';`
- `user_level CONSTANT VARCHAR(4) := 'USER';`

Summary of OWA_CACHE Subprograms

Table 171–1 OWA_CACHE Package Subprograms

Subprogram	Description
DISABLE Procedure on page 171-5	Disables the cache for this particular request
GET_ETAG Function on page 171-6	Returns the tag associated with the cached content (used in the Validation technique model only)
GET_LEVEL Function on page 171-7	Returns the caching level (used in the Validation technique model only)
SET_CACHE Procedure on page 171-8	Sets up the cache headers for validation model cache type
SET_EXPIRES Procedure on page 171-9	Sets up the cache headers for expires model cache type
SET_NOT_MODIFIED Procedure on page 171-10	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
SET_SURROGATE_CONTROL Procedure on page 171-11	Sets up the headers for a surrogate-control header for web cache

DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG
  RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise `NULL`.

GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL
  RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

SET_CACHE Procedure

This sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE(
   p_etag        IN       VARCHAR2,
   p_level       IN       VARCHAR2);
```

Parameters

Table 171–2 SET_CACHE Procedure Parameters

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'

SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```
OWA_CACHE.SET_EXPIRES(
   p_expires      IN       NUMBER,
   p_level        IN       VARCHAR2);
```

Parameters

Table 171–3 SET_EXPIRES Procedure Parameters

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)

SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

Exceptions

`VALUE_ERROR` is thrown if If the `etag` was not passed in

SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(
   p_value        IN       VARCHAR2);
```

Parameters

Table 171–4 SET_SURROGATE_CONTROL Procedure Parameters

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header .

Exceptions

VALUE_ERROR is thrown if If p_value is greater than 55 in length.

172

OWA_COOKIE

The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

The chapter contains the following topics:

- Using OWA_COOKIE
  - Overview
  - Types
  - Rules and Limits
- Summary of OWA_COOKIE Subprograms

Using OWA_COOKIE

- Overview
- Types
- Rules and Limits

Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

Types

This data type contains cookie name-value pairs. Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL `RECORD` holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.

TYPE COOKIE IS RECORD (
   name           VARCHAR2(4000),
   vals           vc_arr,
   num_vals       INTEGER);
```

Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

Summary of OWA_COOKIE Subprograms

Table 172–1 OWA_COOKIE Package Subprograms

Subprogram	Description
GET Function on page 172-7	Gets the value of the specified cookie
GET_ALL Procedure on page 172-8	Gets all cookie name-value pairs
REMOVE Procedure on page 172-9	Removes the specified cookie
SEND procedure on page 172-10	Generates a "Set-Cookie" line in the HTTP header

GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE.

Syntax

```
OWA_COOKIE.GET(
    name           IN       VARCHAR2)
  RETURN COOKIE;
```

Parameters

Table 172–2 GET Procedure Parameters

Parameter	Description
name	The name of the cookie.

Return Values

OWA_COOKIE.COOKIE DATA TYPE.

GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(
   names          OUT      vc_arr,
   vals           OUT      vc_arr,
   num_vals       OUT      INTEGER);
```

Parameters

Table 172–3 GET_ALL Procedure Parameters

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990". This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(
   name           IN       VARCHAR2,
   val            IN       VARCHAR2,
   path           IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 172–4 REMOVE Procedure Parameters

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client. This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND(
   name           in       varchar2,
   value          in       varchar2,
   expires        in       date       DEFAULT NULL,
   path           in       varchar2   DEFAULT NULL,
   domain         in       varchar2   DEFAULT NULL,
   secure         in       varchar2   DEFAULT NULL);
```

Parameters

Table 172–5 SEND Procedure Parameters

Parameter	Description
`name`	The name of the cookie.
`value`	The value of the cookie.
`expires`	The date at which the cookie will expire
`path`	The value for the path field.
`domain`	The value for the domain field.
`secure`	If the value of this parameter is not `NULL`, the "secure" field is added to the line.

173

OWA_CUSTOM

The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function. It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

The chapter contains the following topics:

- Using OWA_CUSTOM
  - Constants
- Summary of OWA_CUSTOM Subprograms

Using OWA_CUSTOM

- Constants

Constants

- `dbms_server_timezone CONSTANT VARCHAR2(3) := 'PST';`
- `dbms_server_gmtdiff CONSTANT NUMBER := NULL;`

Summary of OWA_CUSTOM Subprograms

Table 173–1 OWA_CUSTOM Package Subprograms

Subprogram	Description
AUTHORIZE Function on page 173-5	Provides a Global PLSQL Agent Authorization callback function

AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

Syntax

```
OWA_CUSTOM.AUTHORIZE
  RETURN BOOLEAN;
```

174

OWA_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

The chapter contains the following topics:

  - Overview
  - Types
  - Variables
  - Examples
- Summary of OWA_IMAGE Subprograms

Using OWA_IMAGE

- Overview
- Types
- Variables
- Examples

Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

Types

This data type (`point`) contain the `X` and `Y` values of a coordinate, and so provides the coordinates of a user's click on an imagemap. It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

Examples

```
CREATE OR REPLACE PROCEDURE process_image
    (my_img in OWA_IMAGE.POINT)
    AS
    x integer := OWA_IMAGE.GET_X(my_img);
    y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
    /* process the coordinate */
END
```

Summary of OWA_IMAGE Subprograms

Table 174–1 OWA_IMAGE Package Subprograms

Subprogram	Description
GET_X Function on page 174-8	Gets the X value of a point type
GET_Y Function on page 174-9	Gets the Y value of a point type

GET_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(
   p         IN        point)
 RETURN INTEGER;
```

Parameters

Table 174–2 GET_X Procedure Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The X coordinate as an integer.

GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(
   p        IN        point)
 RETURN INTEGER;
```

Parameters

Table 174–3 GET_Y Procedure Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The Y coordinate as an integer.

175

OWA_OPT_LOCK

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

This chapter contains the following topics:

- Using OWA_OPT_LOCK
  - Overview
  - Types
- Summary of OWA_OPT_LOCK Subprograms

Using OWA_OPT_LOCK

- Overview
- Types

Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the owa_opt_lock.store_values procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the owa_opt_lock.checksum function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

Types

This data type is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR DATA TYPE`.

Summary of OWA_OPT_LOCK Subprograms

Table 175–1 OWA_CACHE Package Subprograms

Subprogram	Description
CHECKSUM Functions on page 175-6	Returns the checksum value
GET_ROWID Function on page 175-7	Returns the ROWID value
STORE_VALUES Procedure on page 175-8	Stores unmodified values in hidden fields for later verification
VERIFY_VALUES Function on page 175-9	Verifies the stored values against modified values

CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
   p_buff        IN       VARCHAR2)
 RETURN NUMBER;

OWA_OPT_LOCK.CHECKSUM(
   p_owner       IN      VARCHAR2,
   p_tname       IN       VARCHAR2,
   p_rowid       IN       ROWID)
  RETURN NUMBER;
```

Parameters

Table 175–2 CHECKSUM Procedure Parameters

Parameter	Description
`p_buff`	The nstring where you want to calculate the `checksum`.
`p_owner`	The owner of the table.
`p_tname`	The table name.
`p_rowid`	The row in `p_tname` where you want to calculate the `checksum` value. Use the GET_ROWID Function to convert `VCARRAY` values to proper rowids.

GET_ROWID Function

This function returns the ROWID data type from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```
OWA_OPT_LOCK.GET_ROWID(
   p_old_values      IN      vcarray)
 RETURN ROWID;
```

Parameters

Table 175–3 GET_ROWID Procedure Parameters

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```
OWA_OPT_LOCK.STORE_VALUES(
   p_owner        IN       VARCHAR2,
   p_tname        IN       VARCHAR2,
   p_rowid        IN       ROWID);
```

Parameters

Table 175–4 STORE_VALUES Procedure Parameters

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.

VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query. Use this function with the STORE_VALUES Procedure.

Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
   p_old_values IN vcarray)
 RETURN BOOLEAN;
```

Parameters

Table 175–5 VERIFY_VALUES Procedure Parameters

Parameter	Description
p_old_values	A PL/SQL table containing the following information: ▪ p_old_values(1) specifies the owner of the table. ▪ p_old_values(2) specifies the table. ▪ p_old_values(3) specifies the rowid of the row to verify. The remaining indexes contain values for the columns in the table. Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.

Return Values

TRUE if no other update has been performed, otherwise FALSE.

176

OWA_PATTERN

The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

The chapter contains the following topics:

- Using OWA_PATTERN
  - Types
  - Operational Notes
- Summary of OWA_PATTERN Subprograms

Using OWA_PATTERN

- Types
- Operational Notes

Types

You can use a pattern as both an input and output parameter. Thus, you can pass the same regular expression to `OWA_PATTERN` function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of MATCH, and four each of AMATCH and CHANGE. The subprograms use the following parameters:

- line - This is the target to be examined for a match. It can be more than one line of text or a owa_text.multi_line data type.
- pat - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the owa_pattern.change function and procedure, this parameter is called from_str.
- flags - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- Wildcards
- Quantifiers
- Flags

Wildcards

Wildcard tokens match something other than themselves:

Table 176–1 Wildcard tokens recognized by OWA_PATTERN package

Token	Description
^	Matches newline or the beginning of the target
$	Matches newline or the end of the target
\n	Matches newline
.	Matches any character except newline
\t	Matches tab
\d	Matches digits [0-9]
\D	Matches non-digits [not 0-9]
\w	Matches word characters (0-9, a-z, A-Z, or _)
\W	Matches non-word characters (not 0-9, a-z, A-Z, or _)
\s	Matches whitespace characters (blank, tab, or newline).
\S	Matches non-whitespace characters (not blank, tab, or newline)
\b	Matches "word" boundaries (between \w and \W)
\x<HEX>	Matches the value in the current character set of the two hexadecimal digits
\<OCT>	Matches the value in the current character set of the two or three octal digits
\	Followed by any character not covered by another case matches that character
&	Applies only to CHANGE. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures.

Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals:

Table 176–2 Quantifiers

Quantifier	Description
?	0 or 1 occurrence(s)
*	0 or more occurrences
+	1 or more occurrence(s)
{n}	Exactly *n* occurrences
(n,}	At least *n* occurrences
{n,m}	At least *n*, but not more than *m*, occurrences

Flags

In addition to targets and regular expressions, the OWA_PATTERN functions and procedures use flags to affect how they are interpreted.

Table 176–3 Flags

Flag	Description
i	This indicates a case-insensitive search.
g	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

Summary of OWA_PATTERN Subprograms

Table 176–4 OWA_CACHE Package Subprograms

Subprogram	Description
AMATCH Function on page 176-7	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
CHANGE Functions and Procedures on page 176-9	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
GETPAT Procedure on page 176-11	Generates a pattern data type from a `VARCHAR2` type
MATCH Function on page 176-12	Determines if a string contains the specified pattern

AMATCH Function

This function specifies if a pattern occurs in a particular location in a string. There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern data type.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern data type.

> **Note:** If multiple overlapping strings match the regular expression, this function takes the longest match.

Syntax

```
OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            in       varchar2
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            IN OUT   PATTERN
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 176–5 AMATCH Procedure Parameters

Parameter	Description
`line`	The text to search in.

Table 176–5 (Cont.) AMATCH Procedure Parameters

Parameter	Description
from_loc	The location (in number of characters) in `line` where the search is to begin.
`pat`	The string to match. It can contain regular expressions. This can be either a `VARCHAR2` or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the `OWA_TEXT.VC_ARR DATA TYPE` PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

The index of the character after the end of the match, counting from the beginning of `line`. If there was no match, the function returns `0`.

CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` data type. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE(
   line           IN OUT    VARCHAR2,
   from_str       IN        VARCHAR2,
   to_str         IN        VARCHAR2,
   flags          IN        VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   line           IN OUT   VARCHAR2,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);

owa_pattern.change(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 176–6 CHANGE Procedure Parameters

Parameter	Description
`line`	The text to search in. The output value of this parameter is the altered string.
mline	The text to search in. This is a `owa_text.multi_line data type`. The output value of this parameter is the altered string.
`from_str`	The regular expression to replace.
to_str	The substitution pattern.
flags	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If `"i"` is specified, the search is case-insensitive. If `"g"` is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "`Cats in`". It then replaces this string with "& red". The ampersand character "`&`" indicates "`Cats in`" because that is what matched the regular expression. Thus, this procedure replaces the string "`Cats in pajamas`" with "`Cats in red`" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found     INTEGER;
   BEGIN
       theline := 'what is the goal?';
       num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
       HTP.PRINT(num_found); -- num_found is 1
       HTP.PRINT(theline); -- theline is 'what is the idea?'
   END;
/
SHOW ERRORS
```

GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN.PATTERN DATA TYPE.

Syntax

```
OWA_PATTERN.GETPAT(
   arg      IN          VARCHAR2,
   pat      IN OUT      pattern);
```

Parameters

Table 176–7 GETPAT Procedure Parameters

Parameter	Description
arg	The string to convert.
pat	the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.

MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```
owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   mline          IN       owa_text.multi_line,
   pat            IN       VARCHAR2,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   mline          IN       owa_text.multi_line,
   pat            IN OUT   pattern,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 176–8 CHANGE Procedure Parameters

Parameter	Description
`line`	The line to search in.
`mline`	The text to search in. This is a `owa_text.multi_line data type`..

Table 176–8 (Cont.) CHANGE Procedure Parameters

Parameter	Description
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext  VARCHAR2(256);
pat       VARCHAR2(256);

sometext    := 'what is the goal?'
pat         := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
   THEN
      HTP.PRINT('Match found');
   ELSE
     HTP.PRINT('Match not found');
END IF;
```

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create AN OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.
- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT.STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.

- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

177

OWA_SEC

The OWA_SEC package provides an interface for custom authentication.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

The chapter contains the following topics:

- Using OWA_SEC
  - Operational Notes
- Summary of OWA_SEC Subprograms

Using OWA_SEC

- Operational Notes

Operational Notes

Parameters that have default values are optional.

Summary of OWA_SEC Subprograms

Table 177–1 OWA_SEC Package Subprograms

Subprogram	Description
GET_CLIENT_HOSTNAME Function on page 177-5	Returns the client's hostname
GET_CLIENT_IP Function on page 177-6	Returns the client's IP address
GET_PASSWORD Function on page 177-7	Returns the password that the user entered
GET_USER_ID Function on page 177-8	Returns the username that the user entered
SET_AUTHORIZATION Procedure on page 177-9	Enables the PL/SQL application to use custom authentication
SET_PROTECTION_REALM Procedure on page 177-10	Defines the realm that the page is in

GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
 RETURN VARCHAR2;
```

Return Values

The hostname.

GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP
  RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address data type` is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is `123.45.67.89` and the variable `ipaddr` is of the owa_util.ip_address data type, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```

GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD
  RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```
OWA_SEC.GET_USER_ID
  RETURN VARCHAR2;
```

Return Values

The username.

SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway. This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(
    scheme          IN       INTEGER);
```

Parameters

Table 177–2 SET_AUTHORIZATION Procedure Parameters

Parameter	Description

`scheme`	The authorization scheme. It is one of the following schemes for `SET_AUTHORIZATION`:
	■ `OWA_SEC.NO_CHECK` - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.
	■ `OWA_SEC.GLOBAL` - Defines an authorize function that is called for all users and all procedures. This is the `OWA_CUSTOM`.AUTHORIZE Function in the "`sys`" schema.
	■ `OWA_SEC.PER_PACKAGE` - Define an `authorize` function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.`AUTHORIZE` function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous `authorize` function in the user's schema is called.
	■ `OWA_SEC.CUSTOM` - Implements different authorize functions for each user. The function `OWA_CUSTOM`.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an `OWA_CUSTOM`.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema.
	The custom `authorize` function has the following signature:
	`FUNCTION AUTHORIZE`
	`  RETURN BOOLEAN;`
	If the function returns `TRUE`, authentication succeeded. If it returns `FALSE`, authentication failed. If the `authorize` function is not defined, the Gateway returns an error and fails.

SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
   realm      IN      VARCHAR2);
```

Parameters

Table 177–3 SET_PROTECTION_REALM Procedure Parameters

Parameter	Description
`realm`	The realm where the page belongs. This string is displayed to the user.

178

OWA_TEXT

The OWA_TEXT package contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

The chapter contains the following topics:

- Using OWA_TEXT
  - Types
- Summary of OWA_TEXT Subprograms

Using OWA_TEXT

- Types

Types

- MULTI_LINE DATA TYPE
- ROW_LIST DATA TYPE
- VC_ARR DATA TYPE

MULTI_LINE DATA TYPE

This data type is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

```
TYPE multi_line IS RECORD (
   rows           vc_arr,
   num_rows       INTEGER,
   partial_row    BOOLEAN);
```

ROW_LIST DATA TYPE

This is the data type for holding data to be processed.

```
TYPE row_list IS RECORD (
   rows           int_arr,
   num_rows       INTEGER);
```

```
int_arr IS DEFINED AS:
```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;

VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of OWA_TEXT Subprograms

Table 178–1 OWA_TEXT Package Subprograms

Subprogram	Description
ADD2MULTI Procedure on page 178-5	Adds text to an existing `multi_line` type
NEW_ROW_LIST Function and Procedure on page 178-6	Creates a new `row_list`
PRINT_MULTI Procedure on page 178-7	Prints out the contents of a `multi_list`
PRINT_ROW_LIST Procedure on page 178-8	Prints out the contents of a `row_list`
STREAM2MULTI Procedure on page 178-9	Converts a varchar2 to a `multi_line` type

ADD2MULTI Procedure

This procedure adds content to an existing MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.ADD2MULTI(
   stream          IN       VARCHAR2,
   mline           IN OUT   multi_line,
  continue      IN      BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 178–2 ADD2MULTI Procedure Parameters

Parameter	Description
`stream`	The text to add.
`mline`	The `OWA_TEXT.MULTI_LINE DATA TYPE`. The output of this parameter contains *stream*.
`continue`	If `TRUE`, the procedure appends *stream* within the previous final row (assuming it is less than 32K). If `FALSE`, the procedure places *stream* in a new row.

NEW_ROW_LIST Function and Procedure

This function or procedure creates a new OWA_TEXT.ROW_LIST DATA TYPE. The function version uses no parameters and returns a new empty row_list. The procedure version creates the row_list data type as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist    OUT     row_list);
```

Parameters

Table 178–3 NEW_ROW_LIST Procedure Parameters

Parameter	Description
rlist	This is an output parameter containing the new row_list data type

Return Values

The function version returns the new row_list data type.

PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_MULTI(
   mline       IN       multi_line);
```

Parameters

Table 178–4 PRINT_MULTI Procedure Parameters

Parameter	Description
mline	The multi_line data type to print.

Return Values

The contents of the multi_line.

PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.ROW_LIST DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(
   rlist       IN       multi_line);
```

Parameters

Table 178–5 PRINT_ROW_LIST Procedure Parameters

Parameter	Description
`rlist`	The row_list data type to print.

Return Values

The contents of the `row_list`.

STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` data type.

Syntax

```
OWA_TEXT.STREAM2MULTI(
   stream          IN       VARCHAR2
   mline           OUT      multi_line);
```

Parameters

Table 178–6 STREAM2MULTI Procedure Parameters

Parameter	Description
`stream`	The string to convert.
`mline`	The stream in `OWA_TEXT.MULTI_LINE DATA TYPE` format

179

OWA_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

This chapter contains the following topics:

- Using OWA_UTIL
  - Overview
  - Types
- Summary of OWA_UTIL Subprograms

Using OWA_UTIL

- Overview
- Types

Overview

The OWA_UTIL package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a data type by the Oracle database.

Types

- DATETYPE Data Type
- IDENT_ARR Data Type
- IP_ADDRESS Data Type

DATETYPE Data Type

The TODATE Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

IDENT_ARR Data Type

This data type is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

IP_ADDRESS Data Type

This data type is used by the GET_CLIENT_IP Function in the "OWA_SEC" package on on page 177-1.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

Summary of OWA_UTIL Subprograms

Table 179–1 OWA_UTIL Package Subprograms

Subprogram	Description
BIND_VARIABLES Function on page 179-6	Prepares a SQL query and binds variables to it
CALENDARPRINT Procedures on page 179-7	Prints a calendar
CELLSPRINT Procedures on page 179-8	Prints the contents of a query in an HTML table
CHOOSE_DATE Procedure on page 179-10	Generates HTML form elements that allow the user to select a date
GET_CGI_ENV Function on page 179-11	Returns the value of the specified CGI environment variable
GET_OWA_SERVICE_PATH Function on page 179-12	Returns the full virtual path for the PL/SQL Gateway
GET_PROCEDURE Function on page 179-13	Returns the name of the procedure that is invoked by the PL/SQL Gateway
HTTP_HEADER_CLOSE Procedure on page 179-14	Closes the HTTP header
LISTPRINT Procedure on page 179-15	Generates a HTML form element that contains data from a query
MIME_HEADER Procedure on page 179-16	Generates the Content-type line in the HTTP header
PRINT_CGI_ENV Procedure on page 179-17	Generates a list of all CGI environment variables and their values
REDIRECT_URL Procedure on page 179-18	Generates the Location line in the HTTP header
SHOWPAGE Procedure on page 179-19	Prints a page generated by the HTP and HTF packages in SQL*Plus
SHOWSOURCE Procedure on page 179-20	Prints the source for the specified subprogram
SIGNATURE procedure on page 179-21	Prints a line that says that the page is generated by the PL/SQL Agent
STATUS_LINE Procedure on page 179-22	Generates the Status line in the HTTP header
TABLEPRINT Function on page 179-23	Prints the data from a table in the database as an HTML table
TODATE Function on page 179-26	Converts dateType data to the standard PL/SQL date type
WHO_CALLED_ME Procedure on page 179-27	Returns information on the caller of the procedure.

BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES(
   theQuery       IN       VARCHAR2   DEFAULT NULL,
   bv1Name        IN       VARCHAR2   DEFAULT NULL,
   bv1Value       IN       VARCHAR2   DEFAULT NULL,
   bv2Name        IN       VARCHAR2   DEFAULT NULL,
   bv2Value       IN       VARCHAR2   DEFAULT NULL,
   bv3Name        IN       VARCHAR2   DEFAULT NULL,
   bv3Value       IN       VARCHAR2   DEFAULT NULL,
        ...
   bv25Name       IN       VARCHAR2   DEFAULT NULL,
   bv25Value      IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 179–2 BIND_VARIABLES Function Parameters

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

Return Values

An integer identifying the opened cursor.

CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.CALENDARPRINT(
   p_query        IN       VARCHAR2,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');

OWA_UTIL.CALENDARPRINT(
   p_cursor       IN       INTEGER,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');
```

Parameters

Table 179–3 CALENDARPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table. There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the FORMAT_CELL Function in the "HTF" package on page 167-1.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```
OWA_UTIL.CELLSPRINT(
   p_colCnt          IN    INTEGER,
   p_resultTbl       IN    vc_arr,
  p_format_numbers IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  iN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER      DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
```

```
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN,
   p_reccnt          OUT   NUMBER);
```

Parameters

Table 179–4 CELLSPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

Examples

This function generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE(
   p_name         IN       VARCHAR2,
   p_date         IN       DATE       DEFAULT SYSDATE);
```

Parameters

Table 179–5 CHOOSE_DATE Procedure Parameters

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a GET_CGI_ENV Function.
- Use the TODATE Function to convert the GET_CGI_ENV Function value to the standard Oracle DATE data type.

Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
     ...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
     ...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
     ...
<OPTION value="2002">2002
</SELECT>
```

GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(
   param_name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 179–6 GET_CGI_ENV Function Parameters

Parameter	Description
`param_name`	The name of the CGI environment variable. It is case-insensitive.

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns `NULL`.

GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH
 RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```
OWA_UTIL.GET_PROCEDURE
 RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as MIME_HEADER Procedure, REDIRECT_URL Procedure, or STATUS_LINE Procedure
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query. There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.LISTPRINT(
   p_theQuery     IN       VARCHAR2,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);

OWA_UTIL.LISTPRINT(
   p_theCursor    IN    INTEGER,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 179–7 LISTPRINT Procedure Parameters

Parameter	Description
p_theQuery	The SQL query.
p_theCursor	The cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_cname	The name of the HTML form element.
p_nsize	The size of the form element (this controls how many items the user can see without scrolling).
p_multiple	Whether multiple selection is permitted.

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
     ...
</SELECT>
```

MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTP.PRINT or HTP.PRN calls to direct the script not to use the default MIME header.

Syntax

```
OWA_UTIL.MIME_HEADER(
   ccontent_type    IN       VARCHAR2   DEFAULT 'text/html',
   bclose_header    IN       BOOLEAN    DEFAULT TRUE,
   ccharset         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 179–8 MIME_HEADER Procedure Parameters

Parameter	Description
ccontent_type	The MIME type to generate
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
ccharset	The character set to use.The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a web page to return or a program to execute.

Syntax

```
OWA_UTIL.REDIRECT_URL(
   curl           IN       VARCHAR2
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 179–9 REDIRECT_URL Function Parameters

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Usage Notes

This procedure must come before any HTP procedure or HTF function call.

Examples

This procedure generates

```
Location: <curl>\n\n
```

SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus. The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

```
OWA_UTIL.SHOWPAGE;
```

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the DBMS_OUTPUT package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```
OWA_UTIL.SHOWSOURCE (
   cname      IN     VARCHAR2);
```

Parameters

Table 179–10 SHOWSOURCE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document. If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the SHOWSOURCE Procedure.

Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
   cname        IN        VARCHAR2);
```

Parameters

Table 179–11 SIGNATURE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client. This procedure must come before any `htp.print` or `htp.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE(
   nstatus        IN       INTEGER,
   creason        IN       VARCHAR2   DEFAULT NULL,
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 179–12 STATUS_LINE Procedure Parameters

Parameter	Description
`nstatus`	The status code.
`creason`	The string for the status code.
`bclose_header`	Whether or not to close the HTTP header. If `TRUE`, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Examples

This procedure generates

`Status: <`*`nstatus`*`> <`*`creason`*`>\n\n`

TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT(
   ctable         IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL,
   ntable_type    IN       INTEGER    DEFAULT HTML_TABLE,
   ccolumns       IN       VARCHAR2   DEFAULT '*',
   cclauses       IN
  VARCHAR2   DEFAULT NULL,
   ccol_aliases   IN       VARCHAR2   DEFAULT NULL,
   nrow_min       IN       NUMBER     DEFAULT 0,
   nrow_max       IN       NUMBER     DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 179–13 TABLEPRINT Function Parameters

Parameter	Description
ctable	The database table.
cattributes	Other attributes to be included as-is in the tag.
ntable_type	How to generate the table. Specify HTML_TABLE to generate the table using <TABLE> tags or PRE_TABLE to generate the table using the <PRE> tags. These are constants: ■ HTML_TABLE CONSTANT INTEGER := 1; ■ PRE_TABLE CONSTANT INTEGER := 2;
ccolumns	A comma-delimited list of columns from ctable to include in the generated table.
cclauses	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.
ccol_aliases	A comma-delimited list of headings for the generated table.
nrow_min	The first row, of those retrieved, to display.
nrow_max	The last row, of those retrieved, to display.

Return Values

Returns TRUE if there are more rows beyond the nrow_max requested, FALSE otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, cattributes is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

```
http://myhost:7777/pls/hr/showemps
```

returns to the following to the client:

```
<PRE>
---------------------------------------------------------------------
| EMPNO |ENAME |JOB      |MGR   |HIREDATE   | SAL | COMM | DEPTNO |
---------------------------------------------------------------------
| 7369| SMITH  | CLERK   | 7902 | 17-DEC-80 | 800 |      | 20 |
| 7499| ALLEN  | SALESMAN| 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521| WARD   | SALESMAN| 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566| JONES  | MANAGER | 7839 | 02-APR-81 | 2975 |     | 20 |
| 7654| MARTIN | SALESMAN| 7698 | 28-SEP-81 | 1250 | 1400| 30 |
| 7698| BLAKE  | MANAGER | 7839 | 01-MAY-81 | 2850 |     | 30 |
| 7782| CLARK  | MANAGER | 7839 | 09-JUN-81 | 2450 |     | 10 |
| 7788| SCOTT  | ANALYST | 7566 | 09-DEC-82 | 3000 |     | 20 |
| 7839| KING   | PRESIDENT |    | 17-NOV-81 | 5000 |     | 10 |
| 7844| TURNER | SALESMAN| 7698 | 08-SEP-81 | 1500 | 0   | 30 |
| 7876| ADAMS  | CLERK   | 7788 | 12-JAN-83 | 1100 |     | 20 |
| 7900| JAMES  | CLERK   | 7698 | 03-DEC-81 | 950  |     | 30 |
| 7902| FORD   | ANALYST | 7566 | 03-DEC-81 | 3000 |     | 20 |
| 7934| MILLER | CLERK   | 7782 | 23-JAN-82 | 1300 |     | 10 |
---------------------------------------------------------------------
</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
 ignore_more BOOLEAN;
begin
 ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
     'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
     'Employee Number, Name, Salary');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showemps_10
```

would return the following to the client:

```
<PRE>
-------------------------------------
| Employee Number |Name    | Salary |
-------------------------------------
| 7782            | CLARK  | 2450   |
| 7839            | KING   | 5000   |
| 7934            | MILLER | 1300   |
-------------------------------------
```

```
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

TODATE Function

This function converts the DATETYPE Data Type to the standard Oracle `DATE` type.

Syntax

```
OWA_UTIL.TODATE(
   p_dateArray      IN     dateType)
 RETURN DATE;
```

Parameters

Table 179–14 TODATE Function Parameters

Parameter	Description
`p_dateArray`	The value to convert.

WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME(
   owner          OUT      VARCHAR2,
   name           OUT      VARCHAR2,
   lineno         OUT      NUMBER,
   caller_t       OUT      VARCHAR2);
```

Parameters

Table 179–15 WHO_CALLED_ME Procedure Parameters

Parameter	Description
owner	The owner of the program unit.
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

180

SDO_CS

The SDO_CS package contains functions and procedures for working with coordinate systems. You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

- Documentation of SDO_CS

Documentation of SDO_CS

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial Developer's Guide*.

181

SDO_CSW_PROCESS

The SDO_CSW_PROCESS package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

- Documentation of SDO_CSW_PROCESS

Documentation of SDO_CSW_PROCESS

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial Developer's Guide*.

182

SDO_GCDR

The SDO_GCDR package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

- Documentation of SDO_GCDR

Documentation of SDO_GCDR

For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in *Oracle Spatial Developer's Guide.*

183

SDO_GEOM

The SDO_GEOM package contains the geometry functions, which can be grouped into the following categories (with examples of each):

- Relationship (True/False) between two objects: RELATE, WITHIN_DISTANCE
- Validation: VALIDATE_GEOMETRY_WITH_CONTEXT, VALIDATE_LAYER_WITH_CONTEXT
- Single-object operations: SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- Two-object operations: SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

This chapter contains the following topic:

- Documentation of SDO_GEOM

Documentation of SDO_GEOM

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOM` in the *Oracle Spatial Developer's Guide*.

184

SDO_GEOR

The SDO_GEOR package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

- Documentation of SDO_GEOR

Documentation of SDO_GEOR

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial GeoRaster Developer's Guide*.

185

SDO_GEOR_ADMIN

The SDO_GEOR_ADMIN package contains subprograms for administrative operations related to GeoRaster.

- Documentation of SDO_GEOR_ADMIN

Documentation of SDO_GEOR_ADMIN

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial GeoRaster Developer's Guide*.

186

SDO_GEOR_UTL

The SDO_GEOR_UTL package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

- Documentation of SDO_GEOR_UTL

Documentation of SDO_GEOR_UTL

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial GeoRaster Developer's Guide*.

187

SDO_LRS

The SDO_LRS package contains functions that create, modify, query, and convert linear referencing elements.

- Documentation of SDO_LRS

Documentation of SDO_LRS

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial Developer's Guide*.

188

SDO_MIGRATE

The SDO_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

- Documentation of SDO_MIGRATE

Documentation of SDO_MIGRATE

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial Developer's Guide*.

189

SDO_NET

The SDO_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

- Documentation of SDO_NET

Documentation of SDO_NET

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial Topology and Network Data Models Developer's Guide.*

190

SDO_NET_MEM

The SDO_NET_MEM package contains functions and procedures for performing editing and analysis operations on network data using a network memory object.

- Documentation of SDO_NET_MEM

Documentation of SDO_NET_MEM

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET_MEM` in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

191

SDO_OLS

The SDO_OLS package contains subprograms for Spatial OpenLS support.

- Documentation of SDO_OLS

Documentation of SDO_OLS

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial Developer's Guide*.

192

SDO_PC_PKG

The SDO_PC_PKG package contains subprograms to support the use of point clouds in Spatial.

- Documentation of SDO_PC_PKG

Documentation of SDO_PC_PKG

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial Developer's Guide*.

193

SDO_SAM

The SDO_SAM package contains functions and procedures for spatial analysis and data mining.

- Documentation of SDO_SAM

Documentation of SDO_SAM

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial Developer's Guide*.

194

SDO_TIN_PKG

The SDO_TIN_PKG package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

- Documentation of SDO_TIN_PKG

Documentation of SDO_TIN_PKG

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the *Oracle Spatial Developer's Guide*.

195

SDO_TOPO

The SDO_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

- Documentation of SDO_TOPO

Documentation of SDO_TOPO

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial Topology and Network Data Models Developer's Guide.*

196

SDO_TOPO_MAP

The SDO_TOPO_MAP package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

- Documentation of SDO_TOPO_MAP

Documentation of SDO_TOPO_MAP

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial Topology and Network Data Models Developer's Guide.*

197

SDO_TUNE

The SDO_TUNE package contains Spatial tuning functions and procedures.

- Documentation of SDO_TUNE

Documentation of SDO_TUNE

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial Developer's Guide*.

198

SDO_UTIL

The SDO_UTIL package contains the utility functions and procedures for Oracle Spatial.

- Documentation of SDO_UTIL

Documentation of SDO_UTIL

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial Developer's Guide*.

199

SDO_WFS_LOCK

The SDO_WFS_LOCK package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

- Documentation of SDO_WFS_LOCK

Documentation of SDO_WFS_LOCK

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial Developer's Guide*.

200

SDO_WFS_PROCESS

The SDO_WFS_PROCESS package contains subprograms for various processing operations related to support for Web Feature Services.

- Documentation of SDO_WFS_PROCESS

Documentation of SDO_WFS_PROCESS

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial Developer's Guide*.

201

SEM_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

- Documentation of SEM_APIS

Documentation of SEM_APIS

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Database Semantic Technologies Developer's Guide*.

202

SEM_PERF

The SEM_PERF package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

- Documentation of SEM_PERF

Documentation of SEM_PERF

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Database Semantic Technologies Developer's Guide*.

203

UTL_COLL

The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- Summary of UTL_COLL Subprograms

Summary of UTL_COLL Subprograms

Table 203–1 UTL_COLL Package Subprograms

Subprogram	Description
IS_LOCATOR Function on page 203-3	Determines whether a collection item is actually a locator or not

IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```
UTL_COLL.IS_LOCATOR (
   coln IN STANDARD)
  RETURNS BOOLEAN;
```

Pragmas

Asserts `WNDS`, `WNPS` and `RNPS` pragmas

Parameters

Table 203–2 IS_LOCATOR Function Parameters

Parameter	Description
`coln`	Nested table or varray item.

Return Values

Table 203–3 IS_LOCATOR Function Return Values

Return Value	Description
`1`	Collection item is indeed a locator.
`0`	Collection item is not a locator.

Examples

```
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
  pno  number,
  ph   list_t );
/

CREATE TABLE phone_book OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
  plist list_t;
  plist1 list_t;
BEGIN
  SELECT ph INTO plist FROM phone_book WHERE pno=1;

  SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

  IF (UTL_COLL.IS_LOCATOR(plist)) THEN
    DBMS_OUTPUT.PUT_LINE('plist is a locator');
```

```
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist is not a locator');
  END IF;

  IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
    DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
  END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

204

UTL_COMPRESS

The `UTL_COMPRESS` package provides a set of data compression utilities.

This chapter contains the following topics:

- Using UTL_COMPRESS
  - Constants
  - Exceptions
  - Operational Notes
- Summary of UTL_COMPRESS Subprograms

Using UTL_COMPRESS

- Constants
- Exceptions
- Operational Notes

Constants

Define max number of handles for piecewise operations:

```
UTLCOMP_MAX_HANDLE   CONSTANT  PLS_INTEGER := 5;
```

Exceptions

Table 204–1 UTL_COMPRESS Exceptions

Exception	Description
BUFFER_TOO_SMALL	The compressed representation is too big.
DATA_ERROR	The input or output data stream was found to be an invalid format.
INVALID_ARGUMENT	One of the arguments was an invalid type or value.
INVALID_HANDLE	Invalid handle for piecewise compress or uncompress.
STREAM_ERROR	An error occurred during compression or uncompression of the data stream

Operational Notes

- It is the caller's responsibility to free the temporary `LOB` returned by the `LZ*` functions with `DBMS_LOB.FREETEMPORARY` call.
- A `BFILE` passed into `LZ_COMPRESS*` or l`Z_UNCOMPRESS*` has to be opened by `DBMS_LOB.FILEOPEN`.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the `UTL_COMPRESS` subprograms may be the same size, or even slightly larger than, the input.
- The output of the `UTL_COMPRESS` compressed data is compatible with `gzip`(with `-n` option)`/gunzip` on a single file.

Summary of UTL_COMPRESS Subprograms

Table 204–2 UTL_COMPRESS Package Subprograms

Subprogram	Description
ISOPEN Function on page 204-7	Checks to see if the handle to a piecewise (un)compress context is open or closed
LZ_COMPRESS Functions and Procedures on page 204-8	Compresses data using Lempel-Ziv compression algorithm
LZ_COMPRESS_ADD Procedure on page 204-10	Adds a piece of compressed data
LZ_COMPRESS_CLOSE on page 204-11	Closes and finishes piecewise compress operation
LZ_COMPRESS_OPEN on page 204-12	Initializes a piecewise context that maintains the compress state and data
LZ_UNCOMPRESS Functions and Procedures on page 204-13	Accepts compressed input, verifies it to be a valid and uncompresses it
LZ_UNCOMPRESS_EXTRACT Procedure on page 204-14	Extracts a piece of uncompressed data
LZ_UNCOMPRESS_OPEN Function on page 204-15	Initializes a piecewise context that maintains the uncompress state and data
LZ_UNCOMPRESS_CLOSE Procedure on page 204-16	Closes and finishes the piecewise uncompress

ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

```
UTL_COMPRESS.ISOPEN(
   handle in binary_integer)
 RETURN BOOLEAN;
```

Parameters

Table 204–3 ISOPEN Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
   UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
   UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
   src       IN           RAW,
   quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src       IN           BLOB,
  quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN            BLOB,
  dst      IN OUT NOCOPY BLOB,
  quality  IN            BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   quality IN            BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   dst     IN OUT NOCOPY BLOB,
   quality IN            BINARY_INTEGER DEFAULT 6);
```

Parameters

Table 204–4 LZ_COMPRESS Function and Procedures Parameters

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

Usage Notes

- `quality` is an optional compression tuning value. It allows the `UTL_COMPRESS` user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB,
   src    IN             RAW);
```

Parameters

Table 204–5 LZ_COMPRESS_ADD Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise compress context.
`dst`	The opened `LOB` from `LZ_COMPRESS_OPEN` to store compressed data.
`src`	The input data to be compressed.

Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - `NULL` handle, src, dst, or invalid `dst`.

LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB);
```

Parameters

Table 204–6 LZ_COMPRESS_CLOSE Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise compress context.
`dst`	The opened `LOB` from `LZ_COMPRESS_OPEN` to store compressed data.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, `dst`, or invalid `dst`.

LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
   dst       IN OUT NOCOPY BLOB,
   quality   IN            BINARY_INTEGER DEFAULT 6)
 RETURN BINARY_INTEGER;
```

Parameters

Table 204–7 LZ_COMPRESS_OPEN Function Parameters

Parameter	Description
`dst`	User supplied LOB to store compressed data.
`quality`	Speed versus efficiency of resulting compressed output. ■ Valid values are the range 1..9, with a default value of 6. ■ 1=fastest compression, 9=slowest compression and best compressed file size.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - `NULL dst` or invalid quality specified.

Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

Syntax

This function returns uncompressed data as RAW:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  RAW)
  RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB)
  RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB,
   dst  IN OUT NOCOPY BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN BFILE)
 RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BFILE,
   dst  IN OUT NOCOPY BLOB);
```

Parameters

Table 204–8 LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
src	Compressed data.
dst	Destination for uncompressed data.

LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
   handle  IN          BINARY_INTEGER,
   dst     OUT NOCOPY  RAW);
```

Parameters

Table 204–9 LZ_UNCOMPRESS_EXTRACT Function Parameters

Parameter	Description
`handle`	The handle to a piecewise uncompress context.
`dst`	The uncompressed data.

Exceptions

- `no_data_found` - finished uncompress.
- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
   src  IN  BLOB)
  RETURN BINARY_INTEGER;
```

Parameters

Table 204–10 LZ_UNCOMPRESS_OPEN Function Parameters

Parameter	Description
src	The input data to be uncompressed.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- invalid_handle - invalid handle, too many open handles.
- invalid_argument - NULL src.

Usage Notes

Close the opened handle with LZ_UNCOMPRESS_CLOSE

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
   handle  IN   BINARY_INTEGER);
```

Parameters

Table 204–11 LZ_UNCOMPRESS_CLOSE Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise uncompress context.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - `NULL` handle.

205

UTL_DBWS

The `UTL_DBWS` package provides database web services.

This chapter contains the following topics:

- Using UTL_DBWS
  - Supported Keys and Default Settings for Standard Call Properties
- Summary of UTL_DBWS Subprograms

Using UTL_DBWS

- Supported Keys and Default Settings for Standard Call Properties

Supported Keys and Default Settings for Standard Call Properties

Table 205–1 Supported Keys and Default Settings for Standard Call Properties

Key	Explanation of Value, Default value
'USERNAME'	User name for authentication.
'PASSWORD'	Password for authentication.
'ENCODINGSTYLE_URI'	Encoding style specified as a namespace URI. The default value is the SOAP 1.1 encoding http://schemas.xmlsoap.org/soap/encoding/.
'OPERATION_STYLE'	Standard property for operation style. Set to 'RPC' if the operation style is RPC, 'DOCUMENT' if the operation style is document.
'SESSION_MAINTAIN'	This boolean property is used by a service client to indicate whether or not it wants to participate in a session with a service endpoint.If this property is set to 'TRUE', the service client indicates that it wants the session to be maintained. If set to 'FALSE', the session is not maintained. The default value for this property is 'FALSE'
'SOAPACTION_USE'	This boolean property indicates whether or not SOAPAction is to be used. The default value of this property is 'FALSE'.
'SOAPACTION_URI'	Indicates the SOAPAction URI if the SOAPACTION_USE property is set to 'TRUE'

Summary of UTL_DBWS Subprograms

Table 205–2 UTL_DBWS Subprograms

Subprogram	Description
CREATE_CALL Function on page 205-5	Creates a Call instance
CREATE_SERVICE Function on page 205-6	Creates a Service instance
GET_IN_PARAMETER_ TYPES Function on page 205-7	Lists the XML type of the input parameters of the Call that is returned
GET_OUT_PARAMETER_ TYPES Function on page 205-8	Lists the XML type of the output parameters of the Call that is returned
GET_OUTPUT_VALUES Function on page 205-9	Obtains the output arguments after a Call invocation
GET_PORTS Function on page 205-10	Lists the qualified names of all of the ports in a service
GET_PROPERTY Function on page 205-11	Returns the value of a particular property on a Call
GET_RETURN_TYPE Function on page 205-12	Lists the XML type that is returned by the given Call
GET_SERVICES Function on page 205-13	Lists the qualified names of the services defined in a WDSL document
INVOKE Function on page 205-14	Invokes a specific operation using a synchronous request-response interaction mode
RELEASE_ALL_SERVICES Procedure on page 205-15	Releases all Service instances
RELEASE_CALL Procedure on page 205-16	Releases a particular Call instance
RELEASE_SERVICE Procedure on page 205-17	Releases a particular Service instance
REMOVE_PROPERTY Procedure on page 205-18	Clears the value of a particular property on a Call
SET_PROPERTY Procedure on page 205-19	Sets the value of a particular property on a Call

CREATE_CALL Function

This procedure creates a Call instance.

Syntax

```
UTL_DBWS.CREATE_CALL (
   service_handle    SERVICE,
   port_name         QNAME,
   operation_name    QNAME)
 RETURN CALL;
```

Parameters

Table 205–3 CREATE_CALL Function Parameters

Parameter	Description
service_handle	The Service instance to be called.
port_name	The qualified name for the port. Use the first port if this is NULL.
operation_name	The qualified name for the operation.

Return Values

Table 205–4 CREATE_CALL Return Values

Parameter	Description
CALL	Returns a handle to the Call instance.

CREATE_SERVICE Function

This procedure creates a Service instance.

Syntax

```
UTL_DBWS.CREATE_SERVICE(
   wsdl_document_location  URITYPE,
   service_name            QNAME)
  RETURN SERVICE;
```

Parameters

Table 205–5 CREATE_SERVICE Function Parameters

Parameter	Description
wsdl_document_location	The URL for the WSDL document location for the service
service_name	The qualified name for the service. Use the first service if this is NULL.

Return Values

Table 205–6 CREATE_SERVICE Return Values

Parameter	Description
SERVICE	Returns a handle to the Service instance.

GET_IN_PARAMETER_TYPES Function

This procedure lists the XML type of the input parameters of the Call that is returned.

Syntax

```
UTL_DBWS.GET_IN_PARAMETER_TYPES(
   call_handle    CALL)
 RETURN QNAME_LIST;
```

Parameters

Table 205–7 GET_IN_PARAMETER_TYPES Function Parameters

Parameter	Description
call_handle	The Service instance whose input types are returned.

Return Values

Table 205–8 GET_IN_PARAMETER_TYPES Function Return Values

Parameter	Description
QNAME_LIST	The list of the XML type of the input parameters of the Call that is returned.

GET_OUT_PARAMETER_TYPES Function

This procedure lists the XML type of the output parameters of the Call that is returned.

Syntax

```
UTL_DBWS.GET_OUT_PARAMETER_TYPES(
   call_handle    CALL)
 RETURN QNAME_LIST;
```

Parameters

Table 205–9 GET_OUT_PARAMETER_TYPES Function Parameters

Parameter	Description
call_handle	The Service instance whose output types are returned.

Return Values

Table 205–10 GET_OUT_PARAMETER_TYPES Function Return Values

Parameter	Description
QNAME_LIST	The list of the XML type of the input parameters of the Call that is returned.

GET_OUTPUT_VALUES Function

This procedure obtains the output arguments after a Call invocation.

Syntax

```
UTL_DBWS.GET_OUTPUT_VALUES(
   call_handle    CALL)
 RETURN ANYDATA_LIST;
```

Parameters

Table 205–11 GET_OUTPUT_VALUES Function Parameters

Parameter	Description
call_handle	The instance of the Call.

Return Values

Table 205–12 GET_OUTPUT_VALUES Function Return Values

Parameter	Description
ANYDATA_LIST	Returns the output arguments in order.

GET_PORTS Function

This procedure lists the qualified names of all of the ports in a service.

Syntax

```
UTL_DBWS.GET_PORTS(
   service_handle    SERVICE)
 RETURN QNAME_LIST;
```

Parameters

Table 205–13 GET_PORTS Function Parameters

Parameter	Description
service_handle	The service instance whose ports are returned

Return Values

Table 205–14 GET_PORTS Function Return Values

Parameter	Description
QNAME_LIST	Returns a list of the qualified names of all ports in a service

GET_PROPERTY Function

This procedure returns the value of a particular property on a Call.

Syntax

```
UTL_DBWS.GET_PROPERTY(
   call_handle    CALL,
   key            VARCHAR2)
  RETURN value VARCHAR2;
```

Parameters

Table 205–15 GET_PROPERTY Function Parameters

Parameter	Description
`call_handle`	The the instance of the Call.
`key`	The key for the property (see Using UTL_DBWS on page 205-2)

Return Values

Table 205–16 GET_PROPERTY Function Return Values

Parameter	Description
`value`	Returns the value of a particular property on a Call.

GET_RETURN_TYPE Function

This procedure lists the XML type that is returned by the given Call.

Syntax

```
UTL_DBWS.GET_RETURN_TYPE (
   call_handle    CALL)
 RETURN QNAME;
```

Parameters

Table 205–17 GET_RETURN_TYPE Function Parameters

Parameter	Description
call_handle	The Service instance whose return type is returned.

Return Values

Table 205–18 GET_RETURN_TYPE Function Return Values

Parameter	Description
QNAME	The type that is returned.

GET_SERVICES Function

This function lists the qualified names of the services defined in a WDSL document.

Syntax

```
UTL_DBWS.GET_SERVICES(
   wsdl_document_location  URITYPE)
 RETURN QNAME_LIST;
```

Parameters

Table 205–19 GET_SERVICES Function Parameters

Parameter	Description
wsdl_document_ location	The Service instance whose return type is returned.

Return Values

Table 205–20 GET_SERVICES Function Return Values

Parameter	Description
QNAME_LIST	A list of the qualified names of the services defined in the WSDL document.

INVOKE Function

This procedure invokes a specific operation using a synchronous request-response interaction mode.

Syntax

```
UTL_DBWS.INVOKE(
   call_handle    CALL,
   input_params   ANYDATA_LIST)
 RETURN ANYDATA;
```

Parameters

Table 205–21 INVOKE Function Parameters

Parameter	Description
`call_handle`	The Service instance whose return type is returned.
`input_params`	The input parameters for this invocation.

Return Values

Table 205–22 INVOKE Function Return Values

Parameter	Description
`ANYDATA`	Returns the return value or NULL.

RELEASE_ALL_SERVICES Procedure

This procedure releases all Service instances.

Syntax

```
UTL_DBWS.RELEASE_ALL_SERVICES;
```

RELEASE_CALL Procedure

This procedure releases a particular Call instance.

Syntax

```
UTL_DBWS.RELEASE_CALL(
   call_handle    CALL);
```

Parameters

Table 205–23 RELEASE_CALL Procedure Parameters

Parameter	Description
`call_handle`	The call instance that is to be released.

RELEASE_SERVICE Procedure

This procedure releases a particular Service instance.

Syntax

```
UTL_DBWS.RELEASE_SERVICE (
   service_handle     SERVICE);
```

Parameters

Table 205–24 RELEASE_SERVICE Procedure Parameters

Parameter	Description
service_handle	The call instance that is to be released.

Usage Notes

This will implicitly release all Call instances that have been created for this Service instance.

REMOVE_PROPERTY Procedure

This procedure clears the value of a particular property on a Call.

Syntax

```
UTL_DBWS.REMOVE_PROPERTY(
   call_handle   CALL,
   key           VARCHAR2);
```

Parameters

Table 205–25 REMOVE_PROPERTY Procedure Parameters

Parameter	Description
`call_handle`	The call instance.
`key`	The key for the property (see Using UTL_DBWS on page 205-2).

SET_PROPERTY Procedure

This procedure sets the value of a particular property on a Call.

Syntax

```
UTL_DBWS.SET_PROPERTY(
   call_handle    CALL,
   key            VARCHAR2,
   value          VARCHAR2);
```

Parameters

Table 205–26 SET_PROPERTY Function Parameters

Parameter	Description
`call_handle`	The instance of the Call.
`key`	The key for the property (see Using UTL_DBWS on page 205-2).
`value`	The value for the property.

206

UTL_ENCODE

The UTL_ENCODE package provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts. You can use UTL_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- Summary of UTL_ENCODE Subprograms

Summary of UTL_ENCODE Subprograms

Table 206–1 UTL_ENCODE Package Subprograms

Subprogram	Description
BASE64_DECODE Function on page 206-3	Reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value
BASE64_ENCODE Function on page 206-4	Encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string
MIMEHEADER_DECODE Function on page 206-5	Decodes a string from mime header format
MIMEHEADER_ENCODE Function on page 206-6	Encodes a string into mime header format
QUOTED_PRINTABLE_ DECODE Function on page 206-7	Reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string
QUOTED_PRINTABLE_ ENCODE Function on page 206-8	Reads the `RAW` input string and encodes it to the corresponding quoted printable format string
TEXT_DECODE Function on page 206-9	Decodes a character set sensitive text string
TEXT_ENCODE Function on page 206-10	Encodes a character set sensitive text string
UUDECODE Function on page 206-11	Reads the `RAW` uuencode format input string and decodes it to the corresponding `RAW` string
UUENCODE Function on page 206-12	Reads the `RAW` input string and encodes it to the corresponding uuencode format string

BASE64_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

Syntax

```
UTL_ENCODE.BASE64_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 206–2 BASE64_DECODE Function Parameters

Parameter	Description
r	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

Return Values

Table 206–3 BASE64_DECODE Function Return Values

Return	Description
RAW	Contains the decoded string

BASE64_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 206–4 BASE64_ENCODE Function Parameters

Parameter	Description
r	The RAW value to be encoded. There are no defaults or optional parameters.

Return Values

Table 206–5 BASE64_ENCODE Function Return Values

Return	Description
RAW	Contains the encoded base 64 elements

MIMEHEADER_DECODE Function

This function accepts as input an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the MIMEHEADER_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
   buf    IN   VARCHAR2 CHARACTER SET ANY_CS)
  RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 206–6 MIMEHEADER_DECODE Function Parameters

Parameter	Description
buf	The encoded text data with mime header format tags.

Return Values

Table 206–7 MIMEHEADER_DECODE Function Return Values

Return	Description
data	The encoded text data with mime header format tags

Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
```

MIMEHEADER_ENCODE Function

This function accepts as input an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The <encoding> value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The ENCODING input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 206–8 MIMEHEADER_ENCODE Function Parameters

Parameter	Description
`buf`	The text data.
`encode_charset`	The target character set.
`encoding`	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`

Return Values

Table 206–9 MIMEHEADER_ENCODE Function Return Values

Return	Description
`string`	A `VARCHAR2` encoded string with mime header format tags.

QUOTED_PRINTABLE_DECODE Function

This function reads the varchar2 quoted printable format input string and decodes it to the corresponding RAW string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 206–10 QUOTED_PRINTABLE_DECODE Function Parameters

Parameters	Description
r	The RAW string containing a quoted printable data string. There are no defaults or optional parameters.

Return Values

Table 206–11 QUOTED_PRINTABLE_DECODE Function Return Values

Return	Description
RAW	The decoded string

QUOTED_PRINTABLE_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS,WNPS, RNPS);
```

Parameters

Table 206–12 QUOTED_PRINTABLE_ENCODE Function Parameters

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

Return Values

Table 206–13 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
RAW	Contains the quoted printable string

TEXT_DECODE Function

This function converts the input text to the target character set as specified by the encode_charset parameter, if not NULL. The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If NULL, quoted-printable is selected as a default decoding format. If encode_charset is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE(
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 206–14 TEXT_DECODE Function Parameters

Parameter	Description
buf	The encoded text data.
encode_charset	The source character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL.

Return Values

Table 206–15 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
string	A VARCHAR2 decoded text string.

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
     'Here is some text',
      WE8ISO8859P1,
      UTL_ENCODE.BASE64);
```

TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`. The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 206–16 TEXT_ENCODE Function Parameters

Parameter	Description
`buf`	The text data.
`encode_charset`	The target character set.
`encoding`	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`

Return Values

Table 206–17 TEXT_ENCODE Function Return Values

Return	Description
`string`	A `VARCHAR2` encoded string with mime header format tags.

Examples

```
v2:=utl_encode.text_encode(
   'Here is some text',
   'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string. See "UUENCODE Function" on page 206-12 for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

Syntax

```
UTL_ENCODE.UUDECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 206–18 UUDECODE Function Parameters

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

Return Values

Table 206–19 UUDECODE Function Return Values

Return	Description
RAW	The decoded RAW string

UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string. The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```
UTL_ENCODE.UUENCODE (
   r          IN RAW,
   type       IN PLS_INTEGER DEFAULT 1,
   filename   IN VARCHAR2 DEFAULT NULL,
   permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 206–20 UUENCODE Function Parameters

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

Return Values

Table 206–21 UUENCODE Function Return Values

Return	Description
RAW	Contains the uuencode format string

207

UTL_FILE

With the UTL_FILE package, PL/SQL programs can read and write operating system text files. UTL_FILE provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- Using UTL_FILE
  - Security Model
  - Types
  - Rules and Limits
  - Exceptions
  - Examples
- Summary of UTL_FILE Subprograms

Using UTL_FILE

- Security Model
- Types
- Operational Notes
- Rules and Limits
- Exceptions
- Examples

Security Model

The set of files and directories that are accessible to the user through UTL_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user. The nature of directory objects is discussed in [AWAITING XLINK TARGET].

Assuming the user has both READ and WRITE access to the directory object user_dir, the user can open a file located in an accessible directory, but not in subdirectories or parent directories. If a file is a link, the user may be able to open that file as well.

Lastly, the client (text I/O) and server implementations are subject to server-side file system permission checking.

UTL_FILE provides file access both on the client side and on the server side. When run on the server, UTL_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL_FILE provides access to operating system files that are accessible from the client.

In the past, accessible directories for the UTL_FILE functions were specified in the initialization file using the UTL_FILE_DIR parameter. However, UTL_FILE_DIR access is no longer recommended. Oracle recommends that you instead use the directory object feature, which replaces UTL_FILE_DIR. Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE DIRECTORY privilege is granted only to SYS and SYSTEM by default.

Note: Use the CREATE DIRECTORY feature instead of UTL_FILE_DIR for directory access verification.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms. However, non-privileged users who need to read these files outside of PL/SQL may need access from a system administrator.

Caution:

- **The privileges needed to access files in a directory object are operating system specific.** UTL_FILE **directory object privileges give you read and write access to all files within the specified directory.**
- **Attempting to apply invalid options will give rise to unpredictable results.**

Types

The contents of `FILE_TYPE` are private to the `UTL_FILE` package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
   id       BINARY_INTEGER,
   datatype BINARY_INTEGER);
```

Operational Notes

The file location and file name parameters are supplied to the FOPEN function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an ALL_DIRECTORIES object.

UTL_FILE implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a GET_LINE call. For example, the len parameter of UTL_FILE.GET_LINE specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The GET_LINE len parameter, or
- The number of bytes until the next line terminator character, or
- The max_linesize parameter specified by UTL_FILE.FOPEN

The FOPEN max_linesize parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The GET_LINE len parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of max_linesize. If max_linesize and len are defined to be different values, then the lesser value takes precedence.

UTL_FILE.GET_RAW ignores line terminators and returns the actual number of bytes requested by the GET_RAW len parameter.

When data encoded in one character set is read and Globalization Support is told (such as by means of NLS_LANG) that it is encoded in another character set, the result is indeterminate. If NLS_LANG is set, it should be the same as the database character set.

Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

Note: The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

Exceptions

Table 207–1 UTL_FILE Package Exceptions

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The open_mode parameter in FOPEN is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Operating system error occurred during the read operation.
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.
FILE_OPEN	The requested operation failed because the file is open.
INVALID_ MAXLINESIZE	The MAX_LINESIZE value for FOPEN() is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the INVALID_OFFSET exception: ■ ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or ■ ABSOLUTE_OFFSET < 0, or ■ Either offset caused a seek past the end of the file
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

Examples

Example 1

Note: The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY out_dir AS '/appl/gl/user'';
SQL> GRANT READ ON DIRECTORY user_dir TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY user_dir TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

Example 2

```
DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('user_dir','u12345.tmp','R',256);
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('   user_dir','u12345.tmp','R');
```

```
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults
to
  -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and
defaults to 1024.
  -- So the number of bytes returned will be 1024 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('user_dir','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1);
  UTL_FILE.FCLOSE(F1);
END;
```

Summary of UTL_FILE Subprograms

Table 207–2 UTL_FILE Subprograms

Subprogram	Description
FCLOSE Procedure on page 207-12	Closes a file
FCLOSE_ALL Procedure on page 207-13	Closes all open file handles
FCOPY Procedure on page 207-14	Copies a contiguous portion of a file to a newly created file
FFLUSH Procedure on page 207-15	Physically writes all pending output to a file
FGETATTR Procedure on page 207-16	Reads and returns the attributes of a disk file
FGETPOS Function on page 207-17	Returns the current relative offset position within a file, in bytes
FOPEN Function on page 207-18	Opens a file for input or output
FOPEN_NCHAR Function on page 207-20	Opens a file in Unicode for input or output
FREMOVE Procedure on page 207-21	Deletes a disk file, assuming that you have sufficient privileges
FRENAME Procedure on page 207-22	Renames an existing file to a new name, similar to the UNIX `mv` function
FSEEK Procedure on page 207-23	Adjusts the file pointer forward or backward within the file by the number of bytes specified
GET_LINE Procedure on page 207-24	Reads text from an open file
GET_LINE_NCHAR Procedure on page 207-25	Reads text in Unicode from an open file
GET_RAW Function on page 207-26	Reads a `RAW` string value from a file and adjusts the file pointer ahead by the number of bytes read
IS_OPEN Function on page 207-27	Determines if a file handle refers to an open file
NEW_LINE Procedure on page 207-28	Writes one or more operating system-specific line terminators to a file
PUT Procedure on page 207-29	Writes a string to a file
PUT_LINE Procedure on page 207-30	Writes a line to a file, and so appends an operating system-specific line terminator
PUT_LINE_NCHAR Procedure on page 207-31	Writes a Unicode line to a file
PUT_NCHAR Procedure on page 207-32	Writes a Unicode string to a file
PUTF Procedure on page 207-33	A `PUT` procedure with formatting

Table 207–2 (Cont.) UTL_FILE Subprograms

Subprogram	Description
PUTF_NCHAR Procedure on page 207-35	A `PUT_NCHAR` procedure with formatting, and writes a Unicode string to a file, with formatting
PUT_RAW Function on page 207-36	Accepts as input a `RAW` data value and writes the value to the output buffer

FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (
   file IN OUT FILE_TYPE);
```

Parameters

Table 207–3 FCLOSE Procedure Parameters

Parameter	Description
`file`	Active file handle returned by an `FOPEN` or `FOPEN_NCHAR` call.

Usage Notes

If there is buffered data yet to be written when `FCLOSE` runs, then you may receive a `WRITE_ERROR` exception when closing a file.

Exceptions

```
WRITE_ERROR
INVALID_FILEHANDLE
```

FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

Note: `FCLOSE_ALL` does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an `FCLOSE_ALL` call still returns `TRUE`, even though the file has been closed. No further read or write operations can be performed on a file that was open before an `FCLOSE_ALL`.

Exceptions

`WRITE_ERROR`

FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file. By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (
   src_location    IN VARCHAR2,
   src_filename    IN VARCHAR2,
   dest_location   IN VARCHAR2,
   dest_filename   IN VARCHAR2,
   start_line      IN BINARY_INTEGER DEFAULT 1,
   end_line        IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 207–4 FCOPY Procedure Parameters

Parameters	Description
`src_location`	Directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`src_filename`	Source file to be copied
`dest_location`	Destination directory where the destination file is created.
`dest_filename`	Destination file created from the source file.
`start_line`	Line number at which to begin copying. The default is `1` for the first line.
`end_line`	Line number at which to stop copying. The default is `NULL`, signifying end of file.

FFLUSH Procedure

FFLUSH physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The FFLUSH procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

```
UTL_FILE.FFLUSH (
   file  IN FILE_TYPE);
invalid_maxlinesize  EXCEPTION;
```

Parameters

Table 207–5 FFLUSH Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(
   location    IN VARCHAR2,
   filename    IN VARCHAR2,
   fexists     OUT BOOLEAN,
   file_length OUT NUMBER,
   blocksize   OUT BINARY_INTEGER);
```

Parameters

Table 207–6 FGETATTR Procedure Parameters

Parameters	Description
`location`	Directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive).
`filename`	The name of the file to be examined.
`fexists`	A `BOOLEAN` for whether or not the file exists.
`file_length`	The length of the file in bytes. `NULL` if file does not exist.
`blocksize`	The file system block size in bytes. `NULL` if the file does not exist.

FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (
   fileid IN file_type)
 RETURN PLS_INTEGER;
```

Parameters

Table 207–7 FGETPOS Parameters

Parameters	Description
fileid	The directory location of the source file

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Usage Notes

If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously. See also FOPEN_NCHAR Function on page 207-20.

Syntax

```
UTL_FILE.FOPEN (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER)
  RETURN file_type;
```

Parameters

Table 207–8 FOPEN Function Parameters

Parameter	Description
location	Directory location of file. This string is a directory object name and is case sensitive. The default is uppercase. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.
open_mode	Specifies how the file is opened. Modes include: r -- read text w -- write text a -- append text rb -- read byte mode wb -- write byte mode ab -- append byte mode If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 207–9 FOPEN Function Return Values

Return	Description
file_type	Handle to open file.

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.

Exceptions

```
INVALID_PATH: File location or name was invalid.
INVALID_MODE: The open_mode string was invalid.
INVALID_OPERATION: File could not be opened as requested.
INVALID_MAXLINESIZE: Specified max_linesize is too large or too small.
```

FOPEN_NCHAR Function

This function opens a file in Unicode for input or output, with the maximum line size specified. You can have a maximum of 50 files open simultaneously. With this function, you can read or write a text file in Unicode instead of in the database charset. See also FOPEN Function on page 207-18.

Syntax

```
UTL_FILE.FOPEN_NCHAR (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER)
RETURN file_type;
```

Parameters

Table 207–10 FOPEN_NCHAR Function Parameters

Parameter	Description
`location`	Directory location of file.
`filename`	File name (including extension).
`open_mode`	Open mode (r,w,a,rb,wb,ab).
`max_linesize`	Maximum number of characters for each line, including the newline character, for this file. (minimum value 1, maximum value 32767).

FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (
   location IN VARCHAR2,
   filename IN VARCHAR2);
```

Parameters

Table 207–11 FREMOVE Procedure Parameters

Parameters	Description
`location`	The directory location of the file, a `DIRECTORY_NAME` from `ALL_DIRECTORIES` (case sensitive)
`filename`	The name of the file to be deleted

Usage Notes

The `FREMOVE` procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX `mv` function.

Syntax

```
UTL_FILE.FRENAME (
   location  IN VARCHAR2,
   filename  IN VARCHAR2,
   dest_dir  IN VARCHAR2,
   dest_file IN VARCHAR2,
   overwrite IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 207–12 FRENAME Procedure Parameters

Parameters	Description
`location`	The directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive).
`filename`	The source file to be renamed.
`dest_dir`	The destination directory of the destination file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive).
`dest_file`	The new name of the file.
`overwrite`	The default is `FALSE`.

Usage Notes

Permission on both the source and destination directories must be granted. You can use the `overwrite` parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is `FALSE` for no overwrite.

FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```
UTL_FILE.FSEEK (
   fid             IN utl_file.file_type,
   absolute_offset IN PL_INTEGER DEFAULT NULL,
   relative_offset IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 207–13 FSEEK Procedure Parameters

Parameters	Description
`fid`	The file ID.
`absolute_offset`	The absolute location to which to seek; default = `NULL`
`relative_offset`	The number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = `NULL`

Usage Notes

- Using `FSEEK`, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset` > 0, or backward, if `relative_offset` < 0, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

Syntax

```
UTL_FILE.GET_LINE (
   file        IN  FILE_TYPE,
   buffer      OUT VARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 207–14 GET_LINE Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` call. The file must be open for reading (mode `r`); otherwise an `INVALID_OPERATION` exception is raised.
`buffer`	Data buffer to receive the line read from the file.
`len`	The number of bytes read from the file. Default is `NULL`. If `NULL`, Oracle supplies the value of max_linesize.

Usage Notes

If the line does not fit in the buffer, a `VALUE_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`.

If unspecified, Oracle supplies a default value of 1024. See also "GET_LINE_NCHAR Procedure" on page 207-25.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
READ_ERROR
NO_DATA_FOUND
VALUE_ERROR
```

GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database charset. See also GET_LINE Procedure on page 207-24.

Syntax

```
UTL_FILE.GET_LINE_NCHAR (
   file        IN  FILE_TYPE,
   buffer      OUT NVARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 207–15 GET_LINE_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Data buffer to receive the line read from the file.
len	The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.

GET_RAW Function

This function reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators and returns the actual number of bytes requested by the GET_RAW len parameter.

Syntax

```
UTL_FILE.GET_RAW (
   fid  IN  utl_file.file_type,
   r    OUT NOCOPY RAW,
   len  IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 207–16 GET_RAW Procedure Parameters

Parameters	Description
fid	The file ID.
r	The RAW data.
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

Usage Notes

The subprogram will raise No_Data_Found when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS
      h     UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
      Buf   RAW(32767);
      Amnt  CONSTANT PLS_INTEGER := 32767;
    BEGIN
      LOOP
        BEGIN
          Utl_File.Get_Raw(h, Buf, Amnt);
          -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
      END LOOP;
      UTL_FILE.FCLOSE (h);
    END;
```

IS_OPEN Function

This function tests a file handle to see if it identifies an open file. IS_OPEN reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```
UTL_FILE.IS_OPEN (
   file  IN FILE_TYPE)
  RETURN BOOLEAN;
```

Parameters

Table 207–17 IS_OPEN Function Parameters

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call.

Return Values

TRUE or FALSE

NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle. This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (
   file     IN FILE_TYPE,
   lines    IN NATURAL := 1);
```

Parameters

Table 207–18 NEW_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call.
lines	Number of line terminators to be written to the file.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "PUT_NCHAR Procedure" on page 207-32.

Syntax

```
UTL_FILE.PUT (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2);
```

Parameters

Table 207–19 PUT Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Buffer that contains the text to be written to the file. You must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "PUT_LINE_NCHAR Procedure" on page 207-31.

Syntax

```
UTL_FILE.PUT_LINE (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2,
   autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 207–20 PUT_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN call.
buffer	Text buffer that contains the lines to be written to the file.
autoflush	Flushes the buffer to disk after the WRITE.

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database charset. See also "PUT_LINE Procedure" on page 207-30.

Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
   file    IN FILE_TYPE,
   buffer  IN NVARCHAR2);
```

Parameters

Table 207–21 PUT_LINE_NCHAR Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN_NCHAR` call. The file must be open for writing.
`buffer`	Text buffer that contains the lines to be written to the file.

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

PUT_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database charset. See also "PUT Procedure" on page 207-29.

Syntax

```
UTL_FILE.PUT_NCHAR (
   file      IN FILE_TYPE,
   buffer    IN NVARCHAR2);
```

Parameters

Table 207–22 PUT_NCHAR Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN_NCHAR` call. If the file is opened by `FOPEN` instead of `FOPEN_NCHAR`, a `CHARSETMISMATCH` exception is raised.
`buffer`	Buffer that contains the text to be written to the file. You must have opened the file using mode `w` or mode `a`; otherwise, an `INVALID_OPERATION` exception is raised.

Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

PUTF Procedure

This procedure is a formatted PUT procedure. It works like a limited printf(). See also "PUTF_NCHAR Procedure" on page 207-35.

Syntax

```
UTL_FILE.PUTF (
   file    IN FILE_TYPE,
   format  IN VARCHAR2,
   [arg1   IN VARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN VARCHAR2  DEFAULT NULL]);
```

Parameters

Table 207–23 PUTF Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN call.
format	Format string that can contain text as well as the formatting characters \n and %s.
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Usage Notes

- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.
- The format string can contain any text, but the character sequences %s and \n have special meaning.

Character Sequence	Meaning
%s	Substitute this sequence with the string value of the next argument in the argument list.
\n	Substitute with the appropriate platform-specific line terminator.

Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.

my_world  varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
                my_world,
                'greetings for all earthlings');
```

If there are more `%s` formatters in the format parameter than there are arguments, then an empty string is substituted for each `%s` for which there is no matching argument.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUTF_NCHAR Procedure

This procedure is a formatted PUT_NCHAR procedure. Using PUTF_NCHAR, you can write a text file in Unicode instead of in the database charset.

Syntax

```
UTL_FILE.PUTF_NCHAR (
   file    IN FILE_TYPE,
   format  IN NVARCHAR2,
   [arg1   IN NVARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN NVARCHAR2  DEFAULT NULL]);
```

Parameters

Table 207–24 PUTF_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
format	Format string that can contain text as well as the formatting characters \n and %s.
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

PUT_RAW Function

This function accepts as input a RAW data value and writes the value to the output buffer.

Syntax

```
UTL_FILE.PUT_RAW (
   fid       IN utl_file.file_type,
   r         IN RAW,
   autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 207–25 PUT_RAW Procedure Parameters

Parameters	Description
fid	The file ID.
r	The RAW data written to the buffer.
autoflush	If TRUE, performs a flush after writing the value to the output buffer; default is FALSE.

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to TRUE.

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

UTL_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager to set up an Oracle wallet. Non-HTTPS fetches do not require an Oracle wallet.

See Also:

- Chapter 220, "UTL_URL"
- Chapter 217, "UTL_SMTP"
- *Oracle Database Advanced Security Administrator's Guide* for more information on Wallet Manager

This chapter contains the following topics:

- Using UTL_HTTP
  - Overview
  - Security Model
  - Constants
  - Datatypes
  - Exceptions
  - Examples
- Subprogram Groups

  - HTTP Cookies Subprograms
  - HTTP Persistent Connections Subprograms
  - Error Conditions Subprograms
- Summary of UTL_HTTP Subprograms

Using UTL_HTTP

This section contains topics which relate to using the `UTL_HTTP` package.

- Overview
- Security Model
- Constants
- Datatypes
- Exceptions
- Examples

Overview

With the UTL_HTTP package, you can write PL/SQL programs that communicate with Web (HTTP) servers. And UTL_HTTP contains a function that can be used in SQL queries.

The package also supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS, directly or through an HTTP proxy.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

Security Model

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

---

Constants

The UTL_HTTP package uses the constants shown in following tables.

- UTL_HTTP Constants - HTTP Versions
- UTL_HTTP Constants - Default Ports
- UTL_HTTP Constants - HTTP 1.1 Status Codes

Table 208–1 UTL_HTTP Constants - HTTP Versions

Name	Type	Value	Description
HTTP_VERSION_1_0	VARCHAR2(10)	'HTTP /1.0'	Denotes HTTP version 1.0 that can be used in the function BEGIN_REQUEST.
HTTP_VERSION_1	VARCHAR2(10)	'HTTP /1.1'	Denotes HTTP version 1.1 that can be used in the function BEGIN_REQUEST.

Table 208–2 UTL_HTTP Constants - Default Ports

Name	Type	Value	Description
DEFAULT_HTTP_PORT	PLS_INTEGER	80	The default TCP/IP port (80) at which a Web server or proxy server listens
DEFAULT_HTTPS_PORT	PLS_INTEGER	443	The default TCP/IP port (443) at which an HTTPS Web server listens

Table 208–3 UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_ PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, via the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED CONSTANT	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.

Table 208–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_NON_ AUTHORITATIVE_INFO	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_ CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.
HTTP_MULTIPLE_ CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_ PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_ REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_ REQUIRED	PLS_INTEGER	402	This code is reserved for future use.

Table 208–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_ REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIME_ OUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_ REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined Content-Length.
HTTP_PRECONDITION_ FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.
HTTP_REQUEST_ ENTITY_TOO_LARGE CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_ TOO_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_ MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_ NOT_SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_ FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.

Table 208–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIME_OUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

Datatypes

- REQ Type
- RESP Type
- COOKIE and COOKIE_TABLE Types
- CONNECTION Type

REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (
   url          VARCHAR2(32767),
   method       VARCHAR2(64),
   http_version  VARCHAR2(64));
```

Parameters

Table 208–4 REQ Type Parameters

Parameter	Description
`url`	The URL of the HTTP request. It is set after the request is created by `BEGIN_REQUEST`.
`method`	The method to be performed on the resource identified by the URL. It is set after the request is created by `BEGIN_REQUEST`.
`http_version`	The HTTP protocol version used to send the request. It is set after the request is created by `BEGIN_REQUEST`.

Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

```
TYPE resp IS RECORD (
   status_code    PLS_INTEGER,
   reason_phrase  VARCHAR2(256),
   http_version   VARCHAR2(64));
```

Parameters

Table 208–5 RESP Type Parameters

Parameter	Description
status_code	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
reason_phrase	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
http_version	The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.

Usage Notes

The information returned in RESP from the interface GET_RESPONSE is read-only. There are other fields in the RESP record type whose names begin with the prefix private_. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

COOKIE and COOKIE_TABLE Types

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```
TYPE cookie IS RECORD (
   name  VARCHAR2(256),
   value  VARCHAR2(1024),
   domain  VARCHAR2(256),
   expire  TIMESTAMP WITH TIME ZONE,
   path  VARCHAR2(1024),
   secure  BOOLEAN,
   version  PLS_INTEGER,
   comment  VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

Fields of COOKIE Record Type

Table 208–6 shows the fields for the COOKIE and COOKIE_TABLE record types.

Table 208–6 Fields of COOKIE and COOKIE_TABLE Type

Field	Description
name	The name of the HTTP cookie
value	The value of the cookie
domain	The domain for which the cookie is valid
expire	The time by which the cookie will expire
path	The subset of URLs to which the cookie applies

Table 208–6 (Cont.) Fields of COOKIE and COOKIE_TABLE Type

Field	Description
secure	Should the cookie be returned to the Web server using secured means only.
version	The version of the HTTP cookie specification the cookie conforms. This field is NULL for Netscape cookies.
comment	The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the UTL_HTTP package. The cookies are maintained by the package transparently. They are maintained inside the UTL_HTTP package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using GET_COOKIES, store them persistently in a database table, and re-store the cookies back in the package using ADD_COOKIES in the next database session. All the fields in the cookie record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "Retrieving and Restoring Cookies" on page 208-22.

CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. connection_table is a PL/SQL table of connection.

For a direct HTTP persistent connection to a Web server, the host and port fields contain the host name and TCP/IP port number of the Web server. The proxy_host and proxy_port fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the proxy_host and proxy_port fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

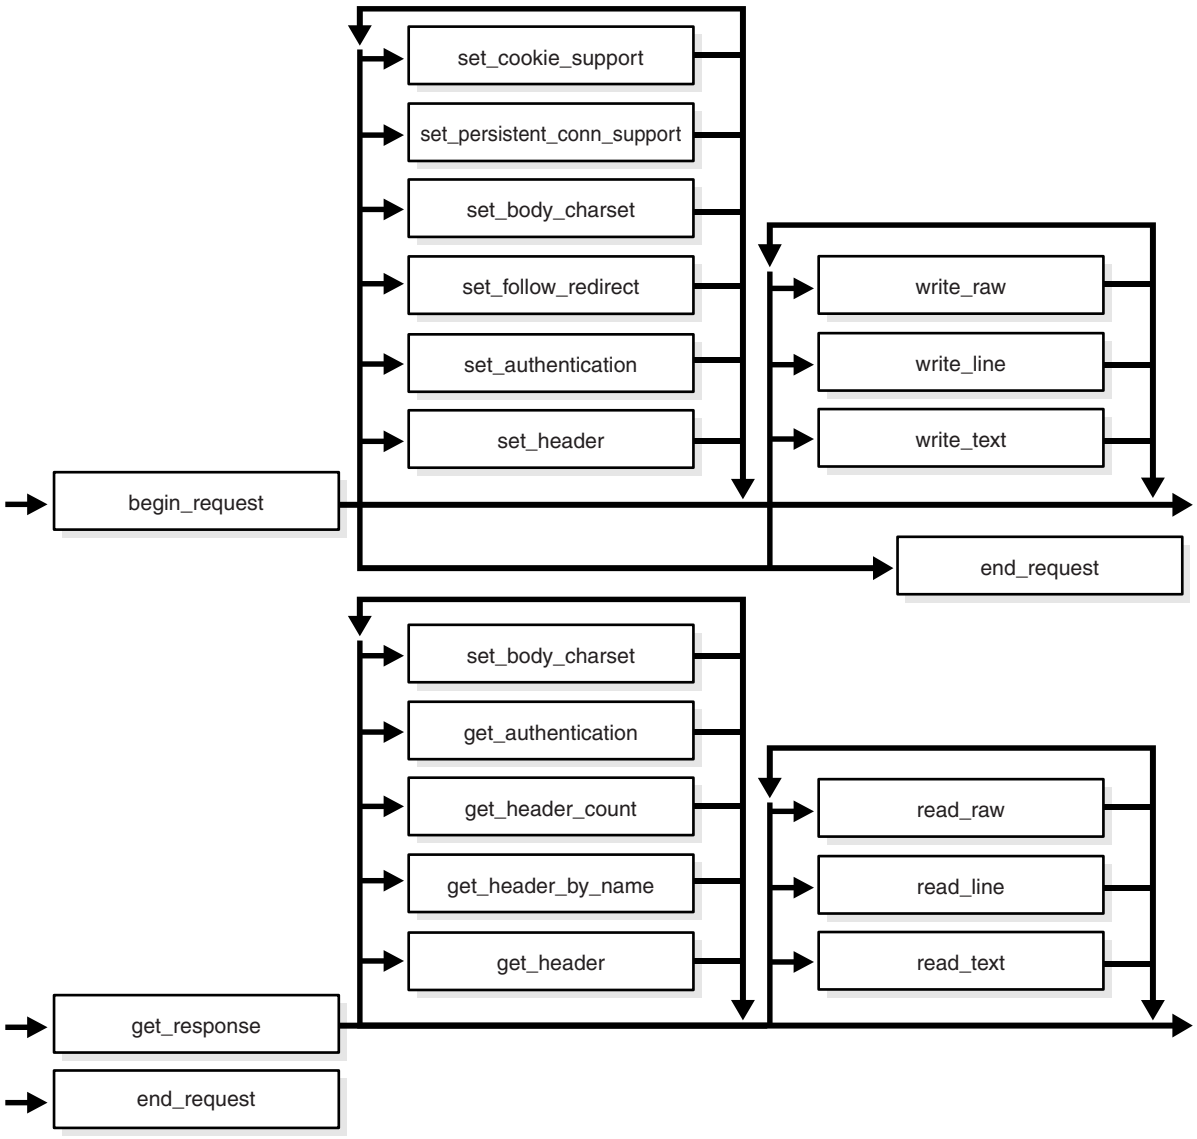
The SSL field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

Syntax

```
TYPE connection IS RECORD (
   host  VARCHAR2(256),
   port  PLS_INTEGER,
   proxy_host  VARCHAR2(256),
   proxy_port  PLS_INTEGER,
```

```
   ssl  BOOLEAN);

TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```



Operational Notes

- Operational Flow
- Simple HTTP Fetches
- HTTP Requests
- HTTP Responses
- Session Settings
- Session Settings

Operational Flow

The `UTL_HTTP` package provides access to the HTTP protocol. The interfaces must be called in the order shown in Figure 208–1, or an exception will be raised.

Figure 208–1 Flow of the Core UTL_HTTP Package

The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - `GET_COOKIE_COUNT`
  - `GET_COOKIES`
  - `ADD_COOKIES`
  - `CLEAR_COOKIES`
- Persistent connections
  - `GET_PERSISTENT_CONN_COUNT`
  - `GET_PERSISTENT_CONNS`
  - `CLOSE_PERSISTENT_CONN`
  - `CLOSE_PERSISTENT_CONNS`

- Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session
  - SET_PROXY
  - GET_PROXY
  - SET_COOKIE_SUPPORT
  - GET_COOKIE_SUPPORT
  - SET_FOLLOW_REDIRECT
  - GET_FOLLOW_REDIRECT
  - SET_BODY_CHARSET
  - GET_BODY_CHARSET
  - SET_PERSISTENT_CONN_SUPPORT
  - GET_PERSISTENT_CONN_SUPPORT
  - SET_DETAILED_EXCP_SUPPORT
  - GET_DETAILED_EXCP_SUPPORT
  - SET_WALLET
  - SET_TRANSFER_TIMEOUT
  - GET_TRANSFER_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session
  - GET_DETAILED_SQLCODE
  - GET_DETAILED_SQLERRM

NOTE: Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

Simple HTTP Fetches

REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect REQUEST or REQUEST_PIECES to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If REQUEST or REQUEST_PIECES fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each REQUEST or REQUEST_PIECES call using the optional proxy parameter.

Note: UTL_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable http_proxy to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable no_proxy to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

Session Settings

Session settings manipulate the configuration and default behavior of UTL_HTTP when HTTP requests are executed within a database user session. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

See Also: Session Settings Subprograms on page 208-26

HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

See Also: HTTP Requests Subprograms on page 208-27

HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server. When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

See Also: HTTP Responses Subprograms on page 208-28

HTTP Cookies

The UTL_HTTP package provides subprograms to manipulate HTTP cookies.

See Also: HTTP Cookies Subprograms on page 208-29

HTTP Persistent Connections

The UTL_HTTP package provides subprograms to manipulate persistent connections.

See Also: HTTP Persistent Connections Subprograms on page 208-30

Error Conditions

The `UTL_HTTP` package provides subprograms to retrieve error information.

See Also: Error Conditions Subprograms on page 208-31

Exceptions

Table 208–7 lists the exceptions that the UTL_HTTP package interface can raise. By default, UTL_HTTP raises the exception request_failed when a request fails to execute. If the package is set to raise a detailed exception by set_detailed_excp_support, the rest of the exceptions will be raised directly (except for the exception end_of_body, which will be raised by READ_TEXT, READ_LINE, and READ_RAW regardless of the setting).

Table 208–7 UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
REQUEST_FAILED	29273	The request fails to executes	Any HTTP request or response interface when detailed_exception is disabled
BAD_ARGUMENT	29261	The argument passed to the interface is bad	Any HTTP request or response interface when detailed_exception is enabled
BAD_URL	29262	The requested URL is badly formed	BEGIN_REQUEST, when detailed_exception is enabled
PROTOCOL_ERROR	29263	An HTTP protocol error occurs when communicating with the Web server	SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled
HEADER_NOT_FOUND	29265	The header is not found	GET_HEADER, GET_HEADER_BY_NAME, when detailed_exception is enabled
END_OF_BODY	29266	The end of HTTP response body is reached	READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled
ILLEGAL_CALL	29267	The call to UTL_HTTP is illegal at the current state of the HTTP request	SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when detailed_exception is enabled
HTTP_CLIENT_ERROR	29268	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled
HTTP_SERVER_ERROR	29269	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled

Table 208–7 (Cont.) UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when detailed_ exception is enabled
PARTIAL_ MULTIBYTE_ EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when detailed_exception is enabled
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled

NOTE: The partial_multibyte_char and transfer_ timeout exceptions are duplicates of the same exceptions defined in UTL_TCP. They are defined in this package so that the use of this package does not require the knowledge of the UTL_TCP. As those exceptions are duplicates, an exception handle that catches the partial_multibyte_char and transfer_timeout exceptions in this package also catch the exceptions in the UTL_ TCP.

For REQUEST and REQUEST_PIECES, the request_failed exception is raised when any exception occurs and detailed_exception is disabled.

Examples

The following examples demonstrate how to use UTL_HTTP.

- General Usage
- Handling HTTP Authentication
- Retrieving and Restoring Cookies

General Usage

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  LOOP
    UTL_HTTP.READ_LINE(resp, value, TRUE);
    DBMS_OUTPUT.PUT_LINE(value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
  WHEN UTL_HTTP.END_OF_BODY THEN
    UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving HTTP Response Headers

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  name  VARCHAR2(256);
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
  DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

Handling HTTP Authentication

```
SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url      IN VARCHAR2,
```

```
                                        username IN VARCHAR2 DEFAULT NULL,
                                        password IN VARCHAR2 DEFAULT NULL,
                                        realm    IN VARCHAR2 DEFAULT NULL) AS
  req       UTL_HTTP.REQ;
  resp      UTL_HTTP.RESP;
  my_scheme VARCHAR2(256);
  my_realm  VARCHAR2(256);
  my_proxy  BOOLEAN;
BEGIN
  -- Turn off checking of status code. We will check it by ourselves.
  UTL_HTTP.HTTP_RESPONSE_ERROR_CHECK(FALSE);
  req := UTL_HTTP.BEGIN_REQUEST(url);
  IF (username IS NOT NULL) THEN
    UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic
Authen. Scheme
  END IF;
  resp := UTL_HTTP.GET_RESPONSE(req);
  IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, my_proxy);
    IF (my_proxy) THEN
       DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
       DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the proxy
server.');
    ELSE
      DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.');
      DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the Web page.');
    END IF;
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  END IF;
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving and Restoring Cookies

```
CREATE TABLE my_cookies (
    session_id  INTEGER,
    name        VARCHAR2(256),
    value       VARCHAR2(1024),
    domain      VARCHAR2(256),
    expire      DATE,
    path        VARCHAR2(1024),
    secure      VARCHAR2(1),
    version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS
  cookies        UTL_HTTP.COOKIE_TABLE;
  my_session_id  PLS_INTEGER;
  secure         VARCHAR2(1);
BEGIN
```

```
  /* assume that some cookies have been set in previous HTTP requests. */
  UTL_HTTP.GET_COOKIES(cookies);
  SELECT session_id.nextval INTO my_session_id FROM DUAL;
  FOR i in 1..cookies.count LOOP
    IF (cookies(i).secure) THEN
      secure := 'Y';
    ELSE
      secure := 'N';
    END IF;
    INSERT INTO my_cookies
    VALUES (my_session_id, cookies(i).name, cookies(i).value,
            cookies(i).domain,
            cookies(i).expire, cookies(i).path, secure, cookies(i).version);
  END LOOP;
  RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
  cookies        UTL_HTTP.COOKIE_TABLE;
  cookie         UTL_HTTP.COOKIE;
  i              PLS_INTEGER := 0;
  CURSOR c (c_session_id PLS_INTEGER) IS
    SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
  FOR r IN c(this_session_id) LOOP
    i := i + 1;
    cookie.name     := r.name;
    cookie.value    := r.value;
    cookie.domain   := r.domain;
    cookie.expire   := r.expire;
    cookie.path     := r.path;
    IF (r.secure = 'Y') THEN
      cookie.secure := TRUE;
    ELSE
      cookie.secure := FALSE;
    END IF;
    cookie.version := r.version;
    cookies(i) := cookie;
  END LOOP;
  UTL_HTTP.CLEAR_COOKIES;
  UTL_HTTP.ADD_COOKIES(cookies);
END;
/
```

Subprogram Groups

UTL_HTTP subprograms are grouped by function:

- Simple HTTP Fetches in a Single Call Subprograms
- Session Settings Subprograms
- HTTP Requests Subprograms
- HTTP Responses Subprograms
- HTTP Cookies Subprograms
- HTTP Persistent Connections Subprograms
- Error Conditions Subprograms

Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 208–8 UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

Subprogram	Description
REQUEST Function on page 208-68	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
REQUEST_PIECES Function on page 208-70	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

Session Settings Subprograms

Table 208–9 UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_BODY_CHARSET Procedure on page 208-46	Retrieves the default character set of the body of all future HTTP requests
GET_COOKIE_SUPPORT Procedure on page 208-48	Retrieves the current cookie support settings
GET_DETAILED_EXCP_SUPPORT Procedure on page 208-50	Checks if the `UTL_HTTP` package will raise a detailed exception or not
GET_FOLLOW_REDIRECT Procedure on page 208-53	Retrieves the follow-redirect setting in the current session
GET_PERSISTENT_CONN_SUPPORT Procedure on page 208-58	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
GET_PROXY Procedure on page 208-60	Retrieves the current proxy settings
GET_RESPONSE_ERROR_CHECK Procedure on page 208-62	Checks if the response error check is set or not
GET_TRANSFER_TIMEOUT Procedure on page 208-63	Retrieves the current network transfer timeout value
SET_TRANSFER_TIMEOUT Procedure on page 208-85	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures on page 208-76	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
SET_DETAILED_EXCP_SUPPORT Procedure on page 208-78	Sets the `UTL_HTTP` package to raise a detailed exception
SET_FOLLOW_REDIRECT Procedures on page 208-79	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP responses to future requests in the `GET_RESPONSE` function
SET_PERSISTENT_CONN_SUPPORT Procedure on page 208-81	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
SET_PROXY Procedure on page 208-83	Sets the proxy to be used for requests of HTTP or other protocols
SET_RESPONSE_ERROR_CHECK Procedure on page 208-84	Sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
SET_TRANSFER_TIMEOUT Procedure on page 208-85	Sets the timeout value for `UTL_HTTP` to read the HTTP response from the Web server or proxy server
SET_WALLET Procedure on page 208-86	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

HTTP Requests Subprograms

Table 208–10 UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
BEGIN_REQUEST Function on page 208-37	Begins a new HTTP request.`UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
END_REQUEST Procedure on page 208-43	Ends the HTTP request
SET_HEADER Procedure on page 208-80	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.
SET_AUTHENTICATION Procedure on page 208-73	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
SET_BODY_CHARSET Procedures on page 208-74	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures on page 208-76	Enables or disables support for the HTTP cookies in the request
SET_FOLLOW_REDIRECT Procedures on page 208-79	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function on page 208-61
SET_PERSISTENT_CONN_SUPPORT Procedure on page 208-81	Enables or disables support for the HTTP 1.1 persistent-connection in the request
SET_PROXY Procedure on page 208-83	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`)
WRITE_RAW Procedure on page 208-88	Writes some binary data in the HTTP request body
WRITE_TEXT Procedure on page 208-89	Writes some text data in the HTTP request body

HTTP Responses Subprograms

Table 208–11 UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
END_RESPONSE Procedure on page 208-44	Ends the HTTP response. It completes the HTTP request and response.
GET_AUTHENTICATION Procedure on page 208-45	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
GET_HEADER Procedure on page 208-54	Returns the n^{th} HTTP response header name and value returned in the response
GET_HEADER_BY_NAME Procedure on page 208-55	Returns the HTTP response header value returned in the response given the name of the header
GET_HEADER_COUNT Function on page 208-56	Returns the number of HTTP response headers returned in the response
GET_RESPONSE Function on page 208-61	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
READ_LINE Procedure on page 208-64	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
READ_RAW Procedure on page 208-65	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
READ_TEXT Procedure on page 208-66	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
SET_BODY_CHARSET Procedures on page 208-74	Sets the character set of the response body when the media type is "text" but the character set is not specified in the "Content-Type" header

HTTP Cookies Subprograms

Table 208–12 UTL_HTTP Subprograms—HTTP Cookies

Subprogram	Description
ADD_COOKIES Procedure on page 208-36	Adds the cookies maintained by `UTL_HTTP`
CLEAR_COOKIES Procedure on page 208-39	Clears all cookies maintained by the `UTL_HTTP` package
GET_COOKIE_COUNT Function on page 208-47	Returns the number of cookies currently maintained by the `UTL_HTTP` package set by all Web servers
GET_COOKIES Function on page 208-49	Returns all the cookies currently maintained by the `UTL_HTTP` package set by all Web servers

HTTP Persistent Connections Subprograms

Table 208–13 UTL_HTTP Subprograms—HTTP Persistent Connections

Subprogram	Description
CLOSE_PERSISTENT_CONN Procedure on page 208-40	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session
CLOSE_PERSISTENT_CONNS Procedure on page 208-41	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session
GET_PERSISTENT_CONN_COUNT Function on page 208-57	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers
GET_PERSISTENT_CONNS Procedure on page 208-59	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers

Error Conditions Subprograms

Table 208–14 UTL_HTTP Subprograms—Error Conditions

Subprogram	Description
GET_DETAILED_SQLCODE Function on page 208-51	Retrieves the detailed SQLCODE of the last exception raised
GET_DETAILED_SQLERRM Function on page 208-52	Retrieves the detailed SQLERRM of the last exception raised

Summary of UTL_HTTP Subprograms

Table 208–15 UTL_HTTP Package Subprograms

Subprogram	Description	Group
ADD_COOKIES Procedure on page 208-36	Adds the cookies maintained by UTL_HTTP	HTTP Cookies Subprograms on page 208-29
BEGIN_REQUEST Function on page 208-37	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	HTTP Requests Subprograms on page 208-27
CLEAR_COOKIES Procedure on page 208-39	Clears all cookies maintained by the UTL_HTTP package	HTTP Cookies Subprograms on page 208-29
CLOSE_PERSISTENT_CONN Procedure on page 208-40	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms on page 208-30
CLOSE_PERSISTENT_CONNS Procedure on page 208-41	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms on page 208-30
END_REQUEST Procedure on page 208-43	Ends the HTTP request	HTTP Requests Subprograms on page 208-27
END_RESPONSE Procedure on page 208-44	Ends the HTTP response. It completes the HTTP request and response	HTTP Responses Subprograms on page 208-28
GET_AUTHENTICATION Procedure on page 208-45	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	HTTP Responses Subprograms on page 208-28
GET_BODY_CHARSET Procedure on page 208-46	Retrieves the default character set of the body of all future HTTP requests	Session Settings Subprograms on page 208-26
GET_COOKIE_COUNT Function on page 208-47	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms on page 208-29
GET_COOKIE_SUPPORT Procedure on page 208-48	Retrieves the current cookie support settings	Session Settings Subprograms on page 208-26
GET_COOKIES Function on page 208-49	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms on page 208-29
GET_DETAILED_EXCP_SUPPORT Procedure on page 208-50	Checks if the UTL_HTTP package will raise a detailed exception or not	Session Settings Subprograms on page 208-26
GET_DETAILED_SQLCODE Function on page 208-51	Retrieves the detailed SQLCODE of the last exception raised	Error Conditions Subprograms on page 208-31

Table 208–15 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_DETAILED_SQLERRM Function on page 208-52	Retrieves the detailed SQLERRM of the last exception raised	Error Conditions Subprograms on page 208-31
GET_FOLLOW_REDIRECT Procedure on page 208-53	Retrieves the follow-redirect setting in the current session	Session Settings Subprograms on page 208-26
GET_HEADER Procedure on page 208-54	Returns the n^{th} HTTP response header name and value returned in the response	HTTP Responses Subprograms on page 208-28
GET_HEADER_BY_NAME Procedure on page 208-55	Returns the HTTP response header value returned in the response given the name of the header	HTTP Responses Subprograms on page 208-28
GET_HEADER_COUNT Function on page 208-56	Returns the number of HTTP response headers returned in the response	HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28
GET_PERSISTENT_CONN_ COUNT Function on page 208-57	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms on page 208-30
GET_HEADER_COUNT Function on page 208-56	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	Session Settings Subprograms on page 208-26
GET_PERSISTENT_CONN_ SUPPORT Procedure on page 208-58	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see Session Settings Subprograms on page 208-26)	HTTP Persistent Connections Subprograms on page 208-30
GET_PERSISTENT_CONNS Procedure on page 208-59	Returns all the network connections currently kept persistent by the UTL_ HTTP package to the Web servers	HTTP Persistent Connections Subprograms on page 208-30
GET_PROXY Procedure on page 208-60	Retrieves the current proxy settings	Session Settings Subprograms on page 208-26
GET_RESPONSE Function on page 208-61	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	HTTP Responses Subprograms on page 208-28
GET_RESPONSE_ERROR_ CHECK Procedure on page 208-62	Checks if the response error check is set or no	Session Settings Subprograms on page 208-26
GET_TRANSFER_TIMEOUT Procedure on page 208-63	Retrieves the current network transfer timeout value	Session Settings Subprograms on page 208-26
READ_LINE Procedure on page 208-64	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 208-28

Table 208–15 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
READ_RAW Procedure on page 208-65	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 208-28
READ_TEXT Procedure on page 208-66	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 208-28
REQUEST Function on page 208-68	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	Simple HTTP Fetches in a Single Call Subprograms on page 208-25
REQUEST_PIECES Function on page 208-70	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	Simple HTTP Fetches in a Single Call Subprograms on page 208-25
SET_AUTHENTICATION Procedure on page 208-73	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	HTTP Requests Subprograms on page 208-27
SET_BODY_CHARSET Procedures on page 208-74	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header	Session Settings Subprograms on page 208-26
SET_BODY_CHARSET Procedures on page 208-74	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header	HTTP Requests Subprograms on page 208-27
SET_BODY_CHARSET Procedures on page 208-74	Sets the character set of the response body when the media type is "text" but the character set is not specified in the "Content-Type" header	HTTP Responses Subprograms and Session Settings Subprograms on page 208-26
SET_COOKIE_SUPPORT Procedures on page 208-76	Enables or disables support for the HTTP cookies in the request	HTTP Requests Subprograms on page 208-27
SET_DETAILED_EXCP_ SUPPORT Procedure on page 208-78	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	Session Settings Subprograms on page 208-26
SET_DETAILED_EXCP_ SUPPORT Procedure on page 208-78	Sets the `UTL_HTTP` package to raise a detailed exception	Session Settings Subprograms on page 208-26
SET_FOLLOW_REDIRECT Procedures on page 208-79	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request in the `GET_RESPONSE` function	HTTP Requests Subprograms on page 208-27
SET_HEADER Procedure on page 208-80	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP responses to future requests in the `GET_RESPONSE` function	Session Settings Subprograms on page 208-26

Table 208–15 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_HEADER Procedure on page 208-80	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	HTTP Requests Subprograms on page 208-27
SET_PERSISTENT_CONN_SUPPORT Procedure on page 208-81	Enables or disables support for the HTTP 1.1 persistent-connection in the request	HTTP Requests Subprograms on page 208-27
SET_PROXY Procedure on page 208-83	Sets the proxy to be used for requests of HTTP or other protocols	Session Settings on page 208-17 and Session Settings Subprograms on page 208-26
SET_RESPONSE_ERROR_CHECK Procedure on page 208-84	Sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	Session Settings Subprograms on page 208-26
SET_TRANSFER_TIMEOUT Procedure on page 208-85	Sets the timeout value for `UTL_HTTP` to read the HTTP response from the Web server or proxy server	Session Settings on page 208-17 and Session Settings Subprograms on page 208-26
SET_WALLET Procedure on page 208-86	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	Session Settings Subprograms on page 208-26
WRITE_LINE Procedure on page 208-87	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	HTTP Requests Subprograms on page 208-27
WRITE_RAW Procedure on page 208-88	Writes some binary data in the HTTP request body	HTTP Requests Subprograms on page 208-27
WRITE_TEXT Procedure on page 208-89	Writes some text data in the HTTP request body	HTTP Requests Subprograms on page 208-27

ADD_COOKIES Procedure

This procedure adds the cookies maintained by `UTL_HTTP`.

> **See Also:** HTTP Cookies on page 208-17 and HTTP Cookies Subprograms on page 208-29

Syntax

```
UTL_HTTP.ADD_COOKIES (
   cookies  IN cookie_table);
```

Parameters

Table 208–16 ADD_COOKIES Procedure Parameters

Parameter	Description
`cookies`	The cookies to be added

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

BEGIN_REQUEST Function

This functions begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

See Also: HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27

Syntax

```
UTL_HTTP.BEGIN_REQUEST (
   url           IN VARCHAR2,
   method        IN VARCHAR2 DEFAULT 'GET',
   http_version  IN VARCHAR2 DEFAULT NULL)
RETURN req;
```

Parameters

Table 208–17 BEGIN_REQUEST Function Parameters

Parameter	Description
url	The URL of the HTTP request
method	The method performed on the resource identified by the URL
http_version	The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See Chapter 220, "UTL_URL" for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- UTL_HTTP.BEGIN_REQUEST can send a URL whose length is up to 32767 bytes. However, different web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the web server. For example, a web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of UTL_HTTP.GET_RESPONSE will raise the UTL_HTTP.PROTOCOL_ERROR exception.

A URL will be long when its QUERY_STRING (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the POST method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      =>  req,
                     name   =>  'Content-Type',
                     value  =>  'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      =>   req,
                     name   =>   'Content-Length',
                     value  =>'  <length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      =>   req,
                     data   =>   'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
                     (r     =>   req);
...
```

The programmer must determine whether a particular web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the SET_WALLET procedure on how to set up an Oracle wallet.

CLEAR_COOKIES Procedure

This procedure clears all cookies maintained by the `UTL_HTTP` package.

See Also: HTTP Cookies on page 208-17 and HTTP Cookies Subprograms on page 208-29

Syntax

```
UTL_HTTP.CLEAR_COOKIES;
```

CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session.

> **See Also:** HTTP Persistent Connections on page 208-17 and HTTP Persistent Connections Subprograms on page 208-30

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
   conn  IN connection);
```

Parameters

Table 208–18 CLOSE_PERSISTENT_CONN Procedure Parameters

Parameter	Description
`conn`	The HTTP persistent connection to close

CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the proxy www-proxy at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

> **See Also:** HTTP Persistent Connections on page 208-17 and HTTP Persistent Connections Subprograms on page 208-30

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
   host        IN VARCHAR2 DEFAULT NULL,
   port        IN PLS_INTEGER DEFAULT NULL,
   proxy_host  IN VARCHAR2 DEFAULT NULL,
   proxy_port  IN PLS_INTEGER DEFAULT NULL,
   ssl         IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 208–19 CLOSE_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
host	The host for which persistent connections are to be closed
port	The port number for which persistent connections are to be closed
proxy_host	The proxy host for which persistent connections are to be closed
proxy_port	The proxy port for which persistent connections are to be closed
ssl	Close persistent SSL connection

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL

of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the CLOSE_PERSISTENT_CONN procedure that closes a specific persistent connection.

END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

> **See Also:** HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27

Syntax

```
UTL_HTTP.END_REQUEST (
   r  IN OUT NOCOPY req);
```

Parameters

Table 208–20 END_REQUEST Procedure Parameters

Parameter	Description
r	The HTTP request

END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

> **See Also:** HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.END_RESPONSE (
   r  IN OUT NOCOPY resp);
```

Parameters

Table 208–21 END_RESPONSE Procedure Parameters

Parameter	Description
r	The HTTP response

GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

See Also: HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
   r          IN OUT NOCOPY resp,
   scheme     OUT VARCHAR2,
   realm      OUT VARCHAR2,
   for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 208–22 GET_AUTHENTICATION Procedure Parameters

Parameter	Description
`r`	The HTTP response
`scheme`	The scheme for the required HTTP authentication
`realm`	The realm for the required HTTP authentication
`for_proxy`	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is `FALSE`

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling `GET_AUTHENTICATION`. The Web client makes the second request and supplies the required authentication information with `SET_AUTHORIZATION`. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.GET_BODY_CHARSET (
   charset  OUT NOCOPY VARCHAR2);
```

Parameters

Table 208–23 GET_BODY_CHARSET Procedure Parameters

Parameter	Description
`charset`	The default character set of the body of all future HTTP requests

GET_COOKIE_COUNT Function

This function returns the number of cookies currently maintained by the `UTL_HTTP` package set by all Web servers.

> **See Also:** HTTP Cookies on page 208-17 and HTTP Cookies Subprograms on page 208-29

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT
RETURN PLS_INTEGER;
```

GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
   enable               OUT BOOLEAN,
   max_cookies          OUT PLS_INTEGER,
   max_cookies_per_site  OUT PLS_INTEGER);
```

Parameters

Table 208–24 GET_COOKIE SUPPORT Procedure Parameters

Parameter	Description
`enable`	Indicates whether future HTTP requests should support HTTP cookies (`TRUE`) or not (`FALSE`)
`max_cookies`	Indicates the maximum total number of cookies maintained in the current session
`max_cookies_per_site`	Indicates the maximum number of cookies maintained in the current session for each Web site

GET_COOKIES Function

This function returns all the cookies currently maintained by the `UTL_HTTP` package set by all Web servers.

> **See Also:** HTTP Cookies on page 208-17 and HTTP Cookies Subprograms on page 208-29

Syntax

```
UTL_HTTP.GET_COOKIES (
   cookies  IN OUT NOCOPY cookie_table);
```

Parameters

Table 208–25 GET_COOKIES Procedure Parameters

Parameter	Description
`cookies`	The cookies returned

GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
   enable  OUT BOOLEAN);
```

Parameters

Table 208–26 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

GET_DETAILED_SQLCODE Function

This function retrieves the detailed `SQLCODE` of the last exception raised.

See Also: Error Conditions on page 208-18 and Error Conditions Subprograms on page 208-31

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```

GET_DETAILED_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

> **See Also:** Error Conditions on page 208-18 and Error Conditions Subprograms on page 208-31

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;
```

GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also: Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (
   max_redirects  OUT PLS_INTEGER);
```

Parameters

Table 208–27 GET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
`max_redirects`	The maximum number of redirections for all future HTTP requests

GET_HEADER Procedure

This procedure returns the n^{th} HTTP response header name and value returned in the response.

> **See Also:** HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.GET_HEADER (
   r      IN OUT NOCOPY resp,
   n      IN PLS_INTEGER,
   name   OUT NOCOPY VARCHAR2,
   value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 208–28 GET_HEADER Procedure Parameters

Parameter	Description
`r`	The HTTP response
`n`	The n^{th} header to return
`name`	The name of the HTTP response header
`value`	The value of the HTTP response header

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

> **See Also:** HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
   r      IN OUT NOCOPY resp,
   name   IN VARCHAR2,
   value  OUT NOCOPY VARCHAR2,
   n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

Table 208–29 GET_HEADER_BY_NAME Procedure Parameters

Parameter	Description
`r`	The HTTP response
`name`	The name of the HTTP response header for which the value is to return
`value`	The value of the HTTP response header
`n`	The n^{th} occurrence of an HTTP response header by the specified name to return. The default is 1.

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

> **See Also:** HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (
   r  IN OUT NOCOPY resp)
RETURN PLS_INTEGER;
```

Parameters

Table 208–30 GET_HEADER_COUNT Function Parameters

Parameter	Description
r	The HTTP response

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

> **See Also:** HTTP Persistent Connections on page 208-17 and HTTP Persistent Connections Subprograms on page 208-30

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks:

- If the persistent connection support is enabled
- Gets the maximum number of persistent connections in the current session

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (
   enable     OUT BOOLEAN,
   max_conns  OUT PLS_INTEGER);
```

Parameters

Table 208–31 GET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`enable`	`TRUE` if persistent connection support is enabled; otherwise `FALSE`
`max_conns`	the maximum number of persistent connections maintained in the current session

GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the `UTL_HTTP` package to the Web servers.

> **See Also:** HTTP Persistent Connections on page 208-17 and HTTP Persistent Connections Subprograms on page 208-30

Syntax

```
UTL_HTTP.get_persistent_conns (
   connections  IN OUT NOCOPY connection_table);
```

Parameters

Table 208–32 GET_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
`connections`	The network connections kept persistent

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

GET_PROXY Procedure

This procedure retrieves the current proxy settings.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.GET_PROXY (
   proxy             OUT NOCOPY VARCHAR2,
   no_proxy_domains  OUT NOCOPY VARCHAR2);
```

Parameters

Table 208–33 GET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) currently used by the `UTL_HTTP` package
`no_proxy_domains`	The list of hosts and domains for which no proxy is used for all requests

GET_RESPONSE Function

This function reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

> **See Also:** HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.GET_RESPONSE (
   r  IN OUT NOCOPY req)
RETURN resp;
```

Parameters

Table 208–34 GET_RESPONSE Procedure Parameters

Parameter	Description
r	The HTTP response

GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
   enable  OUT BOOLEAN);
```

Parameters

Table 208–35 GET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
`enable`	`TRUE` if the response error check is set; otherwise `FALSE`

GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (
   timeout  OUT PLS_INTEGER);
```

Parameters

Table 208–36 GET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
`timeout`	The network transfer timeout value in seconds

READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer. The end of line is as defined in the function `read_line` of UTL_TCP. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:** HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.READ_LINE(
   r            IN OUT NOCOPY resp,
   data         OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
   remove_crlf  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 208–37 READ_LINE Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in text form
`remove_crlf`	Removes the newline characters if set to `TRUE`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the "Content-Type" response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached.

> **See Also:** HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.READ_RAW(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY RAW,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 208–38 READ_RAW Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in binary form
`len`	The number of bytes of data to read. If `len` is `NULL`, this procedure will read as much input as possible to fill the buffer allocated in `data`. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the `transfer_timeout` amount of time has elapsed. The default is `NULL`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:** HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28

Syntax

```
UTL_HTTP.READ_TEXT(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 208–39 READ_TEXT Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in text form
`len`	The maximum number of characters of data to read. If `len` is NULL, this procedure will read as much input as possible to fill the buffer allocated in `data`. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the `transfer_timeout` amount of time has elapsed. The default is NULL.

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the "Content-Type" response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "`ORA-01482:`

unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.

REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL. This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

See Also: Simple HTTP Fetches on page 208-16 and Simple HTTP Fetches in a Single Call Subprograms on page 208-25

Syntax

```
UTL_HTTP.REQUEST (
   url              IN VARCHAR2,
   proxy            IN VARCHAR2 DEFAULT NULL,
   wallet_path      IN VARCHAR2 DEFAULT NULL,
   wallet_password  IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

Table 208–40 REQUEST Function Parameters

Parameter	Description
`url`	Uniform resource locator
`proxy`	(Optional) Specifies a proxy server to use when making the HTTP request. See `SET_PROXY` for the full format of the proxy setting.
`wallet_path`	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of `wallet_path` on a PC is, for example, `file:c:\WINNT\Profiles\<username>\WALLETS`, and in Unix is, for example, `file:/home/<username>/wallets` When the `UTL_HTTP` package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See `SET_WALLET` for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
`wallet_password`	(Optional) Specifies the password required to open the wallet

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SQLPLUS> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM
DUAL;
```

REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

> **See Also:** Simple HTTP Fetches on page 208-16 and Simple HTTP Fetches in a Single Call Subprograms on page 208-25

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
   url             IN VARCHAR2,
   max_pieces      IN NATURAL DEFAULT 32767,
   proxy           IN VARCHAR2 DEFAULT NULL,
   wallet_path     IN VARCHAR2 DEFAULT NULL,
   wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 208–41 REQUEST_PIECES Function Parameters

Parameter	Description
url	Uniform resource locator
max_pieces	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\<username>\WALLETS, and in Unix is, for example, file:/home/<username>/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
wallet_password	(Optional) Specifies the password required to open the wallet

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SET SERVEROUTPUT ON

DECLARE
   x   UTL_HTTP.HTML_PIECES;
   len PLS_INTEGER;
BEGIN
   x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
   DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved.');
   DBMS_OUTPUT.PUT_LINE('with total length ');
   IF x.count < 1 THEN
      DBMS_OUTPUT.PUT_LINE('0');
```

```
  ELSE
   len := 0;
   FOR i in 1..x.count LOOP
      len := len + length(x(i));
   END LOOP;
   DBMS_OUTPUT.PUT_LINE(i);
  END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
```

SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

> **See Also:** HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27

Syntax

```
UTL_HTTP.SET_AUTHENTICATION(
   r         IN OUT NOCOPY req,
   username  IN VARCHAR2,
   password  IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 208–42 SET_AUTHENTICATION Procedure Parameters

Parameter	Description
`r`	The HTTP request
`username`	The username for the HTTP authentication
`password`	The password for the HTTP authentication
`scheme`	The HTTP authentication scheme. The default, `BASIC`, denotes the HTTP Basic Authentication scheme.
`for_proxy`	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is `FALSE`.

Usage Notes

Only the HTTP Basic Authentication scheme is supported.

SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

See Also:

- HTTP Responses on page 208-17 and HTTP Responses Subprograms on page 208-28
- Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
   charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "`ISO-8859-1`". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
   r        IN OUT NOCOPY req,
   charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the "Content-Type" header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the "Content-Type" header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
   r        IN OUT NOCOPY resp,
   charset  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 208–43 SET_BODY_CHARSET Procedure Parameters

Parameter	Description
`r`	The HTTP response.
`charset`	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If `charset` is `NULL`, the database character set is assumed.

SET_COOKIE_SUPPORT Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

This procedure

See Also:

- HTTP Requests on page 208-17 andHTTP Requests Subprograms on page 208-27
- Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
   r       IN OUT NOCOPY REQ,
   enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
   enable       IN BOOLEAN,
   max_cookies  IN PLS_INTEGER DEFAULT 300,
   max_cookies_per_site  IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 208–44 SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
`r`	The HTTP request
`enable`	Set enable to `TRUE` to enable HTTP cookie support; `FALSE` to disable
`max_cookies`	Sets the maximum total number of cookies maintained in the current session
`max_cookies_per_site`	Sets the maximum number of cookies maintained in the current session for each Web site

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" on page 208-21 for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the UTL_HTTP package to raise a detailed exception. By default, UTL_HTTP raises the request_failed exception when an HTTP request fails. Use GET_DETAILED_SQLCODE and GET_DETAILED_SQLEERM for more detailed information about the error.

See Also: Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 208–45 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

See Also:

- HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27
- Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
   max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
   r              IN OUT NOCOPY req,
   max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Parameters

Table 208–46 SET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
r	The HTTP request
max_redirects	The maximum number of redirects. Set to zero to disable redirects.

Usage Notes

If max_redirects is set to a positive number, the GET_RESPONSE Function will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the REQ record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function FOLLOW_REDIRECT and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The SET_FOLLOW_REDIRECT procedure must be called before GET_RESPONSE for any redirection to take effect.

SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

See Also: HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27

Syntax

```
UTL_HTTP.SET_HEADER (
   r      IN OUT NOCOPY req,
   name   IN VARCHAR2,
   value  IN VARCHAR2);
```

Parameters

Table 208–47 SET_HEADER Procedure Parameters

Parameter	Description
r	The HTTP request
name	The name of the HTTP request header
value	The value of the HTTP request header

Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the SET_BODY_CHARSET procedure.

When you set the Transfer-Encoding header with the value chunked, UTL_HTTP automatically encodes the request body written by the WRITE_TEXT, WRITE_LINE and WRITE_RAW procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

SET_PERSISTENT_CONN_SUPPORT Procedure

This procedure enables or disables support for the HTTP 1.1 persistent-connection in the request.

> **See Also:** HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27

Syntax

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
   r       IN OUT NOCOPY req,
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 208–48 SET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`r`	The HTTP request
`enable`	TRUE to keep the network connection persistent. FALSE otherwise.

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in `UTL_HTTP` may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples" on page 208-82.

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Examples

Using SET_PERSISTENT_CONN_SUPPORT in HTTP Requests

```
DECLARE
  TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
  paths VC2_TABLE;

UTL_HTTP.fetch_pages(paths IN vc2_table) AS
    url_prefix   VARCHAR2(256) := 'http://www.my-company.com/';
    req          UTL_HTTP.REQ;
    resp         UTL_HTTP.RESP;
    data  VARCHAR2(1024);
  BEGIN
    FOR i IN 1..paths.count LOOP
      req := UTL_HTTP.BEGIN_REQUEST(url_prefix || paths(i));
      -- Use persistent connection except for the last request
      IF (i < paths.count) THEN
        UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
      END IF;
      resp := UTL_HTTP.GET_RESPONSE(req);
      BEGIN
        LOOP
          UTL_HTTP.READ_TEXT(resp, data);
          -- do something with the data
        END LOOP;
      EXCEPTION
        WHEN UTL_HTTP.END_OF_BODY THEN
          NULL;
      END;
      UTL_HTTP.END_RESPONSE(resp);
    END LOOP;
  END;

BEGIN
  UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);
  paths(1) := '...';
  paths(2) := '...';
  ...
  fetch_pages(paths);
END;
```

SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`. `no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.SET_PROXY (
   proxy             IN VARCHAR2,
   no_proxy_domains  IN VARCHAR2);
```

Parameters

Table 208–49 SET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) to be used by the `UTL_HTTP` package
`no_proxy_domains`	The list of hosts and domains for which no proxy should be used for all requests

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com`, `eng.my-company.com:80`. When `no_proxy_domains` is `NULL` and the proxy is set, all requests go through the proxy. When the proxy is not set, `UTL_HTTP` sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges. For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 208–50 SET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
enable	TRUE to check for response errors; otherwise FALSE

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, GET_RESPONSE will raise the HTTP_CLIENT_ERROR or HTTP_SERVER_ERROR exception. If SET_RESPONSE_ERROR_CHECK is set to FALSE, GET_RESPONSE will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The GET_RESPONSE function can raise other exceptions when SET_RESPONSE_ERROR_CHECK is set to FALSE.

SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL_HTTP package should attempt while reading the HTTP response from the Web server or proxy server. This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (
   timeout  IN PLS_INTEGER DEFAULT 60);
```

Parameters

Table 208–51 SET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds.

Usage Notes

The default value of the time out is 60 seconds.

SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS. When the UTL_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL_HTTP package. An Oracle wallet is required to make an HTTPS request.

> **See Also:** Session Settings on page 208-17 and Session Settings Subprograms on page 208-26

Syntax

```
UTL_HTTP.SET_WALLET (
   path      IN VARCHAR2,
   password  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 208–52 SET_WALLET Procedure Parameters

Parameter	Description
path	The directory path that contains the Oracle wallet. The format is file:<directory-path>. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\<username>\WALLETS, and in Unix is, for example, file:/home/<username>/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.
password	The password needed to open the wallet. A second copy of a wallet in a wallet directory that may be opened without a password. That second copy of the wallet is read-only. If the password is NULL, the UTL_HTTP package will open the second, read-only copy of the wallet instead.

Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

> **See Also:** *Oracle Database Advanced Security Administrator's Guide* for more information on Wallet Manager

WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP). As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

> **See Also:** HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27

Syntax

```
UTL_HTTP.WRITE_LINE(
   r     IN OUT NOCOPY req,
   data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 208–53 WRITE_LINE Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text line to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The UTL_HTTP package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.

WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

> **See Also:** HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27

Syntax

```
UTL_HTTP.WRITE_RAW(
   r     IN OUT NOCOPY REQ,
   data  IN            RAW);
```

Parameters

Table 208–54 WRITE_RAW Procedure Parameters

Parameter	Description
r	The HTTP request
data	The binary data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding:chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: HTTP Requests on page 208-17 and HTTP Requests Subprograms on page 208-27

Syntax

```
UTL_HTTP.WRITE_TEXT(
   r     IN OUT NOCOPY REQ,
   data  IN            VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 208–55 WRITE_TEXT Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.

UTL_I18N

`UTL_I18N` is a set of services that provides additional globalization functionality for applications written in PL/SQL.

> **See Also:** *Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- Using UTL_I18N
  - Overview
  - Constants
- Summary of UTL_I18N Subprograms

Using UTL_I18N

This section contains topics which relate to using the `UTL_I18N` package.

- Overview
- Constants

Overview

The UTL_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.

Constants

The UTL_I18N package uses the constants shown in Table 209–1.

Table 209–1 UTL_I18N Constants

Constant	Type	Value	Description
GENERIC_CONTEXT	PLS_INTEGER	0	Returns the default character set for general cases.
MAIL_GENERIC	PLS_INTEGER	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
ORACLE_TO_IANA	PLS_INTEGER	0	Map from an Oracle character set name to an IANA character set name.
SHIFT_IN	PLS_INTEGER	0	Used with shift_status. Must be set the first time it is called in piecewise conversion.
IANA_TO_ORACLE	PLS_INTEGER	1	Map from an IANA character set name to an Oracle character set name.
MAIL_CONTEXT	PLS_INTEGER	1	The mapping is between an Oracle character set name and an email safe character set name.
MAIL_WINDOWS	PLS_INTEGER	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
SHIFT_OUT	PLS_INTEGER	1	
FWKATAKANA_HIRAGANA	VARCHAR2(30)	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
FWKATAKANA_HWKATAKANA	VARCHAR2(30)	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
HIRAGANA_FWKATAKANA	VARCHAR2(30)	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAKANA	VARCHAR2(30)	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKATAKANA	VARCHAR2(30)	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	VARCHAR2(30)	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2(30)	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.

Table 209–1 (Cont.) UTL_I18N Constants

Constant	Type	Value	Description
KANA_HIRAGANA	VARCHAR2(30)	'kana_ hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
KANA_ HWKATAKANA	VARCHAR2(30)	'kana_ hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.

Summary of UTL_I18N Subprograms

Table 209–2 UTL_I18N Package Subprograms

Procedure	Description
ESCAPE_REFERENCE Function on page 209-8	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
GET_COMMON_TIME_ZONES Function on page 209-9	Returns the list of common time zone IDs that are independent of the locales.
GET_DEFAULT_CHARSET Function on page 209-10	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
GET_DEFAULT_ISO_CURRENCY Function on page 209-11	Returns the default ISO 4217 currency code for the specified territory.
GET_DEFAULT_LINGUISTIC_SORT Function on page 209-12	Returns the default linguistic sort name for the specified language.
GET_LOCAL_LANGUAGES Function on page 209-13	Returns the local language names for the specified territory.
GET_LOCAL_LINGUISTIC_SORTS Function on page 209-14	Returns the local linguistic sort names for the specified language.
GET_LOCAL_TERRITORIES Function on page 209-15	Returns the local territory names for the specified language.
GET_LOCAL_TIME_ZONES Function on page 209-16	Returns the local time zone IDs for the specified territory.
GET_TRANSLATION Function on page 209-18	Returns the translation of the language and territory name in the specified translation language.
MAP_CHARSET Function on page 209-19	■ Maps an Oracle character set name to an IANA character set name. ■ Maps an IANA character set name to an Oracle character set name. ■ Maps an Oracle character set name to an e-mail safe character set name.
MAP_FROM_SHORT_LANGUAGE Function on page 209-21	Maps an Oracle short language name to an Oracle language name.
MAP_LANGUAGE_FROM_ISO Function on page 209-22	Returns an Oracle language name from an ISO locale name.
MAP_LOCALE_TO_ISO Function on page 209-23	Returns an ISO locale name from the Oracle language and territory name.
MAP_TERRITORY_FROM_ISO Function on page 209-24	Returns an Oracle territory name from an ISO locale name.
MAP_TO_SHORT_LANGUAGE Function on page 209-25	Maps an Oracle language name to an Oracle short language name.
RAW_TO_CHAR Functions on page 209-26	Converts `RAW` data that is not encoded in the database character set into a `VARCHAR2` string
RAW_TO_NCHAR Functions on page 209-28	Converts `RAW` data that is not encoded in the national character set into an `NVARCHAR2` string
STRING_TO_RAW Function on page 209-30	Converts a `VARCHAR2` or `NVARCHAR2` string to another character set. The result is returned as a `RAW` datatype.

Table 209–2 (Cont.) UTL_I18N Package Subprograms

Procedure	Description
TRANSLITERATE Function on page 209-31	Transliterates between Japanese hiragana and katakana.
UNESCAPE_REFERENCE Function on page 209-33	Converts an input string that contains character references to a text string.

ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document. Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document.

Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `å` is the numeric character reference for the small letter "a" with a ring above, whereas `å` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `<` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
    str            IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name   IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 209–3 ESCAPE_REFERENCE Function Parameters

Parameter	Description
`str`	Specifies the input string
`page_cs_name`	Specifies the character set of the document. If `page_cs_name` is `NULL`, then the database character set is used for `CHAR` data and the national character set is used for `NCHAR` data.

Usage Notes

If the user specifies an invalid character set or a `NULL` string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns `'hello < å'`.

GET_COMMON_TIME_ZONES Function

This function returns a listing of the most commonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES
 RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
BEGIN
   retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
```

GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

> **See Also:** "MAP_CHARSET Function" on page 209-19 for an explanation of an e-mail safe character set

Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
   language  IN VARCHAR2,
   context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
   iswindows IN BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 209–4 GET_DEFAULT_CHARSET Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language
`context`	`GENERIC_CONTEXT | MAIL_CONTEXT` `GENERIC_CONTEXT`: Returns the default character set for general cases `MAIL_CONTEXT`: Returns the default e-mail safe character set name
`iswindows`	If `context` is set as `MAIL_CONTEXT`, then `iswindows` should be set to `TRUE` if the platform is Windows and `FALSE` if the platform is not Windows. The default is `FALSE`. `iswindows` has no effect if `context` is set as `GENERIC_CONTEXT`.

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a `NULL` string.

Examples

GENERIC_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns `'WE8ISO8859P1'`.

MAIL_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (
   territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 209–5 GET_DEFAULT_ISO_CURRENCY Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Displays the default ISO currency code for China.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
   retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 209–6 GET_DEFAULT_LINGUISTIC_SORT Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
  SELECT value INTO retval FROM nls_session_parameters
   WHERE parameter = 'NLS_LANGUAGE';
   retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

GET_LOCAL_LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (
   territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 209–7 GET_LOCAL_LANGUAGES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Returns the list of local languages used in Belgium.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt    INTEGER;
BEGIN
   retval   :=  UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
   cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
   END LOOP;
END;
/
...
Count = 2
DUTCH
FRENCH
```

GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A `BINARY` sort is included for all languages.

Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 209–8 GET_LOCAL_LINGUISTIC_SORTS Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the local linguistic sort names for `JAPANESE`.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
  retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
  DBMS_OUTPUT.PUT('Count = ');
  DBMS_OUTPUT.PUT_LINE(retval.COUNT);
  cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY
```

GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
 RETURN STRING_ARRAY;
```

Parameters

Table 209–9 GET_LOCAL_TERRITORIES Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
   retval  UTL_I18N.STRING_ARRAY;
   cnt     INTEGER;
BEGIN
   retval  := UTL_I18N.GET_LCOAL_TERRITORIIES('GERMAN');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
  cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt));
   END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
   territory      IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

Parameters

Table 209–10 GET_LOCAL_TIME_ZONES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
  retval  utl_i18n.string_array;
  retval2 utl_i18n.string_array;
  stpos   INTEGER;
BEGIN
  retval  := utl_i18n.get_local_time_zones(
    territory);
  retval2 := utl_i18n.get_common_time_zones;
  stpos := retval.LAST + 1;
  retval(stpos) := '-----'; -- a separator
  FOR i IN retval2.FIRST..retval2.LAST LOOP
    stpos := stpos + 1;
    retval(stpos) := retval2(i);
  END LOOP;
  RETURN retval;
END;
/
```

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
   DBMS_OUTPUT.ENABLE(100000);
   retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
   cnt := retval.FIRST;
```

```
  WHILE cnt IS NOT NULL LOOP
    DBMS_OUTPUT.PUT_LINE(retval(cnt));
    cnt := retval.NEXT(cnt);
  END LOOP;
END;
/

```

GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (
   parameter        IN VARCHAR2 CHARACTER SET ANY_CS,
   trans_language   IN VARCHAR2 'AMERICAN',
   flag             IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

Table 209–11 GET_TRANSLATION Function Parameters

Parameter	Description
`parameter`	Specifies a valid language name, territory name, or a combined string in the form of *`language_territory`*. It is case-insensitive.
`trans_language`	Specifies a translation language name. For example, `ITALIAN` is for the Italian language. The default is `AMERICAN`, which indicates American English.
`flag`	Specifies the translation type: ■ `LANGUAGE_TRANS`: The function returns the language translation. ■ `TERRITORY_TRANS`: The function returns the territory translation. ■ `LANGUAGE_TERRITORY_TRANS`: The function returns the language and territory translation. The default translation type is `LANGUAGE_TRANS`.

Usage Notes

If `VARCHAR2` is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using `NVARCHAR2` as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide `GUJARATI` translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
   CURSOR c1 IS
     SELECT value FROM V$NLS_VALID_VALUES
     WHERE parameter = 'LANGUAGE'
  ORDER BY value;
  retval NVARCHAR2(100);
BEGIN
   FOR item IN c1 LOOP
     retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
   END LOOP;
END;
```

MAP_CHARSET Function

This function maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```
UTL_I18N.MAP_CHARSET(
   charset   IN VARCHAR2,
   context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
   flag      IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

Table 209–12 MAP_CHARSET Function Parameters

Parameter	Description
charset	Specifies the character set name to be mapped. The mapping is case-insensitive.
context	GENERIC_CONTEXT | MAIL_CONTEXT GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value. MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.
flag	■ ORACLE_TO_IANA | IANA_TO_ORACLE if GENERIC_CONTEXT is set ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default. IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name. ■ MAIL_GENERIC | MAIL_WINDOWS if MAIL_CONTEXT is set MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform. MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the MAP_CHARSET function with the MAIL_CONTEXT | MAIL_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.
2. Convert the contents stored in the database to WE8ISO8859P1.
3. Call the MAP_CHARSET function with the ORACLE_TO_IANA | GENERIC_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.
4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

Note: Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

Examples

Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_
ORACLE)
```

This returns 'WE8ISO8859P1'.

Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context,  utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

See Also: *Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
   language           IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 209–13 MAP_FROM_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table customers is from the oe user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the GET_DEFAULT_LINGUISTIC_SORT procedure.

```
DECLARE
   short_n VARCHAR2(10);
   ling_n VARCHAR2(50);
BEGIN
   SELECT nls_language INTO short
   FROM customers WHERE customer_id = 9000;
   ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
   UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
   DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
  isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 209–14 MAP_LANGUAGE_FROM_ISO Function Parameters

Parameter	Description
`isolocale`	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, `American`).

Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns `'American'`.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages

MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name. A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
   ora_language   IN VARCHAR2,
   ora_territory  IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 209–15 MAP_LOCALE_TO_ISO Function Parameters

Parameter	Description
ora_language	Specifies an Oracle language name. It is case-insensitive.
ora_territory	Specifies an Oracle territory name. It is case-insensitive.

Usage Notes

If the user specifies an invalid string, then the function returns a NULL string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en_US'.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (
  isolocale IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 209–16 MAP_TERRITORY_FROM_ISO Function Parameters

Parameter	Description
`isolocale`	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `French`).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns `'America'`.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle territories

MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (
   language    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 209–17 MAP_TO_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

```
DECLARE
  retval VARCHAR2(100);
BEGIN
  retval := UTL_I18N.MAP_TO_SHORT_LANGUAGE('american');
  DBMS_OUTPUT.PUT_LINE(retval);
END;
/

US
```

RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
   data          IN RAW,
   src_charset   IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
   data            IN RAW,
   src_charset     IN VARCHAR2 DEFAULT NULL,
   scanned_length  OUT PLS_INTEGER,
   shift_status    IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 209–18 RAW_TO_CHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to a VARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde'||chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde'||chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to `8`.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
  nvalue VARCHAR2(1024);
  conversion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;

  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);
  LOOP
      tlen := utl_tcp.read_raw(conn, rvalue, 1024);
      rvalue := utl_raw.concat(rtemp, rvalue);
      nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
      if (converted_len < utl_raw.length(rvalue) )
      then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
      else
        rtemp := '';
      end if;
      /* do anything you want with nvalue */
      /* e.g htp.prn(nvalue); */
    END LOOP;
    utl_tcp.close_connection(conn);
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      utl_tcp.close_connection(conn);
END;
```

RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_NCHAR (
   data         IN RAW,
   src_charset  IN VARCHAR2 DEFAULT NULL)
 RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_NCHAR (
   data            IN RAW,
   src_charset      IN VARCHAR2 DEFAULT NULL,
   scanned_length   OUT PLS_INTEGER,
   shift_status     IN OUT PLS_INTEGER)
 RETURN NVARCHAR2;
```

Parameters

Table 209–19 RAW_TO_NCHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to an NVARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde'||chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde'||chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to `8`.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
  nvalue NVARCHAR2(1024);
  converstion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;

  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);
  LOOP
      tlen := utl_tcp.read_raw(conn, rvalue, 1024);
      rvalue := utl_raw.concat(rtemp, rvalue);
      nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
      if (converted_len < utl_raw.length(rvalue) )
      then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
      else
        rtemp := '';
      end if;
      /* do anything you want with nvalue */
      /* e.g htp.prn(nvalue); */
    END LOOP;
    utl_tcp.close_connection(conn);
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      utl_tcp.close_connection(conn);
  END;
```

STRING_TO_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

Syntax

```
UTL_I18N.STRING_TO_RAW(
   data          IN VARCHAR2 CHARACTER SET ANY_CS,
   dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

Parameters

Table 209–20 STRING_TO_RAW Function Parameters

Parameter	Description
data	Specifies the VARCHAR2 or NVARCHAR2 string to convert.
dst_charset	Specifies the destination character set. If dst_charset is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

Examples

```
DECLARE
    r raw(50);
    s varchar2(20);
  BEGIN
    s:='abcdef'||chr(170);
    r:=utl_i18n.string_to_raw(s,'utf8');
    dbms_output.put_line(rawtohex(r));
  end;
/
```

This returns a hex value of '616263646566C2AA'.

TRANSLITERATE Function

This function performs script transliteration. In this release, the TRANSLITERATE function only supports Japanese Kana conversion.

Syntax

```
UTL_I18N.TRANSLITERATE (
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

Table 209–21 TRANSLITERATE Function Parameters

Parameter	Description
data	Specifies the data to be converted. Either CHAR or NCHAR data type can be specified.
name	Specifies the transliteration name string. For a list of valid names, see Table 209–22.

Constants

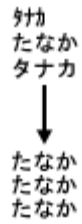
These options specify Japanese Kana conversions.

Table 209–22 TRANSLITERATE Function Constants

Constant Name	Value	Description
KANA_FWKATAKANA	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HWKATAKANA	'kana_hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.
KANA_HIRAGANA	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
FWKATAKANA_HWKATAKANA	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
FWKATAKANA_HIRAGANA	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
HWKATAKANA_FWKATAKANA	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
HIRAGANA_FWKATAKANA	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAKANA	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

Usage Notes

The function returns the converted string.



Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

Figure shows how this output might look.

Figure 209–1 Loading Locale-Specific Data to the Database

The following statement normalizes one kana name to hiragana:

```
DECLARE
   Name  japanese_emp.ename%TYPE;
   Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
   SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
   name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
   UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
   WHEN  UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
   DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

> **See Also:** "ESCAPE_REFERENCE Function" on page 209-8 for more information about escape sequences

Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (
   str IN VARCHAR2 CHARACTER SET ANY_CS)
 RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 209–23 UNESCAPE_REFERENCE Function Parameters

Parameter	Description
`str`	Specifies the input string

Usage Notes

If the user specifies a `NULL` string or a string whose length is 0, then the function returns a `NULL` string. If the function fails, then it returns the original string.

Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')
```

This returns `'hello <'||chr(229).`

210

UTL_INADDR

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- Using UTL_INADDR
  - Exceptions
  - Examples
- Summary of UTL_INADDR Subprograms

Using UTL_INADDR

- Exceptions
- Examples

Exceptions

Table 210–1 Exception - Internet Address Package

Number	Exception	Description
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

Examples

Retrieve the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME);  -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS);  -- get local IP addr
END;
/
```

Summary of UTL_INADDR Subprograms

Table 210–2 UTL_INADDR Package Subprograms

Subprogram	Description
GET_HOST_ADDRESS Function on page 210-6	Retrieves the IP address of the local or remote host given its name
GET_HOST_NAME Function on page 210-7	Retrieves the name of the local or remote host given its IP address

GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (
   host  IN VARCHAR2 DEFAULT NULL)
RETURN host_address VARCHAR2;
```

Parameters

Table 210–3 GET_HOST_ADDRESS Function Parameters

Parameter	Description
host	The name of the host to retrieve the IP address.

Return Values

Table 210–4 GET_HOST_ADDRESS Function Return Values

Parameter	Description
host_address	The IP address of the specified host, or that of the local host if host is NULL.

Exceptions

UNKNOWN_HOST: The specified IP address is unknown.

GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```
UTL_INADDR.GET_HOST_NAME (
   ip  IN VARCHAR2 DEFAULT NULL)
RETURN host_name VARCHAR2;
```

Parameters

Table 210–5 GET_HOST_NAME Function Parameters

Parameter	Description
ip	The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

Return Values

Table 210–6 GET_HOST_NAME Function Return Values

Parameter	Description
host_name	The name of the local or remote host of the specified IP address .

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

211

UTL_LMS

`UTL_LMS` retrieves and formats error messages in different languages.

> **See Also:** *Oracle Database Globalization Support Guide*

This chapter contains the following topics:

- Using UTL_LMS
  - Security Model
- Summary of UTL_LMS Subprograms

Using UTL_LMS

This section contains topics which relate to using the `UTL_LMS` package.

- Security Model

Security Model

This package must be created as the user SYS.

Summary of UTL_LMS Subprograms

Table 211–1 UTL_LMS Package Subprograms

Function	Description
FORMAT_MESSAGE Function on page 211-5	Formats a retrieved error message
GET_MESSAGE Function on page 211-6	Retrieves an error message based on error number, product, facility, language, and message specified

FORMAT_MESSAGE Function

This function formats a message retrieved by the GET_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

Special Character	Description
'%s'	Substitute the next string argument
'%d'	Substitute the next integer argument
'%%'	Represents the special character %

Syntax

```
UTL_LMS.FORMAT_MESSAGE (
   format IN VARCHAR2 CHARACTER SET ANY_CS,
   args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
 RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

Parameters

Table 211–2 FORMAT_MESSAGE Procedure Parameters

Parameter	Description
format	Specifies the string to format
args	Specifies the list of arguments

Examples

```
DECLARE
   s varchar2(200);
   i  pls_integer;
BEGIN
   i:= utl_lms.get_messsage(26052, 'rdbms', 'ora', 'french', s);
   dbms_output.put_line('before format, message is: '||s);
   dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/
```

The following is an unformatted message:

```
Type %d non pris en charge pour l'expression SQL sur la colonne %s.
```

The following is the formatted message:

```
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
```

GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns `0` when it is successful. It returns `-1` when it fails.

> **See Also:** *Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

Syntax

```
UTL_LMS.GET_MESSAGE (
   errnum    IN PLS_INTEGER,
   product   IN VARCHAR2,
   facility  IN VARCHAR2,
   language  IN VARCHAR2,
   message   OUT NOCOPY VARCHAR2CHARCTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 211–3 GET_MESSAGE Function Parameters

Parameter	Description
`errnum`	Specifies the error number. Example: `'972'` (for `ORA-00972`)
`product`	Specifies the product to which the error message applies Example: '`rdbms`'
`facility`	Specifies the error message prefix Example: `'ora'`
`language`	Specifies the language of the message. The parameter is case-insensitive. The default is `NULL`, which causes `GET_MESSAGE` to use the value of the `NLS_LANGUAGE` session parameter.
`message`	Specifies the output buffer for the retrieved message

Usage Notes

If the `language` parameter is set to `NULL`, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

Examples

```
DECLARE
  s varchar2(200);
  i pls_integer;
BEGIN
   i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
   dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

212

UTL_MAIL

The `UTL_MAIL` package is a utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt.

This chapter contains the following topics:

- Using UTL_MAIL
  - Security Model
  - Operational Notes
  - Rules and Limits
- Summary of UTL_MAIL Subprograms

Using UTL_MAIL

- Security Model
- Operational Notes
- Rules and Limits

Security Model

UTL_MAIL is not installed by default because of the SMTP_OUT_SERVER configuration requirement and the security exposure this involves. In installing UTL_MAIL, you should take steps to prevent the port defined by SMTP_OUT_SERVER being swamped by data transmissions .

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

Operational Notes

You must both install UTL_MAIL and define the SMTP_OUT_SERVER.

- To install UTL_MAIL:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the SMTP_OUT_SERVER parameter in the init.ora rdbms initialization file. However, if SMTP_OUT_SERVER is not defined, this invokes a default of DB_DOMAIN which is guaranteed to be defined to perform appropriately.

Rules and Limits

Use `UTL_MAIL` only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

Summary of UTL_MAIL Subprograms

Table 212–1 UTL_MAIL Package Subprograms

Subprogram	Description
SEND Procedure on page 212-7	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
SEND_ATTACH_RAW Procedure on page 212-8	Represents the `SEND` Procedure overloaded for `RAW` attachments
SEND_ATTACH_VARCHAR2 Procedure on page 212-9	Represents the `SEND` Procedure overloaded for `VARCHAR2` attachments

SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients. It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (
   sender      IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message     IN    VARCHAR2 CHARACTER SET ANY_CS,
   mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
   priority    IN    PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 212–2 SEND Procedure Parameters

Parameter	Description
`sender`	The email address of the sender.
`recipients`	The email addresses of the recipient(s), separated by commas.
`cc`	The email addresses of the CC recipient(s), separated by commas, default is `NULL`
`bcc`	The email addresses of the BCC recipient(s), separated by commas, default is `NULL`
`subject`	A string to be included as email subject string, default is `NULL`
`message`	A text message body.
`mime_type`	The mime type of the message, default is `'text/plain; charset=us-ascii'`
`priority`	The message priority, default is `NULL`.

SEND_ATTACH_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (
   sender           IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients       IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   mime_type        IN    VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                              DEFAULT 'text/plain; charset=us-ascii',
   priority         IN    PLS_INTEGER DEFAULT 3,
   attachment       IN    RAW,
   att_inline       IN    BOOLEAN DEFAULT TRUE,
   att_mime_type    IN    VARCHAR2 CHARACTER SET ANY_CS
                                       DEFAULT 'text/plain; charset=us-ascii',
   att_filename     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 212–3 SEND_ATTACH_RAW Procedure Parameters

Parameter	Description
sender	The email address of the sender.
recipients	The email addresses of the recipient(s), separated by commas.
cc	The email addresses of the CC recipient(s), separated by commas, default is NULL.
bcc	The email addresses of the BCC recipient(s), separated by commas, default is NULL.
subject	A string to be included as email subject string, default is NULL.
message	A text message body.
mime_type	The mime type of the message, default is 'text/plain; charset=us-ascii'.
priority	The message priority, the default is NULL.
attachment	A RAW attachment.
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE.
att_mime_type	The mime type of the attachment, default is 'application/octet'.
att_filename	The string specifying a filename containing the attachment, default is NULL.

SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
   sender            IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients        IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc                IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   mime_type         IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-ascii',
   priority          IN    PLS_INTEGER DEFAULT 3,
   attachment        IN    VARCHAR2 CHARACTER SET ANY_CS, ,
   att_inline        IN    BOOLEAN DEFAULT TRUE,
   att_mime_type     IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-ascii,
   att_filename      IN    VARCHAR2CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 212–4 SEND_ATTACH_VARCHAR2 Procedure Parameters

Parameter	Description
sender	The email address of the sender.
recipients	The email addresses of the recipient(s), separated by commas.
cc	The email addresses of the CC recipient(s), separated by commas, default is NULL.
bcc	The email addresses of the BCC recipient(s), separated by commas, default is NULL.
subject	A string to be included as email subject string, default is NULL.
message	A text message body.
mime_type	The mime type of the message, default is 'text/plain; charset=us-ascii.
priority	The message priority, the default is NULL.
attachment	A text attachment.
att_inline	Specifies whether the attachment is inline, default TRUE.
att_mime_type	The mime type of the attachment, default is 'text/plain; charset=us-ascii'.
att_filename	The string specifying a filename containing the attachment, default is NULL.

UTL_NLA

The UTL_NLA package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs.

This chapter contains the following topics:

- Using UTL_NLA
  - Overview
  - Rules and Limits
- Subprogram Groups
  - BLAS Level 1 (Vector-Vector Operations) Subprograms
  - BLAS Level 2 (Matrix-Vector Operations) Subprograms
  - BLAS Level 3 (Matrix-Matrix Operations) Subprograms
  - LAPACK Driver Routines (Linear Equations) Subprograms
  - LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
- Summary of UTL_NLA Subprograms

Using UTL_NLA

This section contains topics which relate to using the `UTL_NLA` package.

- Overview
- Rules and Limits

Overview

The UTL_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage)(Version 3.0) operations on vectors and matrices represented as VARRAYs.

Standards

For more information on the BLAS and LAPACK standards see

http://www.netlib.org/blas/
http://www.netlib.org/lapack/

Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the BLAS_ prefix (for example, theBLAS_ASUM Functions). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the LAPACK_ prefix (for example, the LAPACK_ GBSV Procedures). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all /work/ arguments have been removed. The UTL_NLA package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, pack, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

Rules and Limits

Vectors and matrices are stored in `VARRAY`s with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size RxC <= 1,000,000.

Subprogram Groups

- BLAS Level 1 (Vector-Vector Operations) Subprograms
- BLAS Level 2 (Matrix-Vector Operations) Subprograms
- BLAS Level 3 (Matrix-Matrix Operations) Subprograms
- LAPACK Driver Routines (Linear Equations) Subprograms
- LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 213–1 BLAS Level 1 (Vector-Vector Operations) Subprograms

Subprogram	Description
BLAS_ASUM Functions on page 213-17	Computes the sum of the absolute values of the vector components
BLAS_AXPY Procedures on page 213-18	Copies `alpha*X + Y` into vector `Y`
BLAS_COPY Procedures on page 213-19	Copies the contents of vector `X` to vector `Y`
BLAS_DOT Functions on page 213-20	Returns the dot (scalar) product of two vectors `X` and `Y`
BLAS_IAMAX Functions on page 213-30	Computes the index of the first element of a vector that has the largest absolute value
BLAS_NRM2 Functions on page 213-31	Computes the vector 2-norm (Euclidean norm)
BLAS_ROT Procedures on page 213-32	Returns the plane rotation of points
BLAS_ROTG Procedures on page 213-33	Returns the Givens rotation of points
BLAS_SCAL Procedures on page 213-34	Scales a vector by a constant
BLAS_SWAP Procedures on page 213-43	Swaps the contents of two vectors each of size n

BLAS Level 2 (Matrix-Vector Operations) Subprograms

Table 213–2 BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_GBMV Procedures on page 213-21	Performs the matrix-vector operation `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals
BLAS_GEMV Procedures on page 213-26	Performs the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix
BLAS_GER Procedures on page 213-28	Performs a rank 1 operation `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an n element vector and `A` is an `m` by `n` matrix
BLAS_SBMV Procedures on page 213-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are n element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals
BLAS_SPMV Procedures on page 213-35	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SPR Procedures on page 213-37	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SPR2 Procedures on page 213-39	Performs a symmetric rank 2 operation `A := alpha*x*y' + alpha*y*x' +A` where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SBMV Procedures on page 213-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are n element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals
BLAS_SYMV Procedures on page 213-46	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix
BLAS_SYR Procedures on page 213-48	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix
BLAS_SYR2 Procedures on page 213-50	Performs a symmetric rank 2 operation `A := alpha*x*y' + alpha*y*x' + A` where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix
BLAS_TBMV Procedures on page 213-57	Performs a matrix-vector operation `x := A*x` or `A'*x = b` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals
BLAS_TBSV Procedures on page 213-59	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by n unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals

Table 213–2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_TPMV Procedures on page 213-61	Performs a matrix-vector operation `x := A*x` or `x := A'*x` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TPSV Procedures on page 213-63	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TRMV Procedures on page 213-68	Performs a matrix-vector operation `x := A*x` or `x := A'*x` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix
BLAS_TRSV Procedures on page 213-73	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an n by `n` unit, or non-unit, upper or lower triangular matrix

BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Table 213–3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Subprogram	Description
BLAS_GEMM Procedures on page 213-26	Performs one of the matrix-vector operations `C := alpha*op(A)*op(B) + beta*C` where `op(X) is one of op(X) = X or op(X) = X'` where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix
BLAS_SYMM Procedures on page 213-44	Performs one of the matrix-vector operations `C := alpha*A*B + beta*C` or `C := alpha*B*A + beta*C` where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices
BLAS_SYR2K Procedures on page 213-52	Performs one of the symmetric rank2 k operations `C := alpha*A*B' + alpha*B*A' + beta*C` or `C := alpha*A'*B + alpha*B'*A + beta*C` where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case
BLAS_SYRK Procedures on page 213-55	Performs one of the symmetric rank `k` operations `C := alpha*A*A' + beta*C` or `C := alpha*A'*A + beta*C` where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` is an `n` by `k` matrix in the first case and a `k` by `n` matrix in the second case
BLAS_TRMM Procedures on page 213-65	Performs one of the matrix-vector operations `B := alpha*op(A)*B` or `B := alpha*B*op(A)` where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of two alternatives
BLAS_TRSM Procedures on page 213-70	Performs one of the matrix-vector operations `op(A)*X = alpha*B` or `X*op(A) = alpha*B` where `alpha` is a scalar, `X` and `B` are `m` by `n` matrices, `A` is a unit, or non-unit, upper or lower triangular matrix, `op(A)` is one of two alternatives. The matrix `X` is overwritten on `B`

LAPACK Driver Routines (Linear Equations) Subprograms

Table 213–4 LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
LAPACK_GBSV Procedures on page 213-75	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.
LAPACK_GESV Procedures on page 213-84	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.
LAPACK_GTSV Procedures on page 213-92	This procedure solves the equation `a * x = b` where `a` is an `n` by `n` tridiagonal matrix, by Gaussian elimination with partial pivoting.
LAPACK_PBSV Procedures on page 213-94	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_POSV Procedures on page 213-96	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_PPSV Procedures on page 213-98	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_PTSV Procedures on page 213-100	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite tridiagonal matrix, and `x` and `b` are `n` by `nrhs` matrices.
LAPACK_SPSV Procedures on page 213-110	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.
LAPACK_SYSV Procedures on page 213-120	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.

LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 213–5 LAPACK Driver Routines (LLS and Eigenvalue Problems)

Subprogram	Description
LAPACK_GEES Procedures on page 213-77	Computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).
LAPACK_GEEV Procedures on page 213-89	Computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.
LAPACK_GELS Procedures on page 213-79	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.
LAPACK_GESDD Procedures on page 213-81	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_GESVD Procedures on page 213-86	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and/or right singular vectors. The SVD is written A = U * SIGMA * transpose(V).
LAPACK_SBEV Procedures on page 213-102	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A
LAPACK_SBEVD Procedures on page 213-104	Ccomputes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SPEV Procedures on page 213-106	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
LAPACK_SPEVD Procedures on page 213-108	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_STEV Procedures on page 213-112	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A
LAPACK_STEVD Procedures on page 213-114	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SYEV Procedures on page 213-116	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A
LAPACK_SYEVD Procedures on page 213-118	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

Summary of UTL_NLA Subprograms

Table 213–6 UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_ASUM Functions on page 213-17	Computes the sum of the absolute values of the vector components	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_AXPY Procedures on page 213-18	Copies `alpha*X + Y` into vector `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_COPY Procedures on page 213-19	Copies the contents of vector `X` to vector `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_DOT Functions on page 213-20	Returns the dot (scalar) product of two vectors `X` and `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_GBMV Procedures on page 213-21	Performs the matrix-vector operation `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GEMM Procedures on page 213-26	Performs one of the matrix-vector operations where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_GEMV Procedures on page 213-26	Performs the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GER Procedures on page 213-28	Performs a rank 1 operation `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an `n` element vector and `A` is an `m` by `n` matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_IAMAX Functions on page 213-30	Computes the index of the first element of a vector that has the largest absolute value	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_NRM2 Functions on page 213-31	Computes the vector 2-norm (Euclidean norm)	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROT Procedures on page 213-32	Returns the plane rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROTG Procedures on page 213-33	Returns the Givens rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 213–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_SBMV Procedures on page 213-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SCAL Procedures on page 213-34	Scales a vector by a constant	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SPMV Procedures on page 213-35	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR Procedures on page 213-37	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR2 Procedures on page 213-39	Performs a symmetric rank 2 operation where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SWAP Procedures on page 213-43	Swaps the contents of two vectors each of size n	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SYMM Procedures on page 213-44	Performs one of the matrix-vector operations where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYMV Procedures on page 213-46	Performs a matrix-vector operation where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR Procedures on page 213-48	Performs a symmetric rank 1 operation where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2 Procedures on page 213-50	Performs a symmetric rank 2 operation where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2K Procedures on page 213-52	Performs one of the symmetric rank2 k operations where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYRK Procedures on page 213-55	Performs one of the symmetric rank `k` operations where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` is an `n` by `k` matrix in the first case and a `k` by `n` matrix in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TBMV Procedures on page 213-57	Performs a matrix-vector operation where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms

Table 213–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_TBSV Procedures on page 213-59	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k + 1) diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPMV Procedures on page 213-61	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPSV Procedures on page 213-63	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMM Procedures on page 213-65	Performs one of the matrix-vector operations wherealpha is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of two alternatives	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMV Procedures on page 213-68	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRSM Procedures on page 213-70	Performs one of the matrix-vector operations op(A)*X = alpha*B or X*op(A) = alpha*B where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, op(A) is one of two alternatives. The matrix X is overwritten on B	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TRSV Procedures on page 213-73	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
LAPACK_GBSV Procedures on page 213-75	This procedure computes the solution to a real system of linear equations a * x = b where a is an n by n matrix and x and b are n by nrhs matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_GEES Procedures on page 213-77	Computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GEEV Procedures on page 213-89	Computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GELS Procedures on page 213-79	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ GESDD Procedures on page 213-81	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 213–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
LAPACK_GESV Procedures on page 213-84	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_ GESVD Procedures on page 213-86	Computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and/or right singular vectors. The SVD is written `A = U * SIGMA * transpose(V)`.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GTSV Procedures on page 213-92	This procedure solves the equation `a * x = b` where `a` is an `n` by `n` tridiagonal matrix, by Gaussian elimination with partial pivoting.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PBSV Procedures on page 213-94	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_POSV Procedures on page 213-96	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PPSV Procedures on page 213-98	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PTSV Procedures on page 213-100	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite tridiagonal matrix, and `x` and `b` are `n` by `nrhs` matrices.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_SBEV Procedures on page 213-102	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix `A`	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SBEVD Procedures on page 213-104	Ccomputes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SPEV Procedures on page 213-106	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SPEVD Procedures on page 213-108	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 213–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
LAPACK_SPSV Procedures on page 213-110	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_STEV Procedures on page 213-112	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ STEVD Procedures on page 213-114	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SYEVD Procedures on page 213-118	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SYSV Procedures on page 213-120	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms

BLAS_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ASUM (
   n      IN       POSITIVEN,
   x      IN       UTL_NLA_ARRAY_DBL,
   incx   IN       POSITIVEN)
 RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_ASUM (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_FLT)
 RETURN BINARY_FLOAT
```

Parameters

Table 213–7 BLAS_ASUM Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_AXPY Procedures

This procedure copies `alpha*X + Y` into vector `Y`.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_AXPY (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_DBL,
   incx   IN       POSITIVEN,
   y      IN OUT   UTL_NLA_ARRAY_DBL,
   incy   IN       POSITIVEN);

UTL_NLA.BLAS_AXPY (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_FLT,
   incx   IN       POSITIVEN,
   y      IN OUT   UTL_NLA_ARRAY_FLT,
   incy   IN       POSITIVEN);
```

Parameters

Table 213–8 BLAS_AXPY Procedure Parameters

Parameter	Description
`n`	Specifies the number of elements of the vectors `x` and `y`. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of `dimension` at least `( 1 + ( n - 1 )*abs( incx ) )`
`incx`	Specifies the increment for the elements of `x`. `incx` must not be zero.
`y`	`UTL_NLA_ARRAY_FLT/DBL` of `DIMENSION` at least `( 1 + ( n - 1 )*abs( incy) )`
`incy`	Specifies the increment for the elements of `y`. `incy` must not be zero.

BLAS_COPY Procedures

This procedure copies the contents of vector X to vector Y.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_COPY (
   n     IN     POSITIVEN,
   x     IN     UTL_NLA_ARRAY_DBL,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_DBL,
   incy  IN     POSITIVEN);

UTL_NLA.BLAS_COPY (
   n     IN     POSITIVEN,
   x     IN     UTL_NLA_ARRAY_FLT,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_FLT,
   incy  IN     POSITIVEN);
```

Parameters

Table 213–9 BLAS_COPY Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_DOT Functions

This function returns the dot (scalar) product of two vectors `X` and `Y`.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_DOT (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN,
   y     IN   UTL_NLA_ARRAY_DBL,
   incy  IN   POSITIVEN)
  RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_DOT (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN,
   y     IN   UTL_NLA_ARRAY_FLT,
   incy  IN   POSITIVEN)
  RETURN BINARY_FLOAT;
```

Parameters

Table 213–10 BLAS_DOT Function Parameters

Parameter	Description
`n`	Specifies the number of elements of the vectors `x` and `y`. `n` must be at least zero.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( n - 1 )*abs( incx ) )`
`incx`	Specifies the increment for the elements of `x`. `incx` must not be zero.
`y`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( n - 1 )*abs( incy) )`
`incy`	Specifies the increment for the elements of `y`. `incy` must not be zero.

BLAS_GBMV Procedures

This procedure performs one of the matrix-vector operations

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 213-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_GEMV (

   incx   IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 213–11 BLAS_GBMV Procedure Parameters

Parameter	Description
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'y := alpha*A*x + beta*y ■ trans = 'T' or 't'y := alpha*A'*x + beta*y ■ trans = 'C' or 'c'y := alpha*A'*x + beta*y
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
kl	Specifies the number of sub-diagonals of the matrix A. kl must satisfy 0. le. kl.
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy 0 .le. ku.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry, the leading (kl + ku + 1) by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row (ku+2), and so on. Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (kl+ku+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx)) when trans = ''N' or 'n' and at least (1 + (m - 1)*abs(incx)) otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (m - 1)*abs(incy)) when trans = 'N' or 'n' and at least (1+(n-1)*abs(incy)) otherwise. Before entry with beta non-zero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.

Table 213–11 (Cont.) BLAS_GBMV Procedure Parameters

Parameter	Description
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GEMM Procedures

This procedure performs one of the matrix-matrix operations

```
C := alpha*op( A )*op( B ) + beta*C
```

where `op(X)` is one of

```
op(X) = X
```

or

```
op(X) = X'
```

where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix.

> **See Also:** BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 213-9 for other subprograms in this group

Syntax

   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 213–12 BLAS_GEMM Procedure Parameters

Parameter	Description
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n': op(A) = 'A' ■ transa = 'T' or 't': op(A) = 'A' ■ transa = 'C' or 'c': op(A) = 'A'
transb	Specifies the form of op(B) to be used in the matrix multiplication as follows: ■ transb = 'N' or 'n': op(B) = B ■ transb = 'T' or 't': op(B) = B' ■ transb = 'C' or 'c': op(B) = B'
m	Specifies the number of rows of the matrix op(A) and of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix op(B) and of the matrix C. n must be at least zero.
k	Specifies the rows of the matrix op(A) and the number of columns of the matrix op(B). k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least max (1,k).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = ''N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the arrayb must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least max (1, n).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the arrayC is overwritten by the m by n matrix (alpha*op(A)*op(B) + beta*C).
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GEMV Procedures

This procedure performs one of the matrix-vector operations

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix.

Parameters

Table 213–13 BLAS_GEMV Procedure Parameters

Parameter	Description
`trans`	Specifies the operation to be performed: ▪ `trans = 'N'` or `'n'`,`y := alpha*A*x + beta*y` ▪ `trans = 'T'` or `'t'y := alpha*A'*x + beta*y` ▪ `trans = 'C'` or `'c'y := alpha*A'*x + beta*y`
`m`	Specifies the number of rows of the matrix A. `m` must be at least zero.

Table 213–13 (Cont.) BLAS_GEMV Procedure Parameters

Parameter	Description
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, m).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx)) when trans = ''N' or 'n' and at least (1+(m-1)*abs(incx)) otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
Y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (m - 1)*abs(incy)) when trans = 'N' or 'n' and at least (1 + (n - 1)*abs(incy)) otherwise. Before entry with beta non-zero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GER Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*y' + A
```

where `alpha` is a scalar, `x` is an `m` element vector, `y` is an n element vector and `A` is an `m` by `n` matrix.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 213-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_GER (
   m      IN      POSITIVEN,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DBL,
   x      IN OUT  UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,

   x      IN OUT  UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   y      IN      UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   a      IN OUT  UTL_NLA_ARRAY_FLT,
   lda    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 213–14 BLAS_GER Procedure Parameters

Parameter	Description
`m`	Specifies the number of rows of the matrix `A`. `m` must be at least zero.
`n`	Specifies the number of columns of the matrix `A`. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( m - 1 )*abs( incx ) )` Before entry, the incremented array `X` must contain the m element vector `x`.
`incx`	Specifies the increment for the elements of `x`. incx must not be zero.

Table 213–14 (Cont.) BLAS_GER Procedure Parameters

Parameter	Description
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy)) Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incx must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients. On exit, a is overwritten by the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, m)
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_IAMAX (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN,
  RETURN POSITIVEN;

UTL_NLA.BLAS_IAMAX (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN,
  RETURN POSITIVEN;
```

Parameters

Table 213–15 BLAS_IAMAX Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_NRM2 (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN)
  RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_NRM2 (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN)
  RETURN BINARY_FLOAT;
```

Parameters

Table 213–16 BLAS_NRM2 Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_ROT Procedures

This procedure returns the plane rotation of points.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROT (
   n      IN      POSITIVEN,
   x      IN OUT  UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,
   c      IN      SCALAR_DOUBLE,
   s      IN      SCALAR_DOUBLE);

UTL_NLA.BLAS_ROT (
   n      IN      POSITIVEN,
   x      IN OUT  UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   c      IN      SCALAR_DOUBLE,
   s      IN      SCALAR_DOUBLE);
```

Parameters

Table 213–17 BLAS_ROT Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)* abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.
c	SCALAR_FLOAT/DOUBLE.Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE.Specifies the scalar S.

BLAS_ROTG Procedures

This procedure returns the Givens rotation of points.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROTG (
   a   IN OUT   SCALAR_DOUBLE,
   b   IN OUT   SCALAR_DOUBLE,
   c   IN OUT   SCALAR_DOUBLE,
   s   IN OUT   SCALAR_DOUBLE);

UTL_NLA.BLAS_ROTG (
   a   IN OUT   SCALAR_FLOAT,
   b   IN OUT   SCALAR_FLOAT,
   c   IN OUT   SCALAR_FLOAT,
   s   IN OUT   SCALAR_FLOAT);
```

Parameters

Table 213–18 BLAS_ROT G Procedure Parameters

Parameter	Description
a	SCALAR_FLOAT/DOUBLE. Specifies the scalar A.
b	SCALAR_FLOAT/DOUBLE. Specifies the scalar B.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

BLAS_SCAL Procedures

This procedure scales a vector by a constant.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 213-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SCAL (
   n      IN  POSITIVEN,
   alpha  IN  SCALAR_DOUBLE,
   x      IN  OUT UTL_NLA_ARRAY_DBL,
   incx   IN  POSITIVEN);

UTL_NLA.BLAS_SCAL (
   n      IN  POSITIVEN,
   alpha  IN  SCALAR_FLOAT,
   x      IN  OUT UTL_NLA_ARRAY_FLT,
   incx   IN  POSITIVEN);
```

Parameters

Table 213–19 BLAS_SCAL Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_SPMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 213-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DOUBLE,
   ap     IN      UTL_NLA_ARRAY_DBL,
   x      IN      UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_DOUBLE,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_SPMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_FLOAT,
   ap      IN     UTL_NLA_ARRAY_FLT,
   x      IN      UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 213–20 BLAS_SPMV Procedure Parameters

Parameter	Description
`uplo`	Specifies the upper or lower triangular part of the matrix A is supplied in the packed array `AP`: ▪ `uplo = 'U'` or `'u'`. The upper triangular part of `A` is supplied in `AP`. ▪ `uplo = 'L'` or `'l'`. The lower triangular part of `A` is supplied in `AP`.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`alpha`	`SCALAR_FLOAT/DOUBLE`. Specifies the scalar alpha.

Table 213–20 (Cont.) BLAS_SPMV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains, ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then Y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at leasT (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SPR Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*x' + A
```

where alpha is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 213-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPR (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DBL,
   x      IN OUT  UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   ap     IN OUT  UTL_NLA_ARRAY_DBL,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_SPR (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_FLT,
   x      IN OUT  UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   ap     IN OUT  UTL_NLA_ARRAY_FLT,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 213–21 BLAS_SPR Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array ap: ■ uplo = 'U' or 'u': The upper triangular part of A is supplied in ap. ■ uplo = 'L' or 'l': The lower triangular part of A is supplied in ap.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.

Table 213–21 (Cont.) BLAS_SPR Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n +1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SPR2 Procedures

This procedure performs the rank 2 operation

```
A := alpha*x*y' + alpha*y*x' +A
```

where alpha is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 213-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPR2 (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DBL,

```

Parameters

Table 213–22 BLAS_SPR2 Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array ap : ■ uplo = 'U' or 'u' : The upper triangular part of A is supplied in ap. ■ uplo = 'L' or 'l' : The lower triangular part of A is supplied in ap.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.

Table 213–22 (Cont.) BLAS_SPR2 Procedure Parameters

Parameter	Description
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array X must contain the m element vector y.
incy	Specifies the increment for the elements of y. incy must not be zero.
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SBMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 213-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SBMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   k      IN      NATURALN,

   a      IN      UTL_NLA_ARRAY_FLT,
   lda    IN      POSITIVEN,
   x      IN      UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 213–23 BLAS_SBMV Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the band matrix `A` is being supplied: ▪ `uplo` = `'U'` or `'u'`. The upper triangular part of `A` is supplied. ▪ `uplo` = `'L'` or `'l'`. The lower triangular part of `A` is supplied.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`k`	Specifies the number of super-diagonals of the matrix `A`. `k` must satisfy `0 .le. k`.

Table 213–23 (Cont.) BLAS_SBMV Procedure Parameters

Parameter	Description
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in rowk, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Unchanged on exit
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SWAP Procedures

This procedure swaps the contents of two vectors each of size n.

Syntax

```
UTL_NLA.BLAS_SWAP (
   n     IN     POSITIVEN,
   x     IN OUT UTL_NLA_ARRAY_DBL,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_DBL,
   incy  IN     POSITIVEN);

UTL_NLA.BLAS_SWAP (
   n     IN     POSITIVEN,
   x     IN OUT UTL_NLA_ARRAY_FLT,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_FLT,
   incy  IN     POSITIVEN);
```

Parameters

Table 213–24 BLAS_SWAP Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_SYMM Procedures

This procedure performs one of the matrix-matrix operations

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*B*A + beta*C
```

where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices.

> **See Also:** BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 213-9 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SYMM (
   side   IN      flag,
   uplo   IN      flag,
   m      IN      POSITIVEN,

```

Parameters

Table 213–25 BLAS_SYMM Procedure Parameters

Parameter	Description
`side`	Specifies whether the symmetric matrix `A` appears on the left or right in the operation: ▪ `side = 'L'` or `'l'` : `C := alpha*A*B + beta*C` ▪ `side = 'R'` or `'r'` : `C := alpha*B*A + beta*C`

Table 213–25 (Cont.) BLAS_SYMM Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : Only the upper triangular part of the symmetric matrix is to be referenced. ■ uplo = 'L' or 'l' : Only the lower triangular part of the symmetric matrix is to be referenced.
m	Specifies the number of rows of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix C. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is m when side = 'L' or 'l', and is n otherwise. Before entry with side = 'L' or 'l', the leading m by m part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. Before entry with side = 'R' or 'r', the n by n part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max (1,m).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix.

```

Parameters

Table 213–26 BLAS_SYMV Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the array `A` is to be referenced: ▪ `uplo` = `'U'` or `'u'`. Only the upper triangular part of `A` is to be referenced. ▪ `uplo` = `'L'` or `'l'`. Only the lower triangular part of `A` is to be referenced.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`alpha`	`SCALAR_FLOAT/DOUBLE`. Specifies the scalar alpha.

Table 213–26 (Cont.) BLAS_SYMV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1,n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYR Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*x' + A
```

where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix.

Parameters

Table 213–28 BLAS_SYR2 Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the array `A` is to be referenced: ▪ `uplo` = `'U'` or `'u'`: Only the upper triangular part of `A` is to be referenced. ▪ `uplo` = `'L'` or `'l'`: Only the lower triangular part of `A` is to be referenced.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( n - 1 )*abs( incx ) )` Before entry, the incremented array `X` must contain the m element vector `x`.

Table 213–28 (Cont.) BLAS_SYR2 Procedure Parameters

Parameter	Description
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy)) Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incy must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n) With uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix. With uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, n)
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYR2K Procedures

This procedure performs one of the symmetric rank2 k operations

```
C := alpha*A*B' + alpha*B*A' + beta*C
```

or

```
C := alpha*A'*B + alpha*B'*A + beta*C
```

where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case.

```

Parameters

Table 213–29 BLAS_SYR2K Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array C is to be referenced: ■ uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced. ■ uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced.
trans	Specifies the operations to be performed: ■ trans = 'N' or 'n'C : C := alpha*A*B' + alpha*B*A' + beta*C ■ trans = 'T' or 't'C : C := alpha*A'*B + alpha*B'*A + beta*C ■ trans = 'C' or 'c'C : C := alpha*A'*B + alpha*B'*A + beta*C
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrices A and B. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrices A and B. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where kb is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at leastmax(1,n), otherwise lda must be at least max(1,k).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,kb) where kb is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n by k part of the array B must contain the matrix B, otherwise the leading k by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When trans = 'N' or 'n', ldb must be at least max (1,n), otherwise ldb must be at least max (1,k).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.

Table 213–29 (Cont.) BLAS_SYR2K Procedure Parameters

Parameter	Description
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1,n).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYRK Procedures

This procedure performs one of the symmetric rank k operations

```
C := alpha*A*A' + beta*C
```

or

```
C := alpha*A'*A + beta*C
```

where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and`A` is an `n` by `k` matrix in the first case and a `k` by`n` matrix in the second case.

Parameters

Table 213–30 BLAS_SYRK Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the array `C` is to be referenced: ▪ `uplo = 'U'` or `'u'` : Only the upper triangular part of `C` is to be referenced. ▪ `uplo = 'L'` or `'l'` : Only the lower triangular part of `C` is to be referenced.

Table 213–30 (Cont.) BLAS_SYRK Procedure Parameters

Parameter	Description
trans	Specifies the operations to be performed: ■ trans = 'N' or 'n' : C := alpha*A*A' + beta*C ■ trans = 'T' or 't' : C := alpha*A'*A + beta*C ■ trans ='C' or 'c' : C := alpha*A'*A + beta*C
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrix A. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrix A. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at least max(1,n), otherwise lda must be at least max(1,k).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1,n).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TBMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k+1) diagonals.

```

Parameters

Table 213–31 BLAS_TBMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'x := A*x ■ trans = 'T' or 't'x := A'*x ■ trans = 'C' or 'c'x := A'*x

Table 213–31 (Cont.) BLAS_TBMV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: ■ with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A. ■ with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A. K must satisfy 0 .le. k.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = ''U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)). Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TBSV Procedures

This procedure solves one of the systems of equations

```
A*x = b
```

or

```
A'*x = b
```

where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k+1) diagonals.

Parameters

Table 213–32 BLAS_TBSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the equations to be solved: ■ trans = 'N' or 'n : 'A*x = b ■ trans = 'T' or 't': A'*x = b ■ trans = 'C' or 'c': A'*x = b

Table 213–32 (Cont.) BLAS_TBSV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u' : A is assumed to be unit triangular. ■ diag = 'N' or 'n' : A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: ■ with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A. ■ with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A. K must satisfy 0 .le. k.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	On entry, lda specifies the first dimension of A as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) *abs(incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

Parameters

Table 213–34 BLAS_TPSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l' : A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n' : A*x = b ■ trans = 'T' or 't' : A'*x = b ■ trans = 'C' or 'c' : A'*x = b
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u' : A is assumed to be unit triangular. ■ diag = 'N' or 'n' : 'A is not assumed to be unit triangular.

Table 213–34 (Cont.) BLAS_TPSV Procedure Parameters

Parameter	Description
n	Specifies the order of the matrix A. n must be at least zero.
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) *abs(incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

BLAS_TRMM Procedures

This procedure performs one of the matrix-matrix operations

```
B := alpha*op( A )*B
```

or

```
B := alpha*B*op( A )
```

where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

See Also: BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 213-9 for other subprograms in this group

```

Parameters

Table 213–35 BLAS_TRMM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: ■ side = 'L' or 'l' : B := alpha*op(A)*B ■ side = 'R' or 'r' : B := alpha*B*op(A)
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l'' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n' : op(A) = A ■ transa = 'T' or 't' : op(A) = A' ■ transa ='C' or 'c' : op(A) = A'
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,k) where k is m when side = 'L' or 'l', and is n when side ='R' or 'r'. Before entry with uplo = 'U' or 'u' , the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k byk lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag ='U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).

Table 213–35 (Cont.) BLAS_TRMM Procedure Parameters

Parameter	Description
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TRMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix.

Parameters

Table 213–36 BLAS_TRMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'x := A*x ■ trans= 'T' or 't'x := A'*x ■ trans = 'C' or 'c'x := A'*x

Table 213–36 (Cont.) BLAS_TRMV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1,n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*as(incx)). Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TRSM Procedures

This procedure performs one of the matrix-matrix operations

```
op( A )*X = alpha*B
```

or

```
X*op( A ) = alpha*B
```

where `alpha` is a scalar, `X` and `B` are `m` by `n` matrices, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

The matrix `X` is overwritten on `B`.

   ldb    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 213–37 BLAS_TRSM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: ■ side = 'L' or 'l' : op(A)*X = alpha*B ■ side = 'R' or 'r' : X*op(A) = alpha*B
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n' : op(A) = A ■ transa = 'T' or 't' : op(A) = A' ■ transa = 'C' or 'c' : op(A) = A'
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'. Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1, m), otherwise lda must be at least max (1, n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1, m).

Table 213–37 (Cont.) BLAS_TRSM Procedure Parameters

Parameter	Description
`pack`	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TRSV Procedures

This procedure solves one of the systems of equations

```
A*x = b
```

or

```
A'*x = b
```

where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix.

Table 213–38 BLAS_TRSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'A*x = b ■ trans = 'T' or 't'A'*x = b ■ trans = 'C' or 'c'A'*x = b

Table 213–38 (Cont.) BLAS_TRSV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of A as declared in the calling (sub) program. lda must be at least max(1, n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs (incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where a is a band matrix of order n with kl sub diagonals and ku superdiagonals, and x and b are n by nrhs matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

```
a = L * U
```

where L is a product of permutation and unit lower triangular matrices with kl sub diagonals, and U is upper triangular with kl+ku superdiagonals. The factored form of a is then used to solve the system of equations

```
a * x = b
```

Parameters

Table 213–39 LAPACK_GBSV Procedure Parameters

Parameter	Description
n	The number of linear equations, equivalent to the order of the matrixa .n >= 0
kl	The number of sub diagonals within the band of a. kl >= 0.

Table 213–39 (Cont.) LAPACK_GBSV Procedure Parameters

Parameter	Description
ku	The number of superdiagonals within the band of a . ku >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the matrix a in band storage, in rows kl+1 to 2*kl+ku+1; rows 1 to kl of the array need not be set. The j-th column of A is stored in the j-th column of the array ab: ab(kl+ku+1+i-j,j) = a(i,j) for max(1,j-ku)<=i<=min(n,j+kl) On exit, details of the factorization: U is stored as an upper triangular band matrix with kl+ku superdiagonals in rows 1 to KL+KU+1, and the multipliers used during the factorization are stored in rows: kl+ku+2 to 2*kl+ku+1
ldab	The leading dimension of the array ab. ldab >= 2*kl+ku+1
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row iof the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, and the solution has not been computed
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GEES Procedures

This procedure computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

```
[  a  b  ]
[  c  a  ]
```

where b*c < 0. The eigenvalues of such a block are a +- sqrt(bc).

   ldvs    IN       POSITIVEN,
   info    OUT      integer,
   pack    IN       flag DEFAULT 'C');
```

Parameters

Table 213–40 LAPACK_GEES Procedure Parameters

Parameter	Description
jobz	■ 'N': Schur vectors are not computed. ■ 'V': Schur vectors are computed.
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). ■ On entry, the n by n matrix A. ■ On exit, A has been overwritten by its real Schur form T.
lda	The leading dimension of the array a. lda >= max(1,n).

Table 213–40 (Cont.) LAPACK_GEES Procedure Parameters

Parameter	Description
wr	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form T. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
wi	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz, n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form T. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
vs	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobvs = 'V', vs contains the orthogonal matrix Z of Schur vectors. ■ If jobvs = 'N', vs is not referenced.
ldvs	The leading dimension of the array vs. VS. ldvs >= 1. If jobvs = 'V', ldvs >= N
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, and i is <= N: the QR algorithm failed to compute all the eigenvalues. Elements 1:ILO-1 and i+1:N of wr and wi contain those eigenvalues which have converged. If jobvs = 'V', vs contains the matrix which reduces A to its partially converged Schur form.
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.

The following options are provided:

1. If TRANS = 'N' and m >= n: find the least squares solution of an overdetermined system, that is, solve the least squares problem.

   ```
   minimize || B - A*X ||
   ```

2. If TRANS = 'N' and m < n: find the minimum norm solution of an underdetermined system A * X = B.
3. If TRANS = 'T' and m >= n: find the minimum norm solution of an undetermined system A**T * X = B.
4. If TRANS = 'T' and m < n: find the least squares solution of an overdetermined system, that is, solve the least squares problem minimize || B - A**T * X ||.

Parameter	Description
trans	■ CHARACTER = 'N': The linear system involves A. ■ CHARACTER = 'T': The linear system involves A**T .

Table 213–41 (Cont.) LAPACK_GELS Procedure Parameters

Parameter	Description
m	The number of rows of the matrix a. M >= 0.
n	The number of columns of the matrix a. N >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix band x.nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the matrix b of right hand side vectors, stored columnwise; b is m by nrhs if TRANS = 'N', or n by nrhsif trans = 'T'. On exit, if m >= n, a is overwritten by details of its QR factorization as returned by SGEQRF. If m < n, A is overwritten by details of its LQ factorization as returned by SGELQF.
lda	The leading dimension of the array A. lda >= max(1,m).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the matrix b of right hand side vectors, stored columnwise. b is m bynrhs if trans = 'n', or n by nrhs if trans = 'T'. On exit, b is overwritten by the solution vectors, stored columnwise: ■ If trans = 'n' and m >= n, rows 1 to n of b contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements n+1 to m in that column. ■ If trans = 'n' and m < n, rows 1 to n of b contain the minimum norm solution vectors. ■ If trans = 'T' and m >= n, rows 1 to m of b contain the minimum norm solution vectors. ■ If trans = 'T' and m < n, rows 1 to m of b contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements m+1 to n in that column.
ldb	The leading dimension of the array b. ldb >= max(1,m,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GESDD Procedures

This procedures computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

```
A = U * SIGMA * transpose(V)
```

where SIGMA is an `m` by `n` matrix which is zero except for its `min(m,n)` diagonal elements, `U` is an`m` by `m` orthogonal matrix, and `V` is an`n` by `n` orthogonal matrix. The diagonal elements of SIGMA are the singular values of `A`, they are real and non-negative, and are returned in descending order. The first `min(m,n)` columns of `U` and `V` are the left and right singular vectors of `A`.

Note that the routine returns `V**T`, not `V`.

Parameters

Table 213–42 LAPACK_GESDD Procedure Parameters

Parameter	Description
jobz	Specifies options for computing all or part of the matrix U: ■ 'A': All m columns of u and all n rows of V**T are returned in arrays u and vt. ■ 'S': The first min(m,n) columns of u and the first min(m,n) rows of V**T are returned in the arrays u and vt. ■ 'O': The first min(m,n) columns of u (the left singular vectors) are overwritten on the array a. jobu and jobvt cannot both be 'O ■ 'N': No columns of u (no left singular vectors) are computed.
m	The order of the matrix a. m >= 0.
n	The order of the matrix a. n >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n matrix A. On exit: ■ If jobz = 'O', a is overwritten with the first min(m,n) columns of u (the left singular vectors, stored columnwise). ■ If m >= n, a is overwritten with the first m rows of V**T (the right singular vectors, stored rowwise). ■ If jobz .ne. 'O', the contents of a are destroyed.
lda	The leading dimension of the array a. lda >= max(1,m).
s	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (min(m,n). The singular values of a, sorted so that S(i) >= S(i+1).
u	UTL_NLA_ARRAY_FLT/DBL. ucol = m if jobz = 'A' or jobz = 'O' and m < n; ucol = min(m,n) if jobz = 'S'. ■ If jobz = 'A' or jobz = 'O' and m < n, u contains the m by m orthogonal matrix u. ■ If jobz = 'S', u contains the first min(m,n) columns of u (the left singular vectors, stored columnwise). ■ If jobz = 'O' and m >= n, or jobz = 'n', u is not referenced.
ldu	The leading dimension of the array U. ldu >= 1. If jobz = 'S' or 'A',or jobz = 'O' and m < n, ldu >= m.
vt	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvt, n). ■ If jobz = 'A' or jobz = 'O' and m >= n, vt contains the n by n orthogonal matrix V**T. ■ If jobz = 'S', vt contains the first min(m,n) rows of V**T (the right singular vectors, stored rowwise). ■ If jobz = 'O' and m < n, or jobz = 'N', vt is not referenced.

Table 213–42 (Cont.) LAPACK_GESDD Procedure Parameters

Parameter	Description
ldvt	The leading dimension of the array vt. ldvt >= 1. ■ If jobz = 'A', or jobz = 'O' and m >= n, ldvt >= n. ■ If jobz = 'S', ldvt >= min(m,n).
info	■ = 0 : successful exit ■ < 0 : If info = -i, the i-th argument had an illegal value ■ > 0 : SBDSDC did not converge, updating process failed.
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GESV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices.

The `LU` decomposition with partial pivoting and row interchanges is used to factor `A` as

```
a = P * L * U
```

where `P` is a permutation matrix, `L` is unit lower triangular, and `U` is upper triangular. The factored form of `a` is then used to solve the system of equations

```
a * x = b
```

```

Parameters

Table 213–43 LAPACK_GESV Procedure Parameters

Parameter	Description
`n`	The number of linear equations, equivalent to the order of the matrix `a`. `n >= 0`
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 213–43 (Cont.) LAPACK_GESV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n coefficient matrix a. On exit, the factors L and U from the factorization a = P*L*U; the unit diagonal elements of L are not stored.
lda	The leading dimension of the array a. lda >= max(1,n)
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row iof the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GESVD Procedures

This procedures computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and/or right singular vectors. The SVD is written

```
A = U * SIGMA * transpose(V)
```

where SIGMA is an `m` by `n` matrix which is zero except for its `min(m,n)` diagonal elements, `U` is an`m` by `m` orthogonal matrix, and `V` is an`n` by `n` orthogonal matrix. The diagonal elements of SIGMA are the singular values of `A`, they are real and non-negative, and are returned in descending order. The first `min(m,n)` columns of `U` and `V` are the left and right singular vectors of `A`.

Note that the routine returns `V**T`, not `V`.

Parameters

Table 213–44 LAPACK_GESVD Procedure Parameters

Parameter	Description
jobu	Specifies options for computing all or part of the matrix U: ■ 'A': All m columns of U are returned in array U. ■ 'S': The first min(m,n) columns of U (the left singular vectors) are returned in the array U. ■ 'O': The first min(m,n) columns of U (the left singular vectors) are overwritten on the array a. jobu and jobvt cannot both be 'O ■ 'N': No columns of U (no left singular vectors) are computed.
jobvt	Specifies options for computing all or part of the matrix V**T: ■ 'A': All n rows of V**T are returned in the array vt. ■ 'S': The first min(m,n) rows of V**T (the right singular vectors) are returned in the array vt. ■ 'O': The first min(m,n) rows of V**T (the right singular vectors) are overwritten on the array a. jobvt and jobu cannot both be 'O'. ■ 'N': No rows of V**T (no right singular vectors) are computed.
m	The order of the matrix a. M >= 0.
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n matrix A. On exit: ■ If jobu = 'O', A is overwritten with the first min(m,n) columns of U (the left singular vectors, stored columnwise); ■ If jobvt = 'O', A is overwritten with the first min(m,n) rows of V**T (the right singular vectors, stored rowwise); ■ If jobu.ne.'O' and jobvt.ne.'O', the contents of A are destroyed.
lda	The leading dimension of the array a. lda >= max(1,n).
s	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (min(m,n). The singular values of A, sorted so that S(i) >= S(i+1).
u	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldu,ucol).(ldu,m) if jobu = 'A' or (ldu,min(m,n)) if jobu = 'S'. ■ If jobu = 'A', U contains the m by m orthogonal matrix U. ■ If jobu = 'S', U contains the first min(m,n) columns of U (the left singular vectors, stored columnwise). ■ If jobu = 'N' or 'O', U is not referenced.
ldu	The leading dimension of the array U. ldu >= 1. If jobu = 'S' or 'a', ldu >= m.

Table 213–44 (Cont.) LAPACK_GESVD Procedure Parameters

Parameter	Description
vt	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvt, n). ■ If jobvt = 'A', vt contains the n by n orthogonal matrix V**T. ■ If jobvt = 'S', vt contains the first min(m,n) rows of V**T (the right singular vectors, stored rowwise). ■ If jobvt = 'N' or 'O', vt is not referenced.
ldvt	The leading dimension of the array vt. ldvt >= 1. ■ If jobvt = 'A', ldvt >= n. ■ If jobvt = 'S', ldvt >= min(m,n).
info	■ = 0 : successful exit ■ < 0 : If info = -i, the i-th argument had an illegal value ■ > 0 : If SBDSQR did not converge, info specifies how many superdiagonals of an intermediate bidiagonal form B did not converge to zero.
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GEEV Procedures

This procedures computes for an `n` by `n` real nonsymmetric matrix `A`, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector `v(j)` of `A` satisfies `A * v(j) = lambda(j) * v(j)` where `lambda(j)` is its eigenvalue.
- The left eigenvector `u(j)` of `A` satisfies `u(j)**H * A = lambda(j) * u(j)**H` where `u(j)**H` denotes the conjugate transpose of `u(j)`.

The computed eigenvectors are normalized to have Euclidean norm equal to `1` and largest component real.

Parameters

Table 213–45 LAPACK_GEEV Procedure Parameters

Parameter	Description
`jobvl`	▪ `'N'`: Left eigenvectors of `A` are not computed. ▪ `'V'`: Left eigenvectors of `A` are computed.
`jobvr`	▪ `'N'`: Right eigenvectors of `A` are not computed. ▪ `'V'`: Right eigenvectors of `A` are computed.

Table 213–45 (Cont.) LAPACK_GEEV Procedure Parameters

Parameter	Description
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). ■ On entry, the n by n matrix A. ■ On exit, A has been overwritten.
lda	The leading dimension of the array a. lda >= max(1,n).
wr	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
wi	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz, n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
vl	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobvl = 'V', the left eigenvectors u(j) are stored one after another in the columns of vl, in the same order as their eigenvalues. ■ If jobvs = 'N', vl is not referenced. ■ If the j-th eigenvalue is real, then u(j) = VL(:,j), the j-th column of vl. ■ If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then u(j) = VL(:,j) + i*VL(:,j+1) and u(j+1) = VL(:,j) - i*VL(:,j+1).
ldv1	The leading dimension of the array vl. ldvl >= 1. If jobvl = 'v', ldvl >= n.
vr	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvr, n). ■ If jobvr = 'V', the right eigenvectors v(j) are stored one after another in the columns of vr, in the same order as their eigenvalues.. ■ If jobvr = 'N', vr is not referenced. ■ If the j-th eigenvalue is real, then v(j) = VR(:,j), the j-th column of vr. ■ If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then v(j) = VR(:,j) + i*VR(:,j+1) and v(j+1) = VR(:,j) - i*VR(:,j+1).
ldvr	The leading dimension of the array vr. vr.ldvr >= 1. If jobvr = 'V', ldvr >= N
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, and i is <= N: the QR algorithm failed to compute all the eigenvalues, and no eigenvectors have been computed. Elements i+1:N of wr and wi contain eigenvalues which have converged..

Table 213–45 (Cont.) LAPACK_GEEV Procedure Parameters

Parameter	Description
`pack`	(Optional) Flags the packing of the matricies: ■ `'C'`: column-major (default) ■ `'R'`: row-major

LAPACK_GTSV Procedures

This procedure solves the equation

```
a * x = b
```

where a is an n by n tridiagonal matrix, by Gaussian elimination with partial pivoting.

Note that the equation a'*x = b may be solved by interchanging the order of the arguments du and dl.

> **See Also:** LAPACK Driver Routines (Linear Equations) Subprograms on page 213-10 for other subprograms in this group

Syntax

Parameters

Table 213–46 LAPACK_GTSV Procedure Parameters

Parameter	Description
n	The order of the matrix a .n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
dl	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, dl must contain the (n-1) sub-diagonal elements of a. On exit, dl is overwritten by the (n-2) elements of the second super-diagonal of the upper triangular matrix U from the LU factorization of a, in dl(1), ..., dl(n-2).
d	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). On entry, d must contain the diagonal elements of a. On exit, d is overwritten by the n diagonal elements of U.

Table 213–46 (Cont.) LAPACK_GTSV Procedure Parameters

Parameter	Description
du	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, du must contain the (n-1) super-diagonal elements of a. On exit, du is overwritten by the (n-1) elements of the first super-diagonal of U.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (LDB, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max (1, n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero, and the solution has not been computed. The factorization has not been completed unless i = n.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PBSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices.

The Cholesky decomposition is used to factor `A` as

`A = U**T*U` if `UPLO ='U'`

or

`A = L * L**T` if `UPLO = 'L'`

where `U` is an upper triangular matrix and `L` is a lower triangular matrix. The factored form of `A` is then used to solve the system of equations `A * X = B`.

> **See Also:** LAPACK Driver Routines (Linear Equations) Subprograms on page 213-10 for other subprograms in this group

Syntax

```
UTL_NLA.LAPACK_PBSV (

pack      IN      flag DEFAULT 'C');
```

Parameters

Table 213–47 LAPACK_PBSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'`. Upper triangular of `A` is stored. ▪ `uplo = 'L'`. Lower triangular of `A` is stored.
`n`	The number of linear equations, that is, the order of the matrix `a .n >= 0`

Table 213–47 (Cont.) LAPACK_PBSV Procedure Parameters

Parameter	Description
kd	The number of superdiagonals of the matrix A if uplo = 'U', or the number of subdiagonals if UPLO = 'L'. KD >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the upper or lower triangle of the symmetric band matrix a, stored in the first kd+1 rows of the array. The j-th column of a is stored in the j-th column of the array ab is as follows: ■ if uplo = 'U',AB(KD+1+i-j,j) = A(i,j) for max(1,j-KD)<=i<=j; ■ if uplo = 'L',AB(1+i-j,j) = A(i,j) for j<=i<=min(N,j+KD) .See below for further details. On exit, if info = 0, the triangular factor U or L from the Cholesky factorization A = U**T*U or A = L*L**T of the band matrix A, in the same storage format as a.
ldab	The leading dimension of the array ab. ldb >= kd+1
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, the leading minor of order a of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_POSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric positive definite matrix and `x` and `b` are `n` by `nrhs` matrices.

The Cholesky decomposition is used to factor `A` as

`A = U**T* U` if `uplo = 'U'`

or

`A = L * L**T` if `UPLO = 'L'`

where `U` is an upper triangular matrix and `L` is a lower triangular matrix. The factored form of `A` is then used to solve the system of equations `A * X = B`.

```

Parameters

Table 213–48 LAPACK_POSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo` = 'U'. Upper triangular of `A` is stored. ▪ `uplo` = `'L'`. Lower triangular of `A` is stored.
`n`	The number of linear equations, that is, the order of the matrix `a .n >= 0`
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 213–48 (Cont.) LAPACK_POSV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). If uplo = 'U', the leading NRHS n by n upper triangular part of a contains the upper NRHS triangular part of the matrix A, and the strictly lower NRHS triangular part of A is not referenced. If uplo = ''L', then rhs leading n by n lower triangular part of a contains the lower nrhs triangular part of the matrix a, and the strictly upper nrhs triangular part of a is not referenced. On exit, if info = 0, the factor U or L from the Cholesky factorization A = U**T*U or A = L*L**T.
lda	The leading dimension of the array a. lda >= max (1, n)
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PPSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices.

The Cholesky decomposition is used to factor `A` as

`A = U**T* U` if `UPLO = 'U'`

or

`A = L * L**T` if `UPLO = 'L'`

where **U** is an upper triangular matrix and `L` is a lower triangular matrix. The factored form of `A` is then used to solve the system of equations `A * X = B`.

Parameters

Table 213–49 LAPACK_PPSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'` . Upper triangular of `A` is stored. ▪ `uplo = 'L'`. Lower triangular of `A` is stored.
`n`	The number of linear equations, that is, the order of the matrix `a` .`n >= 0`
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 213–49 (Cont.) LAPACK_PPSV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix a, packed columnwise in a linear array. The j-th column of a is stored in the array ap as follows: If uplo = 'U', AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j; If uplo = 'L', AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n; On exit, if info = 0, the factor U or 'L' from the Cholesky factorization A = U**T*U or A = L*L**T in the same storage format as A.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PTSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by nrhs matrices.

a is factored as A = L*D*L**T, and the factored form of a is then used to solve the system of equations.

Table 213–51 LAPACK_SBEV Procedure Parameters

Parameter	Description
`jobz`	■ `'N'`: Compute eigenvalues only. ■ `'V'`: Compute eigenvalues and eigenvectors.
`uplo`	■ `'U'`: Upper triangle of A is stored. ■ `'L'`: Lower triangle of A is stored.
`n`	The order of the matrix `a. N >= 0`.
`kd`	The number of superdiagonals of the matrix `A` if `uplo = 'U'`, or the number of subdiagonals if `uplo = 'L'. kd >= 0`.

Table 213–51 (Cont.) LAPACK_SBEV Procedure Parameters

Parameter	Description
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the upper or lower triangle of the symmetric band matrix A stored in the first kd+1 rows of the array. The j-th column of A is stored in the j-th column of the array ab: ■ If uplo = 'U', ab(kd+1+i-j,j) = a(i,j) for max(1,j-kd)<=i<=j. ■ If uplo = 'L', AB(1+i-j,j) = A(i,j) for j<=i<=min(n,j+kd). On exit, ab is overwritten by values generated during the reduction to tridiagonal form: ■ If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T are returned in rows kd and kd+1 of ab. ■ If uplo = 'L', the diagonal and first subdiagonal of T are returned in the first two rows of ab.
ldab	The leading dimension of the array ab. ldab >= kd + 1.
w	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). ■ If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v', ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SBEVD Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

Parameters

Table 213–54 LAPACK_SPEVD Procedure Parameters

Parameter	Description
`jobz`	▪ `'N'`: Compute eigenvalues only. ▪ `'V'`: Compute eigenvalues and eigenvectors.
`uplo`	▪ `'U'`: Upper triangle of A is stored. ▪ `'L'`: Lower triangle of A is stored.
`n`	The order of the matrix `a. N >= 0`.

Table 213–54 (Cont.) LAPACK_SPEVD Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix a packed columnwise in a linear array. The j-th column of a is stored in the array ap: ■ If uplo = 'U',ap(i + (j-1)*j/2) = a(i,j) for 1<=i<=j. ■ If uplo = 'L',ap(i + (j-1)*(2*n-j)/2) = a(i,j) for j<=i<=n. On exit, ap is overwritten by values generated during the reduction to tridiagonal form: ■ If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T overwrite the corresponding elements of A. ■ If uplo = 'L', the diagonal and first subdiagonal of T overwrite the corresponding elements of A.
w	UTL_NLA_ARRAY_FLT/DBL,DIMENSION (n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL,DIMENSION (ldz,n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). ■ If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v',ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are n by nrhs matrices.

The diagonal pivoting method is used to factor `A` as

`A = U * D * U**T`, if `UPLO = 'U'`

or

`A = L * D * L**T`, if `UPLO = 'L'`

where `U` (or `L`) is a product of permutation and unit upper (lower) triangular matrices, and `D` is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of `A` is then used to solve the system of equations `A * X = B`.

```

Parameters

Table 213–55 LAPACK_SPSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'`. Upper triangular of `A` is stored. ▪ `uplo = 'L'` . Lower triangular of `A` is stored.
`n`	The number of linear equations, which is the order of the matrix `a`. `N >= 0`.
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 213–55 (Cont.) LAPACK_SPSV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix A, packed columnwise in a linear array. The j-th column of A is stored in the array ap as follows: ■ uplo = 'U': AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j ■ uplo = 'L': AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n See below for further details. On exit, the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSPTRF, stored as a packed triangular matrix in the same storage format as A.
ipiv	INTEGER array, DIMENSION (n). Details of the interchanges and the block structure of d, as determined by SSPTRF. ■ If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block. ■ If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block. ■ If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_STEV Procedures

   w        IN OUT  UTL_NLA_ARRAY_FLT,
   info     OUT     INTEGER,
   pack     IN      flag DEFAULT 'C');
```

Parameters

Table 213–59 LAPACK_SYEVD Procedure Parameters

Parameter	Description
jobz	■ 'N': Compute eigenvalues only. ■ 'V': Compute eigenvalues and eigenvectors.
uplo	■ 'U' : Upper triangle of A is stored. ■ 'L': Upper triangle of A is stored.
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the symmetric matrix a: ■ If uplo = 'U', the leading n by n upper triangular part of a contains the upper triangular part of the matrix a. ■ If uplo = 'L', the leading n byn lower triangular part of a contains the lower triangular part of the matrix a. On exit: ■ If jobz = 'V', then if info = 0, a contains the orthonormal eigenvectors of the matrix a. ■ If jobz = 'N', then on exit the lower triangle (if uplo = 'L') or the upper triangle (if uplo = 'U') of a, including the diagonal, is destroyed.

Table 213–59 (Cont.) LAPACK_SYEVD Procedure Parameters

Parameter	Description
lda	The leading dimension of the array a. lda >= max(1,n).
w	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). If info = 0, the eigenvalues in ascending order.
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric matrix, and `x` and `b` are n by nrhs matrices.

The diagonal pivoting method is used to factor `A` as

`A = U * D * U**T`, if `UPLO = 'U'`

or

`A = L * D * L**T`, if `UPLO = 'L'`

where `U` (or `L`) is a product of permutation and unit upper (lower) triangular matrices, and `D` is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of `A` is then used to solve the system of equations `A * X = B`.

> **See Also:** LAPACK Driver Routines (Linear Equations) Subprograms on page 213-10 for other subprograms in this group

Syntax

```
UTL_NLA.LAPACK_SYSV (
   uplo    IN      flag,
   n       IN      POSITIVEN,
   nrhs    IN      POSITIVEN,
   a       IN OUT  UTL_NLA_ARRAY_DBL,
   lda     IN      POSITIVEN,
   ipiv    IN OUT  UTL_NLA_ARRAY_INT,
   b       IN OUT  UTL_NLA_ARRAY_DBL,
   ldb     IN      POSITIVEN,
   info    OUT     INTEGER,
   pack    IN      flag DEFAULT 'C');

UTL_NLA.LAPACK_SYSV (
   uplo   IN       flag,
   n      IN       POSITIVEN,
   nrhs   IN       POSITIVEN,
   a      IN OUT   UTL_NLA_ARRAY_FLT,
   lda    IN       POSITIVEN,
   ipiv   IN OUT   UTL_NLA_ARRAY_INT,
   b      IN OUT   UTL_NLA_ARRAY_FLT,
   ldb    IN       POSITIVEN,
   info   OUT      INTEGER,
   pack   IN       flag DEFAULT 'C');
```

Parameters

Table 213–60 LAPACK_SYSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'`. Upper triangular of `A` is stored. ▪ `uplo = 'L'` . Lower triangular of `A` is stored.
`n`	The number of linear equations, which is the order of the matrix `a`. `N >= 0`.

Table 213–60 (Cont.) LAPACK_SYSV Procedure Parameters

Parameter	Description
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, the symmetric matrix a. If UPLO = 'U', the leading n by n upper triangular part of a contains the upper triangular part of the matrix a, and the strictly lower triangular part of a is not referenced. If uplo = 'L', the leading n by n lower triangular part of a contains the lower triangular part of the matrix a, and the strictly upper triangular part of a is not referenced. On exit, if info = 0, the block diagonal matrix d and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSYTRF.
lda	The leading dimension of the array a. lda >= max(1,n)
ipiv	INTEGER array, DIMENSION (ldb, nrhs). Details of the interchanges and the block structure of d, as determined by SSYTRF. ■ If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block. ■ If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block. ■ If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

214

UTL_RAW

The `UTL_RAW` package provides SQL functions for manipulating `RAW` datatypes.

This chapter contains the following topics:

- Using UTL_RAW
  - Overview
  - Operational Notes
- Summary of UTL_RAW Subprograms

Using UTL_RAW

- Overview
- Operational Notes

Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.

Operational Notes

UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the hextoraw and rawtohex functions.

Summary of UTL_RAW Subprograms

Table 214–1 UTL_RAW Package Subprograms

Subprogram	Description
BIT_AND Function on page 214-7	Performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW
BIT_COMPLEMENT Function on page 214-8	Performs bitwise logical "complement" of the values in RAW r and returns the "complement'ed" result RAW
BIT_OR Function on page 214-9	Performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the "or'd" result RAW
BIT_XOR Function on page 214-10	Performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the "xor'd" result RAW
CAST_FROM_BINARY_DOUBLE Function on page 214-11	Returns the binary representation of a BINARY_DOUBLE (in RAW)
CAST_FROM_BINARY_FLOAT Function on page 214-12	Returns the binary representation of a BINARY_FLOAT (in RAW)
CAST_FROM_BINARY_INTEGER Function on page 214-13	Returns the binary representation of a BINARY_INTEGER (in RAW)
CAST_FROM_NUMBER Function on page 214-14	Returns the binary representation of a NUMBER (in RAW)
CAST_TO_BINARY_DOUBLE Function on page 214-15	Casts the binary representation of a RAW into a BINARY_DOUBLE
CAST_TO_BINARY_FLOAT Function on page 214-17	Casts the binary representation of a RAW into a BINARY_FLOAT
CAST_TO_BINARY_INTEGER Function on page 214-19	Casts the binary representation of a BINARY_INTEGER (in RAW) into a BINARY_INTEGER
CAST_TO_NUMBER Function on page 214-20	Casts the binary representation of a NUMBER (in RAW) into a NUMBER
CAST_TO_RAW Function on page 214-21	Converts a VARCHAR2 represented using n data bytes into a RAW with n data bytes
CAST_TO_VARCHAR2 Function on page 214-22	Converts a RAW represented using n data bytes into VARCHAR2 with n data bytes
CAST_TO_NVARCHAR2 Function on page 214-23	Converts a RAW represented using n data bytes into NVARCHAR2 with n data bytes
COMPARE Function on page 214-24	Compares RAW r1 against RAW r2
CONCAT Function on page 214-25	Concatenates up to 12 RAWs into a single RAW
CONVERT Function on page 214-26	Converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW
COPIES Function on page 214-27	Returns n copies of r concatenated together
LENGTH Function on page 214-28	Returns the length in bytes of a RAW r

Table 214–1 (Cont.) UTL_RAW Package Subprograms

Subprogram	Description
OVERLAY Function on page 214-29	Overlays the specified portion of target `RAW` with overlay `RAW`, starting from byte position `pos` of target and proceeding for `len` bytes
REVERSE Function on page 214-31	Reverses a byte sequence in `RAW r` from end to end
SUBSTR Function on page 214-32	Returns `len` bytes, starting at `pos` from `RAW r`
TRANSLATE Function on page 214-34	Translates the bytes in the input `RAW r` according to the bytes in the translation `RAWs from_set` and `to_set`
TRANSLITERATE Function on page 214-36	Converts the bytes in the input `RAW r` according to the bytes in the transliteration `RAWs from_set` and `to_set`
XRANGE Function on page 214-38	Returns a `RAW` containing all valid 1-byte encodings in succession, beginning with the value `start_byte` and ending with the value `end_byte`

BIT_AND Function

This function performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW.

Syntax

```
UTL_RAW.BIT_AND (
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–2 BIT_AND Function Parameters

Parameter	Description
r1	RAW to "and" with r2.
r2	RAW to "and" with r1.

Return Values

Table 214–3 BIT_AND Function Return Values

Return	Description
RAW	Containing the "and" of r1 and r2.
NULL	Either r1 or r2 input parameter was NULL.

Usage Notes

If r1 and r2 differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW r and returns the complement'ed result RAW. The result length equals the input RAW r length.

Syntax

```
UTL_RAW.BIT_COMPLEMENT (
   r IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–4 BIT_COMPLEMENT Function Parameters

Parameter	Description
r	RAW to perform "complement" operation.

Return Values

Table 214–5 BIT_COMPLEMENT Function Return Values

Return	Description
RAW	The "complement" of r1.
NULL	If r input parameter was NULL.

BIT_OR Function

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or'd result RAW.

Syntax

```
UTL_RAW.BIT_OR (
   r1 IN RAW,
   r2 IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–6 BIT_OR Function Parameters

Parameters	Description
r1	RAW to "or" with r2.
r2	RAW to "or" with r1.

Return Values

Table 214–7 BIT_OR Function Return Values

Return	Description
RAW	Containing the "or" of r1 and r2.
NULL	Either r1 or r2 input parameter was NULL.

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

Syntax

```
UTL_RAW.BIT_XOR (
   r1 IN RAW,
   r2 IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–8 BIT_XOR Function Parameters

Parameter	Description
r1	RAW to "xor" with r2.
r2	RAW to "xor" with r1.

Return Values

Table 214–9 BIT_XOR Function Return Values

Return	Description
RAW	Containing the "xor" of r1 and r2.
NULL	If either r1 or r2 input parameter was NULL.

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

CAST_FROM_BINARY_DOUBLE Function

This function returns the binary representation of a BINARY_DOUBLE (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
   n          IN BINARY_DOUBLE,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–10 CAST_FROM_BINARY_DOUBLE Function Parameters

Parameter	Description
n	The BINARY_DOUBLE value.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0
```

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the BINARY_DOUBLE argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

CAST_FROM_BINARY_FLOAT Function

This function returns the binary representation of a BINARY_FLOAT (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
   n          IN BINARY_FLOAT,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–11 CAST_FROM_BINARY_FLOAT Function Parameters

Parameter	Description
n	The BINARY_FLOAT value.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation (RAW) of the BINARY_FLOAT value, or NULL if the input is NULL.

Usage Notes

- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit  8
byte 3: bit 7 ~  bit  0
```

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

	rb0	rb1	rb2	rb3
big_endian	fbo	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

CAST_FROM_BINARY_INTEGER Function

This function returns the binary representation of a BINARY_INTEGER (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
   n          IN BINARY_INTEGER
   endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–12 CAST_FROM_BINARY_INTEGER Function Parameters

Parameter	Description
n	The BINARY_INTEGER value.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation of the BINARY_INTEGER value.

CAST_FROM_NUMBER Function

This function returns the binary representation of a NUMBER (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_NUMBER (
   n  IN NUMBER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–13 CAST_FROM_NUMBER Function Parameters

Parameter	Description
n	The NUMBER value.

Return Values

The binary representation of the NUMBER value.

CAST_TO_BINARY_DOUBLE Function

This function casts the binary representation of a BINARY_DOUBLE (in RAW) into a BINARY_DOUBLE.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–14 CAST_TO_BINARY_DOUBLE Function Parameters

Parameter	Description
r	The binary representation of a BINARY_INTEGER.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_DOUBLE_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE_ERROR exception is raised.
- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0
```

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_TO_BINARY_FLOAT Function

This function casts the binary representation of a BINARY_FLOAT (in RAW) into a BINARY_FLOAT.

Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–15 CAST_TO_BINARY_FLOAT Function Parameters

Parameter	Description
r	The binary representation of a BINARY_FLOAT.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit  8
byte 3: bit 7 ~  bit  0
```

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

	rb0	rb1	rb2	rb3
big_endian	fbo	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has

passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_TO_BINARY_INTEGER Function

This function casts the binary representation of a BINARY_INTEGER (in RAW) into a BINARY_INTEGER.

Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–16 CAST_TO_BINARY_INTEGER Function Parameters

Parameter	Description
r	The binary representation of a BINARY_INTEGER.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_INTEGER value

CAST_TO_NUMBER Function

This function casts the binary representation of a NUMBER (in RAW) into a NUMBER.

Syntax

```
UTL_RAW.CAST_TO_NUMBER (
   r  IN RAW)
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–17 CAST_TO_NUMBER function Parameters

Parameter	Description
r	The binary representation of a NUMBER

Return Values

The NUMBER value.

CAST_TO_RAW Function

This function converts a VARCHAR2 represented using n data bytes into a RAW with n data bytes. The data is not modified in any way; only its datatype is recast to a RAW datatype.

Syntax

```
UTL_RAW.CAST_TO_RAW (
   c  IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–18 CAST_TO_RAW Function Parameters

Parameter	Description
c	VARCHAR2 to be changed to a RAW.

Return Values

Table 214–19 CAST_TO_RAW Function Return Values

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field.
NULL	If c input parameter was NULL.

CAST_TO_VARCHAR2 Function

This function converts a RAW represented using n data bytes into VARCHAR2 with n data bytes.

> **Note:** When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
   r IN RAW)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–20 CAST_TO_VARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a VARCHAR2.

Return Values

Table 214–21 CAST_TO_VARCHAR2 Function Return Values

Return	Description
VARCHAR2	Containing having the same data as the input RAW.
NULL	If r input parameter was NULL.

CAST_TO_NVARCHAR2 Function

This function converts a RAW represented using n data bytes into NVARCHAR2 with n data bytes.

> **Note:** When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
   r IN RAW)
RETURN NVARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–22 CAST_TO_NVARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a NVARCHAR2).

Return Values

Table 214–23 CAST_TO_NVARCHAR2 Function Return Values

Return	Description
NVARCHAR2	Containing having the same data as the input RAW.
NULL	If r input parameter was NULL.

COMPARE Function

This function compares RAW r1 against RAW r2. If r1 and r2 differ in length, then the shorter RAW is extended on the right with pad if necessary.

Syntax

```
UTL_RAW.COMPARE (
   r1  IN RAW,
   r2  IN RAW,
   pad IN RAW DEFAULT NULL)
  RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–24 COMPARE Function Parameters

Parameter	Description
r1	1st RAW to be compared, may be NULL or 0 length.
r2	2nd RAW to be compared, may be NULL or 0 length.
pad	This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00'

Return Values

Table 214–25 COMPARE Function Return Values

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte.

CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

Syntax

```
UTL_RAW.CONCAT (
   r1  IN RAW DEFAULT NULL,
   r2  IN RAW DEFAULT NULL,
   r3  IN RAW DEFAULT NULL,
   r4  IN RAW DEFAULT NULL,
   r5  IN RAW DEFAULT NULL,
   r6  IN RAW DEFAULT NULL,
   r7  IN RAW DEFAULT NULL,
   r8  IN RAW DEFAULT NULL,
   r9  IN RAW DEFAULT NULL,
   r10 IN RAW DEFAULT NULL,
   r11 IN RAW DEFAULT NULL,
   r12 IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

r1....r12 are the RAW items to concatenate.

Return Values

Table 214–26 CONCAT Function Return Values

Return	Description
RAW	Containing the items concatenated.

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

CONVERT Function

This function converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW.

Both from_charset and to_charset must be supported character sets defined to the Oracle server.

Syntax

```
UTL_RAW.CONVERT (
   r            IN RAW,
   to_charset   IN VARCHAR2,
   from_charset IN VARCHAR2)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–27 CONVERT Function Parameters

Parameter	Description
r	RAW byte-string to be converted.
to_charset	Name of Globalization Support character set to which r is converted.
from_charset	Name of Globalization Support character set in which r is supplied.

Return Values

Table 214–28 CONVERT Function Return Values

Return	Description
RAW	Byte string r converted according to the specified character sets.

Exceptions

Table 214–29 CONVERT Function Exceptions

Error	Description
VALUE_ERROR	Either: - r missing, NULL, or 0 length - from_charset or to_charset missing, NULL, or 0 length - from_charset or to_charset names invalid or unsupported

COPIES Function

This function returns n copies of r concatenated together.

Syntax

```
UTL_RAW.COPIES (
   r IN RAW,
   n IN NUMBER)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–30 COPIES Function Parameters

Parameters	Description
r	RAW to be copied
n	Number of times to copy the RAW (must be positive).

Return Values

This returns the RAW copied n times.

Exceptions

Table 214–31 COPIES Function Exceptions

Error	Description
VALUE_ERROR	Either: - r is missing, NULL or 0 length - n < 1 - Length of result exceeds maximum length of a RAW

LENGTH Function

This function returns the length in bytes of a `RAW` `r`.

Syntax

```
UTL_RAW.LENGTH (
   r  IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–32 LENGTH Function Parameters

Parameter	Description
`r`	The `RAW` byte stream to be measured.

Return Values

Table 214–33 LENGTH Function Return Values

Return	Description
`NUMBER`	The current length of the `RAW`.

OVERLAY Function

This function overlays the specified portion of target RAW with overlay_str RAW, starting from byte position pos of target and proceeding for len bytes.

Syntax

```
UTL_RAW.OVERLAY (
   overlay_str IN RAW,
   target      IN RAW,
   pos         IN BINARY_INTEGER DEFAULT 1,
   len         IN BINARY_INTEGER DEFAULT NULL,
   pad         IN RAW            DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–34 OVERLAY Function Parameters

Parameters	Description
overlay_str	Byte-string used to overlay target.
target	Byte-string which is to be overlaid.
pos	Position in target (numbered from 1) to start overlay.
len	The number of target bytes to overlay.
pad	Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length.

Defaults and Optional Parameters

Table 214–35 OVERLAY Function Optional Parameters

Optional Parameter	Description
pos	1
len	To the length of overlay_str
pad	x'00'

Return Values

Table 214–36 OVERLAY Function Return Values

Return	Description
RAW	The target byte_string overlaid as specified.

Usage Notes

If overlay_str has less than len bytes, then it is extended to len bytes using the pad byte. If overlay_str exceeds len bytes, then the extra bytes in overlay_str are ignored. If len bytes beginning at position pos of target exceeds the length of target, then target is extended to contain the entire length of overlay_str.

If len is specified, it must be greater than or equal to 0. If pos is specified, it must be greater than or equal to 1. If pos exceeds the length of target, then target is padded with pad bytes to position pos, and target is further extended with overlay_str bytes.

Exceptions

Table 214–37 OVERLAY Function Exceptions

Error	Description
VALUE_ERROR	Either: - Overlay_str is NULL or has 0 length - Target is missing or undefined - Length of target exceeds maximum length of a RAW - len < 0 - pos < 1

REVERSE Function

This function reverses a byte sequence in RAW r from end to end. For example, x'0102F3' would be reversed to x'F30201', and 'xyz' would be reversed to 'zyx'.The result length is the same as the input RAW length.

Syntax

```
UTL_RAW.REVERSE (
   r IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–38 REVERSE Function Parameters

Parameter	Description
r	RAW to reverse.

Return Values

Table 214–39 REVERSE Function Return Values

Return	Description
RAW	Containing the "reverse" of r.

Exceptions

Table 214–40 REVERSE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length.

SUBSTR Function

This function returns `len` bytes, starting at `pos` from `RAW r`.

Syntax

```
UTL_RAW.SUBSTR (
   r   IN RAW,
   pos IN BINARY_INTEGER,
   len IN BINARY_INTEGER DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–41 SUBSTR Function Parameters

Parameter	Description
`r`	The `RAW` byte-string from which a portion is extracted.
`pos`	The byte position in `r` at which to begin extraction.
`len`	The number of bytes from `pos` to extract from `r` (optional).

Defaults and Optional Parameters

Table 214–42 SUBSTR Function Exceptions

Optional Parameter	Description
`len`	Position `pos` through to the end of `r`.

Return Values

Table 214–43 SUBSTR Function Return Values

Return	Description
`portion of r`	Beginning at `pos` for `len` bytes long.
`NULL`	`r` input parameter was `NULL`.

Usage Notes

If `pos` is positive, then `SUBSTR` counts from the beginning of `r` to find the first byte. If `pos` is negative, then `SUBSTR` counts backward from the end of the `r`. The value `pos` cannot be 0.

If `len` is omitted, then `SUBSTR` returns all bytes to the end of `r`. The value `len` cannot be less than 1.

Exceptions

Table 214–44 SUBSTR Function Exceptions

Error	Description
VALUE_ERROR	VALUE_ERROR is returned if: ■ pos = 0 or > length of r ■ len < 1 or > length of r - (pos-1)

TRANSLATE Function

This function translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set. If a byte in r has a matching byte in from_set, then it is replaced by the byte in the corresponding position in to_set, or deleted.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (
   r        IN RAW,
   from_set IN RAW,
   to_set   IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–45 TRANSLATE Function Parameters

Parameter	Description
r	RAW source byte-string to be translated.
from_set	RAW byte-codes to be translated, if present in r.
to_set	RAW byte-codes to which corresponding from_str bytes are translated.

Return Values

Table 214–46 TRANSLATE Function Return Values

Return	Description
RAW	Translated byte-string.

Usage Notes

If to_set is shorter than from_set, then the extra from_set bytes have no translation correspondence and any bytes in r matching.

Note: Difference from TRANSLITERATE:

- Translation RAWs have no defaults.

- r bytes undefined in the to_set translation RAW are deleted.

- Result RAW may be shorter than input RAW r.

Exceptions

Table 214–47 TRANSLATE Function Exceptions

Error	Description
VALUE_ERROR	Either: - r is NULL or has 0 length - from_set is NULL or has 0 length - to_set is NULL or has 0 length

TRANSLITERATE Function

This function converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set. Successive bytes in r are looked up in the from_set, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the to_set, or the pad byte when no correspondence exists.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as r.

Syntax

```
UTL_RAW.TRANSLITERATE (
   r        IN RAW,
   to_set   IN RAW DEFAULT NULL,
   from_set IN RAW DEFAULT NULL,
   pad      IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–48 TRANSLITERATE Function Parameters

Parameter	Description
r	RAW input byte-string to be converted.
from_set	RAW byte-codes to be converted, if present in r (any length).
to_set	RAW byte-codes to which corresponding from_set bytes are converted (any length).
pad	1 byte used when to-set is shorter than the from_set.

Defaults and Optional Parameters

Table 214–49 TRANSLITERATE Function Optional Parameters

Optional Parameter	Description
from_set	x f00' through x fff'
to_set	To the NULL string and effectively extended with pad to the length of from_set as necessary.
pad	x'00'.

Return Values

Table 214–50 TRANSLITERATE Function Return Values

Return	Description
RAW	Converted byte-string.

Usage Notes

If the to_set is shorter than the from_set, then the pad byte is placed in the result RAW when a selected from_set byte has no corresponding to_set byte (as if the to_set were extended to the same length as the from_set with pad bytes).

Note: Difference from TRANSLATE:

- r bytes undefined in to_set are padded.

- Result RAW is always same length as input RAW r.

Exceptions

Table 214–51 TRANSLITERATE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length.

XRANGE Function

This function returns a RAW containing all valid 1-byte encodings in succession, beginning with the value start_byte and ending with the value end_byte. If start_byte is greater than end_byte, then the succession of resulting bytes begins with start_byte, wraps through x fFF f to x f00 f, and ends at end_byte. If specified, start_byte and end_byte must be single-byte RAWs.

Syntax

```
UTL_RAW.XRANGE (
   start_byte IN RAW DEFAULT NULL,
   end_byte   IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 214–52 XRANGE Function Parameters

Parameters	Description
start_byte	Beginning byte-code value of resulting sequence.
end_byte	Ending byte-code value of resulting sequence.

Defaults and Optional Parameters

```
start_byte - x f00 f
end_byte   - x fFF f
```

Return Values

Table 214–53 XRANGE Function Return Values

Return	Description
RAW	Containing succession of 1-byte hexadecimal encodings.

215

UTL_RECOMP

The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- Using UTL_RECOMP
  - Overview
  - Operational Notes
  - Examples
- Summary of UTL_RECOMP Subprograms

Using UTL_RECOMP

- Overview
- Operational Notes
- Examples

Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to RECOMP_PARALLEL Procedure.

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

Operational Notes

- This package uses the job queue for parallel recompilation.
- This package must be run using `SQL*PLUS`.
- You must be connected `AS SYSDBA` to run this script.
- This package expects the following packages to have been created with VALID status:
  - `STANDARD` (`standard.sql`)
  - `DBMS_STANDARD` (`dbmsstdx.sql`)
  - `DBMS_JOB` (`dbmsjob.sql`)
  - `DBMS_RANDOM (dbmsrand.sql)`
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

Examples

Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

Summary of UTL_RECOMP Subprograms

Table 215–1 UTL_RECOMP Package Subprograms

Subprogram	Description
RECOMP_PARALLEL Procedure on page 215-7	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
RECOMP_SERIAL Procedure on page 215-8	Recompiles invalid objects in a given schema or all invalid objects in the database

RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
   threads  IN   PLS_INTEGER DEFAULT NULL,
   schema   IN   VARCHAR2    DEFAULT NULL,
   flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 215–2 RECOMP_PARALLEL Procedure Parameters

Parameter	Description
threads	The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(
   schema    IN   VARCHAR2    DEFAULT NULL,
   flags     IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 215–3 RECOMP_SERIAL Procedure Parameters

Parameter	Description
`schema`	The schema in which to recompile invalid objects. If `NULL`, all invalid objects in the database are recompiled.
`flags`	Flag values are intended for internal testing and diagnosability only.

216

UTL_REF

The UTL_REF package provides PL/SQL procedures to support reference-based operations. Unlike SQL, UTL_REF procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- Using UTL_REF
  - Overview
  - Security Model
  - Types
  - Exceptions
- Summary of UTL_REF Subprograms

Using UTL_REF

- Overview
- Security Model
- Types
- Exceptions

Overview

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

Security Model

The procedural option is needed to use this package. This package must be created under SYS (connect/as sysdba). Operations provided by this package are performed under the current calling user, not under the package owner SYS.

You can use the UTL_REF package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, UTL_REF verifies that the invoker has the appropriate privileges to access the object pointed to by the REF.

> **Note:** This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if UTL_REF is defined under user SYS, and user A invokes UTL_REF.SELECT to select an object from a reference, then user A (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, UTL_REF operates with the privileges of the client session under which the PL/SQL execution is being done.

Types

An object type is a composite datatype defined by the user or supplied as a library type. You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (
   name    VARCHAR2(20),
   id      NUMBER,

member function GET_ID
    (name VARCHAR2)
   RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID`().

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

Exceptions

Exceptions can be returned during execution of UTL_REF functions for various reasons. For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the UTL_REF subprogram must have the proper privilege on the object that is being selected or modified.

Table 216–1 UTL_REF Exceptions

Exceptions	Description
errnum == 942	Insufficient privileges.
errnum == 1031	Insufficient privileges.
errnum == 8177	Unable to serialize, if in a serializable transaction.
errnum == 60	Deadlock detected.
errnum == 1403	No data found (if the REF is NULL, and so on.).

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

Summary of UTL_REF Subprograms

Table 216–2 UTL_REF Package Subprograms

Subprogram	Description
DELETE_OBJECT Procedure on page 216-8	Deletes an object given a reference
LOCK_OBJECT Procedure on page 216-10	Locks an object given a reference
SELECT_OBJECT Procedure on page 216-11	Selects an object given a reference
UPDATE_OBJECT Procedure on page 216-12	Updates an object given a reference

DELETE_OBJECT Procedure

This procedure deletes an object given a reference. The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (
   reference IN REF "<typename>");
```

Parameters

Table 216–3 DELETE_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to delete.

Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address_t and others...

```
CREATE OR REPLACE TYPE Person_t (
   name    VARCHAR2(64),
   gender  CHAR(1),
   address Address_t,
   MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
   MEMBER PROCEDURE setAddress(addr IN Address_t) IS
   BEGIN
      address := addr;
   END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under Person_t: Simulate implementation of inheritance using a REF to Person_t and delegation of setAddress to it.

```
   thePerson  REF Person_t,
   empno      NUMBER(5),
   deptREF    Department_t,
   mgrREF     Employee_t,
   reminders  StringArray_t,
```

```
   MEMBER PROCEDURE setAddress(addr IN Address_t),
   MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t (
   MEMBER PROCEDURE setAddress(addr IN Address_t) IS
      myMgr Employee_t;
      meAsPerson Person_t;
   BEGIN
```

Update the address by delegating the responsibility to `thePerson`. Lock the Person object from the reference, and also select it:

```
      UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
      meAsPerson.setAddress(addr);
```

Delegate to `thePerson`:

```
        UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
        if mgr is NOT NULL THEN
```

Give the manager a reminder:

```
         UTL_REF.LOCK_OBJECT(mgr);
         UTL_REF.SELECT_OBJECT(mgr, myMgr);
         myMgr.addReminder
         ('Update address in the employee directory for' ||
         thePerson.name || ', new address: ' || addr.asString);
         UTL_REF.UPDATE_OBJECT(mgr, myMgr);
      END IF;
   EXCEPTION
      WHEN OTHERS THEN
      errnum := SQLCODE;
      errmsg := SUBSTR(SQLERRM, 1, 200);
```

LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
  INTO object
  FROM object_table t
  WHERE REF(t) = reference
  FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```
UTL_REF.LOCK_OBJECT (
   reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
   reference IN REF "<typename>",
   object    IN OUT "<typename>");
```

Parameters

Table 216–4 LOCK_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference of the object to lock.
`object`	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

Exceptions

May be raised.

SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.SELECT_OBJECT (
   reference IN REF "<typename>",
   object    IN OUT "<typename>");
```

Parameters

Table 216–5 SELECT_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference to the object to select or retrieve.
`object`	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

Exceptions

May be raised.

UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.UPDATE_OBJECT (
   reference IN REF "<typename>",
   object    IN     "<typename>");
```

Parameters

Table 216–6 UPDATE_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference of the object to update.
`object`	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

Exceptions

May be raised.

217

UTL_SMTP

The `UTL_SMTP` package is designed for sending electronic mails (emails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

> **See Also:** How to use the SMTP package to send email in *Oracle Database Advanced Application Developer's Guide*

This chapter contains the following topics:

- Using UTL_SMTP
  - Overview
  - Security Model
  - Types
  - Reply Codes
  - Exceptions
  - Rules and Limits
  - Examples
- Summary of UTL_SMTP Subprograms

Using UTL_SMTP

- Overview
- Security Model
- Types
- Reply Codes
- Exceptions
- Rules and Limits
- Examples

Overview

The protocol consists of a set of commands for an email client to dispatch emails to a SMTP server. The UTL_SMTP package provides interfaces to the SMTP commands. For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and will raise an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using UTL_SMTP, all text data (in other words, those in VARCHAR2) will be converted to US7ASCII before it is sent over the wire to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command may be transferred in full 8 bits, but the rest of the SMTP command and response should be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte VARCHAR2 data to RAW and use the WRITE_RAW_DATA subprogram to send multibyte data using 8-bit MIME encoding.

UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail).You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an email clients to send emails using SMTP.

Security Model

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

---

Types

- CONNECTION Record Type
- REPLY, REPLIES Record Types

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```
TYPE connection IS RECORD (
    host              VARCHAR2(255),      -- remote host name
    port              PLS_INTEGER,        -- remote port number
    tx_timeout        PLS_INTEGER,        -- Transfer time out (in seconds)
    private_tcp_con   utl_tcp.connection, -- private, for implementation use
    private_state     PLS_INTEGER         -- private, for implementation use
);
```

Fields

Table 217–1 CONNECTION Record Type Fields

Field	Description
`host`	The name of the remote host when connection is established. `NULL` when no connection is established.
`port`	The port number of the remote SMTP server connected. `NULL` when no connection is established.
`tx_timeout`	The time in seconds that the `UTL_SMTP` package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent into the network without being blocked. `0` indicates not to wait at all. `NULL` indicates to wait forever.
`private_tcp_con`	Private, for implementation use only. You should not modify this field.
`private_state`	Private, for implementation use only. You should not modify this field.

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with `open_connection`. Changing the values of these fields has no effect on the connection. The fields `private_xxx` are for implementation use only. You should not modify these fields.

REPLY, REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax

```
TYPE reply IS RECORD (
  code    PLS_INTEGER,       -- 3-digit reply code
  text    VARCHAR2(508)      -- text message
);
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;   -- multiple reply lines
```

Fields

Table 217–2 REPLY, REPLIES Record Type Fields

Field	Description
`code`	The 3-digit reply code.
`text`	The text message of the reply.

Reply Codes

The following is a list of the SMTP reply codes.

Table 217–3 SMTP Reply Codes

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; will forward to <forward-path>
252	OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but will take message for this user and attempt delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF>.<CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This may be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.

Table 217–3 (Cont.) SMTP Reply Codes

Reply Code	Meaning
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

Exceptions

The table lists the exceptions that can be raised by the interface of the UTL_SMTP package. The network error is transferred to a reply code of 421- service not available.

Table 217–4 UTL_SMTP Exceptions

INVALID_OPERATION	Raised when an invalid operation is made. In other words, calling API other than write_data, write_raw_data or close_data after open_data is called, or calling write_data, write_raw_data or close_data without first calling open_data.
TRANSIENT_ERROR	Raised when receiving a reply code in 400 range.
PERMANENT_ERROR	Raised when receiving a reply code in 500 range.

Rules and Limits

No limitation or range-checking is imposed by the API. However, you should be aware of the following size limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

Table 217–5 SMTP Size Limitation

Element	Size Limitation
`user`	The maximum total length of a user name is 64 characters.
`domain`	The maximum total length of a domain name or number is 64 characters.
`path`	The maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators).
`command line`	The maximum total length of a command line including the command word and the `<CRLF>` is 512 characters.
`reply line`	The maximum total length of a reply line including the reply code and the `<CRLF>` is 512 characters.
`text line`	The maximum total length of a text line including the `<CRLF>` is 1000 characters (but not counting the leading dot duplicated for transparency).
`recipients buffer`	The maximum total number of recipients that must be buffered is 100 recipients.

Examples

The following example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```
DECLARE
  c UTL_SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;

BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL_SMTP.HELO(c, 'foo.com');
  UTL_SMTP.MAIL(c, 'sender@foo.com');
  UTL_SMTP.RCPT(c, 'recipient@foo.com');
  UTL_SMTP.OPEN_DATA(c);
  send_header('From',    '"Sender" <sender@foo.com>');
  send_header('To',      '"Recipient" <recipient@foo.com>');
  send_header('Subject', 'Hello');
  UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL_SMTP.CLOSE_DATA(c);
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
    BEGIN
      UTL_SMTP.QUIT(c);
    EXCEPTION
      WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
        NULL; -- When the SMTP server is down or unavailable, we don't have
              -- a connection to the server. The QUIT call will raise an
              -- exception that we can ignore.
    END;
    raise_application_error(-20000,
      'Failed to send mail due to the following error: ' || sqlerrm);
END;
```

Summary of UTL_SMTP Subprograms

Table 217–6 UTL_SMTP Package Subprograms

Subprogram	Description
CLOSE_DATA Function and Procedure on page 217-13	Closes the data session
COMMAND Function and Procedure on page 217-14	Performs a generic SMTP command
COMMAND_REPLIES Function on page 217-15	Performs initial handshaking with SMTP server after connecting
DATA Function and Procedure on page 217-16	Performs initial handshaking with SMTP server after connecting, with extended information returned
EHLO Function and Procedure on page 217-17	Performs initial handshaking with SMTP server after connecting, with extended information returned
HELO Function and Procedure on page 217-18	Performs initial handshaking with SMTP server after connecting
HELP Function on page 217-19	Sends `HELP` command
MAIL Function and Procedure on page 217-20	Initiates a mail transaction with the server, the destination is a mailbox
NOOP Function and Procedure on page 217-21	The null command
OPEN_CONNECTION Functions on page 217-22	Opens a connection to an SMTP server
OPEN_DATA Function and Procedure on page 217-24	Sends the DATA command
QUIT Function and Procedure on page 217-25	Terminates an SMTP session and disconnects from the server
RCPT Function on page 217-26	Specifies the recipient of an e-mail message
RSET Function and Procedure on page 217-27	Terminates the current mail transaction
VRFY Function on page 217-28	Verifies the validity of a destination e-mail address
WRITE_DATA Procedure on page 217-29	Writes a portion of the e-mail message
WRITE_RAW_DATA Procedure on page 217-31	Writes a portion of the e-mail message with `RAW` data

CLOSE_DATA Function and Procedure

The CLOSE_DATA call ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 217–7 CLOSE_DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 217–8 CLOSE_DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

CLOSE_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

COMMAND Function and Procedure

This function/procedure performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.COMMAND (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL);
```

Parameters

Table 217–9 COMMAND Function and Procedure Parameters

Parameter	Description
`c`	The SMTP connection.
`cmd`	The SMTP command to send to the server.
`arg`	The optional argument to the SMTP argument. A space will be inserted between `cmd` and `arg`.

Return Values

Table 217–10 COMMAND Function and Procedure Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

COMMAND_REPLIES Function

This functions performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 217–11 COMMAND_REPLIES Function Parameters

Parameter	Description
c	The SMTP connection.
cmd	The SMTP command to send to the server.
arg	The optional argument to the SMTP argument. A space will be inserted between cmd and arg.

Return Values

Table 217–12 COMMAND_REPLIES Function Return Values

Return Value	Description
replies	Reply of the command (see REPLY, REPLIES Record Types).

Usage Notes

This function is used to invoke generic SMTP commands. Use COMMAND if only a single reply line is expected. Use COMMAND_REPLIES if multiple reply lines are expected.

For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

DATA Function and Procedure

This function/procedure specifies the body of an e-mail message.

Syntax

```
UTL_SMTP.DATA (
   c     IN OUT NOCOPY connection
   body  IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;

UTL_SMTP.DATA (
   c     IN OUT NOCOPY connection
   body  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 217–13 DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP Connection.
body	The text of the message to be sent, including headers, in [RFC822] format.

Return Values

Table 217–14 DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of <CR><LF>.<CR><LF> (single period) in body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA call should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command will not be returned to the caller.

EHLO Function and Procedure

This function/procedure performs initial handshaking with SMTP server after connecting, with extended information returned.

Syntax

```
UTL_SMTP.EHLO (
   c       IN OUT NOCOPY connection,
   domain  IN)
RETURN replies;

UTL_SMTP.EHLO (
   c       IN OUT NOCOPY connection,
   domain  IN);
```

Parameters

Table 217–15 EHLO Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
domain	The domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 217–16 EHLO Function and Procedure Return Values

Return Value	Description
replies	Reply of the command (see REPLY, REPLIES Record Types).

Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.

Related Functions

HELO

HELO Function and Procedure

This function/procedure performs initial handshaking with SMTP server after connecting.

Syntax

```
UTL_SMTP.HELO (
   c       IN OUT NOCOPY   connection,
   domain  IN              VARCHAR2)
RETURN reply;

UTL_SMTP.HELO (
   c       IN OUT NOCOPY   connection,
   domain  IN              VARCHAR2);
```

Parameters

Table 217–17 HELO Function and Procedure Parameters

Parameter	Description
`c`	The SMTP connection.
`domain`	The domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 217–18 HELO Function and Procedure Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to OPEN_CONNECTION Functions before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

EHLO

HELP Function

This function sends the `HELP` command.

Syntax

```
UTL_SMTP.HELP (
   c         IN OUT NOCOPY   connection,
   command   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 217–19 HELP Function Parameters

Parameter	Description
`c`	The SMTP connection.
`command`	The command to get the help message.

Return Values

Table 217–20 HELP Function Return Values

Return Value	Description
`replies`	Reply of the command (see REPLY, REPLIES Record Types).

MAIL Function and Procedure

This function/procedure initiates a mail transaction with the server. The destination is a mailbox.

Syntax

```
UTL_SMTP.MAIL (
   c           IN OUT NOCOPY   connection,
   sender      IN              VARCHAR2,
   parameters  IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.MAIL (
   c           IN OUT NOCOPY   connection,
   sender      IN              VARCHAR2,
   parameters  IN              VARCHAR2 DEFAULT NULL);
```

Parameters

Table 217–21 MAIL Function and Procedure Parameters

Parameter	Description
`c`	The SMTP connection.
`sender`	The e-mail address of the user sending the message.
`parameters`	The additional parameters to MAIL command as defined in Section 6 of [RFC1869]. It should follow the format of "XXX=XXX (XXX=XXX ....)".

Return Values

Table 217–22 MAIL Function and Procedure Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to `RCPT` and `DATA` to complete the transaction. The connection to the SMTP server must be open and a `HELO` or `EHLO` command must have already been sent.

The expected response from the server is a message beginning with status code 250.

NOOP Function and Procedure

The null command.

Syntax

```
UTL_SMTP.NOOP (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.NOOP (
   c  IN OUT NOCOPY connection);
```

Parameter

Table 217–23 NOOP Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 217–24 NOOP Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with OPEN_CONNECTION. The NOOP command can be used to verify that the server is still connected and is listening properly.

This command will always reply with a single line beginning with status code 250.

OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (
   host        IN  VARCHAR2,
   port        IN  PLS_INTEGER DEFAULT 25,
   c           OUT connection,
   tx_timeout  IN  PLS_INTEGER DEFAULT NULL)
RETURN reply;

UTL_SMTP.OPEN_CONNECTION (
   host        IN  VARCHAR2,
   port        IN  PLS_INTEGER DEFAULT 25,
   tx_timeout  IN  PLS_INTEGER DEFAULT NULL)
RETURN connection;
```

Parameters

Table 217–25 OPEN_CONNECTION Functions Parameters

Parameter	Description
`host`	The name of the SMTP server host
`port`	The port number on which SMTP server is listening (usually 25).
`c`	The SMTP connection.
`tx_timeout`	The time in seconds that the `UTL_SMTP` package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent into the network without being blocked. `0` indicates not to wait at all. `NULL` indicates to wait forever.

Return Values

Table 217–26 OPEN_CONNECTION Functions Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of `OPEN_CONNECTION` that returns `UTL_SMTP.CONNECTION` record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If a user is interested in examining the reply, he or she can invoke the version of `OPEN_CONNECTION` that returns `REPLY`.

- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

OPEN_DATA Function and Procedure

OPEN_DATA sends the DATA command after which you can use WRITE_DATA and WRITE_RAW_DATA to write a portion of the e-mail message.

Syntax

```
UTL_SMTP.OPEN_DATA (
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 217–27 OPEN_DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Return Values

Table 217–28 OPEN_DATA Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

OPEN_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

QUIT Function and Procedure

This function terminates an SMTP session and disconnects from the server.

Syntax

```
UTL_SMTP.QUIT (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
   c  IN OUT NOCOPY connection);
```

Parameter

Table 217–29 QUIT Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 217–30 QUIT Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The QUIT command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by OPEN_CONNECTION which must have been called before executing this command. If a mail transaction is in progress when QUIT is issued, it is abandoned in the same manner as RSET.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields REMOTE_HOST and REMOTE_PORT of c are reset.

Related Functions

RSET

RCPT Function

This function/procedure specifies the recipient of an e-mail message.

Syntax

```
UTL_SMTP.RCPT (
   c           IN OUT NOCOPY     connection,
   recipient   IN                VARCHAR2,
   parameters  IN                VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
   c           IN OUT NOCOPY     connection,
   recipient   IN                VARCHAR2,
   parameters  IN                VARCHAR2 DEFAULT NULL);
```

Table 217–31 RCPT Function and Procedure Parameters

Parameter	Description
`c`	The SMTP connection.
`recipient`	The e-mail address of the user to which the message is being sent.
`parameters`	The additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It should follow the format of "XXX=XXX (XXX=XXX ....)".

Return Values

Table 217–32 RCPT Function and Procedure Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

RSET Function and Procedure

This function terminates the current mail transaction.

Syntax

```
UTL_SMTP.RSET (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
   c  IN OUT NOCOPY connection);
```

Parameters

Table 217–33 RSET Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 217–34 RSET Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command allows the client to abandon a mail message it was in the process of composing. No mail will be sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN_CONNECTION until DATA or OPEN_DATA is called. Once the email data has been sent, it will be too late to prevent the email from being sent.

The server will always respond to RSET with a message beginning with status code 250.

Related Functions

QUIT

VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (
   c          IN OUT NOCOPY connection
   recipient  IN VARCHAR2)
RETURN reply;
```

Parameters

Table 217–35 VRFY Function Parameters

Parameter	Description
`c`	The SMTP connection.
`recipient`	The e-mail address to be verified.

Return Values

Table 217–36 VRFY Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

WRITE_DATA Procedure

Use WRITE_DATA to write a portion of the e-mail message. A repeat call to WRITE_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_DATA (
   c     IN OUT NOCOPY connection,
   data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 217–37 WRITE_DATA Procedure Parameters

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

Notice that this conversion is not bullet-proof. Consider this code fragment:

```
UTL_SMTP.WRITE_DATA('some message.' || chr(13) || chr(10));
UTL_SMTP.WRITE_DATA('.' || chr(13) || chr(10));
```

Since the sequence <CR><LF>.<CR><LF> is split between two calls to WRITE_DATA, the implementation of WRITE_DATA will not detect the presence of the data-terminator sequence, and therefore, will not perform the translation. It will be the responsibility of the user to handle such a situation, or it may result in premature termination of the message data.

WRITE_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

Text (VARCHAR2) data sent using WRITE_DATA is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension

is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.

WRITE_RAW_DATA Procedure

Use WRITE_RAW_DATA to write a portion of the e-mail message. A repeat call to WRITE_RAW_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
   c     IN OUT NOCOPY connection
   data  IN RAW);
```

Parameters

Table 217–38 WRITE_RAW_DATA Procedure Parameters

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

Notice that this conversion is not bullet-proof. Consider this code fragment:

```
UTL_SMTP.WRITE_DATA('some message.' || chr(13) || chr(10));
UTL_SMTP.WRITE_DATA('.' || chr(13) || chr(10));
```

Since the sequence <CR><LF>.<CR><LF> is split between two calls to WRITE_DATA, the implementation of WRITE_DATA will not detect the presence of the data-terminator sequence, and therefore, will not perform the translation. It will be the responsibility of the user to handle such a situation, or it may result in premature termination of the message data.

XXX_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

Text (VARCHAR2) data sent using WRITE_DATA is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension

is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.

UTL_SPADV

The `UTL_SPADV` package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about this package and the Oracle Streams Performance Advisor

This chapter contains the following topic:

- Summary of UTL_SPADV Subprograms

Summary of UTL_SPADV Subprograms

Table 218–1 DBMS_STREAMS Package Subprograms

Subprogram	Description
COLLECT_STATS Procedure on page 218-3	Uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.
SHOW_STATS Procedure on page 218-5	Generates output that includes the statistics gathered by the `COLLECT_STATS` procedure.

COLLECT_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note: This procedure commits.

See Also: *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.COLLECT_STATS(
   interval                      IN NUMBER  DEFAULT 60,
   num_runs                      IN NUMBER  DEFAULT 10,
   comp_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
   path_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
   top_event_threshold           IN NUMBER  DEFAULT 15,
   bottleneck_idle_threshold     IN NUMBER  DEFAULT 50,
   bottleneck_flowctrl_threshold IN NUMBER  DEFAULT 50);
```

Parameters

Table 218–2 COLLECT_STATS Procedure Parameters

Parameter	Description
`interval`	The time period, in seconds, between two consecutive Oracle Streams Performance Advisor runs.
`num_runs`	The number of times that the Oracle Streams Performance Advisor is run by the procedure.
`comp_stat_table`	The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as *`[schema_name.]object_name`*. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table `STREAMS$_ADVISOR_COMP_STAT`. See "Usage Notes" on page 218-4 for more information about this parameter.
`path_stat_table`	The name of the table that stores the statistics collected for stream paths. Specify the table name as *`[schema_name.]object_name`*. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table `STREAMS$_ADVISOR_PATH_STAT`. See "Usage Notes" on page 218-4 for more information about this parameter.

Table 218–2 (Cont.) COLLECT_STATS Procedure Parameters

Parameter	Description
top_event_threshold	A percentage that determines whether or not a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.
bottleneck_idle_threshold	A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.

Usage Notes

The table specified in the path_stat_table parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the comp_stat_table parameter. The SHOW_STATS procedure in this package shows only the statistics stored in the table specified in the path_stat_table parameter.

SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the COLLECT_STATS procedure.

The output is formatted so that it can be imported into a spreadsheet for analysis.

Note: This procedure does not commit.

See Also: *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.SHOW_STATS(
   path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
   path_id         IN NUMBER    DEFAULT NULL,
   bgn_run_id      IN NUMBER    DEFAULT -1,
   end_run_id      IN NUMBER    DEFAULT -10,
   show_path_id    IN BOOLEAN   DEFAULT TRUE,
   show_run_id     IN BOOLEAN   DEFAULT TRUE,
   show_run_time   IN BOOLEAN   DEFAULT TRUE,
   show_setting    IN BOOLEAN   DEFAULT FALSE,
   show_stat       IN BOOLEAN   DEFAULT TRUE,
   show_sess       IN BOOLEAN   DEFAULT FALSE,
   show_legend     IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 218–3 SHOW_STATS Procedure Parameters

Parameter	Description
path_stat_table	The name of the table that contains the stream path statistics. This table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default.
path_id	A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.
bgn_run_id	The first Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 218-6 for more information about this parameter.
end_run_id	The last Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 218-6 for more information about this parameter.

Table 218–3 (Cont.) SHOW_STATS Procedure Parameters

Parameter	Description
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Streams Performance Advisor run ID is included in the output. If FALSE, then the Oracle Streams Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Streams Performance Advisor run time is included in the output. If FALSE, then the Oracle Streams Performance Advisor run time is not included in the output.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

Usage Notes

Use the bgn_run_id and end_run_id together to specify the range of Oracle Streams Performance Advisor runs that you want to display. Positive numbers show statistics from the an earlier run forward. Negative numbers show statistics from the a a later run backward.

For example, if bgn_run_id is set to 1 and end_run_id is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if bgn_run_id is set to -1 and end_run_id is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

219

UTL_TCP

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- Using UTL_TCP
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Rules and Limits
  - Examples
- Summary of UTL_TCP Subprograms

Using UTL_TCP

- Overview
- Security Model
- Types
- Exceptions
- Rules and Limits
- Examples

Overview

The UTL_TCP package provides TCP/IP client-side access functionality in PL/SQL.

Security Model

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

Types

- CONNECTION Type
- CRLF

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```
TYPE connection IS RECORD (
    remote_host    VARCHAR2(255),
    remote_port    PLS_INTEGER,
    local_host     VARCHAR2(255),
    local_port     PLS_INTEGER,
    charset        VARCHAR2(30),
    newline        VARCHAR2(2),
    tx_timeout     PLS_INTEGER,
    private_sd     PLS_INTEGER);
```

Fields

Table 219–1 Connection Record Type Fields

Field	Description
`remote_host`	The name of the remote host when connection is established. `NULL` when no connection is established.
`remote_port`	The port number of the remote host connected. NULL when no connection is established.
`local_host`	The name of the local host used to establish the connection. `NULL` when no connection is established.
`local_port`	The port number of the local host used to establish the connection. `NULL` when no connection is established.
`charset`	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database will be converted to and from the on-the-wire character set as they are sent and received on the network.
`newline`	The newline character sequence. This newline character sequence is appended to the text line sent by `WRITE_LINE` API.
`tx_timeout`	A time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields

has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields will not be set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the `UTL_TCP` package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used many communication standards.

Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

Exceptions

The exceptions raised by the TCP/IP package are listed in Table 219–2.

Table 219–2 TCP/IP Exceptions

Exception	Description
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead.
END_OF_INPUT	Raised when no more data is available to read from the connection.
NETWORK_ERROR	Generic network error.
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size).
TRANSFER_TIMEOUT	No data is read and a read time out occurred.
PARTIAL_MULTIBYTE_CHAR	No complete character is read and a partial multibyte character is found at the end of the input.

Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

Examples

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```
DECLARE
  c  utl_tcp.connection;  -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                               remote_port =>  80,
                               charset     => 'US7ASCII');  -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');    -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE));  -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```
PROCEDURE send_mail (sender    IN VARCHAR2,
                     recipient IN VARCHAR2,
                   message   IN VARCHAR2)
IS
    mailhost   VARCHAR2(30) := 'mailhost.mydomain.com';
    smtp_error  EXCEPTION;
    mail_conn   utl_tcp.connection;
    PROCEDURE smtp_command(command IN VARCHAR2,
                           ok      IN VARCHAR2 DEFAULT '250')
    IS
        response varchar2(3);
        len pls_integer;
    BEGIN
        len := utl_tcp.write_line(mail_conn, command);
        response := substr(utl_tcp.get_line(mail_conn), 1, 3);
        IF (response <> ok) THEN
            RAISE smtp_error;
        END IF;
    END;

BEGIN
    mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                         remote_port => 25,
                                         charset     => 'US7ASCII');
    smtp_command('HELO ' || mailhost);
    smtp_command('MAIL FROM: ' || sender);
    smtp_command('RCPT TO: ' || recipient);
    smtp_command('DATA', '354');
    smtp_command(message);
```

```
    smtp_command('QUIT', '221');
    utl_tcp.close_connection(mail_conn);
EXCEPTION
    WHEN OTHERS THEN
        -- Handle the error
END;
```

Summary of UTL_TCP Subprograms

Table 219–3 UTL_TCP Package Subprograms

Subprogram	Description
AVAILABLE Function on page 219-12	Determines the number of bytes available for reading from a TCP/IP connection
CLOSE_ALL_ CONNECTIONS Procedure on page 219-14	Closes all open TCP/IP connections
CLOSE_CONNECTION Procedure on page 219-15	Closes an open TCP/IP connection
FLUSH Procedure on page 219-16	Transmits all data in the output buffer, if a buffer is used, to the server immediately
GET_LINE Function on page 219-17	Returns the line of data read
GET_LINE_NCHAR Function on page 219-18	Returns the line of data read in NCHAR form
GET_RAW Function on page 219-19	Return the data read instead of the amount of data read
GET_TEXT Function on page 219-20	Returns the text data read
GET_TEXT_NCHAR Function on page 219-21	Returns the text data read in NCHAR form
OPEN_CONNECTION Function on page 219-22	Opens a TCP/IP connection to a specified service
READ_LINE Function on page 219-24	Receives a text line from a service on an open connection
READ_RAW Function on page 219-26	Receives binary data from a service on an open connection
READ_TEXT Function on page 219-27	Receives text data from a service on an open connection
WRITE_LINE Function on page 219-29	Transmits a text line to a service on an open connection
WRITE_RAW Function on page 219-30	Transmits a binary message to a service on an open connection
WRITE_TEXT Function on page 219-31	Transmits a text message to a service on an open connection

AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```
UTL_TCP.AVAILABLE (
   c        IN OUT NOCOPY connection,
   timeout  IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;
```

Parameters

Table 219–4 AVAILABLE Function Parameters

Parameter	Description
c	The TCP connection to determine the amount of data that is available to be read from.
timeout	A time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Users may use this API to determine if data is available to be read before calling the read API so that the program will not be blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read will result in the END_OF_INPUT exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
   c   utl_tcp.connection
   data VARCHAR2(256);
   len  PLS_INTEGER;
BEGIN
   c := utl_tcp.open_connection(...);
   LOOP
      IF (utl_tcp.available(c) > 0) THEN
         len := utl_tcp.read_text(c, data, 256);
      ELSE
         ---do some other things
        . . . .
      END IF
```

```
   END LOOP;
END;
```

CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

Usage Notes

This call is provided to close all connections before a PL/SQL program avoid dangling connections.

CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (
   c IN OUT NOCOPY connection);
```

Parameters

Table 219–5 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	The TCP connection to close.

Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host, remote_port, local_host, local_port` and `charset` of c will be reset after the connection is closed.

An open connection must be closed explicitly. An open connection will remain open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

FLUSH Procedure

This procedure transmits all data in the output buffer, if a buffer is used, to the server immediately.

Syntax

```
UTL_TCP.FLUSH (
   c IN OUT NOCOPY connection);
```

Parameters

Table 219–6 FLUSH Procedure Parameters

Parameter	Description
c	The TCP connection to send data to.

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

GET_LINE Function

This function returns the line of data read.

Syntax

```
UTL_TCP.GET_LINE (
   c           IN OUT NOCOPY connection,
   remove_crlf IN            BOOLEAN DEFAULT FALSE,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 219–7 GET_LINE Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```
UTL_TCP.GET_LINE_NCHAR (
   c           IN OUT NOCOPY connection,
   remove_crlf IN            BOOLEAN DEFAULT FALSE,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN NVARCHAR2;
```

Parameters

Table 219–8 GET_LINE_NCHAR Function Parameters

Parameter	Description
`c`	The TCP connection to receive data from.
`remove_crlf`	If `TRUE`, the trailing CR/LF character(s) are removed from the received message.
`peek`	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to `TRUE` and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```
UTL_TCP.GET_RAW (
   c     IN OUT NOCOPY connection,
   len   IN            PLS_INTEGER DEFAULT 1,
   peek  IN            BOOLEAN     DEFAULT FALSE)
 RETURN RAW;
```

Parameters

Table 219–9 GET_RAW Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

GET_TEXT Function

This function returns the text data read.

Syntax

```
UTL_TCP.GET_TEXT (
   c    IN OUT NOCOPY connection,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 219–10 GET_TEXT Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
   c    IN OUT NOCOPY connection,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
 RETURN NVARCHAR2;
```

Parameters

Table 219–11 GET_TEXT_NCHAR Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION  (
   remote_host      IN VARCHAR2,
   remote_port      IN PLS_INTEGER,
   local_host       IN VARCHAR2 DEFAULT NULL,
   local_port       IN PLS_INTEGER DEFAULT NULL,
   in_buffer_size   IN PLS_INTEGER DEFAULT NULL,
   out_buffer_size  IN PLS_INTEGER DEFAULT NULL,
   charset          IN VARCHAR2 DEFAULT NULL,
   newline          IN VARCHAR2 DEFAULT CRLF,
   tx_timeout       IN PLS_INTEGER DEFAULT NULL)
  RETURN connection;
```

Parameters

Table 219–12 OPEN_CONNECTION Function Parameters

Parameter	Description
remote_host	The name of the host providing the service. When remote_host is NULL, it connects to the local host.
remote_port	The port number on which the service is listening for connections.
local_host	The name of the host providing the service. NULL means don't care.
local_port	The port number on which the service is listening for connections. NULL means don't care.
in_buffer_size	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the network condition. A 0 value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
out_buffer_size	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A 0 value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database will be converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.

Table 219–12 (Cont.) OPEN_CONNECTION Function Parameters

Parameter	Description
newline	The newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	A time in seconds that the UTL_TCP package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

A connection to the targeted TCP/IP service

Usage Notes

- Note that connections opened by this UTL_TCP package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection will remain open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
- In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields will not be set in the connection record returned by the function.
- tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

READ_LINE Function

This function receives a text line from a service on an open connection. A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```
UTL_TCP.READ_LINE (
   c           IN OUT NOCOPY connection,
   data        IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN PLS_INTEGER;
```

Parameters

Table 219–13 READ_LINE Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
data	The data received.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages will be converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and

read time out occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```
UTL_TCP.READ_RAW (
   c     IN OUT NOCOPY connection,
   data  IN OUT NOCOPY RAW,
   len   IN            PLS_INTEGER DEFAULT 1,
   peek  IN            BOOLEAN     DEFAULT FALSE)
 RETURN PLS_INTEGER;
```

Parameters

Table 219–14 READ_RAW Function Parameters

Parameter	Description
`c`	The TCP connection to receive data from.
`data (IN OUT COPY)`	The data received.
`len`	The number of bytes of data to receive.
`peek`	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to `TRUE` and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```
UTL_TCP.READ_TEXT (
   c    IN OUT NOCOPY connection,
   data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 219–15 READ_TEXT Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
data	The data received.
len	The number of characters of data to receive.
peek	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages will be converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a VARCHAR2 buffer is specified in terms of bytes, while the parameter len refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the VARCHAR2 buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

WRITE_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence will be appended to the message before it is transmitted.

Syntax

```
UTL_TCP.WRITE_LINE (
   c    IN OUT NOCOPY connection,
   data IN            VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)
  RETURN PLS_INTEGER;
```

Parameters

Table 219–16 WRITE_LINE Function Parameters

Parameter	Description
`c`	The TCP connection to send data to.
`data`	The buffer containing the data to be sent.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages will be converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```
UTL_TCP.WRITE_RAW (
   c    IN OUT NOCOPY connection,
   data IN            RAW,
   len  IN            PLS_INTEGER DEFAULT NULL)
 RETURN PLS_INTEGER;
```

Parameters

Table 219–17 WRITE_RAW Function Parameters

Parameter	Description
c	The TCP connection to send data to.
data	The buffer containing the data to be sent.
len	The number of bytes of data to transmit. When len is NULL, the whole length of data is written.

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```
UTL_TCP.WRITE_TEXT (
   c    IN OUT NOCOPY connection,
   data IN            VARCHAR2 CHARACTER SET ANY_CS,
   len  IN            PLS_INTEGER DEFAULT NULL)
 RETURN num_chars PLS_INTEGER;
```

Parameters

Table 219–18 WRITE_TEXT Function Parameters

Parameter	Description
`c`	The TCP connection to send data to.
`data`	The buffer containing the data to be sent.
`len`	The number of characters of data to transmit. When `len` is `NULL`, the whole length of data is written. The actual amount of data written may be less because of network condition.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages will be converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

220

UTL_URL

The UTL_URL package has two functions: ESCAPE and UNESCAPE.

See Also: Chapter 208, "UTL_HTTP"

This chapter contains the following topics:

- Using UTL_URL
  - Overview
  - Exceptions
  - Examples
- Summary of UTL_URL Subprograms

Using UTL_URL

- Overview
- Exceptions
- Examples

Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP). For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign ($), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis (( ), right parenthesis ( ))

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), and comma (,)

The UTL_URL package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

```
http://www.w3.org/TR/html
```

Exceptions

Table 220–1 lists the exceptions that can be raised when the UTL_URL package API is invoked.

Table 220–1 UTL_URL Exceptions

Exception	Error Code	Reason
BAD_URL	29262	The URL contains badly formed escape code sequences
BAD_FIXED_WIDTH_CHARSET	29274	Fixed-width multibyte character set is not allowed as a URL character set.

Examples

You can implement the `x-www-form-urlencoded` encoding using the `UTL_URL.ESCAPE` function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
   data    IN VARCHAR2,
   charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the `form-URL-encode scheme`, the following function implements the decording scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(
   data    IN VARCHAR2,
   charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.unescape(
     replace(data, '+', ' '),
     charset);
END;
```

Summary of UTL_URL Subprograms

Table 220–2 UTL_URL Package Subprograms

Subprogram	Description
ESCAPE Function on page 220-7	Returns a URL with illegal characters (and optionally reserved characters) escaped using the `%2-digit-hex-code` format
UNESCAPE Function on page 220-9	Unescapes the escape character sequences to their original forms in a URL. Convert the `%XX` escape character sequences to the original characters

ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the `%2-digit-hex-code` format.

Syntax

```
UTL_URL.ESCAPE (
   url                  IN VARCHAR2 CHARACTER SET ANY_CS,
   escape_reserved_chars IN BOOLEAN  DEFAULT  FALSE,
   url_charset          IN VARCHAR2 DEFAULT  utl_http.body_charset)
 RETURN VARCHAR2;
```

Parameters

Table 220–3 ESCAPE Function Parameters

Parameter	Description
`url`	The original URL
`escape_reserved_chars`	Indicates whether the URL reserved characters should be escaped. If set to `TRUE`, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is `FALSE`.
`url_charset`	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If `url_charset` is `NULL`, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the `UTL_HTTP` package, whose default value is `ISO-8859-1`. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- `A` through `Z`, `a` through `z`, and `0` through `9`
- Hyphen (`-`), underscore (_), period (`.`), exclamation point (`!`), tilde (`~`), asterisk (`*`), accent (`'`), left parenthesis (`(`), right parenthesis (`)`)

The reserved characters consist of:

- Semi-colon (`;`) slash (`/`), question mark (`?`), colon (`:`), at sign (`@`), ampersand (`&`), equals sign (`=`), plus sign (`+`), dollar sign (`$`), and comma (`,`)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=scott/tiger` into the query string of a URL, escape the `$` and `/` separately as `%24logon=scott%2Ftiger` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://foo.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (`?`), dollar sign (`$`), and space characters in `'Is the use of the "$" sign okay?'` but not the `?` after `search` in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
   url            IN VARCHAR2 CHARACTER SET ANY_CS,
   url_charset    IN VARCHAR2 DEFAULT utl_http.body_charset)
                  RETURN VARCHAR2;
```

Parameters

Table 220–4 UNESCAPE Function Parameters

Parameter	Description
`url`	The URL to unescape
`url_charset`	After a character is unescaped, the character is assumed to be in the `source_charset` character set and it will be converted from the `source_charset` to the database character set before the URL is returned. If `source_charset` is `NULL`, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the `UTL_HTTP` package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a `?` (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

221

WPG_DOCLOAD

The WPG_DOCLOAD package provides an interface to download files, BLOBs and BFILEs.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle HTTP Server mod_plsql User's Guide*

The chapter contains the following topics:

- Using WPG_DOCLOAD
  - Constants
- Summary of WPG_DOCLOAD Subprograms

Using WPG_DOCLOAD

- Constants

Constants

- NAME_COL_LEN
- MIMET_COL_LEN
- MAX_DOCTABLE_NAME_LEN

NAME_COL_LEN

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

MIMET_COL_LEN

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

MAX_DOCTABLE_NAME_LEN

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

Summary of WPG_DOCLOAD Subprograms

Table 221–1 WPG_DOCLOAD Package Subprograms

Subprogram	Description
DOWNLOAD_FILE Procedures on page 221-5	Downloads files, `BLOBS` and `BFILES`

DOWNLOAD_FILE Procedures

There are three versions of this procedure:

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
   p_filename      IN             VARCHAR2,
   p_bcaching      IN             BOOLEAN DEFAULT TRUE);

WPG_DOCLOAD.DOWNLOAD_FILE(
   p_blob          IN OUT NOCOPY  BLOB);

WPG_DOCLOAD.DOWNLOAD_FILE(
   p_bfile         IN OUT         BFILE);
```

Parameters

Table 221–2 DOWNLOAD_FILE Procedure Parameters

Parameter	Description
`p_filename`	The file to download from the document table.
`p_blob`	The `BLOB` to download.
`p_bfile`	The `BFILE` to download (see Usage Notes).
`p_bcaching`	Whether browser caching is enabled (see Usage Notes).

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to FALSE to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.
- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

222

ANYDATA TYPE

An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

- Using ANYDATA TYPE
  - Restrictions
  - Operational Notes
- Summary of ANYDATA Subprograms

Using ANYDATA TYPE

- Restrictions
- Operational Notes

Restrictions

Persistent storage of `ANYDATA` instances whose type contains embedded LOBs other than `BFILE`s is not currently supported.

Operational Notes

- Construction
- Access

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```
STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(invIN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return
ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
```

The second way to construct an ANYDATA is a piece by piece approach. The BEGINCREATE Static Procedure call begins the construction process and ENDCREATE Member Procedure call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the PIECEWISE Member Procedure should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of

these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
   DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
   DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
   TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
   TIMEZONE,
MEMBER FUNCTION AccessURowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

Summary of ANYDATA Subprograms

Table 222–1 ANYDATA Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure on page 222-7	Begins creation process on a new `ANYDATA`
ENDCREATE Member Procedure on page 222-8	Ends creation of an `ANYDATA`
GET* Member Functions on page 222-9	Gets the current data value (which should be of appropriate type)
GETTYPE Member Function on page 222-12	Gets the Type of the `ANYDATA`
GETTYPENAME Member Function on page 222-13	Get the fully qualified type name for the `ANYDATA`
PIECEWISE Member Procedure on page 222-14	Sets the `MODE` of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`)
SET* Member Procedures on page 222-15	Sets the current data value.

BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
   dtype          IN OUT NOCOPY AnyType,
   adata          OUT NOCOPY ANYDATA);
```

Parameters

Table 222–2 BEGINCREATE Procedure Parameters

Parameter	Description
dtype	The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)
adata	ANYDATA being constructed.

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call PIECEWISE immediately after this call. The construction process begins in a piece-wise manner automatically.

ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE EndCreate(
   self         IN OUT NOCOPY ANYDATA);
```

Parameters

Table 222–3 ENDCREATE Procedure Parameter

Parameter	Description
self	An ANYDATA.

GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which we are accessing (depending on whether we have invoked the PIECEWISE call).

If PIECEWISE has NOT been called, we are accessing the ANYDATA in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, we are accessing the ANYDATA piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GetBDouble(
   self         IN ANYDATA,
   dbl          OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
   self         IN ANYDATA,
   b            OUT NOCOPY BFILE)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
   self         IN ANYDATA,
   fl           OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
   self         IN ANYDATA,
   b            OUT NOCOPY BLOB)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetChar(
   self         IN ANYDATA,
   c            OUT NOCOPY CHAR)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetClob(
   self         IN ANYDATA,
   c            OUT NOCOPY CLOB)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetCollection(
   self         IN ANYDATA,
   col          OUT NOCOPY "<collection_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetDate(
   self         IN ANYDATA,
   dat          OUT NOCOPY DATE)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN         PLS_INTEGER;
```

```
MEMBER FUNCTION GetIntervalYM(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNchar(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCHAR)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNClob(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCLOB)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNumber(
   self         IN ANYDATA,
   num          OUT NOCOPY NUMBER)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
   self         IN ANYDATA,
   nc           OUT NOCOPY NVARCHAR2)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetObject(
   self         IN ANYDATA,
   obj          OUT NOCOPY "<object_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRaw(
   self         IN ANYDATA,
   r            OUT NOCOPY RAW)
   RETURN       PLS_INTEGER;

MMEMBER FUNCTION GetRef(
   self         IN ANYDATA,
   rf           OUT NOCOPY REF "<object_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetTimestamp(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
   self         IN ANYDATA,
   c            OUT NOCOPY VARCHAR)
   RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GetVarchar2(
   self         IN ANYDATA,
   c            OUT NOCOPY VARCHAR2)
   RETURN       PLS_INTEGER;
```

Parameters

Table 222–4 GET* Function Parameter

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.

GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```
MEMBER FUNCTION GETTYPE(
   self          IN ANYDATA,
   typ           OUT NOCOPY AnyType)
   RETURN        PLS_INTEGER;
```

Parameters

Table 222–5 GETTYPE Function Parameter

Parameter	Description
self	An ANYDATA.
typ	The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.

Return Values

The typecode corresponding to the type of the ANYDATA.

GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema_name.type_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME(
   self         IN ANYDATA)
   RETURN       VARCHAR2;
```

Parameters

Table 222–6 GETTYPENAME Function Parameter

Parameter	Description
self	An ANYDATA.

Return Values

Type name of the ANYDATA.

PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET* and GET* will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATA);
```

Parameters

Table 222–7 PIECEWISE Procedure Parameters

Parameter	Description
self	The current data value.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS
- DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an OBJECT or COLLECTION type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

SET* Member Procedures

Sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
   self        IN OUT NOCOPY ANYDATA,
   dbl         IN BINARY_DOUBLE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self        IN OUT NOCOPY ANYDATA,
   b           IN BFILE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
   self        IN OUT NOCOPY ANYDATA,
   fl          IN            BINARY_FLOAT,
   last_elem   IN            boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
   self        IN OUT NOCOPY ANYDATA,
   b           IN BLOB,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
   self        IN OUT NOCOPY ANYDATA,
   c           IN CHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
   self        IN OUT NOCOPY ANYDATA,
   c           IN CLOB,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
   self        IN OUT NOCOPY ANYDATA,
   col         IN "<collectyion_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
   self        IN OUT NOCOPY ANYDATA,
   dat         IN DATE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
   self        IN OUT NOCOPY ANYDATA,
   inv         IN INTERVAL DAY TO SECOND,
   last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
   self        IN OUT NOCOPY ANYDATA,
   inv         IN INTERVAL YEAR TO MONTH,
   last_elem   IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETNCHAR(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NCHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NClob,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
   self        IN OUT NOCOPY ANYDATA,
   num         IN NUMBER,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NVarchar2,
   last_elem   IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETOBJECT(
   self        IN OUT NOCOPY ANYDATA,
   obj         IN "<object_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
   self        IN OUT NOCOPY ANYDATA,
   r           IN RAW,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
   self        IN OUT NOCOPY ANYDATA,
   rf          IN REF "<object_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
   self       IN OUT NOCOPY ANYDATA,
   ts         IN TIMESTAMP,
   last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(self IN OUT NOCOPY ANYDATA,
   ts          IN TIMESTAMP WITH TIME ZONE,
   last_elem   IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
   self IN OUT NOCOPY ANYDATA,
   ts IN TIMESTAMP WITH LOCAL TIME ZONE,
   last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
   self        IN OUT NOCOPY ANYDATA,
   c           IN VARCHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
   self        IN OUT NOCOPY ANYDATA,
   c           IN VARCHAR2,
   last_elem   IN boolean DEFAULT FALSE);
```

Parameters

Table 222–8 SET Procedure Parameters*

Parameter	Description
self	An ANYDATA.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

Usage Notes

When BEGINCREATE is called, construction has already begun in a piece-wise fashion. Subsequent calls to SET* will set the successive attribute values.

If the ANYDATA is a standalone collection, the SET* call will set the successive collection elements.

223

ANYDATASET TYPE

An `ANYDATASET TYPE` contains a description of a given type plus a set of data instances of that type. An `ANYDATASET` can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- Construction
- Summary of ANYDATASET TYPE Subprograms

Construction

The ANYDATASET needs to be constructed value by value, sequentially.

For each data instance (of the type of the ANYDATASET), the ADDINSTANCE function must be invoked. This adds a new data instance to the ANYDATASET. Subsequently, SET* can be called to set each value in its entirety.

The MODE of construction/access can be changed to attribute/collection element wise by making calls to PIECEWISE.

- If the type of the ANYDATASET is TYPECODE_OBJECT, individual attributes will be set with subsequent SET* calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent SET* calls. Likewise on access. This call is very similar to ANYDATA.PIECEWISE call defined for the type ANYDATA.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

ENDCREATE should be called to finish the construction process (before which no access calls can be made).

Summary of ANYDATASET TYPE Subprograms

Table 223–1 ANYDATASET Type Subprograms

Subprogram	Description
ADDINSTANCE Member Procedure on page 223-4	Adds a new data instance to an ANYDATASET.
BEGINCREATE Static Procedure on page 223-5	Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.
ENDCREATE Member Procedure on page 223-6	Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.
GET* Member Functions on page 223-7	Gets the current data value (which should be of appropriate type).
GETCOUNT Member Function on page 223-10	Gets the number of data instances in an ANYDATASET.
GETINSTANCE Member Function on page 223-11	Gets the next instance in an ANYDATASET.
GETTYPE Member Function on page 223-12	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type).
GETTYPENAME Member Function on page 223-13	Gets the AnyType describing the type of the data instances in an ANYDATASET.
PIECEWISE Member Procedure on page 223-14	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
SET* Member Procedures on page 223-15	Sets the current data value.

ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

```
MEMBER PROCEDURE AddInstance(
   self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 223–2 ADDINSTANCE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

```
DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.
```

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.

BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

```
STATIC PROCEDURE BeginCreate(
   typecode     IN PLS_INTEGER,
   rtype        IN OUT NOCOPY AnyType,
   aset         OUT NOCOPY ANYDATASET);
```

Parameters

Table 223–3 BEGINCREATE Procedure Parameter

Parameter	Description
typecode	The typecode for the type of the ANYDATASET.
dtype	The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.
aset	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)

ENDCREATE Member Procedure

This procedure ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
   self              IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 223–4 ENDCREATE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which you are accessing it (depending on how we have invoked the PIECEWISE call). If PIECEWISE has not been called, we are accessing the instance in its entirety and the type of the data value should match the type of the ANYDATASET.

If PIECEWISE has been called, we are accessing the instance piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GETBDOUBLE(
   self        IN ANYDATASET,
   dbl         OUT NOCOPY BINARY_DOUBLE)
   RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
   self        IN ANYDATASET,
   fl          OUT NOCOPY BINARY_FLOAT)
   RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
   self        IN ANYDATASET,
   b           OUT NOCOPY BFILE)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
   self        IN ANYDATASET,
   b           OUT NOCOPY BLOB)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
   self        IN ANYDATASET,
   c           OUT NOCOPY CHAR)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
   self        IN ANYDATASET,
   c           OUT NOCOPY CLOB)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
   self        IN ANYDATASET,
   col         OUT NOCOPY "<collection_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETDATE(
   self        IN ANYDATASET,
   dat         OUT NOCOPY DATE)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
   self        IN ANYDATASET,
   inv         IN OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(
   self        IN ANYDATASET,
   inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NCHAR)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NCLOB)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
   self        IN ANYDATASET,
   num         OUT NOCOPY NUMBER)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NVARCHAR2)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
   self        IN ANYDATASET,
   obj         OUT NOCOPY "<object_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETRAW(
   self        IN ANYDATASET,
   r           OUT NOCOPY RAW)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETREF(
   self        IN ANYDATASET,
   rf          OUT NOCOPY REF "<object_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
   self        IN ANYDATASET,
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPLTZ(
   self        IN ANYDATASET,
   ts          OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPTZ(
   self        IN ANYDATASET,
   ts          OUT NOCOPY TIMESTAMP WITH TIME ZONE)
 RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
   self        IN ANYDATASET,
   rid         OUT NOCOPY UROWID)
 RETURN PLS_INTEGER
```

```
MEMBER FUNCTION GETVARCHAR(
   self        IN ANYDATASET,
   c           OUT NOCOPY VARCHAR)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
   self        IN ANYDATASET,
   c           OUT NOCOPY VARCHAR2)
   RETURN      PLS_INTEGER;
```

Parameters

Table 223–5 GET* Procedure Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERs: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GetCount(
   self        IN ANYDATASET)
   RETURN      PLS_INTEGER;
```

Parameter

Table 223–6 GETCOUNT Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

The number of data instances.

GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed. After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

Syntax

```
MEMBER FUNCTION GETINSTANCE(
   self           IN OUT NOCOPY ANYDATASET)
   RETURN         PLS_INTEGER;
```

Parameters

Table 223–7 GETINSTANCE Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.

GETTYPE Member Function

Gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GETTYPE(
   self           IN ANYDATASET,
   typ            OUT NOCOPY AnyType)
   RETURN         PLS_INTEGER;
```

Parameters

Table 223–8 GETTYPE Function Parameter

Parameter	Description
self	The ANYDATASET.
typ	The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.

Return Values

The typecode corresponding to the type of the ANYDATA.

GETTYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return *schema_name.type_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME(
   self           IN ANYDATASET)
   RETURN         VARCHAR2;
```

Parameter

Table 223–9 GETTYPENAME Function Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Return Values

Type name of the ANYDATASET.

PIECEWISE Member Procedure

This procedure sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of construction, access of the data value to be a collection element at a time (if the data value is of a collection TYPE). Once this call has been made, subsequent SET* and GET* calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 223–10 PIECEWISE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters.

DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an object or collectyon type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the MODE with which we are constructing (depending on how we have invoked the PIECEWISE call). The type of the current data should be the type of the ANYDATASET if PIECEWISE has NOT been called. The type should be the type of the attribute at the current position if PIECEWISE has been called.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
   self              IN OUT NOCOPY ANYDATASET,
   dbl               IN BINARY_DOUBLE,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
   self              IN OUT NOCOPY ANYDATASET,
   fl                IN BINARY_FLOAT,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self              IN OUT NOCOPY ANYDATASET,
   b                 IN BFILE,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
   self              IN OUT NOCOPY ANYDATASET,
   b                 IN BLOB,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN CHAR,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN CLOB,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
   self              IN OUT NOCOPY ANYDATASET,
   col               IN "<collection_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
   self              IN OUT NOCOPY ANYDATASET,
   dat               IN DATE,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
   self              IN OUT NOCOPY ANYDATASET,
   inv               IN INTERVAL DAY TO SECOND,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
   self              IN OUT NOCOPY ANYDATASET,
```

```
   inv               IN INTERVAL YEAR TO MONTH,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   nc                IN NCHAR,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(

s
elf              IN OUT NOCOPY ANYDATASET,
  nc                IN NClob,
  last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
   self              IN OUT NOCOPY ANYDATASET,
   num               IN NUMBER,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
   self             IN OUT NOCOPY ANYDATASET,
   nc               IN NVarchar2,
   last_elem        IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
   self              IN OUT NOCOPY ANYDATASET,
   obj               IN "<object_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
   self              IN OUT NOCOPY ANYDATASET,
   r                 IN RAW,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
   self              IN OUT NOCOPY ANYDATASET,
   rf                IN REF "<object_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
   self              IN OUT NOCOPY ANYDATASET,
   ts                IN TIMESTAMP,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
   self             IN OUT NOCOPY ANYDATASET,
   ts               IN TIMESTAMP WITH LOCAL TIME ZONE,
   last_elem        IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(
   self             IN OUT NOCOPY ANYDATASET,
   ts               IN TIMESTAMP WITH TIME ZONE,
   last_elem        IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
   self              IN OUT NOCOPY ANYDATASET,
   rid               IN UROWID,
   last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETVARCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN VARCHAR,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN VARCHAR2,
   last_elem BOOLEAN DEFAULT FALSE);
```

Parameters

Table 223–11 SET* Procedure Parameters

Parameter	Description
`self`	The `ANYDATASET` being accessed.
`num`	The number, and associated information, that is to be set.
`last_elem`	Relevant only if `PIECEWISE` has been already called (for a collection). Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

224

ANYTYPE TYPE

An `ANYTYPE TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

This chapter discusses the following:

- Summary of ANYTYPE Subprograms

Summary of ANYTYPE Subprograms

Table 224–1 ANYTYPE Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure on page 224-3	Creates a new instance of `ANYTYPE` which can be used to create a transient type description.
SETINFO Member Procedure on page 224-4	Sets any additional information required for constructing a `COLLECTION` or builtin type.
ADDATTR Member Procedure on page 224-6	Adds an attribute to an `ANYTYPE` (of typecode `DBMS_TYPES.TYPECODE_OBJECT`).
ENDCREATE Member Procedure on page 224-7	Ends creation of a transient `ANYTYPE`. Other creation functions cannot be called after this call.
GETPERSISTENT Static Function on page 224-8	Returns an `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE` SQL statement.
GETINFO Member Function on page 224-9	Gets the type information for the `ANYTYPE`.
GETATTRELEMINFO Member Function on page 224-10	Gets the type information for an attribute of the type (if it is of `TYPECODE_OBJECT`). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

BEGINCREATE Static Procedure

This procxedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE(
   typecode       IN          PLS_INTEGER,
   atype          OUT NOCOPY  ANYTYPE);
```

Parameters

Table 224–2 BEGINCREATE Procedure Parameters

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: ■ DBMS_TYPES.TYPECODE_OBJECT ■ DBMS_TYPES.TYPECODE_VARRAY or ■ DBMS_TYPES.TYPECODE_TABLE Typecodes for builtin types: ■ DBMS_TYPES.TYPECODE_NUMBER, and similar types.
atype	ANYTYPE for a transient type

SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

```
MEMBER PROCEDURE SETINFO(
   self          IN OUT NOCOPY ANYTYPE,
   prec          IN PLS_INTEGER,
   scale         IN PLS_INTEGER,
   len           IN PLS_INTEGER,
   csid          IN PLS_INTEGER,
   csfrm         IN PLS_INTEGER,
   atype         IN ANYTYPE DEFAULT NULL,
   elem_tc       IN PLS_INTEGER DEFAULT NULL,
   elem_count    IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 224–3 SETINFO Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed.
prec	Optional.Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional.Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	Required if typecode represents types requiring character information such as CHAR, VARCHAR, VARCHAR2, or CFILE.
csfrm	Required if typecode represents types requiring character information such as CHAR, VARCHAR, VARCHAR2, or CFILE.
atype	Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others.. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

Table 224–4 SETINFO Procedure Parameters - Collection Types

Parameter	Description
elem_tc	Must be of the collection element's typecode (from DBMS_TYPES package).
elem_count	Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if *self* represents a VARRAY.

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)

- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```
MEMBER PROCEDURE ADDATTR(
   self          IN OUT NOCOPY ANYTYPE,
   aname         IN VARCHAR2,
   typecode      IN PLS_INTEGER,
   prec          IN PLS_INTEGER,
   scale         IN PLS_INTEGER,
   len           IN PLS_INTEGER,
   csid          IN PLS_INTEGER,
   csfrm         IN PLS_INTEGER,
   attr_type     IN ANYTYPE DEFAULT NULL);
```

Parameters

Table 224–5 ADDATTR Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.
aname	Optional. Attribute's name. Could be NULL.
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, VARCHAR2, CFILE.
csfrm	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, VARCHAR2, CFILE.
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
   self           IN OUT NOCOPY ANYTYPE);
```

Parameter

Table 224–6 ENDCREATE Procedure Parameter

Parameter	Description
self	The transient ANYTYPE that is being constructed.

GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

Syntax

```
STATIC FUNCTION GETPERSISTENT(
   schema_name      IN VARCHAR2,
   type_name        IN VARCHAR2,
   version          IN VARCHAR2 DEFAULT NULL)
   RETURN           ANYTYPE;
```

Parameters

Table 224–7 GETPERSISTENT Function Parameters

Parameter	Description
schema_name	Schema name of the type.
type_name	Type name.
version	Type version.

Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

```
MEMBER FUNCTION GETINFO (
   self        IN ANYTYPE,
   prec        OUT PLS_INTEGER,
   scale       OUT PLS_INTEGER,
   len         OUT PLS_INTEGER,
   csid        OUT PLS_INTEGER,
   csfrm       OUT PLS_INTEGER,
   schema_name OUT VARCHAR2,
   type_name   OUT VARCHAR2,
   version     OUT varchar2,
   count       OUT PLS_INTEGER)
   RETURN      PLS_INTEGER;
```

Parameters

Table 224–8 GETINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
count	If *self* is a VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.

Return Values

The typecode of *self*.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
   self           IN ANYTYPE,
   pos            IN PLS_INTEGER,
   prec           OUT PLS_INTEGER,
   scale          OUT PLS_INTEGER,
   len            OUT PLS_INTEGER,
   csid           OUT PLS_INTEGER,
   csfrm          OUT PLS_INTEGER,
   attr_elt_type  OUT ANYTYPE
   aname          OUT VARRCHAR2)
   RETURN         PLS_INTEGER;
```

Parameters

Table 224–9 GETATTRELEMINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
pos	If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.
prec	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
scale	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid, csfrm	If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE. Gives character set ID, character set form.
attr_elt_type	If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the *attr_elt_type*.
aname	Attribute name (if it is an attribute of an object type, NULL otherwise).

Return Values

The typecode of the attribute or collection element.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

225

Oracle Streams AQ TYPEs

This chapter describes the types used with Oracle Streams Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide* for information about using Oracle Streams AQ.

This chapter contains the following topics:

- Summary of Types

Summary of Types

- AQ$_AGENT Type
- AQ$_AGENT_LIST_T Type
- AQ$_DESCRIPTOR Type
- AQ$_NTFN_DESCRIPTOR Type
- AQ$_POST_INFO Type
- AQ$_POST_INFO_LIST Type
- AQ$_PURGE_OPTIONS_T Type
- AQ$_RECIPIENT_LIST_T Type
- AQ$_REG_INFO Type
- AQ$_REG_INFO_LIST Type
- AQ$_SUBSCRIBER_LIST_T Type
- DEQUEUE_OPTIONS_T Type
- ENQUEUE_OPTIONS_T Type
- SYS.MSG_PROP_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type

AQ$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
   name       VARCHAR2(30),
   address    VARCHAR2(1024),
   protocol   NUMBER  DEFAULT 0);
```

Attributes

Table 225–1 AQ$_AGENT Attributes

Attribute	Description
`name`	Name of a producer or consumer of a message. The name must follow object name guidelines in the *Oracle Database SQL Language Reference* with regard to reserved characters.
`address`	Protocol-specific address of the recipient. If the protocol is `0`, then the address is of the form [*schema.*]*queue*[@*dblink*].
	For example, a queue named `emp_messages` in the `HR` queue at the site `dbs1.net` has the address: hr.emp_messages@dbs1.net
`protocol`	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Streams AQ.

AQ$_AGENT_LIST_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

See Also: "AQ$_AGENT Type" on page 225-3

Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY INTEGER;
```

AQ$_DESCRIPTOR Type

This type specifies the Oracle Streams AQ descriptor received by the AQ PL/SQL callbacks upon notification.

See Also: "MESSAGE_PROPERTIES_T Type" on page 225-24

Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
   queue_name      VARCHAR2(61),
   consumer_name   VARCHAR2(30),
   msg_id          RAW(16),
   msg_prop        MSG_PROP_T,
   gen_desc        AQ$_NTFN_DESCRIPTOR,
   msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
   ntfnsRecdInGrp  NUMBER);
```

Attributes

Table 225–2 AQ$_DESCRIPTOR Attributes

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnsRecdInGrp	Notifications received in group

AQ$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(
   ntfn_flags   NUMBER)
```

Attributes

Table 225–3 AQ$_DESCRIPTOR Attributes

Attribute	Description
`ntfn_flags`	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

AQ$_NTFN_MSGID_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2^{30} which is the max varray size.

Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY
   AS VARRAY(1073741824)OF RAW(16);
```

AQ$_POST_INFO Type

Specifies anonymous subscriptions to which you want to post messages.

Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
   name        VARCHAR2(128),
   namespace   NUMBER,
   payload     RAW(2000)  DEFAULT NULL);
```

Attributes

Table 225–4 AQ$_POST_INFO Attributes

Attribute	Description
`name`	Name of the anonymous subscription to which you want to post
`namespace`	To receive notifications from other applications through `DBMS_AQ.POST` or `OCISubscriptionPost()`, the namespace must be `DBMS_AQ.NAMESPACE_ANONYMOUS`
`payload`	The payload to be posted to the anonymous subscription

AQ$_POST_INFO_LIST Type

Identifies the list of anonymous subscriptions to which you want to post messages.

See Also: AQ$_POST_INFO Type on page 225-8

Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

AQ$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

See Also: PURGE_QUEUE_TABLE Procedure on page 22-42.

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
   block           BOOLEAN       DEFAULT FALSE
   delivery_mode   PLS_INTEGER   DEFAULT PERSISTENT);
```

Table 225–5 AQ$_PURGE_OPTIONS_T Type Attributes

Attribute	Description
`block`	`TRUE/FALSE`. ■ If `block` is `TRUE`, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if `block` is `TRUE`. ■ The default for `block` is `FALSE`. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.
`delivery_mode`	Kind of messages to purge, either `DBMS_AQ.BUFFERED` or `DBMS_AQ.PERSISTENT`

AQ$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

See Also: "AQ$_AGENT Type" on page 225-3

Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```

AQ$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
   name                              VARCHAR2(128),
   namespace                         NUMBER,
   callback                          VARCHAR2(4000),
   context                           RAW(2000)  DEFAULT NULL,
   qosflags                          NUMBER,
   timeout                           NUMBER
   ntfn_grouping_class               NUMBER,
   ntfn_grouping_value               NUMBER    DEFAULT 600,
   ntfn_grouping_type                NUMBER,
   ntfn_grouping_start_time          TIMESTAMP WITH TIME ZONE,
   ntfn_grouping_repeat_count    NUMBER);
```

Attributes

Table 225–6 AQ$_REG_INFO Type Attributes

Attribute	Description
`name`	Specifies the name of the subscription. The subscription name is of the form *`schema.queue`* if the registration is for a single consumer queue or *`schema.queue:consumer_name`* if the registration is for a multiconsumer queues.
`namespace`	Specifies the namespace of the subscription. To receive notification from Oracle Streams AQ queues, the namespace must be `DBMS_AQ.NAMESPACE_AQ`. To receive notifications from other applications through `DBMS_AQ.POST` or `OCISubscriptionPost()`, the namespace must be `DBMS_AQ.NAMESPACE_ANONYMOUS`.
`callback`	Specifies the action to be performed on message notification. For HTTP notifications, use `http://www.company.com:8080`. For e-mail notifications, use `mailto://xyz@company.com`. For raw message payload for the `PLSQLCALLBACK` procedure, use `plsql://`*`schema.procedure`*`?PR=0`. For user-defined type message payload converted to XML for the `PLSQLCALLBACK` procedure, use `plsql://`*`schema.procedure`*`?PR=1`
`context`	Specifies the context that is to be passed to the callback function
`qosflags`	Can be set to one or more of the following values to specify the notification quality of service: ■ `NTFN_QOS_RELIABLE`- This value specifies that reliable notification is required. Reliable notifications persist across instance and database restarts. ■ `NTFN_QOS_PAYLOAD` - This value specifies that payload delivery is required. It is supported only for client notification and only for `RAW` queues. ■ `NTFN_QOS_PURGE_ON_NTFN` - This value specifies that the registration is to be purged automatically when the first notification is delivered to this registration location.

Table 225–6 (Cont.) AQ$_REG_INFO Type Attributes

Attribute	Description
ntfn_grouping_class	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If ntfn_grouping_class is 0, all other notification grouping attributes must be 0. ▪ NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.
ntfn_grouping_value	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until ntfn_grouping_repeat_count is exhausted.
ntfn_grouping_type	▪ NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default) ▪ NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.
ntfn_grouping_start_time	Notification grouping start time. Notification grouping can start from a user-specified time that should a valid timestamp with time zone. If ntfn_grouping_start_time is not specified when using grouping, the default is to current timestamp with time zone
ntfn_grouping_repeat_count	Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntfn_grouping_repeat_count, if not specified, will default to ▪ NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

Table 225–7 shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. Table 225–8 shows the actions performed when XML presentation is specified.

Table 225–7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
Oracle object type	Not supported	Not supported	Not supported

Table 225–8 Actions Performed for Nonpersistent Queues When XML Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
`RAW`	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
`Oracle object type`	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

AQ$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

See Also: "AQ$_REG_INFO Type" on page 225-12

Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

AQ$_SUBSCRIBER_LIST_T Type

Identifies the list of subscribers that subscribe to a queue.

See Also: "AQ$_AGENT Type" on page 225-3

Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```

DEQUEUE_OPTIONS_T Type

Specifies the options available for the dequeue operation.

Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
   consumer_name     VARCHAR2(30)    DEFAULT NULL,
   dequeue_mode      BINARY_INTEGER  DEFAULT REMOVE,
   navigation        BINARY_INTEGER  DEFAULT NEXT_MESSAGE,
   visibility        BINARY_INTEGER  DEFAULT ON_COMMIT,
   wait              BINARY_INTEGER  DEFAULT FOREVER,
   msgid             RAW(16)         DEFAULT NULL,
   correlation       VARCHAR2(128)   DEFAULT NULL,
   deq_condition     VARCHAR2(4000)  DEFAULT NULL,
   signature         aq$_sig_prop    DEFAULT NULL,
   transformation    VARCHAR2(61)    DEFAULT NULL,
   delivery_mode     PLS_INTEGER     DEFAULT PERSISTENT);
```

Attributes

Table 225–9 DEQUEUE_OPTIONS_T Attributes

Attribute	Description
consumer_name	Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL. For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.
dequeue_mode	Specifies the locking behavior associated with the dequeue. Possible settings are: BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.

Table 225–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
navigation	Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are: NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue. FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. FIRST_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups. NEXT_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.
visibility	Specifies whether the new message is dequeued as part of the current transaction.The visibility parameter is ignored when using the BROWSE dequeue mode. Possible settings are: ON_COMMIT: The dequeue will be part of the current transaction. This setting is the default. IMMEDIATE: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.
wait	Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are: FOREVER: Wait forever. This setting is the default. NO_WAIT: Do not wait. number: Wait time in seconds.
msgid	Specifies the message identifier of the message to be dequeued.
correlation	Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.

Table 225–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
deq_condition	A conditional expression based on the message properties, the message data properties, and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Message properties include priority, corrid and other columns in the queue table To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The deq_condition parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be BUFFERED or PERSISTENT or PERSISTENT_OR_BUFFERED. The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

ENQUEUE_OPTIONS_T Type

Specifies the options available for the enqueue operation.

Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
   visibility            BINARY_INTEGER  DEFAULT ON_COMMIT,
   relative_msgid        RAW(16)         DEFAULT NULL,
   sequence_deviation    BINARY_INTEGER  DEFAULT NULL,
   transformation        VARCHAR2(61)    DEFAULT NULL,
   delivery_mode         PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

Attributes

Table 225–10 ENQUEUE_OPTIONS_T Attributes

Attribute	Description
`visibility`	Specifies the transactional behavior of the enqueue request. Possible settings are: `ON_COMMIT`: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default. `IMMEDIATE`: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueuing to a non-persistent queue.
`relative_msgid`	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if `BEFORE` is specified in `sequence_deviation`. This parameter is ignored if sequence deviation is not specified.
`sequence_deviation`	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are: `BEFORE`: The message is enqueued ahead of the message specified by `relative_msgid`. `TOP`: The message is enqueued ahead of any other messages.
`transformation`	Specifies a transformation that will be applied before enqueuing the message. The return type of the transformation function must match the type of the queue.
`delivery_mode`	The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the dequeue options. It can be `BUFFERED` or `PERSISTENT`. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in aq$_descriptor, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
   priority         NUMBER,
   delay            NUMBER,
   expiration       NUMBER,
   correlation      VARCHAR2(128),
   attempts         NUMBER,
   exception_queue  VARCHAR2(51),
   enqueue_time     DATE,
   state            NUMBER,
   sender_id        aq$_agent,
   original_msgid   RAW(16),
   delivery_mode    NUMBER);
```

Parameters

Table 225–11 SYS.MSG_PROP_T Type Attributes

Parameter	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message
expiration	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: NEVER: The message does not expire number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.
correlation	Returns the identifier supplied by the producer of the message at enqueue time.
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

Table 225–11 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
exception_queue	Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases: ■ RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. ■ A message was not dequeued before the expiration time elapsed. ■ Message propagation to the specified destination queue failed with one of the following errors: * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.
enqueue_time	Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.
state	Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow: ■ DBMS_AQ.READY: The message is ready to be processed. ■ DBMS_AQ.WAITING: The message delay has not yet been reached. ■ DBMS_AQ.PROCESSED: The message has been processed and is retained. ■ DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 225–11 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Streams AQ for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

See Also: AQ$_RECIPIENT_LIST_T Type on page 225-11

Syntax

```
TYPE message_properties_t IS RECORD (
   priority               BINARY_INTEGER  NOT NULL DEFAULT 1,
   delay                  BINARY_INTEGER  NOT NULL DEFAULT NO_DELAY,
   expiration             BINARY_INTEGER  NOT NULL DEFAULT NEVER,
   correlation            VARCHAR2(128)   DEFAULT NULL,
   attempts               BINARY_INTEGER,
   recipient_list         AQ$_RECIPIENT_LIST_T,
   exception_queue        VARCHAR2(61)    DEFAULT NULL,
   enqueue_time           DATE,
   state                  BINARY_INTEGER,
   sender_id              SYS.AQ$_AGENT   DEFAULT NULL,
   original_msgid         RAW(16)         DEFAULT NULL,
   signature              aq$_sig_prop    DEFAULT NULL,
   transaction_group      VARCHAR2(30)    DEFAULT NULL,
   user_property          SYS.ANYDATA     DEFAULT NULL
   delivery_mode          PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);
```

Attributes

Table 225–12 MESSAGE_PROPERTIES_T Attributes

Attribute	Description
`priority`	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
`delay`	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by `msgid` overrides the delay specification. A message enqueued with delay set is in the `WAITING` state, and when the delay expires, the message goes to the `READY` state. `DELAY` processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: `NO_DELAY`: The message is available for immediate dequeuing number: The number of seconds to delay the message

Table 225–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
`expiration`	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: `NEVER`: The message does not expire number: The number of seconds message remains in `READY` state. If the message is not dequeued before it expires, then it is moved to the exception queue in the `EXPIRED` state.
`correlation`	Returns the identifier supplied by the producer of the message at enqueue time.
`attempts`	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
`recipient_list`	This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time. For type definition, see the "AQ$_AGENT Type" on page 225-3.

Table 225–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
exception_queue	Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases: ▪ RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. ▪ A message was not dequeued before the expiration time elapsed. ▪ Message propagation to the specified destination queue failed with one of the following errors: * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.
enqueue_time	Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.
state	Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow: ▪ DBMS_AQ.READY: The message is ready to be processed. ▪ DBMS_AQ.WAITING: The message delay has not yet been reached. ▪ DBMS_AQ.PROCESSED: The message has been processed and is retained. ▪ DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 225–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Streams AQ for propagating messages.
signature	Currently not implemented
transaction_group	Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.

MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties. Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T VARRAY`.

See Also: "MESSAGE_PROPERTIES_T Type" on page 225-24

Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
   OF MESSAGE_PROPERTIES_T;
```

MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

226

Database URI TYPEs

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- Summary of URITYPE Supertype Subprograms
- Summary of HTTPURITYPE Subtype Subprograms
- Summary of DBURITYPE Subtype Subprogams
- Summary of XDBURITYPE Subtype Subprograms
- Summary of URIFACTORY Package Subprograms

Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

Table 226–1 URITYPE Type Subprograms

Method	Description
GETBLOB on page 226-3	Returns the `BLOB` located at the address specified by the URL.
GETCLOB on page 226-4	Returns the `CLOB` located at the address specified by the URL.
GETCONTENTTYPE on page 226-5	Returns the URL, in escaped format, stored inside the `UriType` instance.
GETEXTERNALURL on page 226-6	Returns the URL, in escaped format, stored inside the `UriType` instance.
GETURL on page 226-7	Returns the URL, in non-escaped format, stored inside the `UriType` instance.
GETXML on page 226-8	Returns the `XMLType` located at the address specified by the URL.

GETBLOB

This function returns the BLOB located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getBlob() RETURN BLOB;	This function returns the BLOB located at the address specified by the URL.
MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL and the content type.
FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error

GETCLOB

This function returns the CLOB located at the address specified by the URL. This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getClob() RETURN clob;	This function returns the CLOB located at the address specified by the URL.
MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;	This function returns the CLOB located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getXML() RETURN XMLType;	This function returns the XMLType located at the address specified by the URL.
MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

Summary of HTTPURITYPE Subtype Subprograms

The HTTPURITYPE is a subtype of the UriType that provides support for the HTTP protocol. This uses the UTL_HTTP package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 226–2 HTTPURITYPE Type Subprorgams

Method	Description
CREATEURI on page 226-10	Creates an instance of HTTPURITYPE from the given URI.
GETBLOB on page 226-11	Returns the BLOB located at the address specified by the URL.
GETCLOB on page 226-12	Returns the CLOB located at the address specified by the URL.
GETCONTENTTYPE on page 226-13	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 226-14	Returns the URL, in escaped format, stored inside the UriType instance.
GETURL on page 226-7	Returns the URL, in non-escaped format, stored inside the UriType instance.
GETXML on page 226-16	Returns the XMLType located at the address specified by the URL
HTTPURITYPE on page 226-17	Creates an instance of HTTPURITYPE from the given URI.

CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN HTTPURITYPE;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL; escaped format.

GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

Syntax	Description
MEMBER FUNCTION getBlob() RETURN blob;	This function returns the BLOB located at the address specified by the HTTP URL.
MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;	This function returns the BLOB located at the address specified by the HTTP URL and the content type.
FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the `CLOB` located by the HTTP URL address. If a temporary `CLOB` is returned, it must be freed.

Syntax	Description
`MEMBER FUNCTION getClob()` `RETURN clob;`	Returns the `CLOB` located at the address specified by the HTTP URL.

`MEMBER FUNCTION getClob(`
`content OUT VARCHAR2)`
`RETURN clob;`
	Returns the `CLOB` located at the address specified by the HTTP URL and the content type.

Parameter	IN / OUT	Description
`content`	`(OUT)`	Content type of the document to which URI is pointing.

GETCONTENTTYPE

Returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `HTTPURITYPE` instance. The subtype instances override this member function. The `HTTPURITYPE` function does not store the prefix `http://`, but generates it for the external URL.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `HTTPURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

Syntax	Description
`MEMBER FUNCTION getXML()` `RETURN XMLType;`	This function returns the XMLType located at the address specified by the URL.

`MEMBER FUNCTION getXML(`
`content OUT VARCHAR2)`
`RETURN XMLType;`
	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

HTTPURITYPE

This constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE(
   url IN varchar2);
```

Parameter	IN / OUT	Description
`url`	`(IN)`	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

Summary of DBURITYPE Subtype Subprogams

The DBURITYPE is a subtype of the UriType that provides support for DBUri-refs. A DBUri-ref is an intra-database URL that can be used to reference any row or row-column data in the database. The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and view further contain the rows and columns inside them.

Table 226–3 DBURITYPE Type Subprograms

Method	Description
CREATEURI on page 226-19	Constructs a DBURITYPE instance.
DBURITYPE on page 226-20	Creates an instance of DBURITYPE from the given URI.
GETBLOB on page 226-21	Returns the BLOB located at the address specified by the DBURITYPE instance.
GETCLOB on page 226-22	Returns the CLOB located at the address specified by the DBURITYPE instance.
GETCONTENTTYPE on page 226-23	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 226-24	Returns the URL, in escaped format, stored inside the DBURITYPE instance.
GETURL on page 226-25	Returns the URL, in non-escaped format, stored inside the DBURITYPE instance.
GETXML on page 226-26	Returns the XMLType located at the address specified by the URL

CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN DBURITYPE;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid DBURITYPE.

DBURITYPE

This constructs a DBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(
   url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

GETBLOB

This function returns the BLOB located at the address specified by the URL. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getBlob() RETURN blob;	This function returns the BLOB located at the address specified by the URL.
MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;	This function returns the BLOB located at the address specified by the URL and the content type.
FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located at the address specified by the DBURITYPE instance. If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getClob()` `RETURN clob;`	Returns the CLOB located at the address specified by the DBURITYPE instance.

`MEMBER FUNCTION getClob(`
`content OUT VARCHAR2)`
`RETURN clob;`
	Returns the CLOB located at the address specified by the DBURITYPE instance and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in web pages.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the `XMLType` located at the address specified by the URL. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getXML()` `RETURN XMLType;`	This function returns the `XMLType` located at the address specified by the URL.

`MEMBER FUNCTION getXML(`
`content OUT VARCHAR2)`
`RETURN XMLType;`
	This function returns the `XMLType` located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
`content`	`(OUT)`	Content type of the document to which URI is pointing.

Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URIType. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URIType column in a table. The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

Table 226–4 XDBURITYPE Type Subprograms

Method	Description
CREATEURI on page 226-28	Returns the UriType corresponding to the specified URL.
GETBLOB on page 226-29	Returns the BLOB corresponding to the contents of the document specified by the XDBURITYPE instance.
GETCLOB on page 226-22	Returns the CLOB corresponding to the contents of the document specified by the XDBURITYPE instance.
GETCONTENTTYPE on page 226-31	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 226-24	Returns the URL, in escaped format, stored inside the XDBURITYPE instance.
GETURL on page 226-25	Returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.
GETXML on page 226-34	Returns the XMLType corresponding to the contents of the document specified by the URL.
XDBURITYPE on page 226-35	Creates an instance of XDBURITYPE from the given URI.

CREATEURI

This static function constructs a XDBURITYPE instance. Parses the URL given and creates a XDBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid XDBURITYPE.

GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getBlob() RETURN blob;	This function returns the BLOB located at the address specified by the URL.
MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;	This function returns the BLOB located at the address specified by the URL and the content type.
FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getClob() RETURN clob;	Returns the CLOB located at the address specified by the XDBUirType instance.
MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;	Returns the CLOB located at the address specified by the XDBUirType instance and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as `VARCHAR2`.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getXML() RETURN XMLType;	This function returns the XMLType located at the address specified by the URL.
MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
   url     IN   VARCHAR2,
   flags   IN   RAW := NULL)
 RETURN self AS RESULT;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid XDBUirType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: ■ 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised. ■ 2 - Indicates that any errors during document retrieval should be suppressed ■ 3 - Both flag bits (1, 2) are enabled

Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

Table 226–5 URIFACTORY Type Subprograms

Method	Description
GETURI on page 226-37	Returns the correct URL handler for the given URL string.
ESCAPEURI on page 226-38	Returns a URL in escaped format.
UNESCAPEURI on page 226-39	Returns a URL in unescaped format.
REGISTERURLHANDLER on page 226-40	Registers a particular type name for handling a particular URL.
UNREGISTERURLHANDLER on page 226-41	Unregisters a URL handler.

GETURI

This factory method returns the correct URI handler for the given URI string. It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the REGISTERURLHANDLER function. If the prefix matches, GETURI would then use that subtype.

Syntax

```
FUNCTION getUri(
   url IN Varchar2)
RETURN UriType;
```

Parameter	IN / OUT	Description
`uri`	`(IN)`	The URL string, in escaped format, containing a valid HTTP URL.

ESCAPEURI

This function returns a URL in escaped format. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the GETEXTERNALURL function or the GETURI function to get to the URL value instead of using the attribute present in the `UriType`.

Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

Parameter	IN / OUT	Description
`url`	`(IN)`	The URL string to be returned in escaped format.

UNESCAPEURI

This function returns a URL in unescaped format. This function is the reverse of the ESCAPEURI function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a VARCHAR2, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string to be returned in unescaped format.

REGISTERURLHANDLER

Registers a particular type name for handling a particular URL. The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUri` static member function. This function is called by the GETURI function to generate an instance of the type. The `stripprefix` parameter indicates that the prefix must be stripped off before calling this function.

Syntax

```
PROCEDURE registerUrlHandler(
   prefix IN varchar2,
   schemaName IN varchar2,
   typename IN varchar2,
   ignoreCase IN boolean := true,
   stripprefix IN boolean := true);
```

Parameter	IN / OUT	Description
`prefix`	`(IN)`	The prefix to handle; for example, `http://`.
`schemaName`	`(IN)`	Name of the schema where the type resides; case sensitive.
`typename`	`(IN)`	The name of the type to handle the URL; case sensitive.
`ignoreCase`	`(IN)`	Ignore case when matching prefixes.
`stripprefix`	`(IN)`	Strip prefix before generating the instance of the type.

UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

Syntax

```
PROCEDURE unregisterUrlHandler(
   prefix IN varchar2);
```

Parameter	IN / OUT	Description
`prefix`	`(IN)`	The prefix to be unregistered.

227

Expression Filter Types

The Expression Filter feature is supplied with a set of predefined types and public synonyms for these types. Most of these types are used for configuring index parameters with the Expression Filter procedural APIs. The `EXF$TABLE_ALIAS` type is used to support expressions defined on one or more database tables.

> **See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- Summary of Expression Filter Types

Summary of Expression Filter Types

Table 227–1 describes the Expression Filter object types.

All the values and names passed to the types defined in this chapter are not case sensitive. To preserve the case, you use double quotation marks around the values.

Table 227–1 Expression Filter Object Types

Object Type Name	Description
EXF$ATTRIBUTE	Specifies the stored and indexed attributes for the Expression Filter indexes
EXF$ATTRIBUTE_LIST	Specifies a list of stored and indexed attributes when configuring index parameters
EXF$INDEXOPER	Specifies a list of common operators in predicates with a stored or an indexed attribute
EXF$TABLE_ALIAS	Indicates a special form of elementary attribute used to manage expressions defined on one or more database tables
EXF$TEXT	Associates preferences to a text attribute in an attribute set or an event structure
EXF$XPATH_TAG	Configures an XML element or an XML attribute for indexing a set of XPath predicates
EXF$XPATH_TAGS	Specifies a list of XML tags when configuring the Expression Filter index parameters

EXF$ATTRIBUTE

The EXF$ATTRIBUTE type is used to handle stored and indexed attributes for the Expression Filter indexes.

Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE AS OBJECT attr_name    VARCHAR2(350),
                                               attr_oper    EXF$INDEXOPER,
                                               attr_indexed VARCHAR2(5);
```

Attributes

Table 227–2 EXF$ATTRIBUTE Attributes

Attribute	Description
attr_name	The arithmetic expression that constitutes the stored or indexed attribute
attr_oper	The list of common operators in the predicates with the attribute. Default value: EXF$INDEXOPER('all')
attr_indexed	TRUE if the attribute is indexed, else FALSE. Default value: FALSE.

Usage Notes

- The EXF$ATTRIBUTE type is used to specify the stored and indexed attributes for an Expression Filter index using the DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS procedure. When values for attr_oper and attr_indexed fields are omitted during EXF$ATTRIBUTE instantiation, it is considered a stored attribute with a default value for common operators (EXF$INDEXOPER('all')).

Examples

A stored attribute with no preference on the list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)')
```

An indexed attribute is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_indexed => 'TRUE')
```

An indexed attribute with a list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_oper => exf$indexoper('=','<','>','>=','<='),
               attr_indexed => 'TRUE')
```

EXF$ATTRIBUTE_LIST

The EXF$ATTRIBUTE_LIST type is used to specify a list of stored and indexed attributes while configuring the index parameters.

Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE_LIST as VARRAY(490) of exf$attribute;
```

Attributes

None.

Usage Notes

- Also see the "DEFAULT_INDEX_PARAMETERS Procedure" for more information

Examples

A list of stored and indexed attributes can be represented as follows:

```
exf$attribute_list (
       exf$attribute (attr_name => 'Model',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'Price',
                      attr_oper => exf$indexoper('all'),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'HorsePower(Model, Year)',
                      attr_oper => exf$indexoper('=','<','>','>=','<='),
                      attr_indexed => 'FALSE')
    )
```

EXF$INDEXOPER

The EXF$INDEXOPER type is used to specify the list of common operators in predicates with a stored or an indexed attribute.

Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$INDEXOPER as VARRAY(20) of VARCHAR2(15);
```

The values for the EXF$INDEXOPER array are expected to be from the list in the following table:

Value	Predicate Description
=	Equality predicates
>	Greater than predicates
<	Less than predicates
>=	Greater than or equal to predicates
<=	Less than or equal to predicates
!= or <> or ^=	Not equal to predicates
IS NULL	IS NULL predicates
IS NOT NULL	IS NOT NULL predicates
ALL	All the operators listed in this table starting with the equality predicate through the IS NOT NULL predicate
NVL	Predicates with NVL (equality) operator
LIKE	Predicates with LIKE operator
BETWEEN	BETWEEN predicates

Attributes

None.

Usage Notes

- A value of ALL for one of the EXF$INDEXOPER items implies that all the simple operators (=,>,<,>=,<=,!=, IS NULL, IS NOT NULL) are common in the predicates with an attribute. This value can be used along with one or more complex operators (NVL, LIKE and BETWEEN).
- A predicate with a BETWEEN operator is treated as two predicates with binary operators, one with '>=' operator and another with '<=' operator. By default, only one of these operators is indexed, and the other operator is evaluated by value substitution. However, if predicates with the BETWEEN operator are common for an attribute (stored or indexed), both the binary operators resulting from the BETWEEN operator can be indexed by specifying BETWEEN in the EXF$INDEXOPER VARRAY. However, because this uses additional space in the predicate table, this operator should be used only when majority of predicates with an attribute use the BETWEEN operator.
- When the LIKE operator is chosen as one of the common operators for an attribute, LIKE predicates on that attributes are indexed. Indexing a LIKE operator is beneficial only if the VARCHAR2 constant on the right-hand side of the

predicate does not lead with a wild-card character. For example, indexing a `LIKE` operator will filter the following predicates efficiently:

```
company LIKE 'General%'
company LIKE 'Proctor%'
```

But, the following predicates are evaluated as sparse predicates in the last stage:

```
company LIKE '%Electric'
company LIKE "%Gamble'
```

Examples

An attribute with a list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_oper => exf$indexoper('=','<','>','>=','<=', 'between'),
               attr_indexed => 'TRUE')
```

EXF$TABLE_ALIAS

A EXF$TABLE_ALIAS type is a special form of elementary attribute that can be included in the attribute set. These attributes are used to manage expressions defined on one or more database tables.

Syntax

```
CREATE or REPLACE TYPE EXF$TABLE_ALIAS AS OBJECT table_name VARCHAR2(70);
```

Attributes

Table 227–3 EXF$TABLE_ALIAS Attribute

Attribute	Description
table_name	Name of the table with a possible schema extension

Usage Notes

- The concept of a table alias attribute is captured in the Expression Filter dictionary and the corresponding attribute in the attribute set's object type is created with a VARCHAR2 datatype. (Also see Appendix A in Oracle Database Rules Manager and Expression Filter Developer's Guide and "ADD_ELEMENTARY_ATTRIBUTE Procedures".)

Examples

For a set of expressions defined on database tables, the corresponding table alias attributes are configured as follows:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                                attr_set  => 'HRAttrSet',
                                attr_name => 'EMP',
                                tab_alias => exf$table_alias('SCOTT.EMP'));
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                                attr_set  => 'HRAttrSet',
                                attr_name => 'DEPT',
                                tab_alias => exf$table_alias('DEPT'));
END;
/
```

The Expression column using the previous attribute set can store expressions of form EMP.JOB = 'Clerk' and EMP.NAME = 'Joe', where JOB and NAME are the names of the columns in the SCOTT.EMP table.

EXF$TEXT

A EXF$TEXT type is used to associate preferences to a text attribute in an attribute set or an event structure.

Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$TEXT AS OBJECT(preferences VARCHAR2(1000));
```

Attributes

Table 227–4 EXF$TEXT Attribute

Attribute	Description
preferences	Text preference specification, such as LEXER, CLASSIFIER, and WORDLIST

Usage Notes

- The EXF$TEXT attribute is used to specify the preferences for a text attribute at the time of creation. The preferences specified through the instance of EXF$TEXT type are used in creation of the CTXRULE index for the text predicates. The syntax for the text preference specification is similar to the PARAMETERS clause specified for a CTXRULE Indextype. [See CREATE INDEX syntax for CTXRULE Indextype in *Oracle Text Reference*, Release 10g Release 2.]

Examples

A text predicate with a LEXER and WORDLIST preferences can be created using the following instance of EXF$TEXT object as follows:

```
EXF$TEXT ('LEXER insrpt_lexer WORDLIST insrpt_wordlist');
```

EXF$XPATH_TAG

The EXF$XPATH_TAG type is used to configure an XML element or an XML attribute for indexing a set of XPath predicates.

Syntax

```
CREATE or REPLACE TYPE EXF$XPATH_TAG AS OBJECT tag_name    VARCHAR2(350),
                                               tag_indexed VARCHAR2(5),
                                               tag_type    VARCHAR2(30);
```

Attributes

Table 227–5 EXF$XPATH_TAG Attributes

Attribute	Description
tag_name	Name of the XML element or attribute. The name for an XML attribute is formatted as: <ElementName>@<AttributeName>. Optionally, the element name can be prefixed with its namespace URL as in <Namespace URL>:<ElementName>@<AttributeName>.
tag_indexed	TRUE if XML tag is indexed; otherwise FALSE. Default: TRUE if the tag is a positional filter. FALSE if the tag is a value filter.
tag_type	Datatype for the value in the case of value filter. NULL for positional filters.

Usage Notes

- EXF$XPATH_TAG type is used to configure an XML element or an attribute as a positional or a value filter for an Expression Filter index (see "Index Tuning for XPath Predicates" in Oracle Database Rules Manager and Expression Filter Developer's Guide). An instance of the EXF$XPATH_TAG type with NULL value for tag_type configures the XML tag as a positional filter. In the current release, the only other possible values for the tag_type attribute are strings (CHAR or VARCHAR) and such tags are configured as value filters. By default, all positional filters are indexed and the value filters are not indexed. This behavior can be overridden by setting a TRUE or FALSE value for the tag_indexed attribute accordingly.

Examples

An XML element can be configured as a positional filter and be indexed using the following instance of the EXF$XPATH_TAG type.

```
exf$xpath_tag(tag_name    => 'stereo',       --- XML element
              tag_indexed => 'TRUE',         --- indexed predicate group
              tag_type    => null)           --- positional filter
```

An XML attribute can be configured as a value filter and be indexed using the following type instance.

```
exf$xpath_tag(tag_name    => 'stereo@make',  --- XML attribute
              tag_indexed => 'TRUE',         --- indexed predicate group
              tag_type    => 'VARCHAR(15)')  --- value filter
```

The following commands configure the two filters shown previously using the namespace URL for the corresponding elements.

```
exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo',
              tag_indexed => 'TRUE', --- indexed predicate group
              tag_type => null)      --- positional filter

exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo@make'
              tag_indexed => 'TRUE',     --- indexed predicate group
              tag_type => 'VARCHAR(15)') --- value filter
```

EXF$XPATH_TAGS

The EXF$XPATH_TAGS type is used to specify a list of XML tags while configuring the Expression Filter index parameters.

Syntax

```
CREATE or REPLACE TYPE EXF$XPATH_TAGS as VARRAY(490) of EXF$XPATH_TAG;
```

Attributes

None.

Usage Notes

- EXF$XPATH_TAGS type is used to specify a list of XML tags while configuring the Expression Filter index parameters. (See "DEFAULT_INDEX_PARAMETERS Procedure".)

Examples

A list of XML tags configured as positional and value filters can be represented as follows:

```
exf$xpath_tags(
           exf$xpath_tag(tag_name    => 'stereo@make',  --- XML attribute
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(15)'), --- value filter
           exf$xpath_tag(tag_name    => 'stereo',       --- XML element
                         tag_indexed => 'FALSE',
                         tag_type    => null),          --- positional filter
           exf$xpath_tag(tag_name    => 'memory',       --- XML element
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(10)')  --- value filter
         )
```

228

JMS Types

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues. The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueuing or to interpret a dequeued JMS message.

This chapter contains these topics:

- Using JMS Types
  - Overview
  - Java Versus PL/SQL Data Types
  - More on Bytes, Stream and Map Messages
  - Upcasting and Downcasting Between General and Specific Messages
  - JMS Types Error Reporting
  - Oracle JMS Type Constants
  - CONVERT_JMS_SELECTOR
- Summary of JMS Types

Using JMS Types

- Oracle JMS Type Constants
- JMS Types Error Reporting
- Oracle JMS Type Constants
- CONVERT_JMS_SELECTOR

Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Streams AQ offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Streams AQ offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Streams AQ rules

Java Versus PL/SQL Data Types

Data types do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

> **See Also:** JMS specification 3.11.3, Conversion Provided by StreamMessage and MapMessage

New JMS Support in Oracle Database 10*g*

In Oracle Database 10*g*, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any data type that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionalities that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses these common functionalities.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

Note: It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.

   This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.

   For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

  The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

  The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

  Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the Jserv static variable.

  The `prepare` procedure, on the other hand, overwrites the message payload in the Jserv static variable with the payload in the PL/SQL ADT.

  Oracle provides member function `get_mode` for users to query the mode.

Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java `ObjectOutputStream` and bytes messages are encoded using Java `DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support `utf-8` encoding.

Note: All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.

Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Streams AQ provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9*i* Release 2 (9.2).

Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Streams AQ queue. Oracle Streams AQ supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

JMS Types Error Reporting

Table 228–1 lists Oracle JMS types related errors.

Table 228–1 Oracle JMS Types Errors

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the get_text procedure with a VARCHAR2 parameter of aq$_jms_text_message or get_bytes procedure with a RAW parameter of aq$_jms_bytes_message.
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example set_byte_property, set_short_property of aq$_jms_head ADT; set_byte and set_short of aq$_jms_map_message ADT; write_byte and write_short of aq$_jms_stream_message and aq$_jms_bytes_message ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the aq$_jms_namearray ADT capacity. The current size limit is 1024. You can use the get_names function with offset and length parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the get_exception static procedure of aq$_jms_map_message, aq$_jms_bytes_message, and aq$_jms_stream_message to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT aq$_jms_exception is created to represent the exception information on the PL/SQL side.
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the clean procedure after using one message. The clean procedure frees the message slot for use by other messages attempting access.

Oracle JMS Type Constants

This section lists some useful constants when dealing with message type functions.

DBMS_AQ Package Constants

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;
```

SYS.DBMS_JMS_PLSQL Package Constants

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10*g*.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the get_mode function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Streams AQ queue. They are useful during the conversion of JMS selectors to Oracle Streams AQ rules:

```
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a aq$_jms_value type. They are useful when interpreting the aq$_jms_value returned by the get_object method of AQ$_JMS_MAP_MESSAGE or read_object method of AQ$_JMS_STREAM_MESSAGE:

```
DATA_TYPE_BYTE           CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT          CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER        CONSTANT PLS_INTEGER;
DATA_TYPE_LONG           CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT          CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE         CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN        CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER      CONSTANT PLS_INTEGER;
DATA_TYPE_STRING         CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES          CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE  CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW   CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL  CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE    CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH   CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE   CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE      CONSTANT PLS_INTEGER := -24196;
```

```
ERROR_JAVA_EXCEPTION  CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID      CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW  CONSTANT PLS_INTEGER := -24199;
```

CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Streams AQ rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTPLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(
   selector IN VARCHAR2,
   dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type`

parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax

```
Function convert_jms_selector(
   selector         IN  VARCHAR2,
   dest_pload_type  IN  PLS_INTEGER,
   compliant        IN  BOOLEAN )
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Summary of JMS Types

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMESARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type

SYS.AQ$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- CONSTRUCT Static Functions
- Cast Methods
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE AQ$_JMS_MESSAGE AS OBJECT(

MEMBER PROCEDURE get_bytes    (payload  OUT BLOB));
```

CONSTRUCT Static Functions

There are six `CONSTRUCT` static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq$_jms_message
Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the construct method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The `mtype` parameter must be one of the following constants described in "Oracle JMS Type Constants" on page 228-11:

```
DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE
```

STATIC FUNCTION construct (text_msg IN aq$_jms_text_message) RETURN aq$_jms_message
Creates an `aq$_jms_message` from an `aq$_jms_text_message`.

STATIC FUNCTION construct (bytes_msg IN aq$_jms_bytes_message) RETURN aq$_

jms_message;
Creates an aq$_jms_message from an aq$_jms_bytes_message.

STATIC FUNCTION construct (stream_msg IN aq$_jms_stream_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_stream_message.

STATIC FUNCTION construct (map_msg IN aq$_jms_map_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_map_message.

STATIC FUNCTION construct (object_msg IN aq$_jms_object_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_object_message.

Cast Methods

cast_to_bytes_msg RETURN aq$_jms_bytes_message
Casts an aq$_jms_message to an aq$_jms_bytes_message. Returns an aq$_jms_bytes_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.

cast_to_map_msg RETURN aq$_jms_map_message
Casts an aq$_jms_message to an aq$_jms_map_message. Returns an aq$_jms_map_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq$_jms_object_message
Casts an aq$_jms_message to an aq$_jms_object_message. Returns an aq$_jms_object_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq$_jms_stream_message
Casts an aq$_jms_message to an aq$_jms_stream_message. Returns an aq$_jms_stream_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq$_jms_text_message
Casts an aq$_jms_message to an aq$_jms_text_message. Returns an aq$_jms_text_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text and corresponds to `JMSType`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID`.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID`.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID`.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN VARCHAR
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB),
Sets the payload, a `CLOB` value, to an internal representation.

set_bytes (payload IN RAW)
Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload IN BLOB)
Sets the payload, a `BLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a `CLOB` variable payload.

get_bytes (payload OUT RAW)
Puts the internal representation of the payload into a `RAW` variable payload.

get_bytes (payload OUT BLOB)
Puts the internal representation of the payload into a `BLOB` variable payload.

SYS.AQ$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE AQ$_JMS_TEXT_MESSAGE AS OBJECT(

 MEMBER FUNCTION get_short_property   (property_name IN VARCHAR) RETURN INT,
```

```
MEMBER FUNCTION get_string_property  (property_name IN VARCHAR)
  RETURN VARCHAR,
MEMBER PROCEDURE set_text            (payload  IN  VARCHAR2),
MEMBER PROCEDURE set_text            (payload  IN  CLOB),
MEMBER PROCEDURE get_text            (payload  OUT VARCHAR2),
MEMBER PROCEDURE get_text            (payload  OUT CLOB));
```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_text_message
Creates an empty `aq$_jms_text_message`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN INT
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR)
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a `CLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a `CLOB` variable payload.

SYS.AQ$_JMS_BYTES_MESSAGE Type

This type is the ADT used to store a `BytesMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_bytes_message
Creates an empty `aq$_jms_bytes_message`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)
Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload in BLOB)
Sets the payload, a `BLOB` value, to an internal representation.

get_bytes (payload out RAW)
Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

get_bytes (payload out BLOB)
Puts the internal representation of the payload into a `BLOB` variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_bytes_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session

memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY or SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a BYTE value from the bytes message and returns the BYTE value read. Null is returned if the end of the stream has been reached. Because there is no BYTE type in PL/SQL, Oracle Database uses PLS_INTEGER to represent a BYTE. Although PL/SQL users get a PLS_INTEGER, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a write_byte function, then there will not be an out of range error. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER

Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN INT
Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)
Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBounds exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBounds exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_map_message AS object(
 header     aq$_jms_header,
 bytes_len  int,
 bytes_raw  raw(2000),
 bytes_lob  blob,

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_map_message
Creates an empty `aq$_jms_map_message` object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)
Sets the internal payload as a RAW variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a RAW variable without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as a BLOB variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a BLOB variable without interpreting it.

get_bytes (payload OUT RAW)
Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)
Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the `BYTE` value with the specified name in the map. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW))
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT,

length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)
Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)
Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)
This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)
Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB))
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)
Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR
Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION
Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT
Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type

of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER
Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)
Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq$_jms_namearray
Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval [offset, offset+length-1] and interval [0, size-1] where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned.Users can use the `type` attribute of this ADT to interpret the data. See

the map in the AQ$_JMS_VALUE ADT for the correspondence among dbms_jms_plsql package constants, Java data type and AQ$_JMS_VALUE attribute. Note this member procedure might bring additional overhead compared to other get member procedures or functions. It is used only if the user does not know the data type of the fields within a message before hand. Otherwise it is a good idea to use a specific get member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Indicates that an item exists in this map message by returning TRUE. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_stream_message AS object(
 header     aq$_jms_header,
 bytes_len  int,
 bytes_raw  raw(2000),
 bytes_lob  blob,
 STATIC FUNCTION  construct RETURN aq$_jms_stream_message,

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_stream_message
Creates an empty `aq$_jms_stream_message` object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` variable without interpreting it.

set_bytes (payload IN RAW)
Sets the internal payload as the RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as the `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER
Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or SYS.`dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN
Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER) RETURN BLOB
Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)
Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type

is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_string RETURN CLOB
Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)
Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. Users can use the type attribute of this ADT to interpret the data. See Table 228–2 on page 228-57 for the correspondence among `dbms_jms_plsql` package constants, Java data type and `AQ$_JMS_VALUE` attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the data type of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN INT)
Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_OBJECT_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Streams AQ queue.

Syntax

```
TYPE aq$_jms_object_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob);
```

SYS.AQ$_JMS_NAMESARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`. The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMESARRAY AS VARRAY(1024) OF VARCHAR(100);
```

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
   offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

SYS.AQ$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`. The `type` field in this ADT is used to decide which type of data this object is really holding. Table 228–2 lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
 type      number(2),
 num_val   number,
 char_val  char(1),
 text_val  clob,
 bytes_val blob);
```

Table 228–2 AQ$_JMS_VALUE Type Fields and Java Fields

Type	Java Type	aq$_jms_value Data Field
DBMS_JMS_PLSQL.DATA_TYPE_BYTE	byte	num_val
DBMS_JMS_PLSQL.DATA_TYPE_SHORT	short	num_val
DBMS_JMS_PLSQL.DATA_TYPE_INTEGER	int	num_val
DBMS_JMS_PLSQL.DATA_TYPE_LONG	long	num_val
DBMS_JMS_PLSQL.DATA_TYPE_FLOAT	float	num_val
DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE	double	num_val
DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN	boolean	num_val: 0 FALSE, 1 TRUE
DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER	char	char_val
DBMS_JMS_PLSQL.DATA_TYPE_STRING	java.lang.String	text_val
DBMS_JMS_PLSQL.DATA_TYPE_BYTES	byte[]	bytes_val

SYS.AQ$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side. The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
   id          number, -- Reserved and not used. Right now always return 0.
   exp_name    varchar(200),
   err_msg     varchar(500),
   stack       varchar(4000));
```

229

Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types. In Oracle Streams, LCRs are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueuing, and dequeuing LCRs manually.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about LCRs

This chapter contains these topics:

- Summary of Logical Change Record Types
- Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

Summary of Logical Change Record Types

Table 229–1 Logical Change Record (LCR) Types

Type	Description
"LCR$_DDL_RECORD Type" on page 229-3	Represents a data definition language (DDL) change to a database object
"LCR$_ROW_RECORD Type" on page 229-11	Represents a data manipulation language (DML) change to a database object
"LCR$_ROW_LIST Type" on page 229-36	Identifies a list of column values for a row in a table
"LCR$_ROW_UNIT Type" on page 229-37	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM

LCR$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_DDL_RECORD Constructor
- Summary of LCR$_DDL_RECORD Subprograms, which also include the subprograms described in "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 229-28

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

LCR$_DDL_RECORD Constructor

Creates a `SYS.LCR$_DDL_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
   source_database_name  IN  VARCHAR2,
   command_type          IN  VARCHAR2,
   object_owner          IN  VARCHAR2,
   object_name           IN  VARCHAR2,
   object_type           IN  VARCHAR2,
   ddl_text              IN  CLOB,
   logon_user            IN  VARCHAR2,
   current_schema        IN  VARCHAR2,
   base_table_owner      IN  VARCHAR2,
   base_table_name       IN  VARCHAR2,
   tag                   IN  RAW       DEFAULT NULL,
   transaction_id        IN  VARCHAR2  DEFAULT NULL,
   scn                   IN  NUMBER    DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```

LCR$_DDL_RECORD Constructor Function Parameters

Table 229–2 Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
source_database_name	The database where the DDL statement occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the function specifies DBS1.NET automatically. This parameter should be set to a non-NULL value.
command_type	The type of command executed in the DDL statement. This parameter should be set to a non-NULL value. **See Also:** The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types The following command types *are not supported* in DDL LCRs: ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME The snapshot equivalents of the materialized view command types are also not supported.
object_owner	The user who owns the object on which the DDL statement was executed
object_name	The database object on which the DDL statement was executed
object_type	The type of object on which the DDL statement was executed. The following are valid object types: CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.

Table 229–2 (Cont.) Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
ddl_text	The text of the DDL statement. This parameter should be set to a non-NULL value.
logon_user	The user whose session executed the DDL statement
current_schema	The schema that is used if no schema is specified explicitly for the modified database objects in ddl_text. If a schema is specified in ddl_text that differs from the one specified for current_schema, then the function uses the schema specified in ddl_text. This parameter should be set to a non-NULL value.
base_table_owner	If the DDL statement is a table related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_owner specifies the owner of the table involved. Otherwise, base_table_owner is NULL.
base_table_name	If the DDL statement is a table related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_name specifies the name of the table involved. Otherwise, base_table_name is NULL.
tag	A binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record for a captured LCR was written to the redo log. The SCN value is meaningless for a user-created LCR.

Summary of LCR$_DDL_RECORD Subprograms

Table 229–3 LCR$_DDL_RECORD Type Subprograms

Subprogram	Description
"EXECUTE Member Procedure" on page 229-6	Executes the LCR under the security domain of the current user
"GET_BASE_TABLE_NAME Member Function" on page 229-6	Returns the base (dependent) table name
"GET_BASE_TABLE_OWNER Member Function" on page 229-6	Returns the base (dependent) table owner
"GET_CURRENT_SCHEMA Member Function" on page 229-6	Returns the default schema (user) name
"GET_DDL_TEXT Member Procedure" on page 229-7	Gets the DDL text in a CLOB
"GET_LOGON_USER Member Function" on page 229-7	Returns the logon user name
"GET_OBJECT_TYPE Member Function" on page 229-7	Returns the type of the object involved for the DDL
"SET_BASE_TABLE_NAME Member Procedure" on page 229-8	Sets the base (dependent) table name

Table 229–3 (Cont.) LCR$_DDL_RECORD Type Subprograms

Subprogram	Description
"SET_BASE_TABLE_OWNER Member Procedure" on page 229-8	Sets the base (dependent) table owner
"SET_CURRENT_SCHEMA Member Procedure" on page 229-8	Sets the default schema (user) name
"SET_DDL_TEXT Member Procedure" on page 229-8	Sets the DDL text
"SET_LOGON_USER Member Procedure" on page 229-9	Sets the logon user name
"SET_OBJECT_TYPE Member Procedure" on page 229-9	Sets the object type
Common Subprograms	See "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 229-28 for a list of subprograms common to the `SYS.LCR$_ROW_RECORD` and `SYS.LCR$_DDL_RECORD` types

EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Any apply process handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

Note: The `EXECUTE` member procedure can be invoked only in an apply handler for an apply process.

Syntax

```
MEMBER PROCEDURE EXECUTE();
```

GET_BASE_TABLE_NAME Member Function

Returns the base (dependent) table name.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```

GET_BASE_TABLE_OWNER Member Function

Returns the base (dependent) table owner.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;
```

GET_CURRENT_SCHEMA Member Function

Returns the current schema name.

Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;
```

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

The following is an example of a PL/SQL procedure that uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
  ddl_text   CLOB;
BEGIN
  DBMS_OUTPUT.PUT_LINE( '  ----------------------------------------' );
  DBMS_OUTPUT.PUT_LINE( '  Displaying DDL text in a DDL LCR: ' );
  DBMS_OUTPUT.PUT_LINE( '  ----------------------------------------' );
  DBMS_LOB.CREATETEMPORARY(ddl_text, true);
  ddl_lcr.GET_DDL_TEXT(ddl_text);
  DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
  DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

> **Note:** GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

Syntax

```
MEMBER FUNCTION GET_DDL_TEXT
  ddl_text  IN/OUT  CLOB);
```

Parameter

Table 229–4 GET_DDL_TEXT Procedure Parameter

Parameter	Description
ddl_text	The DDL text in the DDL LCR

GET_LOGON_USER Member Function

Returns the logon user name.

Syntax

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

GET_OBJECT_TYPE Member Function

Returns the type of the object involved for the DDL.

Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
```

```
RETURN VARCHAR2;
```

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
   base_table_name  IN  VARCHAR2);
```

Parameter

Table 229–5 SET_BASE_TABLE_NAME Procedure Parameter

Parameter	Description
base_table_name	The name of the base table

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
   base_table_owner  IN  VARCHAR2);
```

Parameter

Table 229–6 SET_BASE_TABLE_OWNER Procedure Parameter

Parameter	Description
base_table_owner	The name of the base owner

SET_CURRENT_SCHEMA Member Procedure

Sets the default schema (user) name.

Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(
   current_schema  IN  VARCHAR2);
```

Parameter

Table 229–7 SET_CURRENT_SCHEMA Procedure Parameter

Parameter	Description
current_schema	The name of the schema to set as the current schema. This parameter should be set to a non-NULL value.

SET_DDL_TEXT Member Procedure

Sets the DDL text.

Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(
   ddl_text  IN  CLOB);
```

Parameter

Table 229–8 SET_DDL_TEXT Procedure Parameter

Parameter	Description
ddl_text	The DDL text. This parameter should be set to a non-NULL value.

SET_LOGON_USER Member Procedure

Sets the logon user name.

Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(
   logon_user  IN  VARCHAR2);
```

Parameter

Table 229–9 SET_LOGON_USER Procedure Parameter

Parameter	Description
logon_user	The name of the schema to set as the logon user

SET_OBJECT_TYPE Member Procedure

Sets the object type.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(
   object_type  IN  VARCHAR2);
```

Parameter

Table 229–10 SET_OBJECT_TYPE Procedure Parameter

Parameter	Description
object_type	The object type. The following are valid object types: CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.

LCR$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the `LCR$_ROW_LIST` type.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_ROW_RECORD Constructor
- Summary of LCR$_ROW_RECORD Subprograms, which also include the subprograms described in Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD on page 229-28

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

See Also: "LCR$_ROW_LIST Type" on page 229-36

LCR$_ROW_RECORD Constructor

Creates a `SYS.LCR$_ROW_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
   source_database_name  IN  VARCHAR2,
   command_type          IN  VARCHAR2,
   object_owner          IN  VARCHAR2,
   object_name           IN  VARCHAR2,
   tag                   IN  RAW               DEFAULT NULL,
   transaction_id        IN  VARCHAR2          DEFAULT NULL,
   scn                   IN  NUMBER            DEFAULT NULL,
   old_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
   new_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```

LCR$_ROW_RECORD Constructor Function Parameters

Table 229–11 Constructor Function Parameters for LCR$_ROW_RECORD

Parameter	Description
source_database_name	The database where the row change occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the function specifies DBS1.NET automatically. This parameter should be set to a non-NULL value.
command_type	The type of command executed in the DML statement. This parameter should be set to a non-NULL value. Valid values are the following: INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM If INSERT, then an LCR should have a new_values collection that is not empty and an empty or NULL old_values collection. If UPDATE, then an LCR should have a new_values collection that is not empty and an old_values collection that is not empty. If DELETE, then an LCR should have a NULL or empty new_values collection and an old_values collection that is not empty. If LOB ERASE, LOB WRITE, or LOB TRIM, then an LCR should have a new_values collection that is not empty and an empty or NULL old_values collection.
object_owner	The user who owns the table on which the row change occurred. This parameter should be set to a non-NULL value.
object_name	The table on which the DML statement was executed. This parameter should be set to a non-NULL value.
tag	A binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record was written to the redo log. The SCN value is meaningless for a user-created LCR.
old_values	The column values for the row before the DML change. If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.

Table 229–11 (Cont.) Constructor Function Parameters for LCR$_ROW_RECORD

Parameter	Description
new_values	The column values for the row after the DML change. If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.

Summary of LCR$_ROW_RECORD Subprograms

Table 229–12 LCR$_ROW_RECORD Type Subprograms

Subprogram	Description
"ADD_COLUMN Member Procedure" on page 229-14	Adds the value as old or new, depending on the value type specified, for the column
"CONVERT_LONG_TO_LOB_CHUNK Member Procedure" on page 229-15	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
"DELETE_COLUMN Member Procedure" on page 229-15	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
"EXECUTE Member Procedure" on page 229-16	Executes the LCR under the security domain of the current user
"GET_LOB_INFORMATION Member Function" on page 229-17	Gets the LOB information for the column
"GET_LOB_OFFSET Member Function" on page 229-18	Returns the LOB offset for the specified column
"GET_LOB_OPERATION_SIZE Member Function" on page 229-18	Gets the operation size for the LOB column
"GET_LONG_INFORMATION Member Function" on page 229-19	Gets the LONG information for the column
"GET_VALUE Member Function" on page 229-20	Returns the old or new value for the specified column, depending on the value type specified
"GET_VALUES Member Function" on page 229-20	Returns a list of old or new values, depending on the value type specified
"GET_XML_INFORMATION Member Function" on page 229-21	Returns the XML information for the specified column
"RENAME_COLUMN Member Procedure" on page 229-21	Renames a column in an LCR
"SET_LOB_INFORMATION Member Procedure" on page 229-22	Sets LOB information for the column
"SET_LOB_OFFSET Member Procedure" on page 229-23	Sets the LOB offset for the specified column
"SET_LOB_OPERATION_SIZE Member Procedure" on page 229-23	Sets the operation size for the LOB column
"SET_VALUE Member Procedure" on page 229-24	Overwrites the value of the specified column

Table 229–12 (Cont.) LCR$_ROW_RECORD Type Subprograms

Subprogram	Description
"SET_VALUES Member Procedure" on page 229-25	Replaces the existing old or new values for the LCR, depending on the value type specified
"SET_XML_INFORMATION Member Procedure" on page 229-27	Sets the XML information for the column
Common Subprograms	See Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD on page 229-28 for a list of subprograms common to the `SYS.LCR$_ROW_RECORD` and `SYS.LCR$_DDL_RECORD` types

ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

Note: To set a column value that already exists, run `SET_VALUE`.

See Also: "SET_VALUE Member Procedure" on page 229-24

Considerations for LOB Columns

When processing a row LCR with LOB columns with a DML handler or error handler and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lobs` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `10.2.0` or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
   value_type    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA);
```

Parameters

Table 229–13 ADD_COLUMN Procedure Parameters

Parameter	Description
value_type	The type of value to add for the column. Specify old to add the old value of the column. Specify new to add the new value of the column.
column_name	The column name. This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.
column_value	The value of the column. If NULL, then this procedure raises an error. If the member procedure is used in a DML handler or error handler that uses LOB assembly, then a LOB locator can be specified. A NULL column value can be specified by encapsulating the NULL value in an ANYDATA wrapper.

CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts LONG data in a row LCR into a CLOB, or converts LONG RAW data in a row LCR into a BLOB.

This procedure can change the operation code from LONG WRITE to LOB WRITE for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- LONG data can be sent as a part of a row LCR with one of the following operation codes: INSERT, UPDATE, or LONG_WRITE. Because LONG data can be sent in multiple pieces, make sure that this method is invoked on either none or all LONG pieces.
- LOB to LONG conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK();
```

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
   column_name  IN  VARCHAR2,
   value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 229–14 DELETE_COLUMN Procedure Parameters

Parameter	Description
column_name	The column name. An error is raised if the column does not exist in the LCR.
value_type	The type of value to delete for the column. Specify old to delete the old value of the column. Specify new to delete the new value of the column. If * is specified, then the procedure deletes both the old and new values.

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply process handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR is in a queue and was last enqueued by an apply process, an application, or a user.
- The LCR has been constructed using the LCR$_ROW_RECORD constructor function but has not been enqueued.
- The LCR is in the error queue.

> **Note:** A custom rule-based transformation should not run this member procedure on a row LCR. Doing so could execute the row LCR outside of its transactional context.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a DML handler or error handler, and the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or NULL.

If assemble_lobs is set to FALSE for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with VARCHAR2 and RAW datatypes. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with assemble_lobs set to FALSE attempts to execute a row LCR that contains a LOB locator.

- A DML or error handler configured with `assemble_lobs` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` datatypes.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```
MEMBER PROCEDURE EXECUTE(
   conflict_resolution  IN  BOOLEAN);
```

Parameters

Table 229–15 EXECUTE Procedure Parameters

Parameter	Description
`conflict_resolution`	If `TRUE`, then any conflict resolution defined for the table using the `SET_UPDATE_CONFLICT_HANDLER` procedure in the `DBMS_APPLY_ADM` package is used to resolve conflicts resulting from the execution of the LCR. If `FALSE`, then conflict resolution is not used. An error is raised if this parameter is not specified or is set to `NULL`.

GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB        CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6;
```

Returns `NULL` if the specified column does not exist.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 229–16 GET_LOB_INFORMATION Function Parameters

Parameter	Description
`value_type`	The type of value to return for the column, either `old` or `new`
`column_name`	The name of the column

Table 229–16 (Cont.) GET_LOB_INFORMATION Function Parameters

Parameter	Description
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

Syntax

```
GET_LOB_OFFSET(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 229–17 GET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to return for the column. Currently, only new can be specified.
column_name	The name of the LOB column

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS_LCR.LAST_LOB_CHUNK

Otherwise, returns NULL.

Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2)
RETURN NUMBER,
```

Parameters

Table 229–18 GET_LOB_OPERATION_SIZE Function Parameters

Parameter	Description
value_type	The type of value to return for the column. Currently, only new can be specified.
column_name	The name of the LOB column

GET_LONG_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG        CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG       CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK        CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK   CONSTANT NUMBER := 5;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 229–19 GET_LONG_INFORMATION Function Parameters

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_VALUE Member Function

Returns the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of a column.

Syntax

```
MEMBER FUNCTION GET_VALUE(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2,
   use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN ANYDATA;
```

Parameters

Table 229–20 GET_VALUE Function Parameters

Parameter	Description
value_type	The type of value to return for the column. Specify old to get the old value for the column. Specify new to get the new value for the column.
column_name	The column name. If the column is present and has a NULL value, then the function returns an ANYDATA instance containing a NULL value. If the column value is absent, then the function returns a NULL.
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function returns NULL if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_VALUES Member Function

Returns a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.

Syntax

```
MEMBER FUNCTION GET_VALUES(
   value_type  IN  VARCHAR2,
   use_old     IN  VARCHAR2  DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

Parameters

Table 229–21 GET_VALUES Function Parameters

Parameter	Description
value_type	The type of values to return. Specify old to return a list of old values. Specify new to return a list of new values.

Table 229–21 (Cont.) GET_VALUES Function Parameters

Parameter	Description
use_old	If Y and value_type is new, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and old values for the new values that do not exist. If N and value_type is new, then the function returns a list of all new values in the LCR without returning any old values. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_XML_INFORMATION Member Function

Returns the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML   CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC   CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF  CONSTANT NUMBER := 3;
```

DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
   column_name  IN  VARCHAR2)
RETURN NUMBER,
```

Parameter

Table 229–22 GET_XML_INFORMATION Function Parameter

Parameter	Description
column_name	The column name

RENAME_COLUMN Member Procedure

Renames a column in an LCR.

Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 229–23 RENAME_COLUMN Procedure Parameters

Parameter	Description
from_column_name	The existing column name
to_column_name	The new column name. An error is raised if a column with the specified name already exists.
value_type	The type of value for which to rename the column. Specify old to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify new to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If * is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

Note: When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
  value_type       IN  VARCHAR2,
  column_name      IN  VARCHAR2,
  lob_information  IN  NUMBER);
```

Parameters

Table 229–24 SET_LOB_INFORMATION Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column, either old or new. Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.
column_name	The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.
lob_information	Specify one of the following values: DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1; DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2; DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3; DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4; DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5; DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

> **Note:** When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2,
   lob_offset   IN  NUMBER);
```

Parameters

Table 229–25 SET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column. Currently, only new can be specified.
column_name	The column name. An error is raised if the column value does not exist in the LCR.
lob_offset	The LOB offset number. Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

> **Note:** When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
  value_type          IN  VARCHAR2,
  column_name         IN  VARCHAR2,
  lob_operation_size  IN  NUMBER);
```

Parameters

Table 229–26 SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column. Currently, only new can be specified.
column_name	The name of the LOB column. An exception is raised if the column value does not exist in the LCR.

Table 229–26 (Cont.) SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
lob_operation_size	If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

Note: To add a column to a row LCR, run ADD_COLUMN.

See Also: "ADD_COLUMN Member Procedure" on page 229-14

Considerations for LOB Columns

When processing a row LCR with LOB columns with a DML handler or error handler, and the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the column_value parameter in the member procedure. The SET_VALUE member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure on a LONG or LONG RAW column.

Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the column_value parameter. The SET_VALUE member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

Syntax

```
MEMBER PROCEDURE SET_VALUE(
   value_type    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA);
```

Parameters

Table 229–27 SET_VALUE Procedure Parameters

Parameter	Description
value_type	The type of value to set. Specify old to set the old value of the column. Specify new to set the new value of the column.
column_name	The column name. An error is raised if the specified column_value does not exist in the LCR for the specified column_type.
column_value	The new value of the column. If NULL is specified, then this procedure raises an error. To set the value to NULL, encapsulate the NULL in an ANYDATA instance. If the member procedure is used in a DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a DML handler or error handler and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a row LCR that contains one or more LOB columns. If `assemble_lobs` is set to `FALSE` for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `10.2.0` or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure on `LONG` or `LONG RAW` columns.

Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a DML handler or error handler, any `XMLType` and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value of one or more `XMLType` columns in a row LCR, specify an `XMLType` for each `XMLType` column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `11.1.0` or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

Syntax

```
MEMBER PROCEDURE SET_VALUES(
   value_type  IN  VARCHAR2,
   value_list  IN  SYS.LCR$_ROW_LIST);
```

Parameters

Table 229–28 SET_VALUES Procedure Parameters

Parameter	Description
`value_type`	The type of values to replace. Specify `old` to replace the old values. Specify `new` to replace the new values.
`value_list`	List of values to replace the existing list. Use a `NULL` or an empty list to remove all values. If the member procedure is used in a DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

SET_XML_INFORMATION Member Procedure

Sets the XML information for the column.

Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
   column_name      IN  VARCHAR2,
   xml_information  IN  NUMBER);
```

Parameters

Table 229–29 SET_XML_INFORMATION Procedure Parameters

Parameter	Description
`column_name`	The name of the column. An exception is raised if the column value does not exist in the LCR.

`xml_information`	Specify one of the following values:
	`DBMS_LCR.NOT_XML CONSTANT NUMBER := 1;`
	`DBMS_LCR.XML_DOC CONSTANT NUMBER := 2;`
	`DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;`
	`DBMS_LCR.NOT_XML` indicates that the column is not an `XMLType` column. `DBMS_LCR.XML_DOC` indicates that the column contains an XML document. `DBMS_LCR.XML_DIFF` indicates that the column contains differences between old and new XML documents for an update operation.

Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

The following functions and procedures are common to both the `LCR$_DDL_RECORD` and `LCR$_ROW_RECORD` type.

> **See Also:** For descriptions of the subprograms for these types that are exclusive to each type:
>
> - "Summary of LCR$_DDL_RECORD Subprograms" on page 229-5
> - "Summary of LCR$_ROW_RECORD Subprograms" on page 229-13

Table 229–30 Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
"GET_COMMAND_TYPE Member Function" on page 229-29	Returns the command type of the logical change record (LCR)
"GET_COMMIT_SCN Member Function" on page 229-29	Returns the commit system change number (SCN) of the transaction to which the current LCR belongs
"GET_COMPATIBLE Member Function" on page 229-29	Returns the minimal database compatibility required to support the LCR
"GET_EXTRA_ATTRIBUTE Member Function" on page 229-30	Returns the value for the specified extra attribute in the LCR
"GET_OBJECT_NAME Member Function" on page 229-31	Returns the name of the object that is changed by the LCR
"GET_OBJECT_OWNER Member Function" on page 229-31	Returns the owner of the object that is changed by the LCR
"GET_SCN Member Function" on page 229-31	Returns the system change number (SCN) of the LCR
"GET_SOURCE_DATABASE_NAME Member Function" on page 229-32	Returns the source database name.
"GET_SOURCE_TIME Member Function" on page 229-32	Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.
"GET_TAG Member Function" on page 229-32	Returns the tag for the LCR
"GET_TRANSACTION_ID Member Function" on page 229-32	Returns the transaction identifier of the LCR
"IS_NULL_TAG Member Function" on page 229-32	Returns `Y` if the tag for the LCR is `NULL`, or returns `N` if the tag for the LCR is not `NULL`
"SET_COMMAND_TYPE Member Procedure" on page 229-33	Sets the command type in the LCR
"SET_EXTRA_ATTRIBUTE Member Procedure" on page 229-33	Sets the value for the specified extra attribute in the LCR
"SET_OBJECT_NAME Member Procedure" on page 229-34	Sets the name of the object that is changed by the LCR
"SET_OBJECT_OWNER Member Procedure" on page 229-35	Sets the owner of the object that is changed by the LCR

Table 229–30 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
"SET_SOURCE_DATABASE_NAME Member Procedure" on page 229-35	Sets the source database name of the object that is changed by the LCR
"SET_TAG Member Procedure" on page 229-35	Sets the tag for the LCR

GET_COMMAND_TYPE Member Function

Returns the command type of the LCR.

> **See Also:** The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

GET_COMMIT_SCN Member Function

Returns the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a DML handler, DDL handler, or error handler. Such a handler can use the SCN obtained by this procedure to flashback to the transaction commit time for an LCR. In this case, the flashback must be performed at the source database for the LCR.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns `NULL`.

Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

GET_COMPATIBLE Member Function

Returns the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
`DBMS_STREAMS.COMPATIBLE_9_2`	`9.2.0`
`DBMS_STREAMS.COMPATIBLE_10_1`	`10.1.0`
`DBMS_STREAMS.COMPATIBLE_10_2`	`10.2.0`
`DBMS_STREAMS.COMPATIBLE_11_1`	`11.1.0`

DDL LCRs always return `DBMS_STREAMS.COMPATIBLE_9_2`.

You can use the following functions for constant compatibility return values:

- The DBMS_STREAMS.COMPATIBLE_9_2 function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.
- The DBMS_STREAMS.COMPATIBLE_10_1 function returns DBMS_STREAMS.COMPATIBLE_10_1 constant.
- The DBMS_STREAMS.COMPATIBLE_10_2 function returns DBMS_STREAMS.COMPATIBLE_10_2 constant.
- The DBMS_STREAMS.COMPATIBLE_11_1 function returns DBMS_STREAMS.COMPATIBLE_11_1 constant.

You can use these functions with the GET_COMPATIBLE member function for an LCR in rule conditions and apply handlers.

Note: You can determine which database objects in a database are not supported by Oracle Streams by querying the DBA_STREAMS_UNSUPPORTED data dictionary view.

See Also:

- *Oracle Streams Concepts and Administration* for examples of rules that discard changes that are not supported by Oracle Streams
- Chapter 129, "DBMS_STREAMS" and Chapter 130, "DBMS_STREAMS_ADM"
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

GET_EXTRA_ATTRIBUTE Member Function

Returns the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an ANYDATA instance. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

See Also: "INCLUDE_EXTRA_ATTRIBUTE Procedure" on page 28-26

Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
   attribute_name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 229–31 GET_EXTRA_ATTRIBUTE Function Parameter

Parameter	Description
attribute_name	The name of the extra attribute to return. Valid names are: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. An error is raised if the specified attribute_name is not valid. If no value exists for the specified extra attribute, then the function returns a NULL. **See Also:** *Oracle Database PL/SQL Language Reference* for more information about the current user

GET_OBJECT_NAME Member Function

Returns the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Returns the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;
```

GET_SCN Member Function

Returns the system change number (SCN) of the LCR.

Syntax

```
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

GET_SOURCE_DATABASE_NAME Member Function

Returns the global name of the source database name. The source database is the database where the change occurred.

Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;
```

GET_SOURCE_TIME Member Function

Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;
```

GET_TAG Member Function

Returns the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER FUNCTION GET_TAG()
RETURN RAW;
```

GET_TRANSACTION_ID Member Function

Returns the transaction identifier of the LCR.

Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

IS_NULL_TAG Member Function

Returns `Y` if the tag for the LCR is `NULL`, or returns `N` if the tag for the LCR is not `NULL`.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```

SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing `INSERT` to `GRANT` would raise an error.

See Also:

- The description of the `command_type` parameter in "LCR$_DDL_RECORD Constructor Function Parameters" on page 229-4
- The description of the command_type parameter in "LCR$_ROW_RECORD Type" on page 229-11
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
   command_type  IN  VARCHAR2);
```

Parameter

Table 229–32 SET_COMMAND_TYPE Procedure Parameter

Parameter	Description
`command_type`	The command type. This parameter should be set to a non-`NULL` value.

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

See Also: "INCLUDE_EXTRA_ATTRIBUTE Procedure" on page 28-26

Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  ANYDATA);
```

Parameters

Table 229–33 SET_EXTRA_ATTRIBUTE Procedure Parameter

Parameter	Description
attribute_name	The name of the extra attribute to set. Valid names are: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. An error is raised if the specified attribute_name is not valid. **See Also:** *Oracle Database PL/SQL Language Reference* for more information about the current user
attribute_value	The value to which the specified extra attribute is set. If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME(
   object_name  IN  VARCHAR2);
```

Parameter

Table 229–34 SET_OBJECT_NAME Procedure Parameter

Parameter	Description
object_name	The name of the object

SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
   object_owner  IN  VARCHAR2);
```

Parameter

Table 229–35 SET_OBJECT_OWNER Procedure Parameter

Parameter	Description
object_owner	The schema that contains the object

SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
   source_database_name  IN  VARCHAR2);
```

Parameter

Table 229–36 SET_SOURCE_DATABASE_NAME Procedure Parameter

Parameter	Description
source_database_name	The source database of the change. If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the procedure specifies DBS1.NET automatically. This parameter should be set to a non-NULL value.

SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER PROCEDURE SET_TAG(
   tag  IN  RAW);
```

Parameter

Table 229–37 SET_TAG Procedure Parameter

Parameter	Description
tag	The binary tag for the LCR. The size limit for a tag value is two kilobytes.

LCR$_ROW_LIST Type

Identifies a list of column values for a row in a table.

This type uses the `LCR$_ROW_UNIT` type and is used in the `LCR$_ROW_RECORD` type.

See Also:

- "LCR$_ROW_UNIT Type" on page 229-37
- "LCR$_ROW_RECORD Type" on page 229-11

Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/
```

LCR$_ROW_UNIT Type

Identifies the value for a column in a row.

This type is used in the LCR$_ROW_LIST type.

See Also: "LCR$_ROW_LIST Type" on page 229-36

Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name         VARCHAR2(4000),
  data                ANYDATA,
  lob_information     NUMBER,
  lob_offset          NUMBER,
  lob_operation_size  NUMBER
  long_information    NUMBER);
/
```

Attributes

Table 229–38 LCR$_ROW_UNIT Attributes

Attribute	Description
column_name	The name of the column
data	The data contained in the column
lob_information	Contains the LOB information for the column and contains one of the following values: DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1; DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2; DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3; DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4; DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5; DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;
lob_offset	The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns. Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.
lob_operation_size	If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.
long_information	Contains the LONG information for the column and contains one of the following values: DBMS_LCR.not_a_long CONSTANT NUMBER := 1; DBMS_LCR.null_long CONSTANT NUMBER := 2; DBMS_LCR.inline_long CONSTANT NUMBER := 3; DBMS_LCR.long_chunk CONSTANT NUMBER := 4; DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5;

230

Oracle Multimedia ORDAudio TYPE

The `Oracle Multimedia ORDAudio` object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. `Oracle Multimedia ORDAudio` can store and retrieve audio data of any data format. `Oracle Multimedia ORDAudio` can automatically extract metadata from audio data of a variety of popular audio formats. `Oracle Multimedia ORDAudio` can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- Documentation of ORDAudio

Documentation of ORDAudio

For a complete description of this package within the context of Oracle Multimedia, see `ORDAudio` in the *Oracle Multimedia Reference*.

231

Oracle Multimedia ORDDicom TYPE

The `Oracle Multimedia ORDDicom` object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

`Oracle Multimedia ORDDicom` provides methods to extract standard and private DICOM metadata from DICOM binary data into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. `Oracle Multimedia ORDDicom` also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- Documentation of ORDDicom

Documentation of ORDDicom

For a complete description of this package within the context of Oracle Multimedia, see `ORDDicom` in the *Oracle Multimedia DICOM Developer's Guide*.

232

Oracle Multimedia ORDDoc TYPE

The `Oracle Multimedia` `ORDDoc` object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. `Oracle Multimedia` can store and retrieve media data of any data format. `Oracle Multimedia ORDDoc` data type can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. Note that you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

- Documentation of ORDDoc

Documentation of ORDDoc

For a complete description of this package within the context of Oracle Multimedia, see `ORDDoc` in the *Oracle Multimedia Reference*.

233

Oracle Multimedia ORDImage TYPE

The `Oracle Multimedia ORDImage` object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. `Oracle Multimedia ORDImage` can store and retrieve image data of any data format. `Oracle Multimedia ORDImage` can process (cut, scale, and generate thumbnails) of images, convert the format of images, and automatically extract properties of images of a variety of popular data formats.

- Documentation of ORDImage

Documentation of ORDImage

For a complete description of this package within the context of Oracle Multimedia, see `ORDImage` in the *Oracle Multimedia Reference*.

234

Oracle Multimedia SQL/MM Still Image TYPE

Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

The following object relational types for images and image characteristics are included in this support: `SI_StillImage`, `SI_AverageColor`, `SI_Color`, `SI_ColorHistogram`, `SI_FeatureList`, `SI_PositionalColor`, and `SI_Texture`.

- Documentation of SQL/MM Still Image

Documentation of SQL/MM Still Image

For a complete description of this package within the context of Oracle Multimedia, see `SQL/MM Still Image` in the *Oracle Multimedia Reference*.

235

Oracle Multimedia ORDVideo TYPE

The `Oracle Multimedia ORDVideo` object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so forth, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. `Oracle Multimedia ORDVideo` can store and retrieve video data of any data format. `Oracle Multimedia ORDVideo` can automatically extract metadata from video data of a variety of popular video formats. `Oracle Multimedia ORDVideo` can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- Documentation of ORDVideo

Documentation of ORDVideo

For a complete description of this package within the context of Oracle Multimedia, see `ORDVideo` in the *Oracle Multimedia Reference*.

236

MGD_ID Package Types

The MGD_ID Package provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types. The MGD_ID Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification). The MGD_ID Package is supplied with several predefined types.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information.

This chapter contains the following topics:

- Summary of Types
- Summary of MGD_ID Subprograms

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

Summary of Types

Table 236–1 describes the MGD_ID Package object types.

Table 236–1 MGD_ID Package Object Types

Object Type Name	Description
MGD_ID_COMPONENT Object Type	Datatype that specifies the name and value pair attributes that define a component
MGD_ID_COMPONENT_VARRAY Object Type	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
MGD_ID Object Type	Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components

MGD_ID_COMPONENT Object Type

The MGD_ID_COMPONENT type is a datatype used to specify the name and value pair attributes that define a component.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT as object (name  VARCHAR2(256),
                                                   value VARCHAR2(1024));
```

Attributes

Table 236–2 MGD_ID_COMPONENT Attributes

Attribute	Description
name	Name of component
value	Value of the component as a character

Usage Notes

None.

Examples

See the MGD_ID Constructor Function for an example.

MGD_ID_COMPONENT_VARRAY Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype used to specify a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_
COMPONENT;
```

Attributes

None.

Usage Notes

None.

Examples

See the MGD_ID Constructor Function for an example.

MGD_ID Object Type

The MGD_ID type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID as object (category_id  VARCHAR2(256),
                                         components   MGD_ID_COMPONENT_VARRAY);
```

Attributes

Table 236–3 MGD_ID Object Type Attributes

Attribute	Description
category_id	Category identifier for the code category of this code
components	List of components as name-value attributes

Methods

Table 236–5 describes the methods of the MGD_ID object type.

Table 236–4 MGD_ID Methods

Method	Description
MGD_ID constructor function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT function	Returns the string representation of the MGD_ID in the specified format
GET_COMPONENT function	Returns the string value of the specified MGD_ID component
TO_STRING function	Returns the string value of semicolon (';') separated component name value pairs of the MGD_ID object
TRANSLATE function	Returns the result of the conversion of the identifier from one format to the specified format

Usage Notes

None.

Examples

See the Summary of MGD_ID Subprograms section and Using the Identity Code Package section for examples.

Summary of MGD_ID Subprograms

Table 236–5 describes the subprograms in the MGD_ID object type.

All the values and names passed to the procedures defined in the MGD_ID object type are case insensitive unless otherwise mentioned. In order to preserve the case, double quotation marks should be used around the values.

Table 236–5 MGD_ID Object Type Subprograms

Subprogram	Description
MGD_ID Constructor Function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT Function	Returns the string representation of the MGD_ID object in the specified format
GET_COMPONENT Function	Returns the string value of the specified MGD_ID component
TO_STRING Function	Returns the string value of semicolon (';') separated component name value pairs of the MGD_ID object
TRANSLATE Function	Returns the result of the conversion of the identifier from one format to the specified format

MGD_ID Constructor Function

This constructor function constructs an identity code type object, MGD_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an MGD_ID object type based on the category ID and a list of components.

```
constructor function MGD_ID (
       category_id      IN VARCHAR2,
       components       IN MGD_ID_COMPONENT_VARRAY)
       RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
constructor function MGD_ID (
       category_id        VARCHAR2,
       identifier         VARCHAR2,
       parameter_list      VARCHAR2)
       RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, and a list of components.

```
constructor function MGD_ID (
       category_name      VARCHAR2,
       category_version   VARCHAR2,
       components         MGD_ID_COMPONENT_VARRAY)
       RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
constructor function MGD_ID (
       category_name      VARCHAR2,
       category_version   VARCHAR2,
       identifier         VARCHAR2,
       parameter_list      VARCHAR2)
       RETURN SELF AS RESULT DETERMINISTIC;
```

Parameters

Table 236–6 MGD_ID Constructor Function Parameters

Parameter	Description
`category_id`	Category identifier
`components`	List of component name value pairs
`category_name`	Category name, such as 'EPC'
`category_version`	Category version. If NULL, the latest version for the specified category name will be used.

Table 236–6 (Cont.) MGD_ID Constructor Function Parameters

Parameter	Description
identifier	Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY. It is expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters '0' and '1', a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (';') as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

Usage Notes

- Use MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID as category_id.
- If the category is not already registered, an error is raised.
- If the bit_length parameter is null, the bit_length is 8* the length of bit_encoding.
- If the component list does not contain all required components, an exception MGD_ID_UTL.e_LackComponent will be thrown.

Examples

The following examples construct identity code type objects.

Construct an MGD_ID object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
              MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
              )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('itemref', '030241'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
```

```
.
.
```

Constructs an MGD_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
              'urn:epc:id:sgtin:0037000.030241.1041970',
              'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor22.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('companyprefixlength', '7'),
                                    MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

Construct an MGD_ID object (SGTIN-64) passing in the category name, category version (if null, then the latest version will be used), and a list of components.

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
              MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
              )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor33.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('itemref', '030241'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.
```

Constructs an MGD_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
              'urn:epc:id:sgtin:0037000.030241.1041970',
              'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor4.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('companyprefixlength', '7'),
                                    MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

FORMAT Function

This function returns the string representation of the MGD_ID object in the specified format.

Syntax

```
function FORMAT (parameter_list  IN VARCHAR2,
                 output_format   IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 236–7 FORMAT Function Parameters

Parameter	Description
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (';') as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96
output_format	One of the supported output formats into which an MGD_ID component is formatted: ■ BINARY ■ LEGACY ■ TAG_ENCODING ■ PURE_IDENTITY ■ ONS_HOSTNAME

Usage Notes

None.

Examples

See the example for the GET_COMPONENT Function.

GET_COMPONENT Function

This function returns the value of the specified MGD_ID component.

Syntax

```
function GET_COMPONENT (
              component_name  IN  VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 236–8 GET_COMPONENT Function Parameter

Parameter	Description
component_name	Name of component

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id  MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    ---------------
    --PURE_IDENTIT
    ---------------
    dbms_output.put_line('..Testing constructor with pure identity');
    ------------------------------------------------------------------------
    -- PURE_IDENTITY representation can be translated to BINARY and
    -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
    ------------------------------------------------------------------------
    id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970',
'scheme=SGTIN-64;filter=3');
    dbms_output.put_line(id.to_string);
    dbms_output.put_line('filter         = ' || id.get_component('filter'));
    dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
    dbms_output.put_line('itemref        = ' || id.get_component('itemref'));
    dbms_output.put_line('serial         = ' || id.get_component('serial'));
    dbms_output.put_line('BINARY format  = ' || id.format(NULL, 'BINARY'));
    dbms_output.put_line('PURE_IDENTITY format  = ' || id.format(NULL, 'PURE_IDENTITY'));
    dbms_output.put_line('TAG_ENCODING format   = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @get_component.sql
.
.
.
..Testing constructor with pure identity
category_id =1;filter = 3;schemes = SGTIN-64;companyprefixlength =
7;companyprefix = 0037000;scheme = SGTIN-64;serial = 1041970;itemref = 030241
filter         = 3
company prefix = 0037000
itemref        = 030241
serial         = 1041970
BINARY format  =100110000000000000100000111011000100001000001111111001100011001O
PURE_IDENTITY format  = urn:epc:id:sgtin:0037000.030241.1041970
TAG_ENCODING format   = urn:epc:tag:sgtin-64:3.0037000.030241.1041970
PL/SQL procedure successfully completed.
.
.
.
```

TO_STRING Function

This function returns the semicolon (';') separated component name value pairs of the MGD_ID object.

Syntax

```
function TO_STRING
  RETURN VARCHAR2;
```

Parameters

None.

Usage Notes

None.

Examples

The following example converts the MGD_ID object into a string value:

```
-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('..Testing to_string');
   id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
      DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
      DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

SQL> @tostring3.sql
.
.
.
..Testing to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970
PL/SQL procedure successfully completed.
.
.
```

TRANSLATE Function

This static function translates between different representations directly without first constructing an MGD_ID object. This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
function TRANSLATE (
              category_name    IN VARCHAR2,
              identifier       IN VARCHAR2,
              parameter_list   IN VARCHAR2,
              output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
function TRANSLATE (
              category_name    IN VARCHAR2,
              category_version IN VARCHAR2,
              identifier       IN VARCHAR2,
              parameter_list   IN VARCHAR2,
              output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 236–9 TRANSLATE Function Parameters

Parameter	Description
`category_name`	Name of category
`category_version`	Category version. If NULL, the latest version of the specified category name will be used.
`identifier`	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters '0' and '1', a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
`parameter_list`	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (';') as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

Table 236–9 (Cont.) TRANSLATE Function Parameters

Parameter	Description
output_format	One of the supported output formats into which an MGD_ID component shall be converted: ■ BINARY ■ LEGACY ■ TAG_ENCODING ■ PURE_IDENTITY ■ ONS_HOSTNAME

Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the parameter_list parameter.

Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL,'00110101000000000000100100001000100000000000011101100010000100000000000000000111111100110001100
010'
, NULL, 'BINARY'));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL,'00110101000000000000100100001000100000000000011101100010000100000000000000000111111100110001100
010'
, NULL, 'PURE_IDENTITY'));
dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is TAG_ENCODING');
  dbms_output.put_line(
    mgd_id.translate('EPC',

Rule TYPEs

This chapter describes the types used with rules, rule sets, and evaluation contexts.

See Also:

- Chapter 112, "DBMS_RULE"
- Chapter 113, "DBMS_RULE_ADM"

This chapter contains the following topic:

- Summary of Rule Types

Summary of Rule Types

Table 237–1 Rule Types

Type	Description
"RE$ATTRIBUTE_VALUE Type" on page 237-4	Specifies the value of a variable attribute
"RE$ATTRIBUTE_VALUE_LIST Type" on page 237-5	Identifies a list of attribute values
"RE$COLUMN_VALUE Type" on page 237-6	Specifies the value of a table column
"RE$COLUMN_VALUE_LIST Type" on page 237-7	Identifies a list of column values
"RE$NAME_ARRAY Type" on page 237-8	Identifies a list of names
"RE$NAME_ARRAY Type" on page 237-8	Identifies a list of name-value pairs
"RE$NV_LIST Type" on page 237-10	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
"RE$NV_NODE Type" on page 237-12	Identifies a name-value pair
"RE$RULE_HIT Type" on page 237-13	Specifies a rule found as a result of evaluation
"RE$RULE_HIT_LIST Type" on page 237-14	Identifies a list of rules found as a result of evaluation
"RE$TABLE_ALIAS Type" on page 237-15	Provides the table corresponding to an alias used in a rule evaluation context
"RE$TABLE_ALIAS_LIST Type" on page 237-16	Identifies a list of table aliases used in a rule evaluation context
"RE$TABLE_VALUE Type" on page 237-17	Specifies the value of a table row using a `ROWID`
"RE$TABLE_VALUE_LIST Type" on page 237-18	Identifies a list of table values
"RE$VARIABLE_TYPE Type" on page 237-19	Provides the type of a variable used in a rule evaluation context
"RE$VARIABLE_TYPE_LIST Type" on page 237-21	Identifies a list of variables and their types used in a rule evaluation context
"RE$VARIABLE_VALUE Type" on page 237-22	Specifies the value of a variable
"RE$VARIABLE_VALUE_LIST Type" on page 237-23	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- `DBMS_RULE`
- `DBMS_RULE_ADM`

You can use the DBMS_RULE_ADM package to create and administer rules, rule sets, and evaluation contexts, and you can use the DBMS_RULE package to evaluate rules.

When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- DBMS_APPLY_ADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_STREAMS_AUTH

See Also: *Oracle Streams Concepts and Administration*

RE$ATTRIBUTE_VALUE Type

Specifies the value of a variable attribute.

> **Note:** Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
   variable_name    VARCHAR2(32),
   attribute_name   VARCHAR2(4000),
   attribute_value  ANYDATA);
```

Attributes

Table 237–2 RE$ATTRIBUTE_VALUE Attributes

Attribute	Description
`variable_name`	Specifies the variable used in a rule
`attribute_name`	Specifies the attribute name. The attribute name can be a multi-component name, such as `a1.b2.c3`.
`attribute_value`	Specifies the attribute value

RE$ATTRIBUTE_VALUE_LIST Type

Identifies a list of attribute values.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

RE$COLUMN_VALUE Type

Specifies the value of a table column.

> **Note:** Enclose the column name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
   table_alias   VARCHAR2(32),
   column_name   VARCHAR2(4000),
   column_value  ANYDATA);
```

Attributes

Table 237–3 RE$COLUMN_VALUE Attributes

Attribute	Description
`table_alias`	Specifies the alias used for the table in a rule
`column_name`	Specifies the column name
`column_value`	Specifies the column value

RE$COLUMN_VALUE_LIST Type

Identifies a list of column values.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

RE$NAME_ARRAY Type

Identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

RE$NV_ARRAY Type

Identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

RE$NV_LIST Type

Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
   actx_list  SYS.RE$NV_ARRAY);
```

Attributes

Table 237–4 RE$NV_LIST Attributes

Attribute	Description
actx_list	The list of name-value pairs

RE$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE$NV_LIST type:

- ADD_PAIR Member Procedure
- GET_ALL_NAMES Member Function
- GET_VALUE Member Function
- REMOVE_PAIR Member Procedure

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
   name   IN  VARCHAR2,
   value  IN  ANYDATA);
```

Parameters

Table 237–5 ADD_PAIR Procedure Parameters

Parameter	Description
name	The name in the name-value pair being added to the list. If the name already exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.

Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER FUNCTION GET_VALUE(
   name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 237–6 GET_VALUE Procedure Parameters

Parameter	Description
name	The name whose value to return

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE REMOVE_PAIR(
   name  IN  VARCHAR2);
```

Parameters

Table 237–7 REMOVE_PAIR Procedure Parameters

Parameter	Description
name	The name of the pair to remove

RE$NV_NODE Type

Identifies a name-value pair.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$NV_NODE (
   nvn_name   VARCHAR2(30),
   nvn_value  ANYDATA);
```

Attributes

Table 237–8 RE$NV_NODE Attributes

Attribute	Description
nvn_name	Specifies the name in the name-value pair
nvn_value	Specifies the value in the name-value pair

RE$RULE_HIT Type

Specifies a rule found as a result of an evaluation.

See Also:

- "CREATE_RULE Procedure" on page 113-14
- "ALTER_RULE Procedure" on page 113-10

Syntax

```
TYPE SYS.RE$RULE_HIT (
   rule_name            VARCHAR2(65),
   rule_action_context  RE$NV_LIST);
```

Attributes

Table 237–9 RE$RULE_HIT Attributes

Attribute	Description
`rule_name`	The rule name in the form *`schema_name.rule_name`*. For example, a rule named `employee_rule` in the `hr` schema is returned in the form `"hr"."employee_rule"`.
`rule_action_context`	The rule action context as specified in the `CREATE_RULE` or `ALTER_RULE` procedure of the `DBMS_RULE_ADM` package

RE$RULE_HIT_LIST Type

Identifies a list of rules found as a result of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

RE$TABLE_ALIAS Type

Provides the table corresponding to an alias used in a rule evaluation context. A specified table name must satisfy the schema object naming rules.

Note: Enclose the table name in double quotation marks (") if the name contains special characters.

See Also: *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
   table_alias  VARCHAR2(32),
   table_name   VARCHAR2(194));
```

Attributes

Table 237–10 RE$TABLE_ALIAS Attributes

Attribute	Description
`table_alias`	The alias used for the table in a rule
`table_name`	The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: *`schema_name.table_name`* *`table_name`* For example, if the *`schema_name`* is `hr` and the *`table_name`* is `employees`, then enter the following: `hr.employees`

RE$TABLE_ALIAS_LIST Type

Identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

RE$TABLE_VALUE Type

Specifies the value of a table row using a `ROWID`.

Syntax

```
TYPE SYS.RE$TABLE_VALUE(
   table_alias  VARCHAR2(32),
   table_rowid  VARCHAR2(18));
```

Attributes

Table 237–11 RE$TABLE_VALUE Attributes

Attribute	Description
`table_alias`	Specifies the alias used for the table in a rule
`table_rowid`	Specifies the rowid for the table row

RE$TABLE_VALUE_LIST Type

Identifies a list of table values.

Note: Each table alias in the list in the list must be unique.

Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

RE$VARIABLE_TYPE Type

Provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

> **Note:** Enclose the variable name in double quotation marks (") if the name contains special characters.

See Also: *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
   variable_name             VARCHAR2(32),
   variable_type             VARCHAR2(4000),
   variable_value_function   VARCHAR2(228),
   variable_method_function  VARCHAR2(228));
```

Attributes

Table 237–12 RE$VARIABLE_TYPE Attributes

Attribute	Description
`variable_name`	The variable name used in a rule
`variable_type`	The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the *Oracle Database SQL Language Reference* for more information about these types.
`variable_value_function`	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the "Usage Notes" for more information.
`variable_method_function`	Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the "Usage Notes" for more information.

Usage Notes

The functions for both the for the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

`schema_name.package_name.function_name@dblink`

Any of the following parts of the format can be omitted: *schema_name*, *package_name*, and *@dblink*.

For example, if the *schema_name* is hr, the *package_name* is var_pac, the *function_name* is func_value, and the *dblink* is dbs1.net, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

Signature for variable_value_function

The function must have the following signature:

```
FUNCTION variable_value_function_name(
  evaluation_context_schema  IN VARCHAR2,
  evaluation_context_name    IN VARCHAR2,
  variable_name              IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

Signature for variable_method_function

This function must have the following signature:

```
FUNCTION variable_method_function_name(
  evaluation_context_schema  IN VARCHAR2,
  evaluation_context_name    IN VARCHAR2,
  variable_value             IN SYS.RE$VARIABLE_VALUE,
  method_name                IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

RE$VARIABLE_TYPE_LIST Type

Identifies a list of variables and their types used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

RE$VARIABLE_VALUE Type

Specifies the value of a variable.

> **Note:** Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (
   variable_name  VARCHAR2(32),
   variable_data  ANYDATA);
```

Attributes

Table 237–13 RE$VARIABLE_VALUE Attributes

Attribute	Description
`variable_name`	Specifies the variable name used in a rule
`variable_data`	Specifies the data for the variable value

RE$VARIABLE_VALUE_LIST Type

Identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

238

Rules Manager Types

Rules Manager is supplied with one predefined type and a public synonym for this type.

> **See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- Summary of Rule Manager Types

Summary of Rule Manager Types

Table 238–1 describes the Rules Manager object type.

Table 238–1 Rules Manager Object Types

Object Type Name	Description
RLM$EVENTIDS Object Type	Specifies a list of event identifiers to the `CONSUME_PRIM_EVENTS` procedure

RLM$EVENTIDS Object Type

The RLM$EVENTIDS type is defined as a table of VARCHAR2 values as follows:

Syntax

```
CREATE OR REPLACE TYPE RLM$EVENTIDS is table of VARCHAR2(38);
```

Attributes

None.

Usage Notes

- RLM$EVENTIDS type is used to pass a list of event identifiers to the CONSUME_PRIM_EVENTS procedure. These event identifiers are ROWIDs for the corresponding events in the database and their values are available through the arguments of the action callback procedure and rule class results view columns, when the rule class is configured for RULE consumption policy

Examples

The following commands show the body of the action callback procedure for a rule class configured for RULE consumption policy. This demonstrates the use of RLM$EVENTDIDS type to consume the events before executing the action for the matched rules.

```
CREATE OR REPLACE PROCEDURE PromoAction (
      Flt        AddFlight,
      Flt_EvtId  ROWID,    --- rowid for the fligt primitive event
      Car        AddRentalCar,
      Car_EvtId  ROWID,
      rlm$rule   TravelPromotions%ROWTYPE) is
 evtcnsmd   NUMBER;
BEGIN
 evtcnsmd := dbms_rlmgr.consume_prim_events(
              rule_class   => 'TravelPromotions',
              event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));

 IF (evtcnsmd = 1) THEN
   -- consume operation was successful; perform the action ---
   OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
 END IF;
END;
/
```

239

UTL Streams Types

`UTL Streams Types` describes abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the '`SYS`' schema. The streams may be referenced by `PUBLIC` and are described in the following sections.

See Also: *F*or more information, see A.

This chapter contains the following topics:

- Summary of UTL Binary Streams Types

Summary of UTL Binary Streams Types

Table 239–1 UTL Binary Streams Types

Type	Description
UTL_BINARYINPUTSTREAM Type on page 239-3	Reads bytes and closes a stream.
UTL_BINARYOUTPUTSTREAM Type on page 239-4	Writes bytes and closes a stream.
UTL_CHARACTERINPUTSTREAM Type on page 239-5	Reads chars and closes a stream.
UTL_CHARACTEROUTPUTSTREAM Type on page 239-6	Writes chars and closes a stream.

UTL_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (

   MEMBER FUNCTION available (
        self    IN OUT NOCOPY  Utl_BinaryInputStream)
     RETURN INTEGER,

   MEMBER FUNCTION read (                                    -- #1
      self      IN OUT NOCOPY  Utl_BinaryInputStream,
      numBytes  IN             INTEGER DEFAULT 1)
    RETURN RAW,

  MEMBER PROCEDURE read (                                    -- #2
     self       IN OUT NOCOPY   Utl_BinaryInputStream,
     bytes      IN OUT NOCOPY  RAW,
     numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE read (                                    -- #3
     self       IN OUT NOCOPY   Utl_BinaryInputStream,
     bytes      IN OUT NOCOPY   RAW,
     offset     IN INTEGER,
     numBytes   IN OUT          INTEGER),

  member function close (
     self       In Out Nocopy   Utl_BinaryInputStream)

 ) NOT FINAL;
```

Attributes

Table 239–2 UTL_BINARYINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	■ #1 - Reads the number of bytes specified by numBytes (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned. ■ #2 - Reads the number of bytes specified in numBytes into the parameter bytes. Additionally, the actual number of bytes read is returned in parameter numBytes. If this parameter is set to 0 then there are no more bytes to be read. ■ #3 - Reads the number of bytes specified in numBytes into the parameter bytes, beginning at the offset specified by parameter offset. The actual number of bytes read is returned in parameter numBytes. If this value is 0, then there are no additional bytes to be read.
CLOSE	Releases all resources held on the node to support the stream

UTL_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

  MEMBER FUNCTION write (                                  -- #1
       self       IN OUT NOCOPY   sys.utl_BinaryOutputStream,
       bytes      IN              RAW,
       numBytes   IN              INTEGER DEFAULT 1)
  RETURN INTEGER,

  MEMBER PROCEDURE write (                                  -- #2
       self       IN OUT NOCOPY  sys.utl_BinaryOutputStream,
       bytes      IN NOCOPY      RAW,
       numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE write (                                  -- #3
       self       IN OUT NOCOPY  utl_BinaryOutputStream,
       bytes      IN NOCOPY      RAW,
       offset     IN             INTEGER,
       numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE flush (
       self       IN OUT NOCOPY  utl_BinaryOutputStream),

  MEMBER PROCEDURE close (
       self       IN OUT NOCOPY utl_BinaryOutputStream)

 ) NOT FINAL;
```

Attributes

Table 239–3 UTL_BINARYOUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
`WRITE`	■ #1 - Writes the number of bytes specified by `numBytes` (default is 1) from `RAW` into the stream. The actual number of bytes written is returned. ■ #2 - Writes the number of bytes specified in parameter `numBytes` from parameter bytes to the stream. The actual number of bytes written is returned in parameter `numBytes`. ■ #3 - Writes the number of bytes specified by `numBytes` to the stream, beginning at the offset specified by parameter offset. The actual number of bytes written is returned in parameter `numBytes`.
`FLUSH`	Insures that any buffered bytes are copied to the node destination
`CLOSE`	Frees all resources associated with the stream

UTL_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

   MEMBER FUNCTION available (
       self       IN OUT NOCOPY   utl_CharacterInputStream)
    RETURN INTEGER,

   MEMBER FUNCTION read (                                  -- #1
       self       IN OUT NOCOPY   utl_CharacterInputStream,
       numChars   IN              INTEGER DEFAULT 1,
       lineFeed   IN              BOOLEAN DEFAULT FALSE)
    RETURN VARCHAR2,

  MEMBER PROCEDURE read (                                  -- #2
       self      IN OUT NOCOPY    utl_CharacterInputStream,
       chars     IN OUT NOCOPY    VARCHAR2,
       numChars  IN OUT           INTEGER,
       lineFeed  IN BOOLEAN DEFAULT FALSE),

  MEMBER PROCEDURE read (                                  -- #3
       self      IN  OUT NOCOPY   utl_CharacterInputStream,
       chars     IN OUT NOCOPY    VARCHAR2,
       offset    IN               INTEGER,
       numChars  IN OUT           INTEGER,
       lineFeed  IN               BOOLEAN DEFAULT FALSE),

   MEMBER PROCEDURE close (
      self       IN OUT NOCOPY    utl_CharacterInputStream)

 ) NOT FINAL;
```

Attributes

Table 239–4 UTL_CHARACTERINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	■ #1 - Returns the number of characters remaining to be read ■ #2 - Reads the number of characters specified by `numChars` (default value is 1) and returns the characters as a `VARCHAR2`. If the value of `lineFeed` is true (default value is `FALSE`) then the reading stops if a linefeed character is found. If there are no remaining characters a value of `NULL` is returned. ■ #3 - Reads reads the number of characters specified by parameter `numChars` into the parameter chars. Additionally, the actual number of characters read is returned in parameter `numChars`. If this value is 0, then there are no more characters to be read. If the value of `lineFeed` is `TRUE` (default is `FALSE`), then reading stops if a linefeed character is encountered.
CLOSE	Releases all resources held by the stream

UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE utl_CharacterOutputStream  AS OBJECT (

 MEMBER FUNCTION write (                                  -- #1
     self      IN OUT NOCOPY   utl_CharacterOutputStream,
     chars     IN              VARCHAR2,
     numChars  IN              INTEGER DEFAULT 1,
     lineFeed  IN              BOOLEAN DEFAULT FALSE)
  RETURN INTEGER,

 MEMBER PROCEDURE write (                                  -- #2
     self      IN OUT NOCOPY   utl_CharacterOutputStream,
     chars     IN OUT NOCOPY   VARCHAR2,
     numChars  IN OUT          INTEGER,
     lineFeed  IN              BOOLEAN DEFAULT FALSE),

 member procedure write (                                  -- #3
     self     IN OUT NOCOPY    utl_CharacterOutputStream,
     chars    IN  NOCOPY       varchar2,
     offset   IN               integer,
     numChars IN OUT           integer,
    lineFeed  IN               boolean default false),

 MEMBER PROCEDURE flush (
     self     IN OUT NOCOPY    utl_CharacterOutputStream),

MEMBER PROCEDURE close (
     self     IN OUT NOCOPY utl_CharacterOutputStream)

 ) NOT FINAL;
```

Attributes

Table 239–5 UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
`WRITE`	■ #1 - Writes the number of characters specified by `numChars` (default is 1) from parameter chars into the stream and returns the actual number of characters written. If the value of `lineFeed` is TRUE (default is `FALSE`) a `lineFeed` character is inserted after the last character. ■ #2 - writes the number of characters specified by parameter `numChars`, from parameter `chars` into the stream. The actual number of characters written is returned in parameter `numChars`. If the value of `lineFeed` is true (default is `FALSE`) a `lineFeed` character is inserted after the last character. ■ #3 - Writes the number of characters specified by parameter `numChars`, from parameter `chars`, beginning at `offset` specified by parameter offset. The actual number of characters written is returned in parameter `numChars`. If the value of `lineFeed` is true (default is `FALSE`) a `lineFeed` character is inserted after the last character .

Table 239–5 (Cont.) UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
FLUSH	Copies all characters that may be contained within buffers to the node value
CLOSE	Releases all resources held by the stream

240

XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It as predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLGEN` and `SYS_XMLAGG SQL` functions.

This chapter contains the following topics:

- Summary of XMLType Subprograms

See Also:

- *Oracle XML DB Developer's Guide*

Summary of XMLType Subprograms

Table 240–1 summarizes functions and procedures of the `XMLType`.

Table 240–1 XMLTYPE Subprograms

Method	Description
CREATENONSCHEMABASEDXML on page 240-4	Creates a non schema based XML from the input schema based instance.
CREATESCHEMABASEDXML on page 240-5	Creates a schema based `XMLType` instance from the non-schema based instance using the input schema URL.
CREATEXML on page 6	Static function for creating and returning an `XMLType` instance.
EXISTSNODE on page 240-8	Takes a `XMLType` instance and a `XPath` and returns 1 or 0 indicating if applying the `XPath` returns a non-empty set of nodes.
EXTRACT on page 240-9	Takes a `XMLType` instance and an `XPath`, applies the XPath expression and returns the results as an `XMLType`.
GETBLOBVAL on page 240-10	Returns the value of the `XMLType` instance as a `BLOB`
GETCLOBVAL on page 240-11	Returns the value of the `XMLType` instance as a `CLOB`.
GETNAMESPACE on page 240-12	Returns the namespace for the top level element in a schema based document.
GETNUMBERVAL on page 240-13	Returns the value of the `XMLType` instance as a `NUMBER`. This is only valid if the input `XMLType` instance contains a simple text node and is convertible to a number.
GETROOTELEMENT on page 240-14	Returns the root element of the input instance. Returns `NULL` if the instance is a fragment
GETSCHEMAURL on page 240-15	Returns the XML schema URL if the input is an XML Schema based.
GETSTRINGVAL on page 240-16	Returns the value of the `XMLType` instance as a string.
ISFRAGMENT on page 240-17	Checks if the input `XMLType` instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
ISSCHEMABASED on page 240-18	Returns 1 or 0 indicating if the input `XMLType` instance is a schema based one or not.
ISSCHEMAVALID on page 240-19	Checks if the input instance is schema valid according to the given schema URL.
ISSCHEMAVALIDATED on page 240-20	Checks if the instance has been validated against the schema.
SCHEMAVALIDATE on page 240-21	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
SETSCHEMAVALIDATED on page 240-22	Sets the schema valid flag to avoid costly schema validation.
TOOBJECT on page 240-23	Converts the `XMLType` instance to an object type.
TRANSFORM on page 240-24	Takes an `XMLType` instance and an associated stylesheet (which is also an `XMLType` instance), applies the stylesheet and returns the result as XML.

Table 240–1 (Cont.) XMLTYPE Subprograms

Method	Description
XMLTYPE on page 240-25	Constructs an instance of the XMLType datatype. The constructor can take in the XML as a `CLOB`, `VARCHAR2` or take in a object type.

CREATENONSCHEMABASEDXML

Member function. Creates a non-schema based XML document from a schema based instance.

Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

CREATESCHEMABASEDXML

Member function. Creates a schema based `XMLType` instance from a non-schema based `XMLType` value. It uses either the supplied `SCHEMA` URL, or the `SCHEMALOCATION` attribute of the instance.

Syntax

```
MEMBER FUNCTION createSchemaBasedXML(
schema IN varchar2 := NULL)
return XMLType deterministic;
```

Parameter	Description
`schema`	Optional XMLSchema URL used to convert the value to the specified schema..

CREATEXML

Static function for creating and returning an XMLType instance. The string and clob parameters used to pass in the date must contain well-formed and valid XML documents. The options are described in the following table.

Syntax	Description

`STATIC FUNCTION createXML(`
`  xmlData IN varchar2)`
`RETURN XMLType deterministic;`
	Creates the XMLType instance from a string.

`STATIC FUNCTION createXML(`
`  xmlData IN clob)`
`RETURN XMLType  deterministic;`
	Creates the XMLType instance from a CLOB.

`STATIC FUNCTION createXML (`
`  xmlData IN clob,`
`  schema IN varchar2,`
`  validated IN number := 0,`
`  wellformed IN number := 0 )`
`RETURN XMLType deterministic;`
	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.

`STATIC FUNCTION createXML (`
`  xmlData IN varchar2,`
`  schema IN varchar2,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`RETURN XMLType deterministic;`
	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.

`STATIC FUNCTION createXML (`
`  xmlData IN "<ADT_1>",`
`  schema IN varchar2 := NULL,`
`  element IN varchar2 := NULL,`
`  validated IN NUMBER := 0)`
`RETURN XMLType deterministic;`
	Creates an XML instance from an instance of an user-defined type.

`STATIC FUNCTION createXML (`
`  xmlData IN SYS_REFCURSOR,`
`  schema in varchar2 := NULL,`
`  element in varchar2 := NULL,`
`  validated in number := 0)`
`RETURN XMLType deterministic;`
	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.

Syntax	Description
STATIC FUNCTION createXML (xmlData IN AnyData, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN sys.XMLType deterministic parallel_enable	Creates an XML instance from ANYDATA. If the ANYDATAinstance contains an ADT, the XMLTypereturned is the same as would be returned for a call directly on the ADT. If the ANYDATAcontains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.
STATIC FUNCTION createXML (xmlData IN blob, csid IN number, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic	Creates an XML instance from a BLOB.
STATIC FUNCTION createXML (xmlData IN bfile, csid IN number, Schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic	Creates an XML instance from a BFILE.

Parameter	Description
xmlData	The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema.
validated	Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)
wellformed	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)
CSID	The character set id of input XML data.

EXISTSNODE

Member function. Checks if the node exists. If the XPath string is `NULL` or the document is empty, then a value of 0 is returned, otherwise returns 1. The options are described in the following table.

Syntax	Description

`MEMBER FUNCTION existsNode(`
`  xpath IN varchar2)`
`RETURN number deterministic;`
	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.

`MEMBER FUNCTION existsNode(`
`  xpath in varchar2,`
`  nsmap in varchar2)`
`RETURN number deterministic;`
	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

Parameter	Description
`xpath`	The XPath expression to test.
`nsmap`	Optional namespace mapping.

EXTRACT

Member function. Extracts an `XMLType` fragment and returns an `XMLType` instance containing the result node(s). If the XPath does not result in any nodes, then returns `NULL`. The options are described in the following table.

Syntax	Description

`MEMBER FUNCTION extract(`
`  xpath IN varchar2)`
`RETURN XMLType deterministic;`
	Given an XPath expression, applies the XPath to the document and returns the fragment as an `XMLType`.

`MEMBER FUNCTION extract(`
`  xpath IN varchar2,`
`  nsmap IN varchar2)`
`RETURN XMLType deterministic;`
	This member function applies the XPath expression and namespace mapping, over the XML data to return a `XMLType` instance containing the resultant fragment.

Parameter	Description
`xpath`	The XPath expression to apply.
`nsmap`	Optional prefix to namespace mapping information.

GETBLOBVAL

Member function. Returns a `BLOB` containing the serialized XML representation; if the returns is a temporary `BLOB`, then it must be freed after use.

Syntax

```
MEMBER FUNCTION getBlobVal()
RETURN Blob deterministic;
```

GETCLOBVAL

Member function. Returns a CLOB containing the serialized XML representation; if the returns is a temporary CLOB, then it must be freed after use.

Syntax

```
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

GETNAMESPACE

Member function. Returns the namespace of the top level element in the instance. Returns `NULL` if the input is a fragment or is a non-schema based instance.

Syntax

```
MEMBER FUNCTION getNamespace
return varchar2 deterministic;
```

GETNUMBERVAL

Member function. Returns a numeric value, formatted from the text value pointed to by the `XMLType` instance. The `XMLType` must point to a valid text node that contains a numerical value. The options are described in the following table.

Syntax

```
MEMBER FUNCTION getNumberVal()
RETURN number deterministic;
```

GETROOTELEMENT

Member function. Gets the root element of the `XMLType` instance. Returns `NULL` if the instance is a fragment.

Syntax

```
MEMBER FUNCTION getRootElement
return varchar2 deterministic;
```

GETSCHEMAURL

Member function. Returns the XML Schema URL corresponding to the `XMLType` instance, if the `XMLType` instance is a schema-based document. Otherwise returns `NULL`.

Syntax

```
MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;
```

GETSTRINGVAL

Member function. Returns the document as a string. Returns s string containing the seralized XML representation, or in case of text nodes, the text itself. If the XML document is bigger than the maximum size of the `VARCHAR2`, which is 4000, then an error is raised at run time.

Syntax

```
MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
```

ISFRAGMENT

Determines if the `XMLType` instance corresponds to a well-formed document, or a fragment. Returns 1 or 0 indicating if the `XMLType` instance contains a fragment or a well-formed document.

Syntax

```
MEMBER FUNCTION isFragment()
RETURN number deterministic;
```

ISSCHEMABASED

Member function. Determines whether the `XMLType` instance is schema-based or not. Returns 1 or 0 depending on whether the `XMLType` instance is schema-based.

Syntax

```
MEMBER FUNCTION isSchemaBased
return number deterministic;
```

ISSCHEMAVALID

Member function. Checks if the input instance is conformant to a specified schema. Does not change the validation status of the XML instance. If a XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the `XMLType` instance's own schema.

Syntax

```
member function isSchemaValid(
schurl IN VARCHAR2 := NULL,
elem IN VARCHAR2 := NULL)
return NUMBER deterministic;
```

Parameter	IN / OUT	Description
`schurl`	`(IN)`	The URL of the XML Schema against which to check conformance.
`elem`	`(IN)`	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

ISSCHEMAVALIDATED

Member function. Returns the validation status of the `XMLType` instance -- tells if a schema based instance has been actually validated against its schema. Returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

SCHEMAVALIDATE

Member procedure. Validates the XML instance against its schema if it hasn't already been done. For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

```
MEMBER PROCEDURE schemaValidate(
   self IF OUT NOCOPY XMLType);
```

Parameter	IN / OUT	Description
self	(OUT)	XML instance being validated against the schema.

SETSCHEMAVALIDATED

Member function. Sets the `VALIDATION` state of the input XML instance.

Syntax

```
MEMBER PROCEDURE setSchemaValidated(
self IF OUT NOCOPY XMLType,
   flag IN BINARY_INTEGER := 1);
```

Parameter	IN / OUT	Description
`self`	`(OUT)`	XML instance.
`flag`	`(IN)`	0 - `NOT VALIDATED`; 1 - `VALIDATED` (Default)

TOOBJECT

Member procedure. Converts the XML value to an object type using the XMLSCHEMA mapping, if available. If a SCHEMA is not supplied or the input is a non-schema based XML, the procedure uses cannonical mapping between elements and object type attributes.

See Also:

- An in-depth discussion of this topic inside *Oracle XML DB Developer's Guide*

Syntax

```
MEMBER PROCEDURE toObject(
SELF in XMLType,
object OUT "<ADT_1>",
schema in varchar2 := NULL,
element in varchar2 := NULL);
```

Parameter	IN / OUT	Description
SELF	(IN)	Instance to be converted. Implicit if used as a member procedure.
object	(IN)	Converted object. An object instance of the required type may be passed in to this function
schema	(IN)	Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema.
element	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter.

TRANSFORM

Member function. This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs. If any of the arguments other than the parammap is NULL, then a NULL is returned.

Syntax

```
MEMBER FUNCTION transform(
xsl IN XMLType,
parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

Parameter	IN / OUT	Description
xsl	(IN)	The XSL stylesheet describing the transformation
parammap	(IN)	Top level parameters to the XSL - string of name=value pairs

XMLTYPE

XMLType constructor. The options are described in the following table.

Syntax	Description
constructor function XMLType(xmlData IN clob, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN Number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.
constructor function XMLType(xmlData IN varchar2, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.
constructor function XMLType (xmlData IN "w<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.
constructor function XMLType(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.
constructor function XMLType(xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic parallel_enable	This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.

Syntax	Description

`constructor function XMLType(`
`  xmlData IN blob, csid IN number,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`return self as result deterministic`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `BLOB` parameter.

`constructor function XMLType(`
`  xmlData IN bfile,`
`  csid IN number,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`return self as result deterministic`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `BFILE` parameter.

Parameter	Description
`xmlData`	The data in the form of a `BFILE`, `BLOB`, `CLOB`, `REF`s, `VARCHAR2` or object type.
`schema`	Optional Schema URL to be used to make the input conform to the given schema.
`validated`	Indicates that the instance is valid to the given XML Schema.
`wellformed`	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
`element`	Optional element name in the case of the `ADT_1` or `REF CURSOR` constructors. (Default is `NULL`)
`CSID`	The character set id of input XML data.
