The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

What's New in PL/SQL Packages and Types Reference? xciii

Oracle Database 11g Release 1 (11.1) xciii

1 Introduction to Oracle Supplied PL/SQL Packages & Types

Package Overview 1-2
Package Components 1-3
Using Oracle Supplied Packages 1-4
Creating New Packages 1-5
Referencing Package Contents 1-8
Summary of Oracle Supplied PL/SQL Packages and Types 1-9

2 APEX_CUSTOM_AUTH

Documentation of APEX_CUSTOM_AUTH 2-2

3 APEX_APPLICATION

Documentation of APEX_APPLICATION 3-2

4 APEX_ITEM

Documentation of APEX_ITEM 4-2

5 APEX_UTIL

Documentation of APEX_UTIL 5-2

6 CTX_ADM

Documentation of CTX_ADM 6-2

7 CTX_CLS

Documentation of CTX_CLS 7-2

8 CTX_DDL

Documentation of CTX_DDL 8-2

9 CTX_DOC

Documentation of CTX_DOC 9-2

10 CTX_OUTPUT

Documentation of CTX_OUTPUT 10-2

11 CTX_QUERY

Documentation of CTX_QUERY 11-2

12 CTX_REPORT

Documentation of CTX_REPORT 12-2

13 CTX_THES

Documentation of CTX_THES 13-2

14 CTX_ULEXER

Documentation of CTX_ULEXER 14-2

15 DBMS_ADDM

Using DBMS_ADDM 15-2
Security Model 15-3
Summary of DBMS_ADDM Subprograms 15-4
ANALYZE_DB Procedure 15-5
ANALYZE_INST Procedure 15-6
ANALYZE_PARTIAL Procedure 15-7
DELETE Procedure 15-8
DELETE_FINDING_DIRECTIVE Procedure 15-9
DELETE_PARAMETER_DIRECTIVE Procedure 15-10
DELETE_SEGMENT_DIRECTIVE Procedure 15-11
DELETE_SQL_DIRECTIVE Procedure 15-12
GET_REPORT Function 15-13
INSERT_FINDING_DIRECTIVE Procedure 15-14
INSERT_PARAMETER_DIRECTIVE Procedure 15-15
INSERT_SEGMENT_DIRECTIVE Procedure 15-16
INSERT_SQL_DIRECTIVE Procedure 15-18

16 DBMS_ADVANCED_REWRITE

Using DBMS_ADVANCED_REWRITE 16-2
Security Model 16-3
Summary of DBMS_ADVANCED_REWRITE Subprograms 16-4
ALTER_REWRITE_EQUIVALENCE Procedure 16-5
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure 16-6
DECLARE_REWRITE_EQUIVALENCE Procedures 16-7
DROP_REWRITE_EQUIVALENCE Procedure 16-9
VALIDATE_REWRITE_EQUIVALENCE Procedure 16-10

17 DBMS_ADVISOR

Using DBMS_ADVISOR 17-2
Security Model 17-3
Summary of DBMS_ADVISOR Subprograms 17-4
ADD_SQLWKLD_REF Procedure 17-7
ADD_SQLWKLD_STATEMENT Procedure 17-8
ADD_STS_REF Procedure 17-10
CANCEL_TASK Procedure 17-11
COPY_SQLWKLD_TO_STS Procedure 17-12
CREATE_FILE Procedure 17-13
CREATE_OBJECT Procedure 17-14
CREATE_SQLWKLD Procedure 17-16
CREATE_TASK Procedures 17-17
DELETE_SQLWKLD Procedure 17-19
DELETE_SQLWKLD_REF Procedure 17-20
DELETE_SQLWKLD_STATEMENT Procedures 17-21
DELETE_STS_REF Procedure 17-22
DELETE_TASK Procedure 17-23
EXECUTE_TASK Procedure 17-24
GET_REC_ATTRIBUTES Procedure 17-26
GET_TASK_REPORT Function 17-27
GET_TASK_SCRIPT Function 17-28
IMPLEMENT_TASK Procedure 17-30
IMPORT_SQLWKLD_SCHEMA Procedure 17-31
IMPORT_SQLWKLD_SQLCACHE Procedure 17-33
IMPORT_SQLWKLD_STS Procedure 17-35
IMPORT_SQLWKLD_SUMADV Procedure 17-37
IMPORT_SQLWKLD_USER Procedure 17-39
INTERRUPT_TASK Procedure 17-41
MARK_RECOMMENDATION Procedure 17-42
QUICK_TUNE Procedure 17-44
RESET_SQLWKLD Procedure 17-45
RESET_TASK Procedure 17-46
SET_DEFAULT_SQLWKLD_PARAMETER Procedures 17-47
SET_DEFAULT_TASK_PARAMETER Procedures 17-48
SET_SQLWKLD_PARAMETER Procedures 17-49

SET_TASK_PARAMETER Procedure 17-50
TUNE_MVIEW Procedure 17-63
UPDATE_OBJECT Procedure 17-65
UPDATE_REC_ATTRIBUTES Procedure 17-67
UPDATE_SQLWKLD_ATTRIBUTES Procedure 17-69
UPDATE_SQLWKLD_STATEMENT Procedure 17-70
UPDATE_TASK_ATTRIBUTES Procedure 17-72

18 DBMS_ALERT

Using DBMS_ALERT 18-2
Overview 18-3
Security Model 18-4
Constants 18-5
Restrictions 18-6
Exceptions 18-7
Operational Notes 18-8
Examples 18-10
Summary of DBMS_ALERT Subprograms 18-11
REGISTER Procedure 18-12
REMOVE Procedure 18-13
REMOVEALL Procedure 18-14
SET_DEFAULTS Procedure 18-15
SIGNAL Procedure 18-16
WAITANY Procedure 18-17
WAITONE Procedure 18-18

19 DBMS_APPLICATION_INFO

Using DBMS_APPLICATION_INFO 19-2
Overview 19-3
Security Model 19-4
Operational Notes 19-5
Summary of DBMS_APPLICATION_INFO Subprograms 19-6
READ_CLIENT_INFO Procedure 19-7
READ_MODULE Procedure 19-8
SET_ACTION Procedure 19-9
SET_CLIENT_INFO Procedure 19-10
SET_MODULE Procedure 19-11
SET_SESSION_LONGOPS Procedure 19-12

20 DBMS_APPLY_ADM

Summary of DBMS_APPLY_ADM Subprograms 20-2
ALTER_APPLY Procedure 20-4
COMPARE_OLD_VALUES Procedure 20-9
CREATE_APPLY Procedure 20-11
CREATE_OBJECT_DEPENDENCY Procedure 20-18
DELETE_ALL_ERRORS Procedure 20-19

DELETE_ERROR Procedure 20-20
DROP_APPLY Procedure 20-21
DROP_OBJECT_DEPENDENCY Procedure 20-22
EXECUTE_ALL_ERRORS Procedure 20-23
EXECUTE_ERROR Procedure 20-24
GET_ERROR_MESSAGE Function 20-27
SET_DML_HANDLER Procedure 20-28
SET_ENQUEUE_DESTINATION Procedure 20-33
SET_EXECUTE Procedure 20-35
SET_GLOBAL_INSTANTIATION_SCN Procedure 20-37
SET_KEY_COLUMNS Procedures 20-39
SET_PARAMETER Procedure 20-41
SET_SCHEMA_INSTANTIATION_SCN Procedure 20-46
SET_TABLE_INSTANTIATION_SCN Procedure 20-48
SET_UPDATE_CONFLICT_HANDLER Procedure 20-50
SET_VALUE_DEPENDENCY Procedure 20-53
START_APPLY Procedure 20-54
STOP_APPLY Procedure 20-55

21 DBMS_AQ

Using DBMS_AQ 21-2
Constants 21-3
Data Structures 21-5
Operational Notes 21-8
Summary of DBMS_AQ Subprograms 21-9
BIND_AGENT Procedure 21-10
DEQUEUE Procedure 21-11
DEQUEUE_ARRAY Function 21-14
ENQUEUE Procedure 21-16
ENQUEUE_ARRAY Function 21-18
LISTEN Procedures 21-19
POST Procedure 21-21
REGISTER Procedure 21-22
UNBIND_AGENT Procedure 21-23
UNREGISTER Procedure 21-24

22 DBMS_AQADM

Using DBMS_AQADM 22-2
Constants 22-3
Subprogram Groups 22-4
Queue Table Subprograms 22-5
Privilege Subprograms 22-6
Queue Subprograms 22-7
Subscriber Subprograms 22-8
Notification Subprograms 22-9
Propagation Subprograms 22-10

Oracle Streams AQ Agent Subprograms 22-11
Alias Subprograms 22-12
Summary of DBMS_AQADM Subprograms 22-13
ADD_ALIAS_TO_LDAP Procedure 22-15
ADD_SUBSCRIBER Procedure 22-16
ALTER_AQ_AGENT Procedure 22-17
ALTER_PROPAGATION_SCHEDULE Procedure 22-18
ALTER_QUEUE Procedure 22-19
ALTER_QUEUE_TABLE Procedure 22-20
ALTER_SUBSCRIBER Procedure 22-21
CREATE_AQ_AGENT Procedure 22-22
CREATE_NP_QUEUE Procedure 22-23
CREATE_QUEUE Procedure 22-24
CREATE_QUEUE_TABLE Procedure 22-26
DEL_ALIAS_FROM_LDAP Procedure 22-29
DISABLE_DB_ACCESS Procedure 22-30
DISABLE_PROPAGATION_SCHEDULE Procedure 22-31
DROP_AQ_AGENT Procedure 22-32
DROP_QUEUE Procedure 22-33
DROP_QUEUE_TABLE Procedure 22-34
ENABLE_DB_ACCESS Procedure 22-35
ENABLE_JMS_TYPES Procedure 22-36
ENABLE_PROPAGATION_SCHEDULE Procedure 22-37
GET_WATERMARK Procedure 22-38
GRANT_QUEUE_PRIVILEGE Procedure 22-39
GRANT_SYSTEM_PRIVILEGE Procedure 22-40
MIGRATE_QUEUE_TABLE Procedure 22-41
PURGE_QUEUE_TABLE Procedure 22-42
QUEUE_SUBSCRIBERS Function 22-44
REMOVE_SUBSCRIBER Procedure 22-45
REVOKE_QUEUE_PRIVILEGE Procedure 22-46
REVOKE_SYSTEM_PRIVILEGE Procedure 22-47
SCHEDULE_PROPAGATION Procedure 22-48
SET_WATERMARK Procedure 22-50
START_QUEUE Procedure 22-51
STOP_QUEUE Procedure 22-52
UNSCHEDULE_PROPAGATION Procedure 22-53
VERIFY_QUEUE_TYPES Procedure 22-54

23 DBMS_AQELM

Summary of DBMS_AQELM Subprograms 23-2
SET_MAILHOST Procedure 23-3
SET_MAILPORT Procedure 23-4
SET_SENDFROM Procedure 23-5

24 DBMS_AQIN

Using DBMS_AQIN 24-2

Overview 24-3

25 DBMS_ASSERT

Using DBMS_ASSERT 25-2
Operational Notes 25-3
Summary of DBMS_ASSERT Subprograms 25-4
ENQUOTE_LITERAL Function 25-5
ENQUOTE_NAME Function 25-6
NOOP Functions 25-7
QUALIFIED_SQL_NAME Function 25-8
SCHEMA_NAME Function 25-9
SIMPLE_SQL_NAME Function 25-10
SQL_OBJECT_NAME Function 25-11

26 DBMS_AUTO_TASK_ADMIN

Using DBMS_AUTO_TASK_ADMIN 26-2
Constants 26-3
Summary of DBMS_AUTO_TASK_ADMIN Subprograms 26-4
DISABLE Procedures 26-5
ENABLE Procedures 26-6
GET_CLIENT_ATTRIBUTES Procedure 26-7
GET_P1_RESOURCES Procedure 26-8
OVERRIDE_PRIORITY Procedures 26-9
SET_CLIENT_SERVICE Procedure 26-10
SET_P1_RESOURCES Procedure 26-11

27 DBMS_AW_STATS

Using DBMS_AW_STATS 27-2
Summary of DBMS_AW_STATS Subprograms 27-3
ANALYZE Procedure 27-4

28 DBMS_CAPTURE_ADM

Summary of DBMS_CAPTURE_ADM Subprograms 28-2
ABORT_GLOBAL_INSTANTIATION Procedure 28-4
ABORT_SCHEMA_INSTANTIATION Procedure 28-5
ABORT_SYNC_INSTANTIATION Procedure 28-6
ABORT_TABLE_INSTANTIATION Procedure 28-7
ALTER_CAPTURE Procedure 28-8
ALTER_SYNC_CAPTURE Procedure 28-13
BUILD Procedure 28-15
CREATE_CAPTURE Procedure 28-16
CREATE_SYNC_CAPTURE Procedure 28-22
DROP_CAPTURE Procedure 28-24
INCLUDE_EXTRA_ATTRIBUTE Procedure 28-26
PREPARE_GLOBAL_INSTANTIATION Procedure 28-28

PREPARE_SCHEMA_INSTANTIATION Procedure 28-29
PREPARE_SYNC_INSTANTIATION Function 28-30
PREPARE_TABLE_INSTANTIATION Procedure 28-31
SET_PARAMETER Procedure 28-32
START_CAPTURE Procedure 28-35
STOP_CAPTURE Procedure 28-36

29 DBMS_CDC_PUBLISH

Using DBMS_CDC_PUBLISH 29-2
Overview 29-3
Deprecated Subprograms 29-4
Security Model 29-5
Views 29-6
Summary of DBMS_CDC_PUBLISH Subprograms 29-7
ALTER_AUTOLOG_CHANGE_SOURCE Procedure 29-8
ALTER_CHANGE_SET Procedure 29-10
ALTER_CHANGE_TABLE Procedure 29-13
ALTER_HOTLOG_CHANGE_SOURCE Procedure 29-16
CREATE_AUTOLOG_CHANGE_SOURCE Procedure 29-18
CREATE_CHANGE_SET Procedure 29-20
CREATE_CHANGE_TABLE Procedure 29-23
CREATE_HOTLOG_CHANGE_SOURCE Procedure 29-27
DROP_CHANGE_SET Procedure 29-29
DROP_CHANGE_SOURCE Procedure 29-30
DROP_CHANGE_TABLE Procedure 29-31
DROP_SUBSCRIPTION Procedure 29-32
GET_DDLOPER Function 29-33
PURGE Procedure 29-34
PURGE_CHANGE_SET Procedure 29-35
PURGE_CHANGE_TABLE Procedure 29-36

30 DBMS_CDC_SUBSCRIBE

Using DBMS_CDC_SUBSCRIBE 30-2
Overview 30-3
Deprecated Subprograms 30-5
Security Model 30-6
Views 30-7
Summary of DBMS_CDC_SUBSCRIBE Subprograms 30-8
ACTIVATE_SUBSCRIPTION Procedure 30-9
CREATE_SUBSCRIPTION Procedure 30-10
DROP_SUBSCRIPTION Procedure 30-12
EXTEND_WINDOW Procedure 30-13
PURGE_WINDOW Procedure 30-15
SUBSCRIBE Procedure 30-16

31 DBMS_COMPARISON

Using DBMS_COMPARISON 31-2
Overview 31-3
Security Model 31-5
Constants 31-6
Views 31-8
Operational Notes 31-9
Data Structures 31-13
COMPARISON_TYPE Record Type 31-14
Summary of DBMS_COMPARISON Subprograms 31-15
COMPARE Function 31-16
CONVERGE Procedure 31-18
CREATE_COMPARISON Procedure 31-20
DROP_COMPARISON Procedure 31-24
PURGE_COMPARISON Procedure 31-25
RECHECK Function 31-26

32 DBMS_CONNECTION_POOL

Summary of DBMS_CONNECTION_POOL Subprograms 32-2
ALTER_PARAM Procedure 32-3
CONFIGURE_POOL Procedure 32-4
START_POOL Procedure 32-6
STOP_POOL Procedure 32-7
RESTORE_DEFAULTS Procedure 32-8

33 DBMS_CQ_NOTIFICATION

Using DBMS_CQ_NOTIFICATION 33-2
Overview 33-3
Security Model 33-4
Constants 33-5
Operational Notes 33-7
Examples 33-8
Data Structures 33-15
CQ_NOTIFICATION$_DESCRIPTOR Object Type 33-16
CQ_NOTIFICATION$_QUERY Object Type 33-17
CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type 33-18
CQ_NOTIFICATION$_TABLE Object Type 33-19
CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type 33-20
CQ_NOTIFICATION$_ROW Object Type 33-21
CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type 33-22
CQ_NOTIFICATION$_REG_INFO Object Type 33-23
Summary of DBMS_CQ_NOTIFICATION Subprograms 33-26
CQ_NOTIFICATION_QUERYID Function 33-27
DEREGISTER Procedure 33-28
ENABLE_REG Procedure 33-29
NEW_REG_START Function 33-30

REG_END Procedure 33-31

34 DBMS_CRYPTO

Using the DBMS_CRYPTO Subprograms 34-2
Overview 34-3
Security Model 34-4
Types 34-5
Algorithms 34-6
Restrictions 34-8
Exceptions 34-9
Operational Notes 34-10
Examples 34-12
Summary of DBMS_CRYPTO Subprograms 34-13
DECRYPT Function 34-14
DECRYPT Procedures 34-15
ENCRYPT Function 34-16
ENCRYPT Procedures 34-17
HASH Function 34-18
MAC Function 34-19
RANDOMBYTES Function 34-20
RANDOMINTEGER Function 34-21
RANDOMNUMBER Function 34-22

35 DBMS_CSX_ADMIN

Using DBMS_CSX_ADMIN 35-2
Overview 35-3
Constants 35-4
Examples 35-5
Summary of DBMS_CSX_ADMIN 35-6
COPYDEFAULTTOKENTABLESET Procedure 35-7
GETTOKENTABLEINFO Procedure & Function 35-8
GETTOKENTABLEINFOBYTABLESPACE Procedure 35-9
NAMESPACEIDTABLE Function 35-10
PATHIDTABLE Function 35-11
QNAMEIDTABLE Function 35-12
REGISTERTOKENTABLESET Procedure 35-13

36 DBMS_CUBE

Using DBMS_CUBE 36-2
Summary of DBMS_CUBE Subprograms 36-3
BUILD Procedure 36-4
IMPORT_XML Procedure 36-11
VALIDATE_XML Procedure 36-13

37 DBMS_CUBE_ADVISE

Summary of DBMS_CUBE_ADVISE Subprograms 1-2

MV_CUBE_ADVICE Function ... 1-3
SET_CNS_EXCEPTION_LOG Procedure ... 1-6
TRACE Procedure ... 1-7

38 DBMS_DATA_MINING

Using DBMS_DATA_MINING ... 2-2
Overview ... 2-3
Mining Model Objects ... 2-5
Deprecated Subprograms ... 2-7
Mining Function Constants ... 2-8
Settings Table ... 2-9
Data Types ... 2-18
Summary of DBMS_DATA_MINING Subprograms ... 2-21
ADD_COST_MATRIX Procedure ... 2-23
ALTER_REVERSE_EXPRESSION Procedure ... 2-25
APPLY Procedure ... 2-27
COMPUTE_CONFUSION_MATRIX Procedure ... 2-30
COMPUTE_LIFT Procedure ... 2-33
COMPUTE_ROC Procedure ... 2-36
CREATE_MODEL Procedure ... 2-40
DROP_MODEL Procedure ... 2-43
EXPORT_MODEL Procedure ... 2-44
GET_ASSOCIATION_RULES Function ... 2-47
GET_DEFAULT_SETTINGS Function ... 2-50
GET_FREQUENT_ITEMSETS Function ... 2-51
GET_MODEL_COST_MATRIX Function ... 2-53
GET_MODEL_DETAILS_ABN Function ... 2-55
GET_MODEL_DETAILS_AI Function ... 2-57
GET_MODEL_DETAILS_GLM Function ... 2-58
GET_MODEL_DETAILS_GLOBAL Function ... 2-61
GET_MODEL_DETAILS_KM Function ... 2-64
GET_MODEL_DETAILS_NB Function ... 2-67
GET_MODEL_DETAILS_NMF Function ... 2-69
GET_MODEL_DETAILS_OC Function ... 2-70
GET_MODEL_DETAILS_SVM Function ... 2-73
GET_MODEL_DETAILS_XML Function ... 2-75
GET_MODEL_SETTINGS Function ... 2-76
GET_MODEL_SIGNATURE Function ... 2-77
GET_MODEL_TRANSFORMATIONS Function ... 2-79
GET_TRANSFORM_LIST Procedure ... 2-80
IMPORT_MODEL Procedure ... 2-81
RANK_APPLY Procedure ... 2-84
REMOVE_COST_MATRIX Procedure ... 2-87
RENAME_MODEL Procedure ... 2-88

39 DBMS_DATA_MINING_TRANSFORM

Using DBMS_DATA_MINING_TRANSFORM 3-2
Data Transformation with Oracle Data Mining 3-3
Types of Transformations 3-4
The DBMS_DATA_MINING_TRANSFORM Framework 3-6
Data Types 3-7
Summary of DBMS_DATA_MINING_TRANSFORM Subprograms 3-9
CREATE_BIN_CAT Procedure 3-11
CREATE_BIN_NUM Procedure 3-12
CREATE_CLIP Procedure 3-13
CREATE_COL_REM Procedure 3-14
CREATE_MISS_CAT Procedure 3-15
CREATE_MISS_NUM Procedure 3-16
CREATE_NORM_LIN Procedure 3-17
DESCRIBE_STACK Procedure 3-18
GET_EXPRESSION Function 3-19
INSERT_AUTOBIN_NUM_EQWIDTH Procedure 3-20
INSERT_BIN_CAT_FREQ Procedure 3-22
INSERT_BIN_NUM_EQWIDTH Procedure 3-24
INSERT_BIN_NUM_QTILE Procedure 3-26
INSERT_BIN_SUPER Procedure 3-28
INSERT_CLIP_TRIM_TAIL Procedure 3-29
INSERT_CLIP_WINSOR_TAIL Procedure 3-31
INSERT_MISS_CAT_MODE Procedure 3-33
INSERT_MISS_NUM_MEAN Procedure 3-34
INSERT_NORM_LIN_MINMAX Procedure 3-35
INSERT_NORM_LIN_SCALE Procedure 3-36
INSERT_NORM_LIN_ZSCORE Procedure 3-37
SET_EXPRESSION Procedure 3-38
SET_TRANSFORM Procedure 3-39
STACK_BIN_CAT Procedure 3-40
STACK_BIN_NUM Procedure 3-43
STACK_CLIP Procedure 3-46
STACK_COL_REM Procedure 3-48
STACK_MISS_CAT Procedure 3-49
STACK_MISS_NUM Procedure 3-51
STACK_NORM_LIN Procedure 3-53
XFORM_BIN_CAT Procedure 3-55
XFORM_BIN_NUM Procedure 3-57
XFORM_CLIP Procedure 3-60
XFORM_COL_REM Procedure 3-62
XFORM_EXPR_NUM Procedure 3-63
XFORM_EXPR_STR Procedure 3-65
XFORM_MISS_CAT Procedure 3-66
XFORM_MISS_NUM Procedure 3-67
XFORM_NORM_LIN Procedure 3-68
XFORM_STACK Procedure 3-70

40 DBMS_DATAPUMP

Using DBMS_DATAPUMP 4-2
Overview 4-3
Security Model 4-4
Constants 4-5
Data Structures 4-6
Data Structures - Object Types 4-7
Summary of DBMS_DATAPUMP Subprograms 4-12
ADD_FILE Procedure 4-13
ATTACH Function 4-16
DATA_FILTER Procedures 4-18
DATA_REMAP Procedure 4-21
DETACH Procedure 4-23
GET_DUMPFILE_INFO Procedure 4-24
GET_STATUS Procedure 4-26
LOG_ENTRY Procedure 4-29
METADATA_FILTER Procedure 4-30
METADATA_REMAP Procedure 4-33
METADATA_TRANSFORM Procedure 4-36
OPEN Function 4-39
SET_PARALLEL Procedure 4-42
SET_PARAMETER Procedures 4-44
START_JOB Procedure 4-53
STOP_JOB Procedure 4-55
WAIT_FOR_JOB Procedure 4-57

41 DBMS_DB_VERSION

Using DBMS_DB_VERSION 5-2
Overview 5-3
Constants 5-4
Examples 5-5

42 DBMS_DDL

Using DBMS_DDL 6-2
Deprecated Subprograms 6-3
Security Model 6-4
Operational Notes 6-5
Summary of DBMS_DDL Subprograms 6-6
ALTER_COMPILE Procedure 6-7
ALTER_TABLE_NOT_REFERENCEABLE Procedure 6-8
ALTER_TABLE_REFERENCEABLE Procedure 6-9
CREATE_WRAPPED Procedures 6-10
IS_TRIGGER_FIRE_ONCE Function 6-12
SET_TRIGGER_FIRING_PROPERTY Procedure 6-13
WRAP Functions 6-14

43 DBMS_DEBUG

Using DBMS_DEBUG 7-2
Overview 7-3
Constants 7-4
Variables 7-5
Exceptions 7-6
Operational Notes 7-8
Data Structures 7-15
BREAKPOINT_INFO Record Type 7-16
PROGRAM_INFO Record Type 7-17
RUNTIME_INFO Record Type 7-18
BACKTRACE_TABLE Table Type 7-19
BREAKPOINT_TABLE Table Type 7-20
INDEX_TABLE Table Type 7-21
VC2_TABLE Table Type 7-22
Summary of DBMS_DEBUG Subprograms 7-23
ATTACH_SESSION Procedure 7-25
CONTINUE Function 7-26
DEBUG_OFF Procedure 7-27
DEBUG_ON Procedure 7-28
DELETE_BREAKPOINT Function 7-29
DELETE_OER_BREAKPOINT Function 7-30
DETACH_SESSION Procedure 7-31
DISABLE_BREAKPOINT Function 7-32
ENABLE_BREAKPOINT Function 7-33
EXECUTE Procedure 7-34
GET_INDEXES Function 7-36
GET_MORE_SOURCE Procedure 7-37
GET_LINE_MAP Function 7-38
GET_RUNTIME_INFO Function 7-39
GET_TIMEOUT_BEHAVIOUR Function 7-40
GET_VALUE Function 7-41
INITIALIZE Function 7-43
PING Procedure 7-45
PRINT_BACKTRACE Procedure 7-46
PRINT_INSTANTIATIONS Procedure 7-47
PROBE_VERSION Procedure 7-48
SELF_CHECK Procedure 7-49
SET_BREAKPOINT Function 7-50
SET_OER_BREAKPOINT Function 7-51
SET_TIMEOUT Function 7-52
SET_TIMEOUT_BEHAVIOUR Procedure 7-53
SET_VALUE Function 7-54
SHOW_BREAKPOINTS Procedures 7-56
SHOW_FRAME_SOURCE Procedure 7-57
SHOW_SOURCE Procedures 7-58
SYNCHRONIZE Function 7-60

TARGET_PROGRAM_RUNNING Procedure 7-61

44 DBMS_DEFER

Documentation of DBMS_DEFER 8-2

45 DBMS_DEFER_QUERY

Documentation of DBMS_DEFER_QUERY 9-2

46 DBMS_DEFER_SYS

Documentation of DBMS_DEFER_SYS 10-2

47 DBMS_DESCRIBE

Using DBMS_DESCRIBE 11-2
Overview 11-3
Security Model 11-4
Types 11-5
Exceptions 11-6
Examples 11-7
Summary of DBMS_DESCRIBE Subprograms 11-10
DESCRIBE_PROCEDURE Procedure 11-11

48 DBMS_DG

Using DBMS_DG 12-2
Summary of the DBMS_DG Subprogram 12-3
INITIATE_FS_FAILOVER Procedure 12-4

49 DBMS_DIMENSION

Using DBMS_DIMENSION 13-2
Security Model 13-3
Summary of DBMS_DIMENSION Subprograms 13-4
DESCRIBE_DIMENSION Procedure 13-5
VALIDATE_DIMENSION Procedure 13-6

50 DBMS_DISTRIBUTED_TRUST_ADMIN

Using DBMS_DISTRIBUTED_TRUST_ADMIN 14-2
Overview 14-3
Security Model 14-4
Examples 14-5
Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms 14-6
ALLOW_ALL Procedure 14-7
ALLOW_SERVER Procedure 14-8
DENY_ALL Procedure 14-9
DENY_SERVER Procedure 14-10

51 DBMS_EPG

Using DBMS_EPG 15-2
Overview 15-3
Security Model 15-4
Exceptions 15-5
Data Structures 15-6
Subprogram Groups 15-7
Configuration Subprograms 15-8
Authorization Subprograms 15-9
Summary of DBMS_EPG Subprograms 15-10
AUTHORIZE_DAD Procedure 15-11
CREATE_DAD Procedure 15-12
DEAUTHORIZE_DAD Procedure 15-13
DELETE_DAD_ATTRIBUTE Procedure 15-14
DELETE_GLOBAL_ATTRIBUTE Procedure 15-15
DROP_DAD Procedure 15-16
GET_ALL_DAD_ATTRIBUTES Procedure 15-17
GET_ALL_DAD_MAPPINGS Procedure 15-18
GET_ALL_GLOBAL_ATTRIBUTES Procedure 15-19
GET_DAD_ATTRIBUTE Function 15-20
GET_DAD_LIST Procedure 15-21
GET_GLOBAL_ATTRIBUTE Function 15-22
MAP_DAD Procedure 15-23
SET_DAD_ATTRIBUTE Procedure 15-24
SET_GLOBAL_ATTRIBUTE Procedure 15-26
UNMAP_DAD Procedure 15-27

52 DBMS_ERRLOG

Using DBMS_ERRLOG 16-2
Security Model 16-3
Summary of DBMS_ERRLOG Subprograms 16-4
CREATE_ERROR_LOG Procedure 16-5

53 DBMS_EXPFIL

Summary of Expression Filter Subprograms 17-2
ADD_ELEMENTARY_ATTRIBUTE Procedures 17-3
ADD_FUNCTIONS Procedure 17-6
ASSIGN_ATTRIBUTE_SET Procedure 17-8
BUILD_EXCEPTIONS_TABLE Procedure 17-10
CLEAR_EXPRSET_STATS Procedure 17-11
COPY_ATTRIBUTE_SET Procedure 17-12
CREATE_ATTRIBUTE_SET Procedure 17-13
DEFAULT_INDEX_PARAMETERS Procedure 17-15
DEFAULT_XPINDEX_PARAMETERS Procedure 17-17
DEFRAG_INDEX Procedure 17-19
DROP_ATTRIBUTE_SET Procedure 17-20

GET_EXPRSET_STATS Procedure 17-21
GRANT_PRIVILEGE Procedure 17-22
INDEX_PARAMETERS Procedure 17-23
MODIFY_OPERATOR_LIST Procedure 17-25
REVOKE_PRIVILEGE Procedure 17-26
SYNC_TEXT_INDEXES Procedure 17-27
UNASSIGN_ATTRIBUTE_SET Procedure 17-28
VALIDATE_EXPRESSIONS Procedure 17-29
XPINDEX_PARAMETERS Procedure 17-30

54 DBMS_FGA

Using DBMS_FGA 18-2
Security Model 18-3
Operational Notes 18-4
Summary of DBMS_FGA Subprograms 18-5
ADD_POLICY Procedure 18-6
DISABLE_POLICY Procedure 18-11
DROP_POLICY Procedure 18-12
ENABLE_POLICY Procedure 18-13

55 DBMS_FILE_GROUP

Using DBMS_FILE_GROUP 19-2
Overview 19-3
Constants 19-4
Summary of DBMS_FILE_GROUP Subprograms 19-5
ADD_FILE Procedure 19-6
ALTER_FILE Procedure 19-8
ALTER_FILE_GROUP Procedure 19-10
ALTER_VERSION Procedure 19-12
CREATE_FILE_GROUP Procedure 19-14
CREATE_VERSION Procedure 19-16
DROP_FILE_GROUP Procedure 19-17
DROP_VERSION Procedure 19-18
GRANT_OBJECT_PRIVILEGE Procedure 19-19
GRANT_SYSTEM_PRIVILEGE Procedure 19-20
PURGE_FILE_GROUP Procedure 19-21
REMOVE_FILE Procedure 19-22
REVOKE_OBJECT_PRIVILEGE Procedure 19-23
REVOKE_SYSTEM_PRIVILEGE Procedure 19-24

56 DBMS_FILE_TRANSFER

Using DBMS_FILE_TRANSFER 20-2
Operating Notes 20-3
Summary of DBMS_FILE_TRANSFER Subprograms 20-4
COPY_FILE Procedure 20-5
GET_FILE Procedure 20-7

PUT_FILE Procedure 20-9

57 DBMS_FLASHBACK

Using DBMS_FLASHBACK 21-2
Overview 21-3
Security Model 21-4
Types 21-5
Exceptions 21-6
Operational Notes 21-7
Examples 21-8
Summary of DBMS_FLASHBACK Subprograms 21-11
DISABLE Procedure 21-12
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure 21-13
ENABLE_AT_TIME Procedure 21-14
GET_SYSTEM_CHANGE_NUMBER Function 21-15
TRANSACTION_BACKOUT Procedures 21-16

58 DBMS_FREQUENT_ITEMSET

Summary of DBMS_FREQUENT_ITEMSET Subprograms 22-2
FI_HORIZONTAL Function 22-3
FI_TRANSACTIONAL Function 22-5

59 DBMS_HM

Using DBMS_HM 23-2
Security Model 23-3
Summary of DBMS_HM Subprograms 23-4
GET_RUN_REPORT Function 23-5
RUN_CHECK Procedure 23-6

60 DBMS_HPROF

Summary of DBMS_HPROF Subprograms 24-2
ANALYZE Function 24-3
START_PROFILING Procedure 24-5
STOP_PROFILING Procedure 24-6

61 DBMS_HS_PARALLEL

LOAD_TABLE 25-2
Using LOAD_TABLE 25-3
CREATE_TABLE_TEMPLATE 25-4
CREATE_OR_REPLACE_VIEW 25-5
Using CREATE_OR_REPLACE_VIEW 25-6
DROP_VIEW 25-7

62 DBMS_HS_PASSTHROUGH

Summary of DBMS_HS_PASSTHROUGH Subprograms 26-2

BIND_INOUT_VARIABLE Procedure 26-3
BIND_INOUT_VARIABLE_RAW Procedure 26-4
BIND_OUT_VARIABLE Procedure 26-5
BIND_OUT_VARIABLE_RAW Procedure 26-6
BIND_VARIABLE Procedure 26-7
BIND_VARIABLE_RAW Procedure 26-8
CLOSE_CURSOR Procedure 26-9
EXECUTE_IMMEDIATE Procedure 26-10
EXECUTE_NON_QUERY Function 26-11
FETCH_ROW Function 26-12
GET_VALUE Procedure 26-13
GET_VALUE_RAW Procedure 26-14
OPEN_CURSOR Function 26-15
PARSE Procedure 26-16

63 DBMS_JAVA

Documentation of DBMS_JAVA 27-2

64 DBMS_IOT

Summary of DBMS_IOT Subprograms 28-2
BUILD_CHAIN_ROWS_TABLE Procedure 28-3
BUILD_EXCEPTIONS_TABLE Procedure 28-4

65 DBMS_JOB

Using DBMS_JOB 29-2
Security Model 29-3
Operational Notes 29-4
Summary of DBMS_JOB Subprograms 29-6
BROKEN Procedure 29-7
CHANGE Procedure 29-8
INSTANCE Procedure 29-9
INTERVAL Procedure 29-10
NEXT_DATE Procedure 29-11
REMOVE Procedure 29-12
RUN Procedure 29-13
SUBMIT Procedure 29-14
USER_EXPORT Procedures 29-16
WHAT Procedure 29-17

66 DBMS_LDAP

Documentation of DBMS_LDAP 30-2

67 DBMS_LDAP_UTL

Documentation of DBMS_LDAP_UTL 31-2

68 DBMS_LIBCACHE

Using DBMS_LIBCACHE 32-2
Overview 32-3
Security Model 32-4
Summary of DBMS_LIBCACHE Subprograms 32-5
COMPILE_FROM_REMOTE Procedure 32-6

69 DBMS_LOB

Using DBMS_LOB 33-2
Overview 33-3
Security Model 33-4
Constants 33-5
Datatypes 33-6
Rules and Limits 33-7
Operational Notes 33-11
Exceptions 33-15
Summary of DBMS_LOB Subprograms 33-16
APPEND Procedures 33-18
CLOSE Procedure 33-19
COMPARE Functions 33-20
CONVERTTOBLOB Procedure 33-22
CONVERTTOCLOB Procedure 33-25
COPY Procedures 33-28
CREATETEMPORARY Procedures 33-30
ERASE Procedures 33-31
FILECLOSE Procedure 33-33
FILECLOSEALL Procedure 33-34
FILEEXISTS Function 33-35
FILEGETNAME Procedure 33-36
FILEISOPEN Function 33-37
FILEOPEN Procedure 33-38
FRAGMENT_DELETE Procedure 33-39
FRAGMENT_INSERT Procedures 33-40
FRAGMENT_MOVE Procedure 33-41
FRAGMENT_REPLACE Procedures 33-42
FREETEMPORARY Procedures 33-44
GET_STORAGE_LIMIT Function 33-45
GETCHUNKSIZE Functions 33-46
GETLENGTH Functions 33-47
GETOPTIONS Functions 33-48
INSTR Functions 33-49
ISOPEN Functions 33-51
ISTEMPORARY Functions 33-52
LOADBLOBFROMFILE Procedure 33-53
LOADCLOBFROMFILE Procedure 33-55
LOADFROMFILE Procedure 33-59
OPEN Procedures 33-61

READ Procedures 33-63
SETOPTIONS Procedures 33-65
SUBSTR Functions 33-66
TRIM Procedures 33-68
WRITE Procedures 33-70
WRITEAPPEND Procedures 33-72

70 DBMS_LOCK

Using DBMS_LOCK 34-2
Overview 34-3
Security Model 34-4
Constants 34-5
Rules and Limits 34-6
Operational Notes 34-7
Summary of DBMS_LOCK Subprograms 34-8
ALLOCATE_UNIQUE Procedure 34-9
CONVERT Function 34-11
RELEASE Function 34-12
REQUEST Function 34-13
SLEEP Procedure 34-14

71 DBMS_LOGMNR

Using DBMS_LOGMNR 35-2
Overview 35-3
Security Model 35-4
Constants 35-5
Views 35-7
Operational Notes 35-8
Summary of DBMS_LOGMNR Subprograms 35-9
ADD_LOGFILE Procedure 35-10
COLUMN_PRESENT Function 35-12
END_LOGMNR Procedure 35-14
MINE_VALUE Function 35-15
REMOVE_LOGFILE Procedure 35-17
START_LOGMNR Procedure 35-18

72 DBMS_LOGMNR_D

Using DBMS_LOGMNR_D 36-2
Overview 36-3
Security Model 36-4
Summary of DBMS_LOGMNR_D Subprograms 36-5
BUILD Procedure 36-6
SET_TABLESPACE Procedure 36-9

73 DBMS_LOGSTDBY

Using DBMS_LOGSTDBY 37-2
Overview 37-3
Operational Notes 37-4
Summary of DBMS_LOGSTDBY Subprograms 37-5
APPLY_SET Procedure 37-6
APPLY_UNSET Procedure 37-9
BUILD Procedure 37-10
INSTANTIATE_TABLE Procedure 37-11
MAP_PRIMARY_SCN Function 37-13
PREPARE_FOR_NEW_PRIMARY Procedure 37-14
PURGE_SESSION Procedure 37-16
REBUILD Procedure 37-17
SET_TABLESPACE Procedure 37-18
SKIP Procedure 37-19
SKIP_ERROR Procedure 37-27
SKIP_TRANSACTION Procedure 37-31
UNSKIP Procedure 37-33
UNSKIP_ERROR Procedure 37-35
UNSKIP_TRANSACTION Procedure 37-37

74 DBMS_METADATA

Using DBMS_METADATA 38-2
Overview 38-3
Security Model 38-4
Rules and Limits 38-5
Data Structures - Object and Table Types 38-6
Subprogram Groupings 38-8
Subprograms for Retrieving Multiple Objects From the Database 38-9
Subprograms for Submitting XML to the Database 38-10
Summary of All DBMS_METADATA Subprograms 38-11
ADD_TRANSFORM Function 38-12
CLOSE Procedure 38-15
CONVERT Functions and Procedures 38-16
FETCH_xxx Functions and Procedures 38-18
GET_xxx Functions 38-21
GET_QUERY Function 38-25
OPEN Function 38-26
OPENW Function 38-32
PUT Function 38-33
SET_COUNT Procedure 38-35
SET_FILTER Procedure 38-36
SET_PARSE_ITEM Procedure 38-46
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures 38-49

75 DBMS_MGD_ID_UTL

Using DBMS_MGD_ID_UTL 39-2
Constants 39-3
Exceptions 39-4
Summary of DBMS_MGD_ID_UTL Subprograms 39-5
ADD_SCHEME Procedure 39-6
CREATE_CATEGORY Function 39-10
EPC_TO_ORACLE_SCHEME Function 39-11
GET_CATEGORY_ID Function 39-14
GET_COMPONENTS Function 39-15
GET_ENCODINGS Function 39-17
GET_JAVA_LOGGING_LEVEL Function 39-18
GET_PLSQL_LOGGING_LEVEL Function 39-19
GET_SCHEME_NAMES Function 39-20
GET_TDT_XML Function 39-21
GET_VALIDATOR Function 39-23
REFRESH_CATEGORY Function 39-28
REMOVE_CATEGORY Procedure 39-29
REMOVE_PROXY Procedure 39-30
REMOVE_SCHEME Procedure 39-31
SET_JAVA_LOGGING_LEVEL Procedure 39-32
SET_PLSQL_LOGGING_LEVEL Procedure 39-33
SET_PROXY Procedure 39-34
VALIDATE_SCHEME Function 39-35

76 DBMS_MGWADM

Using DBMS_MGWADM 40-2
Deprecated Subprograms 40-3
Constants 40-4
Data Structures 40-7
SYS.MGW_MQSERIES_PROPERTIES Object Type 40-8
SYS.MGW_PROPERTIES Object Type 40-10
SYS.MGW_PROPERTY Object Type 40-12
SYS.MGW_TIBRV_PROPERTIES Object Type 40-13
Summary of DBMS_MGWADM Subprograms 40-14
ADD_SUBSCRIBER Procedure 40-16
ALTER_AGENT Procedures 40-20
ALTER_JOB Procedure 40-22
ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous 40-24
ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ 40-25
ALTER_PROPAGATION_SCHEDULE Procedure 40-26
ALTER_SUBSCRIBER Procedure 40-27
CLEANUP_GATEWAY Procedures 40-29
CREATE_AGENT Procedure 40-32
CREATE_JOB Procedure 40-34
CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous 40-38

CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ 40-39
DB_CONNECT_INFO Procedure 40-40
DISABLE_JOB Procedure 40-41
DISABLE_PROPAGATION_SCHEDULE Procedure 40-42
ENABLE_JOB Procedure 40-43
ENABLE_PROPAGATION_SCHEDULE Procedure 40-44
REGISTER_FOREIGN_QUEUE Procedure 40-45
REMOVE_AGENT Procedure 40-46
REMOVE_JOB Procedure 40-47
REMOVE_MSGSYSTEM_LINK Procedure 40-48
REMOVE_OPTION Procedure 40-49
REMOVE_SUBSCRIBER Procedure 40-51
RESET_JOB Procedure 40-52
RESET_SUBSCRIBER Procedure 40-53
SCHEDULE_PROPAGATION Procedure 40-54
SET_LOG_LEVEL Procedures 40-56
SET_OPTION Procedure 40-57
SHUTDOWN Procedures 40-59
STARTUP Procedures 40-60
UNREGISTER_FOREIGN_QUEUE Procedure 40-61
UNSCHEDULE_PROPAGATION Procedure 40-62

77 DBMS_MGWMSG

Using DBMS_MGWMSG 41-2
Security Model 41-3
Constants 41-4
Types 41-6
Summary of DBMS_MGWMSG Subprograms 41-21
LCR_TO_XML Function 41-22
NVARRAY_ADD Procedure 41-23
NVARRAY_FIND_NAME Function 41-24
NVARRAY_FIND_NAME_TYPE Function 41-25
NVARRAY_GET Function 41-26
NVARRAY_GET_BOOLEAN Function 41-27
NVARRAY_GET_BYTE Function 41-28
NVARRAY_GET_DATE Function 41-29
NVARRAY_GET_DOUBLE Function 41-30
NVARRAY_GET_FLOAT Function 41-31
NVARRAY_GET_INTEGER Function 41-32
NVARRAY_GET_LONG Function 41-33
NVARRAY_GET_RAW Function 41-34
NVARRAY_GET_SHORT Function 41-35
NVARRAY_GET_TEXT Function 41-36
XML_TO_LCR Function 41-37

78 DBMS_MONITOR

Summary of DBMS_MONITOR Subprograms 42-2

CLIENT_ID_STAT_DISABLE Procedure 42-3
CLIENT_ID_STAT_ENABLE Procedure 42-4
CLIENT_ID_TRACE_DISABLE Procedure 42-5
CLIENT_ID_TRACE_ENABLE Procedure 42-6
DATABASE_TRACE_DISABLE Procedure 42-7
DATABASE_TRACE_ENABLE Procedure 42-8
SERV_MOD_ACT_STAT_DISABLE Procedure 42-9
SERV_MOD_ACT_STAT_ENABLE Procedure 42-10
SERV_MOD_ACT_TRACE_DISABLE Procedure 42-12
SERV_MOD_ACT_TRACE_ENABLE Procedure 42-13
SESSION_TRACE_DISABLE Procedure 42-15
SESSION_TRACE_ENABLE Procedure 42-16

79 DBMS_MVIEW

Using DBMS_MVIEW 43-2
Operational Notes 43-3
Rules and Limits 43-4
Summary of DBMS_MVIEW Subprograms 43-5
BEGIN_TABLE_REORGANIZATION Procedure 43-6
END_TABLE_REORGANIZATION Procedure 43-7
ESTIMATE_MVIEW_SIZE Procedure 43-8
EXPLAIN_MVIEW Procedure 43-9
EXPLAIN_REWRITE Procedure 43-10
I_AM_A_REFRESH Function 43-12
PMARKER Function 43-13
PURGE_DIRECT_LOAD_LOG Procedure 43-14
PURGE_LOG Procedure 43-15
PURGE_MVIEW_FROM_LOG Procedure 43-16
REFRESH Procedures 43-17
REFRESH_ALL_MVIEWS Procedure 43-19
REFRESH_DEPENDENT Procedures 43-20
REGISTER_MVIEW Procedure 43-22
UNREGISTER_MVIEW Procedure 43-24

80 DBMS_NETWORK_ACL_ADMIN

Using DBMS_NETWORK_ACL_ADMIN 44-2
Examples 44-3
Summary of DBMS_NETWORK_ACL_ADMIN Subprograms 44-5
ADD_PRIVILEGE Procedure 44-6
ASSIGN_ACL Procedure 44-8
CHECK_PRIVILEGE Function 44-10
CHECK_PRIVILEGE_ACLID Function 44-11
CREATE_ACL Procedure 44-12
DELETE_PRIVILEGE Procedure 44-13
DROP_ACL Procedure 44-14
UNASSIGN_ACL Procedure 44-15

81 DBMS_NETWORK_ACL_UTILITY

Using DBMS_NETWORK_ACL_UTILITY 45-2
Examples 45-3
Summary of DBMS_NETWORK_ACL_UTILITY Subprograms 45-4
DOMAIN_LEVEL Function 45-5
DOMAINS Function 45-6

82 DBMS_OBFUSCATION_TOOLKIT

Using DBMS_OBFUSCATION_TOOLKIT 46-2
Overview 46-3
Security Model 46-4
Operational Notes 46-5
Summary of DBMS_OBFUSCATION Subprograms 46-7
DES3DECRYPT Procedures and Functions 46-8
DES3ENCRYPT Procedures and Functions 46-10
DES3GETKEY Procedures and Functions 46-12
DESDECRYPT Procedures and Functions 46-13
DESENCRYPT Procedures and Functions 46-15
DESGETKEY Procedures and Functions 46-17
MD5 Procedures and Functions 46-18

83 DBMS_ODCI

Summary of DBMS_ODCI Subprograms 47-2
ESTIMATE_CPU_UNITS Function 47-3

84 DBMS_OFFLINE_OG

Documentation of DBMS_OFFLINE_OG 48-2

85 DBMS_OUTLN

Using DBMS_OUTLN 49-2
Overview 49-3
Security Model 49-4
Summary of DBMS_OUTLN Subprograms 49-5
CLEAR_USED Procedure 49-6
CREATE_OUTLINE Procedure 49-7
DROP_BY_CAT Procedure 49-8
DROP_UNUSED Procedure 49-9
EXACT_TEXT_SIGNATURES Procedure 49-10
UPDATE_BY_CAT Procedure 49-11
UPDATE_SIGNATURES Procedure 49-12

86 DBMS_OUTLN_EDIT

Summary of DBMS_OUTLN_EDIT Subprograms 50-2
CHANGE_JOIN_POS Procedure 50-3
CREATE_EDIT_TABLES Procedure 50-4

DROP_EDIT_TABLES Procedure 50-5
GENERATE_SIGNATURE Procedure 50-6
REFRESH_PRIVATE_OUTLINE Procedure 50-7

87 DBMS_OUTPUT

Using DBMS_OUTPUT 51-2
Overview 51-3
Security Model 51-4
Operational Notes 51-5
Exceptions 51-6
Rules and Limits 51-7
Examples 51-8
Data Structures 51-11
CHARARR Table Type 51-12
DBMSOUTPUT_LINESARRAY Object Type 51-13
Summary of DBMS_OUTPUT Subprograms 51-14
DISABLE Procedure 51-15
ENABLE Procedure 51-16
GET_LINE Procedure 51-17
GET_LINES Procedure 51-18
NEW_LINE Procedure 51-19
PUT Procedure 51-20
PUT_LINE Procedure 51-21

88 DBMS_PCLXUTIL

Using DBMS_PCLXUTIL 52-2
Overview 52-3
Operational Notes 52-4
Rules and Limits 52-5
Summary of DBMS_PCLXUTIL Subprograms 52-6
BUILD_PART_INDEX Procedure 52-7

89 DBMS_PIPE

Using DBMS_PIPE 53-2
Overview 53-3
Security Model 53-4
Constants 53-5
Operational Notes 53-6
Exceptions 53-8
Examples 53-9
Summary of DBMS_PIPE Subprograms 53-18
CREATE_PIPE Function 53-19
NEXT_ITEM_TYPE Function 53-21
PACK_MESSAGE Procedures 53-22
PURGE Procedure 53-24
RECEIVE_MESSAGE Function 53-25

RESET_BUFFER Procedure 53-27
REMOVE_PIPE Function 53-28
SEND_MESSAGE Function 53-29
UNIQUE_SESSION_NAME Function 53-31
UNPACK_MESSAGE Procedures 53-32

90 DBMS_PREDICTIVE_ANALYTICS

Using DBMS_PREDICTIVE_ANALYTICS 54-2
Overview 54-3
Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms 54-4
EXPLAIN Procedure 54-5
PREDICT Procedure 54-7
PROFILE Procedure 54-9

91 DBMS_PREPROCESSOR

Using DBMS_PREPROCESSOR 55-2
Overview 55-3
Operating Notes 55-4
Data Structures 55-5
SOURCE_LINES_T Table Type 55-6
Summary of DBMS_PREPROCESSOR Subprograms 55-7
GET_POST_PROCESSED_SOURCE Functions 55-8
PRINT_POST_PROCESSED_SOURCE Procedures 55-10

92 DBMS_PROFILER

Using DBMS_PROFILER 56-2
Overview 56-3
Security Model 56-5
Operational Notes 56-6
Exceptions 56-8
Summary of DBMS_PROFILER Subprograms 56-9
FLUSH_DATA Function and Procedure 56-10
GET_VERSION Procedure 56-11
INTERNAL_VERSION_CHECK Function 56-12
PAUSE_PROFILER Function and Procedure 56-13
RESUME_PROFILER Function and Procedure 56-14
START_PROFILER Functions and Procedures 56-15
STOP_PROFILER Function and Procedure 56-16

93 DBMS_PROPAGATION_ADM

Summary of DBMS_PROPAGATION_ADM Subprograms 57-2
ALTER_PROPAGATION Procedure 57-3
CREATE_PROPAGATION Procedure 57-5
DROP_PROPAGATION Procedure 57-8
START_PROPAGATION Procedure 57-10
STOP_PROPAGATION Procedure 57-11

94 DBMS_RANDOM

Using DBMS_RANDOM 58-2
Security Model 58-3
Operational Notes 58-4
Summary of DBMS_RANDOM Subprograms 58-5
INITIALIZE Procedure 58-6
NORMAL Function 58-7
RANDOM Procedure 58-8
SEED Procedures 58-9
STRING Function 58-10
TERMINATE Procedure 58-11
VALUE Functions 58-12

95 DBMS_RECTIFIER_DIFF

Documentation of DBMS_RECTIFIER_DIFF 59-2

96 DBMS_REDEFINITION

Using DBMS_REDEFINITION 60-2
Overview 60-3
Constants 60-4
Operational Notes 60-5
Rules and Limits 60-6
Summary of DBMS_REDEFINITION Subprograms 60-7
ABORT_REDEF_TABLE Procedure 60-8
CAN_REDEF_TABLE Procedure 60-9
COPY_TABLE_DEPENDENTS Procedure 60-10
FINISH_REDEF_TABLE Procedure 60-12
REGISTER_DEPENDENT_OBJECT Procedure 60-13
START_REDEF_TABLE Procedure 60-14
SYNC_INTERIM_TABLE Procedure 60-15
UNREGISTER_DEPENDENT_OBJECT Procedure 60-16

97 DBMS_REFRESH

Documentation of DBMS_REFRESH 61-2

98 DBMS_REPAIR

Using DBMS_REPAIR 62-2
Overview 62-3
Security Model 62-4
Constants 62-5
Operating Notes 62-6
Exceptions 62-7
Examples 62-8
Summary of DBMS_REPAIR Subprograms 62-9
ADMIN_TABLES Procedure 62-10

CHECK_OBJECT Procedure 62-11
DUMP_ORPHAN_KEYS Procedure 62-13
FIX_CORRUPT_BLOCKS Procedure 62-14
ONLINE_INDEX_CLEAN Function 62-15
REBUILD_FREELISTS Procedure 62-16
SEGMENT_FIX_STATUS Procedure 62-17
SKIP_CORRUPT_BLOCKS Procedure 62-18

99 DBMS_REPCAT

Documentation of DBMS_REPCAT 63-2

100 DBMS_REPCAT_ADMIN

Documentation of DBMS_REPCAT_ADMIN 64-2

101 DBMS_REPCAT_INSTANTIATE

Documentation of DBMS_REPCAT_INSTANTIATE 65-2

102 DBMS_REPCAT_RGT

Documentation of DBMS_REPCAT_RGT 66-2

103 DBMS_REPUTIL

Documentation of DBMS_REPUTIL 67-2

104 DBMS_RESCONFIG

Using DBMS_RESCONFIG 68-2
Overview 68-3
Summary of DBMS_RESCONFIG Subprograms 68-4
ADDREPOSITORYRESCONFIG Procedure 68-5
ADDRESCONFIG Procedure 68-6
APPENDRESCONFIG Procedure 68-7
DELETEREPOSITORYRESCONFIG Procedure 68-8
DELETERESCONFIG Procedures 68-9
GETLISTENERS Function 68-10
GETREPOSITORYRESCONFIG Function 68-11
GETREPOSITORYRESCONFIGPATHS Function 68-12
GETRESCONFIG Function 68-13
GETRESCONFIGPATHS Function 68-14

105 DBMS_RESOURCE_MANAGER

Using DBMS_RESOURCE_MANAGER 69-2
Deprecated Subprograms 69-3
Security Model 69-4
Constants 69-5
Summary of DBMS_RESOURCE_MANAGER Subprograms 69-6

CALIBRATE_IO Procedure 69-8
CLEAR_PENDING_AREA Procedure 69-11
CREATE_CONSUMER_GROUP Procedure 69-12
CREATE_PENDING_AREA Procedure 69-13
CREATE_PLAN Procedure 69-15
CREATE_PLAN_DIRECTIVE Procedure 69-16
CREATE_SIMPLE_PLAN Procedure 69-20
DELETE_CONSUMER_GROUP Procedure 69-22
DELETE_PLAN Procedure 69-23
DELETE_PLAN_CASCADE Procedure 69-24
DELETE_PLAN_DIRECTIVE Procedure 69-25
SET_CONSUMER_GROUP_MAPPING Procedure 69-26
SET_CONSUMER_GROUP_MAPPING_PRI Procedure 69-27
SET_INITIAL_CONSUMER_GROUP Procedure 69-28
SUBMIT_PENDING_AREA Procedure 69-29
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure 69-30
SWITCH_CONSUMER_GROUP_FOR_USER Procedure 69-31
SWITCH_PLAN Procedure 69-32
UPDATE_CONSUMER_GROUP Procedure 69-33
UPDATE_PLAN Procedure 69-34
UPDATE_PLAN_DIRECTIVE Procedure 69-35
VALIDATE_PENDING_AREA Procedure 69-39

106 DBMS_RESOURCE_MANAGER_PRIVS

Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms 70-2
GRANT_SWITCH_CONSUMER_GROUP Procedure 70-3
GRANT_SYSTEM_PRIVILEGE Procedure 70-4
REVOKE_SWITCH_CONSUMER_GROUP Procedure 70-5
REVOKE_SYSTEM_PRIVILEGE Procedure 70-6

107 DBMS_RESULT_CACHE

Using DBMS_RESULT_CACHE 71-2
Constants 71-3
Summary of DBMS_RESULT_CACHE Subprograms 71-4
BYPASS Procedure 71-5
FLUSH Function & Procedure 71-6
INVALIDATE Functions & Procedures 71-7
INVALIDATE_OBJECT Functions & Procedures 71-8
MEMORY_REPORT Procedure 71-9
STATUS Function 71-10

108 DBMS_RESUMABLE

Using DBMS_RESUMABLE 72-2
Operational Notes 72-3
Summary of DBMS_RESUMABLE Subprograms 72-4
ABORT Procedure 72-5

GET_SESSION_TIMEOUT Function 72-6
GET_TIMEOUT Function 72-7
SET_SESSION_TIMEOUT Procedure 72-8
SET_TIMEOUT Procedure 72-9
SPACE_ERROR_INFO Function 72-10

109 DBMS_RLMGR

Summary of Rules Manager Subprograms 73-2
ADD_ELEMENTARY_ATTRIBUTE Procedures 73-4
ADD_EVENT Procedures 73-7
ADD_FUNCTIONS Procedure 73-9
ADD_RULE Procedure 73-10
CONDITION_REF Function 73-12
CONSUME_EVENT Function 73-13
CONSUME_PRIM_EVENTS Function 73-15
CREATE_CONDITIONS_TABLE Procedure 73-17
CREATE_EVENT_STRUCT Procedure 73-19
CREATE_EXPFIL_INDEXES Procedure 73-20
CREATE_INTERFACE Procedure 73-22
CREATE_RULE_CLASS Procedure 73-24
DELETE_RULE Procedure 73-28
DROP_CONDITIONS_TABLE Procedure 73-29
DROP_EVENT_STRUCT Procedure 73-30
DROP_EXPFIL_INDEXES Procedure 73-31
DROP_INTERFACE Procedure 73-32
DROP_RULE_CLASS Procedure 73-33
EXTEND_EVENT_STRUCT Procedure 73-34
GET_AGGREGATE_VALUE Function 73-35
GRANT_PRIVILEGE Procedure 73-37
PROCESS_RULES Procedure 73-39
PURGE_EVENTS Procedure 73-41
RESET_SESSION Procedure 73-42
REVOKE_PRIVILEGE Procedure 73-43
SYNC_TEXT_INDEXES Procedure 73-44

110 DBMS_RLS

Using DBMS_RLS 74-2
Overview 74-3
Security Model 74-4
Operational Notes 74-5
Summary of DBMS_RLS Subprograms 74-6
ADD_GROUPED_POLICY Procedure 74-7
ADD_POLICY Procedure 74-9
ADD_POLICY_CONTEXT Procedure 74-13
CREATE_POLICY_GROUP Procedure 74-14
DELETE_POLICY_GROUP Procedure 74-15
DISABLE_GROUPED_POLICY Procedure 74-16

DROP_GROUPED_POLICY Procedure 74-17
DROP_POLICY Procedure 74-18
DROP_POLICY_CONTEXT Procedure 74-19
ENABLE_GROUPED_POLICY Procedure 74-20
ENABLE_POLICY Procedure 74-21
REFRESH_GROUPED_POLICY Procedure 74-22
REFRESH_POLICY Procedure 74-23

111 DBMS_ROWID

Using DBMS_ROWID 75-2
Security Model 75-3
Types 75-4
Exceptions 75-6
Operational Notes 75-7
Examples 75-8
Summary of DBMS_ROWID Subprograms 75-9
ROWID_BLOCK_NUMBER Function 75-10
ROWID_CREATE Function 75-11
ROWID_INFO Procedure 75-12
ROWID_OBJECT Function 75-13
ROWID_RELATIVE_FNO Function 75-14
ROWID_ROW_NUMBER Function 75-15
ROWID_TO_ABSOLUTE_FNO Function 75-16
ROWID_TO_EXTENDED Function 75-17
ROWID_TO_RESTRICTED Function 75-19
ROWID_TYPE Function 75-20
ROWID_VERIFY Function 75-21

112 DBMS_RULE

Using DBMS_RULE 76-2
Security Model 76-3
Summary of DBMS_RULE Subprograms 76-4
CLOSE_ITERATOR Procedure 76-5
EVALUATE Procedures 76-6
GET_NEXT_HIT Function 76-10

113 DBMS_RULE_ADM

Using DBMS_RULE_ADM 77-2
Security Model 77-3
Summary of DBMS_RULE_ADM Subprograms 77-4
ADD_RULE Procedure 77-5
ALTER_EVALUATION_CONTEXT Procedure 77-7
ALTER_RULE Procedure 77-10
CREATE_EVALUATION_CONTEXT Procedure 77-12
CREATE_RULE Procedure 77-14
CREATE_RULE_SET Procedure 77-16

DROP_EVALUATION_CONTEXT Procedure 77-17
DROP_RULE Procedure 77-18
DROP_RULE_SET Procedure 77-19
GRANT_OBJECT_PRIVILEGE Procedure 77-20
GRANT_SYSTEM_PRIVILEGE Procedure 77-22
REMOVE_RULE Procedure 77-24
REVOKE_OBJECT_PRIVILEGE Procedure 77-26
REVOKE_SYSTEM_PRIVILEGE Procedure 77-27

114 DBMS_SCHEDULER

Data Structures 78-2
JOBARG Object Type 78-3
JOBARG_ARRAY Table Type 78-5
JOB Object Type 78-6
JOB_ARRAY Table Type 78-9
JOBATTR Object Type 78-10
JOBATTR_ARRAY Table Type 78-12
SCHEDULER$_STEP_TYPE Object Type 78-13
SCHEDULER$_STEP_TYPE_LIST Table Type 78-14
Using DBMS_SCHEDULER 78-15
Rules and Limits 78-16
Operational Notes 78-17
Summary of DBMS_SCHEDULER Subprograms 78-27
ADD_EVENT_QUEUE_SUBSCRIBER Procedure 78-30
ADD_WINDOW_GROUP_MEMBER Procedure 78-31
ALTER_CHAIN Procedure 78-32
ALTER_RUNNING_CHAIN Procedure 78-33
CLOSE_WINDOW Procedure 78-35
COPY_JOB Procedure 78-36
CREATE_CHAIN Procedure 78-37
CREATE_CREDENTIAL Procedure 78-38
CREATE_EVENT_SCHEDULE Procedure 78-39
CREATE_JOB Procedures 78-41
CREATE_JOB_CLASS Procedure 78-46
CREATE_JOBS Procedure 78-48
CREATE_PROGRAM Procedure 78-49
CREATE_SCHEDULE Procedure 78-51
CREATE_WINDOW Procedures 78-52
CREATE_WINDOW_GROUP Procedure 78-54
DEFINE_ANYDATA_ARGUMENT Procedure 78-55
DEFINE_CHAIN_EVENT_STEP Procedure 78-56
DEFINE_CHAIN_RULE Procedure 78-57
DEFINE_CHAIN_STEP Procedure 78-60
DEFINE_METADATA_ARGUMENT Procedure 78-61
DEFINE_PROGRAM_ARGUMENT Procedures 78-63
DISABLE Procedure 78-65
DROP_CHAIN Procedure 78-68

DROP_CHAIN_RULE Procedure 78-69
DROP_CHAIN_STEP Procedure 78-70
DROP_CREDENTIAL Procedure 78-71
DROP_JOB Procedure 78-72
DROP_JOB_CLASS Procedure 78-73
DROP_PROGRAM Procedure 78-74
DROP_PROGRAM_ARGUMENT Procedures 78-75
DROP_SCHEDULE Procedure 78-76
DROP_WINDOW Procedure 78-77
DROP_WINDOW_GROUP Procedure 78-78
ENABLE Procedure 78-79
EVALUATE_CALENDAR_STRING Procedure 78-80
EVALUATE_RUNNING_CHAIN Procedure 78-82
GENERATE_JOB_NAME Function 78-83
GET_ATTRIBUTE Procedure 78-84
GET_FILE Procedure 78-85
GET_SCHEDULER_ATTRIBUTE Procedure 78-87
OPEN_WINDOW Procedure 78-88
PURGE_LOG Procedure 78-89
PUT_FILE Procedure 78-90
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure 78-91
REMOVE_WINDOW_GROUP_MEMBER Procedure 78-92
RESET_JOB_ARGUMENT_VALUE Procedures 78-93
RUN_CHAIN Procedures 78-94
RUN_JOB Procedure 78-96
SET_AGENT_REGISTRATION_PASS Procedure 78-98
SET_ATTRIBUTE Procedure 78-99
SET_ATTRIBUTE_NULL Procedure 78-112
SET_JOB_ANYDATA_VALUE Procedures 78-113
SET_JOB_ARGUMENT_VALUE Procedures 78-114
SET_JOB_ATTRIBUTES Procedure 78-115
SET_SCHEDULER_ATTRIBUTE Procedure 78-116
STOP_JOB Procedure 78-118

115 DBMS_SERVER_ALERT

Using DBMS_SERVER_ALERT 79-2
Object Types 79-3
Relational Operators 79-4
Supported Metrics 79-5
Summary of DBMS_SERVER_ALERT Subprograms 79-11
EXPAND_MESSAGE Function 79-12
GET_THRESHOLD Procedure 79-13
SET_THRESHOLD Procedure 79-14

116 DBMS_SERVICE

Using DBMS_SERVICE 80-2

Overview 80-3
Security Model 80-4
Constants 80-5
Exceptions 80-7
Summary of DBMS_SERVICE Subprograms 80-8
CREATE_SERVICE Procedure 80-9
DELETE_SERVICE Procedure 80-10
DISCONNECT_SESSION Procedure 80-11
MODIFY_SERVICE Procedure 80-12
START_SERVICE Procedure 80-13
STOP_SERVICE Procedure 80-14

117 DBMS_SESSION

Using DBMS_SESSION 81-2
Security Model 81-3
Operational Notes 81-4
Summary of DBMS_SESSION Subprograms 81-5
CLEAR_ALL_CONTEXT Procedure 81-6
CLEAR_CONTEXT Procedure 81-7
CLEAR_IDENTIFIER Procedure 81-8
CLOSE_DATABASE_LINK Procedure 81-9
FREE_UNUSED_USER_MEMORY Procedure 81-10
IS_ROLE_ENABLED Function 81-12
IS_SESSION_ALIVE Function 81-13
LIST_CONTEXT Procedures 81-14
MODIFY_PACKAGE_STATE Procedure 81-15
SESSION _TRACE_DISABLE Procedure 81-19
SESSION _TRACE_ENABLE Procedure 81-20
RESET_PACKAGE Procedure 81-21
SET_CONTEXT Procedure 81-23
SET_IDENTIFIER 81-25
SET_NLS Procedure 81-26
SET_ROLE Procedure 81-27
SET_SQL_TRACE Procedure 81-28
SWITCH_CURRENT_CONSUMER_GROUP Procedure 81-29
UNIQUE_SESSION_ID Function 81-31

118 DBMS_SHARED_POOL

Using DBMS_SHARED_POOL 82-2
Overview 82-3
Operational Notes 82-4
Summary of DBMS_SHARED_POOL Subprograms 82-5
ABORTED_REQUEST_THRESHOLD Procedure 82-6
KEEP Procedure 82-7
PURGE Procedure 82-8
SIZES Procedure 82-9
UNKEEP Procedure 82-10

119 DBMS_SPACE

Using DBMS_SPACE 83-2
Security Model 83-3
Data Structures 83-4
ASA_RECO_ROW Record Type 83-5
ASA_RECO_ROW_TB Table Type 83-6
Summary of DBMS_SPACE Subprograms 83-7
ASA_RECOMMENDATIONS Function 83-8
CREATE_INDEX_COST Procedure 83-9
CREATE_TABLE_COST Procedures 83-10
FREE_BLOCKS Procedure 83-12
OBJECT_DEPENDENT_SEGMENTS Function 83-14
OBJECT_GROWTH_TREND Function 83-16
SPACE_USAGE Procedures 83-18
UNUSED_SPACE Procedure 83-21

120 DBMS_SPACE_ADMIN

Using DBMS_SPACE_ADMIN 84-2
Security Model 84-3
Constants 84-4
Operational Notes 84-6
Summary of DBMS_SPACE_ADMIN Subprograms 84-7
ASSM_SEGMENT_VERIFY Procedure 84-8
ASSM_TABLESPACE_VERIFY Procedure 84-10
SEGMENT_CORRUPT Procedure 84-11
SEGMENT_DROP_CORRUPT Procedure 84-12
SEGMENT_DUMP Procedure 84-13
SEGMENT_VERIFY Procedure 84-14
TABLESPACE_FIX_BITMAPS Procedure 84-15
TABLESPACE_FIX_SEGMENT_STATES Procedure 84-16
TABLESPACE_MIGRATE_FROM_LOCAL Procedure 84-17
TABLESPACE_MIGRATE_TO_LOCAL Procedure 84-18
TABLESPACE_REBUILD_BITMAPS Procedure 84-19
TABLESPACE_REBUILD_QUOTAS Procedure 84-20
TABLESPACE_RELOCATE_BITMAPS Procedure 84-21
TABLESPACE_VERIFY Procedure 84-22

121 DBMS_SPM

Using DBMS_SPM 85-2
Security Model 85-3
Summary of DBMS_SPM Subprograms 85-4
ALTER_SQL_PLAN_BASELINE Function 85-5
CONFIGURE Procedure 85-7
CREATE_STGTAB_BASELINE Procedure 85-8
DROP_SQL_PLAN_BASELINE Function 85-9
EVOLVE_SQL_PLAN_BASELINE Function 85-10

LOAD_PLANS_FROM_CURSOR_CACHE Functions 85-12
LOAD_PLANS_FROM_SQLSET Function 85-14
PACK_STGTAB_BASELINE Function 85-15
UNPACK_STGTAB_BASELINE Function 85-16

122 DBMS_SQL

Using DBMS_SQL 86-2
Overview 86-3
Security Model 86-4
Constants 86-5
Exceptions 86-6
Operational Notes 86-7
Examples 86-12
Data Structures 86-25
DESC_REC Record Type 86-26
DESC_REC2 Record Type 86-27
DESC_REC3 Record Type 86-28
BFILE_TABLE Table Type 86-29
BINARY_DOUBLE_TABLE Table Type 86-30
BINARY_FLOAT_TABLE Table Type 86-31
BLOB_TABLE Table Type 86-32
CLOB_TABLE Table Type 86-33
DATE_TABLE Table Type 86-34
DESC_TAB Table Type 86-35
DESC_TAB2 Table Type 86-36
DESC_TAB3 Table Type 86-37
INTERVAL_DAY_TO_SECOND_TABLE 86-38
INTERVAL_YEAR_TO_MONTH_TABLE Table Type 86-39
NUMBER_TABLE Table Type 86-40
TIME_TABLE Table Type 86-41
TIME_WITH_TIME_ZONE_TABLE Table Type 86-42
TIMESTAMP_TABLE Table Type 86-43
TIMESTAMP_WITH_LTZ_TABLE Table Type 86-44
TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type 86-45
UROWID_TABLE Table Type 86-46
VARCHAR2_TABLE Table Type 86-47
VARCHAR2A Table Type 86-48
VARCHAR2S Table Type 86-49
Summary of DBMS_SQL Subprograms 86-50
BIND_ARRAY Procedures 86-52
BIND_VARIABLE Procedures 86-55
CLOSE_CURSOR Procedure 86-57
COLUMN_VALUE Procedure 86-58
COLUMN_VALUE_LONG Procedure 86-61
DEFINE_ARRAY Procedure 86-62
DEFINE_COLUMN Procedure 86-65
DEFINE_COLUMN_LONG Procedure 86-67

DESCRIBE_COLUMNS Procedure 86-68
DESCRIBE_COLUMNS2 Procedure 86-69
DESCRIBE_COLUMNS3 Procedure 86-70
EXECUTE Function 86-72
EXECUTE_AND_FETCH Function 86-73
FETCH_ROWS Function 86-74
IS_OPEN Function 86-75
LAST_ERROR_POSITION Function 86-76
LAST_ROW_COUNT Function 86-77
LAST_ROW_ID Function 86-78
LAST_SQL_FUNCTION_CODE Function 86-79
OPEN_CURSOR Function 86-80
PARSE Procedures 86-81
TO_CURSOR_NUMBER Function 86-83
TO_REFCURSOR Function 86-85
VARIABLE_VALUE Procedures 86-87

123 DBMS_SQLDIAG

Using DBMS_SQLDIAG 87-2
Overview 87-3
Constants 87-5
Examples 87-8
Summary of DBMS_SQLDIAG Subprograms 87-9
ACCEPT_SQL_PATCH Function & Procedure 87-11
ALTER_SQL_PATCH Procedure 87-13
CANCEL_DIAGNOSIS_TASK Procedure 87-14
CREATE_DIAGNOSIS_TASK Functions 87-15
CREATE_STGTAB_SQLPATCH Procedure 87-17
DROP_DIAGNOSIS_TASK Procedure 87-18
DROP_SQL_PATCH Procedure 87-19
EXECUTE_DIAGNOSIS_TASK Procedure 87-20
EXPLAIN_SQL_TESTCASE Function 87-21
EXPORT_SQL_TESTCASE Procedures 87-22
EXPORT_SQL_TESTCASE_DIR_BY_INC Function 87-24
EXPORT_SQL_TESTCASE_DIR_BY_TXT Function 87-25
GET_SQL Function 87-26
INCIDENTID_2_SQL Procedure 87-27
INTERRUPT_DIAGNOSIS_TASK Procedure 87-28
PACK_STGTAB_SQLPATCH Procedure 87-29
REPORT_DIAGNOSIS_TASK Function 87-30
RESET_DIAGNOSIS_TASK Procedure 87-31
RESUME_DIAGNOSIS_TASK Procedure 87-32
SET_DIAGNOSIS_TASK_PARAMETER Procedure 87-33
UNPACK_STGTAB_SQLPATCH Procedure 87-34

124 DBMS_SQLPA

Using DBMS_SQLPA 88-2
Overview 88-3
Security Model 88-4
Summary of DBMS_SQLPA Subprograms 88-5
CANCEL_ANALYSIS_TASK Procedure 88-6
CREATE_ANALYSIS_TASK Functions 88-7
DROP_ANALYSIS_TASK Procedure 88-10
EXECUTE_ANALYSIS_TASK Function & Procedure 88-11
INTERRUPT_ANALYSIS_TASK Procedure 88-13
REPORT_ANALYSIS_TASK Function 88-14
RESET_ANALYSIS_TASK Procedure 88-16
RESUME_ANALYSIS_TASK Procedure 88-17
SET_ANALYSIS_TASK_PARAMETER Procedures 88-18
SET_ANALYSIS_DEFAULT_PARAMETER Procedures 88-20

125 DBMS_SQLTUNE

Using DBMS_SQLTUNE 89-2
Overview 89-3
Security Model 89-6
Data Structures 89-7
SQLSET_ROW Object Type 89-8
Subprogram Groups 89-10
SQL Tuning Advisor Subprograms 89-11
SQL Profile Subprograms 89-12
SQL Tuning Set Subprograms 89-13
Real-time SQL Monitoring Subprograms 89-14
Summary of DBMS_SQLTUNE Subprograms 89-15
ACCEPT_SQL_PROFILE Procedure and Function 89-18
ADD_SQLSET_REFERENCE Function 89-21
ALTER_SQL_PROFILE Procedure 89-22
CANCEL_TUNING_TASK Procedure 89-24
CAPTURE_CURSOR_CACHE_SQLSET Procedure 89-25
CREATE_SQLSET Procedure and Function 89-27
CREATE_STGTAB_SQLPROF Procedure 89-28
CREATE_STGTAB_SQLSET Procedure 89-29
CREATE_TUNING_TASK Functions 89-30
DELETE_SQLSET Procedure 89-34
DROP_SQL_PROFILE Procedure 89-35
DROP_SQLSET Procedure 89-36
DROP_TUNING_TASK Procedure 89-37
EXECUTE_TUNING_TASK Function & Procedure 89-38
IMPLEMENT_TUNING_TASK Function 89-39
INTERRUPT_TUNING_TASK Procedure 89-40
LOAD_SQLSET Procedure 89-41
PACK_STGTAB_SQLPROF Procedure 89-45
PACK_STGTAB_SQLSET Procedure 89-46

REMAP_STGTAB_SQLPROF Procedure 89-48
REMAP_STGTAB_SQLSET Procedure 89-49
REMOVE_SQLSET_REFERENCE Procedure 89-50
REPORT_AUTO_TUNING_TASK Function 89-51
REPORT_SQL_MONITOR Function 89-53
REPORT_TUNING_TASK Function 89-56
RESET_TUNING_TASK Procedure 89-58
RESUME_TUNING_TASK Procedure 89-59
SCRIPT_TUNING_TASK Function 89-60
SELECT_CURSOR_CACHE Function 89-62
SELECT_SQLSET Function 89-66
SELECT_WORKLOAD_REPOSITORY Functions 89-68
SET_TUNING_TASK_PARAMETER Procedures 89-70
SQLTEXT_TO_SIGNATURE Function 89-72
UNPACK_STGTAB_SQLPROF Procedure 89-73
UNPACK_STGTAB_SQLSET Procedure 89-74
UPDATE_SQLSET Procedures 89-76

126 DBMS_STAT_FUNCS

Summary of DBMS_STAT_FUNCS Subprograms 90-2
EXPONENTIAL_DIST_FIT Procedure 90-3
NORMAL_DIST_FIT Procedure 90-4
POISSON_DIST_FIT Procedure 90-5
SUMMARY Procedure 90-6
UNIFORM_DIST_FIT Procedure 90-7
WEIBULL_DIST_FIT Procedure 90-8

127 DBMS_STATS

Using DBMS_STATS 91-2
Overview 91-3
Types 91-4
Constants 91-5
Operational Notes 91-6
Deprecated Subprograms 91-12
Examples 91-13
Summary of DBMS_STATS Subprograms 91-15
ALTER_STATS_HISTORY_RETENTION Procedure 91-20
CONVERT_RAW_VALUE Procedures 91-21
CONVERT_RAW_VALUE_NVARCHAR Procedure 91-22
CONVERT_RAW_VALUE_ROWID Procedure 91-23
COPY_TABLE_STATS Procedure 91-24
CREATE_EXTENDED_STATS Function 91-25
CREATE_STAT_TABLE Procedure 91-27
DELETE_COLUMN_STATS Procedure 91-28
DELETE_DATABASE_PREFS Procedure 91-30
DELETE_DATABASE_STATS Procedure 91-33

DELETE_DICTIONARY_STATS Procedure 91-34
DELETE_FIXED_OBJECTS_STATS Procedure 91-35
DELETE_INDEX_STATS Procedure 91-36
DELETE_PENDING_STATS Procedure 91-37
DELETE_SCHEMA_PREFS Procedure 91-38
DELETE_SCHEMA_STATS Procedure 91-41
DELETE_SYSTEM_STATS Procedure 91-42
DELETE_TABLE_PREFS Procedure 91-43
DELETE_TABLE_STATS Procedure 91-46
DIFF_TABLE_STATS_IN_HISTORY Function 91-48
DIFF_TABLE_STATS_IN_PENDING Function 91-49
DIFF_TABLE_STATS_IN_STATTAB Function 91-50
DROP_EXTENDED_STATS Procedure 91-51
DROP_STAT_TABLE Procedure 91-52
EXPORT_COLUMN_STATS Procedure 91-53
EXPORT_DATABASE_PREFS Procedure 91-54
EXPORT_DATABASE_STATS Procedure 91-55

RECOVER_OPERATION Procedure 94-129
REMOVE_QUEUE Procedure 94-131
REMOVE_RULE Procedure 94-132
REMOVE_STREAMS_CONFIGURATION Procedure 94-134
RENAME_COLUMN Procedure 94-136
RENAME_SCHEMA Procedure 94-139
RENAME_TABLE Procedure 94-141
SET_MESSAGE_NOTIFICATION Procedure 94-143
SET_MESSAGE_TRACKING Procedure 94-148
SET_RULE_TRANSFORM_FUNCTION Procedure 94-149
SET_UP_QUEUE Procedure 94-153
SPLIT_STREAMS Procedure 94-156

131 DBMS_STREAMS_ADVISOR_ADM

Using DBMS_STREAMS_ADVISOR_ADM 95-2
Overview 95-3
Constants 95-4
Views 95-5
Operational Notes 95-6
Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms 95-8
ANALYZE_CURRENT_PERFORMANCE Procedure 95-9

132 DBMS_STREAMS_AUTH

Summary of DBMS_STREAMS_AUTH Subprograms 96-2
GRANT_ADMIN_PRIVILEGE Procedure 96-3
GRANT_REMOTE_ADMIN_ACCESS Procedure 96-6
REVOKE_ADMIN_PRIVILEGE Procedure 96-7
REVOKE_REMOTE_ADMIN_ACCESS Procedure 96-9

133 DBMS_STREAMS_MESSAGING

Summary of DBMS_STREAMS_MESSAGING Subprograms 97-2
DEQUEUE Procedure 97-3
ENQUEUE Procedure 97-5

134 DBMS_STREAMS_TABLESPACE_ADM

Using DBMS_STREAMS_TABLESPACE_ADM 98-2
Overview 98-3
Data Structures 98-4
DIRECTORY_OBJECT_SET Table Type 98-5
FILE Record Type 98-6
FILE_SET Table Type 98-7
TABLESPACE_SET Table Type 98-8
Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms 98-9
ATTACH_SIMPLE_TABLESPACE Procedure 98-10
ATTACH_TABLESPACES Procedure 98-12
CLONE_SIMPLE_TABLESPACE Procedure 98-17
CLONE_TABLESPACES Procedure 98-19
DETACH_SIMPLE_TABLESPACE Procedure 98-23
DETACH_TABLESPACES Procedure 98-25
PULL_SIMPLE_TABLESPACE Procedure 98-29
PULL_TABLESPACES Procedure 98-31

135 DBMS_TDB

Using DBMS_TDB 99-2
Overview 99-3
Security Model 99-4
Constants 99-5
Views 99-6
Operational Notes 99-7
Summary of DBMS_TDB Subprograms 99-8
CHECK_DB Function 99-9
CHECK_EXTERNAL Function 99-11

136 DBMS_TRACE

Using DBMS_TRACE 100-2
Overview 100-3
Security Model 100-4
Constants 100-5
Restrictions 100-6
Operational Notes 100-7
Summary of DBMS_TRACE Subprograms 100-10
CLEAR_PLSQL_TRACE Procedure 100-11
GET_PLSQL_TRACE_LEVEL Function 100-12
PLSQL_TRACE_VERSION Procedure 100-13
SET_PLSQL_TRACE Procedure 100-14

137 DBMS_TRANSACTION

Using DBMS_TRANSACTION 101-2
Security Model 101-3
Summary of DBMS_TRANSACTION Subprograms 101-4

ADVISE_COMMIT Procedure 101-6
ADVISE_NOTHING Procedure 101-7
ADVISE_ROLLBACK Procedure 101-8
BEGIN_DISCRETE_TRANSACTION Procedure 101-9
COMMIT Procedure 101-10
COMMIT_COMMENT Procedure 101-11
COMMIT_FORCE Procedure 101-12
LOCAL_TRANSACTION_ID Function 101-13
PURGE_LOST_DB_ENTRY Procedure 101-14
PURGE_MIXED Procedure 101-16
READ_ONLY Procedure 101-17
READ_WRITE Procedure 101-18
ROLLBACK Procedure 101-19
ROLLBACK_FORCE Procedure 101-20
ROLLBACK_SAVEPOINT Procedure 101-21
SAVEPOINT Procedure 101-22
STEP_ID Function 101-23
USE_ROLLBACK_SEGMENT Procedure 101-24

138 DBMS_TRANSFORM

Summary of DBMS_TRANSFORM Subprograms 102-2
CREATE_TRANSFORMATION Procedure 102-3
DROP_TRANSFORMATION Procedure 102-5
MODIFY_TRANSFORMATION Procedure 102-6

139 DBMS_TTS

Using DBMS_TTS 103-2
Security Model 103-3
Exceptions 103-4
Operational Notes 103-5
Summary of DBMS_TTS Subprograms 103-6
DOWNGRADE Procedure 103-7
TRANSPORT_SET_CHECK Procedure 103-8

140 DBMS_TYPES

Using DBMS_TYPES 104-2
Constants 104-3
Exceptions 104-4

141 DBMS_UTILITY

Using DBMS_UTILITY 105-2
Security Model 105-3
Constants 105-4
Types 105-5
Exceptions 105-6

Summary of DBMS_UTILITY Subprograms 105-7
ACTIVE_INSTANCES Procedure 105-9
ANALYZE_PART_OBJECT Procedure 105-10
CANONICALIZE Procedure 105-11
COMMA_TO_TABLE Procedures 105-12
COMPILE_SCHEMA Procedure 105-13
CREATE_ALTER_TYPE_ERROR_TABLE Procedure 105-14
CURRENT_INSTANCE Function 105-15
DATA_BLOCK_ADDRESS_BLOCK Function 105-16
DATA_BLOCK_ADDRESS_FILE Function 105-17
DB_VERSION Procedure 105-18
EXEC_DDL_STATEMENT Procedure 105-19
FORMAT_CALL_STACK Function 105-20
FORMAT_ERROR_BACKTRACE Function 105-21
FORMAT_ERROR_STACK Function 105-24
GET_CPU_TIME Function 105-25
GET_DEPENDENCY Procedure 105-26
GET_HASH_VALUE Function 105-27
GET_PARAMETER_VALUE Function 105-28
GET_TIME Function 105-30
INVALIDATE Procedure 105-31
IS_CLUSTER_DATABASE Function 105-34
MAKE_DATA_BLOCK_ADDRESS Function 105-35
NAME_RESOLVE Procedure 105-36
NAME_TOKENIZE Procedure 105-38
PORT_STRING Function 105-39
TABLE_TO_COMMA Procedures 105-40
VALIDATE Procedure 105-41

142 DBMS_WARNING

Using DBMS_WARNING 106-2
Security Model 106-3
Summary of DBMS_WARNING Subprograms 106-4
ADD_WARNING_SETTING_CAT Procedure 106-5
ADD_WARNING_SETTING_NUM Procedure 106-6
GET_CATEGORY Function 106-7
GET_WARNING_SETTING_CAT Function 106-8
GET_WARNING_SETTING_NUM Function 106-9
GET_WARNING_SETTING_STRING Function 106-10
SET_WARNING_SETTING_STRING Procedure 106-11

143 DBMS_WM

Documentation of DBMS_WM 107-2

144 DBMS_WORKLOAD_CAPTURE

Using DBMS_WORKLOAD_CAPTURE 108-2

Overview 108-3
Security Model 108-4
Summary of DBMS_WORKLOAD_CAPTURE Subprograms 108-5
ADD_FILTER Procedures 108-6
DELETE_CAPTURE_INFO Procedure 108-7
DELETE_FILTER Procedure 108-8
EXPORT_AWR Procedure 108-9
FINISH_CAPTURE Procedure 108-10
GET_CAPTURE_INFO Function 108-11
IMPORT_AWR Function 108-12
REPORT Function 108-13
START_CAPTURE Procedure 108-14

145 DBMS_WORKLOAD_REPLAY

Using DBMS_WORKLOAD_REPLAY 109-2
Security Model 109-3
Summary of DBMS_WORKLOAD_REPLAY Subprograms 109-4
CALIBRATE Function 109-5
CANCEL_REPLAY Procedure 109-6
DELETE_REPLAY_INFO Procedure 109-7
EXPORT_AWR Procedure 109-8
GET_REPLAY_INFO Function 109-9
IMPORT_AWR Function 109-10
INITIALIZE_REPLAY Procedure 109-11
PREPARE_REPLAY Procedure 109-12
PROCESS_CAPTURE Procedure 109-15
REMAP_CONNECTION Procedure 109-16
REPORT Function 109-17
START_REPLAY Procedure 109-18

146 DBMS_WORKLOAD_REPOSITORY

Using DBMS_WORKLOAD_REPOSITORY 110-2
Examples 110-3
Data Structures 110-4
AWR_BASELINE_METRIC_TYPE Object Type 110-5
AWR_BASELINE_METRIC_TYPE_TABLE Table Type 110-6
Summary of DBMS_WORKLOAD_REPOSITORY Subprograms 110-7
ADD_COLORED_SQL Procedure 110-8
ASH_REPORT_HTML Function 110-9
ASH_REPORT_TEXT Function 110-11
AWR_DIFF_REPORT_HTML Function 110-13
AWR_DIFF_REPORT_TEXT Function 110-14
AWR_REPORT_HTML Function 110-15
AWR_REPORT_TEXT Function 110-16
AWR_SQL_REPORT_HTML Function 110-17
AWR_SQL_REPORT_TEXT Function 110-18

CREATE_BASELINE Functions & Procedures 110-19
CREATE_BASELINE_TEMPLATE Procedures 110-21
CREATE_SNAPSHOT Function and Procedure 110-23
DROP_BASELINE Procedure 110-24
DROP_BASELINE_TEMPLATE Procedure 110-25
DROP_SNAPSHOT_RANGE Procedure 110-26
MODIFY_SNAPSHOT_SETTINGS Procedures 110-27
MODIFY_BASELINE_WINDOW_SIZE Procedure 110-29
REMOVE_COLORED_SQL Procedure 110-30
RENAME_BASELINE Procedure 110-31
SELECT_BASELINE_METRICS Function 110-32

147 DBMS_XA

Using DBMS_XA 111-2
Overview 111-3
Security Model 111-4
Constants 111-5
Operational Notes 111-7
Data Structures 111-8
DBMS_XA_XID Object Type 111-9
DBMS_XA_XID_ARRAY Table Type 111-10
Summary of DBMS_XA Subprograms 111-11
DIST_TXN_SYNC Procedure 111-12
XA_COMMIT Function 111-13
XA_END Function 111-14
XA_FORGET Function 111-15
XA_GETLASTOER Function 111-16
XA_PREPARE Function 111-17
XA_RECOVER Function 111-18
XA_ROLLBACK Function 111-19
XA_SETTIMEOUT Function 111-20
XA_START Function 111-21

148 DBMS_XDB

Using DBMS_XDB 112-2
Overview 112-3
Constants 112-4
Summary of DBMS_XDB Subprograms 112-5
ACLCHECKPRIVILEGES Function 112-8
ADDMIMEMAPPING Procedure 112-9
ADDSCHEMALOCMAPPING Procedure 112-10

206 UTL_ENCODE

Summary of UTL_ENCODE Subprograms 170-2
BASE64_DECODE Function 170-3
BASE64_ENCODE Function 170-4
MIMEHEADER_DECODE Function 170-5
MIMEHEADER_ENCODE Function 170-6
QUOTED_PRINTABLE_DECODE Function 170-7
QUOTED_PRINTABLE_ENCODE Function 170-8
TEXT_DECODE Function 170-9
TEXT_ENCODE Function 170-10
UUDECODE Function 170-11
UUENCODE Function 170-12

207 UTL_FILE

Using UTL_FILE 171-2
Security Model 171-3
Types 171-4
Operational Notes 171-5
Rules and Limits 171-6
Exceptions 171-7
Examples 171-8
Summary of UTL_FILE Subprograms 171-10
FCLOSE Procedure 171-12
FCLOSE_ALL Procedure 171-13
FCOPY Procedure 171-14
FFLUSH Procedure 171-15
FGETATTR Procedure 171-16
FGETPOS Function 171-17
FOPEN Function 171-18
FOPEN_NCHAR Function 171-20
FREMOVE Procedure 171-21
FRENAME Procedure 171-22
FSEEK Procedure 171-23
GET_LINE Procedure 171-24
GET_LINE_NCHAR Procedure 171-25
GET_RAW Function 171-26
IS_OPEN Function 171-27
NEW_LINE Procedure 171-28

PUT Procedure 171-29
PUT_LINE Procedure 171-30
PUT_LINE_NCHAR Procedure 171-31
PUT_NCHAR Procedure 171-32
PUTF Procedure 171-33
PUTF_NCHAR Procedure 171-35
PUT_RAW Function 171-36

208 UTL_HTTP

Using UTL_HTTP 172-2
Overview 172-3
Security Model 172-4
Constants 172-5
Datatypes 172-9
Operational Notes 172-13
Exceptions 172-19
Examples 172-21
Subprogram Groups 172-24
Simple HTTP Fetches in a Single Call Subprograms 172-25
Session Settings Subprograms 172-26
HTTP Requests Subprograms 172-27
HTTP Responses Subprograms 172-28
HTTP Cookies Subprograms 172-29
HTTP Persistent Connections Subprograms 172-30
Error Conditions Subprograms 172-31
Summary of UTL_HTTP Subprograms 172-32
ADD_COOKIES Procedure 172-36
BEGIN_REQUEST Function 172-37
CLEAR_COOKIES Procedure 172-39
CLOSE_PERSISTENT_CONN Procedure 172-40
CLOSE_PERSISTENT_CONNS Procedure 172-41
END_REQUEST Procedure 172-43
END_RESPONSE Procedure 172-44
GET_AUTHENTICATION Procedure 172-45
GET_BODY_CHARSET Procedure 172-46
GET_COOKIE_COUNT Function 172-47
GET_COOKIE_SUPPORT Procedure 172-48
GET_COOKIES Function 172-49
GET_DETAILED_EXCP_SUPPORT Procedure 172-50
GET_DETAILED_SQLCODE Function 172-51
GET_DETAILED_SQLERRM Function 172-52
GET_FOLLOW_REDIRECT Procedure 172-53
GET_HEADER Procedure 172-54
GET_HEADER_BY_NAME Procedure 172-55
GET_HEADER_COUNT Function 172-56
GET_PERSISTENT_CONN_COUNT Function 172-57
GET_PERSISTENT_CONN_SUPPORT Procedure 172-58

GET_PERSISTENT_CONNS Procedure 172-59
GET_PROXY Procedure 172-60
GET_RESPONSE Function 172-61
GET_RESPONSE_ERROR_CHECK Procedure 172-62
GET_TRANSFER_TIMEOUT Procedure 172-63
READ_LINE Procedure 172-64
READ_RAW Procedure 172-65
READ_TEXT Procedure 172-66
REQUEST Function 172-68
REQUEST_PIECES Function 172-70
SET_AUTHENTICATION Procedure 172-73

Index

Preface

This Preface contains these topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming:

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

`http://www.oracle.com/accessibility/`

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, 7 days a week. For TTY support, call 800.446.2398. Outside the United States, call +1.407.458.2479.

Related Documents

For more information, see the following documents:

- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database PL/SQL Language Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

`http://oraclestore.oracle.com/`

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

`http://otn.oracle.com/membership/`

If you already have a username and password for OTN, then you can go directly to the documentation section of the OTN Web site at

`http://otn.oracle.com/documentation/`

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
Bold	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an **index-organized table**.
Italics	Italic typeface indicates book titles or emphasis.	*Oracle Database Concepts* Ensure that the recovery catalog and target database do *not* reside on the same disk.

Convention	Meaning	Example
UPPERCASE monospace (fixed-width) font	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.	You can specify this clause only for a NUMBER column. You can back up the database by using the BACKUP command. Query the TABLE_NAME column in the USER_TABLES data dictionary view. Use the DBMS_STATS.GENERATE_STATS procedure.
lowercase monospace (fixed-width) font	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. *Note:* Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	Enter sqlplus to start SQL*Plus. The password is specified in the orapwd file. Back up the datafiles and control files in the /disk1/oracle/dbs directory. The department_id, department_name, and location_id columns are in the hr.departments table. Set the QUERY_REWRITE_ENABLED initialization parameter to true. The JRepUtil class implements these methods.
lowercase italic monospace (fixed-width) font	Lowercase italic monospace font represents placeholders or variables.	You can specify the *parallel_clause*. Run *old_release*.SQL where *old_release* refers to the release you installed prior to upgrading.

Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
[ ]	Anything enclosed in brackets is optional.	DECIMAL (*digits* [, *precision*])
{ }	Braces are used for grouping items.	{ENABLE | DISABLE}
|	A vertical bar represents a choice of two options.	{ENABLE | DISABLE} [COMPRESS | NOCOMPRESS]
...	Ellipsis points mean repetition in syntax descriptions. In addition, ellipsis points can mean an omission in code examples or text.	CREATE TABLE ... AS *subquery*; SELECT *col1*, *col2*, ... , *coln* FROM employees;
Other symbols	You must use symbols other than brackets ([ ]), braces ({ }), vertical bars (|), and ellipsis points (...) exactly as shown.	acctbal NUMBER(11,2); acct CONSTANT NUMBER(4) := 3;
Italics	Italicized text indicates placeholders or variables for which you must supply particular values.	enter *password* DB_NAME = *database_name*

Convention	Meaning	Example

UPPERCASE	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	`SELECT last_name, employee_id FROM employees;`
		`SELECT * FROM USER_TABLES;`
		`DROP TABLE hr.employees;`

lowercase	Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.
	Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.
		`SELECT last_name, employee_id FROM employees;`
		`sqlplus hr/hr`
		`CREATE USER mjones IDENTIFIED BY ty3MU9;`

What's New in PL/SQL Packages and Types Reference?

The following sections describe the new documentation:

- Oracle Database 11g Release 1 (11.1)
  - New Packages
  - Updated Packages
  - New Types
  - Updated Types

Oracle Database 11g Release 1 (11.1)

New Packages

- APEX_CUSTOM_AUTH

Introduction to Oracle Supplied PL/SQL Packages & Types

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
     WHERE Owner IN (
       'SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
       'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
       'ORDPLUGINS', 'OEM_MONITOR', 'WKSYS', 'WKPROXY',
       'WK_TEST', 'WKUSER', 'MDSYS', 'LBACSYS', 'DMSYS',
       'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
       'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA',
       'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
     AND Object_Type IN ('PACKAGE', 'TYPE')
     ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- Package Overview
- Summary of Oracle Supplied PL/SQL Packages and Types

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for information on how to create your own packages

Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

Packages have many advantages over standalone procedures and functions. For example, they:

- Let you organize your application development more efficiently.
- Let you grant privileges more efficiently.
- Let you modify package objects without recompiling dependent schema objects.
- Enable Oracle to read multiple package objects into memory at once.
- Let you *overload* procedures or functions. Overloading means creating multiple procedures with the same name in the same package, each taking arguments of different number or datatype.
- Can contain global variables and cursors that are available to all procedures and functions in the package.

Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS  -- specification (visible part)
   -- public type and item declarations
   -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
   -- private type and item declarations
   -- subprogram bodies
[BEGIN
   -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created and the CATPROC.SQL script is run. For example, to create the DBMS_ALERT package, the DBMSALRT.SQL and PRVTALRT.PLB scripts must be run when connected as the user SYS. These scripts are run automatically by the CATPROC.SQL script.

Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have EXECUTE privileges on the function. To select from a view defined with a PL/SQL function, you must have SELECT privileges on the view. No separate EXECUTE privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

   You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

   Note: It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE just` overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.

   You can declare and define program objects in the package body.

   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

   See Also:

   - *Oracle Database PL/SQL Language Reference*
   - *Oracle Database Advanced Application Developer's Guide*for more information on creating new packages
   - *Oracle Database Concepts*

   for more information on storing and executing packages

Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example

The following example shows a package specification for a package named EMPLOYEE_MANAGEMENT. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER;
   PROCEDURE fire_emp (emp_id NUMBER);
   PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
       new_empno    NUMBER(10);

   BEGIN
      SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
      INSERT INTO emp VALUES (new_empno, name, job, mgr,
         hiredate, sal, comm, deptno);
      RETURN (new_empno);
   END hire_emp;

   PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument emp_id. If no employee is found, then an exception is raised.

```
   BEGIN
      DELETE FROM emp WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
      raise_application_error(-20011, 'Invalid Employee
         Number: ' || TO_CHAR(emp_id));
   END IF;
END fire_emp;

PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. Emp_id is a number that corresponds to an employee number. Sal_incr is the amount by which to increase the employee's salary.

```
   BEGIN

   -- If employee exists, then update salary with increase.

      UPDATE emp
         SET sal = sal + sal_incr
         WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
         raise_application_error(-20011, 'Invalid Employee
```

```
            Number: ' || TO_CHAR(emp_id));
      END IF;
   END sal_raise;
END employee_management;
```

Note: If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
   > START WITH 8000 INCREMENT BY 10;
```

Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```

Summary of Oracle Supplied PL/SQL Packages and Types

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

Caution:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

Table 1–1 Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
APEX_CUSTOM_AUTH	Provides an interface for authentication and session management
APEX_APPLICATION	Enables users to take advantage of global variables
APEX_ITEM	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page
APEX_UTIL	Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users
CTX_ADM	Lets you administer servers and the data dictionary
CTX_CLS	Lets you generate CTXRULE rules for a set of documents
CTX_DDL	Lets you create and manage the preferences, section lists and stopgroups required for Text indexes
CTX_DOC	Lets you request document services
CTX_OUTPUT	Lets you manage the index log
CTX_QUERY	Lets you generate query feedback, count hits, and create stored query expressions
CTX_REPORT	Lets you create various index reports
CTX_THES	Lets you to manage and browse thesauri
CTX_ULEXER	For use with the user-lexer
DBMS_ADVANCED_REWRITE	Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite
DBMS_ADVISOR	Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements
DBMS_ALERT	Provides support for the asynchronous notification of database events

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_APPLICATION_INFO	Lets you register an application name with the database for auditing or performance tracking purposes
DBMS_APPLY_ADM	Provides administrative procedures to start, stop, and configure an apply process
DBMS_AQ	Lets you add a message (of a predefined object type) onto a queue or to dequeue a message
DBMS_AQADM	Lets you perform administrative functions on a queue or queue table for messages of a predefined object type
DBMS_AQELM	Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP
DBMS_AQIN	Plays a part in providing secure access to the Oracle JMS interfaces
DBMS_ASSERT	Provides an interface to validate properties of the input value
DBMS_AUTO_TASK_ADMIN	Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls
DBMS_AW_STATS	Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions
DBMS_CAPTURE_ADM	Describes administrative procedures to start, stop, and configure a capture process; used in Streams
DBMS_CDC_PUBLISH	Identifies new data that has been added to, modified, or removed from, relational tables and publishes the changed data in a form that is usable by an application
DBMS_CDC_SUBSCRIBE	Lets you view and query the change data that was captured and published with the DBMS_LOGMNR_CDC_PUBLISH package
DBMS_COMPARISON	Provides interfaces to compare and converge database objects at different databases
DBMS_CONNECTION_POOL	Provides an interface to manage the Database Resident Connection Pool
DBMS_CQ_NOTIFICATION	Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.
DBMS_CRYPTO	Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms
DBMS_CSX_ADMIN	Provides an interface to customize the setup when transporting a tablespace containing binary XML data
DBMS_CUBE	Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_CUBE_ADVISE	Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite
DBMS_DATA_MINING	Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models
DBMS_DATA_MINING_TRANSFORM	Provides subroutines that can be used to prepare data for Oracle Data Mining
DBMS_DATAPUMP	Lets you move all, or part of, a database between databases, including both data and metadata
DBMS_DB_VERSION	Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions
DBMS_DDL	Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs
DBMS_DEBUG	Implements server-side debuggers and provides a way to debug server-side PL/SQL program units
DBMS_DEFER	Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DEFER_QUERY	Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.
DBMS_DEFER_SYS	Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DESCRIBE	Describes the arguments of a stored procedure with full name translation and security checking
DBMS_DG	Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover
DBMS_DIMENSION	Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition
DBMS_DISTRIBUTED_TRUST_ADMIN	Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted
DBMS_EPG	Implements the embedded PL/SQL gateway that enables a web browser to invoke a PL/SQL stored procedure through an HTTP listener
DBMS_ERRLOG	Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back
DBMS_EXPFIL	Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter
DBMS_FGA	Provides fine-grained security functions

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_FILE_GROUP	One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories
DBMS_FILE_TRANSFER	Lets you copy a binary file within a database or to transfer a binary file between databases
DBMS_FLASHBACK	Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)
DBMS_FREQUENT_ITEMSET	Enables frequent itemset counting
DBMS_HM	Contains constants and procedure declarations for health check management
DBMS_HPROF	Provides an interface for profiling the execution of PL/SQL applications
DBMS_HS_PARALLEL	Enables parallel processing for heterogeneous targets access
DBMS_HS_PASSTHROUGH	Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems
DBMS_IOT	Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command
DBMS_JAVA	Provides a PL/SQL interface for accessing database functionality from Java
DBMS_JOB	Schedules and manages jobs in the job queue
DBMS_LDAP	Provides functions and procedures to access data from LDAP servers
DBMS_LDAP_UTL	Provides the Oracle Extension utility functions for LDAP
DBMS_LIBCACHE	Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution
DBMS_LOB	Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILEs (read-only)
DBMS_LOCK	Lets you request, convert and release locks through Oracle Lock Management services
DBMS_LOGMNR	Provides functions to initialize and run the log reader
DBMS_LOGMNR_D	Queries the dictionary tables of the current database, and creates a text based file containing their contents
DBMS_LOGSTDBY	Describes procedures for configuring and managing the logical standby database environment
DBMS_METADATA	Lets callers easily retrieve complete database object definitions (metadata) from the dictionary
DBMS_MGD_ID_UTL	Provides a set of utility subprograms
DBMS_MGWADM	Describes the Messaging Gateway administrative interface; used in Advanced Queuing

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_MGWMSG	Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.
DBMS_MONITOR	Let you use PL/SQL for controlling additional tracing and statistics gathering
DBMS_MVIEW	Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.
DBMS_NETWORK_ACL_ADMIN	Provides the interface to administer the network Access Control List (ACL)
DBMS_NETWORK_UTL	Provides the interface to administer the network Access Control List (ACL)
DBMS_OBFUSCATION_TOOLKIT	Provides procedures for Data Encryption Standards
DBMS_ODCI	Returns the CPU cost of a user function based on the elapsed time of the function
DBMS_OFFLINE_OG	Provides a public interface for offline instantiation of master groups
DBMS_OLAP	Provides procedures for summaries, dimensions, and query rewrites
DBMS_OUTLN	Provides the interface for procedures and functions associated with management of stored outlines Synonymous with OUTLN_PKG
DBMS_OUTLN_EDIT	Lets you edit an invoker's rights package
DBMS_OUTPUT	Accumulates information in a buffer so that it can be retrieved later
DBMS_PCLXUTIL	Provides intra-partition parallelism for creating partition-wise local indexes
DBMS_PIPE	Provides a DBMS pipe service which enables messages to be sent between sessions
DBMS_PREDICTIVE_ANALYTICS	Provides subroutines that implement automatic data mining operations for predict, explain, and profile
DBMS_PREPROCESSOR	Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form
DBMS_PROFILER	Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks
DBMS_PROPAGATION_ADM	Provides administrative procedures for configuring propagation from a source queue to a destination queue
DBMS_RANDOM	Provides a built-in random number generator
DBMS_RECTIFIER_DIFF	Provides an interface to detect and resolve data inconsistencies between two replicated sites
DBMS_REDEFINITION	Lets you perform an online reorganization of tables
DBMS_REFRESH	Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option
DBMS_REPAIR	Provides data corruption repair procedures

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_REPCAT	Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.
DBMS_REPCAT_ADMIN	Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.
DBMS_REPCAT_INSTATIATE	Instantiates deployment templates. Requires the Replication Option.
DBMS_REPCAT_RGT	Controls the maintenance and definition of refresh group templates. Requires the Replication Option.
DBMS_REPUTIL	Provides routines to generate shadow tables, triggers, and packages for table replication.
DBMS_RESCONFIG	Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource
DBMS_RESOURCE_MANAGER	Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema
DBMS_RESOURCE_MANAGER_PRIVS	Maintains privileges associated with resource consumer groups
DBMS_RESULT_CACHE	Provides an interface to operate on the Result Cache
DBMS_RESUMABLE	Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution
DBMS_RLMGR	Contains various procedures to create and manage rules and rule sessions by the Rules Manager
DBMS_RLS	Provides row level security administrative interface
DBMS_ROWID	Provides procedures to create rowids and to interpret their contents
DBMS_RULE	Describes the EVALUATE procedure used in Streams
DBMS_RULE_ADM	Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams
DBMS_SCHEDULER	Provides a collection of scheduling functions that are callable from any PL/SQL program
DBMS_SERVER_ALERT	Lets you issue alerts when some threshold has been violated
DBMS_SERVICE	Lets you create, delete, activate and deactivate services for a single instance
DBMS_SESSION	Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures
DBMS_SHARED_POOL	Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism
DBMS_SPACE	Provides segment space information not available through standard SQL

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_SPACE_ADMIN	Provides tablespace and segment space administration not available through the standard SQL
DBMS_SPM	Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements
DBMS_SQL	Lets you use dynamic SQL to access the database
DBMS_SQLDIAG	Provides an interface to the SQL Diagnosability functionality
DBMS_SQLTUNE	Provides the interface to tune SQL statements
DBMS_STAT_FUNCS	Provides statistical functions
DBMS_STATS	Provides a mechanism for users to view and modify optimizer statistics gathered for database objects
DBMS_STORAGE_MAP	Communicates with FMON to invoke mapping operations
DBMS_STREAMS	Describes the interface to convert SYS.AnyData objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.
DBMS_STREAMS_ADMIN	Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level
DBMS_STREAMS_AUTH	Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators
DBMS_STREAMS_ADVISOR_ADM	Provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered
DBMS_STREAMS_MESSAGING	Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue
DBMS_STREAMS_TABLESPACE_ADM	Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another
DBMS_TDB	Reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.
DBMS_TRACE	Provides routines to start and stop PL/SQL tracing
DBMS_TRANSACTION	Provides access to SQL transaction statements from stored procedures and monitors transaction activities
DBMS_TRANSFORM	Provides an interface to the message format transformation features of Oracle Advanced Queuing
DBMS_TTS	Checks if the transportable set is self-contained
DBMS_TYPES	Consists of constants, which represent the built-in and user-defined types

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_UTILITY	Provides various utility routines
DBMS_WARNING	Provides the interface to query, modify and delete current system or session settings
DBMS_WM	Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions
DBMS_WORKLOAD_CAPTURE	Configures the Workload Capture system and produce the workload capture data.
DBMS_WORKLOAD_REPLAY	Provides an interface to replay and report on a record of a workload on a production or test system
DBMS_WORKLOAD_REPOSITORY	Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines
DBMS_XA	Contains the XA/Open interface for applications to call XA interface in PL/SQL
DBMS_XDB	Describes Resource Management and Access Control interface for PL/SQL
DBMS_XDB_ADMIN	Provides an interface to implement XMLIndex administration operation
DBMS_XDBRESOURCE	Provides an interface to operate on the XDB resource's metadata and contents
DBMS_XDB_VERSION	Describes the versioning interface
DBMS_XDBT	Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance
DBMS_XDBZ	Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)
DBMS_XEVENT	Provides event-related types and supporting subprograms
DBMS_XMLDOM	Explains access to XMLType objects
DBMS_XMLGEN	Converts the results of a SQL query to a canonical XML format
DBMS_XMLINDEX	Provides an interface to implement asychronous indexing and apply node referencing
DBMS_XMLPARSER	Explains access to the contents and structure of XML documents
DBMS_XMLQUERY	Provides database-to-XMLType functionality
DBMS_XMLSAVE	Provides XML-to-database-type functionality
DBMS_XMLSCHEMA	Explains procedures to register and delete XML schemas
DBMS_XMLSTORE	Provides the ability to store XML data in relational tables
DBMS_XMLTRANSLATIONS	Provides an interface to perform translations so that strings can be searched or displayed in various languages
DBMS_XPLAN	Describes how to format the output of the EXPLAIN PLAN command

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_XSLPROCESSOR	Explains access to the contents and structure of XML documents
DEBUG_EXTPROC	Lets you debug external procedures on platforms with debuggers that attach to a running process
HTF	Hypertext functions generate HTML tags
HTP	Hypertext procedures generate HTML tags
ORD_DICOM	Supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type
ORD_DICOM_ADMIN	Used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository
OWA_CACHE	Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL web applications
OWA_COOKIE	Provides an interface for sending and retrieving HTTP cookies from the client's browser
OWA_CUSTOM	Provides a Global PLSQL Agent Authorization callback function
OWA_IMAGE	Provides an interface to access the coordinates where a user clicked on an image
OWA_OPT_LOCK	Contains subprograms that impose optimistic locking strategies so as to prevent lost updates
OWA_PATTERN	Provides an interface to locate text patterns within strings and replace the matched string with another string
OWA_SEC	Provides an interface for custom authentication
OWA_TEXT	Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.
OWA_UTIL	Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table
SDO_CS	Provides functions for coordinate system transformation
SDO_CSW_PROCESS	Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)
SDO_GCDR	Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses
SDO_GEOM	Provides functions implementing geometric operations on spatial objects
SDO_GEOR	Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
SDO_GEOR_ADMIN	Contains subprograms for administrative operations related to GeoRaster.
SDO_GEOR_UTL	Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data
SDO_LRS	Provides functions for linear referencing system support
SDO_MIGRATE	Provides functions for migrating spatial data from previous releases
SDO_NET	Provides functions and procedures for working with data modeled as nodes and links in a network
SDO_NET_MEM	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_OLS	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_PC_PKG	Contains subprograms to support the use of point clouds in Spatial
SDO_SAM	Contains functions and procedures for spatial analysis and data mining
SDO_TIN_PKG	Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial
SDO_TOPO	Provides procedures for creating and managing Spatial topologies
SDO_TOPO_MAP	Contains subprograms for editing Spatial topologies using a cache (TopoMap object)
SDO_TUNE	Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial
SDO_UTIL	Provides utility functions and procedures for Oracle Spatial
SDO_WFS_LOCK	Contains subprograms for WFS support for registering and unregistering feature tables
SDO_WFS_PROC	Provides utility functions and procedures for Oracle Spatial
SEM_APIS	Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.
SEM_PERF	Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database
UTL_COLL	Enables PL/SQL programs to use collection locators to query and update
UTL_COMPRESS	Provides a set of data compression utilities
UTL_DBWS	Provides database web services

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
UTL_ENCODE	Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts
UTL_FILE	Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O
UTL_HTTP	Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges
UTL_I18N	Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications
UTL_INADDR	Provides a procedure to support internet addressing
UTL_LMS	Retrieves and formats error messages in different languages
UTL_MAIL	A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt
UTL_NLA	Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs
UTL_RAW	Provides SQL functions for manipulating RAW datatypes
UTL_REF	Enables a PL/SQL program to access an object by providing a reference to the object
UTL_SMTP	Provides PL/SQL functionality to send emails
UTL_SPADV	Provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment
UTL_TCP	Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world
UTL_URL	Provides escape and unescape mechanisms for URL characters
WPG_DOCLOAD	Provides an interface to download files, both BLOBs and BFILEs
ANYDATA TYPE	A self-describing data instance type containing an instance of the type plus a description
ANYDATASET TYPE	Contains a description of a given type plus a set of data instances of that type
ANYTYPE TYPE	Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions
Oracle Streams AQ Types	Describes the types used in Advanced Queuing
Database URI Type	Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
Expression Filter Types	Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.
JMS TYPES	Describes JMS types so that a PL/SQL application can use JMS queues of JMS types
Oracle Multimedia ORDAudio TYPE	Supports the storage and management of audio data
Oracle Multimedia ORDDicom Type	Supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data
Oracle Multimedia ORDDoc TYPE	Supports the storage and management of heterogeneous media data including image, audio, and video
Oracle Multimedia ORDImage TYPE	Supports the storage, management, and manipulation of image data
Oracle Multimedia SQL/MM Still Image TYPE	Supports the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates
Oracle Multimedia ORDVideo TYPE	Supports the storage and management of video data
LOGICAL CHANGE RECORD TYPES	Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams
MG_ID Package Types	Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types
RULES TYPEs	Describes the types used with rules, rule sets, and evaluation contexts
RULES Manager Types	Rules Manager is supplied with one predefined type and a public synonym
UTL Streams Types	Describes describes abstract streams types used with Oracle XML functionality
XMLType	Describes the types and functions used for native XML support in the server

2

APEX_CUSTOM_AUTH

The APEX_CUSTOM_AUTH package provides an interface for authentication and session management.

- Documentation of APEX_CUSTOM_AUTH

Documentation of APEX_CUSTOM_AUTH

For a complete description of this package within the context of APEX, see `APEX_CUSTOM_AUTH` in the *Oracle Database Application Express User's Guide*.

3

APEX_APPLICATION

The APEX_APPLICATION package enables users to take advantage of global variables.

- Documentation of APEX_APPLICATION

Documentation of APEX_APPLICATION

For a complete description of this package within the context of APEX, see `APEX_APPLICATION` in the *Oracle Database Application Express User's Guide*.

4

APEX_ITEM

The APEX_ITEM package enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.

- Documentation of APEX_ITEM

Documentation of APEX_ITEM

For a complete description of this package within the context of APEX, see `APEX_ITEM` in the *Oracle Database Application Express User's Guide*.

5

APEX_UTIL

The APEX_UTIL package provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.

- Documentation of APEX_UTIL

Documentation of APEX_UTIL

For a complete description of this package within the context of APEX, see `APEX_UTIL` in the *Oracle Database Application Express User's Guide*.

6

CTX_ADM

This Oracle Text package lets you administer the Oracle Text data dictionary. Note that you must install this package in order to use it.

- Documentation of CTX_ADM

Documentation of CTX_ADM

For a complete description of this package within the context of Oracle Text, see `CTX_ADM` in the *Oracle Text Reference*.

7

CTX_CLS

This Oracle Text package enables generation of CTXRULE rules for a set of documents.

- Documentation of CTX_CLS

Documentation of CTX_CLS

For a complete description of this package within the context of Oracle Text, see `CTX_CLS` in the *Oracle Text Reference*.

8

CTX_DDL

This Oracle Text package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

- Documentation of CTX_DDL

Documentation of CTX_DDL

For complete description of this package within the context of Oracle Text, see `CTX_DDL` in the *Oracle Text Reference.*

9

CTX_DOC

This Oracle Text package lets you request document services. Note that you must install this package in order to use it.

- Documentation of CTX_DOC

Documentation of CTX_DOC

For a complete description of this package within the context of Oracle Text, see `CTX_DOC` in the *Oracle Text Reference*.

10

CTX_OUTPUT

This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

- Documentation of CTX_OUTPUT

Documentation of CTX_OUTPUT

For a complete description of this package within the context of Oracle Text, see `CTX_OUTPUT` in the *Oracle Text Reference*.

11

CTX_QUERY

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

- Documentation of CTX_QUERY

Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see `CTX_QUERY` in the *Oracle Text Reference*.

12

CTX_REPORT

This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

- Documentation of CTX_REPORT

Documentation of CTX_REPORT

For a complete description of this package within the context of Oracle Text, see `CTX_REPORT` in the *Oracle Text Reference.*

13

CTX_THES

This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

- Documentation of CTX_THES

Documentation of CTX_THES

For a complete description of this package within the context of Oracle Text, see `CTX_THES` in the *Oracle Text Reference*.

14

CTX_ULEXER

This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

- Documentation of CTX_ULEXER

Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see `CTX_ULEXER` in the *Oracle Text Reference.*

15

DBMS_ADDM

The DBMS_ADDM package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

See Also:

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"
- *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

This chapter contains the following topics:

- Using DBMS_ADDM
  - Security Model
- Summary of DBMS_ADDM Subprograms

Using DBMS_ADDM

- Security Model

Security Model

The DBMS_ADDM package runs with the caller's permission, not the definer's, and then applies the security constraints required by the DBMS_ADVISOR package.

> **See Also:** The DBMS_ADVISOR package for more information about "Security Model".

Summary of DBMS_ADDM Subprograms

Table 15–1 DBMS_ADDM Package Subprograms

Subprogram	Description
ANALYZE_DB Procedure on page 15-5	Creates an ADDM task for analyzing in database analysis mode and executes it
ANALYZE_INST Procedure on page 15-6	Creates an ADDM task for analyzing in instance analysis mode and executes it.
ANALYZE_PARTIAL Procedure on page 15-7	Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it
DELETE Procedure on page 15-8	Deletes an already created ADDM task (of any kind)
DELETE_FINDING_ DIRECTIVE Procedure on page 15-9	Deletes a finding directive
DELETE_PARAMETER_ DIRECTIVE Procedure on page 15-10	Deletes a parameter directive
DELETE_SEGMENT_ DIRECTIVE Procedure on page 15-11	Deletes a segment directive
DELETE_SQL_DIRECTIVE Procedure on page 15-12	Deletes a SQL directive
GET_REPORT Function on page 15-13	Retrieves the default text report of an executed ADDM task
INSERT_FINDING_ DIRECTIVE Procedure on page 15-14	Creates a directive to limit reporting of a specific finding type.
INSERT_PARAMETER_ DIRECTIVE Procedure on page 15-15	Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter
INSERT_SEGMENT_ DIRECTIVE Procedure on page 15-16	Creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments
INSERT_SQL_DIRECTIVE Procedure on page 15-18	Creates a directive to limit reporting of actions on specific SQL

ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_DB (
   task_name           IN OUT VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 15–2 ANALYZE_DB Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_database_analysis_mode_task';
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

ANALYZE_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_INST (
   task_name           IN OUT VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   instance_number     IN     NUMBER := NULL,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 15–3 ANALYZE_INST Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
instance_number	Number of the instance to analyze. By default it is the instance currently connected
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Usage Notes

On single instance systems (i.e., not using RAC) the resulting task is identical to using the ANALYZE_DB procedure.

Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_PARTIAL (
   task_name           IN OUT VARCHAR2,
   instance_numbers    IN     VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 15–4 ANALYZE_PARTIAL Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
instance_numbers	Comma separated list of instance numbers to analyze
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_modetask';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this will delete the local tasks associated with the main task.

Syntax

```
DBMS_ADDM.DELETE (
   task_name           IN VARCHAR2);
```

Parameters

Table 15–5 DELETE Procedure Parameters

Parameter	Description
task_name	Name of the task to be deleted

Examples

```
BEGIN
  DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');
END
```

DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15–6 DELETE_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it is a system directive.
`dir_name`	Name of the directive. All directives must be given unique names.

DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks will not be affected by this directive.

Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15–7 DELETE_PARAMETER_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

Examples

```
BEGIN
   DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');
END;
```

DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15–8 DELETE_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15–9 DELETE_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it is a system directive.
`dir_name`	Name of the directive. All directives must be given unique names.

GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

Syntax

```
DBMS_ADDM.GET_REPORT (
   task_name           IN VARCHAR2
  RETURN CLOB);
```

Parameters

Table 15–10 GET_REPORT Function Parameters

Parameter	Description
task_name	Name of the task to be reported on

Examples

```
Set long 1000000
Set pagesize 50000
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```

INSERT_FINDING_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   finding_name          IN VARCHAR2,
   min_active_sessions   IN NUMBER := 0,
   min_perc_impact       IN NUMBER := 0);
```

Parameters

Table 15–11 INSERT_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
finding_name	Name of an ADDM finding to which this directive applies. All valid findings names appear in the NAME column of view DBA_ADVISOR_FINDING_NAMES.
min_active_sessions	Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.
min_perc_impact	Minimal number for the "percent impact" of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of GET_REPORT will only show an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
   NULL,
   'Undersized SGA directive',
   'Undersized SGA',
   2,
   10);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_PARAMETER_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   parameter_name        IN VARCHAR2);
```

Parameters

Table 15–12 INSERT_PARAMETER_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
parameter_name	Specifies the parameter to use. Valid parameter names appear in V$PARAMETER.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter 'sga_target'. The result of GET_REPORT will not show actions these actions.

```
var tname varchar2(60);
BEGIN
  DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
   NULL,
   'my Parameter directive',
   'sga_target');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_SEGMENT_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   owner_name            IN VARCHAR2,
   object_name           IN VARCHAR2 := NULL,
   sub_object_name       IN VARCHAR2 := NULL);

DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   object_number         IN NUMBER);
```

Parameters

Table 15–13 INSERT_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
owner_name	Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for "like" constraints.
object_name	Name of the main object to be filtered. Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.
sub_object_name	Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a '.').Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.
object_number	Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET_REPORT will not show actions for running Segment advisor for segments that belong to SCOTT.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
                                     'my Segment directive',
                                     'SCOTT');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_SQL_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   sql_id                IN VARCHAR2,
   min_active_sessions   IN NUMBER := 0,
   min_response_time     IN NUMBER := 0);
```

Parameters

Table 15–14 INSERT_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it applies to all subsequently created ADDM Tasks.
`dir_name`	Name of the directive. All directives must be given unique names.
`sql_id`	Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.
`min_active_sessions`	Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.
`min_response_time`	Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of `GET_REPORT` will only show actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SQL_DIRECTIVE(
      NULL,
      'my SQL directive',
      'abcd123456789',
      2,
      1000000);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

16

DBMS_ADVANCED_REWRITE

DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

- Using DBMS_ADVANCED_REWRITE
  - Security Model
- Summary of DBMS_ADVANCED_REWRITE Subprograms

Using DBMS_ADVANCED_REWRITE

This section contains topics which relate to using the `DBMS_ADVANCED_REWRITE` package.

- Security Model

Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

Summary of DBMS_ADVANCED_REWRITE Subprograms

This table list the all the package subprograms in alphabetical order.

Table 16–1 DBMS_ADVANCED_REWRITE Package Subprograms

Subprogram	Description
ALTER_REWRITE_EQUIVALENCE Procedure on page 16-5	Changes the mode of the rewrite equivalence declaration to the mode you specify
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure on page 16-6	Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure
DECLARE_REWRITE_EQUIVALENCE Procedures on page 16-7	Creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance
DROP_REWRITE_EQUIVALENCE Procedure on page 16-9	Drops the specified rewrite equivalence declaration
VALIDATE_REWRITE_EQUIVALENCE Procedure on page 16-10	Validates the specified rewrite equivalence declaration using the same validation method as described with the `validate` parameter

ALTER_REWRITE_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
   name            VARCHAR2,
   rewrite_mode    VARCHAR2);
```

Parameters

Table 16–2 ALTER_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to alter. The name can be of the form `owner.name`, where `owner` complies with the rules for a schema name, and `name` compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.
`rewrite_mode`	The following modes are supported, in increasing order of power: `disabled`: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. `text_match`: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. `general`: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified `destination_query`. `recursive`: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified `destination_query` for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure. It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in QUERY_REWRITE_INTEGRITY = trusted and stale_tolerated modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in trusted and stale_tolerated integrity modes.

Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          VARCHAR2,
   destination_stmt     VARCHAR2,
   validate             BOOLEAN    := TRUE,
   rewrite_mode         VARCHAR2   := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          CLOB,
   destination_stmt     CLOB,
   validate             BOOLEAN   := TRUE,
   rewrite_mode         VARCHAR2  := 'TEXT_MATCH');
```

Parameters

Table 16–3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate CREATE MATERIALIZED VIEW privileges to alter an equivalence declaration.
source_stmt	A sub-SELECT expression in either VARCHAR2 or CLOB format. This is the query statement that is the target of optimization.
destination_stmt	A sub-SELECT expression in either VARCHAR2 or CLOB format.
validate	A Boolean indicating whether to validate that the specified source_stmt is functionally equivalent to the specified destination_stmt. If validate is specified as TRUE, DECLARE_REWRITE_EQUIVALENCE evaluates the two sub-SELECTs and compares their results. If the results are not the same, DECLARE_REWRITE_EQUIVALENCE does not create the rewrite equivalence and returns an error condition. If FALSE, DECLARE_REWRITE_EQUIVALENCE does not validate the equivalence.

Table 16–3 (Cont.) DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
rewrite_mode	The following modes are supported, in increasing order of power: ■ disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. ■ text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. ■ general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. ■ recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

Exceptions

Table 16–4 DECLARE_REWRITE_EQUIVALENCE Procedure Exceptions

Exception	Description
ORA-30388	Name of the rewrite equivalence is not specified
ORA-30391	The specified rewrite equivalence does not exist
ORA-30392	The checksum analysis for the rewrite equivalence failed
ORA-30393	A query block in the statement did not write
ORA-30396	Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's source_stmt or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination_stmt or the materialized view's container table, respectively.

DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (
   name        VARCHAR2);
```

Parameters

Table 16–5 DROP_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to drop. The name can be of the form `owner.name`, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.

VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the `VALIDATE` parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure" on page 16-10.

Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
   name         VARCHAR2);
```

Parameters

Table 16–6 VALIDATE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the `source_stmt` and `destination_stmt` of the specified equivalence declaration.

17

DBMS_ADVISOR

DBMS_ADVISOR is part of the Server Manageability suite of Advisors, a set of expert systems that identifies and helps resolve performance problems relating to the various database server components.

See Also:

- *Oracle Database Administrator's Guide* for information regarding the Segment Advisor
- *Oracle Database 2 Day + Performance Tuning Guide* for information regarding how to use various Advisors in Enterprise Manager
- *Oracle Database Performance Tuning Guide* for information regarding the SQL Tuning Advisor and SQL Access Advisor
- *Oracle Database 2 Day DBA* and *Oracle Database Administrator's Guide* for information regarding the Undo Advisor

This chapter contains the following topics:

- Using DBMS_ADVISOR
  - Security Model
- Summary of DBMS_ADVISOR Subprograms

Using DBMS_ADVISOR

This section contains topics which relate to using the `DBMS_ADVISOR` package.

- Security Model

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package. In addition, there is an `ADVISOR` privilege, which is required by `DBMS_ADVISOR` procedures.

Summary of DBMS_ADVISOR Subprograms

Table 17–1 DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
ADD_SQLWKLD_REF Procedure on page 17-7	Adds a workload reference to an Advisor task	SQL Access Advisor only
ADD_SQLWKLD_ STATEMENT Procedure on page 17-8	Adds a single statement to a workload	SQL Access Advisor only
ADD_STS_REF Procedure on page 17-10	Establishes a link between the current SQL Access Advisor task and a SQL Tuning Set	SQL Access Advisor only
CANCEL_TASK Procedure on page 17-11	Cancels a currently executing task operation	All Advisors
COPY_SQLWKLD_TO_ STS Procedure on page 17-12	Copies the contents of a SQL workload object to a SQL Tuning Set	SQL Access Advisor
CREATE_FILE Procedure on page 17-13	Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports	All Advisors
CREATE_OBJECT Procedure on page 17-14	Creates a new task object	All Advisors
CREATE_SQLWKLD Procedure on page 17-16	Creates a new workload object	SQL Access Advisor only
CREATE_TASK Procedures on page 17-17	Creates a new Advisor task in the repository	All Advisors
DELETE_SQLWKLD Procedure on page 17-19	Deletes an entire workload object	SQL Access Advisor only
DELETE_SQLWKLD_ REF Procedure on page 17-20	Deletes an entire workload object	SQL Access Advisor only
DELETE_SQLWKLD_ STATEMENT Procedures on page 17-21	Deletes one or more statements from a workload	SQL Access Advisor only
DELETE_STS_REF Procedure on page 17-22	Removes a link between the current SQL Access Advisor task and a SQL Tuning Set object	SQL Access Advisor only
DELETE_TASK Procedure on page 17-23	Deletes the specified task from the repository	All Advisors
EXECUTE_TASK Procedure on page 17-24	Executes the specified task	All Advisors
GET_REC_ATTRIBUTES Procedure on page 17-26	Retrieves specific recommendation attributes from a task	All Advisors
GET_TASK_REPORT Function on page 17-27	Creates and returns a report for the specified task	All Advisors
GET_TASK_SCRIPT Function on page 17-28	Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer	All Advisors
IMPLEMENT_TASK Procedure on page 17-30	Implements the recommendations for a task	All Advisors

Table 17–1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
IMPORT_SQLWKLD_SCHEMA Procedure on page 17-31	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_SQLCACHE Procedure on page 17-33	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_STS Procedure on page 17-35	Imports data into a workload from a SQL Tuning Set into a SQL workload data object	SQL Access Advisor only
IMPORT_SQLWKLD_SUMADV Procedure on page 17-37	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_USER Procedure on page 17-39	Imports data into a workload from the current SQL cache	SQL Access Advisor only
INTERRUPT_TASK Procedure on page 17-41	Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible	All Advisors
MARK_RECOMMENDATION Procedure on page 17-42	Sets the `annotation_status` for a particular recommendation	All Advisors
QUICK_TUNE Procedure on page 17-44	Performs an analysis on a single SQL statement	All Advisors
RESET_TASK Procedure on page 17-46	Resets a task to its initial state	All Advisors
SET_DEFAULT_SQLWKLD_PARAMETER Procedures on page 17-47	Imports data into a workload from schema evidence	SQL Access Advisor only
SET_DEFAULT_TASK_PARAMETER Procedures on page 17-48	Modifies a default task parameter	All Advisors
SET_SQLWKLD_PARAMETER Procedures on page 17-49	Sets the value of a workload parameter	SQL Access Advisor only
SET_TASK_PARAMETER Procedure on page 17-50	Sets the specified task parameter value	All Advisors
TUNE_MVIEW Procedure on page 17-63	Shows how to decompose a materialized view into two or more materialized views or to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite	SQL Access Advisor only
UPDATE_OBJECT Procedure on page 17-65	Updates a task object	All Advisors
UPDATE_REC_ATTRIBUTES Procedure on page 17-67	Updates an existing recommendation for the specified task	All Advisors
UPDATE_SQLWKLD_ATTRIBUTES Procedure on page 17-69	Updates a workload object	SQL Access Advisor only

Table 17–1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
UPDATE_SQLWKLD_STATEMENT Procedure on page 17-70	Updates one or more SQL statements in a workload	SQL Access Advisor only
UPDATE_TASK_ATTRIBUTES Procedure on page 17-72	Updates a task's attributes	All Advisors

ADD_SQLWKLD_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use ADD_STS_REF instead of ADD_SQLWKLD_REF for all SQL Tuning Set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2,
   is_sts                 IN NUMBER :=0);
```

Parameters

Table 17–2 ADD_SQLWKLD_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure DELETE_REFERENCE.
is_sts	Indicates the type of workload source. Possible values are: ■ 0 - SQL workload object ■ 1 - SQL Tuning Set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
END;
/
```

ADD_SQLWKLD_STATEMENT Procedure

This procedure has been deprecated.

This procedure adds a single statement to the specified workload.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (
   workload_name          IN VARCHAR2,
   module                 IN VARCHAR2,
   action                 IN VARCHAR2,
   cpu_time               IN NUMBER := 0,
   elapsed_time           IN NUMBER := 0,
   disk_reads             IN NUMBER := 0,
   buffer_gets            IN NUMBER := 0,
   rows_processed         IN NUMBER := 0,
   optimizer_cost         IN NUMBER := 0,
   executions             IN NUMBER := 1,
   priority               IN NUMBER := 2,
   last_execution_date    IN DATE := 'SYSDATE',
   stat_period            IN NUMBER := 0,
   username               IN VARCHAR2,
   sql_text               IN CLOB);
```

Parameters

Table 17–3 ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload name that uniquely identifies an existing workload.
module	An optional business application module that will be associated with the SQL statement.
action	An optional application action that will be associated with the SQL statement.
cpu_time	The total CPU time in seconds that is consumed by the SQL statement.
elapsed_time	The total elapsed time in seconds that is consumed by the SQL statement.
disk_reads	The total disk-read operations that are consumed by the SQL statement.
buffer_gets	The total buffer-get operations that are consumed by the SQL statement.
rows_processed	The average number of rows processed by the SQL statement.
optimizer_cost	The optimizer's calculated cost value.
executions	The total execution count by the SQL statement. This value should be greater than zero.
priority	The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
last_execution_date	The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.

Table 17–3 (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
stat_period	Time interval in seconds from which statement statistics were calculated.
username	The Oracle user name that executed the SQL statement. Because a username is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
sql_text	The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-46 for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller. cpu_time, elapsed_time, disk_reads, buffer_gets, and optimizer_cost are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the order_list task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter order_list. The order_list parameter accepts any combination of the keys: buffer_gets, optimizer_cost, cpu_time, disk_reads, elapsed_time, executions, and priority. A typical setting of priority, optimizer_cost would indicate the SQL Access Advisor will sort the workload data by priority and optimizer_cost and process the highest cost statements first. Any statements added to the workload would need to include appropriate priority and optimizer_cost values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the order_list task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');
END;
/
```

ADD_STS_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Tuning Set. The link allows an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Tuning Set is made, the STS is protected from removal or modification.

Users should use ADD_STS_REF for any STS-based advisor runs. The older method using ADD_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the ADD_STS_REF function accepts a SQL Tuning Set owner name, whereas ADD_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF(
  task_name  IN VARCHAR2 NOT NULL,
  sts_owner  IN VARCHAR2,
  sts_name   IN VARCHAR2 NOT NULL);
```

Parameters

Table 17–4 ADD_STS_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL Tuning Set. The value of this parameter may be NULL, in which case the advisor assumes the SQL Tuning Set to be owned by the currently logged-in user.
sts_name	The name of the SQL Tuning Set object to be linked. Once a SQL Tuning Set has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to SQL Tuning Sets. To remove the link to the SQL Tuning Set, use the procedure DBMS_ADVISOR.DELETE_STS_REF.

Examples

```
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My STS');
```

CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as `Ctrl-C`. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (
   task_name      IN  VARCHAR2);
```

Parameters

Table 17–5 CANCEL_TASK Procedure Parameter

Parameter	Description
`task_name`	A valid Advisor task name that uniquely identifies an existing task.

Usage Notes

A cancel command effective restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/
```

COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL Tuning Set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL Tuning Set.

Parameters

Table 17–6 COPY_SQLWKLD_TO_STS Procedure Parameter

Parameter	Description
`workload_name`	The SQL Workload object name to copy.
`sts_name`	The SQL Tuning Set name into which the SQL Workload object will be copied.
`import_mode`	Specifies the handling of the target SQL Tuning Set. Possible values are: ■ `APPEND` Causes SQL Workload data to be appended to the target SQL Tuning Set. ■ `NEW` Indicates the SQL Tuning Set can only contain the copied contents. If the SQL Tuning Set exists and has data, an error will be reported. ■ `REPLACE` Causes any existing data in the target SQL Tuning Set to be purged prior to the workload copy. In all cases, if the specified SQL Tuning Set does not exist, it will be created.

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL Tuning Set.

Examples

```
BEGIN
   DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/
```

CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (
   buffer       IN  CLOB,
   location     IN  VARCHAR2,
   filename     IN  VARCHAR2);
```

Parameters

Table 17–7 CREATE_FILE Procedure Parameters

Parameter	Description
buffer	A CLOB buffer containing report or script information.
location	Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.
filename	Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
    'MY_DIR','script.sql');

END;
/
```

CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   object_id         OUT NUMBER);

DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   attr5             IN VARCHAR2 :=  NULL,
   object_id         OUT NUMBER);
```

Parameters

Table 17–8 CREATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.
object_type	Specifies the external object type.
attr1	Advisor-specific data.
attr2	Advisor-specific data.
attr3	Advisor-specific data.
attr4	Advisor-specific data.
attr5	Advisor-specific data.
object_id	The advisor-assigned object identifier.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or

LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
END;
/
```

CREATE_SQLWKLD Procedure

This procedure has been deprecated.

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (
   workload_name            IN OUT VARCHAR2,
   description              IN VARCHAR2 := NULL,
   template                 IN VARCHAR2 := NULL,
   is_template              IN VARCHAR2 := 'FALSE');
```

Parameters

Table 17–9 CREATE_SQLWKLD Procedure Parameters

Parameter	Description
`workload_name`	A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.
`description`	Specifies an optional workload description. Descriptions can be up to 256 characters.
`template`	An optional SQL Workload name of an existing workload data object or data object template.
`is_template`	An optional value that enables you to set the newly created workload as a template. Valid values are `TRUE` and `FALSE`.

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

Once a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the `ADD_SQLWKLD_REF` procedure.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/
```

CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```
DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_id               OUT NUMBER,
   task_name             IN OUT VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_name             IN VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);
```

Parameters

Table 17–10 CREATE_TASK Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
task_id	A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.
task_name	Specifies a new task name. Names must be unique among all tasks for the user. When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.
task_desc	Specifies an optional task description. Descriptions can be up to 256 characters in length.
template	An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.
is_template	An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.
how_created	An optional value that identifies how the source was created.

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the `advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OLTP`

  Parameters are preset to favor an OLTP application environment.

- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`

  Parameters are preset to favor a data warehouse application environment.

- `DBMS_ADVISOR.SQLACCESS_GENERAL`

  Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```

DELETE_SQLWKLD Procedure

This procedure has been deprecated.

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 17–11 DELETE_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "RESET_TASK Procedure" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

DELETE_SQLWKLD_REF Procedure

This procedure has been deprecated.

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Users should use DELETE_STS_REF instead of DELETE_SQLWKLD_REF for all SQL Tuning Set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2,
   is_sts                 IN NUMBER :=0);
```

Parameters

Table 17–12 DELETE_SQLWKLD_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.
is_sts	Indicates the type of workload source. Possible values are: ■ 0 - SQL workload object ■ 1 - SQL Tuning Set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

DELETE_SQLWKLD_STATEMENT Procedures

This procedure has been deprecated.

This procedure deletes one or more statements from a workload.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   sql_id               IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   search               IN VARCHAR2,
   deleted              OUT NUMBER);
```

Parameters

Table 17–13 DELETE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant ADVISOR_ALL.
search	Disabled.
deleted	Returns the number of statements deleted by the searched deleted operation.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "RESET_TASK Procedure" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  deleted NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL Tuning Set object.

Users should use DELETE_STS_REF for any STS-based advisor runs. The older method using DELETE_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the DELETE_STS_REF function accepts an STS owner name, whereas DELETE_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.DELETE_STS_REF (
  task_name  IN VARCHAR2 NOT NULL,
  sts_owner  IN VARCHAR2,
  sts_name   IN VARCHAR2 NOT NULL);
```

Parameters

Table 17–14 DELETE_STS_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL Tuning Set. The value of this parameter may be NULL, in which case the advisor assumes the SQL Tuning Set to be owned by the currently logged-in user.
sts_name	The name of the SQL Tuning Set to be unlinked. The wildcard % is supported as a STS_NAME. The rules of use are identical to the SQL LIKE operator. For example, to remove all links to SQL Tuning Set objects, use the wildcard % as the STS_NAME.

Examples

```
DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My STS');
```

DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17–15 DELETE_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be deleted from the repository. The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME. If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```

EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
   task_name          IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2             := NULL,
   execution_name    IN VARCHAR2             := NULL,
   execution_params  IN dbms_advisor.argList := NULL,
   execution_desc    IN VARCHAR2             := NULL,
RETURN VARCHAR2;
```

Parameters

Table 17–16 EXECUTE_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
execution_type	The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. As an example, the SQL Performance Analyzer accepts the following possible values: ■ EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. ■ TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework. ■ ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function.
execution_params	A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for. As an example, consider the following: DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'foo')
execution_desc	A 256-length string describing the execution.

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
   workload_name         IN VARCHAR2,
   rec_id                IN NUMBER,
   action_id             IN NUMBER,
   attribute_name        IN VARCHAR2,
   value                 OUT VARCHAR2,
   owner_name            IN VARCHAR2 := NULL);
```

Parameters

Table 17–17 GET_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Specifies the attribute to change.
value	The buffer to receive the requested attribute value.
owner_name	Optional owner name of the target task. This permits access to task data not owned by the current user.

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
```

GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_REPORT (
   task_name      IN VARCHAR2,
   type           IN VARCHAR2 := 'TEXT',
   level          IN VARCHAR2 := 'TYPICAL',
   section        IN VARCHAR2 := 'ALL',
   owner_name     IN VARCHAR2 := NULL,
   execution_name IN VARCHAR2 := NULL,
   object_id      IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 17–18 GET_TASK_REPORT Function Parameters

Parameter	Description
task_name	The name of the task from which the script will be created.
type	The only valid value is TEXT.
level	The possible values are BASIC, TYPICAL, and ALL.
section	Advisor-specific report sections.
owner_name	Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the buffer receiving the script.

GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (
   task_name          IN VARCHAR2
   type               IN VARCHAR2 := 'IMPLEMENTATION',
   rec_id             IN NUMBER   := NULL,
   act_id             IN NUMBER   := NULL,
   owner_name         IN VARCHAR2 := NULL,
   execution_name     IN VARCHAR2 := NULL,
   object_id          IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 17–19 GET_TASK_SCRIPT Function Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
type	Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.
rec_id	An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.
act_id	Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.
owner_name	An optional task owner name.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```
DECLARE
  task_id NUMBER;
```

```
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  buf CLOB;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified task.

Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (
   task_name          IN VARCHAR2,
   rec_id             IN NUMBER := NULL,
   exit_on_error      IN BOOLEAN := NULL);
```

Parameters

Table 17–20 IMPLEMENT_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task.
rec_id	An optional recommendation ID.
exit_on_error	An optional boolean to exit on the first error.

IMPORT_SQLWKLD_SCHEMA Procedure

This procedure has been deprecated.

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 17–21 IMPORT_SQLWKLD_SCHEMA Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
failed_rows	Returns the number or rows that were not saved due to syntax or validation errors
saved_rows	Returns the number of rows actually saved in the repository.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

IMPORT_SQLWKLD_SQLCACHE Procedure

This procedure has been deprecated.

This procedure creates a SQL workload from the current contents of the server's SQL cache.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 17–22 IMPORT_SQLWKLD_SQLCACHE Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.
saved_rows	Returns the number of rows saved as output parameters.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
```

```
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

IMPORT_SQLWKLD_STS Procedure

This procedure has been deprecated.

This procedure loads a SQL workload from an existing SQL Tuning Set. A SQL Tuning Set is typically created from the server workload repository using various time and data filters.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name         IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name         IN VARCHAR2,
   sts_owner             IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 17–23 IMPORT_SQLWKLD_STS Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sts_owner	The optional owner of the SQL Tuning Set.
sts_name	The name of an existing SQL Tuning Set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
     saved, failed);
END;
/
```

IMPORT_SQLWKLD_SUMADV Procedure

This procedure has been deprecated.

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9*i* Database Summary Advisor users in the migration to SQL Access Advisor.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
   workload_name          IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   priority               IN NUMBER := 2,
   sumadv_id              IN NUMBER,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 17–24 IMPORT_SQLWKLD_SUMADV Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
sumadv_id	Specifies the Summary Advisor workload identifier number.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
    saved, failed);
END;
/
```

IMPORT_SQLWKLD_USER Procedure

This procedure has been deprecated.

This procedure collects a SQL workload from a specified user table.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   owner_name            IN VARCHAR2,
   table_name            IN VARCHAR2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 17–25 IMPORT_SQLWKLD_USER Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
owner_name	Specifies the owner name of the table or view from which workload data will be collected.
table_name	Specifies the name of the table or view from which workload data will be collected.
saved_rows	Returns the number of rows actually saved in the workload object.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
```

```
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
    'USER_WORKLOAD', saved, failed);
END;
/
```

INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17–26 INTERRUPT_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be interrupted.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN
  DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```

MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
   task_name          IN VARCHAR2
   id                 IN NUMBER,
   action             IN VARCHAR2);
```

Parameters

Table 17–27 MARK_RECOMMENDATION Procedure Parameters

Parameter	Description
task_name	Name of the task.
id	The recommendation identifier number assigned by the Advisor.
action	The recommendation action setting. The possible actions are: ■ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts. ■ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script. ■ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/
```

QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```
DBMS_ADVISOR.QUICK_TUNE (
   advisor_name           IN VARCHAR2,
   task_name              IN VARCHAR2,
   attr1                  IN CLOB,
   attr2                  IN VARCHAR2 := NULL,
   attr3                  IN NUMBER := NULL,
   task_or_template       IN VARCHAR2 := NULL);
```

Parameters

Table 17–28 QUICK_TUNE Procedure Parameters

Parameter	Description
advisor_name	Name of the Advisor that will perform the analysis.
task_name	Name of the task.
attr1	Advisor-specific attribute in the form of a CLOB variable.
attr2	Advisor-specific attribute in the form of a VARCHAR2 variable.
attr3	Advisor-specific attribute in the form of a NUMBER.
task_or_template	An optional task name of an existing task or task template.

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.

attr1 must be the single SQL statement to tune. For the SQL Access Advisor, attr2 is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```
DECLARE
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
                  'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
```

RESET_SQLWKLD Procedure

This procedure has been deprecated.

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 17–29 RESET_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

RESET_TASK Procedure

This procedure resets a task to its initial state. All intermediate and recommendation data will be removed from the task. The task status will be set to INITIAL.

Syntax

```
DBMS_ADVISOR.RESET_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17–30 RESET_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.RESET_TASK(task_name);
END;
/
```

SET_DEFAULT_SQLWKLD_PARAMETER Procedures

This procedure has been deprecated.

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 17–31 SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
`parameter`	The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.
`value`	The value of the specified parameter. The value can be specified as a string or a number. If the value is `DBMS_ADVISOR.DEFAULT`, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/
```

SET_DEFAULT_TASK_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name        IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name        IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN NUMBER);
```

Parameters

Table 17–32 SET_DEFAULT_TASK_PARAMETER Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
   'VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_SQLWKLD_PARAMETER Procedures

This procedure has been deprecated.

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 17–33 SET_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST','SH.%');
END;
/
```

SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name           IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN VARCHAR2);

DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name           IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN NUMBER);
```

Parameters

Table 17–34 SET_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.

Usage Notes

A task cannot be modified unless it is in its initial state. See "RESET_TASK Procedure" on page 17-46 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 17–35 lists SQL Access Advisor task parameters.

Table 17–35 SQL Access Advisor Task Parameters

Parameter	Description
ANALYSIS_SCOPE	A comma-separated list that specifies the tuning artifacts to consider during analysis. The possible values are: ■ ALL Short name for specifying INDEX, MVIEW, TABLE, and PARTITION. ■ EVALUATION Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone. ■ INDEX Allows the SQL Access Advisor to recommend index structure changes. ■ MVIEW Allows the SQL Access Advisor to recommend materialized view and log changes. ■ PARTITION Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options. ■ TABLE Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning. Using the new keywords, the following combinations are valid: ■ INDEX ■ MVIEW ■ INDEX, PARTITION ■ INDEX, MVIEW, PARTITION ■ INDEX, TABLE, PARTITION ■ MVIEW, PARTITION ■ MIVEW, TABLE, PARTITION ■ INDEX, MVIEW, TABLE, PARTITION ■ TABLE, PARTITION ■ EVALUATION The default value is INDEX. The datatype is STRINGLIST.
CREATION_COST	When set to true (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to false, the cost of creation is ignored. The datatype is STRING.
DAYS_TO_EXPIRE	Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation. Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The datatype is NUMBER. Once the task expires, it becomes a candidate for removal by an automatic purge operation. The possible values are: ■ an integer in the range of 0 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is 30.
DEF_EM_TEMPLATE	Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values. The default value is SQLACCESS_EMTASK. The datatype is STRING.
DEF_INDEX_OWNER	Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name. Possible values are: ■ Existing schema name. Quoted identifiers are supported. ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRING.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
DEF_INDEX_ TABLESPACE	Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED No tablespace clause will be present in the script for indexes. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVIEW_ OWNER	Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name. Possible values are: ■ Existing schema name. Quoted identifiers are supported. ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVIEW_ TABLESPACE	Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVLOG_ TABLSPACE	Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_ PARTITION_ TABLESPACE	Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views. The default value is ADVISOR_UNUSED. The datatype is STRING.
DML_ VOLATILITY	When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DMLs on a column, it may favor a Btree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The datatype is STRING. See the related parameter refresh_mode.
END_TIME	Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second The datatype is STRING.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
EVALUATION_ ONLY	This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated. Possible values are: ■ FALSE ■ TRUE The default value is FALSE. The datatype is STRING.
EXECUTION_ TYPE	This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. The translated values are: ■ FULL => FULL ■ INDEX_ONLY => INDEX ■ MVIEW_ONLY => MVIEW ■ MVIEW_LOG_ONLY => MVIEW_LOG_ONLY The type of recommendations that is desired. Possible values: ■ FULL All supported recommendation types will be considered. ■ INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations. ■ MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations. ■ MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations. The default value is FULL. The datatype is STRINGLIST.
IMPLEMENT_ EXIT_ON_ERROR	When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
INDEX_NAME_ TEMPLATE	Specifies the method by which new index names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ ID* in the template. Once formatted, the maximum size of a name is 30 characters. Valid keywords are: ■ Any literal value up to 22 characters. ■ TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit. ■ TASK_ID Causes the current task identifier number to be inserted in hexadecimal form. ■ SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is <TABLE>_IDX$$_<TASK_ID><SEQ>. The datatype is STRING.
INVALID_ ACTION_LIST	Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
INVALID_ MODULE_LIST	Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
INVALID_ SQLSTRING_ LIST	Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
INVALID_ USERNAME_LIST	Contains a fully qualified list of usernames that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's username matches a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. The possible values are: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
JOURNALING	Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal. Possible values are: ■ UNUSED: no journal messages ■ FATAL: explanation of fatal conditions ■ ERROR: explanation of errors ■ WARNING: explanation of warnings ■ INFORMATION: information message ■ INFORMATION2: common information ■ INFORMATION3: common information ■ INFORMATION4: common information ■ INFORMATION5: common information ■ INFORMATION6: common information Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository. INFORMATION6 represents the most thorough message recording and UNUSED is the least. The default value is INFORMATION. The datatype is NUMBER.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
LIMITED_ PARTITION_ SCHEMES	User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor. Possible values are: ■ An integer in the range of 1 to 10 ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is NUMBER.
MAX_NUMBER_ PARTITIONS	Limits the number of partitions the advisor will recommend for any base table, index, or materialized view. Possible values are: ■ An integer in the range of 1 to 4294967295 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.
MODE	Specifies the mode by which Access Advisor will operate during an analysis. Valid values are: ■ LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality. ■ COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality. The default value is COMPREHENSIVE. The datatype is STRING.
MVIEW_NAME_ TEMPLATE	Specifies the method by which new materialized view names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ ID* in the template. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: ■ Any literal value up to 22 characters. ■ *TASK_ID* Causes the current task identifier number to be inserted in hexadecimal form. ■ *SEQ* Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is: MV$$_<TASK_ID><SEQ>. The datatype is STRING.
ORDER_LIST	This parameter has been deprecated. Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_ LIST values. A comma must separate multiple order keys. Possible values are: ■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. ■ CPU_TIME Sets the order using the SQL statement's CPU time value. ■ DISK_READS Sets the order using the SQL statement's disk-read count value. ■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. ■ EXECUTIONS Sets the order using the SQL statement's execution frequency value. ■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. ■ I/O Sets the order using the SQL statement's I/O count value. ■ PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
PARTITION_ NAME_TEMPLATE	Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: ■ Any literal value up to 22 characters. ■ <TABLE> Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit. ■ <TASK_ID> Causes the current task identifier number to be inserted in hexadecimal form. ■ <SEQ> Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is PTN$$_<TABLE>_<TASK_ID><SEQ>. The datatype is STRING.
PARTITIONING_ GOAL	Specifies the approach used to make partitioning recommendations. One possible value is PERFORMANCE, which is the default. The datatype is STRING.
PARTITIONING_ TYPES	Specifies the type of partitioning used. Possible values are RANGE and HASH. The datatype is STRING.
RANKING_ MEASURE	Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using RANKING_MEASURE values. A comma must separate multiple order keys. Possible values are: ■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. ■ CPU_TIME Sets the order using the SQL statement's cpu time value. ■ DISK_READS Sets the order using the SQL statement's disk-read count value. ■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. ■ EXECUTIONS Sets the order using the SQL statement's elapsed time value. ■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. ■ PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.
RECOMMEND_MV_ EXACT_TEXT_ MATCH	When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
RECOMMENDED_ TABLESPACES	Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage. Possible values are: ■ TRUE ■ FALSE (the default) The datatype is STRING.
REFRESH_MODE	Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE. Possible values are: ■ ON_DEMAND ■ ON_COMMIT The default value is ON_DEMAND. The datatype is STRING.
REPORT_DATE_ FORMAT	This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI. The datatype is STRING.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
SHOW_RETAINS	Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
SQL_LIMIT	Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys. The possible values are: ■ an integer in the range of 1 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is NUMBER.
START_TIME	Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second The datatype is STRING.
STORAGE_CHANGE	Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL. When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand. Possible values: ■ Any valid integer including negative values, zero and positive values. The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.
TIME_LIMIT	Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time. Possible values: ■ An integer in the range of 1 to 10,000 ■ ADVISOR_UNLIMITED The default value is 720 (12 hours). The datatype is NUMBER. Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_ACTION_LIST	Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
VALID_MODULE_LIST	Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
VALID_SQLSTRING_LIST	Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_TABLE_LIST	Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is: ▪ schema.table ▪ schema ▪ schema.% (equivalent to schema) ▪ comma-delimited action list ▪ ADVISOR_UNUSED The possible values are: ▪ single table reference ▪ comma-delimited reference list ▪ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is TABLELIST.
VALID_USERNAME_LIST	Contains a fully qualified list of usernames that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. The possible values are: ▪ single username ▪ comma-delimited username list ▪ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
WORKLOAD_SCOPE	Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL. FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables. PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables. The datatype is STRING.

Segment Advisor Parameters

Table 17–36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 17–36 Segment Advisor Task Parameters

Parameter	Description
MODE	The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are: ▪ LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository ▪ COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics
TIME_LIST	The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.

Table 17–36 (Cont.) Segment Advisor Task Parameters

Parameter	Description
RECOMMEND_ALL	Whether to generate recommendations for all segments. The default value is TRUE. If set to TRUE, it generates recommendations all segments specified by the user. If set to FALSE, it generates recommendations for only those objects that are eligible for shrink.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

   DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
   DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
      'SH.%,SCOTT.EMP');
END;
/
```

Undo Advisor Task Parameters

Table 17–37 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

Table 17–37 Undo Advisor Task Parameters

Parameter	Description
TARGET_OBJECTS	The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
BEGIN_TIME_SEC	The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.
END_TIME_SEC	The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.

Examples

```
DECLARE
   tname  VARCHAR2(30);
   oid    NUMBER;
   BEGIN
     DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
     DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
```

```
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
    DBMS_ADVISOR.EXECUTE_TASK(tname);
  END;
/
```

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 17–38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure. See *Oracle Database Performance Tuning Guide* for more information on using these parameters.

Table 17–38 ADDM Task Parameters

Parameter	Description
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
DB_ID	The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.
INSTANCE	The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.
INSTANCES	If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, "1, 3, 5"). By default, all instances are analyzed.
DBIO_EXPECTED	The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.

Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or a RAC database.

```
DECLARE
   tid     NUMBER;
   tname VARCHAR2(30) := 'ADDM_TEST';
BEGIN
   DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
   DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
   DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
   DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/
```

SQL Tuning Advisor Task Parameters

See the DBMS_SQLTUNE package on page 125-1 and *Oracle Database Performance Tuning Guide* for more information.

TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
   task_name IN OUT VARCHAR2,
   mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

Table 17–39 TUNE_MVIEW Procedure Parameters

Parameter	Description
task_name	The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.
mv_create_stmt	The original materialized view creation statement.

See Also: *Oracle Database Performance Tuning Guide* for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.

Table 17–40 USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

Column Name	Column Description
OWNER	The materialized view owner's name.
TASK_NAME	The task name as a key to access the set of recommendations
SCRIPT_TYPE	Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.
ACTION_ID	Action ID used as the command order number.
STATEMENT	For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: ■ CREATE MATERIALIZED VIEW LOG ■ ALTER MATERIALIZED VIEW LOG FORCE ■ [CREATE | DROP] MATERIALIZED VIEW

Examples

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');
```

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND
SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS  ''/myscript_dir'' ;
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_
task'), -
'/homes/tune','my_tune_mview_create.sql');
```

The preceding statement will save the CREATE output results in /myscript_dir/my_tune_mview_create.sql.

UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (
   task_name       IN VARCHAR2
   object_id       IN NUMBER,
   attr1           IN VARCHAR2 := NULL,
   attr2           IN VARCHAR2 := NULL,
   attr3           IN VARCHAR2 := NULL,
   attr4           IN CLOB := NULL,
   attr5           IN VARCHAR2 := NULL);
```

Parameters

Table 17–41 UPDATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid advisor task name that uniquely identifies an existing task.
object_id	The advisor-assigned object identifier.
attr1	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr2	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr3	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr4	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr5	Advisor-specific data. If set to null, there will be no effect on the target object.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
```

```
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id,NULL,NULL,NULL,
                              'SELECT count(*) FROM SH.SALES');
END;
/
```

UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
   task_name            IN VARCHAR2
   rec_id               IN NUMBER,
   action_id            IN NUMBER,
   attribute_name       IN VARCHAR2,
   value                IN VARCHAR2);
```

Parameters

Table 17–42 UPDATE_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
`task_name`	The task name that uniquely identifies an existing task.
`rec_id`	The Advisor-generated identifier number that is assigned to the recommendation.
`action_id`	The Advisor-generated action identifier that is assigned to the particular command.
`attribute_name`	Name of the attribute to be changed. The valid values are: ■ `owner` The new owner of the object. ■ `name` The new name of the object. ■ `tablespace` The new tablespace for the object.
`value`	Specifies the new value for the recommendation attribute.

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

attribute := 'SH';
```

```
  DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/
```

UPDATE_SQLWKLD_ATTRIBUTES Procedure

This procedure has been deprecated.

This procedure changes various attributes of a SQL Workload object or template.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
   workload_name        IN VARCHAR2,
   new_name             IN VARCHAR2 := NULL,
   description          IN VARCHAR2 := NULL,
   read_only            IN VARCHAR2 := NULL,
   is_template          IN VARCHAR2 := NULL,
   how_created          IN VARCHAR2 := NULL);
```

Parameters

Table 17–43 UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
new_name	The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.
description	A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Set to TRUE so it cannot be changed.
is_template	TRUE if workload is to be used as a template.
how_created	Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

UPDATE_SQLWKLD_STATEMENT Procedure

This procedure has been deprecated.

This procedure updates an existing SQL statement in a specified SQL workload.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   sql_id            IN NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);

DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   search            IN VARCHAR2,
   updated           OUT NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);
```

Parameters

Table 17–44 UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.
updated	Returns the number of statements changed by a searched update.
application	Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
action	Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
priority	The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
username	The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. Because a username is an Oracle identifier, the username value must be entered exactly like it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
search	Disabled.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
   task_name          IN VARCHAR2
   new_name           IN VARCHAR2 := NULL,
   description        IN VARCHAR2 := NULL,
   read_only          IN VARCHAR2 := NULL,
   is_template        IN VARCHAR2 := NULL,
   how_created        IN VARCHAR2 := NULL);
```

Parameters

Table 17–45 UPDATE_TASK_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
new_name	The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.
description	A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
is_template	Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
how_created	Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');
END;
/
```

18

DBMS_ALERT

DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- Using DBMS_ALERT
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Exceptions
  - Operational Notes
  - Examples
- Summary of DBMS_ALERT Subprograms

Using DBMS_ALERT

- Overview
- Security Model
- Constants
- Restrictions
- Exceptions
- Operational Notes
- Examples

Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (`WAITONE`) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (`SIGNAL`) whenever the trigger is fired.

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package.

Constants

The DBMS_ALERT package uses the constants shown in Table 18–1:

Table 18–1 DBMS_ALERT Constants

Name	Type	Value	Description
MAXWAIT	INTEGER	86400000	The maximum time to wait for an alert (1000 days which is essentially forever).

Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. Table 18–2 shows the messages and the procedures that can raise them.

Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

  See Also: Chapter 89, "DBMS_PIPE"

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.
  - `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

Table 18–2 DBMS_ALERT Error Messages

Error Message	Procedure
`ORU-10001 lock request error, status: N`	`SIGNAL`
`ORU-10015 error: N waiting for pipe status`	`WAITANY`
`ORU-10016 error: N sending on pipe 'X'`	`SIGNAL`
`ORU-10017 error: N receiving on pipe 'X'`	`SIGNAL`
`ORU-10019 error: N on lock request`	`WAIT`
`ORU-10020 error: N on lock request`	`WAITANY`

Table 18–2 (Cont.) DBMS_ALERT Error Messages

Error Message	Procedure
ORU-10021 lock request error; status: N	REGISTER
ORU-10022 lock request error, status: N	SIGNAL
ORU-10023 lock request error; status N	WAITONE
ORU-10024 there are no alerts registered	WAITANY
ORU-10025 lock request error; status N	REGISTER
ORU-10037 attempting to wait on uncommitted signal from same session	WAITONE

Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
    <<readagain>>:
   /* ... read the emp table and graph it */
      DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
      if status = 0 then goto <<readagain>>; else
      /* ... error condition */
```

The EMP table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
    BEGIN
      DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
   END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

Summary of DBMS_ALERT Subprograms

Table 18–3 DBMS_ALERT Package Subprograms

Subprogram	Description
REGISTER Procedure on page 18-12	Receives messages from an alert
REMOVE Procedure on page 18-13	Disables notification from an alert
REMOVEALL Procedure on page 18-14	Removes all alerts for this session from the registration list
SET_DEFAULTS Procedure on page 18-15	Sets the polling interval
SIGNAL Procedure on page 18-16	Signals an alert (send message to registered sessions)
WAITANY Procedure on page 18-17	Waits `timeout` seconds to receive alert message from an alert registered for session
WAITONE Procedure on page 18-18	Waits `timeout` seconds to receive message from named alert

REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (
   name  IN  VARCHAR2);
```

Parameters

Table 18–4 REGISTER Procedure Parameters

Parameter	Description
name	Name of the alert in which this session is interested.

Caution: Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.

REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (
   name  IN  VARCHAR2);
```

Parameters

Table 18–5 REMOVE Procedure Parameters

Parameter	Description
name	Name of the alert (case-insensitive) to be removed from registration list.

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

```
DBMS_ALERT.REMOVEALL;
```

SET_DEFAULTS Procedure

In case a polling loop is required, use the SET_DEFAULTS procedure to set the polling interval.

Syntax

```
DBMS_ALERT.SET_DEFAULTS (
   sensitivity  IN  NUMBER);
```

Parameters

Table 18–6 SET_DEFAULTS Procedure Parameters

Parameter	Description
sensitivity	Polling interval, in seconds, to sleep between polls. The default interval is five seconds.

SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (
   name     IN  VARCHAR2,
   message  IN  VARCHAR2);
```

Parameters

Table 18–7 SIGNAL Procedure Parameters

Parameter	Description
`name`	Name of the alert to signal.
`message`	Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.

WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (
   name      OUT  VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 18–8 WAITANY Procedure Parameters

Parameter	Description
name	Returns the name of the alert that occurred.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If no alert occurs before timeout seconds, this returns a status of 1.

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

```
-20000, ORU-10024: there are no alerts registered.
```

WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (
   name      IN   VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 18–9 WAITONE Procedure Parameters

Parameter	Description
name	Name of the alert to wait for.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If the named alert does not occurs before timeout seconds, this returns a status of 1.

19

DBMS_APPLICATION_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- Using DBMS_APPLICATION_INFO
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_APPLICATION_INFO Subprograms

Using DBMS_APPLICATION_INFO

- Overview
- Security Model
- Operational Notes

Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the `V$SESSION` and `V$SQLAREA` views.

Security Model

> **Note:** The public synonym for `DBMS_APPLICATION_INFO` is not dropped before creation so that you can redirect the public synonym to point to your own package.

No further privileges are required. The `DBMSAPIN.SQL` script is already run by `catproc`.

Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the `SYS` version of the package. The public synonym for `DBMS_APPLICATION_INFO` can then be changed to point to the DBA's version of the package.

Summary of DBMS_APPLICATION_INFO Subprograms

Table 19–1 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
READ_CLIENT_INFO Procedure on page 19-7	Reads the value of the `client_info` field of the current session
READ_MODULE Procedure on page 19-8	Reads the values of the module and action fields of the current session
SET_ACTION Procedure on page 19-9	Sets the name of the current action within the current module
SET_CLIENT_INFO Procedure on page 19-10	Sets the `client_info` field of the session
SET_MODULE Procedure on page 19-11	Sets the name of the module that is currently running to a new module
SET_SESSION_LONGOPS Procedure on page 19-12	Sets a row in the `V$SESSION_LONGOPS` table

READ_CLIENT_INFO Procedure

This procedure reads the value of the `client_info` field of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (
   client_info OUT VARCHAR2);
```

Parameters

Table 19–2 READ_CLIENT_INFO Procedure Parameters

Parameter	Description
`client_info`	Last client information value supplied to the `SET_CLIENT_INFO` procedure.

READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (
   module_name OUT VARCHAR2,
   action_name OUT VARCHAR2);
```

Parameters

Table 19–3 READ_MODULE Procedure Parameters

Parameter	Description
module_name	Last value that the module name was set to by calling SET_MODULE.
action_name	Last value that the action name was set to by calling SET_ACTION or SET_MODULE.

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ----------------- ----------------
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
   action_name IN VARCHAR2);
```

Parameters

Table 19–4 SET_ACTION Procedure Parameters

Parameter	Description
action_name	The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

   DBMS_APPLICATION_INFO.SET_ACTION(
      action_name => 'transfer from chk to sav');
   UPDATE chk SET bal = bal + :amt
      WHERE acct# = :acct;
   UPDATE sav SET bal = bal - :amt
      WHERE acct# = :acct;
   COMMIT;
   DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
   client_info IN VARCHAR2);
```

Parameters

Table 19–5 SET_CLIENT_INFO Procedure Parameters

Parameter	Description
client_info	Supplies any additional information about the client application. This information is stored in the V$SESSION view. Information exceeding 64 bytes is truncated.

Note: CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
   module_name IN VARCHAR2,
   action_name IN VARCHAR2);
```

Parameters

Table 19–6 SET_MODULE Procedure Parameters

Parameter	Description
module_name	Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.
action_name	Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
            commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

SET_SESSION_LONGOPS Procedure

This procedure sets a row in the V$SESSION_LONGOPS view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the SET_SESSION_LONGOPS procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the V$SESSION_LONGOPS view.

Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
   rindex      IN OUT BINARY_INTEGER,
   slno        IN OUT BINARY_INTEGER,
   op_name     IN     VARCHAR2       DEFAULT NULL,
   target      IN     BINARY_INTEGER DEFAULT 0,
   context     IN     BINARY_INTEGER DEFAULT 0,
   sofar       IN     NUMBER         DEFAULT 0,
   totalwork   IN     NUMBER         DEFAULT 0,
   target_desc IN     VARCHAR2       DEFAULT 'unknown target',
   units       IN     VARCHAR2       DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

Parameters

Table 19–7 SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
rindex	A token which represents the v$session_longops row to update. Set this to set_session_longops_nohint to start a new row. Use the returned value from the prior call to reuse a row.
slno	Saves information across calls to set_session_longops: It is for internal use and should not be modified by the caller.
op_name	Specifies the name of the long running task. It appears as the OPNAME column of v$session_longops. The maximum length is 64 bytes.
target	Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the TARGET column of v$session_longops.
context	Any number the client wants to store. It appears in the CONTEXT column of v$session_longops.
sofar	Any number the client wants to store. It appears in the SOFAR column of v$session_longops. This is typically the amount of work which has been done so far.
totalwork	Any number the client wants to store. It appears in the TOTALWORK column of v$session_longops. This is typically an estimate of the total amount of work needed to be done in this long running operation.

Table 19–7 (Cont.) SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
target_desc	Specifies the description of the object being manipulated in this long operation. This provides a caption for the target parameter. This value appears in the TARGET_DESC field of v$session_longops. The maximum length is 32 bytes.
units	Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v$session_longops. The maximum length is 32 bytes.

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```
DECLARE
        rindex    BINARY_INTEGER;
        slno      BINARY_INTEGER;
        totalwork number;
        sofar     number;
        obj       BINARY_INTEGER;

      BEGIN
        rindex := dbms_application_info.set_session_longops_nohint;
        sofar := 0;
        totalwork := 10;

        WHILE sofar < 10 LOOP
          -- update obj based on sofar
          -- perform task on object target

          sofar := sofar + 1;
          dbms_application_info.set_session_longops(rindex, slno,
            "Operation X", obj, 0, sofar, totalwork, "table", "tables");
        END LOOP;
      END;
```

20

DBMS_APPLY_ADM

The DBMS_APPLY_ADM package, one of a set of Oracle Streams packages, provides subprograms to start, stop, and configure an apply process. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and apply processes

This chapter contains the following topic:

- Summary of DBMS_APPLY_ADM Subprograms

Summary of DBMS_APPLY_ADM Subprograms

Table 20–1 DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
ALTER_APPLY Procedure on page 20-4	Alters an apply process
COMPARE_OLD_VALUES Procedure on page 20-9	Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply
CREATE_APPLY Procedure on page 20-11	Creates an apply process
CREATE_OBJECT_DEPENDENCY Procedure on page 20-18	Creates an object dependency
DELETE_ALL_ERRORS Procedure on page 20-19	Deletes all the error transactions for the specified apply process
DELETE_ERROR Procedure on page 20-20	Deletes the specified error transaction
DROP_APPLY Procedure on page 20-21	Drops an apply process
DROP_OBJECT_DEPENDENCY Procedure on page 20-22	Drops an object dependency
EXECUTE_ALL_ERRORS Procedure on page 20-23	Reexecutes the error transactions for the specified apply process.
EXECUTE_ERROR Procedure on page 20-24	Reexecutes the specified error transaction
GET_ERROR_MESSAGE Function on page 20-27	Returns the message payload from the error queue for the specified message number and transaction identifier
SET_DML_HANDLER Procedure on page 20-28	Alters operation options for a specified object with a specified apply process
SET_ENQUEUE_DESTINATION Procedure on page 20-33	Sets the queue where the apply process automatically enqueues a message that satisfies the specified rule
SET_EXECUTE Procedure on page 20-35	Specifies whether a message that satisfies the specified rule is executed by an apply process
SET_GLOBAL_INSTANTIATION_SCN Procedure on page 20-37	Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas
SET_KEY_COLUMNS Procedures on page 20-39	Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist
SET_PARAMETER Procedure on page 20-41	Sets an apply parameter to the specified value
SET_SCHEMA_INSTANTIATION_SCN Procedure on page 20-46	Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database

Table 20–1 (Cont.) DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
SET_TABLE_INSTANTIATION_SCN Procedure on page 20-48	Records the specified instantiation SCN for the specified table in the specified source database
SET_UPDATE_CONFLICT_HANDLER Procedure on page 20-50	Adds, updates, or drops an update conflict handler for the specified object
SET_VALUE_DEPENDENCY Procedure on page 20-53	Sets or removes a value dependency
START_APPLY Procedure on page 20-54	Directs the apply process to start applying messages
STOP_APPLY Procedure on page 20-55	Stops the apply process from applying any messages and rolls back any unfinished transactions being applied

Note: All procedures commit unless specified otherwise. However, the `GET_ERROR_MESSAGE` function does not commit.

ALTER_APPLY Procedure

This procedure alters an apply process.

Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY(
   apply_name                IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   message_handler           IN  VARCHAR2  DEFAULT NULL
   remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
   ddl_handler               IN  VARCHAR2  DEFAULT NULL,
   remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
   apply_user                IN  VARCHAR2  DEFAULT NULL,
   apply_tag                 IN  RAW       DEFAULT NULL,
   remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler         IN  VARCHAR2  DEFAULT NULL,
   remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–2 ALTER_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply process being altered. You must specify an existing apply process name. Do not specify an owner.
rule_set_name	The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages. If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set.

Table 20–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified apply process. If you remove the positive rule set for an apply process, and the apply process does not have a negative rule set, then the apply process dequeues all messages in its queue. If you remove the positive rule set for an apply process, and a negative rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified apply process. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply process. See "Usage Notes" on page 20-16 in the CREATE_APPLY Procedure for more information about a message handler procedure.
remove_message_handler	If TRUE, then the procedure removes the message handler for the specified apply process. If FALSE, then the procedure retains any message handler for the specified apply process. If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.
ddl_handler	A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply process. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" on page 20-16 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.
remove_ddl_handler	If TRUE, then the procedure removes the DDL handler for the specified apply process. If FALSE, then the procedure retains any DDL handler for the specified apply process. If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 20–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
apply_user	The user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. If NULL, then the apply user is not changed. If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted DBA role. Only the SYS user can set the apply_user to SYS. If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process These privileges must be granted directly to the apply user. They cannot be granted through roles. By default, this parameter is set to the user who created the apply process by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the apply_user for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.
apply_tag	A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter. If NULL, the default, then the apply tag for the apply process is not changed. The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 20–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_apply_tag	If TRUE, then the procedure sets the apply tag for the specified apply process to NULL, and the apply process generates redo entries with NULL tags. If FALSE, then the procedure retains any apply tag for the specified apply process. If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process. An internal commit directive is enqueued in the following ways: ▪ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ▪ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply process. The precommit handler procedure must conform to the following restrictions: ▪ Any work that commits must be an autonomous transaction. ▪ Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" on page 20-16 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.
remove_precommit_handler	If TRUE, then the procedure removes the precommit handler for the specified apply process. If FALSE, then the procedure retains any precommit handler for the specified apply process. If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 20–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages. If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified apply process. If you remove the negative rule set for an apply process, and the apply process does not have a positive rule set, then the apply process dequeues all messages in its queue. If you remove the negative rule set for an apply process, and a positive rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified apply process. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

An apply process is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:

- message_handler
- ddl_handler
- apply_user
- apply_tag
- precommit_handler

COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply. This procedure is relevant only for `UPDATE` and `DELETE` operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about conflict detection and resolution in an Oracle Streams environment

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_list         IN VARCHAR2,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_table        IN DBMS_UTILITY.LNAME_ARRAY,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 20–3 COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
`object_name`	The name of the source table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`column_list`	A comma-delimited list of column names in the table. There must be no spaces between entries. Specify `*` to include all nonkey columns.
`column_table`	A PL/SQL index-by table of type `DBMS_UTILITY.LNAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.
`operation`	The name of the operation, which can be specified as: ■ `UPDATE` for `UPDATE` operations ■ `DELETE` for `DELETE` operations ■ `*` for both `UPDATE` and `DELETE` operations
`compare`	If `compare` is `TRUE`, the old values of the specified columns are compared during apply. If `compare` is `FALSE`, the old values of the specified columns are not compared during apply.

Table 20–3 (Cont.) COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

By default, an apply process uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you use a time column for conflict detection, then an apply process does not need to check old values for non-key and nontime columns.

Note: An apply process always compares old values for key columns when they are present in a row LCR. This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

CREATE_APPLY Procedure

This procedure creates an apply process.

> **Note:** The user who invokes this procedure must be granted `DBA` role.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
   queue_name              IN  VARCHAR2,
   apply_name              IN  VARCHAR2,
   rule_set_name           IN  VARCHAR2  DEFAULT NULL,
   message_handler         IN  VARCHAR2  DEFAULT NULL,
   ddl_handler             IN  VARCHAR2  DEFAULT NULL,
   apply_user              IN  VARCHAR2  DEFAULT NULL,
   apply_database_link     IN  VARCHAR2  DEFAULT NULL,
   apply_tag               IN  RAW       DEFAULT '00',
   apply_captured          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler       IN  VARCHAR2  DEFAULT NULL,
   negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   source_database         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–4 CREATE_APPLY Procedure Parameters

Parameter	Description
`queue_name`	The name of the queue from which the apply process dequeues messages. You must specify an existing queue in the form `[`*`schema_name`*`.]`*`queue_name`*. For example, to specify a queue in the `hr` schema named `streams_queue`, enter `hr.streams_queue`. If the schema is not specified, then the current user is the default. **Note:** The `queue_name` setting cannot be altered after the apply process is created.
`apply_name`	The name of the apply process being created. A `NULL` specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply process or messaging client. **Note:** The `apply_name` setting cannot be altered after the apply process is created.

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages. If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply process applies either all captured messages or all messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply process. See "Usage Notes" on page 20-16 for more information about a message handler procedure.
ddl_handler	A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply process. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" on page 20-16 for more information about a DDL handler procedure.

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_user	The user who applies all DML and DDL changes that satisfy the apply process rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used. Only a user who is granted DBA role can set an apply user. Only the SYS user can set the apply_user to SYS. The apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process These privileges must be granted directly to the apply user. They cannot be granted through roles. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the apply_user setting for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.
apply_database_link	The database at which the apply process applies messages. This parameter is used by an apply process when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply process applies messages at the local database. **Note:** The apply_database_link setting cannot be altered after the apply process is created.

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_tag	A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter. By default, the tag for an apply process is the hexadecimal equivalent of '00' (double zero). The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') If NULL, then the apply process generates redo entries with NULL tags. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
apply_captured	Either TRUE or FALSE. If TRUE, then the apply process applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Streams capture process. If FALSE, then the apply process applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Streams capture process, such as persistent LCRs or user messages. To apply both captured LCRs and messages in a persistent queue, you must create at least two apply processes. **Note:** The apply_captured setting cannot be altered after the apply process is created. **See Also:** *Oracle Streams Concepts and Administration* for more information about processing messages with an apply process

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process. An internal commit directive is enqueued in the following ways: ▪ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ▪ When a synchronous capture captures row LCRs, the the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction. ▪ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For message enqueued by a user or application, the commit SCN is generated by the apply process. The precommit handler procedure must conform to the following restrictions: ▪ Any work that commits must be an autonomous transaction. ▪ Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" on page 20-16 for more information about a precommit handler procedure.
negative_rule_set_name	The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages. If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the apply process applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
source_database	The global name of the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. If NULL, then the source database name of the first LCR received by the apply process is used for the source database. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. The rules in the apply process rule sets determine which messages are dequeued by the apply process. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.

Usage Notes

The following sections describe usage notes for this procedure:

Handler Procedure Names

For the message_handler, ddl_handler, and precommit_handler parameters, specify an existing procedure in one of the following forms:

- *[schema_name.]procedure_name*
- *[schema_name.]package_name.procedure_name*

If the procedure is in a package, then the package_name must be specified. For example, to specify a procedure in the apply_pkg package in the hr schema named process_ddls, enter hr.apply_pkg.process_ddls. An error is returned if the specified procedure does not exist.

The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified handler procedure. Also, if the *schema_name* is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

Message Handler and DDL Handler Procedure

The procedure specified in both the message_handler parameter and the ddl_handler parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a ANYDATA encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a ANYDATA encapsulation of a DDL LCR.

See Also: Chapter 229, "Logical Change Record TYPEs" for information about DDL LCRs

Precommit Handler Procedure

The procedure specified in the `precommit_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name   IN  NUMBER);
```

Here, *`handler_procedure`* stands for the name of the procedure and *`parameter_name`* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply process schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply process uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply process does not use column values in the LCRs to detect dependencies.

Note: An error is raised if `NULL` is specified for either of the procedure parameters.

See Also:

- "DROP_OBJECT_DEPENDENCY Procedure" on page 20-22
- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 20–5 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply process.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
   apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

Table 20–6 DELETE_ALL_ERRORS Procedure Parameter

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are deleted.

DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(
   local_transaction_id  IN  VARCHAR2);
```

Parameter

Table 20–7 DELETE_ERROR Procedure Parameter

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.

DROP_APPLY Procedure

This procedure drops an apply process.

Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
   apply_name             IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20–8 DROP_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply process being dropped. You must specify an existing apply process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified apply process, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop an apply process, information about rules created for the apply process using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply process. The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

> **See Also:** *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

DROP_OBJECT_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:

- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if `NULL` is specified for either of the procedure parameters.

See Also:

- "CREATE_OBJECT_DEPENDENCY Procedure" on page 20-18
- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 20–9 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply process.

The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
   apply_name       IN  VARCHAR2  DEFAULT NULL,
   execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–10 EXECUTE_ALL_ERRORS Procedure Parameters

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are reexecuted.
execute_as_user	If TRUE, then the procedure reexecutes the transactions in the security context of the current user. If FALSE, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.

EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
   local_transaction_id  IN  VARCHAR2,
   execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
   user_procedure        IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–11 EXECUTE_ERROR Procedure Parameters

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.
`execute_as_user`	If `TRUE`, then the procedure reexecutes the transaction in the security context of the current user. If `FALSE`, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The `DBA_APPLY_ERROR` data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.
`user_procedure`	A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify `NULL` to execute the error transaction without running a user procedure. **See Also:** "Usage Notes" on page 20-24 for more information about the user procedure

Usage Notes

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[`*`schema_name`*`.]`*`package_name.procedure_name`*
- `[`*`schema_name`*`.]`*`procedure_name`*

If the procedure is in a package, then the *`package_name`* must be specified. The user who invokes the `EXECUTE_ERROR` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the *`schema_name`* is not specified, then the user who invokes the `EXECUTE_ERROR` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `strmadmin` is the *`schema_name`*.

- fix_errors is the *package_name*.
- fix_hr_errors is the *procedure_name*.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     in_anydata                    IN      ANYDATA,
     error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,
     error_message_number          IN      NUMBER,
     messaging_default_processing  IN OUT  BOOLEAN,
     out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- in_anydata: The ANYDATA encapsulation of a message that the apply process passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- error_record: The row in the DBA_APPLY_ERROR data dictionary view that identifies the transaction
- error_message_number: The message number of the ANYDATA object in the in_anydata parameter, starting at 1
- messaging_default_processing: If TRUE, then the apply process continues processing the message in the in_anydata parameter, which can include executing DML or DDL statements and invoking apply handlers.

  If FALSE, then the apply process skips processing the message in the in_anydata parameter and moves on to the next message in the in_anydata parameter.
- out_anydata: The ANYDATA object processed by the user procedure and used by the apply process if messaging_default_processing is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the messaging_default_processing parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the in_anydata parameter is a row LCR, then the out_anydata parameter must be row LCR if the messaging_default_processing parameter is set to TRUE.

- If the ANYDATA object in the in_anydata parameter is a DDL LCR, then the out_anydata parameter must be DDL LCR if the messaging_default_processing parameter is set to TRUE.
- The user who runs the user procedure must have SELECT privilege on the DBA_APPLY_ERROR data dictionary view.

Note: LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two OUT parameters. These OUT parameters contain the destination queue into which the message should be enqueued, if one exists, and whether or not the message should be executed. The destination queue is specified using the SET_ENQUEUE_DESTINATION procedure, and the execution directive is specified using the SET_EXECUTE procedure.

See Also:

- "SET_ENQUEUE_DESTINATION Procedure" on page 20-33
- "SET_EXECUTE Procedure" on page 20-35

Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2,
   destination_queue_name  OUT  VARCHAR2,
   execute                 OUT  BOOLEAN)
RETURN ANYDATA;

DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 20–12 GET_ERROR_MESSAGE Function Parameters

Parameter	Description
message_number	The identification number of the message. This number identifies the position of the message in the transaction. Query the DBA_APPLY_ERROR data dictionary view to view the message number of each apply error.
local_transaction_id	Identifier of the error transaction for which to return a message
destination_queue_name	Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains NULL.
execute	Contains TRUE if the message should be executed Contains FALSE if the message should not be executed

SET_DML_HANDLER Procedure

This procedure sets a user procedure as a DML handler for a specified operation on a specified object. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER(
   object_name          IN  VARCHAR2,
   object_type          IN  VARCHAR2,
   operation_name       IN  VARCHAR2,
   error_handler        IN  BOOLEAN   DEFAULT FALSE,
   user_procedure       IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL,
   apply_name           IN  VARCHAR2  DEFAULT NULL,
   assemble_lobs        IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–13 SET_DML_HANDLER Procedure Parameters

Parameter	Description
object_name	The name of the source object specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.
object_type	The type of the source object. Currently, TABLE is the only possible source object type.
operation_name	The name of the operation, which can be specified as: ■ INSERT ■ UPDATE ■ DELETE ■ LOB_UPDATE For example, suppose you run this procedure twice for the hr.employees table. In one call, you set operation_name to UPDATE and user_procedure to employees_update. In another call, you set operation_name to INSERT and user_procedure to employees_insert. Both times, you set error_handler to FALSE. In this case, the employees_update procedure is run for UPDATE operations on the hr.employees table, and the employees_insert procedure is run for INSERT operations on the hr.employees table.
error_handler	If TRUE, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply process error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions. If FALSE, then the handler being set is run for all row LCRs involving the specified operation on the specified object.

Table 20–13 (Cont.) SET_DML_HANDLER Procedure Parameters

Parameter	Description
user_procedure	A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when the apply process encounters an error. Specify NULL to unset a DML handler that is set for the specified operation on the specified object.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
apply_name	The name of the apply process that uses the DML handler or error handler. If NULL, then the procedure sets the DML handler or error handler as a general handler for all apply processes in the database. If the user_procedure parameter is set to NULL to unset a handler, and the handler being unset is set for a specific apply process, then use the apply_name parameter to specify the apply process to unset the handler.
assemble_lobs	If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly. If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.

Usage Notes

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply process error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a DML handler, not an error handler, and a DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a DML handler or an error handler for a particular operation on an object. It cannot set both a DML handler and an error handler for the same object and operation.

If the apply_name parameter is non-NULL, then the DML handler or error handler is set for the specified apply process. In this case, this handler is not invoked for other apply processes at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply processes at the destination database. When a handler is set for a specific apply process, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A DML handler named handler_hr is specified for an apply process named apply_hr for UPDATE operations on the hr.employees table.
- A general DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.

In this case, the apply_hr apply process uses the handler_hr DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Attention: Do not modify LONG, LONG RAW, or nonassembled LOB column data in an LCR with DML handlers, error handlers, or custom rule-based transformation functions. DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

Note: Currently, setting an error handler for an apply process that is applying changes to a non-Oracle database is not supported.

The SET_DML_HANDLER procedure can be used to set either a DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- [*schema_name*.]*package_name*.*procedure_name*
- [*schema_name*.]*procedure_name*

If the procedure is in a package, then the *package_name* must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the specified procedure. Also, if the *schema_name* is not specified, then the user who invokes the SET_DML_HANDLER procedure is the default.

For example, suppose the procedure_name has the following properties:

- hr is the *schema_name*.
- apply_pkg is the *package_name*.
- employees_default is the *procedure_name*.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.

- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about and restrictions regarding DML handlers and LOB, LONG, and LONG RAW datatypes

Signature of a DML Handler Procedure

The procedure specified in the user_procedure parameter must have the following signature:

```
PROCEDURE user_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *user_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

> **See Also:** Chapter 229, "Logical Change Record TYPEs" for more information about LCRs

Signature of an Error Handler Procedure

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     message            IN  ANYDATA,
     error_stack_depth  IN  NUMBER,
     error_numbers      IN  DBMS_UTILITY.NUMBER_ARRAY,
     error_messages     IN  emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use error_numbers(1) and error_messages(1).

Note:

- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
- The emsg_array value must be a user-defined array that is a table of type VARCHAR2 with at least 76 characters.

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply process.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply process automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an Oracle Streams apply process. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_ENQUEUE.
- The value is a ANYDATA instance containing the queue name specified as a VARCHAR2.

Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
  rule_name               IN  VARCHAR2,
  destination_queue_name  IN  VARCHAR2);
```

Parameters

Table 20–14 SET_ENQUEUE_DESTINATION Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue into which the apply process should enqueue the message. Specify the queue in the form [*schema_name.*]*queue_name*. Only local queues can be specified. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. If NULL, then an existing name-value pair with the name APPLY$_ENQUEUE is removed. If no name-value pair exists with the name APPLY$_ENQUEUE for the rule, then no action is taken. If non-NULL and a name-value pair already exists for the rule with the name APPLY$_ENQUEUE, then it is removed, and a new name-value pair with the value specified by this parameter is added.

Usage Notes

If an apply handler, such as a DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply process tries to enqueue a message into it.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply processes using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply process. If the rule is in the negative rule set for an apply process, then the apply process does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply process rule sets.

SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply process.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an Oracle Streams apply process. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_EXECUTE.
- The value is a ANYDATA instance that contains NO as a VARCHAR2. When the value is NO, then an apply process does not execute the message and does not send the message to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
  rule_name  IN  VARCHAR2,
  execute    IN  BOOLEAN);
```

Parameters

Table 20–15 SET_EXECUTE Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
execute	If TRUE, then the procedure removes the name-value pair with the name APPLY$_EXECUTE for the specified rule. Removing the name-value pair means that the apply process executes messages that satisfy the rule. If no name-value pair with name APPLY$_EXECUTE exists for the rule, then no action is taken. If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is APPLY$_EXECUTE and the value is NO. An apply process does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair already exists for the rule with the name APPLY$_EXECUTE, then it is removed, and a new one with the value NO is added. If NULL, then the procedure raises an error.

Usage Notes

If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.

Note:

- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply process for the apply process to follow the execution directive. If the rule is in the negative rule set for an apply process, then the apply process ignores the execution directive for the rule.

SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–16 SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables **Note:** If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, `and base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

Note:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

- *Oracle Streams Replication Administrator's Guide*

SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_list          IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_table         IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–17 SET_KEY_COLUMNS Procedure Parameters

Parameter	Description
`object_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If the apply process is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.
`column_list`	A comma-delimited list of the columns in the table that you want to use as the substitute primary key, with no spaces between the column names. If the `column_list` parameter is empty or `NULL`, then the current set of key columns is removed.
`column_table`	A PL/SQL index-by table of type `DBMS_UTILITY.NAME_ARRAY` of the columns in the table that you want to use as the substitute primary key. The index for `column_table` must be 1-based, increasing, dense, and terminated by a `NULL`. If the `column_table` parameter is empty or `NULL`, then the current set of key columns is removed.
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

When not empty, this set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object already has primary key columns and you want to use those primary key columns as the key.

Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.

Note:

- Unlike true primary keys, columns specified as substitute key column columns can contain NULLs. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- You should not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
   apply_name  IN  VARCHAR2,
   parameter   IN  VARCHAR2,
   value       IN  VARCHAR2);
```

Parameters

Table 20–18 SET_PARAMETER Procedure Parameters

Parameter	Description
apply_name	The apply process name. Do not specify an owner.
parameter	The name of the parameter you are setting. See "Apply Process Parameters" on page 20-41 for a list of these parameters.
value	The value to which the parameter is set

Apply Process Parameters

The following table lists the parameters for the apply process.

Table 20–19 Apply Process Parameters

Parameter Name	Possible Values	Default	Description
allow_duplicate_rows	Y or N	N	If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply process only updates or deletes one of the rows. If N, then the apply process raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table. **Note:** Regardless of the setting for this parameter, apply processes do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns. **See Also:** "Duplicate Rows and Substitute Primary Key Columns" on page 20-44
commit_serialization	full or none	full	The order in which applied transactions are committed. If full, then the apply process commits applied transactions in the order in which they were committed at the source database. If none, then the apply process can commit transactions in any order. Performance is best if you specify none. Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies. Logical standby environments typically specify full.
disable_on_error	Y or N	Y	If Y, then the apply process is disabled on the first unresolved error, even if the error is not fatal. If N, then the apply process continues regardless of unresolved errors.

Table 20–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the apply process is disabled if the apply process terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter. If N, then the apply process is restarted immediately after stopping because it reached a limit.
maximum_scn	A valid SCN or infinite	infinite	The apply process is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If infinite, then the apply process runs regardless of the SCN value.
parallelism	A positive integer	1	The number of transactions that can be concurrently applied. Setting the parallelism parameter to a number higher than the number of available parallel execution servers can disable the apply process. Make sure the PROCESSES and PARALLEL_MAX_SERVERS initialization parameters are set appropriately when you set the parallelism apply process parameter. **Note:** When the value of this parameter is changed for a running apply process, the apply process is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.
preserve_encryption	Y or N	Y	Whether to preserve encryption for columns encrypted using transparent data encryption. If Y, then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply process tries to apply the row LCRs. If N, then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply process applies the changes in the row LCRs. **Note:** When the value of this parameter is changed for a running apply process, the apply process is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.
startup_seconds	0, a positive integer, or infinite	0	The maximum number of seconds to wait for another instantiation of the same apply process to finish. If the other instantiation of the same apply process does not finish within this time, then the apply process does not start. If infinite, then an apply process does not start until another instantiation of the same apply process finishes.
time_limit	A positive integer or infinite	infinite	The apply process stops as soon as possible after the specified number of seconds since it started. If infinite, then the apply process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.
transaction_limit	A positive integer or infinite	infinite	The apply process stops after applying the specified number of transactions. If infinite, then the apply process continues to run regardless of the number of transactions applied.

Table 20–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
txn_lcr_spill_threshold	A positive integer or infinite	10000	The apply process begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply process has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way: 1. Reads the first 10,000 messages in the transaction into memory 2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000 3. Reads the next 100 messages in the transaction into memory 4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100 5. Reads the next 100 messages in the transaction into memory The apply process applies the first 10,100 messages from the hard disk and the last 100 messages from memory. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply process is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages. If infinite, then the apply process does not spill messages to the hard disk. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply process. **Note:** When the value of this parameter is changed for a running apply process, the new setting does not take effect until the apply process is restarted.
write_alert_log	Y or N	Y	If Y, then the apply process writes a message to the alert log on exit. If N, then the apply process does not write a message to the alert log on exit. The message specifies the reason why the apply process stopped.

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is `4,294,967,295`. Where applicable, specify `infinite` for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when the all of the column values are identical for two or more rows in the table, excluding LOB, `LONG`, and `LONG RAW` columns. You can specify substitute primary key columns for a table at a destination database using by the `SET_KEY_COLUMNS` procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that updates at the source database always update at least one of the columns specified as a substitute key column at the destination database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

If a table does not have a primary key, a unique index that has at least one `NOT NULL` column, or a substitute key, then the key consists of all non LOB, non `LONG`, and non `LONG RAW` columns. When there is no key for a table and the `allow_duplicate_rows` apply process parameter is set to `Y`, a single row LCR with an `UPDATE` or `DELETE` command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can

update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply process ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply process determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, `LONG`, and `LONG RAW` columns). Therefore, an apply process always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply process does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply process raises an error regardless of the setting for the `allow_duplicate_rows` apply process parameter.

See Also: "SET_KEY_COLUMNS Procedures" on page 20-39

SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–20 SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_schema_name	The name of the source schema. For example, hr.
source_database_name	The global name of the source database. For example, DBS1.NET.
	If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user.
	If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables
	Note: If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-`NULL` `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

Note: Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

- *Oracle Streams Replication Administrator's Guide*

SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
  source_object_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–21 SET_TABLE_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_object_name	The name of the source object specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.

Usage Notes

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply process at the destination database disregards the LCR. Otherwise, the apply process applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a command_type of ALTER TABLE or CREATE TRIGGER.

Note: The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
   object_name          IN  VARCHAR2,
   method_name          IN  VARCHAR2,
   resolution_column    IN  VARCHAR2,
   column_list          IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–22 SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
object_name	The schema and name of the table, specified as [*schema_name.*]*object_name*, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.
method_name	Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained: ■ MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. ■ MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. ■ OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database. ■ DISCARD: Retains the column list from the destination database, discarding the column list from the source database. If NULL, then the procedure removes any existing update conflict handler with the same object_name, resolution_column, and column_list. If non-NULL, then the procedure replaces any existing update conflict handler with the same object_name and resolution_column.

Table 20–22 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
resolution_column	Name of the column used to uniquely identify an update conflict handler. For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the column_list parameter. NULL is not allowed for this parameter. For the OVERWRITE and DISCARD prebuilt methods, you can specify any column in the column list.
column_list	List of columns for which the conflict handler is called. If a conflict occurs for one or more of the columns in the list when an apply process tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. **Note:** Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, and user-defined type columns. Therefore, you should not include these types of columns in the column_list parameter.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. **Note:** Currently, conflict handlers are not supported when applying changes to a non-Oracle database.

Usage Notes

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

If you want to remove an existing update conflict handler, then specify NULL for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply process, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the SET_DML_HANDLER procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

Note: Currently, setting an update conflict handler for an apply process that is applying to a non-Oracle database is not supported.

See Also:

- "Signature of an Error Handler Procedure" on page 20-31 for information about setting an error handler
- "SET_DML_HANDLER Procedure" on page 20-28
- *Oracle Streams Replication Administrator's Guide* for more information about prebuilt and custom update conflict handlers

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name           =>  'hr.employees',
    method_name           =>  'MAXIMUM',
    resolution_column     =>  'salary',
    column_list           =>  cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply process uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 20–23 SET_VALUE_DEPENDENCY Procedure Parameters

Parameter	Description
`dependency_name`	The name of the value dependency. If a dependency with the specified name does not exist, then it is created. If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If `NULL`, an error is raised.
`object_name`	The name of the table, specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If `NULL` and the specified dependency exists, then the dependency is removed. If `NULL` and the specified dependency does not exist, then an error is raised. If `NULL`, then `attribute_list` and `attribute_table` also must be `NULL`.
`attribute_list`	A comma-delimited list of column names in the table. There must be no spaces between entries.
`attribute_table`	A PL/SQL index-by table of type `DBMS_UTILITY.NAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.

START_APPLY Procedure

This procedure directs the apply process to start applying messages.

Syntax

```
DBMS_APPLY_ADM.START_APPLY(
   apply_name  IN  VARCHAR2);
```

Parameter

Table 20–24 START_APPLY Procedure Parameter

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is ENABLED, then the apply process is started upon database instance startup. An apply process (a*nnn*) is an Oracle background process. The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of an apply process.

STOP_APPLY Procedure

This procedure stops the apply process from applying messages and rolls back any unfinished transactions being applied.

Syntax

```
DBMS_APPLY_ADM.STOP_APPLY(
   apply_name  IN  VARCHAR2,
   force       IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–25 STOP_APPLY Procedure Parameters

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the apply process as soon as possible. If FALSE, then the procedure stops the apply process after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply process depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply process parameter. See "Usage Notes" for more information.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply process.

The following table describes apply process behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply process parameter. In all cases, the apply process rolls back any unfinished transactions when it stops.

force	commit_serialization	Apply Process Behavior
TRUE	full	The apply process stops immediately and does not apply any unfinished transactions.
TRUE	none	When the apply process stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.
FALSE	full	The apply process stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.
FALSE	none	Before stopping, the apply process applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the commit_serialization apply process parameter is set to none and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply process has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transaction 2 is not applied, and the apply process stops (transaction 2 is rolled back). If, however, the force parameter is set to FALSE, then transaction 2 is applied before the apply process stops.

A different scenario would result if the commit_serialization apply process parameter is set to full. For example, assume that the commit_serialization apply process parameter is set to full and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply process has applied transaction A and is in the process of applying transactions B and C when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transactions B and C are not applied, and the apply process stops (transactions B and C are rolled back). If, however, the force parameter is set to FALSE, then transaction B is applied before the apply process stops, and transaction C is rolled back.

See Also: "SET_PARAMETER Procedure" on page 20-41 for more information about the commit_serialization apply process parameter

21

DBMS_AQ

The DBMS_AQ package provides an interface to Oracle Streams Advanced Queuing (AQ).

See Also:

- *Oracle Streams Advanced Queuing User's Guide*
- Oracle Streams AQ TYPEs for information about TYPEs to use with DBMS_AQ.

This chapter contains the following topics:

- Using DBMS_AQ
  - Constants
  - Data Structures
  - Operational Notes
- Summary of DBMS_AQ Subprograms

Using DBMS_AQ

- Constants
- Data Structures
- Operational Notes

Constants

The DBMS_AQ package uses the constants shown in Table 21–1.

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE.

> **Note:** The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

Table 21–1 Enumerated Constants

Parameter	Options	Type	Description
VISIBILITY	IMMEDIATE		
.	ON_COMMIT		
DEQUEUE_MODE	BROWSE		
.	LOCKED		
.	REMOVE		
.	REMOVE_NODATA		
NAVIGATION	FIRST_MESSAGE		
.	NEXT_MESSAGE		
STATE	WAITING		
.	READY		
.	PROCESSED		
.	EXPIRED		
SEQUENCE_ DEVIATION	BEFORE		
.	TOP		
WAIT	FOREVER	BINARY_ INTEGER	
.	NO_WAIT	BINARY_ INTEGER	
DELAY	NO_DELAY		
EXPIRATION	NEVER		
NAMESPACE	NAMESPACE_AQ		
.	NAMESPACE_ANONYMOUS		
NTFN_GROUPING_ CLASS	NFTN_GROUPING_CLASS_ TIME	NUMBER	
NTFN_GROUPING_ TYPE	NTFN_GROUPING_TYPE_ SUMMARY	NUMBER	

Table 21–1 (Cont.) Enumerated Constants

Parameter	Options	Type	Description
.	NTFN_GROUPING_TYPE_LAST	NUMBER	
NTFN_GROUPING_REPEAT_COUNT	NTFN_GROUPING_FOREVER	NUMBER	

Data Structures

Table 21–2 DBMS_AQ Data Structures

Data Structures	Description
Object Name on page 21-5	Names database objects
Type Name on page 21-5	Defines queue types
Oracle Streams AQ PL/SQL Callback on page 21-6	Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification

Object Name

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The `type_name` data structure defines queue types.

Syntax

```
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

Attributes

Table 21–3 Type Name Attributes

Attribute	Description
object_type	Maximum number of attributes in the object type is limited to 900.

Table 21–3 (Cont.) Type Name Attributes

Attribute	Description
"RAW"	To store payload of type RAW, Oracle Streams AQ creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Streams AQ. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases. Because LOB columns are used for storing RAW payload, the Oracle Streams AQ administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the storage_clause parameter during queue table creation time.

Oracle Streams AQ PL/SQL Callback

The plsqlcallback data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN  RAW,
  reginfo  IN  SYS.AQ$_REG_INFO,
  descr    IN  SYS.AQ$_DESCRIPTOR,
  payload  IN  RAW,
  payloadl IN  NUMBER);
```

Attributes

Table 21–4 Oracle Streams AQ PL/SQL Callback Attributes

Attribute	Description
context	Specifies the context for the callback function that was passed by dbms_aq.register. See AQ$_REG_INFO Type on page 225-12.
reginfo	See AQ$_REG_INFO Type on page 225-12.
descr	See AQ$_DESCRIPTOR Type on page 225-5
payload	If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.
payloadl	Specifies the length of payload. If payload is null, payload1 = 0.

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN RAW,
  reginfo  IN SYS.AQ$_REG_INFO,
  descr    IN SYS.AQ$_DESCRIPTOR,
```

```
payload  IN VARCHAR2,
payloadl IN NUMBER);
```

Operational Notes

- DBMS_AQ and DBMS_AQADM Java Classes

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for `DBMS_AQ` and `DBMS_AQADM`. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have `EXECUTE` privileges on the `DBMS_AQIN` package to use these interfaces.

Summary of DBMS_AQ Subprograms

Table 21–5 DBMS_AQ Package Subprograms

Subprograms	Description
BIND_AGENT Procedure on page 21-10	Creates an entry for an Oracle Streams AQ agent in the LDAP directory
DEQUEUE Procedure on page 21-11	Dequeues a message from the specified queue
DEQUEUE_ARRAY Function on page 21-14	Dequeues an array of messages from the specified queue
ENQUEUE Procedure on page 21-16	Adds a message to the specified queue
ENQUEUE_ARRAY Function on page 21-18	Adds an array of messages to the specified queue
LISTEN Procedures on page 21-19	Listen to one or more queues on behalf of a list of agents
POST Procedure on page 21-21	Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications
REGISTER Procedure on page 21-22	Registers for message notifications
UNBIND_AGENT Procedure on page 21-23	Removes an entry for an Oracle Streams AQ agent from the LDAP directory
UNREGISTER Procedure on page 21-24	Unregisters a subscription which turns off notification

Note: `DBMS_AQ` does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have `RNDS`, `WNDS`, `RNPS` or `WNPS` constraints defined.

BIND_AGENT Procedure

This procedure creates an entry for an Oracle Streams AQ agent in the LDAP server.

Syntax

```
DBMS_AQ.BIND_AGENT(
   agent        IN SYS.AQ$_AGENT,
   certificate  IN VARCHAR2 default NULL);
```

Parameters

Table 21–6 BIND_AGENT Procedure Parameters

Parameter	Description
`agent`	Agent that is to be registered in LDAP server.
`certificate`	Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute `usercertificate`) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```
DBMS_AQ.DEQUEUE (
   queue_name           IN      VARCHAR2,
   dequeue_options      IN      dequeue_options_t,
   message_properties   OUT     message_properties_t,
   payload              OUT     "<ADT_1>"
   msgid                OUT     RAW);
```

Parameters

Table 21–7 DEQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue.
dequeue_options	See DEQUEUE_OPTIONS_T Type on page 225-17.
message_properties	See MESSAGE_PROPERTIES_T Type on page 225-24.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. For the definition of *type_name* refer to Type Name on page 21-5.
msgid	System generated identification of the message.

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in dequeue_options:

- consumer_name
- msgid

  Msgid uniquely identifies the message to be dequeued. Only messages in the READY state are dequeued unless msgid is specified.

- correlation

  Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Streams AQ.

- deq_condition

  Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include priority, corrid and other columns in the queue table.

  To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

Note: It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Streams AQ continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Streams AQ uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See DEQUEUE_OPTIONS_T Type on page 225-17 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure on page 22-22.
- You must map the Oracle Streams AQ agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure on page 22-35.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   dequeue_options           IN   dequeue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  OUT  message_properties_array_t,
   payload_array             OUT  "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 21–8 DEQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name from which messages are dequeued (same as single-row dequeue).
dequeue_options	The set of options which will be applied to all messages in the array (same as single-row dequeue).
array_size	The number of elements to dequeue.
message_properties_array	A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 225-28.
payload_array	An array of dequeued payload data. "<COLLECTION_1>" can be an associative array, varray or nested table in its PL/SQL representation.
msgid_array	An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 225-29.
error_array	Currently not implemented

Usage Notes

A nonzero wait time, as specified in dequeue_options, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the DEQUEUE_ARRAY function will dequeue up to array_size messages and return immediately.

Dequeue by message_id is not supported. See DEQUEUE Procedure on page 21-11 for more information on the navigation parameter. Existing NAVIGATION modes are supported. In addition, two new NAVIGATION modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

See Also: ENQUEUE_OPTIONS_T Type on page 225-20

For transaction grouped queues and ONE_GROUP navigation, messages are dequeued from a single transaction group only, subject to the array_size limit. In MULTI_GROUP navigation, messages are dequeued across multiple transaction groups, still subject to the array_size limit. ORA-25235 is returned to indicate the end of a transaction group.

DEQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```
DBMS_AQ.ENQUEUE (
   queue_name           IN      VARCHAR2,
   enqueue_options      IN      enqueue_options_t,
   message_properties   IN      message_properties_t,
   payload              IN       "<ADT_1>",
   msgid                OUT     RAW);
```

Parameters

Table 21–9 ENQUEUE Procedure Parameters

Parameter	Description
`queue_name`	Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.
`enqueue_options`	See ENQUEUE_OPTIONS_T Type on page 225-20.
`message_properties`	See MESSAGE_PROPERTIES_T Type on page 225-24.
`payload`	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. `NULL` is an acceptable parameter. For the definition of *`type_name`* refer to Type Name on page 21-5.
`msgid`	System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.

Usage Notes

The `sequence_deviation` parameter in `enqueue_options` can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the `enqueue_options` parameter `relative_msgid`. The relationship is identified by the `sequence_deviation` parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

> **Note:** The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error `ORA_24033` is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See MESSAGE_PROPERTIES_T Type on page 225-24 for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure on page 22-22.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure on page 22-35.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   enqueue_options           IN   enqueue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  IN   message_properties_array_t,
   payload_array             IN   "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 21–10 ENQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name in which messages are enqueued (same as single-row enqueue).
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 225-20.
array_size	The number of elements to enqueue.
message_properties_array	A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 225-28.
payload_array	An array of payload data. "<COLLECTION_1>" can be an associative array, VARRAY, or nested table in its PL/SQL representation.
msgid_array	An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 225-29.
error_array	Currently not implemented

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (
   agent_list            IN    AQ$_AGENT_LIST_T,
   wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
   agent                 OUT   SYS.AQ$_AGENT);

DBMS_AQ.LISTEN (
   agent_list             IN   AQ$_AGENT_LIST_T,
   wait                   IN   BINARY_INTEGER DEFAULT FOREVER,
   listen_delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
   agent                  OUT  SYS.AQ$_AGENT,
   message_delivery_mode  OUT  PLS_INTEGER);

TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

Parameters

Table 21–11 LISTEN Procedure Parameters

Parameter	Description
agent_list	List of agents to listen for
wait	Time out for the listen call in seconds. By default, the call will block forever.
listen_delivery_mode	The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED
agent	Agent with a message available for consumption
message_delivery_mode	Returns the message type along with the queue and consumer for which there is a message

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the `LISTEN` call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

Note: You cannot call `LISTEN` on nonpersistent queues.

POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (
  post_list       IN  SYS.AQ$_POST_INFO_LIST,
  post_count      IN  NUMBER);
```

Parameters

Table 21–12 POST Procedure Parameters

Parameter	Description
`post_list`	Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO_LIST Type.
`post_count`	Specifies the number of entries in the `post_list`.

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```
DBMS_AQ.REGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   count        IN  NUMBER);
```

Parameters

Table 21–13 REGISTER Procedure Parameters

Parameter	Description
`reg_list`	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
`count`	Specifies the number of entries in the `reg_list`.

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only `TIME` criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion `TIME`)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for `DBCHANGE` namespace)
  - Repeat count – how many times to perform grouping (Default is `FOREVER`)
  - Start time – when to start grouping (Default is current time)
- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.
- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

> **See Also:** Chapter 23, "DBMS_AQELM" for more information on e-mail and HTTP notifications

UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Streams AQ agent from the LDAP server.

Syntax

```
DBMS_AQ.UNBIND_AGENT(
   agent     IN SYS.AQ$_AGENT);
```

Parameters

Table 21–14 BIND_AGENT Procedure Parameters

Parameter	Description
agent	Agent that is to be removed from the LDAP server

UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```
DBMS_AQ.UNREGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   reg_count    IN  NUMBER);
```

Parameters

Table 21–15 UNREGISTER Procedure Parameters

Parameter	Description
`reg_list`	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
`reg_count`	Specifies the number of entries in the `reg_list`.

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

22

DBMS_AQADM

The DBMS_AQADM package provides procedures to manage Oracle Streams Advanced Queuing (AQ) configuration and administration information.

See Also:

- *Oracle Streams Advanced Queuing User's Guide*
- Chapter 225, "Oracle Streams AQ TYPEs" for information about the TYPEs to use with DBMS_AQADM

This chapter contains the following topics:

- Using DBMS_AQADM
  - Constants
- Subprogram Groups
  - Queue Table Subprograms
  - Privilege Subprograms
  - Queue Subprograms
  - Subscriber Subprograms
  - Notification Subprograms
  - Propagation Subprograms
  - Oracle Streams AQ Agent Subprograms
  - Alias Subprograms
- Summary of DBMS_AQADM Subprograms

Using DBMS_AQADM

This section contains the following topics.

- Constants

Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

Table 22–1 Enumerated Types in the Administrative Interface

Parameter	Options
retention	0, 1, 2...INFINITE
message_grouping	TRANSACTIONAL, NONE
queue_type	NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE

See Also: For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.

Subprogram Groups

This DBMS_AQADM package is made up of the following subprogram groups:

- Queue Table Subprograms on page 22-5
- Privilege Subprograms on page 22-6
- Queue Subprograms on page 22-7
- Subscriber Subprograms on page 22-8
- Notification Subprograms on page 22-9
- Propagation Subprograms on page 22-10
- Oracle Streams AQ Agent Subprograms on page 22-11
- Alias Subprograms on page 22-12

Queue Table Subprograms

Table 22–2 Queue Table Subprograms

Subprograms	Description
ALTER_QUEUE_TABLE Procedure on page 22-20	Alters the existing properties of a queue table
CREATE_QUEUE_TABLE Procedure on page 22-26	Creates a queue table for messages of a predefined type
DROP_QUEUE_TABLE Procedure on page 22-34	Drops an existing queue table
ENABLE_JMS_TYPES Procedure on page 22-36	A precondition for the enqueue of JMS types and XML types
MIGRATE_QUEUE_TABLE Procedure on page 22-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 22-42	Purges messages from queue tables

Privilege Subprograms

Table 22–3 Privilege Subprograms

Subprograms	Description
GRANT_QUEUE_PRIVILEGE Procedure on page 22-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_ PRIVILEGE Procedure on page 22-40	Grants Oracle Streams AQ system privileges to users and roles
REVOKE_QUEUE_ PRIVILEGE Procedure on page 22-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_ PRIVILEGE Procedure on page 22-47	Revokes Oracle Streams AQ system privileges from users and roles

Queue Subprograms

Table 22–4 Queue Subprograms

Subprograms	Description
ALTER_QUEUE Procedure on page 22-19	Alters existing properties of a queue
CREATE_NP_QUEUE Procedure on page 22-23	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure on page 22-24	Creates a queue in the specified queue table
DROP_QUEUE Procedure on page 22-33	Drops an existing queue
QUEUE_SUBSCRIBERS Function on page 22-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
START_QUEUE Procedure on page 22-51	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure on page 22-52	Disables enqueuing or dequeuing on the specified queue

Subscriber Subprograms

Table 22–5 Subscriber Subprograms

Subprograms	Description
ADD_SUBSCRIBER Procedure on page 22-16	Adds a default subscriber to a queue
ALTER_SUBSCRIBER Procedure on page 22-21	Alters existing properties of a subscriber to a specified queue
REMOVE_SUBSCRIBER Procedure on page 22-45	Removes a default subscriber from a queue

Notification Subprograms

Table 22–6 Notification Subprograms

Subprograms	Description
GET_WATERMARK Procedure on page 22-38	Retrieves the value of watermark set by the `SET_WATERMARK Procedure`
SET_WATERMARK Procedure on page 22-50	Used for Oracle Streams AQ notification to specify and limit memory use

Propagation Subprograms

Table 22–7 Propagation Subprograms

Subprograms	Description
ALTER_PROPAGATION_SCHEDULE Procedure on page 22-18	Alters parameters for a propagation schedule
DISABLE_PROPAGATION_SCHEDULE Procedure on page 22-31	Disables a propagation schedule
ENABLE_PROPAGATION_SCHEDULE Procedure on page 22-37	Enables a previously disabled propagation schedule
SCHEDULE_PROPAGATION Procedure on page 22-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
UNSCHEDULE_PROPAGATION Procedure on page 22-53	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 22-54	Verifies that the source and destination queues have identical types

Oracle Streams AQ Agent Subprograms

Table 22–8 Oracle Streams AQ Agent Subprograms

Subprograms	Description
ALTER_AQ_AGENT Procedure on page 22-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
CREATE_AQ_AGENT Procedure on page 22-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
DISABLE_DB_ACCESS Procedure on page 22-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DROP_AQ_AGENT Procedure on page 22-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
ENABLE_DB_ACCESS Procedure on page 22-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user

Alias Subprograms

Table 22–9 Alias Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 22-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
DEL_ALIAS_FROM_LDAP Procedure on page 22-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP

Summary of DBMS_AQADM Subprograms

Table 22–10 DBMS_AQADM Package Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 22-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
ADD_SUBSCRIBER Procedure on page 22-16	Adds a default subscriber to a queue
ALTER_AQ_AGENT Procedure on page 22-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
ALTER_PROPAGATION_SCHEDULE Procedure on page 22-18	Alters parameters for a propagation schedule
ALTER_QUEUE Procedure on page 22-19	Alters existing properties of a queue
ALTER_QUEUE_TABLE Procedure on page 22-20	Alters the existing properties of a queue table
ALTER_SUBSCRIBER Procedure on page 22-21	Alters existing properties of a subscriber to a specified queue
CREATE_AQ_AGENT Procedure on page 22-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
CREATE_NP_QUEUE Procedure on page 22-23	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure on page 22-24	Creates a queue in the specified queue table
CREATE_QUEUE_TABLE Procedure on page 22-26	Creates a queue table for messages of a predefined type
DEL_ALIAS_FROM_LDAP Procedure on page 22-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP
DISABLE_DB_ACCESS Procedure on page 22-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DISABLE_PROPAGATION_SCHEDULE Procedure on page 22-31	Disables a propagation schedule
DROP_AQ_AGENT Procedure on page 22-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
DROP_QUEUE Procedure on page 22-33	Drops an existing queue
DROP_QUEUE_TABLE Procedure on page 22-34	Drops an existing queue table
ENABLE_DB_ACCESS Procedure on page 22-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user
ENABLE_JMS_TYPES Procedure on page 22-36	A precondition for the enqueue of JMS types and XML types

Table 22–10 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
ENABLE_PROPAGATION_SCHEDULE Procedure on page 22-37	Enables a previously disabled propagation schedule
GET_WATERMARK Procedure on page 22-38	Retrieves the value of watermark set by the `SET_WATERMARK Procedure`
GRANT_QUEUE_PRIVILEGE Procedure on page 22-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure on page 22-40	Grants Oracle Streams AQ system privileges to users and roles
MIGRATE_QUEUE_TABLE Procedure on page 22-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 22-42	Purges messages from queue tables
QUEUE_SUBSCRIBERS Function on page 22-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
REMOVE_SUBSCRIBER Procedure on page 22-45	Removes a default subscriber from a queue
REVOKE_QUEUE_PRIVILEGE Procedure on page 22-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure on page 22-47	Revokes Oracle Streams AQ system privileges from users and roles
SCHEDULE_PROPAGATION Procedure on page 22-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
SET_WATERMARK Procedure on page 22-50	Used for Oracle Streams AQ notification to specify and limit memory use
START_QUEUE Procedure on page 22-51	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure on page 22-52	Disables enqueuing or dequeuing on the specified queue
UNSCHEDULE_PROPAGATION Procedure on page 22-53	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 22-54	Verifies that the source and destination queues have identical types

ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
   alias          IN VARCHAR2,
   obj_location   IN VARCHAR2);
```

Parameters

Table 22–11 ADD_ALIAS_TO_LDAP Procedure Parameters

Parameter	Description
`alias`	Name of the alias. Example: `west_shipping`.
`obj_location`	The distinguished name of the object (queue, agent or connection factory) to which `alias` refers.

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Streams AQ Internet access.

ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (
   queue_name      IN    VARCHAR2,
   subscriber      IN    sys.aq$_agent,
   rule            IN    VARCHAR2 DEFAULT NULL,
   transformation  IN    VARCHAR2 DEFAULT NULL
   queue_to_queue  IN    BOOLEAN DEFAULT FALSE,
   delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 22–12 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being defined.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are priority and corrid. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.
queue_to_queue	If TRUE, propagation is from queue-to-queue.
delivery_mode	The administrator may specify one of DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED, or DBMS_AQADM.PERSISTENT_OR_BUFFERED for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by ALTER_SUBSCRIBER.

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule   => 'PRIORITY <= 3 AND CORRID =  ''FROM JAPAN'''
```

Note that these are all single quotation marks.

ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Streams AQ Internet access. It is also used to alter an Oracle Streams AQ agent that accesses secure queues.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 22–13 ALTER_AQ_AGENT Procedure Parameters

Parameter	Description
`agent_name`	Specifies the username of the Oracle Streams AQ Internet agent.
`certification_location`	Agent's certificate location in LDAP (default is `NULL`). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
`enable_http`	`TRUE` means the agent can access Oracle Streams AQ through HTTP. `FALSE` means the agent cannot access Oracle Streams AQ through HTTP.
`enable_smtp`	`TRUE` means the agent can access Oracle Streams AQ through SMTP (e-mail). `FALSE` means the agent cannot access Oracle Streams AQ through SMTP.
`enable_anyp`	`TRUE` means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
   queue_name           IN    VARCHAR2,
   destination          IN    VARCHAR2 DEFAULT NULL,
   duration             IN    NUMBER   DEFAULT NULL,
   next_time            IN    VARCHAR2 DEFAULT NULL,
   latency              IN    NUMBER   DEFAULT 60,
   destination_queue    IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–14 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.
destination_ queue	Name of the target queue to which messages are to be propagated in the form of a dblink

ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters `max_retries`, `retention_time`, and `retry_delay` are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
   queue_name        IN    VARCHAR2,
   max_retries       IN    NUMBER   DEFAULT NULL,
   retry_delay       IN    NUMBER   DEFAULT NULL,
   retention_time    IN    NUMBER   DEFAULT NULL,
   auto_commit       IN    BOOLEAN  DEFAULT TRUE,
   comment           IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–15 ALTER_QUEUE Procedure Parameters

Parameter	Description
`queue_name`	Name of the queue that is to be altered
`max_retries`	Limits the number of times a dequeue with `REMOVE` mode can be attempted on a message. The maximum value of `max_retries` is 2**31 -1. A message is moved to an exception queue if `RETRY_COUNT` is greater than `MAX_RETRIES`. `RETRY_COUNT` is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including `ALTER SYSTEM KILL SESSION`) or `SHUTDOWN ABORT` on the instance, then `RETRY_COUNT` is not incremented. Note that `max_retries` is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
`retry_delay`	Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is `NULL`, which means that the value will not be altered. Note that `retry_delay` is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
`retention_time`	Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is `NULL`, which means that the value will not be altered.
`auto_commit`	`TRUE` causes the current transaction, if any, to commit before the `ALTER_QUEUE` operation is carried out. The `ALTER_QUEUE` operation become persistent when the call returns. This is the default. `FALSE` means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.
`comment`	User-specified description of the queue. This user comment is added to the queue catalog. The default value is `NULL`, which means that the value will not be changed.

ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
   queue_table          IN   VARCHAR2,
   comment              IN   VARCHAR2       DEFAULT NULL,
   primary_instance     IN   BINARY_INTEGER DEFAULT NULL,
   secondary_instance   IN   BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 22–16 ALTER_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created.
comment	Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.
primary_instance	This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.

ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (
   queue_name     IN    VARCHAR2,
   subscriber     IN    sys.aq$_agent,
   rule           IN    VARCHAR2
   transformation IN    VARCHAR2);
```

Parameters

Table 22–17 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being altered. See "AQ$_ AGENT Type" on page 225-3.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the *schema*.AQ$*queue_table*_R and *schema*.AQ$*queue_table*_S views.

CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Streams AQ agent to access secure queues.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 22–18 CREATE_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

Usage Notes

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Streams AQ Internet agents.

CREATE_NP_QUEUE Procedure

> **Note:** nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

This procedure creates a nonpersistent RAW queue.

Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
   queue_name              IN        VARCHAR2,
   multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,
   comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–19 CREATE_NP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Language Reference.*
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.
comment	User-specified description of the queue. This user comment is added to the queue catalog.

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ$_MEM_SC or AQ$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with CREATE_NP_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the LISTEN call on a nonpersistent queue.

CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE (
   queue_name          IN       VARCHAR2,
   queue_table         IN       VARCHAR2,
   queue_type          IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,
   max_retries         IN       NUMBER         DEFAULT NULL,
   retry_delay         IN       NUMBER         DEFAULT 0,
   retention_time      IN       NUMBER         DEFAULT 0,
   dependency_tracking IN       BOOLEAN        DEFAULT FALSE,
   comment             IN       VARCHAR2       DEFAULT NULL,
   auto_commit         IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

Table 22–20 CREATE_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters.
queue_table	Name of the queue table that will contain the queue.
queue_type	Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.
max_retries	Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.

Table 22–20 (Cont.) CREATE_QUEUE Procedure Parameters

Parameter	Description
dependency_tracking	Reserved for future use. FALSE is the default. TRUE is not permitted in this release.
comment	User-specified description of the queue. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
   queue_table          IN      VARCHAR2,
   queue_payload_type   IN      VARCHAR2,
   storage_clause       IN      VARCHAR2        DEFAULT NULL,
   sort_list            IN      VARCHAR2        DEFAULT NULL,
   multiple_consumers   IN      BOOLEAN         DEFAULT FALSE,
   message_grouping     IN      BINARY_INTEGER  DEFAULT NONE,
   comment              IN      VARCHAR2        DEFAULT NULL,
   auto_commit          IN      BOOLEAN         DEFAULT TRUE,
   primary_instance     IN      BINARY_INTEGER  DEFAULT 0,
   secondary_instance   IN      BINARY_INTEGER  DEFAULT 0,
   compatible           IN      VARCHAR2        DEFAULT NULL,
   secure               IN      BOOLEAN         DEFAULT FALSE);
```

Parameters

Table 22–21 CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created
queue_payload_type	Type of the user data stored. See Type Name on page 21-5 for valid values for this parameter.
storage_clause	Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument.The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLEPSACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See *Oracle Database SQL Language Reference* for the usage of these parameters.

Table 22–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
sort_list	The columns to be used as the sort key in ascending order. This parameter has the following format: '*sort_column_1*,*sort_column_2*' The allowed column names are priority and enq_time. If both columns are specified, then *sort_column_1* defines the most significant order. After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created. If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order. Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified.
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.
message_grouping	Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.
comment	User-specified description of the queue table. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Note: This parameter has been deprecated.
primary_instance	The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance. The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.
compatible	The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.

Table 22–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
secure	This parameter must be set to TRUE if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.

Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- aq$_*queue_table_name*_e, a default exception queue associated with the queue table
- aq$*queue_table_name*, a read-only view, which is used by Oracle Streams AQ applications for querying queue data
- aq$_*queue_table_name*_t, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- aq$_*queue_table_name*_i, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- aq$_*queue_table_name*_s, a table for storing information about the subscribers
- aq$_*queue_table_name*_r, a table for storing information about rules on subscriptions

aq$_*queue_table_name*_h, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Streams AQ object type payloads. However, only CLOB and BLOB can be propagated using Oracle Streams AQ propagation in Oracle8*i* release 8.1.5 or later. See the *Oracle Streams Advanced Queuing User's Guide* for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the primary_instance and secondary_instance only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(
   alias IN VARCHAR2);
```

Parameters

Table 22–22 DEL_ALIAS_FROM_LDAP Procedure Parameters

Parameter	Description
alias	The alias to be removed.

DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent.

Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 22–23 DISABLE_DB_ACCESS Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specifies the database user whose privileges are to be revoked from the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously granted those privileges using the ENABLE_DB_ACCESS Procedure.

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
   queue_name            IN   VARCHAR2,
   destination           IN   VARCHAR2 DEFAULT NULL,
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–24 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
`queue_name`	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`destination`	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
`destination_queue`	Name of the target queue to which messages are to be propagated in the form of a `dblink`

DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Streams AQ Internet access.

Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (
  agent_name                IN VARCHAR2)
```

Parameters

Table 22–25 DROP_AQ_AGENT Procedure Parameters

Parameter	Description
`agent_name`	Specifies the username of the Oracle Streams AQ Internet agent

DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (
   queue_name        IN    VARCHAR2,
   auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–26 DROP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be dropped.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.

DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (
   queue_table       IN    VARCHAR2,
   force             IN    BOOLEAN DEFAULT FALSE,
   auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–27 DROP_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be dropped.
force	FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.

ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Streams AQ Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 22–28 ENABLE_DB_ACCESS Procedure Parameters

Parameter	Description
`agent_name`	Specifies the username of the Oracle Streams AQ Internet agent.
`db_username`	Specified the database user whose privileges are to be granted to the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents and the names of the database users whose privileges are granted to them.

ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams `Sys.Anydata` queues unless you call this procedure after `DBMS_STREAMS_ADM.SET_UP_QUEUE`. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (
   queue_table   IN   VARCHAR2);
```

Parameters

Table 22–29 ENABLE_JMS_TYPES Procedure Parameters

Parameter	Description
`queue_table`	Specifies name of the queue table to be enabled for JMS and XML types.

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
   queue_name          IN   VARCHAR2,
   destination         IN   VARCHAR2 DEFAULT NULL,
   destination_queue   IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 22–30 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
`queue_name`	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`destination`	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
`destination_queue`	Name of the target queue to which messages are to be propagated in the form of a `dblink`

GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by `SET_WATERMARK`.

Syntax

```
DBMS_AQADM.GET_WATERMARK (
   wmvalue     OUT      NUMBER);
```

Parameters

Table 22–31 GET_WATERMARK Procedure Parameter

Parameter	Description
`wmvalue`	Watermark value in megabytes.

GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
   privilege        IN    VARCHAR2,
   queue_name       IN    VARCHAR2,
   grantee          IN    VARCHAR2,
   grant_option     IN    BOOLEAN := FALSE);
```

Parameters

Table 22–32 GRANT_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
grant_option	Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Streams AQ system privileges to users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
   privilege         IN    VARCHAR2,
   grantee           IN    VARCHAR2,
   admin_option      IN    BOOLEAN := FALSE);
```

Parameters

Table 22–33 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
admin_option	Specifies if the system privilege is granted with the ADMIN option or not. If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.

MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (
   queue_table   IN   VARCHAR2,
   compatible    IN   VARCHAR2);
```

Parameters

Table 22–34 MIGRATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
`queue_table`	Specifies name of the queue table to be migrated.
`compatible`	Set this to `8.1` to upgrade an 8.0-compatible queue table, or set this to `8.0` to downgrade an 8.1-compatible queue table.

PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE(
   queue_table        IN   VARCHAR2,
   purge_condition    IN   VARCHAR2,
   purge_options      IN   aq$_purge_options_t);
```

where type aq$_purge_options_t is described in Chapter 225, "Oracle Streams AQ TYPEs".

Parameters

Table 22–35 PURGE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Specifies the name of the queue table to be purged.
purge_condition	Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of aq$queue_table_name view. When specifying the purge_condition, qualify the column names in aq$queue_table_name view with qtview. To purge all queues in a queue table, set purge_condition to either NULL (a bare null word, no quotes) or '' (two single quotes).
purge_options	Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter. ■ If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times. ■ delivery_mode is used to specify whether DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED or DBMS_AQADM.PERSISTENT_OR_BUFFERED types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.

Usage Notes

- You an purge selected messages from the queue table by specifying a purge_condition. Table 22–35 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.

- A trace file is generated in the `udump` destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one `purge_queue_table` call depending on the number of messages in the queue table.

QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`. Each element of the collection is of type `sys.aq$_agent`. This functionality is provided for 8.1-compatible queues by the `AQ$`*`queue_table_name`*`_S` view.

Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
   queue_name         IN         VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

Parameters

Table 22–36 QUEUE_SUBSCRIBERS Function Parameters

Parameter	Description
`queue_name`	Specifies the queue whose subscribers are to be printed.

REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (
   queue_name          IN          VARCHAR2,
   subscriber          IN          sys.aq$_agent);
```

Parameters

Table 22–37 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent who is being removed. See AQ$_AGENT Type on page 225-3.

REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
   privilege         IN      VARCHAR2,
   queue_name        IN      VARCHAR2,
   grantee           IN      VARCHAR2);
```

Parameters

Table 22–38 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor's privileges are revoked.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Streams AQ system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
   privilege         IN   VARCHAR2,
   grantee           IN   VARCHAR2);
```

Parameters

Table 22–39 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.

SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
   queue_name          IN    VARCHAR2,
   destination         IN    VARCHAR2 DEFAULT NULL,
   start_time          IN    DATE     DEFAULT SYSDATE,
   duration            IN    NUMBER   DEFAULT NULL,
   next_time           IN    VARCHAR2 DEFAULT NULL,
   latency             IN    NUMBER   DEFAULT 60,
   destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–40 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
start_time	Initial start time for the propagation window for messages from the source queue to the destination.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in

either the same or different queues, the message is propagated to all of them at the same time.

SET_WATERMARK Procedure

This procedure is used for Oracle Streams AQ notification to specify and limit memory use.

Syntax

```
DBMS_AQADM.SET_WATERMARK (
   wmvalue     IN      NUMBER);
```

Parameters

Table 22–41 SET_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (
   queue_name      IN     VARCHAR2,
   enqueue         IN     BOOLEAN DEFAULT TRUE,
   dequeue         IN     BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–42 START_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be enabled
enqueue	Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (
   queue_name      IN   VARCHAR2,
   enqueue         IN   BOOLEAN DEFAULT TRUE,
   dequeue         IN   BOOLEAN DEFAULT TRUE,
   wait            IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–43 STOP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be disabled
enqueue	Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.
wait	Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
   queue_name         IN  VARCHAR2,
   destination        IN  VARCHAR2 DEFAULT NULL
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–44 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
   src_queue_name    IN    VARCHAR2,
   dest_queue_name   IN    VARCHAR2,
   destination       IN    VARCHAR2 DEFAULT NULL,
   rc                OUT   BINARY_INTEGER);
```

Parameters

Table 22–45 VERIFY_QUEUE_TYPES Procedure Parameters

Parameter	Description
`src_queue_name`	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`dest_queue_name`	Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`destination`	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
`rc`	Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in `rc`.

23

DBMS_AQELM

The DBMS_AQELM package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide* for detailed information about DBMS_AQELM

This chapter contains the following topic:

- Summary of DBMS_AQELM Subprograms

Summary of DBMS_AQELM Subprograms

Table 23–1 DBMS_ALERT Package Subprograms

Subprogram	Description
SET_MAILHOST Procedure on page 23-3	Sets the host name for the SMTP server that the database will uses send out e-mail notifications
SET_MAILPORT Procedure on page 23-4	Sets the port number for the SMTP server
SET_SENDFROM Procedure on page 23-5	Sets the sent-from e-mail address

SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (
   mailhost  IN  VARCHAR2);
```

Parameters

Table 23–2 SET_MAILHOST Procedure Parameters

Parameter	Description
mailhost	SMTP server host name.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```
DBMS_AQELM.SET_MAILPORT (
   mailport  IN NUMBER);
```

Parameters

Table 23–3 SET_MAILPORT Procedure Parameters

Parameter	Description
mailport	SMTP server port number.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```
DBMS_AQELM.SET_SENDFROM (
   sendfrom  IN  VARCHAR2);
```

Parameters

Table 23–4 SET_SENDFROM Procedure Parameters

Parameter	Description
sendfrom	The sent-from e-mail address.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package should set the sent-from address before registering for e-mail notifications

24

DBMS_AQIN

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide* for detailed information about DBMS_AQIN

This chapter contains the following topic:

- Using DBMS_AQIN
  - Over view

Using DBMS_AQIN

This section contains topics which relate to using the `DBMS_AQIN` package.

- Overview

Overview

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

Note that you can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINSTRATOR_ROLE.

25

DBMS_ASSERT

The DBMS_ASSERT package provides an interface to validate properties of the input value.

> **See Also:** *Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- Using DBMS_ASSERT
  - Operational Notes
- Summary of DBMS_ASSERT Subprograms

Using DBMS_ASSERT

- Operational Notes

Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned via return value. Most functions return the value unchanged, however, several functions modify the value.

Summary of DBMS_ASSERT Subprograms

Table 25–1 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
ENQUOTE_LITERAL Function on page 25-5	Enquotes a string literal
ENQUOTE_NAME Function on page 25-6	Encloses a name in double quotes
NOOP Functions on page 25-7	Returns the value without any checking
QUALIFIED_SQL_NAME Function on page 25-8	Verifies that the input string is a qualified SQL name
SCHEMA_NAME Function on page 25-9	Verifies that the input string is an existing schema name
SIMPLE_SQL_NAME Function on page 25-10	Verifies that the input string is a simple SQL name
SQL_OBJECT_NAME Function on page 25-11	Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object

ENQUOTE_LITERAL Function

This function enquotes a string literal.

Syntax

```
DBMS_ASSERT.ENQUOTE_LITERAL (
   str            VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 25–2 ENQUOTE_LITERAL Function Parameters

Parameter	Description
str	String to enquote

Usage Notes

- Add leading and trailing single quotes to a string literal.
- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.

ENQUOTE_NAME Function

This function encloses a name in double quotes.

Syntax

```
DBMS_ASSERT.ENQUOTE_NAME (
   str            VARCHAR2,
   capitalize     BOOLEAN DEFAULT TRUE)
RETURN VARCHAR2;
```

Parameters

Table 25–3 ENQUOTE_NAME Function Parameters

Parameter	Description
`str`	String to enquote
`capitalize`	If `TRUE` or defaulted, alphabetic characters of `str` which was not in quotes are translated to upper case

NOOP Functions

This function returns the value without any checking.

Syntax

```
DBMS_ASSERT.NOOP (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;

DBMS_ASSERT.NOOP (
   str      CLOB CHARACTER SET ANY_CS)
 RETURN     CLOB CHARACTER SET str%CHARSET;
```

Parameters

Table 25–4 NOOP Function Parameters

Parameter	Description
str	Input value

QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

Syntax

```
DBMS_ASSERT.QUALIFIED_SQL_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–5 QUALIFIED_SQL_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44004: string is not a qualified SQL name

Usage Notes

A qualified SQL name <qualified name> can be expressed by the following grammar:

```
<local qualified name> ::= <simple name> {'.' <simple name>}
<database link name> ::= <local qualified name> ['@' <connection string>]
<connection string> ::= <simple name>
<qualified name> ::= <local qualified name> ['@' <database link name>]
```

SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

```
DBMS_ASSERT.SCHEMA_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–6 SCHEMA_NAME Function Parameters

Parameter	Description
`str`	Input value

Exceptions

`ORA44001`: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "`FIRST LAST`" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

SIMPLE_SQL_NAME Function

This function verifies that the input string is a simple SQL name.

Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–7 SIMPLE_SQL_NAME Procedure Parameters

Parameter	Description
str	Input value

Exceptions

ORA44003: string is not a simple SQL name

Usage Notes

- The input value must be meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters _, $, and # in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with "" inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.

SQL_OBJECT_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

Syntax

```
DBMS_ASSERT.SQL_OBJECT_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–8 SQL_OBJECT_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44002: Invalid object name

26

DBMS_AUTO_TASK_ADMIN

The DBMS_AUTO_TASK_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

> **See Also:** *Oracle Database Administrator's Guide* for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

- Using DBMS_AUTO_TASK_ADMIN
  - Constants
- Summary of DBMS_AUTO_TASK_ADMIN Subprograms

Using DBMS_AUTO_TASK_ADMIN

- Constants

Constants

The DBMS_AUTO_TASK_ADMIN package uses the constants shown in Table 26–1:

Table 26–1 DBMS_AUTO_TASK_ADMIN Constants

Name	Type	Value	Description
TASK_PRIORITY_MEDIUM	INTEGER	1	Task with this priority should be executed as time permits.
TASK_PRIORITY_HIGH	INTEGER	2	Task with this priority should be executed within the current Maintenance Window.
TASK_PRIORITY_URGENT	INTEGER	3	Task with this is to be executed at the earliest opportunity.

Summary of DBMS_AUTO_TASK_ADMIN Subprograms

Table 26–2 DBMS_XMLSTORE Package Subprograms

Method	Description
DISABLE Procedures on page 26-5	Prevents AUTOTASK from executing any requests from a specified client or operation.
ENABLE Procedures on page 26-6	Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control
GET_CLIENT_ ATTRIBUTES Procedure on page 26-7	Returns values of select client attributes
GET_P1_RESOURCES Procedure on page 26-8	Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups
OVERRIDE_PRIORITY Procedures on page 26-9	Manually overrides task priority.
SET_CLIENT_SERVICE Procedure on page 26-10	Associates an AUTOTASK Client with a specified Service
SET_P1_RESOURCES Procedure on page 26-11	Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients

DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

Syntax

Disables all AUTOTASK functionality.

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   window_name       IN    VARCHAR2);
```

Parameters

Table 26–3 DISABLE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_ OPERATION View
window_name	Optional name of the window in which client is to be disabled

Usage Notes

- If operation and window_name are both NULL, the client is disabled.
- If operation is not NULL, window_name is ignored and the operation is disabled
- If operation is NULL and window_name is not NULL, the client is disabled in the specified window.

ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control. Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation.Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   window_name       IN    VARCHAR2);
```

Parameters

Table 26–4 DISABLE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_ OPERATION View
window_name	Optional name of the window in which client is to be enabled

Usage Notes

- If operation and window_name are both NULL, the client is enabled.
- If operation is not NULL, window_name is ignored and the specified operation is enabled
- If operation is NULL and window_name is not NULL, the client is enabled in the specified window.

GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES(
   client_name         IN    VARCHAR2,
   service_name        OUT   VARCHAR2,
   window_group        OUT   VARCHAR2);
```

Parameters

Table 26–5 GET_CLIENT_ATTRIBUTES Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL
window_group	Name of the window group in which the client is active

GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES(
   stats_group_pct     OUT   NUMBER,
   seg_group_pct       OUT   NUMBER,
   tune_group_pct      OUT   NUMBER,
   health_group_pct    OUT   NUMBER);
```

Parameters

Table 26–6 GET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values will add up to 100%.

OVERRIDE_PRIORITY Procedures

This procedure is used to manually override task priority. This can be done at the client, operation or individual task level. This priority assignment will be honored during the next maintenance window in which the named client is active. Specifically, setting the priority to URGENT will cause a high priority job to be generated at the start of the maintenance window. Setting priority to CLEAR removes the override.

Syntax

Override Priority for a Client.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Override Priority for an Operation.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Override Priority for a Task.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   task_target_type  IN    VARCHAR2,
   task_target_name  IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Parameters

Table 26–7 OVERRIDE_PRIORITY Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
priority	URGENT, HIGH, MEDIUM or LOW
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
task_target_type	Type of target to be affected, as found in V$AUTOTASK_TARGET_TYPE View
task_target_name	Name of the specific target to be affected

SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(
   client_name        IN    VARCHAR2,
   service_name       IN   VARCHAR2);
```

Parameters

Table 26–8 SET_CLIENT_SERVICE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL

Usage Notes

All work performed on behalf of the Client will take place only on instances where the service is enabled.

SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES(
   stats_group_pct     OUT   NUMBER,
   seg_group_pct       OUT   NUMBER,
   tune_group_pct      OUT   NUMBER,
   health_group_pct    OUT   NUMBER);
```

Parameters

Table 26–9 SET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.

27

DBMS_AW_STATS

DBMS_AW_STATS contains a subprogram that generates and stores optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

> **See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topic:

- Using DBMS_AW_STATS
- Summary of DBMS_AW_STATS Subprograms

Using DBMS_AW_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

Summary of DBMS_AW_STATS Subprograms

Table 27–1 DBMS_AW_STATS Package Subprograms

Subprogram	Description
ANALYZE Procedure on page 27-4	Generates optimizer statistics on OLAP cubes and dimensions.

ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a dimension.

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

Syntax

```
DBMS_AW_STATS.ANALYZE
     (object       IN VARCHAR2);
```

Parameters

Table 27–2 ANALYZE Procedure Parameters

Parameter	Description
`object`	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is *`owner.cube_name`*. For a dimension, the format is *`owner.dimension_name`*.

Example

This sample script generates optimizer statistics on `UNITS_CUBE` and its dimensions.

```
BEGIN
     DBMS_AW_STATS.ANALYZE('units_cube');
     DBMS_AW_STATS.ANALYZE('time');
     DBMS_AW_STATS.ANALYZE('customer');
     DBMS_AW_STATS.ANALYZE('product');
     DBMS_AW_STATS.ANALYZE('channel');
END;
/
```

The optimizer statistics enable Oracle Database to generate an execution plan for queries against `UNITS_CUBE`, as shown here:

```
SQL> EXPLAIN PLAN FOR SELECT * from units_cube_view;

Explained.
```

```
SQL>  SELECT plan_table_output FROM TABLE(dbms_xplan.display());

PLAN_TABLE_OUTPUT
-----------------------------------------------------------------------------------------------------
Plan hash value: 3488499021

-------------------------------------------------------------------------------------------
| Id  | Operation               | Name       | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------------------
|   0 | SELECT STATEMENT        |            |  4475K|    93M|   661  (85)| 00:00:08 |
|   1 |  CUBE SCAN PARTIAL OUTER| UNITS_CUBE |  4475K|    93M|   661  (85)| 00:00:08 |
-------------------------------------------------------------------------------------------

8 rows selected.
```

28

DBMS_CAPTURE_ADM

The DBMS_CAPTURE_ADM package, one of a set of Oracle Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and capture processes

This chapter contains the following topic:

- Summary of DBMS_CAPTURE_ADM Subprograms

Summary of DBMS_CAPTURE_ADM Subprograms

Table 28–1 DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
ABORT_GLOBAL_INSTANTIATION Procedure on page 28-4	Reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SCHEMA_INSTANTIATION Procedure on page 28-5	Reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SYNC_INSTANTIATION Procedure on page 28-6	Reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure
ABORT_TABLE_INSTANTIATION Procedure on page 28-7	Reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure
ALTER_CAPTURE Procedure on page 28-8	Alters a capture process
ALTER_SYNC_CAPTURE Procedure on page 28-13	Alters a synchronous capture
BUILD Procedure on page 28-15	Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns
CREATE_CAPTURE Procedure on page 28-16	Creates a capture process
CREATE_SYNC_CAPTURE Procedure on page 28-22	Creates a synchronous capture
DROP_CAPTURE Procedure on page 28-24	Drops a capture process
INCLUDE_EXTRA_ATTRIBUTE Procedure on page 28-26	Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture
PREPARE_GLOBAL_INSTANTIATION Procedure on page 28-28	Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SCHEMA_INSTANTIATION Procedure on page 28-29	Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SYNC_INSTANTIATION Function on page 28-30	Performs the synchronization necessary for instantiating one or more tables at another database and returns the prepare SCN
PREPARE_TABLE_INSTANTIATION Procedure on page 28-31	Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table
SET_PARAMETER Procedure on page 28-32	Sets a capture process parameter to the specified value

Table 28–1 (Cont.) DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
START_CAPTURE Procedure on page 28-35	Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue
STOP_CAPTURE Procedure on page 28-36	Stops the capture process from mining redo logs

Note: All subprograms commit unless specified otherwise.

ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures

Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION();
```

ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION procedure. It also reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the PREPARE_SCHEMA_INSTANTIATION procedure
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure for tables in the specified schema

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
   schema_name  IN  VARCHAR2);
```

Parameter

Table 28–2 ABORT_SCHEMA_INSTANTIATION Procedure Parameter

Parameter	Description
schema_name	The name of the schema for which to abort the effects of preparing instantiation

ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The table_names parameter is VARCHAR2 datatype in one version and DBMS_UTILITY.UNCL_ARRAY datatype in the other version.

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
   table_names IN VARCHAR2);

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
   table_names IN DBMS_UTILITY.UNCL_ARRAY);
```

Parameters

Table 28–3 ABORT_SYNC_INSTANTIATION Procedure Parameter

Parameter	Description
table_names	When the table_names parameter is VARCHAR2 datatype, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries. When the table_names parameter is DBMS_UTILITY.UNCL_ARRAY datatype, specify a PL/SQL index-by table of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated. In either version of the procedure, specify the name of each table in the form [*schema_name*.]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure

Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
   table_name  IN  VARCHAR2);
```

Parameter

Table 28–4 ABORT_TABLE_INSTANTIATION Procedure Parameter

Parameter	Description
table_name	The name of the table for which to abort the effects of preparing instantiation, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

ALTER_CAPTURE Procedure

This procedure alters a capture process.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
   capture_name              IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   start_scn                 IN  NUMBER    DEFAULT NULL,
   use_database_link         IN  BOOLEAN   DEFAULT NULL,
   first_scn                 IN  NUMBER    DEFAULT NULL,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE,
   capture_user              IN  VARCHAR2  DEFAULT NULL,
   checkpoint_retention_time IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 28–5 ALTER_CAPTURE Procedure Parameters

Parameter	Description
`capture_name`	The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.
`rule_set_name`	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. To change the positive rule set for the capture process, specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a positive rule set in the `hr` schema named `job_capture_rules`, enter `hr.job_capture_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If you specify `NULL` and the `remove_rule_set` parameter is set to `FALSE`, then the procedure retains any existing positive rule set. If you specify `NULL` and the `remove_rule_set` parameter is set to `TRUE`, then the procedure removes any existing positive rule set. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process

Table 28–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified capture process. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
start_scn	A valid SCN for the database from which the capture process should start capturing changes. The SCN value be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN. An error is returned if an invalid SCN is specified or if the capture process is enabled.
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If NULL, then the current value of this parameter for the capture process is not changed.

Table 28–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
`first_scn`	Specifies the lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements: ▪ It must be greater than the current first SCN for the capture process. ▪ It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero. ▪ It must be less than or equal to the required checkpoint SCN for the capture process. An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" on page 28-12 for information about determining an SCN value that meets all of these conditions. When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.
`negative_rule_set_name`	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. To change the negative rule set for the capture process, specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a negative rule set in the `hr` schema named `neg_capture_rules`, enter `hr.neg_capture_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If you specify `NULL` and the `remove_negative_rule_set` parameter is set to `FALSE`, then the procedure retains any existing negative rule set. If you specify `NULL` and the `remove_negative_rule_set` parameter is set to `TRUE`, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

Table 28–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified capture process. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges: ■ EXECUTE privilege on the rule sets used by the capture process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process These privileges must be granted directly to the capture user. They cannot be granted through roles. The capture process is stopped and restarted automatically when you change the value of this parameter. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run.

Table 28–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
checkpoint_retention_time	Either the number of days that a capture process should retain checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If NULL, then the checkpoint retention time is not changed. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. **See Also:** *Oracle Streams Concepts and Administration* for more information about checkpoint retention time

Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the first_scn parameter. The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
   FROM DBA_CAPTURE;
```

ALTER_SYNC_CAPTURE Procedure

This procedure alters a synchronous capture.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE(
   capture_name   IN  VARCHAR2,
   rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   capture_user   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 28–6 ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
`capture_name`	The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.
`rule_set_name`	The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. To change the rule set for the synchronous capture, specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a positive rule set in the `strmadmin` schema named `sync_cap_rules`, enter `strmadmin.sync_cap_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You should only specify a rule set that was created using the `DBMS_STREAMS_ADM` package. If `NULL`, then the rule set is not changed. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a synchronous capture

Table 28–6 (Cont.) ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges: ■ EXECUTE privilege on the rule sets used by the synchronous capture ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process These privileges must be granted directly to the capture user. They cannot be granted through roles. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the capture_user setting for the synchronous capture is set to NULL automatically. You must specify a capture user before the synchronous capture can capture changes.

BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the OUT parameter first_scn, and the other does not.

Syntax

```
DBMS_CAPTURE_ADM.BUILD(
   first_scn  OUT  NUMBER);

DBMS_CAPTURE_ADM.BUILD();
```

Parameters

Table 28–7 BUILD Procedure Parameter

Parameter	Description
first_scn	Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process

Usage Notes

If there are any in-flight transactions, then this procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during the data dictionary build.

You can run this procedure multiple times at a source database.

If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.

After executing this procedure, you can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes.You can specify the first SCN for a capture process when you run the CREATE_CAPTURE or ALTER_CAPTURE procedure in the DBMS_CAPTURE_ADM package.

CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:

- *Oracle Streams Concepts and Administration* for more information about creating a capture process
- Chapter 113, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
   queue_name                 IN  VARCHAR2,
   capture_name               IN  VARCHAR2,
   rule_set_name              IN  VARCHAR2  DEFAULT NULL,
   start_scn                  IN  NUMBER    DEFAULT NULL,
   source_database            IN  VARCHAR2  DEFAULT NULL,
   use_database_link          IN  BOOLEAN   DEFAULT FALSE,
   first_scn                  IN  NUMBER    DEFAULT NULL,
   logfile_assignment         IN  VARCHAR2  DEFAULT 'implicit',
   negative_rule_set_name     IN  VARCHAR2  DEFAULT NULL,
   capture_user               IN  VARCHAR2  DEFAULT NULL,
   checkpoint_retention_time  IN  NUMBER    DEFAULT 60);
```

Parameters

Table 28–8 CREATE_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [*schema_name*.]*queue_name*. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the capture process is created.
capture_name	The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the capture process is created.

Table 28–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process
start_scn	A valid SCN for the database from which the capture process should start capturing changes. If the specified value is lower than the current SCN of the source database, then either the first_scn should be specified, or the SCN value specified for start_scn must be greater than or equal to the first SCN of an existing capture process which has taken at least one checkpoint. If start_scn is NULL and no value is specified for the first_scn parameter, then the current SCN of the database is used as start SCN. If start_scn is NULL and a non-NULL value is specified for the first_scn parameter, then the first_scn value is used. If a value is specified for both start_scn and first_scn, then the start_scn value must be greater than or equal to the first_scn value. An error is returned if an invalid SCN is specified.
source_database	The global name of the source database. The source database is where the changes to be captured originated. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.

Table 28–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary. During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually: ■ Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created. ■ Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process. ■ Prepare source database objects for instantiation.
first_scn	Specifies the lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available.
logfile_assignment	If implicit, the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database. If explicit, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the FOR *logminer_session_name* clause when the redo log file is added manually to the downstream database. If explicit, then redo transport services cannot be used to add redo log files to the capture process being created. If you specify explicit for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log. **See Also:** "Usage Notes" on page 28-20 for information about adding redo log files manually

Table 28–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the user who runs the CREATE_CAPTURE procedure is used. Only a user who is granted DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run. **See Also:** "Usage Notes" on page 28-20 for more information about this parameter.

Table 28–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
checkpoint_retention_time	Either the number of days that a capture process should retain checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. **See Also:** *Oracle Streams Concepts and Administration* for more information about checkpoint retention time

Usage Notes

The user who invokes this procedure must be granted DBA role.

The capture_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process
- EXECUTE privilege on all rule-based transformation functions used in the positive rule set
- EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process

These privileges must be granted directly to the capture user. They cannot be granted through roles.

Note:

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

If you specify explicit for the logfile_assignment parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE
   file_name FOR capture_process;
```

Here, *file_name* is the name of the redo log file being added and *capture_process* is the name of the capture process that will use the redo log file at the downstream database. The *capture_process* is equivalent to the *logminer_session_name* and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the DBMS_FILE_TRANSFER package, FTP, or some other transfer method.

> **See Also:** *Oracle Database SQL Language Reference* for more information about the ALTER DATABASE statement and *Oracle Data Guard Concepts and Administration* for more information registering redo log files

CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about creating a synchronous capture

Syntax

```
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
   queue_name     IN  VARCHAR2,
   capture_name   IN  VARCHAR2,
   rule_set_name  IN  VARCHAR2,
   capture_user   IN  VARCHAR2  DEFAULT NUL);
```

Parameters

Table 28–9 CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form [*schema_name.*]*queue_name*. For example, to specify a queue in the strmadmin schema named streams_queue, enter strmadmin.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the synchronous capture is created.
capture_name	The name of the synchronous capture being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the synchronous capture is created.
rule_set_name	The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. Specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You should only specify a rule set that was created using the DBMS_STREAMS_ADM package. If NULL, then an error is returned. **Note:** Synchronous capture rules must be added to the synchronous capture rule set using the ADD_TABLE_RULES or ADD_SUBSET_RULES procedure in the DBMS_STREAMS_ADM package. A synchronous capture ignores rules added to the rule set with other procedures. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a synchronous capture

Table 28–9 (Cont.) CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the user who runs the CREATE_SYNC_CAPTURE procedure is used. Only a user who is granted DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. **Note:** If the specified user is dropped using DROP USER . . . CASCADE, then the capture_user setting for the synchronous capture is set to NULL automatically. You must specify a capture user before the synchronous capture can capture changes. **See Also:** "Usage Notes" on page 28-23 for more information about this parameter.

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- ENQUEUE privilege on the queue specified in the queue_name parameter
- EXECUTE privilege on the rule set used by the synchronous capture
- EXECUTE privilege on all rule-based transformation functions used in the rule set
- EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture

These privileges must be granted directly to the capture user. They cannot be granted through roles.

Note: A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

DROP_CAPTURE Procedure

This procedure drops a capture process.

Note: A capture process must be stopped before it can be dropped.

See Also: "STOP_CAPTURE Procedure" on page 28-36

Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
   capture_name           IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 28–10 DROP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES
- DBA_STREAMS_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
   capture_name    IN  VARCHAR2,
   attribute_name  IN  VARCHAR2,
   include         IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 28–11 INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.
attribute_name	The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.
include	If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture. If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want

to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify `FALSE` for the `include` parameter.

PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure should be used to prepare the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameter

Table 28–12 PREPARE_GLOBAL_INSTANTIATION Procedure Parameter

Parameter	Description
`supplemental_logging`	Either `none`, `keys`, or `all`. If `none` is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables. If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying `keys` does not enable supplemental logging of bitmap join index columns. If `all` is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure should be used to prepare the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
   schema_name           IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameters

Table 28–13 PREPARE_SCHEMA_INSTANTIATION Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema. For example, `hr`.
`supplemental_logging`	Either `none`, `keys`, or `all`.
	If `none` is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.
	If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying `keys` does not enable supplemental logging of bitmap join index columns.
	If `all` is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function should be used to prepare one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The `table_names` parameter is `VARCHAR2` datatype in one version and `DBMS_UTILITY.UNCL_ARRAY` datatype in the other version.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names IN VARCHAR2)
RETURN NUMBER;

DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names IN DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

Parameters

Table 28–14 PREPARE_SYNC_INSTANTIATION Function Parameter

Parameter	Description
`table_names`	When the `table_names` parameter is `VARCHAR2` datatype, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries. When the `table_names` parameter is `DBMS_UTILITY.UNCL_ARRAY` datatype, specify a PL/SQL index-by table of this type that contains the names of the tables to prepare for instantiation. The first table name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated. In either version of the function, specify the name of each table in the form `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.

PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table. This procedure should be used to prepare the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
   table_name            IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameters

Table 28–15 PREPARE_TABLE_INSTANTIATION Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`supplemental_logging`	Either `none`, `keys`, or `all`.
	If `none` is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.
	If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying `keys` does not enable supplemental logging of bitmap join index columns.
	If `all` is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER(
   capture_name  IN  VARCHAR2,
   parameter     IN  VARCHAR2,
   value         IN  VARCHAR2);
```

Parameters

Table 28–16 SET_PARAMETER Procedure Parameters

Parameter	Description
`capture_name`	The name of the capture process. Do not specify an owner.
`parameter`	The name of the parameter you are setting. See "Capture Process Parameters" on page 28-32 for a list of these parameters.
`value`	The value to which the parameter is set

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 28–17 Capture Process Parameters

Parameter Name	Possible Values	Default	Description
`disable_on_limit`	`Y` or `N`	`N`	If `Y`, then the capture process is disabled because it reached a value specified by the `time_limit` parameter or `message_limit` parameter. If `N`, then the capture process is restarted immediately after stopping because it reached a limit.
`downstream_real_time_mine`	`Y` or `N`	`Y` for local capture processes `N` for downstream capture processes	If `Y`, then the capture process is a real-time downstream capture process. After setting this parameter to `y`, switch the redo log file at the source database using the SQL statement `ALTER SYSTEM ARCHIVE LOG CURRENT` to begin real-time downstream capture. If this parameter is set to `Y`, then redo data from the source database must be sent to the standby redo log at the downstream database. See *Oracle Streams Concepts and Administration* for information about creating a real-time downstream capture process. If `N`, then the capture process is an archived-log downstream capture process. This parameter is ignored for local capture processes.
`maximum_scn`	A valid SCN or `infinite`	`infinite`	The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified. If `infinite`, then the capture process runs regardless of the SCN value.

Table 28–17 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
message_limit	A positive integer or infinite	infinite	The capture process stops after capturing the specified number of messages. If infinite, then the capture process continues to run regardless of the number of messages captured.
message_tracking_frequency	0 or a positive integer	2000000	The frequency at which messages captured by the capture process are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is *capture_process_name*:AUTOTRACK,where *capture_process_name* is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically. See *Oracle Streams Replication Administrator's Guide* for more information about message tracking.
parallelism	A positive integer	1	The number of parallel execution servers that can concurrently mine the redo log Setting the parallelism parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the PROCESSES and PARALLEL_MAX_SERVERS initialization parameters are set appropriately when you set the parallelism capture process parameter. **Note:** When you change the value of this parameter, the capture process is stopped and restarted automatically.
startup_seconds	0, a positive integer, or infinite	0	The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually. If infinite, then the capture process does not start until another instantiation of the same capture process finishes.
time_limit	A positive integer or infinite	infinite	The capture process stops as soon as possible after the specified number of seconds since it started. If infinite, then the capture process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.
write_alert_log	Y or N	Y	If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is `4,294,967,295`. Where applicable, specify `infinite` for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.

START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by c.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of a capture process.

See Also: Chapter 130, "DBMS_STREAMS_ADM"

Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(
   capture_name  IN  VARCHAR2);
```

Parameters

Table 28–18 START_CAPTURE Procedure Parameter

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A NULL setting is not allowed.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup. A capture process (c*nnn*) is an Oracle background process.

STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

The stop status is persistently recorded. Hence, if the status is DISABLED, then the capture process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.

Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
   capture_name  IN  VARCHAR2,
   force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 28–19 STOP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. A NULL setting is not allowed. Do not specify an owner.
force	This parameter is reserved for future use. Currently, valid BOOLEAN settings are ignored.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup. A capture process (*cnnn*) is an Oracle background process.

29

DBMS_CDC_PUBLISH

The DBMS_CDC_PUBLISH package, one of a set of Change Data Capture packages, is used by a publisher to set up an Oracle Change Data Capture system to capture and publish change data from one or more Oracle relational source tables.

Change Data Capture captures and publishes only committed data. Oracle Change Data Capture identifies new data that has been added to, updated in, or removed from relational tables, and publishes the change data in a form that is usable by subscribers.

Typically, a Change Data Capture system has one **publisher** who captures and publishes changes for any number of Oracle relational source tables. The publisher then provides subscribers (applications or individuals) with access to the published data. Subscribers access the published data using the DBMS_CDC_SUBSCRIBE package.

> **See Also:** *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture

This chapter contains the following topics:

- Using DBMS_CDC_PUBLISH
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Views
- Summary of DBMS_CDC_PUBLISH Subprograms

Using DBMS_CDC_PUBLISH

This section contains the following topics, which relate to using the `DBMS_CDC_PUBLISH` package:

- Overview
- Deprecated Subprograms
- Security Model
- Views

Overview

Through the DBMS_CDC_PUBLISH package, the publisher creates and maintains change sources, change sets, and change tables, and eventually drops them when they are no longer useful.

The publisher, typically a database administrator, is concerned primarily with the source of the data and with creating the schema objects that describe the structure of the capture system: change sources, change sets, and change tables.

Most Change Data Capture systems have one publisher and many subscribers. The publisher accomplishes the following main objectives:

1. Determines which source table changes need to be published.
2. Decides whether to capture changes asynchronously or synchronously.
3. Uses the subprograms in the DBMS_CDC_PUBLISH package to capture change data from the source tables and make it available by creating and administering the change source, change set, and change table objects.
4. Allows controlled access to subscribers by using the SQL GRANT and REVOKE statements to grant and revoke the SELECT privilege on change tables for users and roles. (This is necessary to allow the subscribers to subscribe to the change data using the DBMS_CDC_SUBSCRIBE package.)

See Also: Chapter 30, "DBMS_CDC_SUBSCRIBE" for information on the package used to subscribe to published change data

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11*g*:

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION` with a subscription handle

  When dropping a subscription, the publisher should now specify the name of the subscription to be dropped, not the subscription handle.

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIBER_VIEW`

  Dropping a subscriber view is now performed automatically by Change Data Capture.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_CDC_PUBLISH package. Additional privileges and roles are required depending on the publishing mode and whether the publisher is on the source or staging database. See the section on Granting Privileges and Roles to the Publisher in *Oracle Database Data Warehousing Guide* for details.

Views

The DBMS_CDC_PUBLISH package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_PUBLISH Subprograms

Table 29–1 describes the subprograms in the DBMS_CDC_PUBLISH supplied package and the mode or modes with which each can be used. A value of All in the Mode column indicates that the subprogram can be used with synchronous and all modes of asynchronous Change Data Capture, a value of Asynchronous in the Mode column indicates that the subprogram can be used with all modes of asynchronous Change Data Capture (HotLog, Distributed HotLog, and AutoLog).

Table 29–1 DBMS_CDC_PUBLISH Package Subprograms

Subprogram	Mode	Description
ALTER_AUTOLOG_CHANGE_SOURCE Procedure on page 29-8	Asynchronous AutoLog	Changes one or more properties of an existing AutoLog change source
ALTER_CHANGE_SET Procedure on page 29-10	All	Changes one or more of the properties of an existing change set
ALTER_CHANGE_TABLE Procedure on page 29-13	All	Adds or drops columns for an existing change table, or changes the properties of an existing change table
ALTER_HOTLOG_CHANGE_SOURCE Procedure on page 29-16	Asynchronous Distributed HotLog	Changes one or more properties of an existing Distributed HotLog change source
CREATE_AUTOLOG_CHANGE_SOURCE Procedure on page 29-18	Asynchronous AutoLog	Creates an AutoLog change source
CREATE_CHANGE_SET Procedure on page 29-20	All	Creates a change set
CREATE_CHANGE_TABLE Procedure on page 29-23	All	Creates a change table in a specified schema
CREATE_HOTLOG_CHANGE_SOURCE Procedure on page 29-27	Asynchronous Distributed HotLog	Creates a Distributed HotLog change source
DROP_CHANGE_SET Procedure on page 29-29	All	Drops an existing change set
DROP_CHANGE_SOURCE Procedure on page 29-30	Asynchronous Autolog and Asynchronous Distributed Hotlog	Drops an existing AutoLog or Distributed HotLog change source
DROP_CHANGE_TABLE Procedure on page 29-31	All	Drops an existing change table
DROP_SUBSCRIPTION Procedure on page 29-32	All	Allows a publisher to drop a subscription that was created by a subscriber
GET_DDLOPER Function on page 29-33	All	Converts a binary integer into a user friendly string that describes the DDL operation that actually took place
PURGE Procedure on page 29-34	All	Removes unneeded rows from all change tables in the staging database
PURGE_CHANGE_SET Procedure on page 29-35	All	Removes unneeded rows from all change tables in a specified change set
PURGE_CHANGE_TABLE Procedure on page 29-36	All	Removes unneeded rows from a specified change table

ALTER_AUTOLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing AutoLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_AUTOLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     remove_description  IN CHAR DEFAULT 'N',
     first_scn           IN NUMBER DEFAULT NULL);
```

Parameters

Table 29–2 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
`change_source_name`	Name of an existing AutoLog change source. Change source names follow Oracle schema object naming rules.
`description`	New description of the change source. The description must be specified using 255 or fewer characters.
`remove_description`	A value of `'Y'` or `'N'`. If the value is `'Y'`, then the current description is changed to `NULL`. If the value is `'N'`, then the current description is unchanged. Do not specify the description parameter with this parameter.
`first_scn`	New first SCN.

Exceptions

Table 29–3 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
`ORA-31401`	Specified change source is not an existing change source
`ORA-31452`	Invalid value for parameter, expecting: `Y` or `N`
`ORA-31455`	Nothing to `ALTER`
`ORA-31497`	Invalid value specified for `first_scn`
`ORA-31498`	The `description` and `remove_description` parameters cannot both be specified
`ORA-31499`	Null value specified for required parameter
`ORA-31501`	Specified change source is not an AutoLog change source
`ORA-31504`	Cannot alter or drop predefined change source
`ORA-31507`	Specified parameter value longer than maximum length

Usage Notes

- Properties supplied to this procedure with a `NULL` value are unchanged.
- This procedure can be used to change more than one property at a time.
- This procedure can be used in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

See Also: The section on asynchronous Change Data Capture and redo log files in *Oracle Database Data Warehousing Guide* for information on how the publisher can use the `ALTER_AUTOLOG_CHANGE_SOURCE` procedure in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

ALTER_CHANGE_SET Procedure

This procedure changes the properties of an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_SET(
     change_set_name         IN VARCHAR2,
     description             IN VARCHAR2 DEFAULT NULL,
     remove_description      IN CHAR DEFAULT 'N',
     enable_capture          IN CHAR DEFAULT NULL,
     recover_after_error     IN CHAR DEFAULT NULL,
     remove_ddl              IN CHAR DEFAULT NULL,
     stop_on_ddl             IN CHAR DEFAULT NULL);
```

Parameters

Table 29–4 ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
description	New description of the change set. Specify using 255 or fewer characters.
remove_ description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_capture	A value of 'Y' or 'N'. If the value is 'Y', then change data capture is enabled for this change set. If the value is 'N', then change data capture is disabled for this change set. Synchronous change sets are created with change data capture enabled. Asynchronous change sets are created with change data capture disabled.
recover_after_ error	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture will attempt to recover from earlier capture errors. If the value is 'N', then Change Data Capture will not attempt to recover from earlier capture errors.
remove_ddl	A value of 'Y' or 'N'. If the value is 'Y' and the value of the recover_after_error parameter is 'Y', then any DDL records that may have caused capture errors will be filtered out during recovery. If the value is 'N', then DDL records that may have caused capture errors will not be filtered out during recovery. This parameter has meaning only when the recover_after_error parameter is specified with a value of 'Y'.

Table 29–4 (Cont.) ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
stop_on_ddl	A value of 'Y' or 'N'.
	If the value is 'Y', then Change Data Capture stops when a DDL event is detected.
	If the value is 'N', then Change Data Capture continues when a DDL event is detected.
	See the Usage Notes for additional information about this parameter.

Exceptions

Table 29–5 ALTER_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31455	Invalid lock handle while acquiring lock
ORA-31468	Cannot process DDL change record
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31485	Invalid database link
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the predefined synchronous change set, SYNC_SET, cannot be altered, and the following parameters cannot be altered for publisher-defined synchronous change sets: enable_capture, recover_after_error, remove_ddl, and stop_on_ddl.
- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can alter more than one parameter at a time.
- Enabling or disabling an asynchronous HotLog or AutoLog change set starts or stops the Oracle Streams capture process and apply process underlying the change set. Enabling or disabling an asynchronous Distributed HotLog change set starts or stops the Oracle Streams apply process underlying the change set.
- The effect of the stop_on_ddl parameter is as follows:
  - When the stop_on_ddl parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity

to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to `'Y'` and any of the following statements is encountered:

* `ANALYZE TABLE`
* `LOCK TABLE`
* `GRANT` privileges to access a table
* `REVOKE` privileges to access a table
* `COMMENT` on a table
* `COMMENT` on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

– When the `stop_on_ddl` parameter is set to `'N'`, Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects change tables, that change can result in a capture error. There are also system conditions that can cause capture errors, such as being out of disk space.

See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been stopped and the DDL statement that caused it to be stopped. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

- The publisher can attempt to recover an asynchronous change set after a capture error by specifying `'Y'` for the `recover_after_error` parameter. Capture errors can occur when any of the following is true:
  – The `stop_on_ddl` parameter is set to `'Y'` and there is a DDL record in the change data. In this case, to recover from the error, the publisher must also specify `'Y'` for the `remove_ddl` parameter.
  – The `stop_on_ddl` parameter is set to `'N'` and there is a DDL record that affects capture. For example, if the publisher drops and re-creates a change table, it causes an error the next time that Change Data Capture attempts to add change data to the named change table.
  – A miscellaneous error occurs, such as running out of disk space, or a redo log file error (such as ORA-01688: unable to extend table *string*.*string* partition *string* by *string* in tablespace *string*).

  See Also: *Oracle Database Data Warehousing Guide* for more information on how to recover from a capture error.

ALTER_CHANGE_TABLE Procedure

This procedure adds columns to, or drops columns from, or changes the properties of, a change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_TABLE(
     owner                  IN VARCHAR2,
     change_table_name      IN VARCHAR2,
     operation              IN VARCHAR2,
     column_list            IN VARCHAR2,
     rs_id                  IN CHAR,
     row_id                 IN CHAR,
     user_id                IN CHAR,
     timestamp              IN CHAR,
     object_id              IN CHAR,
     source_colmap          IN CHAR,
     target_colmap          IN CHAR,
     ddl_markers            IN CHAR  DEFAULT NULL);
```

Parameters

Table 29–6 ALTER_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	The schema that owns the change table.
change_table_name	The change table that is being altered. Change table names follow the Oracle schema object naming rules.
operation	Either the value ADD or DROP to indicate whether to add or drop the user columns specified with the column_list parameter and any control columns specified by other parameters.
column_list	User column names and datatypes for each column of the source table that should be added to, or dropped from, the change table. The list is comma-delimited.

Table 29–6 (Cont.) ALTER_CHANGE_TABLE Procedure Parameters

Parameter	Description
rs_id row_id user_id timestamp object_id source_colmap target_colmap ddl_markers	Each listed parameter specifies a particular control column, as follows: ■ The rs_id parameter specifies the RSID$ control column. ■ The row_id parameter specifies the ROW_ID$ control column. ■ The user_id parameter specifies the USERNAME$ control column. ■ The timestamp parameter specifies the TIMESTAMP$ control column. ■ The object_id parameter specifies the SYS_NC_OID$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP$ control column. ■ The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. These are the three additional control columns you get when ddl_markers is enabled. There are three values: DDLOPER$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$) to get the name of the DDL operation.) DDLDESC$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN$ is not used in this release. Each parameter must have a value of either 'Y' or 'N', where: ■ 'Y': Adds the specified control column to, or drops it from the change table, as indicated by the operation parameter. ■ 'N': Neither adds the specified control column, nor drops it from the change table.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns.

Exceptions

Table 29–7 ALTER_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31403	Specified change table already contains the specified column
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column *control-column-name*
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31423	Specified change table does not contain the specified column
ORA-31454	Invalid value specified for operation parameter, expecting ADD or DROP

Table 29–7 (Cont.) ALTER_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31455	Nothing to alter
ORA-31456	Error executing a procedure in the DBMS_CDC_UTILITY package
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher cannot add and drop user columns in the same call to the ALTER_CHANGE_TABLE procedure; these schema changes require separate calls.
- The publisher must not specify the name of the control columns in the column_list parameter.
- When altering an asynchronous change table, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.

  See Also: *Oracle Database Data Warehousing Guide* for information about the impact on subscriptions when a publisher adds a column to a change table.

ALTER_HOTLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing Distributed HotLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_HOTLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     remove_description  IN CHAR DEFAULT 'N',
     enable_source       IN CHAR DEFAULT NULL);
```

Parameters

Table 29–8 ALTER_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of an existing Distributed HotLog change source. Change source names follow Oracle schema object naming rules.
description	New description of the change source. The description must be specified using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_source	A value of 'Y' or 'N'. If the value is 'Y', then the change source is enabled. If the value is 'N', then the change source is disabled.

Exceptions

Table 29–9 ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Change source is not an existing change source
ORA-31455	Nothing to ALTER
ORA-31480	Staging database and source database cannot be the same
ORA-31481	Change source is not a HotLog change source
ORA-31482	Invalid option for non-distributed HotLog change source
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Parameter value longer than maximum length
ORA-31532	Cannot enable change source

Table 29–9 (Cont.) ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- Enabling or disabling a Distributed HotLog change source starts or stops the Oracle Streams capture process that underlies the change source.
- This procedure cannot be used to alter the change source for the asynchronous HotLog mode of Change Database Capture. The change source for the asynchronous HotLog mode is the predefined change source, HOTLOG_SOURCE, which cannot be altered.

CREATE_AUTOLOG_CHANGE_SOURCE Procedure

This procedure creates an AutoLog change source. An AutoLog change source is based on of a set of redo log files automatically copied by redo transport services to the system on which the staging database resides.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_AUTOLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     source_database     IN VARCHAR2,
     first_scn           IN NUMBER,
     online_log          IN CHAR DEFAULT 'N');
```

Parameters

Table 29–10 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source. Change source names follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	Global name of the change source's source database instance.
first_scn	The SCN of the start of a LogMiner dictionary that is in the change source's archived redo log files.
online_log	A value of 'Y' or 'N' If the value is 'Y', then the change source uses the AutoLog online option to hot-mine the source database online redo log to gather change data. There can only be one change source with online_log='Y' on a given staging database. If the value is 'N', then the change source uses the AutoLog archive option to get change data from archived redo log files. There can be one or more change sources with online_log='N' on a given staging database.

Exceptions

Table 29–11 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source specified
ORA-31497	Invalid value specified for first_scn
ORA-31499	Null value specified for required parameter
ORA-31507	Specified parameter value is longer than the maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31535	Cannot support change source in this configuration

Usage Notes

- The publisher can use this procedure for asynchronous Change Data Capture only.

- The publisher must take care when specifying a value for the source_database parameter. Change Data Capture does not validate this value when creating the change source. The publisher can query the GLOBAL_NAME column in the GLOBAL_NAME view at the source database for the source_database parameter value.
- The publisher must configure redo transport services to automatically copy the log files to the system on which the staging database resides.

  See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on configuring redo transport services to automatically copy the log files to the system on which the staging database resides.

- An AutoLog change source must begin with an archived redo log file that contains a LogMiner dictionary. The CREATE_AUTOLOG_CHANGE_SOURCE first_scn parameter indicates the SCN for this dictionary extraction and is the point at which the change source can begin capturing changes. The publisher can determine the value for the first_scn parameter using either of the following methods:
  - Direct DBMS_CAPTURE_ADM.BUILD to return the value when the dictionary is built:

```
SET SERVEROUTPUT ON
VARIABLE FSCN NUMBER;
BEGIN
 :FSCN := 0;
 DBMS_CAPTURE_ADM.BUILD(:FSCN);
 DBMS_OUTPUT.PUT_LINE('The first_scn value is ' || :FSCN);
END;
/
The first_scn value is 207722
```

  - Make the following query on the source database. If this query returns multiple distinct values for first_change#, then the data dictionary has been extracted more than once and the publisher should choose the first_change# value that is the most appropriate to the change source.

```
SELECT DISTINCT FIRST_CHANGE#, NAME
   FROM V$ARCHIVED_LOG
   WHERE DICTIONARY_BEGIN = 'YES';
```

  See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on archived redo log files and the LogMiner dictionary.

- For the asynchronous mode of Change Data Capture, the amount of change data captured is dependent on the level of supplemental logging enabled at the source database.

  See Also: *Oracle Database Data Warehousing Guide* for information about supplemental logging.

CREATE_CHANGE_SET Procedure

This procedure allows the publisher to create a change set. For asynchronous HotLog and AutoLog Change Data Capture, the publisher can optionally provide beginning and ending date values at which to begin and end change data capture.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_SET(
     change_set_name        IN VARCHAR2,
     description            IN VARCHAR2 DEFAULT NULL,
     change_source_name     IN VARCHAR2,
     stop_on_ddl            IN CHAR DEFAULT 'N',
     begin_date             IN DATE DEFAULT NULL,
     end_date               IN DATE DEFAULT NULL);
```

Parameters

Table 29–12 CREATE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set. Change set names follow the Oracle schema object naming rules.
description	Description of the change set. Specify using 255 or fewer characters.
change_source_name	Name of the existing change source to contain this change set.
stop_on_ddl	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture stops when a DDL event is detected. If the value is 'N', then Change Data Capture continues when a DDL event is detected. See the Usage Notes for additional information about this parameter.
begin_date	Date on which the publisher wants the change set to begin capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.
end_date	Date on which the publisher wants the change set to stop capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.

Exceptions

Table 29–13 CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31407	The end_date must be greater than the begin_date
ORA-31408	Invalid value specified for begin_scn or end_scn
ORA-31437	Duplicate change set specified
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31483	Cannot have spaces in the parameter
ORA-31485	Invalid database link

Table 29–13 (Cont.) CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31487	Cannot support begin dates or end dates in this configuration
ORA-31488	Cannot support change set in this configuration
ORA-31499	Null value specified for required parameter
ORA-31503	Invalid date supplied for begin_date or end_date
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the default values for the following parameters are the only supported values for synchronous change sets: begin_date, end_date, and stop_on_ddl. The default values for the following parameters are the only supported values for asynchronous Distributed HotLog change sets: begin_date and end_date.
- When the change source is Distributed HotLog on a release of Oracle Database earlier than 10.2, Change Data Capture inserts rows into the CHANGE_PROPAGATION and CHANGE_PROPAGATION_SETS views on the staging database.
- An AutoLog online change source (created with online_log='Y') can only contain one change set.
- The begin_date and end_date parameters are optional. The publisher can specify neither of them, one of them, or both. The effect of these parameters is as follows:
  - When a begin_date is specified, changes from transactions that begin on or after that date are captured.
  - When a begin_date is not specified, capture starts with the earliest available change data.
  - When an end_date is specified, changes from transactions that are committed on or before that date are captured.
  - When an end_date is not specified, Change Data Capture continues indefinitely.
- The effect of the stop_on_ddl parameter is as follows:
  - When the stop_on_ddl parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

    Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the stop_on_ddl parameter is set to 'Y' and any of the following statements is encountered:

    * ANALYZE TABLE
    * LOCK TABLE
    * GRANT privileges to access a table

  * `REVOKE` privileges to access a table
  * `COMMENT` on a table
  * `COMMENT` on a column

  These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

– When the `stop_on_ddl` parameter is set to `'N'`, Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects capture, that change can result in a capture error.

  See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been terminated and the DDL statement that caused it to be terminated. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

CREATE_CHANGE_TABLE Procedure

This procedure creates a change table in a specified schema.

> **Note:** Oracle recommends that the publisher be certain that the source table that will be referenced in a `CREATE_CHANGE_TABLE` procedure has been created prior to calling this procedure, particularly if the change set that will be specified in the procedure has the `stop_on_ddl` parameter set to `'Y'`.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_TABLE(
     owner                  IN VARCHAR2,
     change_table_name      IN VARCHAR2,
     change_set_name        IN VARCHAR2,
     source_schema          IN VARCHAR2,
     source_table           IN VARCHAR2,
     column_type_list       IN VARCHAR2,
     capture_values         IN VARCHAR2,
     rs_id                  IN CHAR,
     row_id                 IN CHAR,
     user_id                IN CHAR,
     timestamp              IN CHAR,
     object_id              IN CHAR,
     source_colmap          IN CHAR,
     target_colmap          IN CHAR,
     options_string         IN VARCHAR2,
     ddl_markers            IN CHAR  DEFAULT 'Y');
```

Parameters

Table 29–14 CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description
`owner`	Name of the schema that owns the change table.
`change_table_name`	Name of the change table that is being created. Change table names follow the Oracle schema object naming rules.
`change_set_name`	Name of the change set in which this change table resides.
`source_schema`	The schema where the source table is located.
`source_table`	The source table from which the change records are captured.
`column_type_list`	The user columns and datatypes that are being tracked. Specify using a comma-delimited list.
`capture_values`	One of the following capture values for update operations: ■ `OLD`: Captures the original values from the source table. ■ `NEW`: Captures the changed values from the source table. ■ `BOTH`: Captures the original and changed values from the source table.

Table 29–14 (Cont.) CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description
rs_id row_id user_id timestamp object_id source_colmap target_colmap ddl_markers	Each listed parameter specifies a particular control column as follows: ■ The rs_id parameter specifies the RSID$ control column. ■ The row_id parameter specifies the ROW_ID$ control column. ■ The user_id parameter specifies the USERNAME$ control column. ■ The timestamp parameter specifies the TIMESTAMP$ control column. ■ The object_id parameter specifies the SYS_NC_OID$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP$ control column. ■ The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. There are three values: DDLOPER$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$) to get the name of the DDL operation.) DDLDESC$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN$ is not used in this release. Each parameter can have a value of 'Y' or 'N', where: ■ 'Y': Adds the specified control column to the change table. ■ 'N': Does not add the specified control column to the change table.
options_string	The syntactically correct options to be passed to a CREATE TABLE DDL statement. The options string is appended to the generated CREATE TABLE DDL statement after the closing parenthesis that defines the columns of the table. See the Usage Notes for more information.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns

Exceptions

Table 29–15 CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31402	Unrecognized parameter specified
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column *control-column-name*
ORA-31418	Specified source schema does not exist
ORA-31419	Specified source table does not exist
ORA-31420	Unable to submit the purge job

Table 29–15 (Cont.) CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Owner schema does not exist
ORA-31438	Duplicate change table
ORA-31447	Cannot create change tables in the SYS schema
ORA-31450	Invalid value for change_table_name
ORA-31451	Invalid value for capture_values, expecting: OLD, NEW, or BOTH
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31467	No column found in the source table
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- A change table is a database table that contains the change data resulting from DML statements (INSERT, UPDATE, and DELETE) made to a source table. A given change table can capture changes from only one source table.
- A change table is a database table that contains two types of columns:
  - User columns, which are copies of actual columns of source tables that reside in the change table.
  - Control columns, which maintain special metadata for each change row in the change table. Information such as the DML operation performed, the capture time (time stamp), and changed column vectors are examples of control columns. The publisher must not specify the name of the control columns in the user column list.
- If there are multiple publishers on the staging database for the Distributed HotLog mode of Change Data capture, and one publisher defines a change table in another publisher's Distributed HotLog change set, then Change Data Capture uses the database link established by the publisher who created the change set to access the source database. Therefore, the database link to the source database established by the publisher who created the change set must be intact for the change table to be successfully created. If the change set publisher's database link is not present when creating a change table, an error is returned indicating that the connection description for the remote database was not found.
- The publisher must not attempt to control a change table's partitioning properties. Change Data Capture automatically manages the change table partitioning as part of its change table management.
- When creating a change table for any mode of asynchronous Change Data Capture, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode of Change Data Capture, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.

- When the publisher specifies the `rs_id` parameter, the `RSID$` column is added to the change table. The `RSID$` column value reflects an operation's capture order within a transaction, but not across transactions. The publisher cannot use the `RSID$` column value by itself to order committed operations across transactions; it must be used in conjunction with the `CSCN$` column value.
- The publisher can control a change table's physical properties, tablespace properties, and so on, by specifying the `options_string` parameter. With the `options_string` parameter, the publisher can set any option that is valid for the `CREATE TABLE` DDL statement (except for partitioning properties).

  Note: How the publisher defines the `options_string` parameter can have an effect on the performance and operations in a Change Data Capture system. For example, if the publisher places several constraints in the options column, it can have a noticeable effect on performance. Also, if the publisher uses `NOT NULL` constraints and a particular column is not changed in an incoming change row, then the constraint can cause the `INSERT` operation to fail and the transaction that contains the `INSERT` operation to be rolled back.

- Oracle recommends that change tables not be created in system tablespaces. This can be accomplished if the publisher's default tablespace is not the system tablespace or if the publisher specifies a tablespace in the `options_string` parameter. If a tablespace is not specified by the publisher, and the publisher's default table space is the system tablespace, then Change Data Capture creates change tables in the system tablespace.

  See Also: *Oracle Database Data Warehousing Guide* for more information on, and examples of, creating change tables in tablespaces managed by the publisher.

CREATE_HOTLOG_CHANGE_SOURCE Procedure

This procedure creates a Distributed HotLog change source on the source database when the publisher runs this procedure from the staging database. A Distributed HotLog change source is based on data in the online redo log files that is automatically transferred to the staging database by Oracle Streams propagation.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_HOTLOG_CHANGE_SOURCE(
     change_source_name     IN VARCHAR2,
     description            IN VARCHAR2 DEFAULT NULL,
     source_database        IN VARCHAR2);
```

Parameters

Table 29–16 CREATE_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameters	Description
change_source_name	Name of the Distributed HotLog change source to be created. Each change source name must be unique and must follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	The name of the database link defined from the staging database to the source database, where the source database is Oracle9*i* Database, Database 10*g* Release 1, Oracle Database 10*g* Release 2, or Oracle Database 11g Release 1. See *Oracle Database Data Warehousing Guide* for information on creating database links for the Distributed HotLog mode of Change Data Capture.

Exceptions

Table 29–17 CREATE_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source
ORA-31480	Staging database and source database cannot be the same
ORA-31483	Cannot have spaces in the parameter
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31507	Parameter value longer than the maximum length
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- The publisher can use this procedure for the asynchronous Distributed HotLog mode of Change Data Capture only.

  This procedure cannot be used to create a change source for the asynchronous HotLog mode of Change Database Capture. The publisher must use the

predefined change source, HOTLOG_SOURCE, for the asynchronous HotLog mode of Change Data Capture.

- A Distributed HotLog change source can contain one or more change sets, but they must all be on the same staging database.
- A staging database publisher cannot create multiple Distributed HotLog change sources with the same name, even when those change sources are on different source databases.
- When the publisher creates a change source on a release of Oracle Database earlier than 10.2, Change Data Capture:
  - Generates names for the Streams capture process, capture queue, and propagation based on the change source name. If a generated name is already in use, an error indicating that the capture process, queue, or propagation cannot be created is returned.
  - Inserts a row into the `CHANGE_SOURCES` view on the staging database where the `SOURCE_TYPE` column of the inserted row indicates that the source Oracle Database release is earlier than 10.2.
- Note that the database link indicated by the `source_database` parameter must exist when creating, altering, or dropping a Distributed HotLog change source and the change sets and change tables it contains. However, this database link is not required for change capture to occur. Once the required Distributed HotLog change sources, change sets and change tables are in place and enabled, this database link can be dropped without interrupting change capture. This database link would need to be recreated to create, alter, or drop Distributed HotLog change sources, change sets and change tables.

DROP_CHANGE_SET Procedure

This procedure drops an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SET(
     change_set_name     IN VARCHAR2);
```

Parameters

Table 29–18 DROP_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set to be dropped. Change set names follow the Oracle schema object naming rules.

Exceptions

Table 29–19 DROP_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31411	Specified change set is referenced by a change table
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value is longer than maximum length

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The change set to be dropped cannot contain any change tables.
- The predefined synchronous change set, SYNC_SET, cannot be dropped.

DROP_CHANGE_SOURCE Procedure

This procedure drops an existing AutoLog change source that was created with the CREATE_AUTOLOG_CHANGE_SOURCE procedure or an existing Distributed HotLog change source that was created with the CREATE_HOTLOG_CHANGE_SOURCE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SOURCE(
     change_source_name    IN VARCHAR2);
```

Parameters

Table 29–20 DROP_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source to be dropped. Change source names follow the Oracle schema object naming rules.

Exceptions

Table 29–21 DROP_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31406	Specified change source is referenced by a change set
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

Usage Notes

- The change source to be dropped cannot contain any change sets.
- The predefined change sources, HOTLOG_SOURCE and SYNC_SOURCE, cannot be dropped.

DROP_CHANGE_TABLE Procedure

This procedure drops an existing change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_TABLE(
     owner              IN VARCHAR2,
     change_table_name  IN VARCHAR2,
     force_flag         IN CHAR);
```

Parameters

Table 29–22 DROP_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Name of the schema that owns the change table.
change_table_name	Name of the change table to be dropped. Change table names follow the Oracle schema object naming rules.
force_flag	Drops the change table, depending on whether or not there are subscriptions to it, as follows: ■ 'Y': Drops the change table even if there are subscriptions to it. ■ 'N': Drops the change table only if there are no subscriptions to it.

Exceptions

Table 29–23 DROP_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31424	Change table has active subscriptions
ORA-31441	Table is not a change table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- If the publisher wants to drop a change table while there are active subscriptions to that table, he or she must call the DROP_CHANGE_TABLE procedure using the force_flag => 'Y' parameter. This tells Change Data Capture to override its normal safeguards and allow the change table to be dropped despite active subscriptions. The subscriptions that include the dropped table will no longer be valid, and subscribers will lose access to the change data.

DROP_SUBSCRIPTION Procedure

This procedure allows a publisher to drop a subscription that was created by a subscriber with a prior call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION(
     subscription_name  IN VARCHAR2);
```

Parameters

Table 29–24 DROP_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	Name of the subscription that was specified by a previous call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 29–25 DROP_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31432	Invalid source table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- This procedure works the same way as the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.
- This procedure provides the publisher with a way to drop subscriptions that have not been dropped by the subscriber. It is possible that a subscription that is no longer needed still exists and is holding change data in a change table indefinitely. The publisher can use this procedure to remove such a subscription so that a purge operation can clean up its change data. Oracle recommends that the publisher attempt to verify that the subscription is not needed prior to dropping it. If that is not possible, the publisher should inform the subscription owner that the subscription has been dropped. Ideally, subscribers drop subscriptions that are no longer needed using the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure and the publisher need not use the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.

GET_DDLOPER Function

This function converts a binary integer into a user friendly string that describes the DDL operation that actually took place.

Syntax

```
DBMS_CDC_PUBLISH.GET_DDLOPER (ddloper IN BINARY_INTEGER)
     RETURN VARCHAR2;
```

Parameters

Table 29–26 Function Parameters

Parameter	Description
ddloper	An integer value representing what DDL operation actually occurred. This value is obtained from the ddloper$ column in the subscriber's view.

Example

The following illustrates how to use change markers. First, you execute a DDL statement and then verify that it has been captured.

```
ALTER TABLE cdc_psales DROP PARTITION Dec_06;

SELECT ddloper$, DECODE(ddloper$, NULL, 'NULL',
       DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$))
          AS DDL_OPER
FROM cdc_psales_act
WHERE DDLOPER$ IS NOT NULL
ORDER BY cscn$;

ddloper$            DDL_OPER
---------------------------------
512                 Drop Partition
1 row selected.

SELECT ddldesc$
FROM cdc_psales_act
WHERE ddloper$
IS NOT NULL
ORDER BY cscn;

DDLDESC$
------------------------
alter table cdc_psales drop partition Dec_06
1 row selected.
```

Usage Notes

- If an invalid value for ddloper is given, then 'Invalid value for DDLOPR$' will be returned by this function.
- This function only works for asynchronous Change Data Capture.

PURGE Procedure

This procedure monitors change table usage by all subscriptions, determines which rows are no longer needed by any subscriptions, and removes the unneeded rows to prevent change tables from growing indefinitely. When called, this procedure purges all change tables on the staging database.

Syntax

```
DBMS_CDC_PUBLISH.PURGE;
```

Exceptions

Only standard Oracle exceptions (for example, a privilege violation) are returned during a purge operation.

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually or automatically:
  - The publisher can run this procedure manually from the command line to purge data from change tables.
  - The publisher can run this procedure in a script to routinely perform a purge operation and control the growth of change tables.
- Note that the `DBMS_CDC_PUBLISH.PURGE` procedure (used by the publisher and the Change Data Capture default purge job) is distinct from the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure (used by subscribers). A call to the `DBMS_CDC_PUBLISH.PURGE` procedure physically removes unneeded rows from change tables. A call to the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_SET Procedure

This procedure removes unneeded rows from all change tables in the named change set. This procedure allows a finer granularity purge operation than the basic PURGE procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_SET(
    change_set_name IN VARCHAR2,
    force           IN CHAR DEFAULT 'Y',
    purge_date      IN DATE DEFAULT NULL);
```

Parameters

Table 29–27 PURGE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
force	If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.
purge_date	All records that have a commit_timestamp of less than or equal to this date will be purged.

Exceptions

Table 29–28 PURGE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Change set is not an existing change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from change tables in a specific change set.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure physically removes unneeded rows from change tables in the specified change set. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_TABLE Procedure

This procedure removes unneeded rows from the named change table. This procedure allows a finer granularity purge operation than the basic PURGE procedure or the PURGE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE(
     owner               IN VARCHAR2,
     change_table_name   IN VARCHAR2,
     force               IN CHAR DEFAULT 'Y',
     purge_date          IN DATE DEFAULT NULL);
```

Parameters

Table 29–29 PURGE_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the named change table.
change_table_name	Name of an existing change table. Change table names follow the Oracle schema object naming rules.
force	If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.
purge_date	All records that have a commit_timestamp of less than or equal to this date will be purged.

Exceptions

Table 29–30 PURGE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from a specified change table.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure physically removes unneeded rows from the specified change table. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

30

DBMS_CDC_SUBSCRIBE

The DBMS_CDC_SUBSCRIBE package, one of a set of Change Data Capture packages, lets subscribers view and query change data that was captured and published with the DBMS_CDC_PUBLISH package.

A Change Data Capture system usually has one publisher and many subscribers. The **subscribers** (applications or individuals), use the Oracle supplied package, DBMS_CDC_SUBSCRIBE, to access published data.

> **See Also:** *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture.

This chapter contains the following topics:

- Using DBMS_CDC_SUBSCRIBE
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Views
- Summary of DBMS_CDC_SUBSCRIBE Subprograms

Using DBMS_CDC_SUBSCRIBE

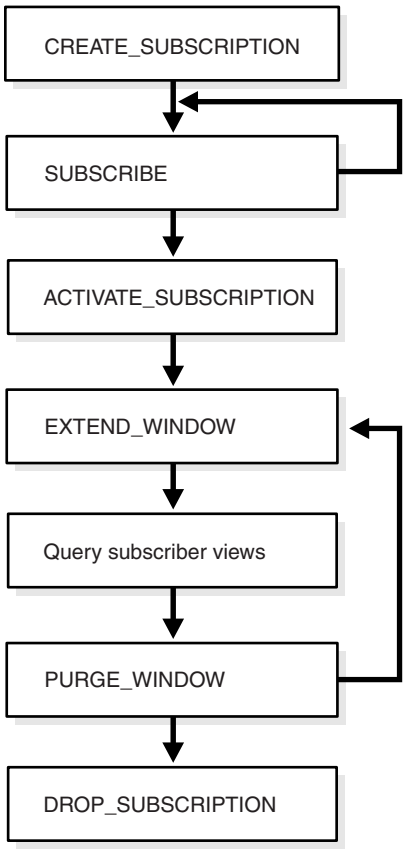
This section contains the following topics, which relate to using the `DBMS_CDC_SUBSCRIBE` package:

- Overview
- Deprecated Subprograms
- Security Model
- Views

Overview

The primary role of the subscriber is to use the change data. Through the DBMS_CDC_SUBSCRIBE package, each subscriber registers interest in source tables by subscribing to them.

Once the publisher sets up the system to capture data into change tables (which are viewed as publications by subscribers) and grants subscribers access to the change tables, subscribers can access and query the published change data for any of the source tables of interest. Using the subprograms in the DBMS_CDC_SUBSCRIBE package, the subscriber accomplishes the following main objectives:



1. Indicates the change data of interest by creating a subscription and associated subscriber views on published source tables and source columns
2. Activates the subscription to indicate that the subscriber is ready to receive change data
3. Extends the subscription window to receive a new set of change data
4. Uses SQL SELECT statements to retrieve change data from the subscriber views
5. Purges the subscription window when finished processing a block of changes
6. Drops the subscription when finished with the subscription

Figure 30–1 provides a graphical flowchart of the order in which subscribers most typically use the subprograms in the DBMS_CDC_SUBSCRIBE package (which are listed in Table 30–1). A subscriber would typically create a subscription, subscribe to one or more source tables and columns, activate the subscription, extend the subscription window, query the subscriber views, purge the subscription window, and then either extend the subscription window again or drop the subscription.

Note: If a subscriber uses the PURGE_WINDOW procedure immediately after using an EXTEND_WINDOW procedure, then change data may be lost without ever being processed.

See Also: Chapter 29, "DBMS_CDC_PUBLISH" for information on the package for publishing change data.

Figure 30–1 Subscription Flow

Deprecated Subprograms

The following subprograms are deprecated with Oracle Database 11*g*:

- `DROP_SUBSCRIBER_VIEW`

  Subscribers no longer need to drop subscriber views. This work is now done automatically by Change Data Capture.

- `GET_SUBSCRIPTION_HANDLE`

  Subscribers no longer explicitly specify subscription handles. Subscribers should use the `CREATE_SUBSCRIPTION` procedure instead to specify a subscription name.

- `PREPARE_SUBSCRIBER_VIEW`

  Subscribers no longer need to prepare subscriber views. This work is now done automatically by Change Data Capture.

Security Model

Change Data Capture grants `EXECUTE` privileges to `PUBLIC` on the `DBMS_CDC_SUBSCRIBE` package.

Views

The DBMS_CDC_SUBSCRIBE package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_SUBSCRIBE Subprograms

Table 30–1 DBMS_CDC_SUBSCRIBE Package Subprograms

Subprogram	Description
ACTIVATE_SUBSCRIPTION Procedure on page 30-9	Indicates that a subscription is ready to start accessing change data
CREATE_SUBSCRIPTION Procedure on page 30-10	Creates a subscription and associates it with one change set
DROP_SUBSCRIPTION Procedure on page 30-12	Drops a subscription that was created with a prior call to the `CREATE_SUBSCRIPTION` procedure
EXTEND_WINDOW Procedure on page 30-13	Sets a subscription window high boundary so that new change data can be seen
PURGE_WINDOW Procedure on page 30-15	Sets the low boundary for a subscription window to notify Change Data Capture that the subscriber is finished processing a set of change data
SUBSCRIBE Procedure on page 30-16	Specifies a source table and the source columns for which the subscriber wants to access change data and specifies the subscriber view through which the subscriber sees change data for the source table

ACTIVATE_SUBSCRIPTION Procedure

This procedure indicates that a subscription is ready to start accessing change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.ACTIVATE_SUBSCRIPTION (
     subscription_name  IN VARCHAR2);
```

Parameters

Table 30–2 ACTIVATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 30–3 ACTIVATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The ACTIVATE_SUBSCRIPTION procedure indicates that the subscriber is finished subscribing to tables, and the subscription is ready to start accessing change data.
- Once the subscriber activates the subscription:
  - No additional source tables can be added to the subscription.
  - Change Data Capture holds the available data for the source tables and sets the subscription window to empty.
  - The subscriber must use the EXTEND_WINDOW procedure to see the initial set of change data.
  - The subscription cannot be activated again.
- A subscription cannot be activated if the underlying change set has reached its end_date parameter value.

CREATE_SUBSCRIPTION Procedure

This procedure creates a subscription that is associated with one change set. This procedure replaces the deprecated GET_SUBSCRIPTION_HANDLE procedure.

Syntax

```
DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION (
     change_set_name      IN  VARCHAR2,
     description          IN  VARCHAR2,
     subscription_name    IN  VARCHAR2);
```

Parameters

Table 30–4 CREATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
change_set_name	The name of an existing change set to which the subscriber subscribes
description	A description of the subscription (which might include, for example, the purpose for which it is used). The description must be specified using 255 or fewer characters.
subscription_name	A unique name for a subscription that must consist of 30 characters or fewer and cannot have a prefix of CDC$. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 30–5 CREATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31449	Invalid value for change_set_name
ORA-31457	Maximum length of description field exceeded
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31506	Duplicate subscription name specified
ORA-31510	Name uses reserved prefix CDC$
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The CREATE_SUBSCRIPTION procedure allows a subscriber to register interest in a change set associated with source tables of interest.
- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source tables for which the subscriber has privileges and the change sets in which the source table columns are published.
- Subscriptions are not shared among subscribers; rather, each subscription name is validated against a given subscriber's login ID.

- Subscriptions cannot be created if the underlying change set has reached its `end_date` parameter value.

DROP_SUBSCRIPTION Procedure

This procedure drops a subscription.

Syntax

```
DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION (
     subscription_name  IN VARCHAR2);
```

Parameters

Table 30–6 DROP_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 30–7 DROP_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist

Usage Notes

Subscribers should be diligent about dropping subscriptions that are no longer needed so that change data will not be held in the change tables unnecessarily.

EXTEND_WINDOW Procedure

This procedure sets the subscription window high boundary so that new change data can be seen.

Syntax

```
DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW (
     subscription_name  IN VARCHAR2,
     upper_bound        IN DATE DEFAULT NULL);
```

Parameters

Table 30–8 EXTEND_WINDOW Procedure Parameters

Parameter	Description
subscription_name	The unique name of the subscription that was specified by a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
upper_bound	A date/timestamp to move the upper bound of the subscription window to.

Exceptions

Table 30–9 EXTEND_WINDOW Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31509	Publication does not exist
ORA-31514	Change set disabled due to capture error

Usage Notes

- Until the subscriber calls the EXTEND_WINDOW procedure to begin receiving change data, the subscription window remains empty.
  - The first time that the subscriber calls the EXTEND_WINDOW procedure, it establishes the initial boundaries for the subscription window.
  - Subsequent calls to the EXTEND_WINDOW procedure extend the high boundary of the subscription window so that new change data can be seen.
- Oracle recommends that subscribers not view change tables directly. Instead, subscribers should use the DBMS_CDC_SUBSCRIBE package and access data through subscriber views only. Control column values are guaranteed to be consistent only when viewed through subscriber views that have been updated with a call to the EXTEND_WINDOW procedure.

- When the underlying change set for a subscription has reached its `end_date` parameter value, subsequent calls to the `EXTEND_WINDOW` procedure will not raise the high boundary.

PURGE_WINDOW Procedure

This procedure sets the low boundary of the subscription window so that the subscription no longer sees any change data, effectively making the subscription window empty. The subscriber calls this procedure to notify Change Data Capture that the subscriber is finished processing a block of change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.PURGE_WINDOW (
     subscription_name   IN VARCHAR2,
     lower_bound         IN DATE DEFAULT NULL);
```

Parameters

Table 30–10 PURGE_WINDOW Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
lower_bound	A date/timestamp to move the lower bound of the subscription window to.

Exceptions

Table 30–11 PURGE_WINDOW Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- When finished with a set of changes, the subscriber purges the subscription window with the PURGE_WINDOW procedure. By this action, the subscriber performs the following functions:
  - Informs Change Data Capture that the subscriber is finished with the current set of change data.
  - Enables Change Data Capture to remove change data that is no longer needed by any subscribers.

  Change Data Capture manages the change data to ensure that it is available as long as there are subscribers who need it.
- When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the PURGE_WINDOW procedure will not move the low boundary.

SUBSCRIBE Procedure

This procedure specifies a source table and the source columns for which the subscriber wants to access change data. In addition, it specifies the subscriber view through which the subscriber sees change data for the source table.

Syntax

There are two versions of syntax for the SUBSCRIBE procedure, as follow:

- Using source schema and source table

  When this syntax is used, Change Data Capture will attempt to find a single publication ID that contains the specified source_table and column_list. If such a publication cannot be found, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
     subscription_name    IN VARCHAR2,
     source_schema        IN VARCHAR2,
     source_table         IN VARCHAR2,
     column_list          IN VARCHAR2,
     subscriber_view      IN VARCHAR2);
```

- Using publication IDs

  When this syntax is used, Change Data Capture will use the publication ID to identify the change table. If the columns specified in the column_list parameter are not in the identified change table, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
   subscription_name    IN VARCHAR2,
   publication_id       IN NUMBER,
   column_list          IN VARCHAR2,
   subscriber_view      IN VARCHAR2);
```

Parameters

Table 30–12 SUBSCRIBE Procedure Parameters

Parameter	Description
subscription_name	The name of a subscription that was specified for, or returned by, a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
source_schema	The name of the schema where the source table resides
source_table	The name of a published source table
column_list	A comma-delimited list of columns from the published source table or publication
subscriber_view	Unique name for the subscriber view for this source table or publication that must consist of 30 or fewer characters and must not have a prefix of CDC$. Subscriber view names follow the Oracle schema object naming rules.
publication_id	A valid publication_id, which the subscriber can obtain from the ALL_PUBLISHED_COLUMNS view.

Exceptions

Table 30–13 SUBSCRIBE Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31427	Specified source table already subscribed
ORA-31428	No publication contains all the specified columns
ORA-31432	Invalid source table
ORA-31466	No publications found
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31510	Name uses reserved prefix CDC$
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The SUBSCRIBE procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the SUBSCRIBE procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the SUBSCRIBE procedure to include multiple source tables or publications IDs in a subscription.
- If the columns of interest are all in a single publication, the subscriber can call the SUBSCRIBE procedure using the source_schema and source_table parameters or using the publication_id parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the SUBSCRIBE procedure using the publication_id parameter.
- The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the ALL_PUBLISHED_COLUMNS view.
- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source table columns accessible to the subscriber.
- Subscriptions must be created before a subscriber calls the SUBSCRIBE procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.
- Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the SUBSCRIBE procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.
- All specified source tables or publications must be in the change set that is associated with the named subscription.
- A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.

- Each publication in a subscription has its own subscriber view. Subscriber views are used to query the change data encompassed by the subscription's current window. Subscriber views are created in the schema of the subscriber.
- A subscriber cannot subscribe to a publication within a change set that has reached its `end_date` parameter value.

DBMS_COMPARISON

The DBMS_COMPARISON package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- Using DBMS_COMPARISON
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- Data Structures
- Summary of DBMS_COMPARISON Subprograms

See Also:

- *Oracle Streams Replication Administrator's Guide* for information about using the advanced features of this package

Using DBMS_COMPARISON

This section contains topics which relate to using the `DBMS_COMPARISON` package.

- Overview
- Security Model
- Constants
- Views
- Operational Notes

Overview

The DBMS_COMPARISON package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the DBMS_COMPARISON package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the CREATE_COMPARE procedure in this package to create a **comparison**. The comparison identifies the database objects to compare and specifies parameters for the comparison.
2. Run the COMPARE function in this package to compare the database object at the two databases and identify differences. This function returns TRUE when no differences are found and FALSE when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the COMPARE function.
3. If you want to examine the comparison results, query the following data dictionary views:
   - DBA_COMPARISON_SCAN
   - USER_COMPARISON_SCAN
   - DBA_COMPARISON_SCAN_SUMMARY
   - USER_COMPARISON_SCAN_SUMMARY
   - DBA_COMPARISON_SCAN_VALUES
   - USER_COMPARISON_SCAN_VALUES
   - DBA_COMPARISON_ROW_DIF
   - USER_COMPARISON_ROW_DIF
4. If there are differences, and you want to synchronize the database objects at the two databases, then run the CONVERGE procedure in this package.

After you create a comparison with the CREATE_COMPARISON procedure in the DBMS_COMPARISON package, you can run the comparison at any time using the COMPARE function. Each time you run the COMPARE function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the RECHECK function.

The comparison results for a single execution of the COMPARE function can include one or more **scans**. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.

A **bucket** is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the COMPARE function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the **parent scan** of each scan that analyzes the smaller buckets into which the larger bucket was split. The **root scan** in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the RECHECK function, and you can converge a scan using the CONVERGE procedure. When you want to recheck or converge all of the rows comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about comparisons, including detailed information about scans, buckets, parent scans, and root scans

Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS_COMPARISON package has a comparison_name parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS_COMPARISON package.

To run the COMPARE function, RECHECK function, or CONVERGE procedure, the following users must have SELECT privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

Constants

The DBMS_COMPARISON package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_COMPARISON.CMP_SCAN_MODE_FULL.

Table 31–1 lists the parameters and enumerated constants.

Table 31–1 DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
comparison_mode	■ CMP_COMPARE_MODE_OBJECT	VARCHAR2(30)	CMP_COMPARE_MODE_OBJECT is a database object. This constant can be specified as 'OBJECT'.
scan_mode	■ CMP_SCAN_MODE_FULL ■ CMP_SCAN_MODE_RANDOM ■ CMP_SCAN_MODE_CYCLIC ■ CMP_SCAN_MODE_CUSTOM	VARCHAR2(30)	CMP_SCAN_MODE_FULL indicates that the entire database object is compared. This constant can be specified as 'FULL'. CMP_SCAN_MODE_RANDOM indicates that a random portion of the database object is compared. This constant can be specified as 'RANDOM'. CMP_SCAN_MODE_CYCLIC indicates that a portion of the database object is compared when you perform a single comparison. When you compare the database object again, another portion of the database object is compared, starting where the last comparison ended. This constant can be specified as 'CYCLIC'. CMP_SCAN_MODE_CUSTOM indicates that the user who runs the subprogram specifies the range to compare in the database object. This constant can be specified as 'CUSTOM'.
converge_options	■ CMP_CONVERGE_LOCAL_WINS ■ CMP_CONVERGE_REMOTE_WINS	VARCHAR2(30)	CMP_CONVERGE_LOCAL_WINS indicates that the column values at the local database replace the column values at the remote database when these column values are different. This constant can be specified as 'LOCAL'. CMP_CONVERGE_REMOTE_WINS indicates that the column values at the remote database replace the column values at the local database when these column values are different. This constant can be specified as 'REMOTE'.

Table 31–1 (Cont.) DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
null_value	■ CMP_NULL_VALUE_DEF	VARCHAR2(100)	CMP_NULL_VALUE_DEF indicates that ORA$STREAMS$NV is substituted for NULL values in database objects during comparison. This constant can be specified as 'ORA$STREAMS$NV'.
max_num_buckets	■ CMP_MAX_NUM_BUCKETS	INTEGER	CMP_MAX_NUM_BUCKETS indicates that the maximum number of buckets is 1,000. This constant can be specified as 1000.
min_rows_in_bucket	■ CMP_MIN_ROWS_IN_BUCKET	INTEGER	CMP_MIN_ROWS_IN_BUCKET indicates that the minimum number of rows in a bucket is 10,000. This constant can be specified as 10000.

Views

The DBMS_COMPARISON package uses the following views:

- DBA_COMPARISON
- USER_COMPARISON
- DBA_COMPARISON_COLUMNS
- USER_COMPARISON_COLUMNS
- DBA_COMPARISON_SCAN
- USER_COMPARISON_SCAN
- DBA_COMPARISON_SCAN_SUMMARY
- USER_COMPARISON_SCAN_SUMMARY
- DBA_COMPARISON_SCAN_VALUES
- USER_COMPARISON_SCAN_VALUES
- DBA_COMPARISON_ROW_DIF
- USER_COMPARISON_ROW_DIF

Operational Notes

This section contains the following operational notes for the DBMS_COMPARISON package:

- Oracle Database Release Requirements for the DBMS_COMPARISON Package
- Database Character Set Requirements for the DBMS_COMPARISON Package
- Database Object Requirements for the DBMS_COMPARISON Package
- Index Column Requirements for the DBMS_COMPARISON Package
- Datatype Requirements for the DBMS_COMPARISON Package
- Only Converge Rows That Are Not Being Updated

Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS_COMPARISON package:

- The local database that runs the subprograms in the DBMS_COMPARISON package must be an Oracle Database 11*g* Release 1 (11.1) database.
- The remote database must be an Oracle Database 10*g* Release 1 (10.1) or later database. Oracle databases prior to this release and non-Oracle databases are not supported.

Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

> **See Also:** *Oracle Database Globalization Support Guide* for information about database character sets

Database Object Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the DBMS_COMPARISON package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the datatypes of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the columns that exist in both database objects.

See Also: CREATE_COMPARISON Procedure on page 31-20

Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following datatypes:

- Number columns are of the following datatypes: NUMBER, FLOAT, BINARY_FLOAT, and BINARY_DOUBLE.
- Timestamp columns are of the following datatypes: TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE
- Interval columns are of the following datatypes: INTERVAL YEAR TO MONTH and INTERVAL DAY TO SECOND.

For all scan modes to be supported by the DBMS_COMPARISON package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or DATE datatype column
- A composite index that only includes number, timestamp, interval, or DATE datatype columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

For the scan modes CMP_SCAN_MODE_FULL and CMP_SCAN_MODE_CUSTOM to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, DATE, VARCHAR2, or CHAR datatype column
- A composite index that only includes number, timestamp, interval, DATE, VARCHAR2, or CHAR columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the DBMS_COMPARISON package does not support the database objects. For example, if the database objects only have a single index on an NVARCHAR2 column, then the DBMS_COMPARISON package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a NUMBER column and an NCHAR column, then the DBMS_COMPARISON package does not support them.

You can specify an index when you create a comparison using the index_schema_name and index_name parameters in the CREATE_COMPARISON procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint
- A unique constraint on one or more non-NULL columns

If these constraints are not present on a table, then use the index_schema_name and index_name parameters in the CREATE_COMPARISON procedure to specify an index whose columns satisfy this requirement.

The DBMS_COMPARISON package can use an index only if all of the columns in the index are included in the column_list parameter when the comparison is created with the CREATE_COMPARISON procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
  WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
        INDEX_COLUMN    = 'Y';
```

If there is more than one index column, then the index column with `1` for the `COLUMN_POSITION` is the lead index column in the composite index.

See Also:

- "Constants" on page 31-6 for information about scan modes
- CREATE_COMPARISON Procedure on page 31-20 for information about specifying an index for a comparison

Datatype Requirements for the DBMS_COMPARISON Package

The `DBMS_COMPARISON` package can compare data in columns of the following datatypes:

- `VARCHAR2`
- `NVARCHAR2`
- `NUMBER`
- `FLOAT`
- `DATE`
- `BINARY_FLOAT`
- `BINARY_DOUBLE`
- `TIMESTAMP`
- `TIMESTAMP WITH TIME ZONE`
- `TIMESTAMP WITH LOCAL TIME ZONE`
- `INTERVAL YEAR TO MONTH`
- `INTERVAL DAY TO SECOND`
- `RAW`
- `CHAR`
- `NCHAR`

If a column with datatype `TIMESTAMP WITH LOCAL TIME ZONE` is compared, then the two databases must use the same time zone. Also, if a column with datatype `NVARCHAR2` or `NCHAR` is compared, then the two databases must use the same national character set.

The `DBMS_COMPARISON` package cannot compare data in columns of the following datatypes:

- `LONG`
- `LONG RAW`
- `ROWID`
- `UROWID`
- `CLOB`

- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFs, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the supported columns in a shared database object.

See Also:

- CREATE_COMPARISON Procedure on page 31-20
- *Oracle Database SQL Language Reference* for more information about datatypes
- *Oracle Database Globalization Support Guide* for information about national character sets

Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have already been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

Attention: If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the CONVERGE procedure is run.

See Also: *Oracle Streams Replication Administrator's Guide* for information about the DBMS_COMPARISON package in an Oracle Streams replication environment

Data Structures

The DBMS_COMPARISON package defines a RECORD type.

RECORD Types

- COMPARISON_TYPE Record Type

COMPARISON_TYPE Record Type

Contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

> **Note:** The COMPARE function only returns a value for the scan_id field.

Syntax

```
TYPE COMPARISON_TYPE IS RECORD(
  scan_id            NUMBER,
  loc_rows_merged    NUMBER,
  rmt_rows_merged    NUMBER,
  loc_rows_deleted   NUMBER,
  rmt_rows_deleted   NUMBER);
```

Fields

Table 31–2 COMPARISON_TYPE Attributes

Field	Description
scan_id	The scan ID of the scan
loc_rows_merged	The number of rows in the local database object updated with information from the database object at the remote site
rmt_rows_merged	The number of rows in the database object updated at the remote site with information from the database object at the local site
loc_rows_deleted	The number of rows deleted from the local database object
rmt_rows_deleted	The number of rows deleted from the remote database object

Summary of DBMS_COMPARISON Subprograms

Table 31–3 DBMS_COMPARISON Package Subprograms

Subprogram	Description
COMPARE Function on page 31-16	Performs the specified comparison
CONVERGE Procedure on page 31-18	Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan
CREATE_COMPARISON Procedure on page 31-20	Creates a comparison
DROP_COMPARISON Procedure on page 31-24	Drops a comparison
PURGE_COMPARISON Procedure on page 31-25	Purges the comparison results, or a subset of the comparison results, for a comparison
RECHECK Function on page 31-26	Rechecks the differences in a specified scan for a comparison

COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the CREATE_COMPARISON procedure.

See Also:

- "Overview" on page 31-3
- CREATE_COMPARISON Procedure on page 31-20

Syntax

```
DBMS_COMPARISON.COMPARE(
   comparison_name  IN   VARCHAR2,
   scan_info        OUT  COMPARISON_TYPE,
   min_value        IN   VARCHAR2   DEFAULT NULL,
   max_value        IN   VARCHAR2   DEFAULT NULL,
   perform_row_dif  IN   BOOLEAN    DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 31–4 COMPARE Function Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_info	Information about the compare operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type on page 31-14.
min_value	When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 31-10. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See Constants on page 31-6 for information about scan modes.

Table 31–4 (Cont.) COMPARE Function Parameters

Parameter	Description
max_value	When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the maximum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 31-10. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See Constants on page 31-6 for information about scan modes.
perform_row_dif	If TRUE, then compares each row individually in the database object being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See "Overview" on page 31-3 for information about buckets.

Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.

CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

Syntax

```
DBMS_COMPARISON.CONVERGE(
   comparison_name      IN   VARCHAR2,
   scan_id              IN   NUMBER,
   scan_info            OUT  COMPARISON_TYPE,
   converge_options     IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
   perform_commit       IN   BOOLEAN   DEFAULT TRUE,
   local_converge_tag   IN   RAW       DEFAULT NULL,
   remote_converge_tag  IN   RAW       DEFAULT NULL);
```

Parameters

Table 31–5 CONVERGE Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_id	The identifier for the scan that contains the differences between the database objects being converged. See "Overview" on page 31-3 for more information about specifying a scan ID in this parameter.
scan_info	Information about the converge operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type on page 31-14.
converge_options	Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant. See "Constants" on page 31-6 for information about these constants.
perform_commit	If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE. If FALSE, then does not perform a COMMIT after making DML changes
local_converge_tag	The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used. See the *Oracle Streams Replication Administrator's Guide* for more information about tags.

Table 31–5 (Cont.) CONVERGE Procedure Parameters

Parameter	Description
remote_converge_tag	The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used. See the *Oracle Streams Replication Administrator's Guide* for more information about tags.

Usage Notes

If one of the database objects being converged is a read-only materialized view, then the converge_options parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The CONVERGE procedure raises an error if it tries to make changes to a read-only materialized view.

CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```
DBMS_COMPARISON.CREATE_COMPARISON(
   comparison_name      IN  VARCHAR2,
   schema_name          IN  VARCHAR2,
   object_name          IN  VARCHAR2,
   dblink_name          IN  VARCHAR2,
   index_schema_name    IN  VARCHAR2  DEFAULT NULL,
   index_name           IN  VARCHAR2  DEFAULT NULL,
   remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
   remote_object_name   IN  VARCHAR2  DEFAULT NULL,
   comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
   column_list          IN  VARCHAR2  DEFAULT '*',
   scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
   scan_percent         IN  NUMBER    DEFAULT NULL,
   null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
   local_converge_tag   IN  RAW       DEFAULT NULL,
   remote_converge_tag  IN  RAW       DEFAULT NULL,
   max_num_buckets      IN  NUMBER    DEFAULT CMP_MAX_NUM_BUCKETS,
   min_rows_in_bucket   IN  NUMBER    DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

Table 31–6 CREATE_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
schema_name	The name of the schema that contains the local database object to compare.
object_name	The name of the local database object to compare.
dblink_name	Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database. If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the remote_schema_name and remote_object_name parameters.
index_schema_name	The name of the schema that contains the index. If NULL, then the schema specified in the schema_name parameter is used.
index_name	The name of the index. If NULL, then the system determines the index columns for the comparison automatically. If the index_schema_name parameter is non-NULL, then the index_name parameter must also be non-NULL. Otherwise, an error is raised. **See Also:** "Usage Notes" on page 31-22 for more information about specifying an index

Table 31–6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
remote_schema_name	The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases. If NULL, then the schema specified in the schema_name parameter is used.
remote_object_name	The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases. If NULL, then the database object specified in the object_name parameter is used.
comparison_mode	Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.
column_list	Specify '*' to include all of the columns in the database objects being compared. To compare a subset of columns in the database objects, specify a comma-separated list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence. See "Usage Notes" on page 31-22 for information about columns that are required in the column_list parameter.
scan_mode	Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM. If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function. See "Constants" on page 31-6 for information about these constants.
scan_percent	The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run. If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored. **Note:** When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 31-10 for more information about the lead index column.

Table 31–6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
null_value	The value to substitute for each NULL in the database objects being compared. Specify a value or use the CMP_NULL_VALUE_DEF constant. If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found. See "Constants" on page 31-6 for information about this constant.
local_converge_tag	The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared. If the local_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 31-18 for more information. See the *Oracle Streams Replication Administrator's Guide* for more information about tags.
remote_converge_tag	The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being compared. If the remote_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 31-18 for more information. See the *Oracle Streams Replication Administrator's Guide* for more information about tags.
max_num_buckets	Specify the maximum number of buckets to use. Specify a value or use the CMP_MAX_NUM_BUCKETS constant. See "Constants" on page 31-6 for information about this constant. See "Overview" on page 31-3 for information about buckets. **Note:** If an index column for a comparison is a VARCHAR2 or CHAR column, then the number of buckets might exceed the value specified for the max_num_buckets parameter.
min_rows_in_bucket	Specify the minimum number of rows in each bucket. Specify a value or use the CMP_MIN_ROWS_IN_BUCKET constant. See "Constants" on page 31-6 for information about this constant. See "Overview" on page 31-3 for information about buckets.

Usage Notes

This section contains usage notes for the CREATE_COMPARISON procedure.

Usage Notes for the index_schema_name and index_name Parameters

When you specify an index for a comparison with the index_schema_name and index_name parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.

The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether or not to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in `column_list` parameter might or might not be used.

The columns in the specified index must meet the requirements described in "Index Column Requirements for the DBMS_COMPARISON Package" on page 31-10. If the index columns do not meet these requirements, then an error is raised.

Usage Notes for the column_list Parameter

When the `column_list` parameter is set to a value other than `'*'`, the following columns are required in the `column_list` parameter:

- Any columns that are required to meet the index column requirements for the `DBMS_COMPARISON` package. If the `index_name` parameter is non-`NULL`, then the columns in the specified index must be in the column list. If the `index_name` parameter is `NULL`, then see "Index Column Requirements for the DBMS_COMPARISON Package" on page 31-10.
- If you plan to use the `CONVERGE` procedure to make changes to a database object based on the comparison, then any columns in this database object that have a `NOT NULL` constraint but no default value must be included in the column list. If these columns are not included, then the `CONVERGE` procedure returns an error. See CONVERGE Procedure on page 31-18.

DROP_COMPARISON Procedure

This procedure drops a comparison.

Syntax

```
DBMS_COMPARISON.DROP_COMPARISON(
   comparison_name  IN  VARCHAR2);
```

Parameters

Table 31–7 DROP_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.

PURGE_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

> **Note:** At least one of the following parameters must be set to NULL: scan_id or purge_time. If both the scan_id and purge_time parameters are NULL, then this procedure purges all comparison results for the comparison.

Syntax

```
DBMS_COMPARISON.PURGE_COMPARISON(
   comparison_name  IN  VARCHAR2,
   scan_id          IN  NUMBER     DEFAULT NULL,
   purge_time       IN  TIMESTAMP  DEFAULT NULL);
```

Parameters

Table 31–8 PURGE_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_id	The scan ID of the scan for which results are purged. The scan ID must identify a root scan. If the scan ID does not identify a root scan, then an error is raised. When a root scan ID is specified, it is purged, and all direct and indirect child scans of the specified root scan are purged. If NULL, then no scan ID is considered when purging comparison results for the comparison. See "Overview" on page 31-3 for information about scans.
purge_time	The date before which results are purged. If NULL, then no date is considered when purging comparison results for the comparison.

RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function will continue to check the database object from the point where the previous scan ended.

Note: This function does not identify new differences in the database objects that have appeared since the specified scan was run. To identify new differences, run the `COMPARE` function in this package.

See Also:

- *Oracle Streams Replication Administrator's Guide*
- COMPARE Function on page 31-16

Syntax

```
DBMS_COMPARISON.RECHECK(
   comparison_name  IN  VARCHAR2,
   scan_id          IN  NUMBER,
   perform_row_dif  IN  BOOLEAN  DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 31–9 RECHECK Function Parameters

Parameter	Description
`comparison_name`	The name of the comparison.
`scan_id`	The scan ID of the scan to recheck. See "Overview" on page 31-3 for more information about specifying a scan ID in this parameter.
`perform_row_dif`	If `TRUE`, then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison. If `FALSE`, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See "Overview" on page 31-3 for information about buckets.

Return Values

This function returns `TRUE` when differences are found in the database objects being compared. This function returns `FALSE` when no differences are found in the database objects being compared.

32

DBMS_CONNECTION_POOL

The DBMS_CONNECTION_POOL package provides an interface to manage Database Resident Connection Pool.

> **See Also:** *Oracle Database Concepts* for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:

- Summary of DBMS_CONNECTION_POOL Subprograms

Summary of DBMS_CONNECTION_POOL Subprograms

Table 32–1 DBMS_CONNECTION_POOL Package Subprograms

Subprogram	Description
ALTER_PARAM Procedure on page 32-3	Alters a specific configuration parameter as a standalone unit and does not affect other parameters
CONFIGURE_POOL Procedure on page 32-4	Configures the pool with advanced options
START_POOL Procedure on page 32-6	Starts the pool for operations. It is only after this call that the pool could be used by connection clients for creating sessions
STOP_POOL Procedure on page 32-7	Stops the pool and makes it unavailable for the registered connection clients
RESTORE_DEFAULTS Procedure on page 32-8	Restores the pool to default settings

ALTER_PARAM Procedure

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

Syntax

```
DBMS_CONNECTION_POOL.ALTER_PARAM (
   pool_name     IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
   param_name    IN  VARCHAR2,
   param_value   IN  VARCHAR2);
```

Parameters

Table 32–2 ALTER_PARAM Procedure Parameters

Parameter	Description
`pool_name`	Pool to be configured. Currently only the default pool name is supported.
`param_name`	Any parameter name from `CONFIGURE_POOL`
`param_value`	Parameter value for `param_name`.

Exceptions

Table 32–3 ALTER_PARAM Procedure Exceptions

Exception	Description
`ORA-56500`	Connection pool not found
`ORA-56504`	Invalid connection pool configuration parameter name
`ORA-56505`	Invalid connection pool configuration parameter value
`ORA-56507`	Connection pool alter configuration failed

Examples

```
DBMS_CONNECTION_POOL.ALTER_PARAM(
   'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
```

CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```
DBMS_CONNECTION_POOL.CONFIGURE_POOL (
   pool_name                IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
   minsize                  IN NUMBER   DEFAULT 4,
   maxsize                  IN NUMBER   DEFAULT 40,
   incrsize                 IN NUMBER   DEFAULT 2,
   session_cached_cursors   IN NUMBER   DEFAULT 20,
   inactivity_timeout       IN NUMBER   DEFAULT 300,
   max_think_time           IN NUMBER   DEFAULT 120,
   max_use_session          IN NUMBER   DEFAULT 500000,
   max_lifetime_session     IN NUMBER   DEFAULT 86400);
```

Parameters

Table 32–4 CONFIGURE_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be configured. Currently only the default pool name is supported.
minsize	Minimum number of pooled servers in the pool
maxsize	Maximum allowed pooled servers in the pool
incrsize	Pool would increment by this number of pooled server when pooled server are unavailable at application request time
session_cached_cursors	Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter
inactivity_timeout	TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.
max_think_time	Maximum time of inactivity by the client after getting a session from the pool. If the client does not issue a database call after grabbing a server from the pool, the client will be forced to relinquish control of the pooled server and will get an ORA-xxxxx error. The freed up server may or may not be returned to the pool.
max_use_session	Maximum number of times a connection can be taken and released to the pool
max_lifetime_session	TTL (Time to live) for a pooled session

Exceptions

Table 32–5 CONFIGURE_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
- `minsize` should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
- `maxsize` should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
- `session_cached_cursors` is typically set to the number of most frequently used statements. It occupies cursor resource on the server
- In doubt, do not set the `increment` and `inactivity_timeout`. The pool will have reasonable defaults.
- `max_use_session` and `max_lifetime_session` allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.

START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

```
DBMS_CONNECTION_POOL.START_POOL (
   pool_name  IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 32–6 START_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be started. Currently only the default pool name is supported.

Exceptions

Table 32–7 START_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56501	Connection pool startup failed

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```
DBMS_CONNECTION_POOL.STOP_POOL (
   pool_name   IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 32–8 STOP_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be stopped. Currently only the default pool name is supported.

Exceptions

Table 32–9 STOP_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56506	Connection pool shutdown failed

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.

RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (
   pool_name   IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 32–10 RESTORE_DEFAULTS Procedure Parameters

Parameter	Description
pool_name	Pool to be restored. Currently only the default pool name is supported.

Exceptions

Table 32–11 RESTORE_DEFAULTS Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

33

DBMS_CQ_NOTIFICATION

The DBMS_CQ_NOTIFICATION package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* regarding implementing database change notification.

This chapter contains the following topics:

- Using DBMS_CQ_NOTIFICATION
  - Overview
  - Security Model
  - Constants
  - Operational Notes
  - Examples
- Data Structures
  - OBJECT Types
- Summary of DBMS_CQ_NOTIFICATION Subprograms

Using DBMS_CQ_NOTIFICATION

- Overview
- Security Model
- Constants
- Operational Notes
- Examples

Overview

The DBMS_CQ_NOTIFICATION package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and |COMMIT|s, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a BEGIN-END block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the BEGIN phase. Any queries executed subsequently (inside the registration block) are considered "interesting queries" and objects referenced by those queries during query execution are registered. The registration is completed by ENDing the registration block.

The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

Security Model

The DBMS_CQ_NOTIFICATION package requires that the user have the CHANGE NOTIFICATION system privilege in order to receive notifications, and be granted EXECUTE privilege on the DBMS_CQ_NOTIFICATION package.

In addition the user is required to have SELECT privileges on all objects to be registered. Note that if the SELECT privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

Constants

The DBMS_CQ_NOTIFICATION package uses the constants shown in Table 33–1. The constants are used as flag parameters either during registration or when received during the notification.

The DBMS_CQ_NOTIFICATION package has sets of constants:

- EVENT_STARTUP, EVENT_SHUTDOWN, EVENT_SHUTDOWN_ANY, EVENT_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS_RELIABLE, QOS_DEREG_NFY, QOS_ROWIDs describe registration Quality of Service properties that the client requires. These are specified during registration.

Table 33–1 DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
ALL_OPERATIONS	BINARY_INTEGER	0	Interested in being notified on all operations, specified as a parameter during registration
ALL_ROWS BINARY_ INTEGER	BINARY_INTEGER	1	All rows within the table may have been potentially modified
EVENT_STARTUP	BINARY_INTEGER	1	Instance startup notification
EVENT_SHUTDOWN	BINARY_INTEGER	2	Instance shutdown notification
EVENT_SHUTDOWN_ANY	BINARY_INTEGER	3	Any instance shutdown when running RAC
EVENT_DEREG	BINARY_INTEGER	5	Registration has been removed
EVENT_OBJCHANGE	BINARY_INTEGER	6	Notification for object change
EVENT_QUERYCHANGE CONSTANT	BINARY_INTEGER	7	Notification for query result set change
INSERTOP	BINARY_INTEGER	2	Insert operation
UPDATEOP	BINARY_INTEGER	4	Update operation
DELETEOP	BINARY_INTEGER	8	Delete operation
ALTEROP	BINARY_INTEGER	16	Table altered
DROPOP	BINARY_INTEGER	32	Table dropped
UNKNOWNOP	BINARY_INTEGER	64	Unknown operation
QOS_RELIABLE	BINARY_INTEGER	1	Reliable or persistent notification. Also implies that the notifications will be inserted into the persistent storage atomically with the committing transaction that results in an object change.
QOS_DEREG_NFY	BINARY_INTEGER	2	Purge registration on first notification
QOS_ROWIDS	BINARY_INTEGER	4	Require rowids of modified rows
QOS_QUERY	BINARY_INTEGER	8	Register at query granularity
QOS_BEST_EFFORT	BINARY_INTEGER	16	Best effort evaluation

Table 33–1 (Cont.) DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
NTFN_GROUPING_CLASS_TIME	BINARY_INTEGER	1	Group notifications by time
NTFN_GROUPING_TYPE_SUMMARY	BINARY_INTEGER	1	Summary grouping of notifications
NTFN_GROUPING_TYPE_LAST	BINARY_INTEGER	2	Last notification in the group
NTFN_GROUPING_FOREVER	BINARY_INTEGER	-1	Repeat notifications forever

Operational Notes

With regard to object level registration:

- The notifications are published by the database when a transaction changes the registered objects and COMMITs.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

With regard to query result change registration:

- The notifications are published by the database when a transaction changes the result set of the registered query and COMMITs.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the job_queue_processes parameter set to a non-zero value? This parameter needs to be configured to a non-zero value in order to receive PL/SQL notifications via the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you COMMITing the transaction? Please note that the notifications are transactional and will be generated when the transaction COMMITs.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the JOBQ process that attempts to execute the procedure. The trace file would be usually named <ORACLE_SID>_j*_<PID>.trc.'

  For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc.

  Suppose a registration is created with 'chnf_callback as the notification handler and with registration_id 100. Let us suppose the user forgets to define the chnf_callback procedure. Then the JOBQ trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
   Error in PLSQL notification of msgid:
   Queue :
   Consumer Name :
   PLSQL function :chnf_callback
   Exception Occured, Error msg:
   ORA-00604: error occurred at recursive SQL level 2
   ORA-06550: line 1, column 7:
   PLS-00201: identifier 'CHNF_CALLBACK' must be declared
   ORA-06550: line 1, column 7:
   PL/SQL: Statement ignored
```

See Also: For more information about troubleshooting Database Change Notification, see *Oracle Database Advanced Application Developer's Guide*.

Examples

Object Change Registration Example

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The DBMS_CQ_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.
2. Create a server side stored procedure to process notifications

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                            table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                          row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
   regid           NUMBER;
   tbname          VARCHAR2(60);
   event_type      NUMBER;
   numtables       NUMBER;
   operation_type  NUMBER;
   numrows         NUMBER;
   row_id          VARCHAR2(20);
 BEGIN
     regid      := ntfnds.registration_id;
     numtables  := ntfnds.numtables;
     event_type := ntfnds.event_type;

  INSERT INTO nfevents VALUES(regid, event_type);
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
    FOR i IN 1..numtables LOOP
      tbname          := ntfnds.table_desc_array(i).table_name;
      operation_type  := ntfnds.table_desc_array(I). Opflags;
      INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
```

```
      /* Send the table name and operation_type to client side listener using UTL_
HTTP */
      /* If interested in the rowids, obtain them as follows */
      IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
        numrows := ntfnds.table_desc_array(i).numrows;
      ELSE
        numrows :=0;   /* ROWID INFO NOT AVAILABLE */
      END IF;

      /* The body of the loop is not executed when numrows is ZERO */
      FOR j IN 1..numrows LOOP
          Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
          INSERT INTO nfrowchanges VALUES(regid, tbname, Row_id);
         /* optionally Send out row_ids to client side listener using UTL_HTTP; */
      END LOOP;

    END LOOP;
  END IF;
  COMMIT;
END;
/
```

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (`chnf_callback`) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

```
Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
  REGDS      SYS.CHNF$_REG_INFO;
  regid      NUMBER;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  qosflags   NUMBER;
BEGIN
 qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
         DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
DBMS_CQ_NOTIFICATION.REG_END;
END;
/
```

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any `COMMIT`ted changes to the `HR.EMPLOYEES` table. As an example, let us assume that the following update is performed on the employees table.

```
UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;
COMMIT;
```

Once the notification is processed, you will find rows which might look like the following in the `nfevents`, `nftablechanges` and `nfrowchanges` tables.

```
SQL> SELECT * FROM nfevents;

     REGID     EVENT_TYPE
---------------------------
     20045          6
```

```
SQL> SELECT * FROM nftablechanges;

  REGID      TABLE_NAME         TABLE_OPERATION
----------------------------------------
  20045      HR.EMPLOYEES            4

SQL> select * from nfrowchanges;

    REGID      TABLE_NAME          ROW_ID
-----------------------------------------------------
    20045     HR.EMPLOYEES    AAAKB/AABAAAJ8zAAF
```

Notes

1. In the above example, a registration was created on the `EMPLOYEES` table with '`chnf_callback`' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (`QOS_RELIABLE`) and rowid notifications (`QOS_ROWIDS`)
2. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of `EVENT_OBJCHANGE`. In all other cases (e.g `EVENT_DEREG`, `EVENT_SHUTDOWN`), the table descriptor array should not be accessed.
3. The handler accesses the row descriptor array from the table notification descriptor only if the `ALL_ROWS` bit is not set in the table operation flag. If the `ALL_ROWS` bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like `TRUNCATE` that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

   This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

   Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier `HTTP` listener of its cache management system (as in the example) using `UTL_HTTP`. The listener could then refresh its cache by querying from the back-end database.

Query Result Change Registration Example

1. Creating a Callback

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);

Rem Create a table to record notification queries
```

```
CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);

Rem Create a table to record changes to registered tables
CREATE TABLE nftablechanges(
       qid               NUMBER,
       table_name        VARCHAR2(100),
       table_operation   NUMBER);

Rem Create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(
       qid               NUMBER,
       table_name        VARCHAR2(100),
       row_id            VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
  (ntfnds IN CQ_NOTIFICATION$_DESCRIPTOR)
IS
  regid           NUMBER;
  tbname          VARCHAR2(60);
  event_type      NUMBER;
  numtables       NUMBER;
  operation_type  NUMBER;
  numrows         NUMBER;
  row_id          VARCHAR2(2000);
  numqueries      NUMBER;
  qid NUMBER;
  qop NUMBER;

BEGIN
  regid := ntfnds.registration_id;
  event_type := ntfnds.event_type;
  INSERT INTO nfevents VALUES(regid, event_type);
  numqueries :=0;
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
      numqueries := ntfnds.query_desc_array.count;
      FOR i in 1..numqueries LOOP
         qid := ntfnds.QUERY_DESC_ARRAY(i).queryid;
         qop := ntfnds.QUERY_DESC_ARRAY(i).queryop;
         INSERT INTO nfqueries VALUES(qid, qop);
         numtables := 0;
         numtables := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array.count;
         FOR j IN 1..numtables LOOP
           tbname := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).table_name;
           operation_type := ntfnds.QUERY_DESC_ARRAY(i).table_desc_
array(j).Opflags;
           INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
           IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0)
           THEN
             numrows := ntfnds.query_desc_array(i).table_desc_array(j).numrows;
           ELSE
             numrows :=0;   /* ROWID INFO NOT AVAILABLE */
           END IF;

            /* The body of the loop is not executed when numrows is ZERO */
            FOR k IN 1..numrows LOOP
               Row_id := ntfnds.query_desc_array(i).table_desc_array(j).row_
desc_array(k).row_id;
               INSERT INTO nfrowchanges VALUES(qid, tbname, Row_id);
```

```
           END LOOP;  /* loop over rows */
         END LOOP;     /* loop over tables */
       END LOOP;        /* loop over queries */
  END IF;
  COMMIT;
END;
/
```

2. Creates a query registration

```
DECLARE
  reginfo    cq_notification$_reg_info;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  v_cursor   SYS_REFCURSOR;
  regid      NUMBER;
BEGIN
  /* Register two queries for result-set-change notifications: */
  /* 1. Construct registration information.
        'chnf_callback' is name of notification handler.
        QOS_QUERY specifies result-set-change notifications. */

        reginfo := cq_notification$_reg_info('chnf_callback',
           DBMS_CQ_NOTIFICATION.QOS_QUERY,0, 0, 0);

  /* 2. Create registration */

        regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);

        OPEN v_cursor FOR
           SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
           FROM HR.employees
           WHERE employee_id = 7902;
        CLOSE v_cursor;

       OPEN v_cursor for
        SELECT dbms_cq_notification.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
       CLOSE v_cursor;

  DBMS_CQ_NOTIFICATION.REG_END;
END;
/
```

3. After creating the query registrations, the output from `USER_CQ_NOTIFICATION_QUERIES` would appear as follows.

```
SQL> SELECT queryid, regid, to_char(querytext)
     FROM user_cq_notification_queries;

   QUERYID      REGID
---------- ----------
TO_CHAR(QUERYTEXT)
--------------------------------------------------------------------------------
-
        22         41
 SELECT HR.DEPARTMENTS.DEPARTMENT_ID  FROM HR.DEPARTMENTS  WHERE
HR.DEPARTMENTS.
DEPARTMENT_NAME  = 'IT'
```

```
        21         41
 SELECT HR.EMPLOYEES.MANAGER_ID  FROM HR.EMPLOYEES  WHERE
HR.EMPLOYEES.EMPLOYEE_
ID  = 7902

Now, let us perform an UPDATE that changes the result of the query with queryid
22
by renaming the department with name 'IT' to FINANCE.

SQL>  update departments set department_name = 'FINANCE' where department_name
= 'IT';

1 row updated.

SQL> commit;

Commit complete.

Now we can query the notifications that we recorded in the callback.

SQL> select * from nfevents;

     REGID EVENT_TYPE
---------- ----------
        61          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nfqueries;

       QID        QOP
---------- ----------
        42          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nftablechanges;
SQL> select * from nftablechanges;

     REGID
----------
TABLE_NAME
--------------------------------------------------------------------------------
-
TABLE_OPERATION
---------------
        42
HR.DEPARTMENTS
              4

TABLE_OPERATION 4 corresponds to UPDATEOP

SQL> select * from nfrowchanges;
     REGID
----------
TABLE_NAME
```

```
--------------------------------------------------------------------------------
-
ROW_ID
--------------------------------------------------------------------------------
-
        61
HR.DEPARTMENTS
AAANkdAABAAALinAAF
```

Data Structures

The DBMS_CQ_NOTIFICATION package defines the following OBJECT types.

OBJECT Types

- CQ_NOTIFICATION$_DESCRIPTOR Object Type
- CQ_NOTIFICATION$_QUERY Object Type
- CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_TABLE Object Type
- CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_ROW Object Type
- CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_REG_INFO Object Type

CQ_NOTIFICATION$_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the SYS.CHNF$_DESC type.

Syntax

```
TYPE SYS.CHNF$_DESC IS OBJECT(
   registration_id    NUMBER,
   transaction_id     RAW(8),
   dbname             VARCHAR2(30),
   event_type         NUMBER,
   numtables          NUMBER,
   table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY,
   query_desc_array   CQ_NOTIFICATION$_QUERY_ARRAY);
```

Attributes

Table 33–2 CQ_NOTIFICATION$_DESCRIPTOR Object Type

Attribute	Description
registration_id	Registration ID returned during registration
transaction_id	Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE or EVENT_QUERYCHANGE.
dbname	Name of database
event_type	Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)
numtables	Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.
table_desc_array	Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.
query_desc_array	Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE

CQ_NOTIFICATION$_QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit. An array of CQ_NOTIFICATION$_QUERY descriptors is embedded inside the top level notification descriptor (CQ_NOTIFICATION$_DESCRIPTOR) for events of type EVENT_QUERYCHANGE. The array corresponds to the SET of queryids which were invalidated as a result of the event.

This is a synonym for the base type SYS.CHNF$_QDESC.

Syntax

```
TYPE SYS.CHNF$_QDESC IS OBJECT (
  queryid            NUMBER,
  queryop            NUMBER,
  table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY);
```

Attributes

Table 33–3 TYPE SYS.CQ_NOTIFICATION$_QUERY Object Type

Attribute	Description
queryid	QueryId of the changed query
queryop	Operation describing change to the query
table_desc_array	Array of table changes which contributed to the query Result Set change

CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type

This type corresponds to an array of `CQ_NOTIFICATION$_QUERY` objects. It is a synonym for the `SYS.CHNF$_QUERY_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_
TABLE;
```

CQ_NOTIFICATION$_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for events of type EVENT_OBJCHANGE For query result set changes (event type will be set to EVENT_QUERYCHANGE), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_TDESC.

Syntax

```
TYPE SYS.CHNF$_TDESC IS OBJECT (
  opflags            NUMBER,
  table_name         VARCHAR2(2*M_IDEN+1),
  numrows            NUMBER,
  row_desc_array     CQ_NOTIFICATION$_ROW_ARRAY)
```

Attributes

Table 33–4 TYPE SYS.CQ_NOTIFICATION$_TABLE Object Type

Attribute	Description
opflags	Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.
table_name	Name of modified table
numrows	Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.
row_desc_array	Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.

CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type

This type corresponds to an array of `CQ_NOTIFICATION$_TABLE` objects. It is a synonym for the `SYS.CHNF$_TDESC_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_
TABLE;
```

CQ_NOTIFICATION$_ROW Object Type

An array of CQ_NOTIFICATION$_ROW is embedded inside a CQ_NOTIFICATION$_TABLE (table change descriptor) if the QOS_ROWIDS option was chosen at the time of registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_RDESC.

Syntax

```
TYPE SYS.CHNF$_RDESC IS OBJECT (
  opflags            NUMBER,
  row_id             VARCAHR2 (2000));
```

Attributes

Table 33–5 TYPE SYS.CQ_NOTIFICATION$_ROW Object Type

Attribute	Description
opflags	Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).
row_id	The rowid of the modified row

CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type

This object type corresponds to an array of CQ_NOTIFICATION$_ROW objects and is embedded inside the CQ_NOTIFICATION$_TABLE if QOS_ROWIDS was specified during registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

This type is a synonym for the SYS.CHNF$_RDESC_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_
ROW;
```

CQ_NOTIFICATION$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type previously named SYS.CHNF$_REG_INFO.

Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                       VARCHAR2(20),
  quosflags                      NUMBER,
  timeout                        NUMBER,
  operations_filter              NUMBER,
  transaction_lag                NUMBER,
  ntfn_grouping_class            NUMBER,
  ntfn_grouping_value            NUMBER,
  ntfn_grouping_type             NUMBER,
  ntfn_grouping_start_time       TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count     NUMBER);
```

Attributes

Table 33–6 TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
callback	Name of the server side PL/SQL procedure to be executed on a notification. Prototype is <call_backname>(ntfnds IN SYS.chnf$_desc)
qosflags	Quality of service flags. Can be set to an OR of the following values: ■ QOS_RELIABLE (0x1): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in a RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/ latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown. ■ QOS_DEREG_NFY (0x2): The registration will be expunged on the first notification ■ QOS_ROWIDS (0x4): The notification needs to include information about the rowids that were modified ■ QOS_QUERY (0x8): specifies query result change notification as opposed to object change notification ■ QOS_BEST_EFFORt (0x16): can register simplified versions of queries and minimizes evaluation with some false positives.

Table 33–6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
timeout	If set to a non-zero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the timeout option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.
operations_filter	if non-zero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types: ■ 0: Notify on all operations (DBMS_CQ_NOTIFICATION.ALL_OPERATIONS) ■ 0x2: Notify on every INSERT (DBMS_CQ_NOTIFICATION.INSERTOP) ■ 0x4: Notify on every UPDATE (DBMS_CQ_NOTIFICATION.UPDATEOP) ■ 0x8: Notify on every DELETE (DBMS_CQ_NOTIFICATION.DELETEOP) A combination of operations can be specified by using a bitwise OR. **Caution:** This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the "GROUPING notification" option.
transaction_lag	Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated. **Caution**: This parameter will be honored for object level registrations but ignored for query result change notification registrations.
ntfn_grouping_class	When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME by which notifications are grouped by time.
ntfn_grouping_value	The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.
ntfn_grouping_type	The type of grouping desired. It can be one of two allowed values ■ DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY - all notifications in the group are summarized into a single notification ■ DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST - only the last notification in the group is published and the earlier ones discarded
ntfn_grouping_start_time	When to start generating notifications. If specified as NULL, it defaults to the current system generated time.

Table 33–6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
ntfn_grouping_repeat_count	How many times the notification should be repeated. Set this to DBMS_CQ_NOTIFICATION.NTFN_GROUPING_FOREVER to receive notifications for the life time of the registration. Set to a non-zero value if only a certain number of notifications are desired for the life time of the registration.

Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER);
```

  The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  transaction_lag               NUMBER);
```

  The third definition contains all the members of the type except transaction_lag which is being deprecated:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  ntfn_grouping_class           NUMBER,
  ntfn_grouping_value           NUMBER,
  ntfn_grouping_type            NUMBER,
  ntfn_grouping_start_time      TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count    NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format schema_name.procedure_name. The procedure must have the following signature:

```
PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
```

  CHNF$_DESC describes the change notification descriptor.

- The init.ora parameter job_queue_processes must be set to a non-zero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

Summary of DBMS_CQ_NOTIFICATION Subprograms

Table 33–7 DBMS_CQ_NOTIFICATION Package Subprograms

Subprogram	Description
CQ_NOTIFICATION_QUERYID Function on page 33-27	Returns the queryid of the most recent query that was attempted to be registered in a registration block
DEREGISTER Procedure on page 33-28	De-subscribes the client with the supplied registration identifier (ID)
ENABLE_REG Procedure on page 33-29	Begins a registration block using an existing registration identifier (ID)
NEW_REG_START Function on page 33-30	Begins a new registration block
REG_END Procedure on page 33-31	Ends the registration boundary

CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

Syntax

```
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID
 RETURN NUMBER;
```

Return Values

Returns the queryid of the most recently registered query.

DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CQ_NOTIFICATION.DEREGISTER (
  regid IN NUMBER);
```

Parameters

Table 33–8 DEREGISTER Procedure Parameters

Parameter	Description
`regid`	Client registration ID

Usage Notes

Only the user that created the registration (or the `SYS` user) will be able to desubscribe the registration.

ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID). This subprogram is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.

Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the REG_END Procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.ENABLE_REG (
  regid IN NUMBER);
```

Parameters

Table 33–9 ENABLE_REG Procedure Parameters

Parameter	Description
`regid`	Client registration ID

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

NEW_REG_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG_END procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.NEW_REG_START (
  regds IN sys.chnf$_reg_info)
 RETURN NUMBER;
```

Parameters

Table 33–10 NEW_REG_START Function Parameters

Parameter	Description
sys.chnf$_reg_info	Registration descriptor describing the notification handler and other properties of the registration

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the CHANGE NOTIFICATION system privilege and SELECT privileges on any objects to be registered.
- The SYS user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CQ_NOTIFICATION.REG_END;
```

34

DBMS_CRYPTO

DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

> **See Also:** *Oracle Database Security Guide* for further information about using this package and about encrypting data in general.

This chapter contains the following topics:

- Using the DBMS_CRYPTO Subprograms
  - Overview
  - Security Model
  - Types
  - Algorithms
  - Restrictions
  - Exceptions
  - Operational Notes
- Summary of DBMS_CRYPTO Subprograms

Using the DBMS_CRYPTO Subprograms

- Overview
- Security Model
- Types
- Algorithms
- Restrictions
- Exceptions
- Operational Notes

Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, and SHA-1 cryptographic hashes
- MD5 and SHA-1 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPTO. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 34–1 lists the DBMS_CRYPTO package features in comparison to the other PL/SQL encryption package, the DBMS_OBFUSCATION_TOOLKIT.

Table 34–1 DBMS_CRYPTO and DBMS_OBFUSCATION_TOOLKIT Feature Comparison

Package Feature	DBMS_CRYPTO	DBMS_OBFUSCATION_TOOLKIT
Cryptographic algorithms	DES, 3DES, AES, RC4, 3DES_2KEY	DES, 3DES
Padding forms	PKCS5, zeroes	none supported
Block cipher chaining modes	CBC, CFB, ECB, OFB	CBC
Cryptographic hash algorithms	MD5, SHA-1, MD4	MD5
Keyed hash (MAC) algorithms	HMAC_MD5, HMAC_SH1	none supported
Cryptographic pseudo-random number generator	RAW, NUMBER, BINARY_INTEGER	RAW, VARCHAR2
Database types	RAW, CLOB, BLOB	RAW, VARCHAR2

DBMS_CRYPTO is intended to replace the DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, or SHA-1.

Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

Types

Parameters for the DBMS_CRYPTO subprograms use these datatypes:

Table 34–2 DBMS_CRYPTO Datatypes

Type	Description
BLOB	A source or destination binary LOB
CLOB	A source or destination character LOB (excluding NCLOB)
PLS_INTEGER	Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)
RAW	A source or destination RAW buffer

Algorithms

The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

Table 34–3 DBMS_CRYPTO Cryptographic Hash Functions

Name	Description
HASH_MD4	Produces a 128-bit hash, or message digest of the input message
HASH_MD5	Also produces a 128-bit hash, but is more complex than MD4
HASH_SH1	Secure Hash Algorithm (SHA). Produces a 160-bit hash.

Table 34–4 DBMS_CRYPTO MAC (Message Authentication Code) Functions

Name	Description
HMAC_MD5[1]	Same as MD5 hash function, except it requires a secret key to verify the hash value.
HMAC_SH1[1]	Same as SHA hash function, except it requires a secret key to verify the hash value.

[1] Complies with IETF RFC 2104 standard

Table 34–5 DBMS_CRYPTO Encryption Algorithms

Name	Description
ENCRYPT_DES	Data Encryption Standard. Block cipher. Uses key length of 56 bits.
ENCRYPT_3DES_2KEY	Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.
ENCRYPT_3DES	Data Encryption Standard. Block cipher. Operates on a block 3 times.
ENCRYPT_AES128	Advanced Encryption Standard. Block cipher. Uses 128-bit key size.
ENCRYPT_AES192	Advanced Encryption Standard. Block cipher. Uses 192-bit key size.
ENCRYPT_AES256	Advanced Encryption Standard. Block cipher. Uses 256-bit key size.
ENCRYPT_RC4	Stream cipher. Uses a secret, randomly generated key unique to each session.

Table 34–6 DBMS_CRYPTO Block Cipher Suites

Name	Description
DES_CBC_PKCS5	ENCRYPT_DES[1] + CHAIN_CBC[2]+ PAD_PKCS5[3]
DES3_CBC_PKCS5	ENCRYPT_3DES[1] + CHAIN_CBC[2] + PAD_PKCS5[3]

[1] See Table 34–5, " DBMS_CRYPTO Encryption Algorithms"
[2] See Table 34–7, " DBMS_CRYPTO Block Cipher Chaining Modifiers"
[3] See Table 34–8, " DBMS_CRYPTO Block Cipher Padding Modifiers"

Table 34–7 DBMS_CRYPTO Block Cipher Chaining Modifiers

Name	Description
CHAIN_ECB	Electronic Codebook. Encrypts each plaintext block independently.
CHAIN_CBC	Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.
CHAIN_CFB	Cipher-Feedback. Enables encrypting units of data smaller than the block size.
CHAIN_OFB	Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that *n* bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.

Table 34–8 DBMS_CRYPTO Block Cipher Padding Modifiers

Name	Description
PAD_PKCS5	Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard
PAD_NONE	Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.
PAD_ZERO	Provides padding consisting of zeroes.

Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to the RAW datatype. After performing these conversions, you can then encrypt it with the DBMS_CRYPTO package.

> **See Also:** "Conversion Rules" on page 34-11 for information about converting datatypes.

Exceptions

Table 34–9 lists exceptions that have been defined for DBMS_CRYPTO.

Table 34–9 DBMS_CRYPTO Exceptions

Exception	Code	Description
CipherSuiteInvalid	28827	The specified cipher suite is not defined.
CipherSuiteNull	28829	No value has been specified for the cipher suite to be used.
KeyNull	28239	The encryption key has not been specified or contains a NULL value.
KeyBadSize	28234	DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.
DoubleEncryption	28233	Source data was previously encrypted.

Operational Notes

- When to Use Encrypt and Decrypt Procedures or Functions
- When to Use Hash or Message Authentication Code (MAC) Functions
- About Generating and Storing Encryption Keys
- Conversion Rules

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt `LOB` datatypes (overloaded for `CLOB` and `BLOB` datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to encrypt and decrypt `RAW` datatypes. Data of type `VARCHAR2` must be converted to `RAW` before you can use `DBMS_CRYPTO` functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the `HASH` function and the `MAC` function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, Laurel runs `DBMS_CRYPTO.HASH` against the stored data to create a hash value. When she retrieves the stored data at a later date, she can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The `HASH` function included with `DBMS_CRYPTO`, is a one-way hash function that you can use to generate a hash value from either `RAW` or `LOB` data. The `MAC` function is also a one-way hash function, but with the addition of a secret key. It works the same way as the `DBMS_CRYPTO.HASH` function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The `DBMS_CRYPTO` package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by `DBMS_CRYPTO` occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although DBMS_CRYPTO cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys. (Calls to the RANDOMBYTES function behave like calls to the DESGETKEY and DES3GETKEY functions of the DBMS_OBFUSCATION_TOOLKIT package.)

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

See Also:

- *Oracle Database Advanced Security Administrator's Guide* for information about configuring network encryption and SSL.
- "Key Management" on page 82-5 for a full discussion about securely storing encryption keys
- "RANDOMBYTES Function" on page 34-20

Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:

  1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

  Syntax example:

  ```
  UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
  ```

- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:

  1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

  Syntax example:

  ```
  UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
  ```

  See Also: Chapter 209, "UTL_I18N" for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

Examples

The following listing shows PL/SQL block encrypting and decrypting pre-defined '`input_string`' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
   input_string       VARCHAR2 (200) :=  'Secret Message';
   output_string      VARCHAR2 (200);
   encrypted_raw      RAW (2000);             -- stores encrypted binary text
   decrypted_raw      RAW (2000);             -- stores decrypted binary text
   num_key_bytes      NUMBER := 256/8;        -- key length 256 bits (32 bytes)
   key_bytes_raw      RAW (32);               -- stores 256-bit encryption key
   encryption_type    PLS_INTEGER :=          -- total encryption type
                         DBMS_CRYPTO.ENCRYPT_AES256
                       + DBMS_CRYPTO.CHAIN_CBC
                       + DBMS_CRYPTO.PAD_PKCS5;
BEGIN
   DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
   key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
   encrypted_raw := DBMS_CRYPTO.ENCRYPT
      (
         src => UTL_I18N.STRING_TO_RAW (input_string,  'AL32UTF8'),
         typ => encryption_type,
         key => key_bytes_raw
      );
    -- The encrypted value "encrypted_raw" can be used here

   decrypted_raw := DBMS_CRYPTO.DECRYPT
      (
         src => encrypted_raw,
         typ => encryption_type,
         key => key_bytes_raw
      );
   output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

   DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```

Summary of DBMS_CRYPTO Subprograms

Table 34–10 DBMS_CRYPTO Package Subprograms

Subprogram	Description
DECRYPT Function on page 34-14	Decrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV (initialization vector)
DECRYPT Procedures on page 34-15	Decrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Function on page 34-16	Encrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Procedures on page 34-17	Encrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
HASH Function on page 34-18	Applies one of the supported cryptographic hash algorithms (MD4, MD5, or SHA-1) to data
MAC Function on page 34-19	Applies Message Authentication Code algorithms (MD5 or SHA-1) to data to provide keyed message protection
RANDOMBYTES Function on page 34-20	Returns a `RAW` value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys
RANDOMINTEGER Function on page 34-21	Returns a random `BINARY_INTEGER`
RANDOMNUMBER Function on page 34-22	Returns a random 128-bit integer of the `NUMBER` datatype

DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW DEFAULT NULL)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 34–11 DECRYPT Function Parameters

Parameter Name	Description
src	RAW data to be decrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

  See Also: "Usage Notes" for the ENCRYPT function on page 34-16 for additional information about the ciphers and modifiers available with this package.

- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

  See Also: "Conversion Rules" on page 34-11 for a discussion of the VARCHAR2 to RAW conversion process.

DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPT.DECRYPT(
   dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 34–12 DECRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is all zeroes.

ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW          DEFAULT NULL)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 34–13 ENCRYPT Function Parameters

Parameter Name	Description
src	RAW data to be encrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 34–7 and Table 34–8 on page 34-7 for block cipher chaining and padding modifier constants that have been defined for this package.
- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

  ```
  DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
                                     + DBMS_CRYPTO.CHAIN_CBC
                                     + DBMS_CRYPTO.PAD_NONE;
  ```

  See Table 34–6 on page 34-6 for the block cipher suites already defined as constants for this package.
- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

  See Also: "Conversion Rules" on page 34-11 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            CLOB         CHARACTER SET ANY_CS,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 34–14 ENCRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

See "Conversion Rules" on page 34-11 for usage notes about using the ENCRYPT procedure.

HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a *hash value*. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 34-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 34–3 on page 34-6.

Syntax

```
DBMS_CRYPTO.Hash (
   src IN RAW,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.Hash (
   src IN BLOB,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.Hash (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 34–15 HASH Function Parameters

Parameter Name	Description
`src`	The source data to be hashed.
`typ`	The hash algorithm to be used.

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm), specified with the constant, `HASH_SH1`, because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "HASH Function" on page 34-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 34-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See Table 34–4 on page 34-6 for a list of MAC algorithms that have been defined for this package.

Syntax

```
DBMS_CRYPTO.MAC (
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN BLOB,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 34–16 MAC Function Parameters

Parameter Name	Description
src	Source data to which MAC algorithms are to be applied.
typ	MAC algorithm to be used.
key	Key to be used for MAC algorithm.

RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator), and it draws its entropy (seed) from the sqlnet.ora file parameter SQLNET.CRYPTO_SEED.

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (
   number_bytes IN POSITIVE)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 34–17 RANDOMBYTES Function Parameter

Parameter Name	Description
number_bytes	The number of pseudo-random bytes to be generated.

Usage Note

- The number_bytes value should not exceed the maximum length of a RAW variable.
- The SQLNET.CRYPTO_SEED parameter can be set by entering 10 to 70 random characters with the following syntax in the sqlnet.ora file:

  ```
  SQLNET.CRYPTO_SEED = <10 to 70 random characters>
  ```

  See Also: *Oracle Database Advanced Security Administrator's Guide* for more information about the SQLNET.CRYPTO_SEED parameter and its use.

RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle `BINARY_INTEGER` datatype.

Syntax

```
DBMS_CRYPTO.RANDOMINTEGER
 RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
```

RANDOMNUMBER Function

This function returns an integer in the Oracle `NUMBER` datatype in the range of [0..2**128-1].

Syntax

```
DBMS_CRYPTO.RANDOMNUMBER
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
```

35

DBMS_CSX_ADMIN

The DBMS_CSX_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

- Using DBMS_CSX_ADMIN
  - Overview
  - Constants
- Summary of DBMS_CSX_ADMIN

Using DBMS_CSX_ADMIN

- Overview
- Constants

Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.

Constants

The DBMS_CSX_ADMIN package uses the constants shown in Table 35–1:

Table 35–1 DBMS_CSX_ADMIN Constants

Name	Type	Value	Description
DEFAULT_LEVEL	BINARY_INTEGER	0	Default token table
TAB_LEVEL	BINARY_INTEGER	1	Token table set associated with tables, not tablespaces
TBS_LEVEL	BINARY_INTEGER	2	Token table set associated with a tablespace
NO_CREATE	BINARY_INTEGER	0	Token tables already exist, associate them with the given table/tablespace
NO_INDEXES	BINARY_INTEGER	1	Do not create indexes on the new set of token tables
WITH_INDEXES	BINARY_INTEGER	2	Create indexes on the token tables
DEFAULT_TOKS	BINARY_INTEGER	0	Prepopulate the token tables with default token mappings
NO_DEFAULT_TOKS	BINARY_INTEGER	1	Do not prepopulate the token tables with default token mappings

Examples

Example 1: Register a New Set of Token Tables for the Tablespace

To prepare a tablespace CSXTS for export, the DBA can register a new set of token tables for the tablespace with the following PL/SQL:

```
DECLARE
  tsno   number;
  stmt   varchar2(2000);
BEGIN
  stmt := 'SELECT ts# FROM ts$ WHERE (name = ''' || 'CSXTS' || ''')';
  EXECUTE IMMEDIATE stmt into tsno;
  DBMS_CSX_ADMIN.REGISTERTOKENTABLESET(
    tstabno     =>  tsno,
    guid        =>  NULL,
    flags       =>  DBMS_CSX_ADMIN.TBS_LEVEL,
    tocreate    =>  DBMS_CSX_ADMIN.WITH_INDEXES,
    defaulttoks =>  DBMS_CSX_ADMIN.DEFAULT_TOKS);
  COMMIT;
END;
/
```

In this example, the new token tables are indexed, populated with default token mappings, and associated with all tables in the `CSXTS` tablespace. All subsequent loads of binary XML data in `CSXTS` will make use of the new set of token tables. The advantage is that no loading of binary XML data in other tablespaces will affect the size of the token tables used by `CSXTS` and exported during a tablespace export of `CSXTS`. This setup is suited to the case in which the tablespace does not yet contain binary XML data.

Example 2: Copying the Default Token Tables in a New Set

If binary XML data already exists in the tablespace to be exported, the DBA has the option of copying the default token tables in a new set.

```
DECLARE
  tsno   number;
  stmt   varchar2(2000);
  qntab  varchar2(34);
  nmtab  varchar2(34);
  pttab  varchar2(34);
BEGIN
  stmt := 'select ts# from ts$ where (name = ''' || 'CSXTS' || ''')';
  EXECUTE IMMEDIATE stmt INTO tsno;
  DBMS_CSX_ADMIN.COPYDEFAULTTOKENTABLESET(
    tstabno => tsno, qntab, nmtab, pttatb);
  COMMIT;
END;
/
```

This setup is suited to the case in which the DBA wishes to optimize the export of a tablespace that already contains binary XML data, and does not have associated a token table set. After cloning the default token table set, all subsequent loads of binary XML data in `CSXTS` will make use of the new set of token tables.

Summary of DBMS_CSX_ADMIN

Table 35–2 DBMS_CSX_ADMIN Package Subprograms

Subprogram	Description
COPYDEFAULTTOKENTABLESET Procedure on page 35-7	Creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables
GETTOKENTABLEINFO Procedure & Function on page 35-8	Returns the GUID of the token table set where token mappings for this table
GETTOKENTABLEINFOBYTABLESPACE Procedure on page 35-9	Returns the GUID and the token table names for this tablespace
NAMESPACEIDTABLE Function on page 35-10	Returns default namespace-ID token table
PATHIDTABLE Function on page 35-11	Returns the default path-ID token table
QNAMEIDTABLE Function on page 35-12	Returns the default qname-ID token table.
REGISTERTOKENTABLESET Procedure on page 35-13	Registers a new token table set, creates (if required) the token tables (with the corresponding indexes)

COPYDEFAULTTOKENTABLESET Procedure

This procedure creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables.

Syntax

```
DBMS_CSX_ADMIN.COPYDEFAULTTOKENTABLESET  (
   tsno         IN    NUMBER,
   qnametable   OUT   VARCHAR2,
   nmspctable   OUT   VARCHAR2,
   pttable      OUT   VARCHAR2);
```

Parameters

Table 35–3 COPYDEFAULTTOKENTABLESET Procedure Parameters

Parameter	Description
tsno	Tablespace number the new set of token tables will be associated with
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
pttable	Name of the path-id table in the new set

GETTOKENTABLEINFO Procedure & Function

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
   ownername      IN   VARCHAR2,
   tablename      IN   VARCHAR2,
   guid           OUT  RAW,
   qnametable     OUT  VARCHAR2,
   nmspctable     OUT  VARCHAR2,
   level          OUT  NUMBER,
   tabno          OUT  NUMBER);

DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
   tabno          IN   NUMBER,
   guid           OUT  RAW);
 RETURN BOOLEAN;
```

Parameters

Table 35–4 GETTOKENTABLEINFO Procedure & Function Parameters

Parameter	Description
`ownername`	Owner of the table
`tablename`	Name of the table
`guid`	GUID of the token table set used by the given table
`qnametable`	Name of the qname-ID table in the new set
`nmspctable`	Name of the namespace-ID table in the new set
`level`	`DEFAULT_LEVEL` if default token table set, `TBS_LEVEL` if same token table set is used by all tables in the same tablespace as the given table, `TAB_LEVEL` otherwise
`tabno`	Table object number

GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE  (
   tsname          IN   VARCHAR2,
   tablespaceno    IN   NUMBER,
   guid            OUT  RAW,
   qnametable      OUT  VARCHAR2,
   nmspctable      OUT  VARCHAR2,
   isdefault       OUT  BOOLEAN,
   containTokTab   OUT  BOOLEAN);
```

Parameters

Table 35–5 GETTOKENTABLEINFOBYTABLESPACE Procedure Parameters

Parameter	Description
tsname	Tablespace name
tablespaceno	Tablespace number
guid	GUID of the token table set associated with this tablespace (if any)
qnametable	Name of the qname-ID table
nmspctable	Name of the namespace-ID table
isdefault	TRUE if the token table is the default one
containTokTab	TRUE if the tablespace contains its own token table set

NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

Syntax

```
DBMS_CSX_ADMIN.NAMESPACEIDTABLE
  RETURN VARCHAR2;
```

PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing `EXPLAIN PLAN` for a query on an XML table with an XML index.

Syntax

```
DBMS_CSX_ADMIN.PATHIDTABLE
  RETURN VARCHAR2;
```

QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

Syntax

```
DBMS_CSX_ADMIN.QNAMEIDTABLE
  RETURN VARCHAR2;
```

REGISTERTOKENTABLESET Procedure

This procedure registers a new token table set, creates (if required) the token tables (with the corresponding indexes).

Syntax

```
DBMS_CSX_ADMIN.REGISTERTOKENTABLESET  (
   tstabno      IN  NUMBER  DEFAULT NULL,
   guid         IN  RAW     DEFAULT NULL,
   flags        IN  NUMBER  DEFAULT TBS_LEVEL,
   tocreate     IN  NUMBER  DEFAULT WITH_INDEXES,
   defaulttoks  IN  NUMBER  DEFAULT DEFAULT_TOKS);
```

Parameters

Table 35–6 REGISTERTOKENTABLESET Procedure Parameters

Parameter	Description
tstabno	Tablespace/table number of the tablespace/table using the set of token table we register
guid	GUID of the token table set. If NULL, a new identifier is created, provided the user is SYS.
flags	TAB_LEVEL for table level, TBS_LEVEL for tablespace level
tocreate	Possible values: ■ NO_CREATE if no token tables are created ■ NO_INDEXES if token tables are created, but no indexes ■ WITH_INDEXES if token tables and corresponding indexes are created
defaulttoks	If DEFAULT_TOKS, insert default token mappings

36

DBMS_CUBE

DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

> **See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_CUBE
- Summary of DBMS_CUBE Subprograms

Using DBMS_CUBE

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

The metadata for cubes and dimensions is defined in XML templates, which you can generate interactively using a graphical tool named Analytic Workspace Manager.

The `IMPORT_XML` procedure creates an analytic workspace with its cubes and dimensions. The `BUILD` procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying. You can also use Analytic Workspace Manager to create analytic workspaces from XML and initiate a data load. The two methods are completely interchangeable.

Summary of DBMS_CUBE Subprograms

Table 36–1 DBMS_CUBE Subprograms

Subprogram	Description
BUILD Procedure on page 36-4	Loads data into one or more cubes and dimensions, and prepares the data for querying.
IMPORT_XML Procedure on page 36-11	Creates an analytic workspace, or adds objects to an existing analytic workspace, from an XML template.
VALIDATE_XML Procedure on page 36-13	Checks the XML to assure that it is valid, without committing the results to the database.

BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

```
DBMS_CUBE.BUILD (
       SCRIPT                IN  VARCHAR2,
       METHOD                IN  VARCHAR2         DEFAULT,
       REFRESH_AFTER_ERRORS  IN  BOOLEAN          DEFAULT,
       PARALLELISM           IN  BINARY_INTEGER   DEFAULT,
       ATOMIC_REFRESH        IN  BOOLEAN          DEFAULT,
       AUTOMATIC_ORDER       IN  BOOLEAN          DEFAULT,
       ADD_DIMENSIONS        IN  BOOLEAN          DEFAULT,
       SCHEDULER_JOB         IN  VARCHAR2         DEFAULT );
```

Parameters

Table 36–2 BUILD Procedure Parameters

Parameter	Description
SCRIPT	A list of cubes and dimensions and their build options (see "SCRIPT Parameter" on page 36-5).
METHOD	A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes. ■ C: Complete refresh clears all dimension values before loading. (Default) ■ F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table. ■ ?: Fast refresh if possible, and otherwise a complete refresh. ■ P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables. ■ S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. See the "Usage Notes" on page 36-8 for additional details. Methods do not apply to dimensions.
REFRESH_AFTER_ERRORS	TRUE to roll back just the cube or dimension with errors, and then continue building the other objects. FALSE to roll back all objects in the build. (Default)
PARALLELISM	Number of parallel processes to allocate to this job (see Usage Notes).

Table 36–2 (Cont.) BUILD Procedure Parameters

Parameter	Description
ATOMIC_REFRESH	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. (Default) FALSE enables users to access intermediate results during an build.
AUTOMATIC_ORDER	TRUE enables optimization of the build order. Dimensions are loaded before cubes.(Default) FALSE builds objects in the order you list them in the script.
ADD_DIMENSIONS	TRUE automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script. FALSE includes only dimensions specifically listed in the script.
SCHEDULER_JOB	Any text identifier for the build, which will appear in the log table. Each build is assigned a unique sequential number, but a text identifier is useful for tracking a particular build.

SCRIPT Parameter

The SCRIPT parameter identifies the objects that will be included in the build, and specifies the type of processing that will be performed on each one. The parameter has this syntax:

```
object [ USING ( commands ) ][,...]
```

Where:

object is the fully qualified name of a cube or a dimension in the form *aw_name.object*, such as GLOBAL.TIME.

SCRIPT Parameter: USING Clause

The USING clause specifies the processing options. It consists of one or more commands separated by commas.

> **Note:** A cube with a rewrite materialized view cannot have a USING clause, except for the ANALYZE command. It uses the default build options.

The commands can be any of the following.

- CLEAR [VALUES | LEAVES | AGGREGATES]

  Prepares the cube for a data refresh. It can also be used on dimensions, but CLEAR removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

  The optional arguments control the refresh method:

  – VALUES: Clears all data in the cube. This option supports the COMPLETE refresh method. (Default for the C and F methods)

  - LEAVES: Clears the detail data and retains the aggregates. This option supports the FAST refresh method. (Default for the ? method)
  - AGGREGATES: Clears the aggregates and retains the detail data.

- LOAD [SYNCH | NO SYNCH]

  Loads data into the dimension or cube. The optional arguments apply only to dimensions:

  - SYNCH matches the dimension keys to the relational data source. (Default)
  - NO SYNCH loads new dimension keys but does not delete old keys.

- SOLVE

  Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

- COMPILE

  Creates the supporting structures for the dimension. (Dimensions only)

- ANALYZE

  Runs DBMS_AW_STATS.ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.

- EXECUTE OLAP DML string

  Executes an OLAP DML command or program in the analytic workspace.

- EXECUTE PLSQL string

  Executes a PL/SQL command or script in the database.

- MODEL model_name

  Executes a model previously created for the cube.

- AGGREGATE USING [MEASURE]

  Generates aggregate values using the syntax described in "SCRIPT Parameter: USING Clause: AGGREGATE command".

SCRIPT Parameter: USING Clause: AGGREGATE command

The AGGREGATE command in a script specifies the aggregation rules for one or more measures.

> **Note:** The AGGREGATE command is available only for uncompressed cubes.

AGGREGATE has the following syntax:

```
{ AGGREGATE USING MEASURE
     WHEN measure1 THEN operator1
     WHEN measure2 THEN operator2...
          ELSE default_operator
|
 [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES (hierarchy)}
```

USING MEASURE Clause

This clause enables you to specify different aggregation operators for different measures in the cube.

Operator Clause

The `operator_clause` has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

`WEIGHTBY` multiplies each data value by an expression before aggregation.

`SCALEBY` adds the value of an expression to each data value before aggregation.

Table 36–3 Aggregation Operators

Operator	Option	Description
AVG	WEIGHTBY	Adds data values, then divides the sum by the number of data values that were added together.
FIRST	WEIGHTBY	The first real data value.
HIER_AVG	WEIGHTBY	Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.
HIER_FIRST	WEIGHTBY	The first data value in the hierarchy, even when that value is NA.
HIER_LAST	WEIGHTBY	The last data value in the hierarchy, even when that value is NA.
LAST	WEIGHTBY	The last real data value.
MAX	WEIGHTBY	The largest data value among the children of each parent.
MIN	WEIGHTBY	The smallest data value among the children of each parent.
SUM	SCALEBY | WEIGHTBY	Adds data values. (Default)

Processing Options

You can specify these processing options for aggregation:

- `(ALLOW | DISALLOW) OVERFLOW`

  Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.

  - `ALLOW`: A calculation that generates overflow executes without error and produces null results. (Default)
  - `DISALLOW`: A calculation involving overflow stops executing and generates an error message.

- `(ALLOW | DISALLOW) DIVISION BY ZERO`

  Specifies whether to allow division by zero.

  - `ALLOW`: A calculation involving division by zero executes without error but returns a null value. (Default)

  - DISALLOW: A calculation involving division by zero stops executing and generates an error message.

- (CONSIDER | IGNORE) NULLS

  Specifies whether nulls are included in the calculations.

  - CONSIDER: Nulls are included in the calculations. A calculation that includes a null value returns a null value.
  - IGNORE: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)

- MAINTAIN COUNT

  Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

Usage Notes

Build Methods

The C, S, and ? methods always succeed and can be used on any cube.

The F and P methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

Parallelism

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually used by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the PARALLELISM argument of the BUILD procedure.
- Setting of the JOB_QUEUE_PROCESSES database initialization parameter.

Suppose UNITS_CUBE has 12 partitions, PARALLELISM is set to 10, and JOB_QUEUE_PROCESSES is set to 4. The build will use four processes, which will appear as slave processes in the build log.

Build Log

The build log is stored as a table named CUBE_BUILD_LOG in the owner's schema. It is updated dynamically, so that you can monitor the progress of a build. Analytic Workspace Manager creates this log automatically. Otherwise, you can create the log file by running $ORACLE_HOME/olap/admin/utlolaplog.sql.

The following is an example of some columns from the default build of a cube named UNITS_CUBE.

```
SQL> SELECT command, status, build_object, build_object_type type
     FROM cube_build_log WHERE build_id='1';

COMMAND              STATUS     BUILD_OBJECT                         TYPE
-------------------- ---------- ------------------------------------ ----------
BUILD                STARTED    BUILD GLOBAL.UNITS_CUBE              BUILD
LOAD SYNCH           STARTED    TIME                                 DIMENSION
LOAD SYNCH           COMPLETED  TIME                                 DIMENSION
COMPILE              STARTED    TIME                                 DIMENSION
```

```
COMPILE             COMPLETED  TIME                                DIMENSION
UPDATE              STARTED    TIME                                DIMENSION
UPDATE              COMPLETED  TIME                                DIMENSION
COMMIT              STARTED    TIME                                DIMENSION
COMMIT              COMPLETED  TIME                                DIMENSION
LOAD SYNCH          STARTED    PRODUCT                             DIMENSION
LOAD SYNCH          COMPLETED  PRODUCT                             DIMENSION
COMPILE             STARTED    PRODUCT                             DIMENSION
COMPILE             COMPLETED  PRODUCT                             DIMENSION
UPDATE              STARTED    PRODUCT                             DIMENSION
UPDATE              COMPLETED  PRODUCT                             DIMENSION
COMMIT              STARTED    PRODUCT                             DIMENSION
COMMIT              COMPLETED  PRODUCT                             DIMENSION
LOAD SYNCH          STARTED    CUSTOMER                            DIMENSION
LOAD SYNCH          COMPLETED  CUSTOMER                            DIMENSION
COMPILE             STARTED    CUSTOMER                            DIMENSION
COMPILE             COMPLETED  CUSTOMER                            DIMENSION
UPDATE              STARTED    CUSTOMER                            DIMENSION
UPDATE              COMPLETED  CUSTOMER                            DIMENSION
COMMIT              STARTED    CUSTOMER                            DIMENSION
COMMIT              COMPLETED  CUSTOMER                            DIMENSION
LOAD SYNCH          STARTED    CHANNEL                             DIMENSION
LOAD SYNCH          COMPLETED  CHANNEL                             DIMENSION
COMPILE             STARTED    CHANNEL                             DIMENSION
COMPILE             COMPLETED  CHANNEL                             DIMENSION
UPDATE              STARTED    CHANNEL                             DIMENSION
UPDATE              COMPLETED  CHANNEL                             DIMENSION
COMMIT              STARTED    CHANNEL                             DIMENSION
COMMIT              COMPLETED  CHANNEL                             DIMENSION
LOAD                STARTED    UNITS_CUBE                          CUBE
LOAD                COMPLETED  UNITS_CUBE                          CUBE
SOLVE               STARTED    UNITS_CUBE                          CUBE
SOLVE               COMPLETED  UNITS_CUBE                          CUBE
UPDATE              STARTED    UNITS_CUBE                          CUBE
UPDATE              COMPLETED  UNITS_CUBE                          CUBE
COMMIT              STARTED    UNITS_CUBE                          CUBE
COMMIT              COMPLETED  UNITS_CUBE                          CUBE
BUILD               COMPLETED  BUILD GLOBAL.UNITS_CUBE             BUILD

42 rows selected.
```

Examples

This example uses the default parameters to build UNITS_CUBE.

```
EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');
```

The next example builds UNITS_CUBE and explicitly builds two of its dimensions, TIME and CHANNEL.

```
BEGIN
      DBMS_CUBE.BUILD(
          'GLOBAL.TIME USING (LOAD NO SYNCH, COMPILE),
           GLOBAL.CHANNEL,
           GLOBAL.UNITS_CUBE USING (CLEAR LEAVES, LOAD, SOLVE, ANALYZE)
          ',
               '?',           -- solve
               false,         -- refresh after errors
               2,             -- parallelism
               false,         -- atomic refresh
               true,          -- automatic order
```

```
                false,          -- add dimensions
                'Units Cube'    -- identify build
        );
END;
/
```

IMPORT_XML Procedure

This procedure creates an analytic workspace from an XML template.

Syntax

```
DBMS_CUBE.IMPORT_XML
       (IN_XML                IN      CLOB;

DBMS_CUBE.IMPORT_XML
       (IN_XML                IN      CLOB
       OUT_XML                IN/OUT  CLOB );
```

Parameters

Table 36–4 IMPORT_XML Procedure Parameters

Parameter	Description
IN_XML	The name of a CLOB containing an XML template.
OUT_XML	An XML file generated by DBMS_CUBE that shows changes DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.

Usage Notes

The XML template must be loaded into a CLOB (see Example). The XML can define an entire analytic workspace, a single cube, or a single dimension. When re-creating just a cube or dimension, you must provide the context of an existing analytic workspace.

Example

This example loads an XML template into a temporary CLOB, then creates the GLOBAL analytic workspace. The script is named GLOBAL.XML, and it is located in a database directory named XML_DIR.

```
DEFINE xml_file = 'GLOBAL.XML';
SET ECHO ON;
SET SERVEROUT ON;

DECLARE
     xml_file     BFILE := bfilename('XML_DIR', '&xml_file');
     in_xml       CLOB;
     out_xml      CLOB := NULL;
     dest_offset  INTEGER := 1;
     src_offset   INTEGER := 1;
     lang_context INTEGER := 0;
     warning      INTEGER;
BEGIN
     -- Setup the clob from a file
     DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
     DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
     DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
     DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
        dest_offset, src_offset, 0, lang_context, warning);
```

```
     -- Import the xml
     DBMS_CUBE.IMPORT_XML(in_xml);
END;
/
```

VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

```
DBMS_CUBE.VALIDATE_XML
       (IN_XML                IN  CLOB );
```

Parameters

Table 36–5 VALIDATE_XML Procedure Parameters

Parameter	Description
IN_XML	The name of a CLOB containing an XML template.

Usage Notes

The XML template must be loaded into a CLOB (see Example).

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example loads an XML template into a temporary CLOB, then validates it. The script is named GLOBAL.XML, and it is located in a database directory named XML_DIR.

```
DEFINE xml_file = 'GLOBAL.XML';

SET ECHO ON;
SET SERVEROUT ON;

DECLARE
     xml_file     BFILE := bfilename('XML_DIR', '&xml_file');
     in_xml       CLOB;
     out_xml      CLOB := NULL;
     dest_offset  INTEGER := 1;
     src_offset   INTEGER := 1;
     lang_context INTEGER := 0;
     warning      INTEGER;
BEGIN
     -- Setup the clob from a file
     DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
     DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
     DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
     DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
        dest_offset, src_offset, 0, lang_context, warning);

     -- Validate the xml
     DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
```

DBMS_CUBE_ADVISE

DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topic:

- Summary of DBMS_CUBE_ADVISE Subprograms

> **See Also:** *Oracle OLAP User's Guide* for information about cube materialized views.

Summary of DBMS_CUBE_ADVISE Subprograms

Table 37–1 Summary of DBMS_CUBE_ADVISE Subprograms

Subprogram	Description
MV_CUBE_ADVICE Function on page 37-3	Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.
SET_CNS_EXCEPTION_LOG Procedure on page 37-6	Identifies the name of an exception log used in validated constraints generated by `MV_CUBE_ADVICE`.
TRACE Procedure on page 37-7	Displays or suppresses diagnostic messages for `MV_CUBE_ADVICE`.

MV_CUBE_ADVICE Function

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

Syntax

```
DBMS_CUBE_ADVISE.MV_CUBE_ADVICE (
          owner        IN  VARCHAR2  DEFAULT USER,
          mvname       IN  VARCHAR2,
          reqtype      IN  VARCHAR2  DEFAULT '0',
          validate     IN  NUMBER    DEFAULT 0)
     RETURN COAD_ADVICE_T  PIPELINED;
```

Parameters

Table 37–2 MV_CUBE_ADVICE Function Parameters

Parameter	Description
owner	Owner of the cube materialized view
mvname	Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB$UNITS_CUBE
reqtype	Type of advice to generate: ■ 0: All applicable advice types ■ 1: Column NOT NULL constraints ■ 2: Primary key constraints ■ 3: Foreign key constraints ■ 4: Relational dimension objects ■ 5: Cube materialized view logs with primary key
validate	Validation option: ■ 0: Validate the constraints ■ 1: Do not validate the constraints

Returns

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC. Table 37–3 describes the columns.

Table 37–3 MV_CUBE_ADVICE Return Values

Column	Data Type	Description
OWNER	VARCHAR2(30)	Owner of the dimensional object identified in APIOBJECT.
APIOBJECT	VARCHAR2(30)	Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.
SQLOBJOWN	VARCHAR2(30)	Owner of the relational object identified in SQLOBJECT.
SQLOBJECT	VARCHAR2(65)	Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB$UNITS_CUBE.

Table 37–3 (Cont.) MV_CUBE_ADVICE Return Values

Column	Data Type	Description
ADVICETYPE	NUMBER(38,0)	Type of recommendation: ■ 1: Create NOT NULL constraints on the foreign key columns ■ 2: Create primary key constraints on the master table ■ 3: Create primary key constraints on the master view ■ 4: Create foreign key constraints on the master table ■ 5: Create foreign key constraints on the master view ■ 6: Create relational dimensions on the master dimension tables ■ 7: Create a materialized view log ■ 8: Compile the materialized view
DISPOSITION	CLOB	Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed.
SQLTEXT	CLOB	SQL statement that implements the recommendation.
DROPTEXT	CLOB	SQL statement that reverses SQLTEXT. Pre-existing conditions may prevent these statements from restoring the schema to its previous state.

Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

MV_CUBE_ADVICE generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

Examples

The following query displays the SQL statements recommended by MV_CUBE_ADVICE. UNITS_FACT is the master table for UNITS_CUBE, and MV_CUBE_ADVICE generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB$UNITS_CUBE cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
      FROM TABLE(dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'));

APIOBJECT    SQLOBJECT       SQLTEXT
------------ --------------- --------------------------------------------
UNITS_CUBE   UNITS_FACT      alter table "GLOBAL"."UNITS_FACT" add constra
                             int "COAD_PK000208" PRIMARY KEY ("CHANNEL_ID"
```

```
                                , "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") rely d
                                isable novalidate

UNITS_CUBE    CB$UNITS_CUBE     alter materialized view "GLOBAL"."CB$UNITS_CU
                                BE" compile
```

SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.

Syntax

```
DBMS_CUBE_ADVISE.SET_CNS_EXCEPTION_LOG (
       exceptlogtab     IN   VARCHAR2  DEFAULT user.EXCEPTIONS);
```

Parameters

Table 37–4 SET_CNS_EXCEPTION_LOG Procedure Parameters

Parameter	Description
exceptlogtab	The name of an existing exception log.

Usage Notes

To create an exception log, use the utlexcpt.sql or the utlexpt1.sql script before executing SET_CNS_EXCEPTION_LOG.

The validate parameter of MV_CUBE_ADVICE must be set to 1.

Examples

The utlexcpt.sql script creates a table named EXCEPTIONS, and the SET_CNS_EXCEPTION_LOG procedure identifies it as the exception log for MV_CUBE_ADVICE. The ALTER TABLE statement now includes the clause VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS".

```
SQL> @utlexcpt
Table created.

SQL> EXECUTE dbms_cube_advise.set_cns_exception_log;
PL/SQL procedure successfully completed.

SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
     FROM TABLE(
     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));

APIOBJECT    SQLOBJECT       TYPE SQLTEXT
------------ --------------- ---- ------------------------------------------------
UNITS_CUBE   UNITS_FACT         2 alter table "GLOBAL"."UNITS_FACT" add constrai
                                  nt "COAD_PK000219" PRIMARY KEY ("CHANNEL_ID",
                                  "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") norely en
                                  able validate exceptions into "GLOBAL"."EXCEPT
                                  IONS"

UNITS_CUBE   CB$UNITS_CUBE      8 alter materialized view "GLOBAL"."CB$UNITS_CUB
                                  E" compile
```

TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the MV_CUBE_ADVICE function.

Syntax

```
DBMS_CUBE_ADVISE.TRACE (
     diaglevel       IN  BINARY_INTEGER DEFAULT 0);
```

Parameters

Table 37–5 TRACE Procedure Parameters

Parameter	Description
diaglevel	0 to turn tracing off, or 1 to turn tracing on.

Examples

The following example directs the diagnostic messages to server output. The SQL*Plus SERVEROUTPUT setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
DBMS_COAD_DIAG: Changing diagLevel from [0] to [1]

PL/SQL procedure successfully completed.

SQL> SELECT sqlobject, sqltext, droptext
     FROM TABLE(
     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))
     WHERE apiobject='UNITS_CUBE';

SQLOBJECT       SQLTEXT                                  DROPTEXT
--------------- ---------------------------------------- ----------------------------------------
UNITS_FACT      alter table "GLOBAL"."UNITS_FACT" add co alter table "GLOBAL"."UNITS_FACT" drop c
                nstraint "COAD_PK000222" PRIMARY KEY ("C onstraint "COAD_PK000222" cascade
                HANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MO
                NTH_ID") rely disable novalidate

CB$UNITS_CUBE   alter materialized view "GLOBAL"."CB$UNI alter materialized view "GLOBAL"."CB$UNI
                TS_CUBE" compile                         TS_CUBE" compile

DBMS_DATA_MINING

Oracle Data Mining is an analytical technology for deriving actionable information from large data stores. You can use Oracle Data Mining to evaluate the probability of future events and discover unsuspected associations and groupings within your data.

The `DBMS_DATA_MINING` package is the primary interface to Oracle Data Mining. A Java API is layered on the PL/SQL API. Oracle Data Mining also supports a family of SQL functions for deploying data mining models.

See Also:

- Chapter 39, "DBMS_DATA_MINING_TRANSFORM". This package supports data pre-processing for data mining models.
- Chapter 90, "DBMS_PREDICTIVE_ANALYTICS". This package supports several routines that perform automated data mining.
- *Oracle Database SQL Language Reference* for information about the SQL Data Mining functions.
- *Oracle Data Mining Concepts* for an overview of Oracle Data Mining.
- *Oracle Data Mining Concepts* for new features in 11*g* Release 1 (11.1.).

This chapter contains the following topics:

- Using DBMS_DATA_MINING
  - Overview
  - Mining Model Objects
  - Deprecated Subprograms
  - Mining Function Constants
  - Settings Table
  - Data Types
- Summary of DBMS_DATA_MINING Subprograms

Using DBMS_DATA_MINING

This section contains topics that relate to using the `DBMS_DATA_MINING` package.

- Overview
- Mining Model Objects
- Deprecated Subprograms
- Mining Function Constants
- Settings Table
- Data Types

Overview

Oracle Data Mining supports both **supervised** and **unsupervised** data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target.

> **See Also:** *Oracle Data Mining Concepts* for background information on supervised and unsupervised data mining, and for additional information about Data Mining functions and algorithms.

A data mining **function** refers to the methods for solving a given class of data mining problems. The mining function must be specified when a model is created. See "Mining Function Constants" on page 38-8.

> **Note on Terminology:** In data mining terminology, a *function* is a general type of problem to be solved by a given approach to data mining. In SQL language terminology, a *function* is an operator that returns a value.
>
> In Oracle Data Mining documentation, the term *function*, or *mining function* refers to a data mining function; the term *SQL function* or *SQL Data Mining function* refers to a SQL function for scoring (deploying) data mining models. The SQL Data Mining functions are documented in *Oracle Database SQL Language Reference*.

Supervised data mining functions include:

- Classification
- Regression
- Attribute Importance

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction

The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in Table 38–1.

Table 38–1 Oracle Data Mining Algorithms

Algorithm	Abbreviation	Function
Adaptive Bayes Network (deprecated)	ABN	Classification
Apriori	AP	Association
Decision Tree	DT	Classification
Generalized Linear Model	GLM	Classification and regression
k-Means (default clustering algorithm)	KM	Clustering
Minimal Descriptor Length	MDL	Attribute Importance

Table 38–1 (Cont.) Oracle Data Mining Algorithms

Algorithm	Abbreviation	Function
Naive Bayes (default classification algorithm)	NB	Classification
Non-Negative Matrix Factorization	NMF	Feature Extraction
Orthogonal Partitioning Clustering	O-Cluster	Clustering
Support Vector Machine (default regression algorithm)	SVM	Classification and regression (and anomaly detection through classification)

Mining Model Objects

Mining models are Oracle Database schema objects. They support the standard security features of Oracle Database. Mining models are also supported by SQL `COMMENT` and SQL `AUDIT`.

See Also:

- *Oracle Data Mining Administrator's Guide* for information about mining model objects, SQL `COMMENT`, and SQL `AUDIT`.
- *Oracle Data Mining Administrator's Guide* for information about mining model security
- *Oracle Data Mining Administrator's Guide* for information about the sample Data Mining programs.

ALL_MINING_MODELS

You can query the data dictionary view `ALL_MINING_MODELS` to obtain a list of accessible mining models.

Example 38–1 ALL_MINING_MODELS

```
SQL> describe all_mining_models
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 OWNER                                     NOT NULL VARCHAR2(30)
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 MINING_FUNCTION                                    VARCHAR2(30)
 ALGORITHM                                          VARCHAR2(30)
 CREATION_DATE                             NOT NULL DATE
 BUILD_DURATION                                     NUMBER
 MODEL_SIZE                                         NUMBER
 COMMENTS                                           VARCHAR2(4000)
```

See Also: *Oracle Data Mining Application Developer's Guide* for more information about `ALL_MINING_MODELS`.

Mining Model Naming Restrictions

The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

- It must be 25 or fewer characters long.
- It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in *Oracle Database SQL Language Reference*.

ALL_MINING_MODEL_ATTRIBUTES

You can query the data dictionary view `ALL_MINING_MODEL_ATTRIBUTES` to obtain a list of the **data attributes** for each accessible mining model. Data attributes are the

columns of data used by an algorithm to build a model. Some or all of these columns must be present in the data to which the model is applied.

Data attributes are referred to as the **model signature**. The ALL_MINING_MODEL_ATTRIBUTES view lists the data attributes in the model signature plus the target if the model is supervised.

An algorithm builds an internal representation of the data attributes and uses them as either **categoricals** (data that classifies or categorizes) or as **numericals** (continuous data). These internal **model attributes** can be viewed using the GET_MODEL_DETAILS functions.

Example 38–2 ALL_MINING_MODEL_ATTRIBUTES

```
SQL> describe all_mining_model_attributes
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 OWNER                                     NOT NULL VARCHAR2(30)
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 ATTRIBUTE_NAME                            NOT NULL VARCHAR2(30)
 ATTRIBUTE_TYPE                                     VARCHAR2(11)
 DATA_TYPE                                          VARCHAR2(12)
 DATA_LENGTH                                        NUMBER
 DATA_PRECISION                                     NUMBER
 DATA_SCALE                                         NUMBER
 USAGE_TYPE                                         VARCHAR2(8)
 TARGET                                             VARCHAR2(3)
```

See Also: *Oracle Data Mining Application Developer's Guide* for more information about attributes and ALL_MINING_MODEL_ATTRIBUTES.

ALL_MINING_MODEL_SETTINGS

The view ALL_MINING_MODEL_SETTINGS returns the **settings** for each accessible mining model. Settings control various characteristics of mining models.

All settings have default values. The values of some settings are generated by the algorithm by default. You can override the default value of a setting by specifying its value in a settings table for the model. All settings, both default and user-specified, are listed in ALL_MINING_MODEL_SETTINGS.

Example 38–3 ALL_MINING_MODEL_SETTINGS

```
SQL> describe all_mining_model_settings
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 OWNER                                     NOT NULL VARCHAR2(30)
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 SETTING_NAME                              NOT NULL VARCHAR2(30)
 SETTING_VALUE                                      VARCHAR2(4000)
 SETTING_TYPE                                       VARCHAR2(7)
```

See Also:

- Settings Table on page 38-9
- *Oracle Data Mining Application Developer's Guide* for more information about ALL_MINING_MODEL_SETTINGS

Deprecated Subprograms

The following subprograms are deprecated in 11*g* Release 1 (11.1.).

- `GET_DEFAULT_SETTINGS`

  Replaced with data dictionary views:
  `USER/ALL/DBA_MINING_MODEL_SETTINGS`

- `GET_MODEL_SETTINGS`

  Replaced with data dictionary views:
  `USER/ALL/DBA_MINING_MODEL_SETTINGS`

- `GET_MODEL_SIGNATURE`

  Replaced with data dictionary views:
  `USER/ALL/DBA_MINING_MODEL_ATTRIBUTES`

The following view is deprecated in 11*g* Release 1 (11.1.).

- `DM_USER_MODELS`

  Replaced with data dictionary views: `USER/ALL/DBA_MINING_MODELS`

The Adaptive Bayes Network algorithm is deprecated in 11*g* Release 1 (11.1.).

> **Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The `DMSYS` schema no longer exists in 11*g* Release 1 (11.1.). Oracle Data Mining metadata is now in `SYS`.

Mining Function Constants

The constants that specify the mining function of a model are listed in Table 38–2. The concept of a "mining function" is introduced in "Overview" on page 38-3.

All models are created with a mining function. The mining function is a required argument to the **CREATE_MODEL Procedure**.

Table 38–2 Mining Functions

Value	Description
`ASSOCIATION`	Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. Association models use the Apriori algorithm.
`ATTRIBUTE_IMPORTANCE`	Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. Attribute Importance models use the Minimal Descriptor Length algorithm.
`CLASSIFICATION`	Classification is a predictive mining function. A classification model uses historical data to predict a categorical target. Classification models can use: Naive Bayes, Adaptive Bayes Network (deprecated), Decision Tree, Logistic Regression, or Support Vector Machine algorithms. The default is Naive Bayes. The classification function can also be used for **anomaly detection**. In this case, the SVM algorithm with a null target is used (One-Class SVM).
`CLUSTERING`	Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set. Clustering models can use: *k*-Means or O-Cluster algorithms. The default is *k*-Means.
`FEATURE_EXTRACTION`	Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model. Feature extraction models use the Non-Negative Matrix Factorization algorithm.
`REGRESSION`	Regression is a predictive mining function. A regression model uses historical data to predict a numerical target. Regression models can use Support Vector Machine or Linear Regression. The default is Support Vector Machine.

Settings Table

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and data types shown in Table 38–3.

Table 38–3 Required Columns in the Model Settings Table

Column Name	Data Type
SETTING_NAME	VARCHAR2(30)
SETTING_VALUE	VARCHAR2(4000)

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the CREATE_MODEL Procedure.

You can find the settings used by a model by querying the data dictionary view ALL_MINING_MODEL_SETTINGS. This view lists all the model settings used by the mining models to which you have access. All the setting values are included in the view, whether default or user-specified. See "ALL_MINING_MODEL_SETTINGS" on page 38-6.

Algorithm Name Setting

The **ALGO_NAME** setting specifies the model algorithm. Oracle Data Mining supports more than one algorithm for the classification, regression, and clustering mining functions. Each of these mining functions has a default algorithm, as shown in Table 38–4.

Table 38–4 Default Algorithms

Mining Function	Default Algorithm
Classification	Naive Bayes
Regression	Support Vector Machine
Clustering	*k*-Means

The values for the ALGO_NAME setting are listed in Table 38–5.

Table 38–5 Algorithm Names

ALGO_NAME Value	Description	Mining Function
ALGO_ADAPTIVE_BAYES_NETWORK	Adaptive Bayes Network (deprecated)	Classification
ALGO_DECISION_TREE	Decision Tree	Classification
ALGO_NAIVE_BAYES	Naive Bayes	Classification
ALGO_GENERALIZED_LINEAR_MODEL	Generalized Linear Model	Classification and Regression
ALGO_SUPPORT_VECTOR_MACHINES	Support Vector Machine	Classification and Regression
ALGO_KMEANS	Enhanced *k*_Means	Clustering
ALGO_O_CLUSTER	O-Cluster	Clustering

Table 38–5 (Cont.) Algorithm Names

ALGO_NAME Value	Description	Mining Function
ALGO_AI_MDL	Minimum Description Length	Attribute Importance
ALGO_APRIORI_ASSOCIATION_RULES	Apriori	Association Rules
ALGO_NONNEGATIVE_MATRIX_FACTOR	Non-Negative Matrix Factorization	Feature Extraction

Automatic Data Preparation Setting

The **PREP_AUTO** setting indicates whether or not the model will use Automatic Data Preparation (ADP). By default ADP is disabled.

When you enable ADP, the model uses heuristics to transform the build data according to the requirements of the algorithm. The transformation instructions are stored with the model and reused whenever the model is applied. You can view the transformation instructions in the model details.

You can choose to supplement automatic data preparations by specifying additional transformations in the `xform_list` parameter when you build the model. (See "CREATE_MODEL Procedure" on page 38-40.)

If you do not use ADP (default) *and* do not specify transformations in the `xform_list` parameter to `CREATE_MODEL` (also the default), you will continue to operate in 10.2 mode. This means that you must implement your own transformations separately in the build, test, and scoring data; you must take special care to implement the exact same transformations in each data set.

If you do not use ADP, but you *do* specify transformations in the `xform_list` parameter to `CREATE_MODEL`, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data. Because of automatic and embedded data preparation, mining models are known as **supermodels**.

The values for the `PREP_AUTO` setting are described in Table 38–6.

Table 38–6 Automatic Data Preparation Setting

PREP_AUTO =	Description
PREP_AUTO_OFF	Disable Automatic Data Preparation (default).
PREP_AUTO_ON	Enable Automatic Data Preparation.

See Also: *Oracle Data Mining Concepts* for information about data preparation.

Mining Function Settings

The settings described in Table 38–7 apply to a mining function.

Table 38–7 Mining Function Settings

Setting Name	Setting Value	Description
ASSO_MAX_RULE_LENGTH	TO_CHAR(2<= *numeric_expr* <=20)	Maximum rule length for association rules. Default is 4.
ASSO_MIN_CONFIDENCE	TO_CHAR(0<= *numeric_expr* <=1)	Minimum confidence for association rules. Default is 0.1.
ASSO_MIN_SUPPORT	TO_CHAR(0<= *numeric_expr* <=1)	Minimum support for association rules. Default is 0.1.

Table 38–7 (Cont.) Mining Function Settings

Setting Name	Setting Value	Description
CLAS_COST_TABLE_NAME	*table_name*	(Decision Tree only) Name of a table that stores the cost matrix for a Decision Tree model. The cost matrix specifies the cost of misclassifications. Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See *Oracle Data Mining Concepts* for the column requirements and for additional information.
CLAS_PRIORS_TABLE_NAME	*table_name*	(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. SVM classification uses the priors table for weights. The priors table is user-created. See *Oracle Data Mining Concepts* for the column requirements and for additional information.
CLUS_NUM_CLUSTERS	*TO_CHAR(numeric_expr >=1)*	Number of clusters generated by a clustering algorithm. Default is 10.
CLAS_WEIGHTS_TABLE_NAME	*table_name*	Name of a table that stores weighting information for individual target values in a GLM classification model. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See *Oracle Data Mining Concepts* for the column requirements and for additional information.
FEAT_NUM_FEATURES	TO_CHAR(*numeric_expr* >=1)	Number of features to be extracted by a feature extraction model. The default is estimated from the data by the algorithm.

See Also: *Oracle Data Mining Concepts* for information about mining functions

Global Settings

The settings in Table 38–8 are applicable to any type of model, but are currently only implemented for GLM.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–8 Global Settings

Setting Name	Setting Value	Description
ODMS_MISSING_VALUE_TREATMENT	ODMS_MISSING_VALUE_MEAN_MODE	(GLM only) How to treat missing values in the training data. This setting does not affect the scoring data.
	ODMS_MISSING_VALUE_DELETE_ROW	Oracle Data Mining replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time. You can set ODMS_MISSING_VALUE_TREATMENT to ODMS_MISSING_VALUE_DELETE_ROW to override this behavior in the training data. When ODMS_MISSING_VALUE_TREATMENT is set to ODMS_MISSING_VALUE_DELETE_ROW, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, you must perform the transformation explicitly. For instructions, see *Oracle Data Mining Concepts*.
		The value ODMS_MISSING_VALUE_DELETE_ROW is only valid for tables without nested columns. If this value is used with nested data, an exception is raised.
ODMS_ROW_WEIGHT_COLUMN_NAME	*column_name*	(GLM only) Name of a column in the training data that contains a weighting factor for the rows.
		Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data.

See Also: *Oracle Data Mining Concepts* for information about GLM.

Algorithm Settings: Adaptive Bayes Network (deprecated)

These settings affect the behavior of the Adaptive Bayes Network algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–9 ABN Settings

Setting	Value	Description
ABNS_MAX_BUILD_MINUTES	TO_CHAR(*numeric_expr* >=0)	Maximum time to complete an ABN model build. Default is 0, which implies no time limit.
ABNS_MAX_NB_PREDICTORS	TO_CHAR(*numeric_expr* >0)	Maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type abns_naive_bayes. Default is 10.
ABNS_MAX_PREDICTORS	TO_CHAR(*numeric_expr* >0)	Maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type abns_single_feature or abns_multi_feature. Default is 25.
ABNS_MODEL_TYPE	ABNS_MULTI_FEATURE ABNS_NAIVE_BAYES ABNS_SINGLE_FEATURE	Type of ABN model. The default is multi_feature.

Algorithm Settings: Decision Tree

These settings affect the behavior of the Decision Tree algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–10 Decision Tree Settings

Setting	Value	Description
TREE_IMPURITY_METRIC	TREE_IMPURITY_ENTROPY	Tree impurity metric for Decision Tree.
	TREE_IMPURITY_GINI	Tree algorithms seek the best test question for splitting data at each node. The best splitter and split value are those that result in the largest increase in target value homogeneity (purity) for the entities in the node. Purity is measured in accordance with a metric. Decision trees can use either gini (TREE_IMPURITY_GINI) or entropy (TREE_IMPURITY_ENTROPY) as the purity metric. By default, the algorithm uses gini.
TREE_TERM_MAX_DEPTH	TO_CHAR(2<= *numeric_expr* <=20)	Criteria for splits: maximum tree depth (the maximum number of nodes between the root and any leaf node, including the leaf node).
		Default is 7.
TREE_TERM_MINPCT_MODE	TO_CHAR(0<= *numeric_expr* <=10)	No child shall have fewer records than this number, which is expressed as a percentage of the training rows.
		Default is 0.05, indicating 0.05%.
TREE_TERM_MINPCT_SPLIT	TO_CHAR(0 <= *numeric_expr* <=20)	Criteria for splits: minimum number of records in a parent node expressed as a percent of the total number of records used to train the model. No split is attempted if number of records is below this value.
		Default is 0.1, indicating 0.1%.
TREE_TERM_MINREC_NODE	TO_CHAR(*numeric_expr* >=0)	No child shall have fewer records than this number.
		Default is 10.
TREE_TERM_MINREC_SPLIT	TO_CHAR(numeric_expr >=0)	Criteria for splits: minimum number of records in a parent node expressed as a value. No split is attempted if number of records is below this value.
		Default is 20.

Algorithm Settings: Generalized Linear Models

These settings affect the behavior of GLM models. GLM can be used for classification (logistic regression) or regression (linear regression).

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–11 GLM Settings

Setting Name	Setting Value	Description
GLMS_CONF_LEVEL	TO_CHAR(0< *numeric_expr* <1)	The confidence level for coefficient confidence intervals. The default confidence level is 0.95.
GLMS_DIAGNOSTICS_TABLE_NAME	*table_name*	The name of a table to contain row-level diagnostic information for a GLM model. The table is created during model build. If you want to create a diagnostics table, you must specify a case ID when you build the model. (See the CREATE_MODEL Procedure.) If you specify a diagnostics table but do not provide a case ID, an exception is raised. For information on GLM diagnostics, see *Oracle Data Mining Concepts*.
GLMS_REFERENCE_CLASS_NAME	*target_value*	The target value to be usedas the reference value in a logistic regression model. Probabilities will be produced for the other (non-reference) class. By default, the algorithm chooses the value with the highest prevalence (the most cases) for the reference class.
GLMS_RIDGE_REGRESSION	GLMS_RIDGE_REG_ENABLE GLMS_RIDGE_REG_DISABLE	Whether or not ridge regression will be enabled. By default, the algorithm determines whether or not to use ridge. You can explicitly enable ridge by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE. Ridge applies to both regression and classification mining functions. When ridge is enabled, no prediction bounds are produced by the PREDICTION_BOUNDS SQL operator.
GLMS_RIDGE_VALUE	TO_CHAR(0< *numeric_expr)*	The value for the ridge parameter used by the algorithm. This setting is only used when you explicitly enable ridge regression by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE. If ridge regression is enabled internally by the algorithm, the ridge parameter is determined by the algorithm.
GLMS_VIF_FOR_RIDGE	GLMS_VIF_RIDGE_ENABLE GLMS_VIF_RIDGE_DISABLE	(Linear regression only) Whether or not to produce Variance Inflation Factor (VIF) statistics when ridge is being used. By default, VIF is not produced when ridge is enabled. When you explicitly enable ridge regression by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE, you can request VIF statistics by setting GLMS_VIF_FOR_RIDGE to GLMS_VIF_RIDGE_ENABLE; the algorithm will produce VIF if enough system resources are available.

See Also: *Oracle Data Mining Concepts* for information about GLM.

Algorithm Settings: *k*-Means

These settings affect the behavior of the *k*-Means algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–12 k-Means Settings

Setting Name	Setting Value	Description
KMNS_BLOCK_GROWTH	TO_CHAR(1< *numeric_expr* <=5)	Growth factor for memory allocated to hold cluster data Default value is 2
KMNS_CONV_TOLERANCE	TO_CHAR(0< *numeric_expr* <=0.5)	Convergence tolerance for *k*-Means algorithm Default is 0.01
KMNS_DISTANCE	KMNS_COSINE KMNS_EUCLIDEAN KMNS_FAST_COSINE	Distance Function for *k*-Means Clustering. The default is euclidean.
KMNS_ITERATIONS	TO_CHAR(0< *numeric_expr* <=20)	Number of iterations for *k*-Means algorithm Default is 3
KMNS_MIN_PCT_ATTR_SUPPORT	TO_CHAR(0<= *numeric_expr* <=1)	The fraction of attribute values that must be non-null in order for the attribute to be included in the rule description for the cluster. Setting the parameter value too high in data with missing values can result in very short or even empty rules. Default is 0.1.
KMNS_NUM_BINS	TO_CHAR(*numeric_expr* >0)	Number of histogram bins. Specifies the number of bins in the attribute histogram produced by *k*-Means. The bin boundaries for each attribute are computed globally on the entire training data set. The binning method is equi-width. All attributes have the same number of bins with the exception of attributes with a single value that have only one bin. Default is 10.
KMNS_SPLIT_CRITERION	KMNS_SIZE KMNS_VARIANCE	Split criterion for *k*-Means Clustering. The default criterion is the variance.

See Also: *Oracle Data Mining Concepts* for information about *k*-Means.

Algorithm Settings: Naive Bayes

These settings affect the behavior of the Naive Bayes Algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–13 Naive Bayes Settings

Setting Name	Setting Value	Description
NABS_PAIRWISE_THRESHOLD	TO_CHAR(0<= *numeric_expr* <=1)	Value of pairwise threshold for NB algorithm Default is 0.01.
NABS_SINGLETON_THRESHOLD	TO_CHAR(0<= *numeric_expr* <=1)	Value of singleton threshold for NB algorithm Default value is 0.01

See Also: *Oracle Data Mining Concepts* for information about Naive Bayes

Algorithm Settings: Non-Negative Matrix Factorization

These settings affect the behavior of the Non-Negative Matrix Factorization algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–14 NMF Settings

Setting Name	Setting Value	Description
NMFS_CONV_TOLERANCE	TO_CHAR(0< *numeric_expr* <=0.5)	Convergence tolerance for NMF algorithm Default is 0.05
NMFS_NUM_ITERATIONS	TO_CHAR(1 <= *numeric_expr* <=500)	Number of iterations for NMF algorithm Default is 50
NMFS_RANDOM_SEED	TO_CHAR(*numeric_expr*)	Random seed for NMF algorithm. Default is –1.

See Also: *Oracle Data Mining Concepts* for information about NMF

Algorithm Settings: O-Cluster

These settings affect the behavior of the O-Cluster algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–15 O-CLuster Settings

Setting Name	Setting Value	Description
OCLT_MAX_BUFFER	TO_CHAR(*numeric_expr* >0)	Buffer size for O-Cluster. Default is 50,000.
OCLT_SENSITIVITY	TO_CHAR(0 <=*numeric_expr* <=1)	A fraction that specifies the peak density required for separating a new cluster. The fraction is related to the global uniform density. Default is 0.5.

See Also: *Oracle Data Mining Concepts* for information about O-Cluster.

Algorithm Settings: Support Vector Machine

These settings affect the behavior of the Support Vector Machine algorithm. SVM can be used for classification or regression, or for anomaly detection (classification with a null target).

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–16 SVM Settings

Setting Name	Setting Value	Description
SVMS_ACTIVE_LEARNING	SVMS_AL_DISABLE SVMS_AL_ENABLE	Whether active learning is enabled or disabled. By default, active learning is enabled. When active learning is enabled, the SVM algorithm uses active learning to build a reduced size model. When active learning is disabled, the SVM algorithm builds a standard model.
SVMS_COMPLEXITY_FACTOR	TO_CHAR(*numeric_expr* >0)	Value of complexity factor for SVM algorithm (both classification and regression). Default value estimated from the data by the algorithm.
SVMS_CONV_TOLERANCE	TO_CHAR(*numeric_expr* >0)	Convergence tolerance for SVM algorithm. Default is 0.001.
SVMS_EPSILON	TO_CHAR(*numeric_expr* >0)	Value of epsilon factor for SVM regression. Default value estimated from the data by the algorithm.
SVMS_KERNEL_CACHE_SIZE	TO_CHAR(*numeric_expr* >0)	Value of kernel cache size for SVM algorithm. Applies to Gaussian kernel only. Default is 50000000 bytes.
SVMS_KERNEL_FUNCTION	svm_gaussian svms_linear	Kernel for Support Vector Machine. The default is determined by the algorithm based on the number of attributes in the training data. When there are many attributes, the algorithm uses a linear kernel, otherwise it uses a nonlinear (Gaussian) kernel. The number of attributes does not correspond to the number of columns in the training data. The algorithm explodes categorical attributes to binary, numeric attributes. In addition, Oracle Data Mining handles each row in a nested column as a separate attribute. SVM takes these factors into account when choosing the kernel function.
SVMS_OUTLIER_RATE	TO_CHAR(*0*< *numeric_expr* <1)	The desired rate of outliers in the training data. Valid for One-Class SVM models only (anomaly detection). Default is.1.
SVMS_STD_DEV	TO_CHAR(*numeric_expr* >0)	Value of standard deviation for SVM algorithm. This is applicable only for Gaussian kernel. Default value estimated from the data by the algorithm.

See Also: *Oracle Data Mining Concepts* for information about SVM.

Data Types

The DBMS_DATA_MINING package uses object data types to store information about model attributes. Most of these types are returned by the table functions GET_*n*, where *n* identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows.

For a list of the GET functions, see "Summary of DBMS_DATA_MINING Subprograms" on page 38-21.

Oracle Data Mining also uses object data types for handling transactional data. These types, DM_NESTED_NUMERICALS and DM_NESTED_CATEGORICALS specify nested tables that can be used for storing a set of mining attributes in a single column. For more information on nested tables, see the *Oracle Data Mining Application Developer's Guide*.

All the table functions use **pipelining**, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL Language Reference.*

The Data Mining object data types are described in Table 38–17.

Table 38–17 DBMS_DATA_MINING Summary of Data Types

Data Type	Description
DM_ABN_DETAIL	Information about an attribute in an Adaptive Bayes Network model.
DM_ABN_DETAILS	A collection of DM_ABN_DETAIL. Returned by GET_MODEL_DETAILS_ABN Function.
DM_CENTROID	The centroid of a cluster.
DM_CENTROIDS	A collection of DM_CENTROID. A member of DM_CLUSTER.
DM_CHILD	A child node of a cluster.
DM_CHILDREN	A collection of DM_CHILD. A member of DM_CLUSTER.
DM_CLUSTER	A cluster. A cluster includes DM_PREDICATES, DM_CHILDREN, DM_CENTROIDS, and DM_HISTOGRAMS. It also includes a DM_RULE.
DM_CLUSTERS	A collection of DM_CLUSTER. Returned by GET_MODEL_DETAILS_KM Function and GET_MODEL_DETAILS_OC Function.
DM_CONDITIONAL	The conditional probability of an attribute in a Naive Bayes model.
DM_CONDITIONALS	A collection of DM_CONDITIONAL. Returned by GET_MODEL_DETAILS_NB Function.
DM_COST_ELEMENT	The actual and predicted values in a cost matrix.
DM_COST_MATRIX	A collection of DM_COST_ELEMENT. Returned by GET_MODEL_COST_MATRIX Function.
DM_GLM_COEFF	The coefficient and associated statisticsof an attribute in a Generalized Linear Model.
DM_GLM_COEFF_SET	A collection of DM_GLM_COEFF. Returned by GET_MODEL_DETAILS_GLM Function.
DM_HISTOGRAM_BIN	A histogram associated with a cluster.

Table 38–17 (Cont.) DBMS_DATA_MINING Summary of Data Types

Data Type	Description
DM_HISTOGRAMS	A collection of DM_HISTOGRAM_BIN. A member of DM_CLUSTER.
DM_ITEM	An item in an association rule.
DM_ITEMS	A collection of DM_ITEM.
DM_ITEMSET	A collection of DM_ITEMS.
DM_ITEMSETS	A collection of DM_ITEMSET. Returned by GET_FREQUENT_ITEMSETS Function.
DM_MODEL_GLOBAL_DETAIL	High-level statistics about a model.
DM_MODEL_GLOBAL_DETAILS	A collection of DM_MODEL_GLOBAL_DETAIL. Returned by GET_MODEL_DETAILS_GLOBAL Function.
DM_MODEL_SETTING	A model setting.
DM_MODEL_SETTINGS	A collection of DM_MODEL_SETTING. Returned by GET_MODEL_SETTINGS Function and GET_DEFAULT_SETTINGS Function.
DM_MODEL_SIGNATURE_ATTRIBUTE	An attribute in the model signature.
DM_MODEL_SIGNATURE	A collection of DM_MODEL_SIGNATURE. Returned by GET_MODEL_SIGNATURE Function.
DM_NB_DETAIL	Information about an attribute in a Naive Bayes model.
DM_NB_DETAILS	A collection of DM_DB_DETAIL. Returned by GET_MODEL_DETAILS_NB Function.
DM_NESTED_CATEGORICAL	The name and value of a categorical attribute.
DM_NESTED_CATEGORICALS	A collection of DM_NESTED_CATEGORICAL. A collection of attributes defined as a single model attribute. Transactional data must be defined as nested attributes for Data Mining.
DM_NESTED_NUMERICAL	The name and value of a numerical attribute.
DM_NESTED_NUMERICALS	A collection of DM_NESTED_NUMERICAL. A collection of attributes defined as a single model attribute. Transactional data must be defined as nested attributes for Data Mining.
DM_NMF_ATTRIBUTE	An attribute in a feature of a Non-Negative Matrix Factorization model.
DM_NMF_ATTRIBUTE_SET	A collection of DM_NMF_ATTRIBUTE. A member of DM_NMF_FEATURE.
DM_NMF_FEATURE	A feature in a Non-Negative Matrix Factorization model.
DM_NMF_FEATURE_SET	A collection of DM_NMF_FEATURE. Returned by GET_MODEL_DETAILS_NMF Function.
DM_PREDICATE	Antecedent and consequent attributes.
DM_PREDICATES	A collection of DM_PREDICATE. A member of DM_RULE, DM_CLUSTER, and DM_ABN_DETAIL.
DM_RANKED_ATTRIBUTE	An attribute ranked by its importance in an Attribute Importance model.
DM_RANKED_ATTRIBUTES	A collection of DM_RANKED_ATTRIBUTE. Returned by GET_MODEL_DETAILS_AI Function.

Table 38–17 (Cont.) DBMS_DATA_MINING Summary of Data Types

Data Type	Description
DM_RULE	A rule that defines a conditional relationship. The rule can be one of the association rules returned by GET_ASSOCIATION_RULES Function, or it can be a rule associated with a cluster in the collection of clusters returned by GET_MODEL_DETAILS_KM Function and GET_MODEL_DETAILS_OC Function.
DM_RULES	A collection of DM_RULE. Returned by GET_ASSOCIATION_RULES Function.
DM_SVM_ATTRIBUTE	The name, value, and coefficient of an attribute in a Support Vector Machine model.
DM_SVM_ATTRIBUTE_SET	A collection of DM_SVM_ATTRIBUTE. Returned by GET_MODEL_DETAILS_SVM Function. Also a member of DM_SVM_LINEAR_COEFF.
DM_SVM_LINEAR_COEFF	The linear coefficient of each attribute in a Support Vector Machine model.
DM_SVM_LINEAR_COEFF_SET	A collection of DM_SVM_LINEAR_COEFF. Returned by GET_MODEL_DETAILS_SVM Function for an SVM model built using the linear kernel.
DM_TRANSFORM	The transformation and reverse transformation expressions for an attribute.
DM_TRANSFORMS	A collection of DM_TRANSFORM. Returned by GET_MODEL_TRANSFORMATIONS Function.
TRANSFORM_LIST	A list of user-specified transformations for a model. Accepted as a parameter by the CREATE_MODEL Procedure. This collection type is defined in the DBMS_DATA_MINING_TRANSFORM package.

Summary of DBMS_DATA_MINING Subprograms

Table 38–18 summarizes the subprograms included in the `DBMS_DATA_MINING` package.

Table 38–18 DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
ADD_COST_MATRIX Procedure on page 38-23	Adds a cost matrix to a classification model
ALTER_REVERSE_EXPRESSION Procedure on page 38-25	Changes the reverse transformation expression to an expression that you specify
APPLY Procedure on page 38-27	Applies a model to a data set (scores the data)
COMPUTE_CONFUSION_MATRIX Procedure on page 38-30	Computes the confusion matrix from the `APPLY` results on test data for a classification model; also provides the accuracy of the model
COMPUTE_LIFT Procedure on page 38-33	Computes lift for a given positive target value from the `APPLY` results on test data for a classification model
COMPUTE_ROC Procedure on page 38-36	Computes Receiver Operating Characteristic (ROC) for a classification model
CREATE_MODEL Procedure on page 38-40	Creates (builds) a model
DROP_MODEL Procedure on page 38-43	Drops a model
EXPORT_MODEL Procedure on page 38-44	Exports a model to a dump file
GET_ASSOCIATION_RULES Function on page 38-47	Returns the rules from an association model
GET_DEFAULT_SETTINGS Function on page 38-50	Returns all the default settings for all mining functions and algorithms
GET_FREQUENT_ITEMSETS Function on page 38-51	Returns the frequent itemsets for an association model
GET_MODEL_COST_MATRIX Function on page 38-53	Returns the cost matrix for a model
GET_MODEL_DETAILS_ABN Function on page 38-55	Returns the details of an Adaptive Bayes Network model
GET_MODEL_DETAILS_AI Function on page 38-57	Returns the details of an Attribute Importance model
GET_MODEL_DETAILS_GLM Function on page 38-58	Returns the details of a Generalized Linear Model
GET_MODEL_DETAILS_GLOBAL Function on page 38-61	Returns high-level statistics about a model
GET_MODEL_DETAILS_KM Function on page 38-64	Returns the details of a *k*-Means model
GET_MODEL_DETAILS_NB Function on page 38-67	Returns the details of a Naive Bayes model
GET_MODEL_DETAILS_NMF Function on page 38-69	Returns the details of an NMF model

Table 38–18 (Cont.) DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
GET_MODEL_DETAILS_OC Function on page 38-70	Returns the details of an O-Cluster model
GET_MODEL_DETAILS_SVM Function on page 38-73	Returns the details of an SVM model with a linear kernel
GET_MODEL_DETAILS_XML Function on page 38-75	Returns the details of a Decision Tree model
GET_MODEL_SETTINGS Function on page 38-76	Returns the settings used to build a model
GET_MODEL_SIGNATURE Function on page 38-77	Returns the signature of a model
GET_MODEL_TRANSFORMATIONS Function on page 38-79	Returns the user-specified transformation definitions embedded in the model, as well as many of the ADP transformations
GET_TRANSFORM_LIST Procedure on page 38-80	Converts between two different transformation specification formats
IMPORT_MODEL Procedure on page 38-81	Imports a model into a user schema
RANK_APPLY Procedure on page 38-84	Ranks the predictions from the `APPLY` results for a classification model
REMOVE_COST_MATRIX Procedure on page 38-87	Removes a cost matrix from a model
RENAME_MODEL Procedure on page 38-88	Renames a model

ADD_COST_MATRIX Procedure

This procedure associates a cost matrix table with a classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes.

The cost matrix is stored with the model and taken into account when the model is scored. The stored cost matrix is the default scoring matrix for the model.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. When an inline cost matrix is specified, it is used instead of the default, stored cost matrix (if one exists).

To obtain the default scoring matrix for a model, use the `GET_MODEL_COST_MATRIX` function. To remove the default scoring matrix from a model, use the `REMOVE_COST_MATRIX` procedure. See "GET_MODEL_COST_MATRIX Function" on page 38-53 and "REMOVE_COST_MATRIX Procedure" on page 38-87.

See Also:

- "Biasing a Classification Model" in *Oracle Data Mining Concepts* for more information about costs
- *Oracle Database SQL Language Reference* for syntax of inline cost matrix

Syntax

```
DBMS_DATA_MINING.ADD_COST_MATRIX (
       model_name                IN VARCHAR2,
       cost_matrix_table_name    IN VARCHAR2,
       cost_matrix_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–19 ADD_COST_MATRIX Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is assumed.
`cost_matrix_table_name`	Name of the cost matrix table (described in Table 38–20).
`cost_matrix_schema_name`	Schema of the cost matrix table. If no schema is specified, the current schema is used.

Usage Notes

1. If the model is not in your schema, then `ADD_COST_MATRIX` requires the `ALTER ANY MINING MODEL` system privilege or the `ALTER` object privilege for the mining model.
2. The cost matrix table must have the columns shown in Table 38–20. Note that the actual and predicted target values must have the same data type.

Table 38–20 Required Columns in a Cost Matrix Table

Column Name	Data Type
`ACTUAL_TARGET_VALUE`	`VARCHAR2(4000)` for categorical targets `NUMBER` for numeric targets

Table 38–20 (Cont.) Required Columns in a Cost Matrix Table

Column Name	Data Type
PREDICTED_TARGET_VALUE	VARCHAR2(4000) for categorical targets NUMBER for numeric targets
COST	NUMBER

3. Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the costs column of the cost matrix table.
4. All classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time.If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 38–7, " Mining Function Settings".

   The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

Example

This example creates a cost matrix table called COSTS_NB and adds it to a Naive Bayes model called NB_SH_CLAS_SAMPLE. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of 1 to misclassifications of customers who do not respond and a cost of 4 to misclassifications of customers who do respond. This means that it is four times more costly to misclassify responders than it is to misclassify non-responders.

```
CREATE TABLE costs_nb (
  actual_target_value           NUMBER,
  predicted_target_value        NUMBER,
  cost                          NUMBER);
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, 1);
INSERT INTO costs_nb values (1, 0, 4);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;

EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
   FROM mining_data_apply_v
   WHERE PREDICTION(nb_sh_clas_sample COST MODEL
      USING cust_marital_status, education, household_size) = 1
   GROUP BY cust_gender
   ORDER BY cust_gender;

C        CNT    AVG_AGE
- ---------- ----------
F         80         39
M        572         43
```

ALTER_REVERSE_EXPRESSION Procedure

This procedure changes a reverse transformation expression to an expression that you specify.

A transformation expression specifies how an attribute will be changed before it is used to create a model. The reverse transformation expression specifies how the attribute will be returned to its original form (or some approximation of its original form) for purposes of model transparency.

The GET_MODEL_DETAILS functions apply reverse transformations before returning information about a model's attributes. When the target is transformed, its reverse transformation is applied to the results of scoring. See the Usage Notes.

You can use ALTER_REVERSE_EXPRESSION to associate a name/description with a cluster or feature; the descriptor that you specify will be displayed when the model is scored.You can use the CLUSTER_ID, CLUSTER_PROBABILITY, and CLUSTER_SET functions to score clustering models. You can use the FEATURE_ID, FEATURE_SET, or FEATURE_VALUE functions to score feature extraction models. See the example and *Oracle Database SQL Language Reference*.

You can use ALTER_REVERSE_EXPRESSION to associate a name/description with the results of an anomaly detection model. These models use One-Class SVM to predict either 1 or 0 for each record, indicating whether or not the record is anomalous. With ALTER_REVERSE_EXPRESSION, you can replace the zeros and ones with labels that are more meaningful.

Syntax

```
DBMS_DATA_MINING. ALTER_REVERSE_EXPRESSION (
         model_name             VARCHAR2,
         expression             CLOB,
         attribute_name         VARCHAR2 DEFAULT NULL,
         attribute_subname      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–21 ALTER_REVERSE_EXPRESSION Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
expression	A SQL expression.
attribute_name	Name of the attribute. Specify NULL if you wish to apply *expression* to a cluster, feature, or One-Class SVM prediction.
attribute_subname	Name of the nested attribute if *attribute_name* is a nested column, otherwise NULL.

Usage Notes

If you are using automatic data preparation, the transformations and reverse transformations are performed automatically by the system. When you create the model, you can specify transformations and reverse transformations to be applied in addition to the system-generated expressions. If you are not using automatic data preparation, the transformations and reverse transformations that you specify are the only ones that are applied.

Example

This example specifies labels for the clusters that result from the `sh_clus` model. The labels consist of the word "Cluster" and the internal numeric identifier for the cluster.

```
SQL> begin
  2    dbms_data_mining.alter_reverse_expression(
  3      'sh_clus', '''Cluster ''||value');
  4  end;
  5  /

SQL> select cust_id, cluster_id(sh_clus using *) cluster_id
  2    from sh_aprep_num
  3   where cust_id < 100011
  4   order by cust_id;

CUST_ID CLUSTER_ID
------- ----------------------------------------------
 100001 Cluster 18
 100002 Cluster 14
 100003 Cluster 14
 100004 Cluster 18
 100005 Cluster 19
 100006 Cluster 7
 100007 Cluster 18
 100008 Cluster 14
 100009 Cluster 8
 100010 Cluster 8
```

APPLY Procedure

This procedure applies a mining model to the data of interest, and generates the results in a table. The apply process is also referred to as **scoring**.

For predictive mining functions, the apply process generates predictions in a target column. For descriptive mining functions such as clustering, the apply process assigns each case to a cluster with a probability.

The apply operation is not applicable to association models and attribute importance models.

> **Note:** Scoring can also be performed directly in SQL using the Data Mining functions. See "Scoring and Deployment" in *Oracle Data Mining Application Developer's Guide*.

Syntax

```
DBMS_DATA_MINING.APPLY (
      model_name           IN VARCHAR2,
      data_table_name      IN VARCHAR2,
      case_id_column_name  IN VARCHAR2,
      result_table_name    IN VARCHAR2,
      data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–22 APPLY Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
`data_table_name`	Name of table or view representing data to be scored
`case_id_column_name`	Name of the case identifier column
`result_table_name`	Name of the table to store apply results
`data_schema_name`	Name of the schema containing the data to be scored

Usage Notes

1. The data provided for `APPLY` must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model — both at build time and apply time. (See "Automatic Data Preparation Setting" on page 38-10.)
2. `APPLY` creates a table in the user's schema to hold the results. The columns are algorithm-specific.

   The columns in the results table are listed in subsequent sections. The `CASE_ID` column will match the case identifier column name provided by you. The type of the incoming case ID column is preserved in `APPLY` output.
3. The data type for `PREDICTION`, `CLUSTER_ID`, and `FEATURE_ID` is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types

will conform to the descriptions in the following tables. See "ALTER_REVERSE_EXPRESSION Procedure" on page 38-25.

Classification

The results table for classification has the columns described in Table 38–23. If the target of the model is categorical, the PREDICTION column will have a VARCHAR2 data type. If the target is numerical, the PREDICTION column will have a NUMBER data type.

Table 38–23 Columns in the APPLY Results Table for Classification Models

Column Name	Data Type
CASE_ID	VARCHAR2 or NUMBER
PREDICTION	VARCHAR2 or NUMBER
PROBABILITY	NUMBER

One-Class SVM (Anomaly Detection)

The results table for anomaly detection has the columns described in Table 38–24.

Table 38–24 Columns in the APPLY Results Table for Anomaly Detection Models

Column Name	Data Type
CASE_ID	VARCHAR2 or NUMBER
PREDICTION	NUMBER
PROBABILITY	NUMBER

Values in the PREDICTION column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

Regression using SVM or GLM

The results table for regression has the columns described in Table 38–25.

Table 38–25 Columns in the APPLY Results Table for Regression Models

Column Name	Data Type
CASE_ID	VARCHAR2 or NUMBER
PREDICTION	NUMBER

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table has the columns described in Table 38–26.

Table 38–26 Columns in the APPLY Results Table for Clustering Models

Column Name	Data Type
CASE_ID	VARCHAR2 or NUMBER
CLUSTER_ID	NUMBER
PROBABILITY	NUMBER

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in Table 38–27.

Table 38–27 Columns in the APPLY Results Table for Feature Extraction Models

Column Name	Data Type
CASE_ID	VARCHAR2 or NUMBER
FEATURE_ID	NUMBER
MATCH_QUALITY	NUMBER

Examples

This example applies the GLM regression model GLMR_SH_REGR_SAMPLE to the data in the MINING_DATA_APPLY_V view. The apply results are output to the table REGRESSION_APPLY_RESULT.

```
SQL> BEGIN
       DBMS_DATA_MINING.APPLY (
       model_name     => 'glmr_sh_regr_sample',
       data_table_name     => 'mining_data_apply_v',
       case_id_column_name => 'cust_id',
       result_table_name   => 'regression_apply_result');
    END;
    /

SQL> SELECT * FROM regression_apply_result WHERE cust_id >  101485;

   CUST_ID PREDICTION
---------- ----------
    101486 22.8048824
    101487 25.0261101
    101488 48.6146619
    101489   51.82595
    101490 22.6220714
    101491 61.3856816
    101492 24.1400748
    101493  58.034631
    101494 45.7253149
    101495 26.9763318
    101496 48.1433425
    101497 32.0573434
    101498 49.8965531
    101499  56.270656
    101500 21.1153047
```

COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes the confusion matrix for a classification model and also provides the accuracy of the model.

See *Oracle Data Mining Concepts* for a description of confusion matrix.

Before executing a COMPUTE_CONFUSION_MATRIX procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
      accuracy                    OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      confusion_matrix_table_name  IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      cost_matrix_table_name       IN  VARCHAR2 DEFAULT NULL,
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–28 COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
accuracy	Accuracy of the model
apply_result_table_name	Name of the table containing the results of an APPLY operation on the test dataset (see Usage Notes)
target_table_name	Name of the table or view containing only the case identifier column and target column values (see Usage Notes)
case_id_column_name	Name of the case identifier column in the test data set. This must be common across the target table and the apply results table.
target_column_name	Name of the target column in the target table
confusion_matrix_table_name	Name of the table into which the confusion matrix is to be generated
score_column_name	Name of the column representing the score from the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.
score_criterion_column_name	Name of the column representing the ranking factor for the score from the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. Values in this column must be represented numerically.

Table 38–28 (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
cost_matrix_table_name	Name of the fixed-schema cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can also provide a cost matrix as an optional input in order to have the cost of predictions reflected in the results.

It is important to note that the inputs to COMPUTE_CONFUSION_MATRIX do not always have to be generated using APPLY. As long as the definition of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can produce the confusion matrix and accuracy. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing.

Before you use the COMPUTE_CONFUSION_MATRIX procedure, you must prepare two data input streams from your test data.

First, you must APPLY the model on your test data. Use the result table name from APPLY as apply_result_table_name in the COMPUTE_CONFUSION_MATRIX procedure.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. Use the name of this second table as target_table_name.

The definition for the second view or table name for a numerical target attribute is:

```
(case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name            NUMBER)
```

The definition for the second view or table name for a categorical target attribute is:

```
(case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name            NUMBER)
```

You must provide the name of the table in which the confusion matrix is to be generated. The resulting fixed schema table will always be created in the schema owning the model.

For numerical target attributes, the confusion matrix table will have the definition:

```
(actual_target_value    NUMBER,
predicted_target_value  NUMBER,
value                   NUMBER)
```

For categorical target attributes, the confusion matrix table will have the definition:

```
(actual_target_value     VARCHAR2,
```

```
predicted_target_value   VARCHAR2,
value                    NUMBER)
```

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```
DECLARE
  v_sql_stmt VARCHAR2(4000);
  v_accuracy NUMBER;
BEGIN

/* apply the model census_model on test data */
DBMS_DATA_MINING.APPLY(
  model_name           => 'census_model',
  data_table_name      => 'census_2d_test',
  case_id_column_name  => 'person_id',
  result_table_name    => 'census_test_result');
CREATE VIEW census_2d_test_view as select person_id, class from census_2d_test;

/* now compute the confusion matrix from the two
 * data streams, also providing a cost matrix as input.
 */
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
  accuracy                     => v_accuracy,
  apply_result_table_name      => 'census_test_result',
  target_table_name            => 'census_2d_test_view',
  case_id_column_name          => 'person_id',
  target_column_name           => 'class',
  confusion_matrix_table_name  => 'census_confusion_matrix',
  cost_matrix_table_name       => 'census_cost_matrix');
DBMS_OUTPUT.PUT_LINE('Accuracy of the model: ' || v_accuracy);
END;
/

-- View the confusion matrix using Oracle SQL
SELECT actual_target_value, predicted_target_value, value
  FROM census_confusion_matrix;
```

COMPUTE_LIFT Procedure

This procedure computes a lift table for a given positive target for a classification model. See *Oracle Data Mining Concepts* for a description of lift.

Before executing a COMPUTE_LIFT procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_LIFT (
      apply_result_table_name      IN VARCHAR2,
      target_table_name            IN VARCHAR2,
      case_id_column_name          IN VARCHAR2,
      target_column_name           IN VARCHAR2,
      lift_table_name              IN VARCHAR2,
      positive_target_value        IN VARCHAR2,
      score_column_name            IN VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN VARCHAR2 DEFAULT 'PROBABILITY',
      num_quantiles                IN NUMBER DEFAULT 10,
      cost_matrix_table_name       IN VARCHAR2 DEFAULT NULL,
      apply_result_schema_name     IN VARCHAR2 DEFAULT NULL,
      target_schema_name           IN VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–29 COMPUTE_LIFT Procedure Parameters

Parameter	Description
apply_result_table_name	Name of the table containing the results of an APPLY operation on the test dataset (see Usage Notes)
target_table_name	Name of the table or view containing only the case identifier column and target column values (see Usage Notes)
case_id_column_name	Name of the case identifier column in the test data set. This must be common across the targets table and the apply results table.
target_column_name	Name of the target column
lift_table_name	Name of the table into which the lift table is to be generated
positive_target_value	Value of the positive target. If the target column is of NUMBER type, use TO_CHAR() operator to provide the value as a string.
score_column_name	Name of the column representing the score in the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.

Table 38–29 (Cont.) COMPUTE_LIFT Procedure Parameters

Parameter	Description
score_criterion_column_name	Name of the column representing the ranking factor for the score in the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. This column must be a numerical type.
num_quantiles	Number of quantiles required in the lift table
cost_matrix_table_name	Name of the cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can also provide a cost matrix as an optional input to have the cost of predictions reflected in the results.

It is important to note that the data inputs to COMPUTE_LIFT do not always have to be generated using APPLY. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the lift table as output. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the same binning table used in build pre-processing.

Before you use the COMPUTE_LIFT procedure, you must prepare two data input streams from your test data.

First, you must APPLY the model on your test data. The parameter apply_result_table_name in the COMPUTE_LIFT procedure represents the table that will be generated in your schema as a result of the APPLY operation.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. The parameter target_table_name reflects this input. The definition for this view or table name for a numerical target attribute is:

```
(case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name             NUMBER)
```

The definition for this view or table name for a categorical target attribute is:

```
(case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name            NUMBER)
```

You must provide the name of the table in which the lift table is to be generated. The resulting fixed schema table is always created in the schema that owns the model.

The resulting lift table will have the following definition:

```
(quantile_number               NUMBER,
 probability_threshold         NUMBER,
 gain_cumulative               NUMBER,
 quantile_total_count          NUMBER,
 quantile_target_count         NUMBER,
 percent_records_cumulative    NUMBER,
```

```
 lift_cumulative              NUMBER,
 target_density_cumulative    NUMBER,
 targets_cumulative           NUMBER,
 non_targets_cumulative       NUMBER,
 lift_quantile                NUMBER,
 target_density               NUMBER)
```

When a cost matrix is passed to the `COMPUTE_LIFT` procedure, the cost threshold is returned in the `probability_threshold` column.

The output columns are explained in *Oracle Data Mining Concepts*.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```
DECLARE
  v_sql_stmt VARCHAR2(4000);
BEGIN

/* apply the model census_model on test data */
DBMS_DATA_MINING.APPLY(
  model_name           => 'census_model',
  data_table_name      => 'census_2d_test,
  case_id_column_name  => 'person_id',
  result_table_name    => 'census_test_result');

/* next create a view from test data that projects
 * only the case identifier and target column
 */

/* now compute lift with the default 10 quantiles
 * from the two data streams
 */
DBMS_DATA_MINING.COMPUTE_LIFT (
  apply_result_table_name   => 'census_test_result',
  target_table_name         => 'census_2d_test_view',
  case_id_column_name       => 'person_id',
  target_column_name        => 'class',
  lift_table_name           => 'census_lift',
  positive_target_value     => '1',
  cost_matrix_table_name    => 'census_cost_matrix');
END;
/

-- View the lift table contents using SQL
SELECT *
  FROM census_lift;
```

COMPUTE_ROC Procedure

This procedure computes the receiver operating characteristic (ROC) for a binary classification model. See *Oracle Data Mining Concepts* for a description of receiver operating characteristic.

Before executing a `COMPUTE_ROC` procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_ROC (
      roc_area_under_curve         OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      roc_table_name               IN  VARCHAR2,
      positive_target_value        IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–30 COMPUTE_ROC Procedure Parameters

Parameter	Description
`roc_area_under_the_curve`	A measure of model accuracy, specifically, the probability that the model will correctly rank a randomly chosen pair of rows of opposite classes.
`apply_result_table_name`	Name of the table containing the results of an `APPLY` operation on the test dataset (see Usage Notes)
`target_table_name`	Name of the table or view containing the case identifiers and target values from the test data. (See the Usage Notes.)
`case_id_column_name`	Name of the case identifier column in the test data set. This must be common across the targets table and the apply results table.
`target_column_name`	Name of the target column
`roc_table_name`	Name of the table into which ROC results are to be generated. See Table 38–31, " COMPUTE_ROC Output".
`positive_target_value`	Value of the positive target. If the target column is of `NUMBER` type, use `TO_CHAR()` operator to provide the value as a string.

Table 38–30 (Cont.) COMPUTE_ROC Procedure Parameters

Parameter	Description
score_column_name	Name of the column representing the score in the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.
score_criterion_column_name	Name of the column representing the ranking factor for the score in the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. Values in this column must be represented numerically.
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table

Usage Notes

It is important to note that the data inputs to COMPUTE_ROC do not always have to be generated using APPLY. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the ROC table as output. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing.

Before you use the COMPUTE_ROC procedure, you must prepare two data input streams from your test data.

First, you must APPLY the model on your test data. The parameter apply_result_table_name in the COMPUTE_ROC procedure identifies the table that will be generated in your schema as a result of the APPLY operation.

Next, you must create a table or view containing only the case identifiers and target values from the test data. The parameter target_table_name identifies this table. For a numerical target attribute, the columns of this table are:

```
case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name           NUMBER
```

For a categorical target attribute, the columns of this table are:

```
case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name           VARCHAR2
```

You must provide the name of the table in which the ROC table is to be generated. The resulting table will always be created in the schema that owns the model, and it will always have the following columns.

```
(probability              NUMBER,
 true_positives           NUMBER,
 false_negatives          NUMBER,
 false_positives          NUMBER,
 true_negatives           NUMBER,
 true_positive_fraction   NUMBER,
 false_positive_fraction  NUMBER)
```

The output columns are explained in Table 38–31.

Table 38–31 COMPUTE_ROC Output

Output Column	Description
probability	Minimum predicted positive class probability resulting in a positive class prediction. Thus, different threshold values result in different hit rates and false_alarm_rates.
true_negatives	Negative cases in the test data with predicted probabilities below the probability_threshold (correctly predicted)
true_positives	Positive cases in the test data with predicted probabilities above the probability_threshold (correctly predicted)
false_negatives	Positive cases in the test data with predicted probabilities below the probability_threshold (incorrectly predicted)
false_positives	Negative cases in the test data with predicted probabilities above the probability_threshold (incorrectly predicted)
true_positive_fraction	true_positives/(true_positives + false_negatives)
false_positive_fraction	false_positives/(false_positives + true_negatives)

The typical use scenario is to examine the true_positive_fraction and false_positive_fraction to determine the most desirable probability_threshold. This threshold is then used to predict class values in subsequent apply operations. For example, to identify positively predicted cases in probability rank order from an apply result table, given a probability_threshold:

```
select case_id_column_name from apply_result_table_name where probability >
probability_threshold order by probability DESC;
```

There are two procedures one might use to identify the most desirable probability_threshold. One procedure applies when the relative cost of positive class versus negative class prediction errors are known to the user. The other applies when such costs are not well known to the user. In the first instance, one can apply the relative costs to the ROC table to compute the minimum cost probability_threshold. Suppose the relative cost ratio, Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like:

```
WITH cost AS (
  SELECT probability_threshold, 20 * false_negatives + false positives cost
    FROM ROC_table
  GROUP BY probability_threshold),
    minCost AS (
      SELECT min(cost) minCost
        FROM cost)
      SELECT max(probability_threshold)probability_threshold
        FROM cost, minCost
    WHERE cost = minCost;
```

If relative costs are not well known, the user simply scans the values in the table (in sorted order) and makes a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable:

```
select * from ROC_table order by probability_threshold
```

Examples

Assume that you have built a classification model census_model using the SVM algorithm, and you have been provided the test data in a table called

census_2d_test, with case identifier column name person_id, and the target column name class.

```
DECLARE
  v_sql_stmt VARCHAR2(4000);
  v_accuracy NUMBER;
BEGIN

/* apply the model census_model on test data */
DBMS_DATA_MINING.APPLY(
  model_name           => 'census_model',
  data_table_name      => 'census_2d_test',
  case_id_column_name  => 'person_id',
  result_table_name    => 'census_test_result');

/* next create a view from test data that projects
 * only the case identifier and target column
 */
v_sql_stmt :=
'CREATE VIEW census_2d_test_view AS ' ||
'SELECT person_id, class FROM census_2d_test';
EXECUTE IMMEDIATE v_sql_stmt;

/* now compute the receiver operating characterestics from
 * the two data streams, also providing a cost matrix
 * as input.
 */
DBMS_DATA_MINING.COMPUTE_ROC (
  accuracy                => v_accuracy,
  apply_result_table_name  => 'census_test_result',
  target_table_name        => 'census_2d_test_view',
  case_id_column_name      => 'person_id',
  target_column_name       => 'class',
  roc_table_name           => 'census_roc',
  cost_matrix_table_name   => 'census_cost_matrix');
END;
/

-- View the ROC results using Oracle SQL
SELECT *
  FROM census_roc;
```

CREATE_MODEL Procedure

This procedure creates a mining model with a given mining function.

By passing an `xform_list` to `CREATE_MODEL`, you can specify a list of transformations to be performed on the input data. If the `PREP_AUTO` setting is on, the transformations are used in addition to the automatic transformations. If the `PREP_AUTO` setting is off, the specified transformations are the only ones implemented by the model. In both cases, the transformation definitions are embedded in the model, causing the data for model building, testing, and scoring to be prepared. See "Automatic Data Preparation Setting" on page 38-10.

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
      model_name            IN VARCHAR2,
      mining_function       IN VARCHAR2,
      data_table_name       IN VARCHAR2,
      case_id_column_name   IN VARCHAR2,
      target_column_name    IN VARCHAR2 DEFAULT NULL,
      settings_table_name   IN VARCHAR2 DEFAULT NULL,
      data_schema_name      IN VARCHAR2 DEFAULT NULL,
      settings_schema_name  IN VARCHAR2 DEFAULT NULL,
      xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

Table 38–32 CREATE_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. See also "Mining Model Naming Restrictions" on page 38-5.
`mining_function`	Constant representing the mining function. The values are listed in Table 38–2, " Mining Functions"
`data_table_name`	Name of the table or view containing the training data
`case_id_column_name`	Name of the case identifier column
`target_column_name`	Name of the target column — null for descriptive models and for One-Class SVM models
`settings_table_name`	Name of the table or view containing mining function settings and algorithm settings
`data_schema_name`	Name of the schema hosting the training data
`settings_schema_name`	Name of the schema hosting the settings table/view

Table 38–32 (Cont.) CREATE_MODEL Procedure Parameters

Parameter	Description

transform_list	A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See "Automatic Data Preparation Setting" on page 38-10.)
	The data type is TRANSFORM_LIST, which consists of records of type TRANSFORM_REC.
	`TYPE`
	`  TRANFORM_REC  IS RECORD (`
	`  attribute_name  VARCHAR2(4000),`
	`  attribute_subname  VARCHAR2(4000),`
	`  expression  EXPRESSION_REC,`
	`  reverse_expression  EXPRESSION_REC,`
	`  attribute_spec  VARCHAR2(4000));`
	Each TRANSFORM_REC describes the transformation and reverse transformation for an attribute. EXPRESSION_REC stores a SQL expression for an individual transformation.
	The SQL expression stored in EXPRESSION_REC can be manipulated using routines in DBMS_DATA_MINING_TRANSFORM. Examples are: SET_EXPRESSION, GET_EXPRESSION, and SET_TRANSFORM.

Usage Notes

You can obtain information about a model by querying these data dictionary views.

```
ALL_MINING_MODELS
ALL_MINING_MODEL_ATTRIBUTES
ALL_MINING_MODEL_SETTINGS
```

Specify the USER prefix instead of ALL to obtain information about models in your own schema only.

> **See Also:** *Oracle Data Mining Application Developer's Guide* for information on the data dictionary views.

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```
/* prepare a settings table to override default
 * settings (Naive Bayes is the default classifier)
 */
CREATE TABLE census_settings (
  setting_name  VARCHAR2(30),
  setting_value VARCHAR2(128));

BEGIN
/* indicate that SVM is the chosen classifier */
INSERT INTO census_settings VALUES (
DBMS_DATA_MINING.ALGO_NAME, DBMS_DATA_MINING.ALGO_SUPPORT_VECTOR_MACHINES);

/* override the default value for complexity factor */
INSERT INTO census_settings (setting_name, setting_value)
VALUES (dbms_data_mining.svms_complexity_factor, TO_CHAR(0.081));
COMMIT;
```

```
/* build a model with name census_model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'census_model',
  mining_function      => DBMS_DATA_MINING.CLASSIFICATION,
  data_table_name      => 'census_2d_build',
  case_id_column_name  => 'person_id',
  target_column_name   => 'class',
  settings_table_name  => 'census_settings');
END;
/
```

You use similar code to build a One-Class SVM model. The main difference is that the target column is empty.

```
/* prepare a settings table to override default
 * settings (Naive Bayes is the default classifier)
 */
CREATE TABLE census_settings (
  setting_name  VARCHAR2(30),
  setting_value VARCHAR2(128));

BEGIN
/* indicate that SVM is the chosen classifier */
INSERT INTO census_settings VALUES (
DBMS_DATA_MINING.ALGO_NAME, DBMS_DATA_MINING.ALGO_SUPPORT_VECTOR_MACHINES);

/* override the default value for outlier rate */
INSERT INTO census_settings (setting_name, setting_value)
VALUES (dbms_data_mining.svms_outlier_rate, TO_CHAR(0.05));
COMMIT;

/* build a model with name census_model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'census_model',
  mining_function      => DBMS_DATA_MINING.CLASSIFICATION,
  data_table_name      => 'census_2d_build',
  case_id_column_name  => 'person_id',
  target_column_name   => NULL,
  settings_table_name  => 'census_settings');
END;
/
```

DROP_MODEL Procedure

This procedure drops an existing mining model.

Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2);
```

Parameters

Table 38–33 DROP_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Usage Notes

If an `APPLY` operation is using a model, and you attempt to drop the model during that time, the `DROP` will succeed and `APPLY` will return indeterminate results.

Examples

Assume the existence of a model `census_model`. The following example shows how to drop this model.

```
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'census_model');
END;
/
```

EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set. You can import from the dump file set using the `IMPORT_MODEL` procedure. Both `EXPORT_MODEL` and `IMPORT_MODEL` use Oracle Data Pump technology.

> **See Also:** *Oracle Data Mining Administrator's Guide* for more information on model export and import

Syntax

```
DBMS_DATA_MINING.EXPORT_MODEL (
      filename          IN VARCHAR2,
      directory         IN VARCHAR2,
      model_filter      IN VARCHAR2 DEFAULT NULL,
      filesize          IN VARCHAR2 DEFAULT NULL,
      operation         IN VARCHAR2 DEFAULT NULL,
      remote_link       IN VARCHAR2 DEFAULT NULL,
      jobname           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–34 EXPORT_MODEL Procedure Parameters

Parameter	Description
`filename`	Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the `filesize` parameter, or you can use the `operation` parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to *`filename01.dmp`*, even if there is only one file in the dump set. If there are additional files, they are named sequentially as *`filename02.dmp`*, *`filename03.dmp`*, and so forth.
`directory`	Name of a pre-defined directory object that specifies where the dump file set should be created. You must have read/write privileges on the directory object and on the file system directory that it identifies.
`model_filter`	Optional parameter that specifies which model or models to export. If you do not specify a value for `model_filter`, all models in the schema are exported. You can also specify `NULL` (the default) or `'ALL'` to export all models. You can export individual models by name and groups of models based on mining function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in Table 38–35.
`filesize`	Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB. If the size of the models to export is larger than `filesize`, one or more additional files are created within the dump set. See the description of the `filename` parameter for more information.

Table 38–34 (Cont.) EXPORT_MODEL Procedure Parameters

Parameter	Description
operation	Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the filesize parameter determines the size of the files. You can specify either of the following values for operation: ▪ 'EXPORT' — Export all or the specified models. (Default) ▪ 'ESTIMATE' — Estimate the size of the exporting models.
remote_link	Optional parameter not used in this release. Set to NULL.
jobname	Optional parameter that specifies the name of the export job. By default, the name has the form *username*_exp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_exp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the export job, named *jobname*.log, is created in the same directory as the dump file set.

Usage Notes

The model_filter parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. You can query the USER_MINING_MODELS view to list the models in your schema.

```
SQL> describe user_mining_models
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 MINING_FUNCTION                                    VARCHAR2(30)
 ALGORITHM                                          VARCHAR2(30)
 CREATION_DATE                             NOT NULL DATE
 BUILD_DURATION                                     NUMBER
 MODEL_SIZE                                         NUMBER
 COMMENTS                                           VARCHAR2(4000)
```

For more information on data dictionary views of mining models, see "Mining Model Objects" on page 38-5.

Examples of model filters are provided in Table 38–35.

Table 38–35 Sample Values for the Model Filter Parameter

Sample Value	Meaning
'mymodel'	Export the model named mymodel
'name= ''mymodel'''	Export the model named mymodel
'name IN (''mymodel2'',''mymodel3'')'	Export the models named mymodel2 and mymodel3
'ALGORITHM_NAME = ''NAIVE_BAYES'''	Export all Naive Bayes models. See Table 38–5 for a list of algorithm names.
'FUNCTION_NAME =''CLASSIFICATION'''	Export all classification models. See Table 38–2 for a list of mining functions.

Examples

The following statement exports all the models in the DMUSER3 schema to a dump file set called models_out in the directory $ORACLE_HOME/rdbms/log. This directory is mapped to a directory object called DATA_PUMP_DIR. The DMUSER3 user has read/write access to the directory and to the directory object.

```
SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
```

You can exit SQL*Plus and list the resulting dump file and log file.

```
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
```

The following example uses the same directory object and is executed by the same user. It exports the models called NMF_SH_SAMPLE and SVMR_SH_REGR_SAMPLE to a different dump file set in the same directory.

```
SQL>execute dbms_data_mining.export_model ( 'models2_out', 'DATA_PUMP_DIR',
            'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
 DMUSER3_exp_924.log  models2_out01.dmp
```

GET_ASSOCIATION_RULES Function

This table function returns the rules from an Association model.

You can specify filtering criteria to cause GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the topn parameter.

Syntax

```
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
   model_name            IN VARCHAR2,
   topn                  IN NUMBER DEFAULT NULL,
   rule_id               IN INTEGER DEFAULT NULL,
   min_confidence        IN NUMBER DEFAULT NULL,
   min_support           IN NUMBER DEFAULT NULL,
   max_rule_length       IN INTEGER DEFAULT NULL,
   min_rule_length       IN INTEGER DEFAULT NULL,
   sort_order            IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
   antecedent_items      IN DM_ITEMS DEFAULT NULL,
   consequent_items      IN DM_ITEMS DEFAULT NULL,
   min_lift              IN NUMBER DEFAULT NULL)
 RETURN DM_RULES PIPELINED;
```

Parameters

Table 38–36 GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.
topn	Return the *n* top rules ordered by confidence and then support, both descending. If you specify a sort order, the top *n* rules are derived after the sort is performed. If topn is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are RULE_CONFIDENCE and RULE_SUPPORT. If *topn* is specified and a maximum or minimum rule length *is* specified, then RULE_CONFIDENCE, RULE_SUPPORT, and NUMBER_OF_ITEMS are allowed in the sort order.
rule_id	Identifier of the rule to return. If you specify a value for rule_id, do not specify values for the other filtering parameters.
min_confidence	Return the rules with confidence greater than or equal to this number
min_support	Return the rules with support greater than or equal to this number
max_rule_length	Return the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 38–37). For example, in the rule A=>B (if A, then B), the number of items is 2. If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.

Table 38–36 (Cont.) GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
min_rule_length	Return the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
sort_order	Sort the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you would specify: ORA_MINING_VARCHAR2_NT('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC') If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by confidence in descending order, then by support in descending order. See the examples.
antecedent_items	Return the rules with these items in the antecedent. See the examples.
consequent_items	Return the rules with this item in the consequent. See the examples.
min_lift	Return the rules with lift greater than or equal to this number.

Return Values

Table 38–37 GET_ASSOCIATION RULES Function Return Values

Return Value	Description
DM_RULES	Represents a set of rows of type DM_RULE. The rows have the following columns: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, rule_lift NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER) The antecedent and consequent columns each return nested tables of type DM_PREDICATES.The rows, of type DM_PREDICATE, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

Usage Notes

This table function pipes out rows of type DM_RULES. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

The ORA_MINING_VARCHAR2_NT type is defined as a table of VARCHAR2(4000).

Examples

The following example demonstrates an Association model build followed by several invocations of the GET_ASSOCIATION_RULES table function.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE census_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'census_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following example returns all the rules which have 'AQUATIC' or 'EGGS' in the antecedent, and has 'VENOMOUS' as the consequent. The rules are sorted first by NUMBER_OF_ITEMS in descending order, then by RULE_CONFIDENCE in descending order, and finally by RULE_SUPPORT in descending order.

```
SELECT * FROM TABLE
(    DBMS_DATA_MINING.GET_ASSOCIATION_RULES
       ('AR_Model_31', 120, NULL, 1, .51, 7,
         ORA_MINING_VARCHAR2_NT
          ('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
         ORA_MINING_VARCHAR2_NT('AQUATIC', 'EGGS'),
         ORA_MINING_VARCHAR2_NT('VENOMOUS')));
```

GET_DEFAULT_SETTINGS Function

The GET_DEFAULT_SETTINGS function is deprecated in 11*g* Release 1 (11.1.). It is replaced with the data dictionary view, *_MINING_MODEL_SETTINGS. USER_, ALL_, and DBA_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Note: See "Deprecated Subprograms" on page 38-7

This table function returns the default settings for all mining functions and algorithms supported in the DBMS_DATA_MINING package.

Syntax

```
DBMS_DATA_MINING.GET_DEFAULT_SETTINGS
  RETURN DM_MODEL_SETTINGS PIPELINED;
```

Return Values

Table 38–38 GET_DEFAULT_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

This table function pipes out rows of type DM_MODEL_SETTING. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

This function is particularly useful if you do not know what settings are associated with a particular function or algorithm, and you want to override some or all of them.

Examples

For example, if you want to override some or all of *k*-Means clustering settings, you can create a settings table as shown, and update individual settings as required.

```
BEGIN
  CREATE TABLE mysettings AS
  SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
   WHERE setting_name LIKE 'KMNS%';
  -- now update individual settings as required
  UPDATE mysettings
     SET setting_value = 0.02
   WHERE setting_name = DBMS_DATA_MINING.KMNS_MIN_PCT_ATTR_SUPPORT;
END;
/
```

GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult *Oracle Data Mining Concepts*.

Syntax

```
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (
    model_name          IN VARCHAR2,
    topn                IN NUMBER DEFAULT NULL,
    max_itemset_length  IN NUMBER DEFAULT NULL)
  RETURN DM_ITEMSETS PIPELINED;
```

Parameters

Table 38–39 GET_FREQUENT_ITEMSETS Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
topn	When not NULL, return the top *n* rows ordered by support in descending order
max_itemset_length	Maximum length of an item set.

Return Values

Table 38–40 GET_FREQUENT_ITEMSETS Function Return Values

Return Value	Description
DM_ITEMSETS	Represents a set of rows of type DM_ITEMSET. The rows have the following columns: (itemsets_id NUMBER, items DM_ITEMS, support NUMBER, number_of_items NUMBER) The items column returns a nested table of type DM_ITEMS. The rows have type DM_ITEM: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000))

Usage Notes

This table function pipes out rows of type DM_ITEMSETS. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

Examples

The following example demonstrates an Association model build followed by an invocation of GET_FREQUENT_ITEMSETS table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
```

```
    SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'market_model',
  function             => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name      => 'market_build',
  case_id_column_name  => 'item_id',
  target_column_name   => NULL,
  settings_table_name  => 'census_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

GET_MODEL_COST_MATRIX Function

This function returns the rows of the default scoring matrix associated with the specified model.

By default, this function returns the scoring matrix that was added to the model with the ADD_COST_MATRIX procedure. If you wish to obtain the cost matrix used to create a model, specify cost_matrix_type_create as the matrix_type. See Table 38–41.

See also ADD_COST_MATRIX Procedure.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (
      model_name        IN VARCHAR2,
      matrix_type       IN VARCHAR2 DEFAULT cost_matrix_type_score)
RETURN DM_COST_MATRIX PIPELINED;
```

Parameters

Table 38–41 GET_MODEL_COST_MATRIX Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
matrix_type	The type of cost matrix. COST_MATRIX_TYPE_SCORE — cost matrix used for scoring. (Default.) COST_MATRIX_TYPE_CREATE — cost matrix used to create the model (Decision Tree only).

Return Values

Table 38–42 GET_MODEL_COST_MATRIX Function Return Values

Return Value	Description
DM_COST_MATRIX	Represents a set of rows of type DM_COST_ELEMENT. The rows have the following columns: actual VARCHAR2(4000), predicted VARCHAR2(4000), cost NUMBER)

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 38–7, " Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can modify the values in the cost matrix table or you can use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one

Example

This example returns the scoring cost matrix associated with the Naive Bayes model NB_SH_CLAS_SAMPLE.

```
column actual format a10
column predicted format a10
SELECT *
    FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
    ORDER BY predicted, actual;

ACTUAL     PREDICTED        COST
---------- ---------- ----------
0          0                   0
1          0                   4
0          1                   1
1          1                   0
```

GET_MODEL_DETAILS_ABN Function

The Adaptive Bayes Network algorithm ABN algorithm is deprecated in 11*g* Release 1 (11.1.).

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

> **Note:** See "Deprecated Subprograms" on page 38-7

This table function returns a set of rows that provide the details of an Adaptive Bayes Network model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN (
    model_name          IN VARCHAR2)
  RETURN DM_ABN_DETAILS PIPELINED;
```

Parameters

Table 38–43 GET_MODEL_DETAILS_ABN Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–44 GET_MODEL_DETAILS_ABN Function Return Values

Return Value	Description

DM_ABN_DETAILS	Represents a set of rows of type DM_ABN_DETAIL. The rows have the following columns:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER)`
	The antecedent and consequent columns of DM_ABN_DETAIL each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2), /*=,<>,<,>,<=,>=*/`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

This table function pipes out rows of type DM_ABN_DETAIL. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

This function returns details only for a single feature ABN model.

Examples

The following example demonstrates an ABN model build followed by an invocation of GET_MODEL_DETAILS_ABN table function from Oracle SQL.

```
BEGIN
  -- prepare a settings table to override default algorithm and model type
  CREATE TABLE abn_settings (setting_name VARCHAR2(30),
  setting_value
VARCHAR2(128));
  INSERT INTO abn_settings VALUES (DBMS_DATA_MINING.ALGO_NAME,
    DBMS_DATA_MINING.ALGO_ADAPTIVE_BAYES_NETWORK);
  INSERT INTO abn_settings VALUES
    (DBMS_DATA_MINING.ABNS_MODEL_TYPE,
     DBMS_DATA_MINING.ABNS_SINGLE_FEATURE);
   COMMIT;
  -- create a model
  DBMS_DATA_MINING.CREATE_MODEL (
    model_name           => 'abn_model',
    function             => DBMS_DATA_MINING.CLASSIFICATION,
    data_table_name      => 'abn_build',
    case_id_column_name  => 'id',
    target_column_name   => NULL,
    settings_table_name  => 'abn_settings');
END;
/
-- View the (unformatted) results from SQL*Plus
SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN('abn_model'));
```

GET_MODEL_DETAILS_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (
  model_name          IN VARCHAR2)
 RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

Parameters

Table 38–45 GET_MODEL_DETAILS_AI Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–46 GET_MODEL_DETAILS_AI Function Return Values

Return Value	Description
DM_RANKED_ATTRIBUTES	Represents a set of rows of type DM_RANKED_ATTRIBUTE. The rows have the following columns: (attribute_name VARCHAR2(4000, attribute_subname VARCHAR2(4000), importance_value NUMBER, rank NUMBER(38))

GET_MODEL_DETAILS_GLM Function

This table function returns the coefficient statistics for a Generalized Linear Model.

The same set of statistics is returned for both linear and logistic regression, but statistics that do not apply to the mining function are returned as NULL. For more details, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLM (
             model_name             VARCHAR2)
RETURN DM_GLM_COEFF_SET PIPELINED;
```

Parameters

Table 38–47 GET_MODEL_DETAILS_GLM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–48 GET_MODEL_DETAILS_GLM Return Values

Return Value	Description
DM_GLM_COEFF_SET	Represents a set of rows of type DM_GLM_COEFF. The rows have the following columns: (class VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER, std_error NUMBER, test_statistic NUMBER, p_value NUMBER, VIF NUMBER, std_coefficient NUMBER, lower_coeff_limit NUMBER, upper_coeff_limit NUMBER, exp_coefficient BINARY_DOUBLE, exp_lower_coeff_limit BINARY_DOUBLE, exp_upper_coeff_limit BINARY_DOUBLE)

GET_MODEL_DETAILS_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM_GLM_COEFF data type. The statistics are described in Table 38–49.

Table 38–49 DM_GLM_COEFF Data Type Description

Column	Description
class	The non-reference target class for logistic regression. The model is built to predict the probability of this class. The other class (the reference class) is specified in the model setting GLMS_REFERENCE_CLASS_NAME. See Table 38–11, " GLM Settings". For linear regression, class is null.
attribute_name	The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of attribute_name is also the name of the column in the case table that is the source for this attribute. For the intercept, attribute_name is null. Intercepts are equivalent to the bias term in SVM models.
attribute_subname	The name of an attribute in a nested table. The full name of a nested attribute has the form: *attribute_name.attribute_subname* where *attribute_name* is the name of the nested column in the case table that is the source for this attribute. If the attribute is not nested, attribute_subname is null. If the attribute is an intercept, both the attribute_name and the attribute_subname are null.
attribute_value	The value of the attribute (categorical attribute only). For numerical attributes, attribute_value is null.
coefficient	The linear coefficient estimate.
std_error	Standard error of the coefficient estimate.
test_statistic	For linear regression, the t-value of the coefficient estimate. For logistic regression, the Wald chi-square value of the coefficient estimate.
p-value	Probability of the test_statistic. Used to analyze the significance of specific attributes in the model.
VIF	Variance Inflation Factor. The value is zero for the intercept. For logistic regression, VIF is null.
std_coefficient	Standardized estimate of the coefficient.
lower_coeff_limit	Lower confidence bound of the coefficient.
upper_coeff_limit	Upper confidence bound of the coefficient.
exp_coefficient	Exponentiated coefficient for logistic regression. For linear regression, exp_coefficient is null.
exp_lower_coeff_limit	Exponentiated coefficient for lower confidence bound of the coefficient for logistic regression. For linear regression, exp_lower_coeff_limit is null.
exp_upper_coeff_limit	Exponentiated coefficient for upper confidence bound of the coefficient for logistic regression. For linear regression, exp_lower_coeff_limit is null.

Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the mining function. For example, `exp_coefficient` does not apply to linear regression.
- They cannot be computed from a theoretical standpoint. For example, when ridge regression is enabled, the coefficient values are returned with no statistics except VIF if it is enabled. (For information on ridge regression, see Table 38–11, " GLM Settings".)
- They cannot be computed because of limitations in system resources.
- Their values would be infinity.

GET_MODEL_DETAILS_GLOBAL Function

This table function returns statistics about the model as a whole. Global details are available for GLM and for association rules.

Separate global details are returned for linear and logistic regression. When ridge regression is enabled, fewer global details are returned. For information about ridge, see Table 38–11, " GLM Settings".

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLOBAL (
      model_name     IN  VARCHAR2)
RETURN DM_MODEL_GLOBAL_DETAILS PIPELINED;
```

Parameters

Table 38–50 GET_MODEL_DETAILS_GLOBAL Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–51 GET_MODEL_DETAILS_GLOBAL Function Return Values

Return Value	Description
DM_MODEL_GLOBAL_DETAILS	A collection of rows of type DM_MODEL_GLOBAL_DETAIL. The rows have the following columns: (global_detail_name VARCHAR2(30), global_detail_value NUMBER)

Global Details for GLM: Linear Regression

Table 38–52 Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
MODEL_DF	Model degrees of freedom
MODEL_SUM_SQUARES	Model sum of squares
MODEL_MEAN_SQUARE	Model mean square
F_VALUE	Model *F* value statistic
MODEL_F_P_VALUE	Model *F* value probability
ERROR_DF	Error degrees of freedom
ERROR_SUM_SQUARES	Error sum of squares
ERROR_MEAN_SQUARE	Error mean square
CORRECTED_TOTAL_DF	Corrected total degrees of freedom
CORRECTED_TOT_SS	Corrected total sum of squares
ROOT_MEAN_SQ	Root mean square error

Table 38–52 (Cont.) Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
DEPENDENT_MEAN	Dependent mean
COEFF_VAR	Coefficient of variation
R_SQ	R-Square
ADJUSTED_R_SQUARE	Adjusted R-Square
AIC	Akaike's information criterion
SBIC	Schwarz's Bayesian information criterion
GMSEP	Estimated mean square error of the prediction, assuming multivariate normality
HOCKING_SP	Hocking Sp statistic
J_P	JP statistic (the final prediction error)
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)
NUM_ROWS	Number of rows
MODEL_CONVERGED	Whether or not the model converged. Value is 1 if it converged, or 0 if it did not converge
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if it was not computed

Global Details for GLM: Logistic Regression

Table 38–53 Global Details for Logistic Regression

GLOBAL_DETAIL_NAME	Description
AIC_INTERCEPT	Akaike's criterion for the fit of the intercept only model
AIC_MODEL	Akaike's criterion for the fit of the intercept and the covariates (predictors) mode
SC_INTERCEPT	Schwarz's Criterion for the fit of the intercept only model
SC_MODEL	Schwarz's Criterion for the fit of the intercept and the covariates (predictors) model
NEG2_LL_INTERCEPT	-2 log likelihood of the intercept only model
NEG2_LL_MODEL	-2 log likelihood of the model
LR_DF	Likelihood ratio degrees of freedom
LR_CHI_SQ	Likelihood ratio chi-square value
LR_CHI_SQ_P_VALUE	Likelihood ratio chi-square probability value
PSEUDO_R_SQ_CS	Pseudo R-square Cox and Snell
PSEUDO_R_SQ_N	Pseudo R-square Nagelkerke
DEPENDENT_MEAN	Dependent mean
PCT_CORRECT	Percent of correct predictions
PCT_INCORRECT	Percent of incorrectly predicted rows
PCT_TIED	Percent of cases where probability for both cases is the same
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)

Table 38–53 (Cont.) Global Details for Logistic Regression

GLOBAL_DETAIL_NAME	Description
NUM_ROWS	Number of rows
MODEL_CONVERGED	Whether or not the model converged. Value is 1if it converged, or 0 if it did not converge.
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if the covariance matrix not computed

Global Detail for Association Rules

A single global detail is produced by an Association model.

Table 38–54 Global Detail for Association Rules

GLOBAL_DETAIL_NAME	Description
RULE_COUNT	The number of association rules in the model.

GET_MODEL_DETAILS_KM Function

This table function returns a set of rows that provide the details of a *k*-Means clustering model.

You can provide input to GET_MODEL_DETAILS_KM to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODEL_DETAILS_KM returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_KM (
         model_name          VARCHAR2,
         cluster_id          NUMBER    DEFAULT NULL,
         attribute           VARCHAR2  DEFAULT NULL,
         centroid            NUMBER    DEFAULT 1,
         histogram           NUMBER    DEFAULT 1,
         rules               NUMBER    DEFAULT 2,
         attribute_subname   VARCHAR2  DEFAULT NULL)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 38–55 GET_MODEL_DETAILS_KM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
centroid	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
histogram	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
rules	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 38–56 GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description
DM_CLUSTERS	Represents a set of rows of type DM_CLUSTER. The rows have the following columns: (id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE) The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child. The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER) The histogram column of DM_CLUSTER returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER)

Table 38–56 (Cont.) GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description

	The `rule` column of `DM_CLUSTER` returns a single row of type `DM_RULE`. The columns are:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER,`
	`rule_confidence NUMBER,`
	`rule_lift NUMBER,`
	`antecedent_support NUMBER,`
	`consequent_support NUMBER,`
	`number_of_items INTEGER)`
	The `antecedent` and `consequent` columns of `DM_RULE` each return nested tables of type `DM_PREDICATES`. The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

The table function pipes out rows of type `DM_CLUSTERS`. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

Examples

The following example demonstrates a *k*-Means clustering model build followed by an invocation of `GET_MODEL_DETAILS_KM` table function from Oracle SQL.

```
BEGIN
-- create a settings table
UPDATE cluster_settings
   SET setting_value = 3
 WHERE setting_name = DBMS_DATA_MINING.KMEANS_BLOCK_GROWTH;

/* build a k-Means clustering model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'eight_clouds',
  function             => DBMS_DATA_MINING.CLUSTERING,
  data_table_name      => 'eight_clouds_build',
  case_id_column_name  => 'id',
  target_column_name   => NULL,
  settings_table_name  => 'cluster_settings');
END;
/

-- View the (unformatted) rules from SQL*Plus
SELECT id, record_count, parent, tree_level, dispersion,
       child, centroid, histogram, rule
  FROM TABLE(DBMS_DATA_MINING_GET_MODEL_DETAILS_KM('eight_clouds'));
```

GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
   model_name      IN       VARCHAR2)
 RETURN DM_NB_DETAILS PIPELINED;
```

Parameters

Table 38–57 GET_MODEL_DETAILS_NB Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–58 GET_MODEL_DETAILS_NB Function Return Values

Return Value	Description
DM_NB_DETAILS	Represents a set of rows of type DM_NB_DETAIL. The rows have the following columns: (target_attribute_name VARCHAR2(30), target_attribute_str_value VARCHAR2(4000), target_attribute_num_value NUMBER, prior_probability NUMBER, conditionals DM_CONDITIONALS) The conditionals column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_str_value VARCHAR2(4000), attribute_num_value NUMBER, conditional_probability NUMBER)

Usage Notes

The table function pipes out rows of type DM_NB_DETAILS. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

Examples

Assume that you have built a classification model census_model using the Naive Bayes algorithm. You can retrieve the model details as shown in this example.

```
-- You can view the Naive Bayes model details in many ways
-- Consult the Oracle Application Developer's Guide -
-- Object-Relational Features for different ways of
-- accessing Oracle Objects.
```

```
-- View the (unformatted) details from SQL*Plus
SELECT attribute_name, attribute_num_value, attribute_str_value,
       prior_probability, conditionals,
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('census_model');
```

See `nbdemo.sql` for generation of formatted rules.

GET_MODEL_DETAILS_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (
   model_name        IN        VARCHAR2)
 RETURN DM_NMF_FEATURE_SET PIPELINED;
```

Parameters

Table 38–59 GET_MODEL_DETAILS_NMF Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–60 GET_MODEL_DETAILS_NMF Function Return Values

Return Value	Description

DM_NMF_FEATURE_SET	Represents a set of rows of DM_NMF_FEATURE. The rows have the following columns:
	`(feature_id NUMBER,`
	`mapped_feature_id VARCHAR2(4000),`
	`attribute_set DM_NMF_ATTRIBUTE_SET)`
	The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`attribute_value VARCHAR2(4000),`
	`coefficient NUMBER)`

Usage Notes

The table function pipes out rows of type DM_NMF_FEATURE_SET. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

Examples

Assume you have built an NMF model called my_nmf_model. You can retrieve model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT feature_id, attribute_set
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF(
        'my_nmf_model'));
```

GET_MODEL_DETAILS_OC Function

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to GET_MODEL_DETAILS_OC to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODEL_DETAILS_OC returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (
         model_name         VARCHAR2,
         cluster_id         NUMBER    DEFAULT NULL,
         attribute          VARCHAR2  DEFAULT NULL,
         centroid           NUMBER    DEFAULT 1,
         histogram          NUMBER    DEFAULT 1,
         rules              NUMBER    DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 38–61 GET_MODEL_DETAILS_OC Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
centroid	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
histogram	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
rules	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 38–62 GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description
DM_CLUSTERS	Represents a set of rows of type DM_CLUSTER. The rows have the following columns: (id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE) The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child. The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER) The histogram column of DM_CLUSTER returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER)

Table 38–62 (Cont.) GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description

	The `rule` column of `DM_CLUSTER` returns a single row of type `DM_RULE`. The columns are:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER,`
	`rule_confidence NUMBER,`
	`rule_lift NUMBER,`
	`antecedent_support NUMBER,`
	`consequent_support NUMBER,`
	`number_of_items INTEGER)`
	The `antecedent` and `consequent` columns each return nested tables of type `DM_PREDICATES`.The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

The table function pipes out rows of type `DM_CLUSTER`. For information about Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

Examples

Assume you have built an OC model called `my_oc_model`. You can retrieve information from the model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT T.id           clu_id,
       T.record_count rec_cnt,
       T.parent       parent,
       T.tree_level   tree_level
  FROM (SELECT *
          FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC(
                 'my_oc_model'))
        ORDER BY id) T
 WHERE ROWNUM < 11;
```

GET_MODEL_DETAILS_SVM Function

This table function returns a set of rows that provide the details of a Support Vector Machine model. This is applicable only for classification or regression models built using a linear kernel. For any other kernel, the table function returns ORA-40215.

In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by GET_MODEL_DETAILS_SVM, then the coefficient of this attribute should be interpreted as zero.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (
  model_name      IN       VARCHAR2)
 RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;
```

Parameters

Table 38–63 GET_MODEL_DETAILS_SVM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–64 GET_MODEL_DETAILS_SVM Function Return Values

Return Value	Description

DM_SVM_LINEAR_COEFF_SET	Represents a set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:
	`(class VARCHAR2(4000),`
	`attribute_set DM_SVM_ATTRIBUTE_SET)`
	The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`attribute_value VARCHAR2(4000),`
	`coefficient NUMBER)`
	See Usage Notes.

Usage Notes

The table function pipes out rows of type DM_SVM_LINEAR_COEFF. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

The class column of DM_SVM_LINEAR_COEFF represents classification target values. For regression targets, class is null. For each classification target value for classification models, a set of coefficients is returned. For binary classification, one-class classifier, and regression models, only a single set of coefficients is returned.

The attribute_value column in the nested table DM_SVM_ATTRIBUTE_SET is used for categorical attributes. The coefficient column is the linear coefficient value.

Examples

The following example demonstrates an SVM model build followed by an invocation of `GET_MODEL_DETAILS_SVM` table function from Oracle SQL:

```
 -- Create SVM model
BEGIN
  dbms_data_mining.create_model(
    model_name           => 'SVM_Clas_sample',
    mining_function      => dbms_data_mining.classification,
    data_table_name      => 'svmc_sample_build_prepared',
    case_id_column_name  => 'id',
    target_column_name   => 'affinity_card',
    settings_table_name  => 'svmc_sample_settings');
END;
/
-- Display model details
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVM_Clas_sample'))
ORDER BY class;
```

GET_MODEL_DETAILS_XML Function

This table function returns an XML object that provides the details of a Decision Tree model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (
         model_name      IN       VARCHAR2)
   RETURN XMLTYPE;
```

Parameters

Table 38–65 GET_MODEL_DETAILS_XML Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–66 GET_MODEL_DETAILS_XML Function Return Value

Return Value	Description
XMLTYPE	The PMML 2.1 XML definition for the decision tree model.

Usage Notes

The function returns the XML representing the decision tree; the definition is the one specified in the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at http://www.dmg.org.

GET_MODEL_SETTINGS Function

The GET_MODEL_SETTINGS function is deprecated in 11*g* Release 1 (11.1.). It is replaced with the data dictionary view, *_MINING_MODEL_SETTINGS. USER_, ALL_, and DBA_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

> **Note:** See "Deprecated Subprograms" on page 38-7

This table function returns the list of settings that were used to build the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SETTINGS(
   model_name           IN VARCHAR2)
 RETURN DM_MODEL_SETTINGS PIPELINED;
```

Parameters

Table 38–67 GET_MODEL_SETTINGS Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–68 GET_MODEL_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

The table function pipes out rows of type DM_MODEL_SETTING. For information about Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

You can use this table function to determine the settings that were used to build the model. This is purely for informational purposes only — you cannot alter the model to adopt new settings.

Examples

Assume that you have built a classification model census_model using the Naive Bayes algorithm. You can retrieve the model settings using Oracle SQL as follows:

```
SELECT setting_name, setting_value
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SETTINGS('census_model'));
```

GET_MODEL_SIGNATURE Function

The GET_MODEL_SIGNATURE function is deprecated in 11*g* Release 1 (11.1.). It is replaced with the data dictionary view, *_MINING_MODEL_ATTRIBUTES. USER_, ALL_, and DBA_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

> **Note:** See "Deprecated Subprograms" on page 38-7

This table function returns the model signature, which lists the column attributes used to build the model and which should be present in the scoring data.

The case identifier is not considered a mining attribute. For classification and regression models, the target attribute is also not considered part of the model signature.

> **See Also:** Instead of using the GET_MODEL_SIGNATURE function, you can query the data dictionary view, ALL_MINING_MODEL_ATTRIBUTES. See the *Oracle Data Mining Application Developer's Guide*.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SIGNATURE(
  model_name           IN VARCHAR2)
RETURN DM_MODEL_SIGNATURE PIPELINED;
```

Parameters

Table 38–69 GET_MODEL_SIGNATURE Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–70 GET_MODEL_SIGNATURE Function Return Values

Return Value	Description
DM_MODEL_SIGNATURE	Represents a set of rows of type DM_MODEL_SIGNATURE_ATTRIBUTE. The rows have the following columns: (attribute_name VARCHAR2(30), attribute_type VARCHAR2(106))

Usage Notes

This table function pipes out rows of type DM_MODEL_SIGNATURE. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model details using Oracle SQL as follows:

```
SELECT attribute_name, attribute_type
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SIGNATURE('census_model');
```

GET_MODEL_TRANSFORMATIONS Function

This function returns the transformation definitions associated with a model.

The data is transformed and the transformation definitions are embedded in the model during the model training (create) process. The transformations can be automatically generated, user-specified, or both.

> **See Also:** "CREATE_MODEL Procedure" on page 38-40 and "Automatic Data Preparation Setting" on page 38-10.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS (
      model_name     IN VARCHAR2)
RETURN DM_TRANSFORMS PIPELINED;
```

Parameters

Table 38–71 GET_MODEL_TRANSFORMATIONS Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 38–72 GET_MODEL_TRANSFORMATIONS Function Return Values

Return Value	Description
DM_TRANSFORMS	Represents a set of rows of type DM_TRANSFORM. The rows have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), expression CLOB, reverse_expression CLOB)

In addition to the transformation definitions, GET_MODEL_TRANSFORMATIONS returns the reverse transformation definitions. The reverse transformations are applied to the model attributes returned by the GET_MODEL_DETAILS functions. They are also applied to the target when a predictive model is applied. Reverse transformations enable model transparency, meaning that attribute information generated by the model is in its original, untransformed state, to the extent that it is possible.

GET_TRANSFORM_LIST Procedure

This function is used to convert a transformation specification from type DM_TRANSFORMS to type TRANSFORM_LIST.

DM_TRANSFORMS is used to output model transforms that are returned from the GET_MODEL_TRANSFORMATIONS function.

CREATE_MODEL and functions in the DBMS_DATA_MINING_TRANSFORM package accept TRANSFORM_LIST. To use them on the output of GET_MODEL_TANSFORMATIONS, you must first call GET_TRANSFORM_LIST to convert to TRANSFORM_LIST type.

Syntax

```
DBMS_DATA_MINING.GET_TRANSFORM_LIST (
      xform_list           OUT NOCOPY TRANSFORM_LIST,
      model_xforms         IN  DM_TRANSFORMS);
```

Parameters

Table 38–73 GET_TRANSFORM_LIST Procedure Parameters

Parameter	Description
xform_list	The transformation specification converted from model_xforms to type TRANSFORM_LIST.
model_xforms	A transformation specification returned by GET_MODEL_TRANSFORMATIONS

IMPORT_MODEL Procedure

This procedure imports the specified data mining models from a dump file set that was created with EXPORT_MODEL or with the expdp export utility. Both IMPORT_MODEL and EXPORT_MODEL use Oracle Data Pump technology.

> **See Also:** *Oracle Data Mining Administrator's Guide* for more information on model export and import

Syntax

```
DBMS_DATA_MINING.IMPORT_MODEL (
    filename             IN  VARCHAR2,
    directory            IN  VARCHAR2,
    model_filter         IN  VARCHAR2 DEFAULT NULL,
    operation            IN  VARCHAR2 DEFAULT NULL,
    remote_link          IN  VARCHAR2 DEFAULT NULL,
    jobname              IN  VARCHAR2 DEFAULT NULL,
    schema_remap         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–74 IMPORT_MODEL Procedure Parameters

Parameter	Description
filename	Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to "EXPORT_MODEL Procedure" on page 38-44 for details.) If the dump file set contains multiple files, you can specify '*filename*%U' instead of listing them. For example, if your dump file set contains 3 files, archive01.dmp, archive02.dmp, and archive03.dmp, you can import them by specifying 'archive%U'.
directory	Name of a pre-defined directory object that specifies where the dump file set is located. You must have read/write privileges on the directory object and on the file system directory that it identifies.
model_filter	Optional parameter that specifies one or more models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models. The value of model_filter can be one or more model names. The following are valid filters. 'mymodel1' 'name IN (''mymodel2'',''mymodel3'')' The first causes IMPORT_MODEL to import a single model named mymodel1. The second causes IMPORT_MODEL to import two models, mymodel2 and mymodel3.
operation	Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. You can specify either of the following values for operation: ■ 'IMPORT' — Import the models (Default) ■ 'SQL_FILE'— Write the SQL DDL for creating the models to a text file. The text file is named *job_name*.sql and is located in the dump set directory.

Table 38–74 (Cont.) IMPORT_MODEL Procedure Parameters

Parameter	Description
remote_link	Optional parameter not used in this release. Set to NULL
jobname	Optional parameter that specifies the name of the import job. By default, the name has the form *username*_imp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the import job, named *jobname*.log, is created in the same directory as the dump file set.
schema_remap	Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. If the dump file set belongs to a different schema, you must specify a schema mapping in the form *export_user*:*import_user*. For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema. NOTE: In some cases, you may need to have the IMPORT_FULL_DATABASE privilege or the SYS role to import a model from a different schema.

Examples

This example shows a model being exported and imported within the schema dmuser2. Then the same model is imported into the dmuser3 schema. The dmuser3 user has the IMPORT_FULL_DATABASE privilege.

```
SQL> connect dmuser2
Enter password: dmuser2_password
Connected.
SQL> select model_name from user_mining_models;

MODEL_NAME
------------------------------
NMF_SH_SAMPLE
SVMO_SH_CLAS_SAMPLE
SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ('NMF_SH_SAMPLE_out', 'DATA_PUMP_DIR',
                            'name = ''NMF_SH_SAMPLE''');
-- import the model back into the same schema
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                            'DATA_PUMP_DIR', 'name = ''NMF_SH_SAMPLE''');

-- connect as different user
-- import same model into that schema
SQL> connect dmuser3
Enter password: dmuser3_password
Connected.
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                            'DATA_PUMP_DIR', 'name = ''NMF_SH_SAMPLE''',
                            'IMPORT', NULL, 'nmf_imp_job', 'dmuser2:dmuser3');
```

The following example shows user MARY importing all models from a dump file, model_exp_001.dmp, which was created by user SCOTT. The dump file is located in the file system directory mapped to a directory object called DM_DUMP. If user MARY does not have IMPORT_FULL_DATABASE privileges, IMPORT_MODEL will raise an error.

```
-- import all models
DECLARE
  file_name       VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
               filename=>file_name,
              directory=>'DM_DUMP',
               schema_remap=>'SCOTT:MARY');
  DBMS_OUTPUT.PUT_LINE(
'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

RANK_APPLY Procedure

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```
DBMS_DATA_MINING.RANK_APPLY (
      apply_result_table_name        IN VARCHAR2,
      case_id_column_name            IN VARCHAR2,
      score_column_name              IN VARCHAR2,
      score_criterion_column_name    IN VARCHAR2,
      ranked_apply_table_name        IN VARCHAR2,
      top_N                          IN INTEGER DEFAULT 1,
      cost_matrix_table_name         IN VARCHAR2 DEFAULT NULL,
      apply_result_schema_name       IN VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–75 RANK_APPLY Procedure Parameters

Parameter	Description
apply_result_table_name	Name of the table or view containing the results of an APPLY operation on the test dataset (see Usage Notes)
case_id_column_name	Name of the case identifier column. This must be the same as the one used for generating APPLY results.
score_column_name	Name of the prediction column in the apply results table
score_criterion_column_name	Name of the probability column in the apply results table
ranked_apply_result_tab_name	Name of the table containing the ranked apply results
top_N	Top N predictions to be considered from the APPLY results for precision recall computation
cost_matrix_table_name	Name of the cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can use RANK_APPLY to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of RANK_APPLY is similar to that of APPLY with respect to other DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from APPLY.

The main intended use of RANK_APPLY is for the generation of the final APPLY results against the scoring data in a production setting. You can apply the model against test

data using APPLY, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for RANK_APPLY.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will be the same case identifier column as that of the apply results.

Classification Models — NB, ABN, SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id       VARCHAR2/NUMBER,
prediction     NUMBER,
probability    NUMBER,
cost           NUMBER,
rank           INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```
(case_id       VARCHAR2/NUMBER,
prediction     VARCHAR2,
probability    NUMBER,
cost           NUMBER,
rank           INTEGER)
```

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id       VARCHAR2/NUMBER,
cluster_id     NUMBER,
probability    NUMBER,
rank           INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id        VARCHAR2/NUMBER,
feature_id      NUMBER,
match_quality   NUMBER,
rank            INTEGER)
```

Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if training data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
```

```
 */

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
  apply_result_table_name       => 'census_apply_result',
  case_id_column_name           => 'person_id',
  score_column_name             => 'prediction',
  score_criterion_column_name   => 'probability
  ranked_apply_result_tab_name  => 'census_ranked_apply_result',
  top_N                         => 3,
  cost_matrix_table_name        => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
  FROM census_ranked_apply_result;
```

REMOVE_COST_MATRIX Procedure

Removes the default scoring matrix from a classification model.

See Also:

- "ADD_COST_MATRIX Procedure" on page 38-23
- "REMOVE_COST_MATRIX Procedure" on page 38-87

Syntax

```
DBMS_DATA_MINING.REMOVE_COST_MATRIX (
      model_name   IN  VARCHAR2);
```

Parameters

Table 38–76 Remove_Cost_Matrix Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Usage Notes

If the model is not in your schema, then REMOVE_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

Example

The Naive Bayes model NB_SH_CLAS_SAMPLE has an associated cost matrix that can be used for scoring the model.

```
SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;

ACTUAL     PREDICTED        COST
---------- ---------- ----------
0          0                   0
1          0                   4
0          1                   1
1          1                   0
```

You can remove the cost matrix with REMOVE_COST_MATRIX.

```
SQL>EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');

SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;

no rows selected
```

RENAME_MODEL Procedure

This procedure renames a mining model to a new name that you specify.

The model name is in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see

Syntax

```
DBMS_DATA_MINING.RENAME_MODEL (
     model_name            IN VARCHAR2,
     new_model_name        IN VARCHAR2);
```

Parameters

Table 38–77 RENAME_MODEL Procedure Parameters

Parameter	Description
`model_name`	Old name of the model
`new_model_name`	New name of the model.

Usage Notes

If an `APPLY` operation is using a model, and you attempt to rename the model during that time, the `RENAME` will succeed and `APPLY` will return indeterminate results.

Examples

Assume the existence of a model `census_model`. The following example shows how to rename this model.

```
BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name      => 'census_model',
    new_model_name  => 'census_new_model');
END;
/
```

39

DBMS_DATA_MINING_TRANSFORM

The DBMS_DATA_MINING_TRANSFORM package contains transformation routines that can be used to prepare data for mining.

See Also:

- Chapter 38, "DBMS_DATA_MINING".
- *Oracle Data Mining Concepts* for information about automatic and embedded data transformation in Oracle Data Mining.

This chapter contains the following topics:

- Using DBMS_DATA_MINING_TRANSFORM
  - Data Transformation with Oracle Data Mining
  - Types of Transformations
  - The DBMS_DATA_MINING_TRANSFORM Framework
  - Data Types
- Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Using DBMS_DATA_MINING_TRANSFORM

This section contains topics that relate to using the `DBMS_DATA_MINING_TRANSFORM` package.

- Data Transformation with Oracle Data Mining
- Types of Transformations
- The DBMS_DATA_MINING_TRANSFORM Framework
- Data Types

Data Transformation with Oracle Data Mining

A **transformation** is a SQL expression that modifies one or more of the columns used in data mining.

Most data mining algorithms require some form of data transformation, and many columns of data can be affected. Data sets used for creating, testing, and scoring the model must all undergo the same transformations. To replicate these changes in each data set can be very time consuming.

Oracle Data Mining **embeds** transformation expressions in the model. The transformations used to create the model are automatically performed on any data sets to which the model is applied. This ability to deploy a model together with its transformations significantly enhances the model's usability while simplifying the process of model management.

Oracle Data Mining further simplifies the data transformation process by offering an **Automatic Data Preparation** mode (ADP). When you create a model using ADP, the training data is automatically transformed according to the requirements of the algorithm; the automatic transformations are embedded in the model. To enable ADP, set the `PREP_AUTO` setting to `PREP_AUTO_ON` in the settings table for the model.

> **See Also:** Table 38–6 in Chapter 38, "DBMS_DATA_MINING" for information about the `PREP_AUTO` setting

You can supplement automatic transformations by passing a list of transformation expressions to `DBMS_DATA_MINING.CREATE_MODEL`. Your transformations are embedded in the model along with the automatic transformations. If ADP is turned off, only the transformations that you pass to `CREATE_MODEL` are embedded.

> **See Also:** "CREATE_MODEL Procedure" in Chapter 38, "DBMS_DATA_MINING" for information about the transformation list parameter

The routines in `DBMS_DATA_MINING_TRANSFORM` are convenience routines to assist you in creating your own transformations. If these routines do not entirely suit your needs, you can write SQL to modify them, or you can write your own routines.

Note on Notation:

This chapter uses standard interval notation for number sets:

- **[a,b]** is the set of all real numbers greater than or equal to **a** and less than or equal to **b**
- **[a,b)** is the set of all real numbers greater than or equal to **a** and less than **b**.

(**b** is in the set **[a,b]**; **b** is not in the set **[a,b)**.)

Subscripts do not conform to standard notation; instead "**X_N**" is used for "$\mathbf{X}_N$".

Types of Transformations

The DBMS_DATA_MINING_TRANSFORM package supports transformations that are typically used in data mining: binning, normalization, outlier treatment, and missing value treatment.

Binning

Binning involves mapping both continuous and discrete values to discrete values of reduced cardinality. For example, the age of persons can be binned into discrete numeric bins: 1-20 to 1, 21-40 to 2, and so on. Popular car manufacturers such as Ford, Chrysler, BMW, Volkswagen can be binned into discrete categorical bins: {Ford, Chrysler} to US_Car_Makers, and {BMW, Volkswagen} to European_Car_Makers.

DBMS_DATA_MINING_TRANSFORM supports binning for both categorical and numerical attributes. Categorical attributes have VARCHAR2/CHAR data types; numerical attributes have NUMBER data types.

Supervised Binning (Categorical and Numerical)

The bin contents are groupings calculated by a Decision Tree model.

Top-N Frequency Categorical Binning

The bin contents are based on the frequency of each value in the column. The number of bins is user-specified. The first bin contains the most frequent values, the second bin contains the second-most frequent values, and so on. The final bin contains all the remaining values.

Equi-Width Numerical Binning

Each bin contains the same number of values. The number of bins is user-specified or estimated from the data.The first bin contains the highest values, the second bin contains the next highest values, and so on.

Quantile Numerical Binning

Each bin contains the numbers in a quantile that is computed using the SQL NTILE function. Quantiles are partitions of a data distribution. For example, percentiles are quantiles that divide a data distribution into 100 partitions.

Normalization

Normalization is the process of scaling continuous values down to a specific range, typically between zero and one. Normalization applies only to numerical attributes.

Normalization transforms each number by subtracting (**shifting**) it by a given quantity and dividing the result by the **scale**. For example:

```
x_new = (x_old-shift)/scale
```

Min-Max Normalization

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for shift and scale are:

```
shift = min
scale = max-min
```

Scale Normalization

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for shift and scale are:

```
shift = 0
```

```
scale = max{abs(max), abs(min)}
```

Z-Score Normalization

The normalization definition for each attribute is computed based on the values for mean and standard deviation that are computed from the data. The values for shift and scale are:

```
shift = mean
scale = standard_deviation
```

Outlier Treatment

Some computations on attribute values can be significantly affected by extreme values. One approach to achieving a more robust computation is to either winsorize or trim (clip) the data as a preprocessing step.

Winsorizing involves setting the tail values of a particular attribute to some specified value. For example, for a 90% winsorization, the bottom 5% are set equal to the minimum value in the 6th percentile, while the upper 5% are set equal to the value corresponding to the maximum value in the 95th percentile.

Trimming sets the tail values to NULL.

Missing Value Treatment

Oracle Data Mining distinguishes between **sparse data** and data that contains **random missing values**. The latter means that some attribute values are unknown. Sparse data, on the other hand, contains values that are assumed to be known, although they are not represented in the data.

NULLs in columns with simple data types (not nested) are assumed to represent random missing values. Values that are not present in nested columns indicate sparsity. Oracle Data Mining replaces numerical data that is missing at random with the mean and categorical data that is missing at random with the mode. Missing numerical values in sparse data are replaced with zeros. Missing categorical values in sparse data are replaced with a zero vector or a special value `DM$SPARSE`, depending on the algorithm.

`DBMS_DATA_MINING_TRANSFORM` provides routines for handling missing values. These routines are available for anyone who wishes to manage missing value treatment explicitly, instead of relying on the default treatment.

> **See Also:** *Oracle Data Mining Application Developer's Guide* for more information about missing value treatment by Oracle Data Mining

The DBMS_DATA_MINING_TRANSFORM Framework

DBMS_DATA_MINING_TRANSFORM provides a framework for defining transformations. The framework is implemented with CREATE, INSERT, STACK, and XFORM operations. You can modify the output or implement your own version of any of these operations.

The DBMS_DATA_MINING_TRANSFORM framework consists of:

1. **CREATE** routines that create transformation definition tables.

   The tables have the columns needed for specifying any of the following transformations:

   - Binning (categorical and numerical)
   - Column removal
   - Normalization
   - Outlier treatment
   - Missing value treatment

2. **INSERT** routines that populate the definition tables with information necessary for transforming selected columns of input data.

   You can invoke CREATE and INSERT routines several times to transform all relevant columns from various data sources until the definition tables fully represents all the data attributes for a given mining problem.

3. **STACK** routines that generate SQL expressions based on the definition tables.

   STACK routines add the expressions to a transformation list. The transformation list can be passed to the CREATE_MODEL procedure or to other STACK routines. (See "CREATE_MODEL Procedure" on page 38-40.)

4. **XFORM** routines that generate views based on the definition tables.

   The views are suitable for mining (creating, testing, or scoring a model).

Data Types

DBMS_DATA_MINING_TRANSFORM defines the data types described in this section.

COLUMN LIST Collection Type

This type is used to store quoted and non-quoted identifiers for column names.

```
TYPE
    COLUMN_LIST                    IS VARRAY(1000) OF VARCHAR2(32);
```

DESCRIBE LIST Collection Type

This type holds the results of describe operations.

```
SUBTYPE
    DESCRIBE_LIST                  IS dbms_sql.DESC_TAB2;
```

EXPRESSION Record Type

This type is used for storing transformation expressions.

```
  TYPE
    EXPRESSION_REC                 IS RECORD (
                                        ..........);,
```

Unlike VARCHAR2, EXPRESSION_REC can be used for expressions that can grow larger than 32K.

Use SET_EXPRESSION to write to an EXPRESSION_REC. Use GET_EXPRESSION to retrieve the contents of an EXPRESSION_REC.

TRANSFORMATION Record Type

This type is used for storing the in-memory transformation stack definition for a single attribute.

```
TYPE
    TRANSFORM_REC                  IS RECORD (
      attribute_name                 VARCHAR2(30),
      attribute_subname              VARCHAR2(4000),
      expression                     EXPRESSION_REC,
      reverse_expression             EXPRESSION_REC,
      attribute_spec                 VARCHAR2(4000));
```

The attribute_spec field is used to specify additional information and actions for an attribute. You can specify the value NOPREP for attribute_spec.

NOPREP disables ADP for an individual attribute. NOPREP can be used in the transformation list passed to DBMS_DATA_MINING.CREATE_MODEL. (See "CREATE_MODEL Procedure" on page 38-40.)

TRANSFORMATION LIST Collection Type

This type is used for storing the in-memory stack definition.

```
TYPE
    TRANSFORM_LIST                   IS TABLE OF TRANSFORM_REC;
```

NESTED COLUMN Constants

These constants are used for specifying data types of nested columns.

```
NEST_NUM_COL_TYPE                CONSTANT NUMBER := 100001;
NEST_CAT_COL_TAYPE               CONSTANT NUMBER := 100002;
```

Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Table 39–1 DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
CREATE_BIN_CAT Procedure on page 39-11	Creates a categorical bin definition table
CREATE_BIN_NUM Procedure on page 39-12	Creates a numerical bin definition table
CREATE_CLIP Procedure on page 39-13	Creates a clipping definition table
CREATE_COL_REM Procedure on page 39-14	Creates a column removal definition table
CREATE_MISS_CAT Procedure on page 39-15	Creates a categorical missing value treatment definition table
CREATE_MISS_NUM Procedure on page 39-16	Creates a numerical missing value treatment definition table
CREATE_NORM_LIN Procedure on page 39-17	Creates a normalization definition table
DESCRIBE_STACK Procedure on page 39-18	Describes the stack definition
INSERT_AUTOBIN_NUM_EQWIDTH Procedure on page 39-20	Populates the numerical bin definition table, using the number of bins estimated from the data
GET_EXPRESSION Function on page 39-19	Returns a transformation expression
INSERT_BIN_CAT_FREQ Procedure on page 39-22	Populates the categorical bin definition table, applying frequency-based binning to the categorical input data
INSERT_BIN_NUM_EQWIDTH Procedure on page 39-24	Populates the numerical bin definition table, applying equi-width binning to the numerical input data
INSERT_BIN_NUM_QTILE Procedure on page 39-26	Populates the numerical bin definition table, applying quantile binning to the numerical input data
INSERT_BIN_SUPER Procedure on page 39-28	Populates a binning definition table, applying supervised binning to both numerical and categorical data
INSERT_CLIP_TRIM_TAIL Procedure on page 39-29	Populates the clipping definition table, applying trimming based on tail fraction to the numerical input data
INSERT_CLIP_WINSOR_TAIL Procedure on page 39-31	Populates the clipping definition table, applying Winsorizing based on tail fraction to the numerical input data
INSERT_MISS_CAT_MODE Procedure on page 39-33	Populates the categorical missing value treatment definition table, applying the mode to each missing value
INSERT_MISS_NUM_MEAN Procedure on page 39-34	Populates the numerical missing value treatment definition table, applying the mean to each missing value
INSERT_NORM_LIN_MINMAX Procedure on page 39-35	Populates the normalization definition table, applying min-max normalization to the numerical input data

Table 39–1 (Cont.) DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
INSERT_NORM_LIN_SCALE Procedure on page 39-36	Populates the normalization definition table, applying scale normalization to the numerical input data
INSERT_NORM_LIN_ZSCORE Procedure on page 39-37	Populates the normalization definition table applying z-score normalization to the numerical input data
SET_TRANSFORM Procedure on page 39-39	Specifies a transformation expression
STACK_BIN_CAT Procedure on page 39-40	Add categorical binning expressions to the transformation list
STACK_BIN_NUM Procedure on page 39-43	Add numerical binning expressions to the transformation list
STACK_CLIP Procedure on page 39-46	Add clipping expressions to the transformation list
STACK_COL_REM Procedure on page 39-48	Add column removal expressions to the transformation list
STACK_MISS_CAT Procedure on page 39-49	Add categorical missing value treatment expressions to the transformation list
STACK_MISS_NUM Procedure on page 39-51	Add numerical missing value treatment expressions to the transformation list
STACK_NORM_LIN Procedure on page 39-53	Add linear normalization expressions to the transformation list
XFORM_BIN_CAT Procedure on page 39-55	Creates a view that applies a categorical binning transformation to the data
XFORM_BIN_NUM Procedure on page 39-57	Creates a view that applies a numerical binning transformation to the data
XFORM_CLIP Procedure on page 39-60	Creates a view that applies a clipping transformation to the data
XFORM_COL_REM Procedure on page 39-62	Creates a view that removes the specified columns from the data
XFORM_EXPR_NUM Procedure on page 39-63	Creates a view that applies a transformation expression to a numerical column in the data
XFORM_EXPR_STR Procedure on page 39-65	Creates a view that applies a transformation expression to a character column in the data
XFORM_MISS_CAT Procedure on page 39-66	Creates a view that performs missing value treatment on the categorical attributes in the data
XFORM_MISS_NUM Procedure on page 39-67	Creates a view that performs missing value treatment on the numerical attributes in the data
XFORM_NORM_LIN Procedure on page 39-68	Creates a view that performs linear normalization to numerical attributes in the data
XFORM_STACK Procedure on page 39-70	Creates a view that transforms the data as specified by the stack definition (transformation list)

CREATE_BIN_CAT Procedure

This procedure creates a categorical binning definition table. This table is used as input to the INSERT_BIN_CAT_FREQ and XFORM_BIN_CAT procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (
     bin_table_name     IN VARCHAR2,
     bin_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–2 CREATE_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table
bin_schema_name	Name of the schema hosting the bin definition table

Usage Notes

The generated bin definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
val	VARCHAR2(4000)
bin	VARCHAR2(4000)

Examples

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('build_bin_cat_table');
END;
/

DESCRIBE build_bin_cat_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                VARCHAR2(4000)
 BIN                                                VARCHAR2(4000)
```

CREATE_BIN_NUM Procedure

This procedure creates a numerical binning definition table. This table is used as input to the INSERT_BIN_NUM_EQWIDTH, INSERT_BIN_NUM_QTILE, INSERT_AUTOBIN_NUM_EQWIDTH, and XFORM_BIN_NUM procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
     bin_table_name    IN VARCHAR2,
     bin_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–3 CREATE_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table
bin_schema_name	Name of the schema hosting the bin definition table

Usage Notes

The generated bin definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
val	NUMBER
bin	VARCHAR2(4000)

Examples

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('build_bin_num_table');
END;
/

DESCRIBE build_bin_num_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                NUMBER
 BIN                                                VARCHAR2(4000)
```

CREATE_CLIP Procedure

This procedure creates a clipping definition table. This table is used as input to the INSERT_CLIP_WINSOR_TAIL, INSERT_CLIP_TRIM_TAIL, and XFORM_CLIP procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
     clip_table_name    IN VARCHAR2,
     clip_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–4 CREATE_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table
clip_schema_name	Name of the schema hosting the clipping definition table

Usage Notes

The generated clipping definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
lcut	NUMBER
lval	NUMBER
rcut	NUMBER
rval	NUMBER

Examples

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('build_clip_table');
END;
/

DESCRIBE build_clip_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 LCUT                                               NUMBER
 LVAL                                               NUMBER
 RCUT                                               NUMBER
 RVAL                                               NUMBER
```

CREATE_COL_REM Procedure

This procedure creates a column removal definition table. This table is used by the STACK_COL_REM, XFORM_COL_REM, INSERT_BIN_SUPER, and INSERT_AUTOBIN_NUM_EQWIDTH procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (
      rem_table_name           VARCHAR2,
      rem_schema_name          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–5 CREATE_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the column removal definition table.
rem_schema_name	Schema of the column removal definition table.

Usage Notes

The generated column removal definition table has the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)

The column removal definition table lists the column names and the associated attribute names to remove from the data source. The col column is case sensitive, since it generates quoted identifiers. There can be multiple entries in the column removal definition table for the same col when it is a nested column.

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('col_rem_tbl');
END;
 /

DESCRIBE col_rem_tbl
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
```

CREATE_MISS_CAT Procedure

This procedure creates a categorical missing value treatment definition table. This table is used as input to the INSERT_MISS_CAT_MODE procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
     miss_table_name       IN VARCHAR2,
     miss_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–6 CREATE_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table

Usage Notes

The generated categorical missing value treatment definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
val	VARCHAR2(4000)

Examples

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('build_miss_cat_table');
END;
/

DESCRIBE build_miss_cat_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                VARCHAR2(4000)
```

CREATE_MISS_NUM Procedure

This procedure creates a numerical missing value treatment definition table. This table is used as input to the INSERT_MISS_NUM_MEAN procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
     miss_table_name       IN VARCHAR2,
     miss_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–7 CREATE_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the numeric missing value treatment definition table
miss_schema_name	Name of the schema hosting the numeric missing value treatment definition table

Usage Notes

The generated numeric missing value definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR(4000)
val	NUMBER

Example

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('build_miss_num_table');
END;
/

DESCRIBE build_miss_num_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                NUMBER
```

CREATE_NORM_LIN Procedure

This procedure creates a linear normalization definition table. This table is used as input to the INSERT_NORM_LIN_MINMAX, INSERT_NORM_LIN_SCALE, INSERT_NORM_LIN_ZSCORE, and XFORM_NORM_LIN procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
     norm_table_name       IN VARCHAR2,
     norm_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–8 CREATE_NORMALIZE_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table
norm_schema_name	Name of the schema hosting the normalization definition table

Usage Notes

The generated linear normalization definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
shift	NUMBER
scale	NUMBER

Examples

```
BEGIN
     DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('build_norm_table');
END;
/

DESCRIBE build_norm_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 SHIFT                                              NUMBER
 SCALE                                              NUMBER
```

DESCRIBE_STACK Procedure

This procedure describes the transformation of the data table specified by the stack definition.

Only the columns that are specified in the stack definition are transformed. The remaining columns do not change.

All columns in the stack definition are applied. Columns with NULL in the expression field are excluded. Columns in the stack definition that do not have a matching column in the data are added to the describe list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (
     xform_list           IN TRANSFORM_LIST,
     data_table_name      IN VARCHAR2,
     describe_list        OUT DESCRIBE_LIST
     data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–9 DESCRIBE_STACK Procedure Parameters

Parameter	Description
`xform_list`	List of stacked transformations
`data_table_name`	Table that contains the mining data
`describe_list`	Descriptions of stacked transformations
`data_schema_name`	Schema of table that contains the mining data. If you do not specify a schema, your own schema is used.

Usage Notes

For `DM_NESTED_NUMERICALS`, the value of `col_type` is `nest_num_col_type`. For `DM_NESTED_CATEGORICALS`, the value of `col_type` is `nest_cat_col_type`.

GET_EXPRESSION Function

This procedure returns a VARCHAR2 chunk from the expression.

Chunk numbering starts with one. For chunks outside of the range, the return value is NULL. When a chunk number is NULL the whole expression is returned as a string. If the expression is too big, a VALUE_ERROR is raised.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (
     expression           IN EXPRESSION_REC,
     chunk_num            IN PLS_INTEGER DEFAULT NULL);
 RETURN VARCHAR2;
```

Parameters

Table 39–10 GET_EXPRESSION Function Parameters

Parameter	Description
expression	Transformation expression
chunk_num	Number of the chunk

INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every numerical column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM. Based on the statistical information it collects on the input data, this procedure calculates the number of bins.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table.

N, the number of bins, is computed for each column separately and is based on the number of non-NULL values (cnt), the maximum (max), the minimum (min), the standard deviation (dev) and the constant C=3.49/0.9 as follows:

```
N=floor(power(cnt,1/3)*(max-min)/(c*dev))
```

Each of the bin_num (= N) bins bin_1,..., bin_N span ranges of equal width inc = (max – min) / N where bin_I = I when N > 0 or bin_I = N+1–I when N < 0, and bin_0 = bin_(N+1) = NULL. The values of the val column are rounded to round_num significant digits prior to scoring them in the definition table.

The parameter bin_num is used to adjust N to be at least bin_num. No adjustment is done when bin_num is NULL or 0. The parameter max_bin_num is used to adjust N to be at most max_bin_num. No adjustment is done when bin_num is NULL or 0. For columns with all integer values (discrete columns), N is adjusted to be at most the maximum number of distinct values in the observed range max-min+1.

The parameter sample_size is used to adjust cnt to be at most sample_size. No adjustment is done when sample_size is NULL or 0.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
     bin_table_name        IN VARCHAR2,
     data_table_name       IN VARCHAR2,
     bin_num               IN PLS_INTEGER DEFAULT 3,
     max_bin_num           IN PLS_INTEGER DEFAULT 100,
     exclude_list          IN Column_List DEFAULT NULL,
     round_num             IN PLS_INTEGER DEFAULT 6,
     sample_size           IN PLS_INTEGER DEFAULT 50000,
     bin_schema_name       IN VARCHAR2 DEFAULT NULL,
     data_schema_name      IN VARCHAR2 DEFAULT NULL,
     rem_table_name        IN VARCHAR2 DEFAULT NULL,
     rem_schema_name       IN VARCHAR2 DEFAULT NULL));
```

Parameters

Table 39–11 INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorical bin table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Minimum number of bins; default number is 3
max_bin_num	Maximum number of bins that sets the upper limit for estimates of bin numbers; default is 100

Table 39–11 (Cont.) INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process; categorical attributes are automatically excluded
round_num	Number of significant digits; default is 6
sample_size	Size of the data sample; default is 50,000
bin_schema_name	Name of the schema hosting the bin definition table; default is user schema
data_schema_name	Name of the schema hosting the table with data; default is user schema
rem_table_name	Name of the column removal definition table created with CREATE_COL_REM.
rem_schema_name	Schema of the column removal definition table.

Usage Notes

For a given input table, you can call this routine several times with different specifications for number of bins for a given input table. For each call, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. The sign of bin_num, max_bin_num, and sample_size have no effect on the result; absolute values are used. The value adjustment of N is done in the following order: First bin_num, next, max_bin_num, and, finally, discrete column adjustment.

Examples

The simplest invocation of this routine populates bin definitions in the num_bin_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQUIWIDTH(
      'num_bin_table', 'build_data_table');
END;
/
```

INSERT_BIN_CAT_FREQ Procedure

This procedure finds the categorical binning definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the categorical binning definition table created using CREATE_BIN_CAT.

Definition for each relevant column is computed based on the occurrence frequency of column values that are computed from the data table. Each of the bin_num(N) bins bin_1, ..., bin_N corresponds to the values with top frequencies when N > 0 or bottom frequencies when N < 0, and bin_(N+1) to all remaining values, where bin_I = I. Ordering ties among identical frequencies are broken by ordering on column values (ASC for N > 0 or DESC for N < 0). When the number of distinct values C < N only C+1 bins will be created.

The parameter default_num (D) is used for pruning based on the number of values that fall into the default bin. When D > 0 only columns that have at least D defaults are kept while others are ignored. When D < 0 only columns that have at most D values are kept. No pruning is done when D is NULL or D = 0. Parameter bin_support (SUP) is used for restricting bins to frequent (SUP > 0) values frq >= SUP*tot, or infrequent (SUP < 0) ones frq <= –SUP*tot, where frq is a given value count and tot is a sum of all counts as computed from the data. No support filtering is done when SUP is NULL or when SUP = 0.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
     bin_table_name       IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     bin_num              IN PLS_INTEGER DEFAULT 9,
     exclude_list         IN Column_List DEFAULT NULL,
     default_num          IN PLS_INTEGER DEFAULT 2,
     bin_support          NUMBER DEFAULT NULL,
     bin_schema_name      IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–12 INSERT_BIN_CAT_FREQ Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorical bin table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
default_num	Number of default values
bin_support	Bin support as a fraction
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the `exclude_list` parameter for a particular binning specification.

Columns with all `NULL`s are ignored. No bin definitions are populated when bin_num = 0, or bin_num, is `NULL`.

Examples

The simplest invocation of this routine populates bin definitions in the `cat_bin_table` for all the categorical attributes found in `build_table`.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
      'cat_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table. Each of the bin_num (= N) bins bin_1,..., bin_N span ranges of equal width inc = (max – min) / N where bin_I = I when N > 0 or bin_I = N+1–I when N < 0, and bin_0 = bin_(N+1) = NULL.

The values of the val column in the bin definition table are rounded to round_num significant digits. For more information, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
     bin_table_name        IN VARCHAR2,
     data_table_name       IN VARCHAR2,
     bin_num               IN PLS_INTEGER DEFAULT 10,
     exclude_list          IN Column_List DEFAULT NULL,
     round_num             IN PLS_INTEGER DEFAULT 6,
     bin_schema_name       IN VARCHAR2 DEFAULT NULL,
     data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–13 INSERT_BIN_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical bin table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
round_num	Number of significant digits. See Usage Notes.
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. No bin definitions are populated when bin_num = 0, or bin_num is NULL.

For example, when N=2, col='mycol', min=10, and max = 21, the following three rows are inserted into the definition table (inc = 5.5):

```
COL     VAL  BIN
----- -----  -----
mycol    10  NULL
```

```
 mycol  15.5  1
 mycol    21  2
```

The round_num parameter specifies how to round the number in the VAL column of the definition table. When round_num is positive, it specifies the most significant digits to retain. When round_num is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. When round_num is 0, the value is unchanged.

For example, a value of 308.162 would be rounded as follows.

```
For a value of 308.162:
     when round_num = 1       result is 300
     when round_num = 2       result is 310
     when round_num = 3       result is 308
     when round_num =  0      result is 308.162
     when round_num = -1      result is 308.16
     when round_num = -2      result is 308.2
     when round_num = NULL    result is NULL
```

Examples

The simplest invocation of this routine populates bin definitions in the num_bin_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
      'num_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_QTILE Procedure

This procedure finds a numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the binning definition table that was created using CREATE_BIN_NUM.

The definition for each relevant column is computed based on the minimum values for each quantile, where quantiles are computed from the data using NTILE function. Bins bin_1,..., bin_N span the following ranges: bin_1 spans [min_1,min_2]; bin_2,..., bin_i,..., bin_N-1 span (min_i, min_(i+1)] and bin_N spans (min_N, max_N]. Bins with equal left and right boundaries are collapsed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
    bin_table_name       IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    bin_num              IN PLS_INTEGER DEFAULT 10,
    exclude_list         IN Column_List DEFAULT NULL,
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–14 INSERT_BIN_NUM_QTILE Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using the CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
bin_schema_name	Name of the schema hosting the numerical binning definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for bin_num for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When N = 4, col='mycol', and data is {1,2,2,2,2,3,4}, the following three rows are inserted into the definition table:

```
COL     VAL   BIN
----- -----  -----
mycol     1   NULL
mycol     2   1
mycol     4   2
```

Here quantities are {1,2}, {2,2}, {2,3}, {4} and min(1) = 1, min(2) = 2, min(3) = 2, min(4) = 4, max(4) = 4, and ranges are [1,2], (2,2], (2,4], (4,4]. After collapsing [1,2] and (2,4].

Examples

The simplest invocation of this routine populates numerical binning definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE(
       'num_bin_table', 'build_table');
END;
```

INSERT_BIN_SUPER Procedure

This procedure finds a numerical and categorical binning definition for every NUMBER, FLOAT, VARCHAR2, or CHAR column in the data table that is not in the exclusion list and inserts the definition into the numerical or categorical binning definition table.

The bin boundaries are computed using a technique called **Supervised Binning**. The definition for each relevant column is computed based on the splits found by a Decision Tree model built on a single predictor. Columns that have no interesting splits are inserted into the column removal definition table (if one is specified).

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (
    num_table_name        IN VARCHAR2,
    cat_table_name        IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    target_column_name    IN VARCHAR2,
    max_bin_num           IN PLS_INTEGER  DEFAULT 1000,
    exclude_list          IN COLUMN_LIST  DEFAULT NULL,
    num_schema_name       IN VARCHAR2     DEFAULT NULL,
    cat_schema_name       IN VARCHAR2     DEFAULT NULL,
    data_schema_name      IN VARCHAR2     DEFAULT NULL,
    rem_table_name        IN VARCHAR2     DEFAULT NULL,
    rem_schema_name       IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 39–15 INSERT_BIN_SUPER Procedure Parameters

Parameter	Description
num_table_name	Name of the numerical bin definition table generated using the CREATE_BIN_NUM procedure.
cat_table_name	Name of the categorical bin definition table generated using the CREATE_BIN_CAT procedure.
data_table_name	Name of the table containing the data.
target_column_name	Name of the target column.
max_bin_num	The maximum number of bins.
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process.
num_schema_name	Schema of the numerical bin definition table.
cat_schema_name	Schema of the categorical bin definition table.
data_schema_name	Schema of the table containing the data.
rem_table_name	Name of the column removal definition table created with CREATE_COL_REM.
rem_schema_name	Schema of the column removal definition table.

INSERT_CLIP_TRIM_TAIL Procedure

This procedure finds the trimming definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

The definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that val(1) < val(2) <... < val(N), where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = NULL
rcut = val(N-floor(*N*q))
rval = NULL
```

where q = ABS(NVL(tail_frac,0)). Nothing is done when q >= 0.5.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
    clip_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    tail_frac           IN NUMBER DEFAULT 0.025,
    exclude_list        IN Column_List DEFAULT NULL,
    clip_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–16 INSERT_CLIP_TRIM_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using the CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification.

Example 1. When q = 0.2, col='mycol', and data is {1,2,2,2,3,4,4}, the following row is inserted into the definition table:

```
COL    LCUT   LVAL   RCUT   RVAL
----- -----  -----  -----  -----
mycol     2    NULL     4   NULL
```

Here 1 + floor(N*q) = 1 + floor(7*0.2) = 2, lcut = val(2) = 2.

N – floor(N*q) = 7 – floor(7*0.2) = 6, rcut = val(6) = 4.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL(
       'clip_table', 'build_table');
END;
```

INSERT_CLIP_WINSOR_TAIL Procedure

This procedure finds the Winsorizing definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

Definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that val(1) < val(2) <... < val(N), where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = lcut
rcut = val(N-floor(N*q))
rval = rcut
```

where q = ABS(NVL(tail_fraq,0)). Nothing is done when q >= 0.5.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
    clip_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    tail_frac          IN NUMBER DEFAULT 0.025,
    exclude_list       IN Column_List DEFAULT NULL,
    clip_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–17 INSERT_CLIP_WINSOR_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attribute (that is, column names using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When q = 0.2, col='mycol', and data is {1,2,2,2,3,4,4}, the following row is inserted into the definition table:

```
COL    LCUT   LVAL   RCUT  RVAL
----- -----  -----  ----- -----
mycol     2      2      4      4
```

Here 1 + floor(N*q) = 1 + floor(7*0.2) = 2, lcut = val(2) = 2.

N – floor(N*q) = 7 – floor(7*0.2) = 6, rcut = val(6) = 4.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL(
       'clip_table', 'build_table');
END;
```

INSERT_MISS_CAT_MODE Procedure

This procedure finds the categorical missing value treatment definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_CAT.

The definition for each selected column is computed based on the mode value that is computed from the data table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–18 INSERT_MISS_CAT_MODE Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the missing value treatment. See "Data Types" on page 39-7 for the definition of COLUMN_LIST.
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the categorical attributes that will receive missing value treatment by using the exclude_list parameter. NULL values in all the selected attributes will be replaced with the mode (the most commonly occurring value) for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in miss_table for all categorical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
       'miss_table', 'build_table');
END;
```

INSERT_MISS_NUM_MEAN Procedure

This procedure finds the numerical missing value treatment definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_NUM.

The definition for each selected column is computed based on the mean value that is computed from the data table. The value of mean is rounded to round_num significant digits prior to storing it in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–19 INSERT_MISS_NUM_MEAN Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the miss value treatment. See "Data Types" on page 39-7 for the definition of COLUMN_LIST.
round_num	The number of significant digits
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the numerical attributes that will receive missing value treatment by using the exclude_list parameter. NULL values in all the selected attributes will be replaced with the mean (average) value for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in miss_table for all numerical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
       'miss_table', 'build_table');
END;
```

INSERT_NORM_LIN_MINMAX Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the mean and standard deviation that are computed from the data table, such that shift = mean and scale = standard deviation. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–20 INSERT_NORM_LIN_MINMAX Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_minmax_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX(
      'norm_minmax_table', 'build_table');
END;
```

INSERT_NORM_LIN_SCALE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for shift and scale are shift = 0 and scale = max{abs(max), abs(min)}.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–21 INSERT_NORM_LIN_SCALE Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_minmax_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE(
      'norm_scale_table', 'build_table');
END;
```

INSERT_NORM_LIN_ZSCORE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on z-score normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table, such that shift = min and scale = max – min. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–22 INSERT_NORM_LIN_ZSCORE Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_zscore_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE(
      'norm_zscore_table', 'build_table');
END;
/
```

SET_EXPRESSION Procedure

This procedure appends a VARCHAR2 chunk to the expression. Appending NULL clears the expression.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (
           expression       IN OUT NOCOPY EXPRESSION_REC,
           chunk            VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–23 SET_EXPRESSION Procedure Parameters

Parameter	Description
expression	Transformation expression
chunk	Chunk to add to the expression

SET_TRANSFORM Procedure

This procedure specifies a transformation expression and a reverse transformation expression for an attribute.

The new transformation specification is appended to the transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
          xform_list               IN OUT NOCOPY TRANSFORM_LIST,
          attribute_name           VARCHAR2,
          attribute_subname        VARCHAR2,
          expression               VARCHAR2,
          reverse_expression       VARCHAR2,
          attribute_spec           VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–24 SET_TRANSFORM Procedure Parameters

Parameter	Description
`xform_list`	The transformation list for the attribute
`attribute_name`	Name of the attribute
`attribute_subname`	Name of the nested attribute if *`attribute_name`* is a nested column, otherwise `NULL`.
`expression`	A SQL expression.
`reverse_expression`	SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)
`attribute_spec`	You can specify the value `NOPREP` for `attribute_spec` to prevent this attribute from being automatically transformed in `DBMS_DATA_MINING.CREATE_MODEL`. (See "CREATE_MODEL Procedure" on page 38-40.)

STACK_BIN_CAT Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks a categorical binning expression on top of the existing expression and updates the stack definition.

Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When a reverse expression is NULL, it is treated as an identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, {expr} has the following form after stacking:

```
DECODE({expr}, '{val1}', '{bin1}',
                ...
               '{valN}', '{binN}',
                NULL,     NULL,
                         '{bin(N+1)}')
```

and {rexp} has the following form:

```
DECODE("{attr}", '{bin1}',     '{rev1}',
                 ...
                 '{binN}',     '{revN}',
                 NULL,         'NULL',
                 '{bin(N+1)}', 'DEFAULT')
```

where {revI} is the result of applying reverse expression to {valI}.

If {binI} and {binJ} are equal, then the corresponding entries of the DECODE function above are merged into:

```
'{binI}', '{revI}, {revJ}'
```

If more than one entry maps to the default bin {bin(N+1)}, they are all merged to

```
 '{bin(N+1)}', 'DEFAULT'
```

Note that the reverse expression implicitly maps invalid bins to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (
     bin_table_name     IN       VARCHAR2,
     transform_list     IN/OUT   DM_TRANSFORMS,
     literal_flag       IN       BOOLEAN  DEFAULT FALSE,
     bin_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–25 STACK_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table

Table 39–25 (Cont.) STACK_BIN_CAT Procedure Parameters

Parameter	Description
transform_list	List of stacked transformations
literal_flag	Literal flag (See the Usage Notes)
bin_schema_name	Schema of the bin definition table

Usage Notes

The Literal flag indicates whether the values in {bin} are valid SQL literals. When the the flag is set to TRUE, the value of {bin} is used "as is" in the expression generation, otherwise it is converted into a valid text literal (surrounded by quotes and double the quotes inside). By default the flag is set to FALSE. One example when it can be set to TRUE is in cases when all {bin} are numbers. In that case the transformed column will remain numeric as opposed to textual (default behavior). For example, for the following transform definition:

```
COL   VAL            BIN
----- -------------- ----
mycol Waltham        1
mycol Burlington     1
mycol Redwood Shores 2
```

the following {expr} and {rexp} are generated when the flag is FALSE:

```
expr = DECODE("mycol", 'Waltham',        '1',
                       'Burlington',     '1',
                       'Redwood Shores', '2')
rexp = DECODE("COL1", '1',  '''Waltham'', ''Burlington''',
                      '2',  '''Redwood Shores''',
                        NULL, 'DEFAULT')
```

and when the flag is set to TRUE:

```
expr = DECODE("mycol", 'Waltham',        1,
                       'Burlington',     1,
                       'Redwood Shores', 2)
 rexp = DECODE("COL1", 1,    '''Waltham'', ''Burlington''',
                       2,    '''Redwood Shores''',
                       NULL, 'DEFAULT')
```

Example

Given transformation definition:

```
{col = COL1, val = waltham,        bin = MA}
{col = COL1, val = burlington,     bin = MA}
{col = COL1, val = redwood shores, bin = CA}
{col = COL2, val = MA,             bin = East}
{col = COL2, val = CA,             bin = West}
{col = COL2, val = NULL,           bin = USA}
```

and stack definition:

```
{attr = COL1, expr = lower(COL1), rexp = initcap(COL1)}
{attr = COL3, expr = upper(COL3), rexp = initcap(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = DECODE(lower(COL1), 'waltham',        'MA',
```

```
                            'burlington',     'MA',
                            'redwood shores', 'CA'),
 rexp = DECODE("COL1", 'MA', '''Waltham'', ''Burlington''',
                       'CA', '''Redwood Shores''',
                        NULL, 'DEFAULT')}
{attr = COL3,
 expr = upper(COL3),
 rexp = initcap(COL3)}
{attr = COL2,
 expr = DECODE("COL2", 'MA', 'East',
                       'NY', 'East',
                       'CA', 'West',
                        NULL, NULL,
                              'USA')
 rexp = DECODE("COL2", 'East', '''MA''',
                       'West', '''CA''',
                        NULL,   'NULL',
                       'USA',  'DEFAULT')}
```

STACK_BIN_NUM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks numerical a binning expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added, or remains unchanged, then a corresponding reverse expression is also updated, added, or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, {expr} has the following form after stacking:

```
CASE WHEN ({expr}) <  {val0}   THEN '{bin0}'
     WHEN ({expr}) <= {val1}   THEN '{bin1}'
     ...
     WHEN ({expr}) <= {valN}   THEN '{binN}'
     WHEN ({expr}) IS NOT NULL THEN '{bin(N+1)}'
END
```

and {rexp} has the following form:

```
DECODE("{attr}", '{bin0}',     '( ; {rev0})',
                 '{bin1}',     '[{rev0}; {rev1})',
                 ...
                 '{binN}',     '[{rev(N-1)}; {revN}]',
                 '{bin(N+1)}', '({revN}; )',
                   NULL,         'NULL')
```

where {revI} is the result of applying reverse expression to {valI}.

If {binI} and {binJ} are equal then the corresponding entries of the DECODE function above are merged into:

```
       '{binI}', '[{rev(I-1)}; {revI}), [{rev(J-1)}; {revJ})'
```

Note that reverse expression implicitly maps invalid bins to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (
     bin_table_name     IN       VARCHAR2,
     transform_list     IN/OUT   DM_TRANSFORMS,
     literal_flag       IN       BOOLEAN  DEFAULT FALSE,
     bin_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–26 STACK_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table.

Table 39–26 (Cont.) STACK_BIN_NUM Procedure Parameters

Parameter	Description
transform_list	Stack definition.
literal_flag	Literal flag (See Usage Notes)
bin_schema_name	Schema of the bin definition table

Usage Notes

Literal flag indicates whether the values in {bin} are valid SQL literals. When the flag is set to TRUE the value of {bin} is used "as is" in the expression generation, otherwise it is converted into a valid text literal (surround by quotes and double the quotes inside. By default the flag is set to FALSE. One example when it can be set to TRUE is in cases when all {bin} are numbers. In that case the transformed column will remain numeric as opposed to textual (default behavior). For example, for the following xform definition:

```
COL     VAL BIN
----- ----- -----
mycol    10 NULL
mycol    15 1
mycol    20 2
```

the following {expr} and {rexp} are generated when the flag is FALSE:

```
expr = CASE WHEN "mycol" <  10 THEN NULL
            WHEN "mycol" <= 15 THEN '1'
            WHEN "mycol" <= 20 THEN '2' END

rexp = DECODE("mycol", '1',  '[10; 15)',
                       '2',  '[15; 20]'
                       NULL, '( ; 10) OR (20; ) OR NULL')
```

and when the flag is set to TRUE:

```
expr = CASE WHEN "mycol" <  10 THEN NULL
            WHEN "mycol" <= 15 THEN 1
            WHEN "mycol" <= 20 THEN 2 END
rexp = DECODE("mycol", 1,    '[10; 15)',
                       2,    '[15; 20]',
                       NULL, '( ; 10) OR (20; ) OR NULL')
```

Examples

Given transformation definition:

```
{col = COL1, val = 0,   bin = NULL}
{col = COL1, val = 1,   bin = A}
{col = COL1, val = 2,   bin = B}
{col = COL1, val = 3,   bin = A}
{col = COL2, val = 10,  bin = NULL}
{col = COL2, val = 15,  bin = 1}
{col = COL2, val = 20,  bin = 2}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = CASE WHEN (log(10, COL1)) <  0 THEN NULL
             WHEN (log(10, COL1)) <= 1 THEN 'A'
             WHEN (log(10, COL1)) <= 2 THEN 'B'
             WHEN (log(10, COL1)) <= 3 THEN 'A' END,
 rexp = DECODE("COL1", 'A',   '[1; 10), [100; 1000]',
                       'B',   '[10; 100)',
                       NULL, '( ; 1), (1000; ), NULL')}
 {attr = COL3,
  expr = ln(COL3),
  rexp = exp(COL3)}
 {attr = COL2,
  expr = CASE WHEN "COL2" <  10 THEN NULL
              WHEN "COL2" <= 15 THEN '1'
              WHEN "COL2" <= 20 THEN '2' END
  rexp = DECODE("COL2", '1',  '[10; 15)',
                        '2',  '[15; 20]',
                         NULL, '( ; 10) OR (20; ) OR NULL')}
```

STACK_CLIP Procedure

For every column in the stack definition that has a matching entry in the transformation definition. Stacks clipping expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed.

Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When the reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
CASE WHEN {expr} < {lcut} THEN {lval}
     WHEN {expr} > {rcut} THEN {rval}
                          ELSE {expr}
  END
```

and {rexp} remains unchanged

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (
          clip_table_name       VARCHAR2,
          xform_list            IN OUT NOCOPY TRANSFORM_LIST,
          clip_schema_name       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–27 STACK_CLIP Procedure Parameters

Parameter	Description
`clip_table_name`	Clipping definition table
`xform_list`	Stack definition
`clip_schema_list`	Schema of the clipping definition table. If you do not specify a schema, you own schema is assumed.

Example

Given transformation definition:

```
{col = COL1, lcut = -1.5, lval = -1.5, rcut = 4.5, rval = 4.5}
{col = COL2, lcut = 0,    lval = 0,    rcut = 1,   rval = 1}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
  expr = CASE WHEN log(10, COL1) < -1.5 THEN -1.5
              WHEN log(10, COL1) > 4.5  THEN 4.5
                                        ELSE log(10, COL1)
         END,
  rexp = power(10, COL1)}
 {attr = COL3,
  expr = ln(COL3),
  rexp = exp(COL3)}
 {attr = COL2,
  expr = CASE WHEN COL2 < 0 THEN 0
              WHEN COL2 > 1 THEN 1
                            ELSE COL2
         END,
  rexp = NULL}
```

STACK_COL_REM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks column removal expression (NULL expression) instead of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (with NULL expression).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as "{attr}" (identity function) or "VALUE" for nested columns.

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} and {rexp} are both changed to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_COL_REM (
     rem_table_name     IN       VARCHAR2,
     transform_list     IN/OUT   DM_TRANSFORMS,
     rem_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–28 STACK_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the column removal definition table.
transform_list	Stack definition
rem_schema_name	Schema of the column removal definition table.

Examples

Given transformation definition:

```
{col = COL1, att = NULL}
{col = COL2, att = NULL}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1, expr = NULL,     rexp = NULL}
{attr = COL3, expr = ln(COL3), rexp = exp(COL3)}
{attr = COL2, expr = NULL,     rexp = NULL}
```

STACK_MISS_CAT Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks categorical missing value treatment expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes). Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
NVL({expr}, {val})
```

and {rexp} remains unchanged.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT (
     miss_table_name     IN       VARCHAR2,
     transform_list      IN/OUT   DM_TRANSFORMS,
     miss_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–29 STACK_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the missing value definition table.
transform_list	Stack definition.
miss_schema_name	Schema of the missing value definition table.

Examples

Given transformation definition:

```
{col = COL1, val = 'ma'}
{col = COL2, val = 'CA'}
```

and stack definition:

```
{attr = COL1, expr = lower(COL1), rexp = initcap(COL1)}
{attr = COL3, expr = upper(COL3), rexp = initcap(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = NVL(lower(COL1), 'ma'),
 rexp = initcap(COL1)}
{attr = COL3,
expr = upper(COL3),
```

```
 rexp = initcap(COL3)}
{attr = COL2,
 expr = NVL(COL2, 'CA'),
 rexp = NULL}
```

STACK_MISS_NUM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, stacks numerical missing value treatment expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
NVL({expr}, {val})
```

and {rexp} remains unchanged

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_NUM (
     miss_table_name     IN       VARCHAR2,
     transform_list      IN/OUT   DM_TRANSFORMS,
     miss_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–30 STACK_MISS_NUM Procedure Parameters

Parameter	Description
`miss_table_name`	Name of the missing value definition table.
`transform_list`	Stack definition.
`miss_schema_name`	Schema of the missing value definition table.

Examples

Given transformation definition:

```
{col = COL1, val = 4.5}
{col = COL2, val = 0}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = NVL(log(10, COL1), 4.5),
 rexp = power(10, COL1)}
{attr = COL3,
 expr = ln(COL3),
```

```
 rexp = exp(COL3)}
{attr = COL2,
 expr = NVL(COL2, 0),
 rexp = NULL}
```

STACK_NORM_LIN Procedure

For every column in the stack definition that has a matching entry in the transformation definition, stacks linear normalization expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
({expr} - {shift})/{scale}
```

and {rexp} maintains the following form with every occurrence of {attr} replaced with:

```
{attr}*{scale} + {shift}
```

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_NORM_LIN (
     norm_table_name     IN       VARCHAR2,
     transform_list      IN/OUT   DM_TRANSFORMS,
     norm_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–31 STACK_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the linear normalization definition table.
transform_list	Stack definition.
norm_schema_name	Schema of the linear normalization definition table.

Examples

Given transformation definition:

```
{col = COL1, shift = -1.5, scale = 20}
{col = COL2, shift = 0,    scale = 10}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = (log(10, COL1) - (-1.5)) / 20,
 rexp = power(10, COL1*20 + (-1.5))}
```

```
{attr = COL3,
 expr = ln(COL3),
 rexp = exp(COL3)}
{attr = COL2,
 expr = (COL2 - 0) / 10,
 rexp = COL2*10 + 0}
```

XFORM_BIN_CAT Procedure

This procedure creates the view that performs categorical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
     bin_table_name       IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     xform_view_name      IN VARCHAR2,
     literal_flag         IN BOOLEAN DEFAULT FALSE,
     bin_schema_name      IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL,
     xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–32 XFORM_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorized binning definition table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_CAT and populated with bin definitions by INSERT_BIN_CAT_FREQ is used to guide the query generation process to construct categorical binning expressions of the following form:

```
DECODE("col", val_1, bin_1,
              ...
              val_N, bin_N,
              NULL,   NULL,
              bin_(N+1)) "col"
```

This expression maps values val_1,..., val_N into N bins bin_1,..., bin_N, and other values into bin_(N+1), while NULL values remain unchanged. bin_(N+1) is optional. If not specified, it defaults to NULL. To specify bin_(N+1) provide a row with val set to NULL.

The literal_flag parameter indicates whether the values in bin are valid SQL literals. When the flag is set to TRUE, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Set `literal_flag` to TRUE when the data is binned for an O-Cluster model build.

The `col` parameter is case-sensitive since it generates quoted identifiers. In cases when there are multiple entries with the same `col`,`val` combination with different `bin`, the behavior is undefined — any one of the `bin` values might be used.

Examples

Example 1. bin_cat contains four rows with col = 'mycol':

```
{col = 'mycol', val = 'Waltham',        bin = 'MA'}
{col = 'mycol', val = 'Burlington',     bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
{col = 'mycol', val = NULL,             bin = 'OTHER'}
```

the following expression is generated:

```
 DECODE("mycol", 'Waltham',        'MA',
                 'Burlington',     'MA',
                 'Redwood Shores', 'CA',
                  NULL,             NULL,
                                   'OTHER') "mycol"
```

Example 2. bin_cat contains three rows with col = 'mycol':

```
{col = 'mycol', val = 'Waltham',        bin = 'MA'}
{col = 'mycol', val = 'Burlington',     bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
```

the following expression is generated:

```
DECODE("mycol", 'Waltham',        'MA',
                'Burlington',     'MA',
                'Redwood Shores', 'CA') "mycol"
```

Example 3. For the definition:

```
COL   VAL            BIN
----- ----------     ---
mycol Waltham        1
mycol Burlington     1
mycol Redwood Shores 2
```

the following expression is generated when the literal flag is set to FALSE:

```
DECODE ("mycol", 'Waltham',        '1',
                 'Burlington'      '1',
                 'Redwood Shores', '2') "mycol"
```

and when the flag is set to TRUE:

```
DECODE("mycol", 'Waltham',        1,
                'Burlington',     1,
                'Redwood Shores', 2) "mycol"
```

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on bin definitions in the cat_bin_table.

```
BEGIN
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT(
'cat_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_BIN_NUM Procedure

This procedure creates the view that performs numerical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (
     bin_table_name     IN VARCHAR2,
     data_table_name    IN VARCHAR2,
     xform_view_name    IN VARCHAR2,
     literal_flag       IN BOOLEAN DEFAULT FALSE,
     bin_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name   IN VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–33 XFORM_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_NUM and populated with bin definitions by INSERT_BIN_NUM_EQWIDTH or INSERT_BIN_NUM_QTILE is used to guide the query generation process to construct numerical binning expressions of the following form:

```
CASE WHEN "col" <  val_0   THEN 'bin0_0
     WHEN "col" <= val_1   THEN 'bin_1'
     ...
     WHEN "col" <= val_N   THEN 'bin_N'
     WHEN "col" IS NOT NULL THEN 'bin_(N+1)'
END "col"
```

This expression maps values in the range [val_0;val_N] into N bins bin_1,..., bin_N, values outside of this range into bin_0 or bin_(N+1), such that

```
(-inf; val_0)  -> bin_0
[val_0; val_1)  -> bin_1
...
(val_(N-1); val_N] -> bin_N
(val_N; +inf)  -> bin_(N+1)
```

NULL values remain unchanged. bin_(N+1) is optional. If it is not specified, the values ("col" > val_N) are mapped to NULL. To specify bin_(N+1), provide a row with val set to NULL. The order of the WHEN... THEN pairs is based on the ascending order of val for a given col.

The literal_flag parameter indicates whether the values in bin are valid SQL literals. When the flag is set to TRUE, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Note that col is case-sensitive since it generates quoted identifiers. In cases where there are multiple entries with the same col,val combination with different bin, the behavior is undefined — any one of the bin values might be used.

Examples

Example 1. bin_num contains four rows with col = 'mycol':

```
{col = 'mycol', val = 15.5, bin = 'small'}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
{col = 'mycol', val = NULL, bin = 'huge'}
```

the following expression is generated:

```
CASE WHEN "mycol" <  10       THEN 'tiny'
     WHEN "mycol" <= 15.5     THEN 'small'
     WHEN "mycol" <= 20       THEN 'large'
     WHEN "mycol" IS NOT NULL THEN 'huge'
 END "mycol"
```

Example 2. bin_num contains three rows with col = 'mycol':

```
{col = 'mycol', val = 15.5, bin = NULL}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
```

the following expression is generated:

```
CASE WHEN "mycol" <  10   THEN NULL
     WHEN "mycol" <= 15.5 THEN 'small'
     WHEN "mycol" <= 20   THEN 'large'
END "mycol"
```

Example 3. For the definition:

```
COL   VAL  BIN
----- ---- ---
mycol   10 NULL
mycol 15.5 1
mycol   21 2
```

the following expression is generated when the literal flag is set to FALSE:

```
CASE WHEN "mycol" <  10   THEN NULL
     WHEN "mycol" <= 15.5 THEN '1'
     WHEN "mycol" <= 20   THEN '2'
 END "mycol"
```

and when the flag is set to TRUE:

```
CASE WHEN "mycol" <   10  THEN NULL
     WHEN "mycol" <= 15.5 THEN 1
     WHEN "mycol" <=  20  THEN 2
     END "mycol"
```

The simplest invocation of this routine generates a view `build_view` that represents the transformation query on `build_table` based on transform definitions in bin definitions in the `num_bin_table`.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM(
      'num_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_CLIP Procedure

This procedure creates the view that performs clipping. Only the columns that are specified in the transform definition are clipped; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
    clip_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    clip_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2,DEFAULT NULL,
    xform_schema_name     IN VARCHAR2,DEFAULT NULL;
```

Parameters

Table 39–34 XFORM_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The clipping definition table created by CREATE_CLIP and populated with clipping definitions by INSERT_CLIP_WINSOR_TAIL or INSERT_CLIP_TRIM_TAIL is used to guide query generation process to construct clipping expressions of the following form:

```
CASE WHEN "col" < lcut THEN lval
     WHEN "col" > rcut THEN rval
                       ELSE "col"
END "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

Example 1 (Winsorizing). When col = 'my_col', lcut = –1.5, lval = –1.5, and rcut = 4.5 and rval = 4.5, the following expression is generated:

```
CASE WHEN "my_col" < -1.5 THEN -1.5
     WHEN "my_col" >  4.5 THEN 4.5
                          ELSE "my_col"
END "my_col"
```

Examples

The simplest invocation of this routine generates a view object `build_view` that represents the transformation query on `build_table` based on transform definitions in clipping definitions in the `clip_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP(
    'clip_table', 'build_table', 'build_view');
END;
```

XFORM_COL_REM Procedure

This procedure creates a view that removes columns from the data table. Only the columns that are specified in the transform definition are removed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
     rem_table_name     IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     rem_schema_name    IN       VARCHAR2 DEFAULT NULL,
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–35 XFORM_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the column removal definition table.
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
rem_schema_name	Schema of the column removal definition table.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transforming view.

XFORM_EXPR_NUM Procedure

Creates a view that applies a given expression for every NUMBER column in the data table that is not in the exclusion list and in the inclusion list. The remaining columns do not change.

Expressions are constructed from the expression pattern by replacing every occurrence of the column pattern with an actual column name.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (
     expr_pattern       IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     exclude_list       IN       COLUMN_LIST DEFAULT NULL,
     include_list       IN       COLUMN_LIST DEFAULT NULL,
     col_pattern        IN       VARCHAR2 DEFAULT ':col',
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–36 XFORM_EXPR_NUM Procedure Parameters

Parameter	Description
expr_pattern	Expression pattern
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
exclude_list	List of columns to exclude.
include_list	List of columns to include.
col_pattern	Column pattern.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transformation view.

Examples

1. For a table TAB with two NUMBER columns CN1, CN3 and one CHAR columns CC2 and expression pattern TO_CHAR(:col), the following query is generated:

```
SELECT TO_CHAR("CN1") "CN1", "CC2", TO_CHAR("CN3") "CN3"
       FROM TAB
```

2. This procedure can be used for clipping (winsorizing) normalized data to a [0..1] range, that is values x > 1 become 1 and values x < 0 become 0.

   For the table in example 1 and pattern

   ```
   CASE WHEN :col < 0 THEN 0 WHEN :col > 1 THEN 1 ELSE :col END
   ```

   the following query is generated:

```
SELECT CASE WHEN "CN1" < 0 THEN 0 WHEN "CN1" > 1 THEN 1
            ELSE "CN1" END "CN1",
       "CC2",
     CASE WHEN "CN3" < 0 THEN 0 WHEN "CN3" > 1 THEN 1
```

```
     ELSE "CN3" END "CN3"
FROM TAB
```

XFORM_EXPR_STR Procedure

This procedure creates a view that applies a given expression for every VARCHAR2 or CHAR column in the data table that is not in the exclusion list and in the inclusion list. The remaining columns do not change.

Similar to xform_expr_num, except that it applies to CHAR and VARCHAR2 columns instead of NUMBER. See "XFORM_EXPR_NUM Procedure" on page 39-63

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR (
     expr_pattern       IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     exclude_list       IN       COLUMN_LIST DEFAULT NULL,
     include_list       IN       COLUMN_LIST DEFAULT NULL,
     col_pattern        IN       VARCHAR2 DEFAULT ':col',
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–37 XFORM_EXPR_STR Procedure Parameters

Parameter	Description
expr_pattern	Expression pattern
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
exclude_list	List of columns to exclude.
include_list	List of columns to include.
col_pattern	Column pattern.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transformation view.

XFORM_MISS_CAT Procedure

This procedure creates a view that performs categorical missing value treatment. Only the columns that are specified in the xform definition are treated; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 39–38 XFORM_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The data type of the transformed columns is preserved by putting a CAST expression around the NVL function. For example, when col = 'state', val = 'MA' the data type is CHAR(2) the following expression is generated:

```
CAST (NVL("state", 'MA') AS CHAR(2)) "state"
```

Examples

The simplest invocation of this routine generates a view object build_view that represents the transformation query on build_table based on transform definitions in missing value definitions in miss_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT(
       'miss_table', 'build_table', 'build_view');
END;
```

XFORM_MISS_NUM Procedure

This procedure creates a view that performs numerical missing value treatment of the data table. Only the columns that are specified in the xform definition are treated, the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 39–39 XFORM_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the numeric missing value treatment definition table generated using CREATE_MISS_NUM
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Examples

The simplest invocation of this routine generates a view object build_view that represents the transformation query on build_table based on transform definitions in missing value definitions in miss_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM(
    'miss_table', 'build_table', 'build_view');
END;
```

XFORM_NORM_LIN Procedure

This procedure creates the view that performs linear normalization. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
     norm_table_name      IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     xform_view_name      IN VARCHAR2,
     norm_schema_name     IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL,
     xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–40 XFORM_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The normalization table created by CREATE_NORM_LIN is populated with definitions by either INSERT_NORM_LIN_ZSCORE or INSERT_NORM_LIN_MINMAX is used to guide the query generation process to construct normalization expressions of the following form:

```
("col" - shift)/scale "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

For example, when col = 'my_col', shift = -1.5, and scale = 20. The following expression is generated:

```
("my_col" - (-1.5))/20 "my_col"
```

Examples

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on normalization definitions in the norm_minmax_table.

```
BEGIN
```

```
   DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN(
      'norm_minmax_table', 'build_table', 'build_view');
END;
```

XFORM_STACK Procedure

Creates a view that performs transformation of the data table specified by the stack definition. Only the columns that are specified in the stack definition are transformed, the remaining columns do not change.

All columns in the stack definition are applied. Columns with NULL value in the expression field are excluded. Columns in the stack definition that do not have a matching column in the data are added to the view.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (
     transform_list     IN     DM_TRANSFORMS,
     data_table_name    IN     VARCHAR2,
     xform_view_name    IN     VARCHAR2,
     data_schema_name   IN     VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–41 XFORM_STACK Procedure Parameters

Parameter	Description
transform_list	Stack definition.
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transformation view.

DBMS_DATAPUMP

The DBMS_DATAPUMP package is used to move all, or part of, a database between databases, including both data and metadata.

> **See Also:** *Oracle Database Utilities* for more information on the concepts behind the DBMS_DATAPUMP API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- Using DBMS_DATAPUMP
  - Overview
  - Security Model
  - Constants
- Data Structures
  - Data Structures - Object Types
- Summary of DBMS_DATAPUMP Subprograms

Using DBMS_DATAPUMP

This section contains topics that relate to using the `DBMS_DATAPUMP` package.

- Overview
- Security Model
- Constants

Overview

The support and functionality provided by DBMS_DATAPUMP is as follows:

- The source and target databases can have different hardware, operating systems, character sets, and time zones.
- All object types and datatypes existing in Oracle Database 11*g* are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, datafile names, and tablespace names can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The existing EXP_FULL_DATABASE and IMP_FULL_DATABASE roles will be used to allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

EXP_FULL_DATABASE

The EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the EXP_FULL_DATABASE role will also grant access to the SYS schema.

IMP_FULL_DATABASE

The IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the IMP_FULL_DATABASE role will also grant access to the SYS schema.

Constants

There are several public constants defined for use with the DBMS_DATAPUMP.GET_STATUS procedure. All such constants are defined as part of the DBMS_DATAPUMP package. Any references to these constants must be prefixed by DBMS_DATAPUMP. and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the DBMS_DATAPUMP.GET_STATUS procedure.

- `KU$_STATUS_WIP CONSTANT BINARY_INTEGER := 1;`
- `KU$_STATUS_JOB_DESC CONSTANT BINARY_INTEGER := 2;`
- `KU$_STATUS_JOB_STATUS CONSTANT BINARY_INTEGER := 4;`
- `KU$_STATUS_JOB_ERROR CONSTANT BINARY_INTEGER := 8;`

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the DBMS_DATAPUMP.GET_STATUS procedure.

- `KU$_DUMPFILE_TYPE_DISK CONSTANT BINARY_INTEGER := 0;`
- `KU$_DUMPFILE_TYPE_TEMPLATE CONSTANT BINARY_INTEGER := 3;`

Data Structures

The DBMS_DATAPUMP package defines OBJECT types. The types described in this section are defined in the SYS schema for use by the GET_STATUS function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the GET_STATUS procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 10*g*, release 1 (10.1), there is a sys.ku$_Status1010 type, and in the next Oracle Database release, there could be a sys.ku$_Status1110 type defined. Both types could be used with the GET_STATUS procedure.

Public synonyms have been defined for each of the types used with the GET_STATUS procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym ku$_Status1010 is defined for the sys.ku$_Status1010 type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 10*g*, release 1, the generic synonym ku$_Status is defined as ku$_Status1010. In a future release, there might be a ku$_Status1110 synonym for sys.ku$Status1110. Because the ku$_Status generic synonym always points to the latest definition, it would now point to ku$_Status1110 rather than to ku$_Status1010.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

Note: Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

See Also: GET_STATUS Procedure on page 40-26 for additional information about how types are used

Data Structures - Object Types

The DBMS_DATAPUMP package defines the following kinds of OBJECT types:

- Worker Status Types
- Log Entry and Error Types
- Job Status Types
- Job Description Types
- Status Types

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The percent_done refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$_WorkerStatus1010 AS OBJECT (
               worker_number      NUMBER,
               process_name       VARCHAR2(30),
               state              VARCHAR2(30),
               schema             VARCHAR2(30),
               name               VARCHAR2(4000),
               object_type        VARCHAR2(200),
               partition          VARCHAR2(30),
               completed_objects  NUMBER,
               total_objects      NUMBER,
               completed_rows     NUMBER,
               completed_bytes    NUMBER,
               percent_done       NUMBER)

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1010
  FOR sys.ku$_WorkerStatus1010;

CREATE TYPE sys.ku$_WorkerStatus1020 AS OBJECT (
               worker_number     NUMBER,        --  Worker process identifier
               process_name      VARCHAR2(30),  --  Worker process name
               state             VARCHAR2(30),  --  Worker process state
               schema            VARCHAR2(30),  --  Schema name
               name              VARCHAR2(4000),--  Object name
               object_type       VARCHAR2(200), --  Object type
               partition         VARCHAR2(30),  --  Partition name
               completed_objects NUMBER,        --  Completed number of objects
               total_objects     NUMBER,        --  Total number of objects
               completed_rows    NUMBER,        --  Number of rows completed
               completed_bytes   NUMBER,        --  Number of bytes completed
               percent_done      NUMBER,        --  Percent done current object
               degree            NUMBER         --  Degree of parallelism)

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1020
  FOR sys.ku$_WorkerStatus1020;
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus FOR ku$_WorkerStatus1020;

CREATE TYPE sys.ku$_WorkerStatusList1010 AS TABLE OF sys.ku$_WorkerStatus1010

CREATE TYPE sys.ku$_WorkerStatusList1020 AS TABLE OF sys.ku$_WorkerStatus1020

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1010
  FOR sys.ku$_WorkerStatusList1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1020
  FOR sys.ku$_WorkerStatusList1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList
  FOR ku$_WorkerStatusList1020;
```

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The `ku$LogLine.errorNumber` type is set to `NULL` for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

```
CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
              logLineNumber   NUMBER,
              errorNumber     NUMBER,
              LogText         VARCHAR2(2000))

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;
```

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (`percent_done` applies to data only):

```
CREATE TYPE sys.ku$_DumpFile1010 IS OBJECT (
              file_name          VARCHAR2(4000), -- Fully-qualified name
              file_type          NUMBER,         -- 0=Disk, 1=Pipe, etc.
              file_size          NUMBER,         -- Its length in bytes
              file_bytes_written NUMBER          -- Bytes written so far)

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1010 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1020 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile FOR ku$_DumpFile1010;

CREATE TYPE sys.ku$_DumpFileSet1010 AS TABLE OF sys.ku$_DumpFile1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1010 FOR
  sys.ku$_DumpFileSet1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1020 FOR
```

```
  sys.ku$_DumpFileSet1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet FOR ku$_DumpFileSet1010;

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT (
               job_name            VARCHAR2(30),
               operation           VARCHAR2(30),
               job_mode            VARCHAR2(30),
               bytes_processed     NUMBER,
               percent_done        NUMBER,
               degree              NUMBER,
               error_count         NUMBER,
               state               VARCHAR2(30),
               phase               NUMBER,
               restart_count       NUMBER,
               worker_status_list  ku$_WorkerStatusList1010,
               files               ku$_DumpFileSet1010)

CREATE PUBLIC SYNONYM ku$_JobStatus1010 FOR
   sys.ku$_JobStatus1010;

CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT (
             job_name           VARCHAR2(30),             -- Name of the job
             operation          VARCHAR2(30),             -- Current operation
             job_mode           VARCHAR2(30),             -- Current mode
             bytes_processed    NUMBER,                   -- Bytes so far
             total_bytes        NUMBER,                   -- Total bytes for job
             percent_done       NUMBER,                   -- Percent done
             degree             NUMBER,                   -- Of job parallelism
             error_count        NUMBER,                   -- #errors so far
             state              VARCHAR2(30),             -- Current job state
             phase              NUMBER,                   -- Job phase
             restart_count      NUMBER,                   -- #Job restarts
             worker_status_list ku$_WorkerStatusList1020, -- job worker processes
             files              ku$_DumpFileSet1010       -- Dump file info)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1020 FOR   sys.ku$_JobStatus1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus FOR ku$_JobStatus1020;
```

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```
CREATE TYPE sys.ku$_ParamValue1010 AS OBJECT (
               param_name     VARCHAR2(30),
               param_op       VARCHAR2(30),
               param_type     VARCHAR2(30),
               param_length   NUMBER,
               param_value_n  NUMBER,
               param_value_t  VARCHAR2(4000));

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1010 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1020 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue FOR ku$_ParamValue1010;

CREATE TYPE sys.ku$_ParamValues1010 AS TABLE OF sys.ku$_ParamValue1010;
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1010 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1020 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues FOR ku$_ParamValues1010;

CREATE TYPE sys.ku$_JobDesc1010 AS OBJECT (
               job_name       VARCHAR2(30),
               guid           RAW(16),
               operation      VARCHAR2(30),
               job_mode       VARCHAR2(30),
               remote_link    VARCHAR2(4000),
               owner          VARCHAR2(30),
               instance       VARCHAR2(16),
               db_version     VARCHAR2(30),
               creator_privs  VARCHAR2(30),
               start_time     DATE,
               max_degree     NUMBER,
               log_file       VARCHAR2(4000),
               sql_file       VARCHAR2(4000),
               params         ku$_ParamValues1010)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1010 FOR sys.ku$_JobDesc1010;

CREATE TYPE sys.ku$_JobDesc1020 IS OBJECT (
               job_name        VARCHAR2(30),     -- The job name
               guid            RAW(16),          -- The job GUID
               operation       VARCHAR2(30),     -- Current operation
               job_mode        VARCHAR2(30),     -- Current mode
               remote_link     VARCHAR2(4000),   -- DB link, if any
               owner           VARCHAR2(30),     -- Job owner
               platform        VARCHAR2(101),    -- Current job platform
               exp_platform    VARCHAR2(101),    -- Export platform
               global_name     VARCHAR2(4000),   -- Global name of DB
               exp_global_name VARCHAR2(4000),   -- Export global name
               instance        VARCHAR2(16),     -- The instance name
               db_version      VARCHAR2(30),     -- Version of objects
               exp_db_version  VARCHAR2(30),     -- Export version
               scn             NUMBER,           -- Job SCN
               creator_privs   VARCHAR2(30),     -- Privs of job
               start_time      DATE,             -- This job start time
               exp_start_time  DATE,             -- Export start time
               term_reason     NUMBER,           -- Job termination code
               max_degree      NUMBER,           -- Max. parallelism
               log_file        VARCHAR2(4000),   -- Log file name
               sql_file        VARCHAR2(4000),   -- SQL file name
               params          ku$_ParamValues1010  -- Parameter list)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1020 FOR sys.ku$_JobDesc1020;
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1020;
```

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the `GET_STATUS` call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the ku$_LogEntry that is returned has already had its log lines ordered for proper output. That is, the original ku$_LogEntry objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```
CREATE TYPE sys.ku$_Status1010 AS OBJECT
(
mask NUMBER,         /* Indicates which status types are present*/
wip ku$_LogEntry1010,  /* Work-In-Progress: std. exp/imp msgs */
job_description    ku$_JobDesc1010,   /* Complete job description */
job_status         ku$_JobStatus1010, /* Detailed job status + per-worker sts */
error              ku$_LogEntry1010   /* Multi-level contextual errors */
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT
        (
               mask             NUMBER,            -- Status types present
               wip              ku$_LogEntry1010,  -- Work in progress
               job_description  ku$_JobDesc1020,   -- Complete job description
               job_status       ku$_JobStatus1020, -- Detailed job status
               error            ku$_LogEntry1010   -- Multi-level context errors
        )

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1020 FOR sys.ku$_Status1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status FOR ku$_Status1020;
```

Summary of DBMS_DATAPUMP Subprograms

Table 40–1 DBMS_DATAPUMP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 40-13	Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the `FILETYPE` parameter provided with this procedure
ATTACH Function on page 40-16	Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state
DATA_FILTER Procedures on page 40-18	Specifies restrictions on the rows that are to be retrieved
DETACH Procedure on page 40-23	Specifies that the user has no further interest in using the handle
GET_DUMPFILE_INFO Procedure on page 40-24	Retrieves information about a specified dump file.
GET_STATUS Procedure on page 40-26	Monitors the status of a job or waits for the completion of a job or for more details on API errors
LOG_ENTRY Procedure on page 40-29	Inserts a message into the log file
METADATA_FILTER Procedure on page 40-30	Provides filters that allow you to restrict the items that are included in a job
METADATA_REMAP Procedure on page 40-33	Specifies a remapping to be applied to objects as they are processed in the specified job
METADATA_TRANSFORM Procedure on page 40-36	Specifies transformations to be applied to objects as they are processed in the specified job
OPEN Function on page 40-39	Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures except `ATTACH`
SET_PARALLEL Procedure on page 40-42	Adjusts the degree of parallelism within a job
SET_PARAMETER Procedures on page 40-44	Specifies job-processing options
START_JOB Procedure on page 40-53	Begins or resumes execution of a job
STOP_JOB Procedure on page 40-55	Terminates a job, but optionally, preserves the state of the job
WAIT_FOR_JOB Procedure on page 40-57	Runs a job until it either completes normally or stops for some other reason.

ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```
DBMS_DATAPUMP.ADD_FILE (
   handle     IN NUMBER,
   filename   IN VARCHAR2,
   directory  IN VARCHAR2,
   filesize   IN VARCHAR2 DEFAULT NULL,
   filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE),
   reusefile  IN NUMBER DEFAULT NULL;
```

Parameters

Table 40–2 ADD_FILE Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
filename	The name of the file being added. filename must be a simple filename without any directory path information. For dump files, the filename can include a substitution variable, %U, which indicates that multiple files may be generated with the specified filename as a template. The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of export%U would cause export01, export02, export03, and so on, to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as %% to avoid ambiguity. Any % in a filename must be followed by either a % or a U.
directory	The name of a directory object within the database that is used to locate filename. A directory must be specified. See the Data Pump Export chapter in *Oracle Database Utilities* for information about the DIRECTORY command-line parameter.
filesize	The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M) or number of gigabytes (if followed by G). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, filesize will default to an unlimited size. For Import and SQL_FILE operations, filesize is ignored. The minimum value for filesize is ten times the default Data Pump block size, which is 4 kilobytes. filesize may only be specified for dump files.
filetype	The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP.: ■ KU$_FILE_TYPE_DUMP_FILE (dump file for a job) ■ KU$_FILE_TYPE_LOG_FILE (log file for a job) ■ KU$_FILE_TYPE_SQL_FILE (output for SQL_FILE job)

Table 40–2 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
reusefile	If 0, a preexisting file will cause an error. If 1, a preexisting file will be overwritten. If NULL, the default action for the file type will be applied (that is, dump files will not be overwritten). This parameter should only be non-NULL for dump files. The reusefile parameter is restricted to export jobs.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- INVALID_STATE. The job is completing, or the job is past the defining state for an import or SQL_FILE job or is past the defining state for LOG and SQL files.
- INVALID_OPERATION. A dump file was specified for a Network Import or ESTIMATE_ONLY export operation.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a SQL_FILE operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and SQL_FILE operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation and reusefile is not set to 1, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the SET_PARALLEL procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (%U) is included in a filename, multiple dump files may be specified through a single call to ADD_FILE. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current SET_PARALLEL value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple ADD_FILEs with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if expa%U, expb%U and expc%U were all specified for a job having a parallelism of 6, the initial dump

files created would look like: `expa01`, `expb01`, `expc01`, `expa02`, `expb02`, and `expc02`.

- If presented with dump file specifications, `expa%U`, `expb%U` and `expc%U`, an Import or SQL_FILE operation will begin by attempting to open the dump files, `expa01`, `expb01`, and `expc01`. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, `expa02`, `expb02`, and `expc02`). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.

ATTACH Function

This function gains access to a previously-created job.

Syntax

```
DBMS_DATAPUMP.ATTACH(
   job_name    IN VARCHAR2 DEFAULT NULL,
   job_owner    IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 40–3 ATTACH Function Parameters

Parameter	Description
job_name	The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).
job_owner	The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the EXP_FULL_DATABASE role (for export operations) or the IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT_NOT_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.

- If the ATTACH fails, use a null handle in a subsequent call to GET_STATUS for more information about the failure.

DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```
DBMS_DATAPUMP.DATA_FILTER (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.DATA_FILTER(
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN VARCHAR2,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.DATA_FILTER(
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN CLOB,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–4 DATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle that is returned from the OPEN procedure.
name	The name of the filter.
value	The value of the filter.
table_name	The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.
schema_name	The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.

Exceptions

- INVALID_ARGVAL. There can be several reasons for this message:
  - A bad filter name is specified
  - The mode is TRANSPORTABLE, which does not support data filters
  - The specified table does not exist
  - The filter has already been set for the specified values of schema_name and table_name
- INVALID_STATE. The user called DATA_FILTER when the job was not in the Defining state.

- INCONSISTENT_ARGS. The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- PRIVILEGE_ERROR. A schema name was supplied, but the user did not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple SUBQUERY filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

  With the exception of the INCLUDE_ROWS filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

  The available data filters are described in Table 40–5.

Table 40–5 Data Filters

Name	Datatype	Operations that Support Filter	Description
INCLUDE_ ROWS	NUMBER	EXPORT, IMPORT	If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.
PARTITION_ EXPR PARTITION_ LIST	text	EXPORT, IMPORT	For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for PARTITION_EXPR) or are included in the list (for PARTITION_LIST). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. PARTITION_EXPR is not supported on jobs across a network link. Default=All partitions are processed.
SAMPLE	NUMBER	EXPORT, IMPORT	For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.

Table 40–5 (Cont.) Data Filters

Name	Datatype	Operations that Support Filter	Description
SUBQUERY	text	EXPORT, IMPORT	Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.

DATA_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

Syntax

```
DBMS_DATAPUMP.DATA_REMAP(
   handle          IN NUMBER,
   name            IN VARCHAR2,
   table_name      IN VARCHAR2,
   column          IN VARCHAR2,
   remap_function  IN VARCHAR2),
   schema          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–6 DATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle of the current job. The current session must have previously attached to the handle through an OPEN call.
name	The name of the remap.
table_name	The table containing the column to be remapped.
column	The name of the column to be remapped.
remap_function	The meaning of remap_function is dependent upon the value of name. See Table 40–7 for a list of possible names.
schema	The schema containing the column to be remapped. If NULL, the remapping applies to all schemas moved in the job that contain the specified table.

Exceptions

- INVALID_ARGVAL. The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
- INVALID_OPERATION. Data remaps are only supported for Export and Import operations.
- INVALID_STATE. The DATA_REMAP procedure was called after the job started (that is, it was not in the defining state).
- NO_SUCH_JOB. The job handle is no longer valid.

Usage Notes

- The DATA_REMAP procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The name of the remap determines the remap operation to be performed.
- For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is

consistent across the dump file set, the same function should be called for every column that contains the credit card number.

- For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

> **Note:** If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a SET_PARALLEL value of 1 and no restart operations should be performed.

The Data Remap functions are listed in Table 40–7.

Table 40–7 Names of Data Remap Functions

Name	Meaning of `remap_function`	Meaning
`COLUMN_FUNCTION`	String having the format: `[schema.]package.function`	The `name` parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export.

DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```
DBMS_DATAPUMP.DETACH(
   handle  IN NUMBER);
```

Parameters

Table 40–8 DETACH Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.

GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
   filename    IN VARCHAR2,
   directory   IN VARCHAR2,
   info_table  OUT ku$_dumpfile_info,
   filetype    OUT NUMBER);
```

Parameters

Table 40–9 GET_DUMPFILE_INFO Procedure Parameters

Parameter	Description
filename	A simple filename with no directory path information.
directory	A directory object that specifies where the file can be found.
info_table	A PL/SQL table for storing information about the dump file.
filetype	The type of file (Data Pump dump file, original Export dump file, or unknown).

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- NO_DUMPFILE_INFO. Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of zero will be returned and the dump file info_table will remain empty.

A filetype value of one indicates a Data Pump dump file. A file type value of two indicates an original Export dump file. In both cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
               item_code       NUMBER,           -- Identifies header item
               value           VARCHAR2(2048)    -- Text string value)
/

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item
/
```

```
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as follows (prepended with the package name, `DBMS_DATAPUMP.`):

```
KU$_DFHDR_FILE_VERSION          CONSTANT NUMBER := 1;
KU$_DFHDR_MASTER_PRESENT        CONSTANT NUMBER := 2;
KU$_DFHDR_GUID                  CONSTANT NUMBER := 3;
KU$_DFHDR_FILE_NUMBER           CONSTANT NUMBER := 4;
KU$_DFHDR_CHARSET_ID            CONSTANT NUMBER := 5;
KU$_DFHDR_CREATION_DATE         CONSTANT NUMBER := 6;
KU$_DFHDR_FLAGS                 CONSTANT NUMBER := 7;
KU$_DFHDR_JOB_NAME              CONSTANT NUMBER := 8;
KU$_DFHDR_PLATFORM              CONSTANT NUMBER := 9;
KU$_DFHDR_INSTANCE              CONSTANT NUMBER := 10;
KU$_DFHDR_LANGUAGE              CONSTANT NUMBER := 11;
KU$_DFHDR_BLOCKSIZE             CONSTANT NUMBER := 12;
KU$_DFHDR_DIRPATH               CONSTANT NUMBER := 13;
KU$_DFHDR_METADATA_COMPRESSED   CONSTANT NUMBER := 14;
KU$_DFHDR_DB_VERSION            CONSTANT NUMBER := 15;
KU$_DFHDR_MAX_ITEM_CODE         CONSTANT NUMBER := 20;
KU$_DFHDR_MASTER_PIECE_COUNT    CONSTANT NUMBER := 16;
KU$_DFHDR_MASTER_PIECE_NUMBER   CONSTANT NUMBER := 17;
KU$_DFHDR_DATA_COMPRESSED       CONSTANT NUMBER := 18;
KU$_DFHDR_METADATA_ENCRYPTED    CONSTANT NUMBER := 19;
KU$_DFHDR_DATA_ENCRYPTED        CONSTANT NUMBER := 20;
```

GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

```
DBMS_DATAPUMP.GET_STATUS(
   handle    IN NUMBER,
   mask      IN BINARY_INTEGER,
   timeout   IN NUMBER DEFAULT NULL,
   job_state OUT VARCHAR2,
   status    OUT ku$_Status1010);
```

Parameters

Table 40–10 GET_STATUS Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. A null handle can be used to retrieve error information after OPEN and ATTACH failures.
mask	A bit mask that indicates which of four types of information to return: ■ KU$_STATUS_WIP ■ KU$_STATUS_JOB_DESC ■ KU$_STATUS_JOB_STATUS ■ KU$_STATUS_JOB_ERROR Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See Data Structures - Object Types on page 40-7.
timeout	Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.
job_state	Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku$_Status structure.
status	A ku$_Status is returned. The ku$_Status mask indicates what kind of information is included. This could be none if only KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and the timeout period expires. This can be a ku$_Status1010 or ku$_Status1020 object type.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_VALUE. The mask or timeout contains an illegal value.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The GET_STATUS procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The KU$_STATUS_JOB_DESC and KU$_STATUS_JOB_STATUS values are classified as synchronous information because the information resides in the master table. The KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information *only* is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a *maximum* of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the job_state returned by GET_STATUS does not indicate a terminating job, it is possible that the job could still terminate before the next call to GET_STATUS. This would result in an INVALID_HANDLE exception. Alternatively, the job could terminate during the call to GET_STATUS, which would result in a NO_SUCH_JOB exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the GET_STATUS procedure:

- Errors resulting from other procedure calls: For example, the SET_PARAMETER procedure may produce an INCONSISTENT_ARGS exception. The client should immediately call GET_STATUS with mask=8 (errors) and timeout=0. The returned ku$_Status.error will contain a ku$_LogEntry that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be Table already exists when trying to create a table. The ku$_Status.error will contain a ku$_LogEntry with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to GET_STATUS with an infinite timeout (-1) "listening" for KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages. If status was requested, then JOB_STATUS information will also be in the request.

When the ku$_Status is interpreted, the following guidelines should be used:

- ku$_Status.ku$_JobStatus.percent_done refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  - EXPORT or network IMPORT--(bytes_processed/estimated_bytes) * 100
  - IMPORT--(bytes_processed/total_expected_bytes) * 100
  - SQL_FILE or estimate-only EXPORT--0.00 if not done or 100.00 if done

  The effects of the QUERY and PARTITION_EXPR data filters are not considered in computing percent_done.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

```
((SYSDATE - start time) / ku$_Status.ku$_JobStatus.percent_done) * 100
```

- The caller should not use `ku$_Status.ku$_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```
DBMS_DATAPUMP.LOG_ENTRY(
   handle         IN NUMBER,
   message        IN VARCHAR2
   log_file_only  IN NUMBER DEFAULT 0);
```

Parameters

Table 40–11 LOG_ENTRY Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
message	A text line to be added to the log file.
log_file_only	Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU$_STATUS_WIP) messages.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If log_file_only is zero (the default), the message is also broadcast as a KU$_STATUS_WIP message through the GET_STATUS procedure to all users attached to the job.

The LOG_ENTRY procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports INCLUDE and EXCLUDE parameters defined by the user. Identifying these values as calls to the underlying METADATA_FILTER procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the INCLUDE and EXCLUDE parameters.

Lines entered in the log stream from LOG_ENTRY are prefixed by the string, ";;; "

METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

```
DBMS_DATAPUMP.METADATA_FILTER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN VARCHAR2,
   object_path  IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_FILTER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN CLOB,
   object_path  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–12 METADATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from the OPEN procedure.
name	The name of the filter. See Table 40–13 for descriptions of the available filters.
value	The value of the filter.
object_path	The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.

Table 40–13 describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

Table 40–13 Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
NAME_EXPR NAME_LIST	Named objects	Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.

Table 40–13 (Cont.) Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
SCHEMA_EXPR SCHEMA_LIST	Schema objects	Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN (''SCOTT'')'). For Schema mode, identifies which users are to be processed.
TABLESPACE_EXPR TABLESPACE_LIST	TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT	Restricts the job to objects stored in a tablespace whose name is satisfied by the expression. For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.
INCLUDE_PATH_EXPR INCLUDE_PATH_LIST EXCLUDE_PATH_EXPR EXCLUDE_PATH_LIST	All	Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_*) or excluded (EXCLUDE_PATH_*) from the operation. The object_path parameter is not supported for these filters.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception can indicate any of the following conditions:
  - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
  - The specified object_path is not supported for the current mode.
  - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter,

grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.

- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:
  - NAME_EXPR
  - SCHEMA_EXPR
  - TABLESPACE_EXPR
  - INCLUDE_PATH_EXPR
  - EXCLUDE_PATH_EXPR

  The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:
  - NAME_LIST
  - SCHEMA_LIST
  - TABLESPACE_LIST
  - INCLUDE_PATH_LIST
  - EXCLUDE_PATH_LIST
- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.
- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).
- The same filter name can be specified multiple times within a job. For example, specifying `NAME_EXPR as '!=''EMP'''` and `NAME_EXPR as '!=''DEPT'''` on a Table mode export would produce a file set containing all of the tables except for `EMP` and `DEPT`.

METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_REMAP (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   old_value   IN VARCHAR2,
   value       IN VARCHAR2,
   object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–14 METADATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.
name	The name of the remap. See Table 40–15 for descriptions of the available remaps.
old_value	Specifies which value in the dump file set should be reset to value.
value	The value of the parameter for the remap. This signifies the new value that old_value should be translated into.
object_type	Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.

Table 40–15 describes the remaps provided by the METADATA_REMAP procedure.

Table 40–15 Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_SCHEMA	Text	Schema objects	Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE's objects to SCOTT, but SCOTT cannot remap SCOTT's objects to BLAKE.

Table 40–15 (Cont.) Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_TABLESPACE	Text	TABLE, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG,TABLE_SPACE	Any storage segment in the job that matches the object_type parameter and was located in the old_value tablespace will be relocated to the value tablespace.
REMAP_DATAFILE	Text	LIBRARY, TABLESPACE, DIRECTORY	Any datafile reference in the job that matches the object_type parameter and referenced the old_value datafile will be redefined to use the value datafile.
REMAP_TABLE	Text	TABLE	Any reference to a table in the job that matches the old_value table name will be replaced with the value table name. The old_value parameter may refer to a partition such as employees.low. This allows names for tables constructed the by PARTITION_OPTIONS=DEPARTITION parameter to be specified by the user.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The job's mode does not include the specified object_type.
  - The remap has already been specified for the specified old_value and object_type.
- INVALID_OPERATION. Remaps are only supported for SQL_FILE and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- INVALID_STATE. The user called METADATA_REMAP after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the remap.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_REMAP procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing

the DDL directly and then executing it, you can produce any remappings that you need.

- Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN VARCHAR2,
   object_type IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_TRANSFORM (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER,
   object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–16 METADATA_TRANSFORM Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.
name	The name of the transformation. See Table 40–17 for descriptions of the available transforms.
value	The value of the parameter for the transform.
object_type	Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.

Table 40–17 describes the transforms provided by the METADATA_TRANSFORM procedure.

Table 40–17 Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
PCTSPACE	NUMBER	TABLE INDEX TABLESPACE	Specifies a percentage multiplier used to alter extent allocations and datafile sizes. Used to shrink large tablespaces for testing purposes. Defaults to 100.
SEGMENT_ATTRIBUTES	NUMBER	TABLE, INDEX	If nonzero (TRUE), emit storage segment parameters. Defaults to 1.

Table 40–17 (Cont.) Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
STORAGE	NUMBER	TABLE	If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.) Defaults to nonzero (TRUE).
OID	NUMBER	TYPE TABLE	If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified object_type.
  - The transform has already been specified for the specified value and object_type.
- INVALID_OPERATION. Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- INVALID_STATE. The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique

according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.

OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures except ATTACH.

Syntax

```
DBMS_DATAPUMP.OPEN (
   operation    IN VARCHAR2,
   mode         IN VARCHAR2,
   remote_link  IN VARCHAR2 DEFAULT NULL,
   job_name     IN VARCHAR2 DEFAULT NULL,
   version      IN VARCHAR2 DEFAULT 'COMPATIBLE'
 RETURN NUMBER;
```

Parameters

Table 40–18 OPEN Function Parameters

Parameter	Meaning
operation	The type of operation to be performed. Table 40–19 contains descriptions of valid operation types.
mode	The scope of the operation to be performed. Table 40–20 contains descriptions of valid modes. Specifying NULL generates an error.
remote_link	If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.
job_name	The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN procedure and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: "SYS_<OPERATION>_<MODE>_%N". The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, "SYS_IMPORT_FULL_03"). The name supplied for the job will also be used to name the master table and other resources associated with the job.
version	The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows: ■ COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. ■ LATEST - the version of the metadata corresponds to the database version. ■ A specific database version, for example, '10.0.0'. In Oracle Database10*g*, this value cannot be lower than 10.0.0.

Table 40–19 describes the valid operation types for the OPEN Function.

Table 40–19 Valid Operation Types for the OPEN Function

Operation	Description
EXPORT	Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.
IMPORT	Restores data and metadata from a dump file set or across a database link.
SQL_FILE	Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.

Table 40–20 describes the valid modes for the OPEN procedure.

Table 40–20 Valid Modes for the OPEN Function

Mode	Description
FULL	Operates on the full database or full dump file set except for the SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, and LBACSYS schemas.
SCHEMA	Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. Users cannot specify SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS schemas for this mode.
TABLE	Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.
TABLESPACE	Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.
TRANSPORTABLE	Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, CREATE_JOB_VIEW, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, LOG_ERROR, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB

Exceptions

- INVALID_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- JOB_EXISTS. A table already exists with the specified job name.
- PRIVILEGE_ERROR. The user does not have the necessary privileges or roles to use the specified mode.
- INTERNAL_ERROR. The job was created under the wrong schema or the master table was of the wrong format.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.

- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the ATTACH procedure.
- If the OPEN fails, call GET_STATUS with a null handle to retrieve additional information about the failure.

SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
   handle      IN NUMBER,
   degree      IN NUMBER);
```

Parameters

Table 40–21 SET_PARALLEL Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
degree	The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_OPERATION. The SET_PARALLEL procedure is only valid for export and import operations.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
- To parallelize an Export job to a degree of *n*, the user should supply *n* files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

- SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

```
DBMS_DATAPUMP.SET_PARAMETER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN VARCHAR2);

DBMS_DATAPUMP.SET_PARAMETER (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER);
```

Parameters

Table 40–22 SET_PARAMETER Procedure Parameters

Parameter	Description
`handle`	The handle of a job. The current session must have previously attached to the handle through an `OPEN` call.
`name`	The name of the parameter. Table 40–23 describes the valid parameter names.
`value`	The value for the specified parameter.

Table 40–23 describes the valid options for the `name` parameter of the `SET_PARAMETER` procedure.

Table 40–23 Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
CLIENT_ COMMAND	Text	All	An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.
COMPRESSION	Text	Export	Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations. The DATA_ONLY option compresses only user data in the dump file set. The METADATA_ONLY option compresses only metadata in the dump file set. The ALL option compresses both user data and metadata. The NONE option stores the dump file set in an uncompressed format. The METADATA_ONLY and NONE options require a job version of 10.2 or later. All other options require a job version of 11.1 or later. Default=METADATA_ONLY
DATA_OPTIONS	Number	Export and Import	A bitmask to supply special options for processing the job. The supported values are as follows: ■ KU$_DATAOPT_SKIP_CONST_ERR CONSTANT NUMBER := 1; ■ KU$_DATAOPT_XMLTYPE_CLOB CONSTANT NUMBER := 2; Export supports the value KU$_DATAOPT_XMLTYPE_ CLOB. This option stores compressed XMLType columns in the dump file as CLOBs rather than as XML documents. Import supports the value KU$_DATAOPT_SKIP_CONST_ ERR. This option specifies that if constraint violations occur while data is being imported into user tables, the rows that cause the violations will be rejected and the load will continue. If this option is not set, a constraint error will abort the loading of the entire partition (or table for unpartitioned tables). Setting this option may affect performance, especially for pre-existing tables with unique indexes or constraints. Use of this parameter requires that the version on the OPEN procedure be set to 11.1 or later. Default=0

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION	Text	Export	Specifies what to encrypt in the dump file set, as follows: ALL enables encryption for all data and metadata in the ecport operation. DATA_ONLY specifies that only data is written to the dump file set in encrypted format. ENCRYPTED_COLUMNS_ONLY specifies that only encrypted columns are written to the dump file set in encrypted format. METADATA_ONLY specifies that only metadata is written to the dump file set in encrypted format. NONE specifies that no data is written to the dump file set in encrypted format. This parameter requires a job version of 11.1 or later. The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either ENCRYPTION or ENCRYPTION_PASSWORD or both, must be specified. If only ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to ALL. If neither ENCRYPTION nor ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to NONE. To specify ALL, DATA_ONLY, or METADATA_ONLY, the COMPATIBLE initialization parameter must be set to at least 11.1. **NOTE**: If the data being exported includes SecureFiles that you want to be encrypted, then you must specify ENCRYPTION=ALL to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.
ENCRYPTION_ALGORITHM	Text	Export	Identifies which cryptographic algorithm should be used to perform encryption. Possible values are AES128, AES192, and AES256. The ENCRYPTION_ALGORITHM parameter requires that you also specify either ENCRYPTION or ENCRYPTION_PASSWORD; otherwise an error is returned. See *Oracle Database Advanced Security Administrator's Guide* for information about encryption algorithms. This parameter requires a job version of 11.1 or later. Default=AES128

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_MODE	Text	Export	Identifies the types of security used for encryption and decryption. The values are as follows: PASSWORD requires that you provide a password when creating encrypted dump file sets. You will need to provide the same password when you import the dump file set. PASSWORD mode requires that you also specify the ENCRYPTION_PASSWORD parameter. The PASSWORD mode is best suited for cases in which the dump file set will be imported into a different or remote database, but which must remain secure in transit. TRANSPARENT allows an encrypted dump file set to be created without any intervention from a database administrator (DBA), provided the required Oracle Encryption Wallet is available. Therefore, the ENCRYPTION_PASSWORD parameter is not required, and will in fact, cause an error if it is used in TRANSPARENT mode. This encryption mode is best suited for cases in which the dump file set will be imported into the same database from which it was exported. DUAL creates a dump file set that can later be imported using either the Oracle Encryption Wallet or the password that was specified with the ENCRYPTION_PASSWORD parameter. DUAL mode is best suited for cases in which the dump file set will be imported onsite using the Oracle Encryption Wallet, but which may also need to be imported offsite where the Oracle Encryption Wallet is not available. When you use the ENCRYPTION_MODE parameter, you must also use either the ENCRYPTION or ENCRYPTION_PASSWORD parameter. Otherwise, an error is returned. To use DUAL or TRANSPARENT mode, the COMPATIBLE initialization parameter must be set to at least 11.1. The default mode depends on which other encryption-related parameters are used. If only ENCRYPTION is specified, then the default mode is TRANSPARENT. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is open, then the default is DUAL. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is closed, then the default is PASSWORD.

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_ PASSWORD	Text	Export and Import	Specifies a key for re-encrypting encrypted table columns, metadata, or table data so that they are not written as clear text in the dump file set. If the export operation involves encrypted table columns, but an encryption password is not supplied, then the encrypted columns will be written to the dump file set as clear text and a warning will be issued. **NOTE**: Data Pump encryption functionality has changed as of Oracle Database 11g release 1 (11.1). Prior to release 11.1, the ENCRYPTION_PASSWORD parameter applied only to encrypted columns. However, as of release 11.1, the new ENCRYPTION parameter provides options for encrypting other types of data. This means that if you now specify ENCRYPTION_PASSWORD without also specifying ENCRYPTION and a specific option, then *all* data written to the dump file will be encrypted (equivalent to specifying ENCRYPTION=ALL). If you want to re-encrypt *only* encrypted columns, you must now specify ENCRYPTION=ENCRYPTED_ COLUMNS_ONLY in addition to ENCRYPTION_ PASSWORD. For export operations, this parameter is required if ENCRYPTION_MODE is set to either PASSWORD or DUAL. If ENCRYPTION_PASSWORD is specified but ENCRYPTION_MODE is not specified, then it is not necessary to have Transparent Data Encryption set up since ENCRYPTION_MODE will default to PASSWORD. The ENCRYPTION_PASSWORD parameter is not valid if the requested encryption mode is TRANSPARENT. To use the ENCRYPTION_PASSWORD parameter if ENCRYPTION_MODE is set to DUAL, you must have Transparent Data Encryption set up. See *Oracle Database Advanced Security Administrator's Guide* for more information about Transparent Data Encryption. For network exports, the ENCRYPTION_PASSWORD parameter in conjunction with ENCRYPTION=ENCRYPTED_COLUMNS_ONLY is not supported with user-defined external tables that have encrypted columns. The table will be skipped and an error message will be displayed, but the job will continue. Encryption attributes for all columns must match between the exported table definition and the target table. This parameter requires a job version of 10.2 or later.

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ESTIMATE	Text	Export and Import	Specifies that the estimate method for the size of the tables should be performed before starting the job. If BLOCKS, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables. If STATISTICS, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using BLOCKS. The ESTIMATE parameter cannot be used in Transportable Tablespace mode. Default=BLOCKS.
ESTIMATE_ONLY	Number	Export	Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.
FLASHBACK_SCN	NUMBER	Export and network Import	System change number (SCN) to serve as transactionally consistent point for reading user data. If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. FLASHBACK_SCN is not supported in Transportable mode.
FLASHBACK_ TIME	Text	Export and network Import	Either the date and time used to determine a consistent point for reading user data or a string of the form TO_ TIMESTAMP(...). If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions. FLASHBACK_SCN and FLASHBACK_TIME cannot both be specified for the same job. FLASHBACK_TIME is not supported in Transportable mode.
INCLUDE_ METADATA	NUMBER	Export and Import	If nonzero, metadata for objects will be moved in addition to user table data. If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data. INCLUDE_METADATA is not supported in Transportable mode. Default=1.

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
PARTITION_ OPTIONS	Text	Import	Specifies how partitioned tables should be handled during an import operation. The options are as follows: NONE means that partitioning is reproduced on the target database as it existed in the source database. DEPARTITION means that each partition or subpartition that contains storage in the job is reproduced as a separate unpartitioned table. Intermediate partitions that are subpartitioned are not re-created (although their subpartitions are converted into tables). The names of the resulting tables are system-generated from the original table names and partition names unless the name is overridden by the REMAP_TABLE metadata transform. MERGE means that each partitioned table is re-created in the target database as an unpartitioned table. The data from all of the source partitions is merged into a single storage segment. This option is not supported for transportable jobs or when the TRANSPORTABLE parameter is set to ALWAYS. This parameter requires a job version of 11.1 or later. Default=NONE
SKIP_ UNUSABLE_ INDEXES	NUMBER	Import	If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode. Default=1
TABLE_EXISTS_ ACTION	Text	Import	Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP. If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported. If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import. Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE. If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped. If APPEND, new rows are added to the existing rows in the table. If SKIP, the preexisting table is left unchanged. TABLE_EXISTS_ACTION is not supported in Transportable mode. The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.
TABLESPACE_ DATAFILE	Text	Import	Specifies the full file specification for a datafile in the transportable tablespace set. TABLESPACE_DATAFILE is only valid for transportable mode imports. TABLESPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
TRANSPORTABLE	Text	Export	For export operations done in table mode, allows the data to be moved using transportable tablespaces. Storage segments in the moved tablespaces that are not associated with the parent schemas (tables) will be reclaimed at import time. If individual partitions are selected in a table-mode job, only the tablespaces referenced by those partitions will be moved. During import, the moved partitions can only be reconstituted as tables by using the PARTITION_OPTIONS=DEPARTITION parameter. Use of the TRANSPORTABLE parameter prohibits the subsequent import of the dump file into a database at a lower version or using different character sets. Additionally, the data files may need to be converted if the target database is on a different platform. The TRANSPORTABLE parameter is not allowed if a network link is supplied on the OPEN call. The possible values for this parameter are as follows: ALWAYS - data is always moved by moving data files. NEVER - data files are never used for copying user data. This parameter requires a job version of 11.1 or later Default=NEVER
TTS_FULL_CHECK	NUMBER	Export	If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports. Default=0.
USER_METADATA	NUMBER	Export and network Import	For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter. The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode. Default=1 if user has EXP_FULL_DATABASE role; 0 otherwise.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception could be due to any of the following causes:
  - An invalid name was supplied for an input parameter
  - The wrong datatype was used for value
  - A value was not supplied
  - The supplied value was not allowed for the specified parameter name
  - A flashback parameter had been established after a different flashback parameter had already been established
  - A parameter was specified that did not support duplicate definitions
- INVALID_OPERATION. The operation specified is invalid in this context.

- INVALID_STATE. The specified job is not in the Defining state.
- INCONSISTENT_ARGS. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- PRIVILEGE_ERROR. The user does not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role required for the specified parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARAMETER procedure is used to specify optional features for the current job. See Table 40–23 for a list of supported options.

START_JOB Procedure

This procedure begins or resumes execution of a job.

Syntax

```
DBMS_DATAPUMP.START_JOB (
   handle       IN NUMBER,
   skip_current IN NUMBER DEFAULT 0);
```

Parameters

Table 40–24 START_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through either the OPEN or ATTACH procedure.
skip_ current	If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index. A description of the actions skipped is entered into the log file. skip_ current is ignored for the initial START_JOB in a job. If zero, no data or metadata is lost upon a restart.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The causes of this exception can be any of the following:
  - No files have been defined for an Export, non-network Import, or SQL_FILE job
  - An ADD_FILE procedure has not been called to define the output for a SQL_ FILE job
  - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
  - A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
  - The dump file set on an Import of SQL_FILE job was either incomplete or missing a master table specification
- INVALID_OPERATION. Unable to restore master table from a dump file set.
- INTERNAL_ERROR. An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the `SET_PARALLEL` procedure was not called prior to the `START_JOB` procedure, the initial level of parallelism used in the job will be 1. If `SET_PARALLEL` was called prior to the job starting, the `degree` specified by the last `SET_PARALLEL` call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another `SET_PARALLEL` call.
- To restart a stopped job, an `ATTACH` must be performed prior to executing the `START_JOB` procedure.

STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```
DBMS_DATAPUMP.STOP_JOB (
   handle      IN NUMBER,
   immediate   IN NUMBER DEFAULT 0,
   keep_master IN NUMBER DEFAULT NULL,
   delay       IN NUMBER DEFAULT 60);
```

Parameters

Table 40–25 STOP_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.
immediate	If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.
keep_master	If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.
delay	The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID STATE. The job is already in the process of being stopped or completed.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.

- Once a job is stopped, it can be restarted using the `ATTACH` and `START_JOB` procedures, provided the master table and the dump file set are left intact.
- If the `KEEP_MASTER` parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

```
DBMS_DATAPUMP.WAIT_FOR_JOB (
  handle      IN   NUMBER,
  job_state   OUT  VARCHAR2);
```

Parameters

Table 40–26 WAIT_FOR_JOB Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.
job_state	The state of the job when it has stopped executing. This will be either Stopped or Completed.

Exceptions

- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS API.
- INVALID_HANDLE. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling WAIT_FOR_JOB. When WAIT_FOR_JOB returns, the job will no longer be executing. If the job completed normally, the final status will be Completed. If the job stopped executing because of a STOP_JOB request or an internal error, the final status will be Stopped.

41

DBMS_DB_VERSION

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

> **See Also:** *PL/SQL Users Guide and Reference* regarding conditional compilation

This package contains the following topics

- Using DBMS_DB_VERSION
  - Overview
  - Constants
  - Examples

Using DBMS_DB_VERSION

- Overview
- Constants

Overview

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 11g Release 1 version is shown below.

```
PACKAGE DBMS_DB_VERSION IS
   VERSION CONSTANT PLS_INTEGER := 11; -- RDBMS version number
   RELEASE CONSTANT PLS_INTEGER := 1;  -- RDBMS release number
   ver_le_9_1    CONSTANT BOOLEAN := FALSE;
   ver_le_9_2    CONSTANT BOOLEAN := FALSE;
   ver_le_9      CONSTANT BOOLEAN := FALSE;
   ver_le_10_1   CONSTANT BOOLEAN := FALSE;
   ver_le_10_2   CONSTANT BOOLEAN := FALSE;
   ver_le_10     CONSTANT BOOLEAN := FALSE;
   ver_le_11_1   CONSTANT BOOLEAN := TRUE;
   ver_le_11     CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- VER_LE_9_1 represents version <= 9 and release <= 1
- VER_LE_10_2 represents version <= 10 and release <= 2
- VER_LE_10 represents version <= 10

A typical usage of these boolean constants is:

```
$IF DBMS_DB_VERSION.VER_LE_10 $THEN
   version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
   version 11 code
$ELSE
   version 12 and later code
$END
```

This code structure will protect any reference to the code for hypothetical version 12. It also prevents the controlling package constant DBMS_DB_VERSION.VER_LE_11 from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant VER_LE_11 is not defined in version 10 database because conditional compilation protects the $ELSIF from evaluation if DBMS_DB_VERSION.VER_LE_10 is TRUE.

Constants

The DBMS_DB_VERSION package contains different constants for different Oracle Database releases. The Oracle Database 11g Release 1 version of the DBMS_DB_VERSION package uses the constants shown in Table 41–1.

Table 41–1 DBMS_DB_VERSION Constants

Name	Type	Value	Description
VERSION	PLS_INTEGER	10	Current version
RELEASE	PLS_INTEGER	2	Current release
VER_LE_9	BOOLEAN	FALSE	Version <= 9
VER_LE_9_1	BOOLEAN	FALSE	Version <= 9 and release <= 1
VER_LE_9_2	BOOLEAN	FALSE	Version <= 9 and release <= 2
VER_LE_10	BOOLEAN	TRUE	Version <= 10
VER_LE_10_1	BOOLEAN	FALSE	Version <= 10 and release <= 1
VER_LE_10_2	BOOLEAN	TRUE	Version <=10 and release <= 2
VER_LE_11	BOOLEAN	FALSE	Version <= 11
VER_LE_11_1	BOOLEAN	TRUE	Version <=11 and release <= 1

Examples

This example uses conditional compilation to guard new features.

```
CREATE OR REPLACE PROCEDURE whetstone IS

 -- Notice that conditional compilation constructs
 -- can interrupt a regular PL/SQL statement.
 -- You can locate a conditional compilation directive anywhere
 -- there is whitespace in the regular statement.

 SUBTYPE my_real IS
    $IF DBMS_DB_VERSION.VER_LE_9 $THEN NUMBER
                                 $ELSE BINARY_DOUBLE
    $END;

 t  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 0.499975
                                                     $ELSE 0.499975d
                        $END;

 t2 CONSTANT my_real := $if DBMS_DB_VERSION.VER_LE_9 $THEN 2.0
                                                     $ELSE 2.0d
                        $END;

 x  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                                     $ELSE 1.0d
                        $END;

 y  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                                     $ELSE 1.0d
                        $END;

 z  MY_REAL;

 PROCEDURE P(x IN my_real, y IN my_real, z OUT NOCOPY my_real) IS
   x1 my_real;
   y1 my_real;
 BEGIN
   x1 := x;
   y1 := y;
   x1 := t * (x1 + y1);
   y1 := t * (x1 + y1);
   z := (x1 + y1)/t2;
 END P;
BEGIN
 P(x, y, z);
 DBMS_OUTPUT.PUT_LINE ('z = '|| z);
END whetstone;
/
```

42

DBMS_DDL

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

- Using DBMS_DDL
  - Deprecated Subprograms
  - Security Model
  - Operational Notes
- Summary of DBMS_DDL Subprograms

Using DBMS_DDL

This section contains topics which relate to using the `DBMS_DDL` package.

- Deprecated Subprograms
- Security Model
- Operational Notes

Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Release 10gR2:

- ALTER_COMPILE Procedure

Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

Summary of DBMS_DDL Subprograms

Table 42–1 DBMS_DDL Package Subprograms

Subprogram	Description
ALTER_COMPILE Procedure on page 42-7	Compiles the PL/SQL object
ALTER_TABLE_NOT_ REFERENCEABLE Procedure on page 42-8	Reorganizes object tables
ALTER_TABLE_REFERENCEABLE Procedure on page 42-9	Reorganizes object tables
CREATE_WRAPPED Procedures on page 42-10	Takes as input a single `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a `CREATE OR REPLACE` statement with the PL/SQL source text obfuscated and executes the generated statement
IS_TRIGGER_FIRE_ONCE Function on page 42-12	Returns `TRUE` if the specified DML or DDL trigger is set to fire once. Otherwise, returns `FALSE`
SET_TRIGGER_FIRING_PROPERTY Procedure on page 42-13	Sets the specified DML or DDL trigger's firing property
WRAP Functions on page 42-14	Takes as input a `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a `CREATE OR REPLACE` statement where the text of the PL/SQL unit has been obfuscated

ALTER_COMPILE Procedure

This procedure is equivalent to the following SQL statement:

```
ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]
```

> **Note:** This procedure is deprecated in Release 10gR2. While the procedure remains available in the package, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

Syntax

```
DBMS_DDL.ALTER_COMPILE (
   type             VARCHAR2,
   schema           VARCHAR2,
   name             VARCHAR2
   reuse_settings   BOOLEAN := FALSE);
```

Parameters

Table 42–2 ALTER_COMPILE Procedure Parameters

Parameter	Description
type	Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER
schema	Schema name If NULL, then use current schema (case-sensitive)
name	Name of the object (case-sensitive)
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 42–3 ALTER_COMPILE Procedure Exceptions

Exception	Description
ORA-20000:	Insufficient privileges or object does not exist
ORA-20001:	Remote object, cannot compile
ORA-20002:	Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER

ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name> NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
   table_name        IN           VARCHAR2,
   table_schema      IN  DEFAULT  NULL,
   affected_schema   IN  DEFAULT  NULL);
```

Parameters

Table 42–4 ALTER_TABLE_NOT_REFERENCEABLE Procedure Parameters

Parameter	Description
`table_name`	The name of the table to be altered. Cannot be a synonym. Must not be `NULL`. Case sensitive.
`table_schema`	The name of the schema owning the table to be altered. If `NULL` then the current schema is used. Case sensitive.
`affected_schema`	The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for `PUBLIC`; that is., it simply undoes the previous `ALTER_TABLE_REFERENCEABLE` call for this specific schema. The affected schema must a particular schema (cannot be `PUBLIC`).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has `ALTER ANY TABLE` and `SELECT ANY TABLE` and `DROP ANY TABLE` privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name>  REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
   table_name       IN  VARCHAR2,
   table_schema     IN  DEFAULT  NULL,
   affected_schema  IN  DEFAULT  NULL);
```

Parameters

Table 42–5 ALTER_TABLE_REFERENCEABLE Procedure Parameters

Parameter	Description
`table_name`	The name of the table to be altered. Cannot be a synonym. Must not be `NULL`. Case sensitive.
`table_schema`	The name of the schema owning the table to be altered. If `NULL` then the current schema is used. Case sensitive.
`affected_schema`	The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same `EOID`; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it will make the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

CREATE_WRAPPED Procedures

The procedure takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

See Also: WRAP Functions on page 42-14

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual WRAP Functions and DBMS_SQL.PARSE (or EXECUTE IMMEDIATE) calls. The different functionality of each form of syntax is presented with the definition.

Syntax

Is a shortcut for EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(*ddl*):

```
DBMS_DDL.CREATE_WRAPPED (
   ddl     VARCHAR2);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
   ddl     DBMS_SQL.VARCHAR2A,
   lb      PLS_INTEGER,
   ub      PLS_INTEGER);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
   ddl     DBMS_SQL.VARCHAR2S,
   lb      PLS_INTEGER,
   ub      PLS_INTEGER);
```

Parameters

Table 42–6 CREATE_WRAPPED Procedure Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS_DDL.CREATE_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name

DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.

- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a entire SQL*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

IS_TRIGGER_FIRE_ONCE Function

This function returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, it returns FALSE.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package

Note: Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: "SET_TRIGGER_FIRING_PROPERTY Procedure" on page 42-13

Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
   trig_owner          IN  VARCHAR2,
   trig_name           IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 42–7 IS_TRIGGER_FIRE_ONCE Function Parameters

Parameter	Description
trig_owner	Schema of trigger
trig_name	Name of trigger

SET_TRIGGER_FIRING_PROPERTY Procedure

This procedure sets the specified DML or DDL trigger's firing property. Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package.

Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY
   trig_owner         IN  VARCHAR2,
   trig_name          IN  VARCHAR2,
   fire_once          IN  BOOLEAN);
```

Parameters

Table 42–8 SET_TRIGGER_FIRING_PROPERTY Procedure Parameters

Parameter	Description
trig_owner	Schema of the trigger to set
trig_name	Name of the trigger to set
fire_once	If TRUE, the trigger is set to fire once. By default, the fire_once parameter is set to TRUE for DML and DDL triggers. If FALSE, the trigger is set to always fire.

Usage Notes

You can specify one of the following settings for a trigger's firing property:

- If the fire_once parameter is set to TRUE for a trigger, then the trigger does not fire for these types of changes.
- If the fire_once parameter is set to FALSE for a trigger, then the trigger fires for these types of changes.

Regardless of the firing property set by this procedure, a trigger continues to fire when changes are made by means other than the apply process or apply error execution. For example, if a user session or an application makes a change, then the trigger continues to fire, regardless of the firing property.

Note:

- If you dequeue an error transaction from the error queue and execute it without using the DBMS_APPLY_ADM package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
- Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: *Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property

WRAP Functions

This function takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to DBMS_SQL or EXECUTE IMMEDIATE. The different functionality of each form of syntax is presented with the definition.

See Also: CREATE_WRAPPED Procedures on page 42-10

Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP(
   ddl      VARCHAR2)
  RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the PARSE Procedures in the DBMS_SQL package and its argument list follows the convention of DBMS_SQL.PARSE:

```
DBMS_DDL.WRAP(
   ddl      DBMS_SQL.VARCHAR2S,
   lb       PLS_INTEGER,
   ub       PLS_INTEGER)
  RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the PARSE Procedures in the DBMS_SQL package:

```
DBMS_DDL.WRAP(
   ddl      DBMS_SQL.VARCHAR2A,
   lb       PLS_INTEGER,
   ub       PLS_INTEGER)
  RETURN DBMS_SQL.VARCHAR2A;
```

Parameters

Table 42–9 WRAP Function Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
   ddl VARCHAR2(32767);
BEGIN
   ddl := GENERATE_PACKAGE(...);
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

43

DBMS_DEBUG

DBMS_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This API is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

> **Note:** The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

- Using DBMS_DEBUG
  - Overview
  - Constants
  - Variables
  - Exceptions
  - Operational Notes
- Data Structures
  - RECORD Types
  - TABLE Types
- Summary of DBMS_DEBUG Subprograms

Using DBMS_DEBUG

- Overview
- Constants
- Variables
- Exceptions
- Operational Notes

Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with DBMS_DEBUG. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using DBMS_DEBUG: This tells it which target session to supervise. The debug session may then call entry points in DBMS_DEBUG to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- SYNCHRONIZE Function
- DEBUG_ON Procedure
- DEBUG_OFF Procedure

DBMS_DEBUG does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

Constants

A breakpoint status may have the following value:

- `breakpoint_status_unused`—breakpoint is not in use

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

Variables

The DBMS_DEBUG uses the variables shown in Table 43–1.

Table 43–1 DBMS_DEBUG Variables

Variable	Description
default_timeout	The timeout value (used by both sessions).The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.

Exceptions

These values are returned by the various functions called in the debug session (SYNCHRONIZE, CONTINUE, SET_BREAKPOINT, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

Value	Description
success	Normal termination.

Statuses returned by GET_VALUE and SET_VALUE:

Status	Description
error_bogus_frame	No such entrypoint on the stack.
error_no_debug_info	Program was compiled without debug symbols.
error_no_such_object	No such variable or parameter.
error_unknown_type	Debug information is unreadable.
error_indexed_table	Returned by GET_VALUE if the object is a table, but no index was provided.
error_illegal_index	No such element exists in the collection.
error_nullcollection	Table is atomically null.
error_nullvalue	Value is null.

Statuses returned by SET_VALUE:

Status	Description
error_illegal_value	Constraint violation.
error_illegal_null	Constraint violation.
error_value_malformed	Unable to decipher the given value.
error_other	Some other error.
error_name_incomplete	Name did not resolve to a scalar.

Statuses returned by the breakpoint functions:

Status	Description
error_no_such_breakpt	No such breakpoint.
error_idle_breakpt	Cannot enable or disable an unused breakpoint.
error_bad_handle	Unable to set breakpoint in given program (nonexistent or security violation).

General error codes (returned by many of the DBMS_DEBUG subprograms):

Status	Description
error_unimplemented	Functionality is not yet implemented.
error_deferred	No program running; operation deferred.
error_exception	An exception was raised in the DBMS_DEBUG or Probe packages on the server.
error_communication	Some error other than a timeout occurred.
error_timeout	Timout occurred.

Exception	Description
illegal_init	DEBUG_ON was called prior to INITIALIZE.

The following exceptions are raised by procedure SELF_CHECK:

Exception	Description
pipe_creation_failure	Could not create a pipe.
pipe_send_failure	Could not write data to the pipe.
pipe_receive_failure	Could not read data from the pipe.
pipe_datatype_mismatch	Datatype in the pipe was wrong.
pipe_data_error	Data got garbled in the pipe.

Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 43–1 and Figure 43–2 illustrate the flow of operations in the session to be debugged and in the debugging session.

Figure 43–1 Target Session

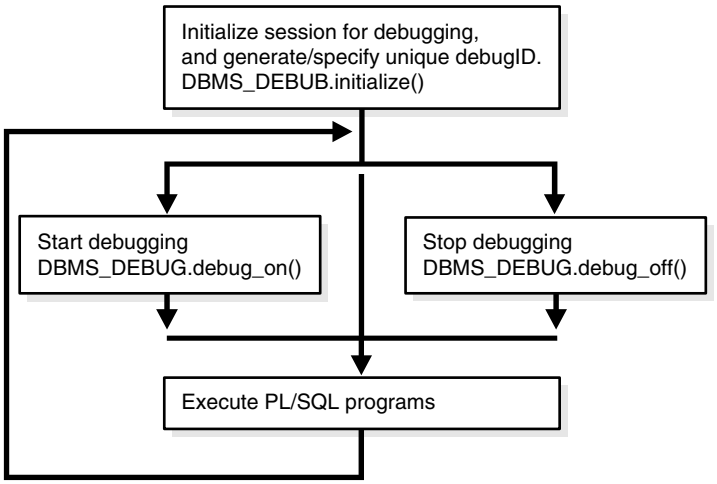

Figure 43–2 Debug Session

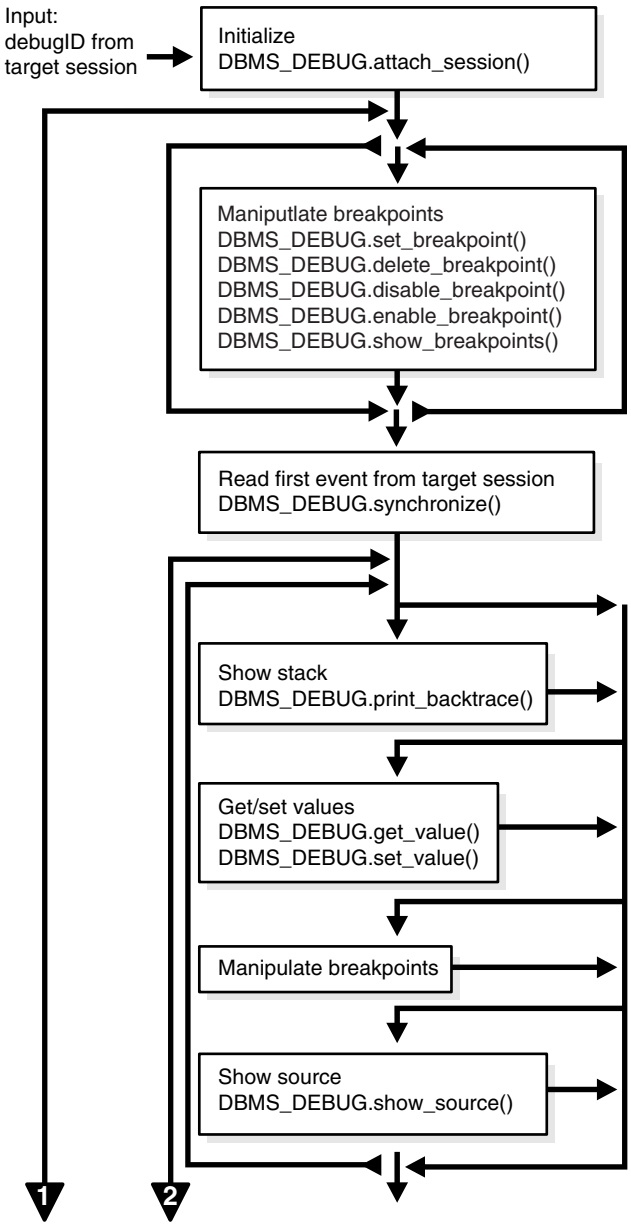

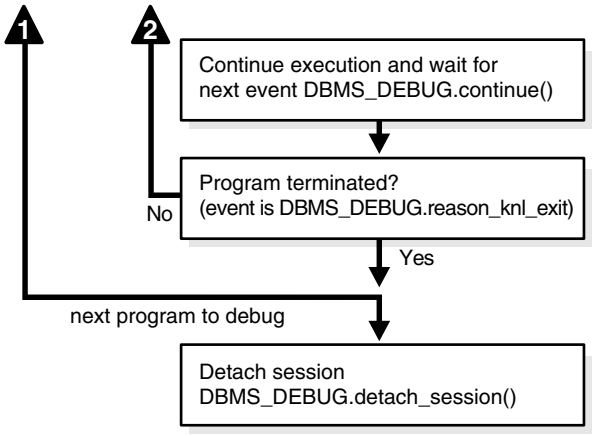

Figure 43–3 Debug Session (Cont.)

Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to `DBMS_DEBUG.CONTINUE` in the `breakflags` parameter.

Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to `DBMS_DEBUG.SYNCHRONIZE` after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

Common and Debug Session Sections

- Common Section

- Target Session
- Debug Session Section

Common Section

The following subprograms may be called in either the target or the debug session:

- PROBE_VERSION Procedure
- SELF_CHECK Procedure
- SET_TIMEOUT Function

Target Session

The following subprograms may be called only in the target session:

- INITIALIZE Function
- DEBUG_ON Procedure
- SET_TIMEOUT_BEHAVIOUR Procedure
- GET_TIMEOUT_BEHAVIOUR Function

Debug Session Section

The following subprograms should be run in the debug session only:

- ATTACH_SESSION Procedure
- SYNCHRONIZE Function
- SHOW_FRAME_SOURCE Procedure
- SHOW_SOURCE Procedures
- GET_MORE_SOURCE Procedure
- PRINT_BACKTRACE Procedure
- CONTINUE Function
- SET_BREAKPOINT Function
- DELETE_BREAKPOINT Function
- SET_OER_BREAKPOINT Function
- DELETE_OER_BREAKPOINT Function
- ENABLE_BREAKPOINT Function
- DISABLE_BREAKPOINT Function
- SHOW_BREAKPOINTS Procedures
- SET_VALUE Functionn
- GET_VALUE Function
- TARGET_PROGRAM_RUNNING Procedure
- DETACH_SESSION Procedure
- GET_RUNTIME_INFO Function
- PRINT_INSTANTIATIONS Procedure
- PING Procedure
- GET_LINE_MAP Function

- GET_RUNTIME_INFO Function
- GET_INDEXES Function
- EXECUTE Procedure

OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are exception_init'd to the same OER, they are indistinguishable.

Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
   - Package specifications.
   - Procedures and functions that are not nested inside other packages, procedures, or functions.
   - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
4. `Namespace_trigger` contains triggers.

Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in `PROGRAM_INFO` when Probe is giving a stack backtrace.

- `LibunitType_cursor`
- `LibunitType_procedure`
- `LibunitType_function`
- `LibunitType_package`
- `LibunitType_package_body`
- `LibunitType_trigger`
- `LibunitType_Unknown`

Breakflags

These are values to use for the `breakflags` parameter to `CONTINUE`, in order to tell Probe what events are of interest to the client. These flags may be combined.

Value	Description
`break_next_line`	Break at next source line (step over calls).

Value	Description
break_any_call	Break at next source line (step into calls).
break_any_return	Break after returning from current entrypoint (skip over any entrypoints called from the current routine).
break_return	Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running Proc1, which calls Proc2, then break_return stops at the end of Proc2.)
break_exception	Break when an exception is raised.
break_handler	Break when an exception handler is executed.
abort_execution	Stop execution and force an 'exit' event as soon as DBMS_DEBUG.CONTINUE is called.

Information Flags

These are flags which may be passed as the info_requested parameter to SYNCHRONIZE, CONTINUE, and GET_RUNTIME_INFO.

Flag	Description
info_getStackDepth	Get the current depth of the stack.
info_getBreakpoint	Get the breakpoint number.
info_getLineinfo	Get program unit information.

Reasons for Suspension

After CONTINUE is run, the program either runs to completion or breaks on some line.

Reason	Description
reason_none	-
reason_interpreter_starting	Interpreter is starting.
reason_breakpoint	Hit a breakpoint.
reason_enter	Procedure entry.
reason_return	Procedure is about to return.
reason_finish	Procedure is finished.
reason_line	Reached a new line.
reason_interrupt	An interrupt occurred.
reason_exception	An exception was raised.
reason_exit	Interpreter is exiting (old form).
reason_knl_exit	Kernel is exiting.
reason_handler	Start exception-handler.
reason_timeout	A timeout occurred.
reason_instantiate	Instantiation block.
reason_abort	Interpreter is aborting.

Data Structures

The DBMS_DEBUG package defines RECORD types and TABLE types.

RECORD Types

- BREAKPOINT_INFO Record Type
- PROGRAM_INFO Record Type
- RUNTIME_INFO Record Type

TABLE Types

- BACKTRACE_TABLE Table Type
- BREAKPOINT_TABLE Table Type
- INDEX_TABLE Table Type
- VC2_TABLE Table Type

BREAKPOINT_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

Syntax

```
TYPE breakpoint_info IS RECORD (
   name        VARCHAR2(30),
   owner       VARCHAR2(30),
   dblink      VARCHAR2(30),
   line#       BINARY_INTEGER,
   libunittype BINARY_INTEGER,
   status      BINARY_INTEGER);
```

Fields

Table 43–2 RUNTIME_INFO Fields

Field	Description
`name`	Name of the program unit
`owner`	Owner of the program unit
`dblink`	Database link, if remote
`line#`	Line number
`libunittype`	`NULL`, unless this is a nested procedure or function
`status`	See Constants on page 43-4 for values of `breakpoint_status_*`

PROGRAM_INFO Record Type

This type specifies a program location. It is a line number in a program unit. This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

Syntax

```
TYPE program_info IS RECORD(
    -- The following fields are used when setting a breakpoint
    namespace        BINARY_INTEGER,
    name             VARCHAR2(30),
    owner            VARCHAR2(30),
    dblink           VARCHAR2(30),
    line#            BINARY_INTEGER,
    -- Read-only fields (set by Probe when doing a stack backtrace)
    libunittype      BINARY_INTEGER,
    entrypointname   VARCHAR2(30));
```

Fields

Table 43–3 PROGRAM_INFO Fields

Field	Description
`namespace`	See Namespaces on page 43-12
`name`	Name of the program unit
`owner`	Owner of the program unit
`dblink`	Database link, if remote
`line#`	Line number
`libunittype`	A read-only field, `NULL`, unless this is a nested procedure or function
`entrypointname`	A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See the Libunit Types on page 43-13 for more information.

RUNTIME_INFO Record Type

This type gives context information about the running program.

Syntax

```
TYPE runtime_info IS RECORD(
    line#            BINARY_INTEGER,
    terminated       binary_integer,
    breakpoint       binary_integer,
    stackdepth       BINARY_INTEGER,
    interpreterdepth BINARY_INTEGER,
    reason           BINARY_INTEGER,
    program          program_info);
```

Fields

Table 43–4 RUNTIME_INFO Fields

Field	Description
`line#`	Duplicate of `program.line#`
`terminated`	Whether the program has terminated
`breakpoint`	Breakpoint number
`stackdepth`	Number of frames on the stack
`interpreterdepth`	[A reserved field]
`reason`	Reason for suspension
`program`	Source location

BACKTRACE_TABLE Table Type

This type is used by `PRINT_BACKTRACE`.

Syntax

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

BREAKPOINT_TABLE Table Type

This type is used by SHOW_BREAKPOINTS.

Syntax

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

INDEX_TABLE Table Type

This type is used by `GET_INDEXES` to return the available indexes for an indexed table.

Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

VC2_TABLE Table Type

This type is used by SHOW_SOURCE.

Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_DEBUG Subprograms

Table 43–5 DBMS_DEBUG Package Subprograms

Subprogram	Description
ATTACH_SESSION Procedure on page 43-25	Notifies the debug session about the target debugID
CONTINUE Function on page 43-26	Continues execution of the target program
DEBUG_OFF Procedure on page 27	Turns debug-mode off
DEBUG_ON Procedure on page 43-28	Turns debug-mode on
DELETE_BREAKPOINT Function on page 43-29	Deletes a breakpoint
DELETE_OER_ BREAKPOINT Function on page 43-30	Deletes an OER breakpoint
DETACH_SESSION Procedure on page 43-31	Stops debugging the target program
DISABLE_BREAKPOINT Function on page 43-32	Disables a breakpoint
ENABLE_BREAKPOINT Function on page 43-33	Activates an existing breakpoint
EXECUTE Procedure on page 43-34	Executes SQL or PL/SQL in the target session
GET_INDEXES Function on page 43-36	Returns the set of indexes for an indexed table
GET_MORE_SOURCE Procedure on page 43-37	Provides additional source in the event of buffer overflow when using SHOW_SOURCE
GET_LINE_MAP Function on page 43-38	Returns information about line numbers in a program unit
GET_RUNTIME_INFO Function on page 43-39	Returns information about the current program
GET_TIMEOUT_ BEHAVIOUR Function on page 43-40	Returns the current timeout behavior
GET_VALUE Function on page 43-41	Gets a value from the currently-running program
INITIALIZE Function on page 43-43	Sets debugID in target session
PING Procedure on page 43-45	Pings the target session to prevent it from timing out
PRINT_BACKTRACE Procedure on page 43-46	Prints a stack backtrace
PRINT_INSTANTIATIONS Procedure on page 43-47	Prints a stack backtrace
PROBE_VERSION Procedure on page 43-48	Returns the version number of `DBMS_DEBUG` on the server

Table 43–5 (Cont.) DBMS_DEBUG Package Subprograms

Subprogram	Description
SELF_CHECK Procedure on page 43-49	Performs an internal consistency check
SET_BREAKPOINT Function on page 43-50	Sets a breakpoint in a program unit
SET_OER_BREAKPOINT Function on page 43-51	Sets an OER breakpoint
SET_TIMEOUT Function on page 43-52	Sets the timeout value
SET_TIMEOUT_ BEHAVIOUR Procedure on page 43-53	Tells Probe what to do with the target session when a timeout occurs
SET_VALUE Function on page 43-54	Sets a value in the currently-running program
SHOW_BREAKPOINTS Procedures on page 43-56	Returns a listing of the current breakpoints
SHOW_FRAME_SOURCE Procedure on page 43-57	Fetches the frame source
SHOW_SOURCE Procedures on page 43-58	Fetches program source
SYNCHRONIZE Function on page 43-60	Waits for program to start running
TARGET_PROGRAM_ RUNNING Procedure on page 43-61	Returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not

ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```
DBMS_DEBUG.ATTACH_SESSION (
   debug_session_id  IN VARCHAR2,
   diagnostics       IN BINARY_INTEGER := 0);
```

Parameters

Table 43–6 ATTACH_SESSION Procedure Parameters

Parameter	Description
`debug_session_id`	Debug ID from a call to `INITIALIZE` in target session.
`diagnostics`	Generate diagnostic output if nonzero.

CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not `NULL`, then calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.CONTINUE (
   run_info       IN OUT runtime_info,
   breakflags     IN     BINARY_INTEGER,
   info_requested IN     BINARY_INTEGER := NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–7 CONTINUE Function Parameters

Parameter	Description
`run_info`	Information about the state of the program.
`breakflags`	Mask of events that are of interest. See "Breakflags" on page 43-13.
`info_requested`	Which information should be returned in `run_info` when the program stops. See "Information Flags" on page 43-13.

Return Values

Table 43–8 CONTINUE Function Return Values

Return	Description
`success`	
`error_timeout`	Timed out before the program started running.
`error_communication`	Other communication error.

DEBUG_OFF Procedure

Caution: There must be a debug session waiting if immediate is `TRUE`**.**

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (
   no_client_side_plsql_engine BOOLEAN := TRUE,
   immediate                   BOOLEAN := FALSE);
```

Parameters

Table 43–9 DEBUG_ON Procedure Parameters

Parameter	Description
`no_client_side_ plsql_engine`	Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine.
`immediate`	If this is `TRUE`, then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.

DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–10 DELETE_BREAKPOINT Function Parameters

Parameter	Description
`breakpoint`	Breakpoint number from a previous call to `SET_BREAKPOINT`.

Return Values

Table 43–11 DELETE_BREAKPOINT Function Return Values

Return	Description
`success`	
`error_no_such_ breakpt`	No such breakpoint exists.
`error_idle_breakpt`	Cannot delete an unused breakpoint.
`error_stale_breakpt`	The program unit was redefined since the breakpoint was set.

DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (
   oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 43–12 DELETE_OER_BREAKPOINT Function Parameters

Parameter	Description
`oer`	The OER (positive 4-byte number) to delete.

DETACH_SESSION Procedure

This procedure stops debugging the target program. This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–13 DISABLE_BREAKPOINT Function Parameters

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT.

Return Values

Table 43–14 DISABLE_BREAKPOINT Function Return Values

Returns	Description
success	
error_no_such_ breakpt	No such breakpoint exists.
error_idle_breakpt	Cannot disable an unused breakpoint.

ENABLE_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–15 ENABLE_BREAKPOINT Function Parameters

Parameter	Description
`breakpoint`	Breakpoint number from a previous call to `SET_BREAKPOINT`.

Return Values

Table 43–16 ENABLE_BREAKPOINT Function Return Values

Return	Description
`success`	Success.
`error_no_such_ breakpt`	No such breakpoint exists.
`error_idle_breakpt`	Cannot enable an unused breakpoint.

EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to DBMS_DEBUG.EXECUTE occurs in the debug session, which then asks the target session to execute the code.

Syntax

```
DBMS_DEBUG.EXECUTE (
   what         IN VARCHAR2,
   frame#       IN BINARY_INTEGER,
   bind_results IN BINARY_INTEGER,
   results      IN OUT NOCOPY dbms_debug_vc2coll,
   errm         IN OUT NOCOPY VARCHAR2);
```

Parameters

Table 43–17 EXECUTE Procedure Parameters

Parameter	Description
what	SQL or PL/SQL source to execute.
frame#	The context in which to execute the code. Only -1 (global context) is supported at this time.
bind_results	Whether the source wants to bind to results in order to return values from the target session. 0 = No 1 = Yes
results	Collection in which to place results, if bind_results is not 0.
errm	Error message, if an error occurred; otherwise, NULL.

Examples

Example 1

This example executes a SQL statement. It returns no results.

```
DECLARE
   coll sys.dbms_debug_vc2coll; -- results (unused)
   errm VARCHAR2(100);
BEGIN
   dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                      'values(''LJE'', 1, 1)',
                      -1, 0, coll, errm);
END;
```

Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```
DECLARE
   coll sys.dbms_debug_vc2coll;
   errm VARCHAR2(100);
BEGIN
```

```
   dbms_debug.execute(
       'DECLARE PRAGMA autonomous_transaction; ' ||
       'BEGIN ' ||
       '   insert into emp(ename, empno, deptno) ' ||
       '   values(''LJE'', 1, 1); ' ||
       ' COMMIT; ' ||
       'END;',
       -1, 0, coll, errm);
END;
```

Example 3

This example executes a PL/SQL block, and it returns some results.

```
DECLARE
   coll sys.dbms_debug_vc2coll;
   errm VARCHAR2(100);
BEGIN
   dbms_debug.execute(
      'DECLARE ' ||
      '   pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
      '   x  PLS_INTEGER; ' ||
      '   i  PLS_INTEGER := 1; ' ||
      'BEGIN ' ||
      '   SELECT COUNT(*) INTO x FROM emp; ' ||
      '   pp.EXTEND(x * 6); ' ||
      '   FOR c IN (SELECT * FROM emp) LOOP ' ||
      '      pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
      '      pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
      '      pp(i) := ''Job:   '' || c.job;   i := i+1; ' ||
      '      pp(i) := ''Mgr:   '' || c.mgr;   i := i+1; ' ||
      '      pp(i) := ''Sal:   '' || c.sal;   i := i+1; ' ||
      '      pp(i) := null;                   i := i+1; ' ||
      '   END LOOP; ' ||
      '   :1 := pp;' ||
      'END;',
       -1, 1, coll, errm);
   each := coll.FIRST;
   WHILE (each IS NOT NULL) LOOP
      dosomething(coll(each));
      each := coll.NEXT(each);
   END LOOP;
END;
```

GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```
DBMS_DEBUG.GET_INDEXES (
   varname   IN  VARCHAR2,
   frame#    IN  BINARY_INTEGER,
   handle    IN  program_info,
   entries   OUT index_table)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–18 GET_INDEXES Function Parameters

Parameter	Description
varname	Name of the variable to get index information about.
frame#	Number of frame in which the variable or parameter resides; NULL for a package variable.
handle	Package description, if object is a package variable.
entries	1-based table of the indexes. If non-NULL, then entries(1) contains the first index of the table, entries(2) contains the second index, and so on.

Return Values

Table 43–19 GET_INDEXES Function Return Values

Return	Description
error_no_such_object	Either: - The package does not exist. - The package is not instantiated. - The user does not have privileges to debug the package. - The object does not exist in the package.

GET_MORE_SOURCE Procedure

When source does not fit in the buffer provided by that version of the SHOW_SOURCE Procedures which produce a formatted buffer, this procedure provides additional source.

Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (
   buffer          IN OUT VARCHAR2,
   buflen          IN BINARY_INTEGER,
   piece#          IN BINARY_INTEGER);
```

Parameters

Table 43–20 GET_MORE_SOURCE Procedure Parameters

Parameter	Description
buffer	The buffer.
buflen	The length of the buffer.
piece#	A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures.

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.

GET_LINE_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

```
DBMS_DEBUG.GET_LINE_MAP (
   program                IN   program_info,
   maxline                OUT  BINARY_INTEGER,
   number_of_entry_points OUT  BINARY_INTEGER,
   linemap                OUT  RAW)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–21 GET_LINE_MAP Function Parameters

Parameter	Description
`program`	A top-level program unit (procedure / package / function / package body, and so on). Its `Namespace`, `Name`, and `Owner` fields must be initialized, the remaining fields are ignored.
`maxline`	The largest source code line number in 'program'.
`number_of_entry_points`	The number of subprograms in 'program'
`linemap`	A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either `maxline` divided by 8 (plus one if `maxline` MOD 8 is not zero) or 32767 in the unlikely case of `maxline` being larger than 32767 * 8.

Return Values

Table 43–22 GET_LINE_MAP Function Return Values

Return	Description
`success`	A successful completion.
`error_no_debug_info`	The program unit exists, but has no debug info.
`error_bad_handle`	No such program unit exists.

GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to `0`.

> **Note:** This is currently only used by client-side PL/SQL.

Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (
   info_requested  IN  BINARY_INTEGER,
   run_info        OUT runtime_info)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–23 GET_RUNTIME_INFO Function Parameters

Parameter	Description
`info_requested`	Which information should be returned in `run_info` when the program stops. See "Information Flags" on page 43-13.
`run_info`	Information about the state of the program.

GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
 RETURN BINARY_INTEGER;
```

Parameters

Table 43–24 GET_TIMEOUT_BEHAVIOUR Function Parameters

Parameter	Description
`oer`	The OER (a 4-byte positive number).

Return Values

Table 43–25 GET_TIMEOUT_BEHAVIOUR Function Return Values

Return	Description
`success`	A successful completion.

Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET_VALUE functions.

Syntax

```
DBMS_DEBUG.GET_VALUE (
   variable_name  IN  VARCHAR2,
   frame#         IN  BINARY_INTEGER,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–26 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter.
frame#	Frame in which it lives; 0 means the current procedure.
scalar_value	Value.
format	Optional date format to use, if meaningful.

Return Values

Table 43–27 GET_VALUE Function Return Values

Return	Description
success	A successful completion.
error_bogus_frame	Frame does not exist.
error_no_debug_info	Entrypoint has no debug information.
error_no_such_object	variable_name does not exist in frame#.
error_unknown_type	The type information in the debug information is illegible.
error_nullvalue	Value is NULL.
error_indexed_table	The object is a table, but no index was provided.

This form of GET_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

Syntax

```
DBMS_DEBUG.GET_VALUE (
   variable_name  IN  VARCHAR2,
   handle         IN  program_info,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–28 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter.
handle	Description of the package containing the variable.
scalar_value	Value.
format	Optional date format to use, if meaningful.

Return Values

Table 43–29 GET_VALUE Function Return Values

Return	Description
error_no_such_object	Either: - Package does not exist. - Package is not instantiated. - User does not have privileges to debug the package. - Object does not exist in the package.
error_indexed_table	The object is a table, but no index was provided.

Examples

This example illustrates how to get the value with a given package PACK in schema SCOTT, containing variable VAR:

```
DECLARE
   handle     dbms_debug.program_info;
   resultbuf  VARCHAR2(500);
   retval     BINARY_INTEGER;
BEGIN
   handle.Owner     := 'SCOTT';
   handle.Name      := 'PACK';
   handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
   retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```
DBMS_DEBUG.INITIALIZE (
   debug_session_id  IN VARCHAR2       := NULL,
   diagnostics       IN BINARY_INTEGER := 0)
  RETURN VARCHAR2;
```

Parameters

Table 43–30 INITIALIZE Function Parameters

Parameter	Description
debug_session_id	Name of session ID. If NULL, then a unique ID is generated.
diagnostics	Indicates whether to dump diagnostic output to the tracefile. 0 = (default) no diagnostics 1 = print diagnostics

Return Values

The newly-registered debug session ID (debugID)

Usage Notes

You cannot use DBMS_DEBUG and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to DBMS_DEBUG will succeed only if either the caller or the specified debug role carries the DEBUG CONNECT SESSION privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The CREATE ANY PROCEDURE privilege does not affect the visibility of routines through the debugger. A privilege DEBUG for each object has been introduced with a corresponding DEBUG ANY PROCEDURE variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for DEBUG CONNECT SESSION privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or PUBLIC will be used to check for DEBUG CONNECT SESSION. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the DEBUG privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made

(even if those roles were not available within a definer's rights environment of the call), and the debug role.

PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

Syntax

```
DBMS_DEBUG.PING;
```

Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour`.

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call debug_off) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling debug_on.
- `abort_on_timeout` - Continue execution, using the abort_execution flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;

continue_on_timeout CONSTANT BINARY_INTEGER:= 1;

nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;

abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT_BACKTRACE procedures.

Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (
  listing IN OUT VARCHAR2);

DBMS_DEBUG.PRINT_BACKTRACE (
  backtrace OUT backtrace_table);
```

Parameters

Table 43–31 PRINT_BACKTRACE Procedure Parameters

Parameter	Description
listing	A formatted character buffer with embedded newlines.
backtrace	1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.

PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
   pkgs   IN OUT NOCOPY backtrace_table,
   flags  IN BINARY_INTEGER);
```

Parameters

Table 43–32 PRINT_INSTANTIATIONS Procedure Parameters

Parameter	Description
`pkgs`	The instantiated packages
`flags`	Bitmask of options: ■ 1 - show specs ■ 2 - show bodies ■ 4 - show local instantiations ■ 8 - show remote instantiations (NYI) ■ 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.

Exceptions

`no_target_program` - target session is not currently executing

Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: `Namespace, Name, Owner,` and `LibunitType.`

In addition, Line# contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

PROBE_VERSION Procedure

This procedure returns the version number of DBMS_DEBUG on the server.

Syntax

```
DBMS_DEBUG.PROBE_VERSION (
   major out BINARY_INTEGER,
   minor out BINARY_INTEGER);
```

Parameters

Table 43–33 PROBE_VERSION Procedure Parameters

Parameter	Description
major	Major version number.
minor	Minor version number: increments as functionality is added.

SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pbload.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

```
DBMS_DEBUG.SELF_CHECK (
   timeout IN binary_integer := 60);
```

Parameters

Table 43–34 SELF_CHECK Procedure Parameters

Parameter	Description
timeout	The timeout to use for the communication test. Default is 60 seconds.

Exceptions

Table 43–35 SELF_CHECK Procedure Exceptions

Exception	Description
OER-6516	Probe version is inconsistent.
pipe_creation_ failure	Could not create a pipe.
pipe_send_failure	Could not write data to the pipe.
pipe_receive_failure	Could not read data from the pipe.
pipe_datatype_ mismatch	Datatype in the pipe was wrong.
pipe_data_error	Data got garbled in the pipe.

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session. Execution pauses if the target program reaches the breakpoint.

Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
   program     IN  program_info,
   line#       IN  BINARY_INTEGER,
   breakpoint# OUT BINARY_INTEGER,
   fuzzy       IN  BINARY_INTEGER := 0,
   iterations  IN  BINARY_INTEGER := 0)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–36 SET_BREAKPOINT Function Parameters

Parameter	Description
program	Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)
line#	Line at which the breakpoint is to be set.
breakpoint#	On successful completion, contains the unique breakpoint number by which to refer to the breakpoint.
fuzzy	Only applicable if there is no executable code at the specified line: 0 means return error_illegal_line. 1 means search forward for an adjacent line at which to place the breakpoint. -1 means search backward for an adjacent line at which to place the breakpoint.
iterations	Number of times to wait before signalling this breakpoint.

Return Values

Note: The fuzzy and iterations parameters are not yet implemented.

Table 43–37 SET_BREAKPOINT Function Return Values

Return	Description
success	A successful completion.
error_illegal_line	Cannot set a breakpoint at that line.
error_bad_handle	No such program unit exists.

SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (
   oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 43–38 SET_OER_BREAKPOINT Function Parameters

Parameter	Description
`oer`	The OER (positive 4-byte number) to delete.

Return Values

Table 43–39 SET_OER_BREAKPOINT Function Return Values

Return	Description
`success`	A successful completion.
`error_no_such_ breakpt`	No such OER breakpoint exists.

SET_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT (
   timeout BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–40 SET_TIMEOUT Function Parameters

Parameter	Description
`timeout`	The timeout to use for communication between the target and debug sessions.

SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
   behaviour IN PLS_INTEGER);
```

Parameters

Table 43–41 SET_TIMEOUT_BEHAVIOUR Procedure Parameters

Parameter	Description
`behaviour - One of the following:`	
`retry_on_timeout`	Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
`continue_on_timeout`	Continue execution, using same event flags.
`nodebug_on_timeout`	Turn debug-mode OFF (in other words, call `debug_off`) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
`abort_on_timeout`	Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

```
DBMS_DEBUG.SET_VALUE (
   frame#               IN binary_integer,
   assignment_statement IN varchar2)
  RETURN BINARY_INTEGER;

DBMS_DEBUG.SET_VALUE (
   handle               IN program_info,
   assignment_statement IN VARCHAR2)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–42 SET_VALUE Function Parameters

Parameter	Description
frame#	Frame in which the value is to be set; 0 means the currently executing frame.
handle	Description of the package containing the variable.
assignment_statement	An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'. Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.

Return Values

Table 43–43 SET_VALUE Function Return Values

Return	Description
success	-
error_illegal_value	Not possible to set it to that value.
error_illegal_null	Cannot set to NULL because object type specifies it as 'not null'.
error_value_ malformed	Value is not a scalar.
error_name_ incomplete	The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record.
error_no_such_object	Either: - Package does not exist. - Package is not instantiated. - User does not have privileges to debug the package. - Object does not exist in the package.

Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that

modification to a package variable using SET_VALUE might not take effect for a line or two.

Examples

To set the value of SCOTT.PACK.var to 6:

```
DECLARE
   handle  dbms_debug.program_info;
   retval  BINARY_INTEGER;
BEGIN
   handle.Owner     := 'SCOTT';
   handle.Name      := 'PACK';
   handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
   retval           := dbms_debug.set_value(handle, 'var := 6;');
END;
```

SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW_BREAKPOINTS procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
   listing    IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS (
   listing    OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS (
   code_breakpoints  OUT breakpoint_table,
   oer_breakpoints   OUT oer_table);
```

Parameters

Table 43–44 SHOW_BREAKPOINTS Procedure Parameters

Parameter	Description
listing	A formatted buffer (including newlines) of the breakpoints.
	Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.
code_breakpoints	The indexed table of breakpoint entries, indexed by breakpoint number.
oer_breakpoints	The indexed table of OER breakpoints, indexed by OER.

SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
   first_line  IN            BINARY_INTEGER,
   last_line   IN            BINARY_INTEGER,
   source      IN OUT NOCOPY vc2_table,
   frame_num   IN            BINARY_INTEGER);
```

Parameters

Table 43–45 SHOW_FRAME_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#.
frame_num	1-based frame number.

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source n order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW_SOURCE can also be used.
- If it's a stored PLSQL package/function/procedure then use SQL as described in the Usage Notes to SHOW_SOURCE Procedures.

SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded `SHOW_SOURCE` procedures.

Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
   first_line  IN   BINARY_INTEGER,
   last_line   IN   BINARY_INTEGER,
   source      OUT  vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
   first_line   IN     BINARY_INTEGER,
   last_line    IN     BINARY_INTEGER,
   window       IN     BINARY_INTEGER,
   print_arrow  IN     BINARY_INTEGER,
   buffer       IN OUT VARCHAR2,
   buflen       IN     BINARY_INTEGER,
   pieces       OUT    BINARY_INTEGER);
```

Parameters

Table 43–46 SHOW_SOURCE Procedure Parameters

Parameter	Description
`first_line`	Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)
`last_line`	Line number of last line to fetch. No lines are fetched past the end of the program.
`source`	The resulting table, which may be indexed by line#.
`window`	'Window' of lines (the number of lines around the current source line).
`print_arrow`	Nonzero means to print an arrow before the current line.
`buffer`	Buffer in which to place the source listing.
`buflen`	Length of buffer.
`pieces`	Set to nonzero if not all the source could be placed into the given buffer.

Return Values

An indexed table of source-lines. The source lines are stored starting at `first_line`. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
   -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
   -- or GET_RUNTIME_INFO to fill in 'info'
   SELECT text INTO <buffer> FROM all_source
```

```
   WHERE owner = info.Program.Owner
     AND name  = info.Program.Name
     AND line  = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in bufferlength (`buflen`), then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (`pieces` returns the number of additional pieces that need to be retrieved).

SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not `NULL`, then it calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
   run_info       OUT  runtime_info,
   info_requested IN   BINARY_INTEGER := NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 43–47 SYNCHRONIZE Function Parameters

Parameter	Description
`run_info`	Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.
`info_requested`	Optional bit-field in which to request information other than the default (which is `info_getStackDepth` + `info_getLineInfo`). 0 means that no information is requested at all. See "Information Flags" on page 43-13.

Return Values

Table 43–48 SYNCHRONIZE Function Return Values

Return	Description
`success`	A successful completion.
`error_timeout`	Timed out before the program started execution.
`error_communication`	Other communication error.

TARGET_PROGRAM_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING
  RETURN BOOLEAN;
```

44

DBMS_DEFER

DBMS_DEFER is the user interface to a replicated transactional deferred remote procedure call facility. Replicated applications use the calls in this interface to queue procedure calls for later transactional execution at remote nodes.

These procedures are typically called from either after row triggers or application specified update procedures.

- Documentation of DBMS_DEFER

Documentation of DBMS_DEFER

For a complete description of this package within the context of Replication, see DBMS_DEFER in the *Oracle Database Advanced Replication Management API Reference.*

45

DBMS_DEFER_QUERY

DBMS_DEFER_QUERY enables you to query the deferred transactions queue data that is not exposed through views.

- Documentation of DBMS_DEFER_QUERY

Documentation of DBMS_DEFER_QUERY

For a complete description of this package within the context of Replication, see DBMS_DEFER_QUERY in the *Oracle Database Advanced Replication Management API Reference*.

46

DBMS_DEFER_SYS

DBMS_DEFER_SYS subprograms manage default replication node lists. This package is the system administrator interface to a replicated transactional deferred remote procedure call facility. Administrators and replication daemons can execute transactions queued for remote nodes using this facility, and administrators can control the nodes to which remote calls are destined.

- Documentation of DBMS_DEFER_SYS

Documentation of DBMS_DEFER_SYS

For a complete description of this package within the context of Replication, see `DBMS_DEFER_SYS` in the *Oracle Database Advanced Replication Management API Reference*.

47

DBMS_DESCRIBE

You can use the DBMS_DESCRIBE package to get information about a PL/SQL object. When you specify an object name, DBMS_DESCRIBE returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- Using DBMS_DESCRIBE
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Examples
- Summary of DBMS_DESCRIBE Subprograms

Using DBMS_DESCRIBE

- Overview
- Security Model
- Types
- Exceptions
- Examples

Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

See Also: *Oracle Call Interface Programmer's Guide*

Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

Types

The DBMS_DESCRIBE package declares two PL/SQL table types, which are used to hold data returned by DESCRIBE_PROCEDURE in its OUT parameters. The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
    INDEX BY BINARY_INTEGER;

TYPE NUMBER_TABLE IS TABLE OF NUMBER
    INDEX BY BINARY_INTEGER;
```

Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.

Table 47–1 DBMS_DESCRIBE Errors

Error	Description
ORA-20000	ORU 10035: cannot describe a package ('X') only a procedure within a package.
ORA-20001	ORU-10032: procedure 'X' within package 'Y' does not exist.
ORA-20002	ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'.
ORA-20003	ORU-10036: object 'X' is invalid and cannot be described.
ORA-20004	Syntax error attempting to parse 'X'.

Examples

One use of the DESCRIBE_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT_NAME of SCOTT.ACCOUNT_UPDATE, where ACCOUNT_UPDATE is an overloaded function with specification:

```
TABLE account (account_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person  (person_id number(4), person_nm varchar2(10))

FUNCTION ACCOUNT_UPDATE (account_no   NUMBER,
                         person       person%rowtype,
                         amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                         trans_date   DATE)
                         return       account.balance%type;

FUNCTION ACCOUNT_UPDATE (account_no   NUMBER,
                         person       person%rowtype,
                         amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                         trans_no     NUMBER)
                         return       account.balance%type;
```

This procedure might look similar to the following output:

```
overload position  argument level  datatype length prec scale rad
-------- --------- -------- ------ -------- ------ ---- ----- ---
       1         0             0        2     22    7     2  10
       1         1   ACCOUNT   0        2      0    0     0   0
       1         2   PERSON    0      250      0    0     0   0
       1         1   PERSON_ID 1        2     22    4     0  10
       1         2   PERSON_NM 1        1     10    0     0   0
       1         3   AMOUNTS   0      251      0    0     0   0
       1         1             1        2     22    0     0   0
       1         4   TRANS_DATE 0      12      0    0     0   0
       2         0             0        2     22    7     2  10
       2         1   ACCOUNT_NO 0       2     22    0     0   0
       2         2   PERSON    0        2     22    4     0  10
       2         3   AMOUNTS   0      251     22    4     0  10
       2         1             1        2      0    0     0   0
       2         4   TRANS_NO  0        2      0    0     0   0
```

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
        pvc2    IN     VARCHAR2,
        pvc     OUT    VARCHAR,
        pstr    IN OUT STRING,
        plong   IN     LONG,
        prowid  IN     ROWID,
        pchara  IN     CHARACTER,
        pchar   IN     CHAR,
        praw    IN     RAW,
        plraw   IN     LONG RAW,
        pbinint IN     BINARY_INTEGER,
        pplsint IN     PLS_INTEGER,
        pbool   IN     BOOLEAN,
        pnat    IN     NATURAL,
        ppos    IN     POSITIVE,
        pposn   IN     POSITIVEN,
```

```
        pnatn   IN     NATURALN,
        pnum    IN     NUMBER,
        pintgr  IN     INTEGER,
        pint    IN     INT,
        psmall  IN     SMALLINT,
        pdec    IN     DECIMAL,
        preal   IN     REAL,
        pfloat  IN     FLOAT,
        pnumer  IN     NUMERIC,
        pdp     IN     DOUBLE PRECISION,
        pdate   IN     DATE,
        pmls    IN     MLSLABEL) AS

BEGIN
    NULL;
END;
```

If you describe this procedure using the following:

```
CREATE OR REPLACE PACKAGE describe_it AS

    PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

  PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
    n INTEGER;
  BEGIN
    n := isize - LENGTHB(val);
    IF n < 0 THEN
      n := 0;
    END IF;
    DBMS_OUTPUT.PUT(val);
    FOR i in 1..n LOOP
      DBMS_OUTPUT.PUT(' ');
    END LOOP;
  END prt_value;

  PROCEDURE desc_proc (name VARCHAR2) IS

      overload     DBMS_DESCRIBE.NUMBER_TABLE;
      position     DBMS_DESCRIBE.NUMBER_TABLE;
      c_level      DBMS_DESCRIBE.NUMBER_TABLE;
      arg_name     DBMS_DESCRIBE.VARCHAR2_TABLE;
      dty          DBMS_DESCRIBE.NUMBER_TABLE;
      def_val      DBMS_DESCRIBE.NUMBER_TABLE;
      p_mode       DBMS_DESCRIBE.NUMBER_TABLE;
      length       DBMS_DESCRIBE.NUMBER_TABLE;
      precision    DBMS_DESCRIBE.NUMBER_TABLE;
      scale        DBMS_DESCRIBE.NUMBER_TABLE;
      radix        DBMS_DESCRIBE.NUMBER_TABLE;
      spare        DBMS_DESCRIBE.NUMBER_TABLE;
      idx          INTEGER := 0;

  BEGIN
      DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
              name,
              null,
              null,
```

```
                overload,
                position,
                c_level,
                arg_name,
                dty,
                def_val,
                p_mode,
                length,
                precision,
                scale,
                radix,
                spare);

        DBMS_OUTPUT.PUT_LINE('Position    Name        DTY  Mode');
        LOOP
            idx := idx + 1;
            prt_value(TO_CHAR(position(idx)), 12);
            prt_value(arg_name(idx), 12);
            prt_value(TO_CHAR(dty(idx)), 5);
            prt_value(TO_CHAR(p_mode(idx)), 5);
            DBMS_OUTPUT.NEW_LINE;
        END LOOP;
    EXCEPTION
       WHEN NO_DATA_FOUND THEN
          DBMS_OUTPUT.NEW_LINE;
          DBMS_OUTPUT.NEW_LINE;

    END desc_proc;
END describe_it;
```

Then the results list all the numeric codes for the PL/SQL datatypes:

```
Position  Name    Datatype_Code  Mode
1         PVC2      1              0
2         PVC       1              1
3         PSTR      1              2
4         PLONG     8              0
5         PROWID    11             0
6         PCHARA    96             0
7         PCHAR     96             0
8         PRAW      23             0
9         PLRAW     24             0

```

Summary of DBMS_DESCRIBE Subprograms

Table 47–2 DBMS_DESCRIBE Package Subprograms

Subprogram	Description
DESCRIBE_PROCEDURE Procedure on page 47-11	Provides a brief description of a PL/SQL stored procedure

DESCRIBE_PROCEDURE Procedure

The procedure DESCRIBE_PROCEDURE provides a brief description of a PL/SQL stored procedure. It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
   object_name                  IN  VARCHAR2,
   reserved1                    IN  VARCHAR2,
   reserved2                    IN  VARCHAR2,
   overload                     OUT NUMBER_TABLE,
   position                     OUT NUMBER_TABLE,
   level                        OUT NUMBER_TABLE,
   argument_name                OUT VARCHAR2_TABLE,
   datatype                     OUT NUMBER_TABLE,
   default_value                OUT NUMBER_TABLE,
   in_out                       OUT NUMBER_TABLE,
   length                       OUT NUMBER_TABLE,
   precision                    OUT NUMBER_TABLE,
   scale                        OUT NUMBER_TABLE,
   radix                        OUT NUMBER_TABLE,
   spare                        OUT NUMBER_TABLE
   include_string_constraints   OUT BOOLEAN DEFAULT FALSE);
```

Parameters

Table 47–3 DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
object_name	Name of the procedure being described. The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified OBJECT_NAME can result in one of the following exceptions: ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function. ORA-20001 - The procedure or function that you specified does not exist within the given package. ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects. ORA-20003 - The object that you specified is invalid and cannot be described. ORA-20004 - The object was specified with a syntax error.
reserved1 reserved2	Reserved for future use -- must be set to NULL or the empty string.
overload	A unique number assigned to the procedure's signature. If a procedure is overloaded, then this field holds a different value for each version of the procedure.
position	Position of the argument in the parameter list. Position 0 returns the values for the return type of a function.

Table 47–3 (Cont.) DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
level	If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the *Oracle Call Interface Programmer's Guide* for a description of the ODESSP call for an example.
argument_name	Name of the argument associated with the procedure that you are describing.
datatype	Oracle datatype of the argument being described. The datatypes and their numeric type codes are: 0 placeholder for procedures with no arguments 1 VARCHAR, VARCHAR, STRING 2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL 3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL 8 LONG 11 ROWID 12 DATE 23 RAW 24 LONG RAW 58 OPAQUE TYPE 96 CHAR (ANSI FIXED CHAR), CHARACTER 106 MLSLABEL 121 OBJECT 122 NESTED TABLE 123 VARRAY 178 TIME 179 TIME WITH TIME ZONE 180 TIMESTAMP 181 TIMESTAMP WITH TIME ZONE 231 TIMESTAMP WITH LOCAL TIME ZONE 250 PL/SQL RECORD 251 PL/SQL TABLE 252 PL/SQL BOOLEAN
default_value	1 if the argument being described has a default value; otherwise, the value is 0.
in_out	Describes the mode of the parameter: 0 IN 1 OUT 2 IN OUT
length	For %rowtype formal arguments, the length constraint is returned, otherwise 0 is returned.If the include_string_constraints parameter is set to TRUE, the argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96
precision	If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number.
scale	If the argument being described is of datatype 2 (NUMBER), then this parameter is the scale of that number.
radix	If the argument being described is of datatype 2 (NUMBER), then this parameter is the radix of that number.
spare	Reserved for future functionality.
include_ string_ constraints	The default is FALSE. If the parameter is set to TRUE, the arguments' formal type constraints is passed back if it is of the appropriate type.Those are the string types: 1;8;23;24;96

Return Values

All values from DESCRIBE_PROCEDURE are returned in its OUT parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

48

DBMS_DG

The DBMS_DG package allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover.

> **See Also:** *Oracle Data Guard Broker* for more information about performing a fast-start failover in a broker configuration

This chapter contains the following topics:

- Using DBMS_DG
- Summary of the DBMS_DG Subprogram

Using DBMS_DG

There are conditions detectable by applications running outside of the Oracle database that may warrant the Oracle Data Guard broker to perform a fast-start failover. Because the range of possible conditions is virtually unlimited, it is left to the applications to determine which conditions warrant a fast-start failover.

When such conditions occur, the application calls the `DBMS_DG.INITIATE_FS_FAILOVER` procedure to alert the primary database that the application wants a fast-start failover to occur immediately. The primary database then notifies the observer, which immediately initiates a fast-start failover as long as the standby database is in a valid fast-start failover state ("observed" and either "synchronized" or "within lag") to accept a failover.

If the configuration is not in a valid fast-start failover state, the `INITIATE_FS_FAILOVER` subprogram returns an ORA error message (it will not signal an exception) to inform the calling application that a fast-start failover could not be performed.

Summary of the DBMS_DG Subprogram

Table 48–1 DBMS_DG Package Subprogram

Subprogram	Description
INITIATE_FS_FAILOVER Procedure on page 48-4	Enables an application to notify the primary database that a fast-start failover is necessary when the application encounters conditions that warrant a failover.

INITIATE_FS_FAILOVER Procedure

Use this procedure to specify a condition string that, when encountered by an application, allows the application to request the primary database to immediately invoke a fast-start failover.

Syntax

```
DBMS_DG.INITIATE_FS_FAILOVER (
     condstr          IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

Table 48–2 INITIATE_FS_FAILOVER Procedure Parameters

Parameter	Description
condstr	Specifies the condition string for which a fast-start failover should be requested. If no condition string argument is supplied, the default string of "Application Failover Requested" will be logged in the broker log file and in the database alert log of the primary database.

Usage Notes

- Requires `SYSDBA` privilege and must be defined as an invoker's rights package.
- This procedure returns a binary integer.
- Query the `V$FS_FAILOVER_STATS` view to see the time of the last fast-start failover and the reason it was performed.

Errors

Table 48–3 INITIATE_FS_FAILOVER Procedure Errors

Error	Description
`ORA-00000: normal, successful completion`	The request to initiate a fast-start failover has been posted to the observer.
`ORA-16646: Fast-Start Failover is disabled`	Either a broker configuration does not exist or fast-start failover has not been enabled.
`ORA-16666: unable to initiate Fast-Start Failover on a standby database`	`DBMS_DG.INITIATE_FS_FAILOVER` was invoked on a standby site.
`ORA-16817: unsynchronized Fast-Start Failover configuration`	`DBMS_DG.INITIATE_FS_FAILOVER` was invoked in a maximum available fast-start failover configuration when the configuration was not synchronized.
`ORA-16819: Fast-Start Failover observer not started`	`DBMS_DG.INITIATE_FS_FAILOVER` was invoked but an observer had not yet been started.
`ORA-16820: Fast-Start Failover observer is no longer observing this database`	`DBMS_DG.INITIATE_FS_FAILOVER` was invoked but the configuration detects that the observer may not be running.

Table 48–3 (Cont.) INITIATE_FS_FAILOVER Procedure Errors

Error	Description
ORA-16829: lagging Fast-Start Failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum performance fast-start failover configuration when the configuration was not in the user-specified redo lag limit.

Examples

Connect as user SYS with SYDDBA privileges to use the following example.

```
set serveroutput on

declare
status integer;

begin
status := dbms_dg.initiate_fs_failover(''Failover Requested'');

dbms_output.put_line(''FSFO is disabled: Expected status = ORA-16646'');
dbms_output.put_line(''                  Actual Status = ORA-'' || status);

end;
/
exit;
```

49

DBMS_DIMENSION

DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

> **See Also:** *Oracle Database Data Warehousing Guide* for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

- Using DBMS_DIMENSION
  - Security Model
- Summary of DBMS_DIMENSION Subprograms

Using DBMS_DIMENSION

This section contains topics which relate to using the `DBMS_DIMENSION` package.

- Security Model

Security Model

Security on this package can be controlled by granting `EXECUTE` to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: `CREATE ANY DIMENSION`, `ALTER ANY DIMENSION`, and `DROP ANY DIMENSION`.

Summary of DBMS_DIMENSION Subprograms

Table 49–1 DBMS_DIMENSION Package Subprograms

Subprogram	Description
DESCRIBE_DIMENSION Procedure on page 49-5	Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes
VALIDATE_DIMENSION Procedure on page 49-6	Verifies that the relationships specified in a dimension are correct

DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS_OUTPUT package.

Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (
   dimension  IN VARCHAR2);
```

Parameters

Table 49–2 DESCRIBE_DIMENSION Procedure Parameter

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.

VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table DIMENSION_EXCEPTIONS in the user's schema.

Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
   dimension               IN VARCHAR2,
   incremental             IN BOOLEAN := TRUE,
   check_nulls             IN BOOLEAN := FALSE,
   statement_id            IN VARCHAR2 := NULL );
```

Parameters

Table 49–3 VALIDATE_DIMENSION Procedure Parameters

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.
incremental	If TRUE, check only the new rows for tables of this dimension. If FALSE, check all the rows.
check_nulls	If TRUE, then all level columns are verified to be non-null. If FALSE, this check is omitted. Specify FALSE when non-NULLness is guaranteed by other means, such as NOT NULL constraints.
statement_id	A client-supplied unique identifier to associate output rows with specific invocations of the procedure.

50

DBMS_DISTRIBUTED_TRUST_ADMIN

DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- Using DBMS_DISTRIBUTED_TRUST_ADMIN
  - Overview
  - Security Model
  - Examples
- Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

Using DBMS_DISTRIBUTED_TRUST_ADMIN

- Overview
- Security Model
- Examples

Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

Security Model

To execute DBMS_DISTRIBUTED_TRUST_ADMIN, the EXECUTE_CATALOG_ROLE role must be granted to the DBA. To select from the view TRUSTED_SERVERS, the SELECT_CATALOG_ROLE role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the ALLOW_SERVER procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the DENY_SERVER procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures DENY_ALL and ALLOW_ALL delete all entries (in other words, server names) that are explicitly allowed or denied using the ALLOW_SERVER procedure or DENY_SERVER procedure respectively.

Examples

If you have not yet used the package DBMS_DISTRIBUTED_TRUST_ADMIN to change the trust listing, by default you trust all databases in the same enterprise domain if that domain it listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST     NAME
--------- --------------------
Trusted   All
```

Because all servers are currently trusted, you can execute the DENY_SERVER Procedure and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
                           ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
--------- ----------------------------------------------
Untrusted SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the DENY_ALL Procedure, you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;

PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;

TRUST      NAME
--------- ----------------------------------------------
Untrusted All
```

The ALLOW_SERVER Procedure can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
                             ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
--------- ----------------------------------------------
Trusted   SALES.US.AMERICAS.ACME_AUTO.COM
```

Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

Table 50–1 DBMS_DISTRIBUTED_TRUST_ADMIN Package Subprograms

Subprogram	Description
ALLOW_ALL Procedure on page 50-7	Empties the list and inserts a row indicating that all servers should be trusted
ALLOW_SERVER Procedure on page 50-8	Enables a specific server to be allowed access even though `deny` all is indicated in the list
DENY_ALL Procedure on page 50-9	Empties the list and inserts a row indicating that all servers should be untrusted
on page 50-10DENY_ SERVER Procedure	Enables a specific server to be denied access even though allow all is indicated in the list

ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view TRUSTED_SERVERS will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

Usage Notes

ALLOW_ALL only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "`deny all`").

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (
   server IN VARCHAR2);
```

Parameters

Table 50–2 ALLOW_SERVER Procedure Parameters

Parameter	Description
`server`	Unique, fully-qualified name of the server to be trusted.

Usage Notes

If the Trusted Servers List contains the entry "`deny all`", then this procedure adds a specification indicating that a specific database (for example, `DBx`) is to be trusted.

If the Trusted Servers List contains the entry "`allow all`", and if there is no "`deny DBx`" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "`allow all`", and if there is a "`deny DBx`" entry in the list, then that entry is deleted.

DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view TRUSTED_SERVERS will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified `allow all`).

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (
   server IN VARCHAR2);
```

Parameters

Table 50–3 DENY_SERVER Procedure Parameters

Parameter	Description
`server`	Unique, fully-qualified name of the server to be untrusted.

Usage Notes

If the Trusted Servers List contains the entry `allow all`, then this procedure adds an entry indicating that the specified database (for example, `DBx`) is not to be trusted.

If the Trusted Servers List contains the entry "`deny all`", and if there is no "`allow DBx`" entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry "`deny all`", and if there is an "`allow DBx`" entry, then this procedure causes that entry to be deleted.

51

DBMS_EPG

The DBMS_EPG package implements the embedded PL/SQL gateway that enables a web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

- Using DBMS_EPG
  - Overview
  - Security Model
  - Exceptions
- Data Structures
  - VARCHAR2_TABLE Table Type
- Subprogram Groups
  - Configuration Subprograms
  - Authorization Subprograms
- Summary of DBMS_EPG Subprograms

Using DBMS_EPG

- Overview
- Security Model
- Exceptions

Overview

The DBMS_EPG package is a platform on which PL/SQL users develop and deploy PL/SQL web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of mod_plsql in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser via HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

Security Model

The XDBADMIN role is required to invoke the configuration interface. It may invoked by the database user "XDB".

The authorization interface can be invoked by any user.

Exceptions

The following table lists the exceptions raised by the DBMS_EPG package.

Table 51–1 DBMS_EPG Exceptions

Exception	Error Code	Description
DAD_NOT_FOUND	20000	Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.

Data Structures

The DBMS_EPG package defines a TABLE type.

VARCHAR2_TABLE Table Type

This type is used by the procedures GET_ALL_GLOBAL_ATTRIBUTES, GET_ALL_DAD_ATTRIBUTES, GET_ALL_DAD_MAPPINGS, and GET_DAD_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

Subprogram Groups

The DBMS_EPG consists of two interfaces:

- Configuration Subprograms
- Authorization Subprograms

Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

Table 51–2 Configuration Subprogram Group

Subprogram	Description
CREATE_DAD Procedure on page 51-12	Creates a new DAD
DELETE_DAD_ATTRIBUTE Procedure on page 51-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 51-15	Deletes a global attribute
DROP_DAD Procedure on page 51-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 51-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 51-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 51-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 51-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 51-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 51-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 51-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 51-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 51-26	Sets the value of a global attribute
UNMAP_DAD Procedure on page 51-27	Unmaps a DAD from the specified virtual path

Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

Table 51–3 Authorization Subprogram Group

Subprogram	Description
AUTHORIZE_DAD Procedure on page 51-11	Authorizes a DAD to invoke procedures and access document tables with a database user's privileges
DEAUTHORIZE_DAD Procedure on page 51-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges

Summary of DBMS_EPG Subprograms

Table 51–4 DBMS_ALERT Package Subprograms

Subprogram	Description
AUTHORIZE_DAD Procedure on page 51-11	authorizes a DAD to invoke procedures and access document tables with a database user's privileges
CREATE_DAD Procedure on page 51-12	Creates a new DAD
DEAUTHORIZE_DAD Procedure on page 51-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges
DELETE_DAD_ATTRIBUTE Procedure on page 51-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 51-15	Deletes a global attribute
DROP_DAD Procedure on page 51-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 51-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 51-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 51-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 51-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 51-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 51-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 51-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 51-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 51-26	Sets the value of a global attribute
UNMAP_DAD Procedure on page 51-27	Unmaps a DAD from the specified virtual path

AUTHORIZE_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

> **See Also:** Authorization Subprograms on page 51-9 for other subprograms in this group

Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 51–5 AUTHORIZE_DAD Procedure Parameters

Parameter	Description
`dad_name`	The name of the DAD to create
`user`	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

- To authorize the use of another user's privileges, the invoker must have the `ALTER USER` system privilege.
- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

CREATE_DAD Procedure

This procedure creates a new DAD.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.CREATE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 51–6 CREATE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to create
path	The virtual path to which to map the DAD

DEAUTHORIZE_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

> **See Also:** Authorization Subprograms on page 51-9 for other subprograms in this group

Syntax

```
DBMS_EPG.DEAUTHORIZE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 51–7 DEAUTHORIZE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to deauthorize use
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

To deauthorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

DELETE_DAD_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

See Also: Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (
   dad_name      IN  VARCHAR2,
   attr_name     IN  VARCHAR2);
```

Parameters

Table 51–8 DELETE_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to delete a DAD attribute
attr_name	The name of the DAD attribute to delete

Exceptions

Raises an error if DAD does not exist

DELETE_GLOBAL_ATTRIBUTE Procedure

This procedure deletes a global attribute.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (
   attr_name     IN  VARCHAR2);
```

Parameters

Table 51–9 DELETE_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to delete

DROP_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DROP_DAD (
   dadname  IN  VARCHAR2);
```

Parameters

Table 51–10 DROP_DAD Procedure Parameters

Parameter	Description
dad_name	The DAD to drop

Exceptions

Raises an error if the DAD does not exist.

GET_ALL_DAD_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
   dad_name      IN          VARCHAR2,
   attr_names    OUT NOCOPY  VARCHAR2_TABLE,
   attr_values   OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 51–11 GET_ALL_DAD_ATTRIBUTES Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
attr_names	The attribute names
attr_values	The attribute values

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD has no attributes set, then attr_names and attr_values will be set to empty arrays.

GET_ALL_DAD_MAPPINGS Procedure

This procedure retrieves all virtual paths to which the specified DAD is mapped.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (
   dad_name      IN          VARCHAR2,
   paths         OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 51–12 GET_ALL_DAD_MAPPINGS Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
paths	The virtual paths to which h the DAD is mapped

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD is not mapped to any virtual path, paths will be set to empty arrays.

GET_ALL_GLOBAL_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
   attr_names     OUT   NOCOPY  VARCHAR2_TABLE,
   attr_values    OUT   NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 51–13 GET_ALL_GLOBAL_ATTRIBUTES Procedure Parameters

Parameter	Description
attr_names	The global attribute names
attr_values	The values of the global attributes

Usage Notes

If the gateway instance has no global attributes set, then attr_names and attr_values will be set to empty arrays.

GET_DAD_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (
   dad_name     IN  VARCHAR2,
   attr_name    IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 51–14 GET_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_names	The name of the DAD for which to delete an attribute
attr_name	The name of the attribute to delete

Return values

Returns the DAD attribute value. Returns NULL if attribute is unknown or has not been set.

Exceptions

Raises an error if DAD does not exist.

GET_DAD_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_LIST (
   dad_names     OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 51–15 GET_DAD_LIST Procedure Parameters

Parameter	Description
dad_names	The list of all DADs

Usage Notes

If no DADs exist then dad_names will be set to an empty array.

GET_GLOBAL_ATTRIBUTE Function

This function retrieves the value of a global attribute.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (
   attr_name  IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 51–16 GET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to retrieve

Return Values

Returns the global attribute value. Returns NULL if attribute has not been set or is not a valid attribute.

MAP_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.MAP_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2);
```

Parameters

Table 51–17 MAP_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to map
path	The virtual path to map

Exceptions

Raises and error if the DAD does not exist.

SET_DAD_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

See Also: Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
   dad_name    IN  VARCHAR2,
   attr_name   IN  VARCHAR2,
   attr_value  IN  VARCHAR2);
```

Parameters

Table 51–18 SET_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to set the attribute
attr_name	The name of the attribute to set
attr_value	The attribute value to set

Table 51–19 Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlAfterProcedure	after-procedure	No	String
PlsqlAlwaysDescribeProcedure	always-describe-procedure	No	Enumeration of On, Off
PlsqlAuthenticationMode	authentication-mode	No	Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa
PlsqlBeforeProcedure	before-procedure	No	String
PlsqlBindBucketLengths	bind-bucket-lengths	Yes	Unsigned integer
PlsqlBindBucketWidths	bind-bucket-widths	Yes	Unsigned integer
PlsqlCGIEnvironmentList	cgi-environment-list	Yes	String
PlsqlCompatibilityMode	compatibility-mode	No	Unsigned integer
PlsqlDatabaseUsername	database-username	No	String
PlsqlDefaultPage	default-page	No	String
PlsqlDocumentPath	document-path	No	String
PlsqlDocumentProcedure	document-procedure	No	String
PlsqlDocumentTablename	document-table-name	No	String

Table 51–19 (Cont.) Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlErrorStyle	error-style	No	Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle
PlsqlExclusionList	exclusion-list	Yes	String
PlsqlFetchBufferSize	fetch-buffer-size	No	Unsigned integer
PlsqlInfoLogging	info-logging	No	Enumeration of InfoDebug
PlsqlOWADebugEnable	owa-debug-enable	No	Enumeration of On, Off
PlsqlMaxRequestsPerSession	max-requests-per-session	No	Unsigned integer
PlsqlNLSLanguage	nls-language	No	String
PlsqlPathAlias	path-alias	No	String
PlsqlPathAliasProcedure	path-alias-procedure	No	String
PlsqlRequestValidationFunction	request-validation-function	No	String
PlsqlSessionCookieName	session-cookie-name	No	String
PlsqlSessionStateManagement	session-state-management	No	Enumeration of StatelessWithResetPackageState, StatelessWithFastRestPackageState, StatelessWithPreservePackageState
PlsqlTransferMode	transfer-mode	No	Enumeration of Char, Raw
PlsqlUploadAsLongRaw	upload-as-long-raw	No	String

Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. mod_plsql users should note the following
  - The `PlsqlDatabasePassword` attribute is not needed.
  - The `PlsqlDatabaseConnectString` attribute is not needed because the embedded gateway does not support logon to external databases.

Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

SET_GLOBAL_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

See Also: Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
   attr_name    IN VARCHAR2,
   attr_value   IN VARCHAR2);
```

Parameters

Table 51–20 SET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to set
attr_value	The attribute value to set

Table 51–21 Mapping Between mod_plsql and Embedded PL/SQL Gateway Global Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlLogLevel	log-level	No	Unsigned integer
PlsqlMaxParameters	max-parameters	No	Unsigned integer

Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If attr_name attribute has been set before, then the old value will be overwritten with the new attr_value argument.

Exceptions

Raises an error if the attribute is unknown.

Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

UNMAP_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is NULL, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

> **See Also:** Configuration Subprograms on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.UNMAP_DAD (
   dad_name IN VARCHAR2,
   path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 51–22 UNMAP_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to unmap
path	The virtual path to unmap

Usage Notes

Raises and error if the DAD does not exist.

52

DBMS_ERRLOG

The DBMS_ERRLOG package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information regarding how to use DBMS_ERRLOG and *Oracle Database SQL Language Reference* for error_logging_clause syntax

This chapter contains the following topics:

- Using DBMS_ERRLOG
  - Security Model
- Summary of DBMS_ERRLOG Subprograms

Using DBMS_ERRLOG

This section contains topics which relate to using the `DBMS_ERRLOG` package.

- Security Model

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

Summary of DBMS_ERRLOG Subprograms

Table 52–1 DBMS_ERRLOG Package Subprograms

Subprogram	Description
CREATE_ERROR_LOG Procedure on page 52-5	Creates the error logging table used in DML error logging

CREATE_ERROR_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

LONG, CLOB, BLOB, BFILE, and ADT datatypes are not supported in the columns.

Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
   dml_table_name            IN VARCHAR2,
   err_log_table_name        IN VARCHAR2 := NULL,
   err_log_table_owner       IN VARCHAR2 := NULL,
   err_log_table_space       IN VARCHAR2 := NULL,
   skip_unsupported          IN BOOLEAN := FALSE);
```

Parameters

Table 52–2 CREATE_ERROR_LOG Procedure Parameters

Parameter	Description
dml_table_name	The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased.
err_log_table_name	The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR$_'. Examples are the following: dml_table_name: 'EMP',err_log_table_name: 'ERR$_EMP' dml_table_name: '"Emp2"',err_log_table_name: 'ERR$_Emp2'
err_log_table_owner	The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.
err_log_table_space	The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.
skip_unsupported	When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.

Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                                      Null?    Type
----------------------------              -------  -----
CHANNEL_ID                                NOT NULL CHAR(1)
```

```
CHANNEL_DESC                              NOT NULL    VARCHAR2(20)
CHANNEL_CLASS                                         VARCHAR2(20)
```

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```
SQL> DESC ERR$_CHANNELS
Name                              Null?    Type
----------------                  ----     ----
ORA_ERR_NUMBER$                            NUMBER
ORA_ERR_MESG$                              VARCHAR2(2000)
ORA_ERR_ROWID$                             ROWID
ORA_ERR_OPTYP$                             VARCHAR2(2)
ORA_ERR_TAG$                               VARCHAR2(2000)
CHANNEL_ID                                 VARCHAR2(4000)
CHANNEL_DESC                               VARCHAR2(4000)
CHANNEL_CLASS                              VARCHAR2(4000)
```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

53

DBMS_EXPFIL

The DBMS_EXPFIL package contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter.

> **See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- Summary of Expression Filter Subprograms

Summary of Expression Filter Subprograms

Table 53–1 describes the subprograms in the DBMS_EXPFIL package.

All the values and names passed to the procedures defined in the DBMS_EXPFIL package are not case sensitive, unless otherwise mentioned. To preserve the case, you use double quotation marks around the values.

Table 53–1 DBMS_EXPFIL Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the attribute set
ADD_FUNCTIONS Procedure	Adds a function, type, or package to the approved list of functions with an attribute set
ASSIGN_ATTRIBUTE_SET Procedure	Assigns an attribute set to a column storing expressions
BUILD_EXCEPTIONS_TABLE Procedure	Creates an exception table to hold references to invalid expressions
CLEAR_EXPRSET_STATS Procedure	Clears the predicate statistics for an expression set
COPY_ATTRIBUTE_SET Procedure	Makes a copy of the attribute set
CREATE_ATTRIBUTE_SET Procedure	Creates an attribute set
DEFAULT_INDEX_PARAMETERS Procedure	Assigns default index parameters to an attribute set
DEFAULT_XPINDEX_PARAMETERS Procedure	Assigns default XPath index parameters to an attribute set
DEFRAG_INDEX Procedure	Rebuilds the bitmap indexes online to reduce fragmentation
DROP_ATTRIBUTE_SET Procedure	Drops an unused attribute set
GET_EXPRSET_STATS Procedure	Collects predicate statistics for an expression set
GRANT_PRIVILEGE Procedure	Grants an expression DML privilege to a user
INDEX_PARAMETERS Procedure	Assigns index parameters to an expression set
MODIFY_OPERATOR_LIST Procedure	Modifies the list of common operators used in predicates with a certain attribute
REVOKE_PRIVILEGE Procedure	Revokes an expression DML privilege from a user
SYNC_TEXT_INDEXES Procedure	Synchronizes the indexes defined to process the predicates involving the CONTAINS operator in stored expressions
UNASSIGN_ATTRIBUTE_SET Procedure	Breaks the association between a column storing expressions and the attribute set
VALIDATE_EXPRESSIONS Procedure	Validates expression metadata and the expressions stored in a column
XPINDEX_PARAMETERS Procedure	Assigns XPath index parameters to an expression set

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to the attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   attr_type  IN   VARCHAR2,
   attr_defv1 IN   VARCHAR2 DEFAULT NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   tab_alias  IN   exf$table_alias);
```

Allows addition of text attributes to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
   attr_set       IN   VARCHAR2,
   attr_name      IN   VARCHAR2,
   attr_type      IN   VARCHAR2,
   text_pref      IN   EXF$TEXT);
```

Parameters

Table 53–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
attr_defv1	Default value for the elementary attribute
tab_alias	Type that identifies the database table to which the attribute is aliased
text_pref	Text preferences such as LEXER and WORDLIST specification.

Usage Notes

- This procedure adds an elementary attribute to an attribute set. If the attribute set was originally created from an existing object type, then additional attributes cannot be added.
- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or

more table alias attributes cannot be created from an existing object type. For more information about table aliases, see Appendix A in *Oracle Database Rules Manager and Expression Filter Developer's Guide.*

- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- The default value specification for an attribute is similar to a default value specification for a table column. The resulting default values should agree with the datatype of the attribute. For example, valid default values for an attribute of `DATE` datatype are `SYSDATE` and `to_date('01-01-2004','DD-MM-YYYY')`.
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ATTRIBUTES`.
- This procedure with a text preference bound to the `text_pref` argument creates a text attribute in the attribute set. The data type for such an attribute should be a VARCHAR2 or a CLOB. The preferences specified with this procedure are validated only when an Expression Filter index is created using this attribute set.
- These preferences are used in the creation of the CTXRULE index that processes the predicates involving CONTAINS operator. The valid preferences are those that are valid in the PARAMETERS clause of CTXRULE index creation. See *Oracle Text Application Developer's Guide* for the syntax.

Examples

The following commands add two elementary attributes to an attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                              attr_set   => 'HRAttrSet',
                              attr_name  => 'HRREP',
                              attr_type  => 'VARCHAR2(30)'
                              attr_defv1 => 'Betty Smith');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                              attr_set  => 'HRAttrSet',
                              attr_name => 'DEPT',
                              tab_alias => exf$table_alias('DEPT'));
END;
/
```

The following commands define a CreationTime elementary attribute that takes the database time as the default value.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                         attr_set   => 'PurchaseOrder',
                         attr_name  => 'CreationTime',
                         attr_type  => 'DATE',
                         attr_defvl => 'SYSDATE');
END;
/
```

Alternately, the following commands initialize the CreationTime attribute to a specific value when it is not explicitly specified in the data item passed to the EVALUATE operator.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
```

```
                        attr_set   => 'PurchaseOrder',
                        attr_name  => 'CreationTime',
                        attr_type  => 'DATE',
                        attr_defvl => 'to_date(''01-01-2004'',''DD-MM-YYYY'')');
END;
/
```

The following commands create an attribute set with a Model attribute of VARCHAR2 data type and an InsReport attribute configured for text predicates.

```
BEGIN
   DBMS_EXPFIL.CREATE_EVENT_STRUT(event_struct => 'Car4Sale');
   // create scalar attributes
   DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                     attr_set  => 'Car4Sale',
                     attr_name => 'Model',
                     attr_type => 'VARCHAR2(30)');

   //create text attribute
   DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                     attr_set  => 'Car4Sale',
                     attr_name => 'InsReport',
                     attr_type => 'CLOB',
                     attr_type => exf$text(
                                  'LEXER insrpt_lexer
                                   WORDLIST insrpt_wordlist'));
END;
/
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the attribute set.

Syntax

```
DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   IN   VARCHAR2,
   funcs_name IN   VARCHAR2);
```

Parameters

Table 53–3 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle supplied SQL functions for use by the expression set. If the expression set refers to a user-defined function, the function must be explicitly added to the attribute set.
- The ADD_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list. The function added to the attribute set, and thus used in the stored expressions, should not perform any DML or DDL (database state changing) operations. Any violations to this rule will only be caught at run-time while evaluating the expressions (this implies that this will not be checked during the ADD_FUNCTIONS procedure call).
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the expression set are considered valid. The expressions in a set can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See "Defining Attribute Sets"in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding functions to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following commands add two functions to the attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   => 'Car4Sale',
   funcs_name => 'HorsePower');
  DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   => 'Car4Sale',
   funcs_name => 'Scott.CrashTestRating');
```

```
END;
/
```

ASSIGN_ATTRIBUTE_SET Procedure

This procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column.

Syntax

```
DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2,
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   force      IN   VARCHAR2 DEFAULT 'FALSE');
```

Parameters

Table 53–4 ASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
force	Argument used to trust the existing expressions in a table (and skip validation)

Usage Notes

- The ASSIGN_ATTRIBUTE_SET procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column. The attribute set contains the elementary attribute names and their datatypes and any functions used in the expressions. The attribute set is used by the Expression column to validate changes and additions to the expression set.
- An attribute set can be assigned only to a table column in the same schema as the attribute set. An attribute set can be assigned to one or more table columns. Assigning an attribute set to a column storing expressions implicitly creates methods for the associated object type. For this operation to succeed, the object type cannot have any dependent objects before the attribute set is assigned.
- By default, the column should not have any expressions at the time of association. However, if the values in the column are known to be valid expressions, you can use a value of 'TRUE' for the force argument to assign the attribute set to a column containing expressions.
- See "Defining Expression Columns" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following command assigns the attribute set to a column storing expressions. The expression set should be empty at the time of association.

```
BEGIN
  DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (attr_set => 'Car4Sale',
                                    expr_tab => 'Consumer',
```

```
                                        expr_col => 'Interest');
END;
/
```

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates the exception table, used in validation, in the current schema.

Syntax

```
DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (
   exception_tab IN VARCHAR2);
```

Parameters

Table 53–5 BUILD_EXCEPTIONS_TABLE Procedure Parameter

Parameter	Description
exception_tab	Name of the exception table

Usage Notes

- The expressions stored in a table column can be validated using the VALIDATE_EXPRESSIONS procedure. During expression validation, you can optionally provide the name of the exception table in which the references to the invalid expressions are stored. The BUILD_EXCEPTIONS_TABLE procedure creates the exception table in the current schema.
- See "Evaluation Semantics" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and VALIDATE_EXPRESSIONS Procedure in this chapter for more information.
- Related view: USER_TABLES

Examples

The following command creates the exception table, InterestExceptions, in the current schema:

```
BEGIN
  DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (
                              exception_tab => 'InterestExceptions');
END;
/
```

CLEAR_EXPRSET_STATS Procedure

This procedure clears the predicate statistics for the expression set stored in a table column.

Syntax

```
DBMS_EXPFIL.CLEAR_EXPRSET_STATS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 53–6 CLEAR_EXPRSET_STATS Procedure Parameters

Parameter	Description
`expr_tab`	Name of table storing the expression set
`expr_col`	Name of column in the table that stores the expressions

Usage Notes

- This procedure clears the predicate statistics for the expression set stored in a table column. See also GET_EXPRSET_STATS Procedure in this chapter for information about gathering the statistics.
- Related views: `USER_EXPFIL_EXPRESSION_SETS` and `USER_EXPFIL_EXPRSET_STATS`

Examples

The following command clears the predicate statistics for the expression set stored in `Interest` column of the `Consumer` table:

```
BEGIN
  DBMS_EXPFIL.CLEAR_EXPRSET_STATS (expr_tab => 'Consumer',
                                   expr_col => 'Interest');
END;
/
```

COPY_ATTRIBUTE_SET Procedure

This procedure copies an attribute set along with its user-defined function list and default index parameters to another set.

Syntax

```
DBMS_EXPFIL.COPY_ATTRIBUTE_SET (
   from_set   IN   VARCHAR2,
   to_set     IN   VARCHAR2);
```

Parameters

Table 53–7 COPY_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
from_set	Name of an existing attribute set to be copied
to_set	Name of the new attribute set

Usage Notes

- A schema-extended name can be used for the from_set argument to copy an attribute set across schemas. The user issuing the command must have EXECUTE privileges for the object type associated with the original attribute set. The user must ensure that any references to schema objects (user-defined functions, tables, and embedded objects) are valid in the new schema.
- The default index parameters and the user-defined function list of the new set can be changed independent of the original set.
- Related views: ALL_EXPFIL_ATTRIBUTE_SETS and ALL_EXPFIL_ATTRIBUTES.

Examples

The following command makes a copy of the Car4Sale attribute set:

```
BEGIN
  DBMS_EXPFIL.COPY_ATTRIBUTE_SET (from_set => 'Car4Sale',
                                  to_set   => 'Vehicle');
END;
/
```

CREATE_ATTRIBUTE_SET Procedure

This procedure creates an empty attribute set or an attribute set with a complete set of elementary attributes derived from an object type with a matching name.

Syntax

```
DBMS_EXPFIL.CREATE_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2,
   from_type  IN   VARCHAR2 DEFAULT 'NO');
```

Parameters

Table 53–8 CREATE_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to be created
from_type	YES, if the attributes for the attribute set should be derived from an existing object type

Usage Notes

- The object type used for an attribute set cannot contain any user methods, and it should not be an evolved type (with the use of ALTER TYPE command). This object type should not have any dependent objects at the time of the attribute set creation. If the attribute set is not derived from an existing object type, this procedure creates an object type with a matching name.
- An attribute set with one or more table alias attributes cannot be derived from an object type. For this purpose, create an empty attribute set and add one elementary attribute at a time using the DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE procedure. (See Appendix A in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.)
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and ADD_ELEMENTARY_ATTRIBUTE Procedures in this chapter for more information.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ATTRIBUTES.

Examples

The following commands create an attribute set with all the required elementary attributes derived from the Car4Sale type:

```
CREATE OR REPLACE TYPE Car4Sale AS OBJECT
                                  (Model   VARCHAR2(20),
                                   Year    NUMBER,
                                   Price   NUMBER,
                                   Mileage NUMBER);
/

BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set  => 'Car4Sale',
                                  from_type => 'YES');
END;
/
```

Assuming that the `Car4Sale` type does not exist, the attribute set can be created from scratch as shown in the following example:

```
BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Model',
                               attr_type => 'VARCHAR2(20)');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Year',
                               attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Price',
                               attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Mileage',
                               attr_type => 'NUMBER');
END;
/
```

DEFAULT_INDEX_PARAMETERS Procedure

This procedure assigns default index parameters to an attribute set. It also adds or drops a partial list of stored and indexed attributes to or from the default list associated with the attribute list.

Syntax

```
DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
   attr_set   IN   VARCHAR2,
   attr_list  IN   EXF$ATTRIBUTE_LIST,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 53–9 DEFAULT_INDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
attr_list	An instance of EXF$ATTRIBUTE_LIST with a partial list of (default) stored and indexed attributes for an Expression Filter index
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- Existing Expression Filter indexes are not modified when the default parameters for the corresponding attribute set are changed. The new index defaults are used when a new Expression Filter index is created and when an existing index is rebuilt. (See "Alter Index Rebuild" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about rebuilding indexes.)
- See "Creating an Index from Default Parameters" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about assigning default index parameters to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following command adds the specified stored and indexed attributes to the attribute set's default index parameters list:

```
BEGIN
 DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERs(
    attr_set  => 'Car4Sale',
    attr_list => exf$attribute_list (
       exf$attribute (attr_name => 'Model',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'Price',
                      attr_oper => exf$indexoper('all'),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'HorsePower(Model, Year)',
                      attr_oper => exf$indexoper('=','<','>','>=','<='),
                      attr_indexed => 'FALSE'),
       exf$attribute (attr_name => 'CrashTestRating(Model, Year)',
```

```
                    attr_oper => exf$indexoper('=','<','>','>=','<='),
                    attr_indexed => 'FALSE')),
    operation => 'ADD');
END;
/
```

The following command drops the `CrashTestRating(Model, Year)` attribute (stored or indexed) from the previous list.

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS(
      attr_set  => 'Car4Sale',
      attr_list => exf$attribute_list (
         exf$attribute (attr_name => 'CrashTestRating(Model, Year)')),
      operation => 'DROP');
END;
/
```

DEFAULT_XPINDEX_PARAMETERS Procedure

This procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set.

Syntax

```
DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS (
   attr_set   IN   VARCHAR2,
   xmlt_attr  IN   VARCHAR2,
   xptag_list IN   EXF$XPATH_TAGS,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 53–10 DEFAULT_XPINDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
xmlt_attr	Name of the attribute with the XMLType datatype
xptag_list	An instance of EXF$XPATH_TAGS type with a partial list of XML elements and attributes to be configured for the Expression Filter index
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- The attribute set used for an expression set may have one or more XML type attributes (defined with XMLType datatype) and the corresponding expressions may contain XPath predicates on these attributes. The Expression Filter index created for the expression set can be tuned to process these XPath predicates efficiently by using some XPath-specific index parameters (in addition to some non-XPath index parameters).
- The DEFAULT_XPINDEX_PARAMETERS procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set. The XPath parameters are assigned to a specific XMLType attribute in the attribute set and this information can be viewed using the USER_EXPFIL_DEF_INDEX_PARAMS view. The DEFAULT_INDEX_PARAMETERS procedure and the DEFAULT_XPINDEX_PARAMETERS procedure can be used independent of each other. They maintain a common list of default index parameters for the attribute set.
- See "Index Tuning for XPath Predicates"in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about XPath parameters to the default index parameters of an attribute set. See also DEFAULT_INDEX_PARAMETERS Procedure in this chapter for more information about default index parameters.
- Related views: USER_EXPFIL_ATTRIBUTES and USER_EXPFIL_DEF_INDEX_PARAMS.

> **Note:** The values assigned to the tag_name argument of exf$xpath_tag type are case sensitive.

Examples

The following command adds the specified XML tags to the default index parameters list along with their preferences such as positional or value filter and indexed or stored predicate group:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
       attr_set   => 'Car4Sale',
       xmlt_attr  => 'Details',
       xptag_list =>                                    --- XPath tag list
         exf$xpath_tags(
           exf$xpath_tag(tag_name    => 'stereo@make',  --- XML attribute
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(15)'), --- value filter
           exf$xpath_tag(tag_name    => 'stereo',       --- XML element
                         tag_indexed => 'FALSE',
                         tag_type    => null),          --- positional filter
           exf$xpath_tag(tag_name    => 'memory',       --- XML element
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(10)'), --- value filter
           exf$xpath_tag(tag_name    => 'GPS',
                         tag_indexed => 'TRUE',
                         tag_type    => null)
         )
        );
END;
/
```

The following command drops the `stereo@make` tag from the default index parameters:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
       attr_set   => 'Car4Sale',
       xmlt_attr  => 'Details',
       xptag_list =>                                    --- XPath tag list
         exf$xpath_tags(
           exf$xpath_tag(tag_name    => 'stereo@make')
         ),
       operation => 'DROP'
       );
END;
/
```

DEFRAG_INDEX Procedure

This procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.

Syntax

```
DBMS_EXPFIL.DEFRAG_INDEX (
   idx_name   IN  VARCHAR2);
```

Parameters

Table 53–11 DEFRAG_INDEX Procedure Parameter

Parameter	Description
idx_name	Name of the Expression Filter index

Usage Notes

- The bitmap indexes defined for the indexed attributes of an Expression Filter index become fragmented as additions and updates are made to the expression set. The DEFRAG_INDEX procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.
- Indexes can be defragmented when the expression set is being modified. However, you should schedule defragmentation when the workload is relatively light.
- See "Index Storage and Maintenance" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about rebuilding indexes.
- Related views: USER_EXPFIL_INDEXES and USER_INDEXES.

Examples

The following command is issued to defragment the bitmap indexes associated with the Expression Filter index:

```
BEGIN
  DBMS_EXPFIL.DEFRAG_INDEX (idx_name => 'InterestIndex');
END;
/
```

DROP_ATTRIBUTE_SET Procedure

This procedure drops an attribute set not being used for any expression set.

Syntax

```
DBMS_EXPFIL.DROP_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2);
```

Parameters

Table 53–12 DROP_ATTRIBUTE_SET Procedure Parameter

Parameter	Description
attr_set	Name of the attribute set to be dropped

Usage Notes

- The DROP_ATTRIBUTE_SET procedure drops an attribute set not being used for any expression set. If the attribute set was initially created from an existing object type, the object type remains after dropping the attribute set. Otherwise, the object type is dropped with the attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS.

Examples

Assuming that the attribute set is not used by an Expression column, the following command drops the attribute set:

```
BEGIN
  DBMS_EXPFIL.DROP_ATTRIBUTE_SET(attr_set => 'Car4Sale');
END;
/
```

GET_EXPRSET_STATS Procedure

This procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.

Syntax

```
DBMS_EXPFIL.GET_EXPRSET_STATS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 53–13 GET_EXPRSET_STATS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

Usage Notes

- When a representative set of expressions are stored in a table column, you can use predicate statistics for those expressions to configure the corresponding Expression Filter index (using the TOP parameters clause). The GET_EXPRSET_STATS procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.
- See "Creating an Index from Statistics"in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about using predicate statistics.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_EXPRSET_STATS.

Examples

The following command computes the predicate statistics for the expressions stored in the Interest column of the Consumer table:

```
BEGIN
  DBMS_EXPFIL.GET_EXPRSET_STATS (expr_tab => 'Consumer',
                                 expr_col => 'Interest');
END;
/
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on one or more Expression columns to other users.

Syntax

```
DBMS_EXPFIL.GRANT_PRIVILEGE (
   expr_tab   IN  VARCHAR2,
   expr_col   IN  VARCHAR2,
   priv_type  IN  VARCHAR2,
   to_user    IN  VARCHAR2);
```

Parameters

Table 53–14 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
priv_type	Type of the privilege to be granted. Valid values: INSERT EXPRESSION, UPDATE EXPRESSION, ALL.
to_user	User to whom the privilege is to be granted

Usage Notes

- The SQL EVALUATE operator evaluates expressions with the privileges of the owner of the table that stores the expressions. The privileges of the user issuing the query are not considered. The owner of the table can insert, update, and delete expressions. Other users must have INSERT and UPDATE privileges for the table and INSERT EXPRESSION and UPDATE EXPRESSION privilege for a specific Expression column in the table.
- Using the GRANT_PRIVILEGE procedure, the owner of the table can grant INSERT EXPRESSION or UPDATE EXPRESSION privileges on one or more Expression columns to other users. Both the privileges can be granted to a user by specifying ALL for the privilege type.
- See REVOKE_PRIVILEGE Procedure in this chapter and "Granting and Revoking Privileges" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The owner of Consumer table can grant INSERT EXPRESSION privileges to user SCOTT with the following command. User SCOTT should also have INSERT privileges on the table so that he can add new expressions to the set.

```
BEGIN
  DBMS_EXPFIL.GRANT_PRIVILEGE (expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               priv_type => 'INSERT EXPRESSION',
                               to_user   => 'SCOTT');
END;
```

INDEX_PARAMETERS Procedure

This procedure fine-tunes the index parameters for each expression set before index creation.

Syntax

```
DBMS_EXPFIL.INDEX_PARAMETERS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   attr_list  IN   EXF$ATTRIBUTE_LIST,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 53–15 INDEX_PARAMETERS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions.
attr_list	An instance of EXF$ATTRIBUTE_LIST with a partial list of stored and indexed attributes
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- An attribute set can be used by multiple expression sets stored in different columns of user tables. By default, the index parameters associated with the attribute set are used to define an Expression Filter index on an expression set. If you need to fine-tune the index for each expression set, you can specify a small list of the index parameters in the PARAMETERS clause of the CREATE INDEX statement. However, when an Expression Filter index uses a large number of index parameters or if the index is configured for XPath predicates, fine-tuning the parameters with the CREATE INDEX statement is not possible.
- The INDEX_PARAMETERS procedure fine-tunes the index parameters for each expression set before index creation. This procedure can be used to copy the defaults from the corresponding attribute set and selectively add (or drop) additional index parameters for the expression set. (You use the XPINDEX_PARAMETERS procedure to add and drop XPath index parameters.) The Expression Filter index defined for an expression set with a non-empty list of index parameters always uses these parameters. The INDEX_PARAMETERS procedure cannot be used when the Expression Filter index is already defined for the column storing expressions.
- The operations allowed with this procedure include:
  - Deriving the current list of default index parameters (including any XPath-specific parameters) from the corresponding attribute set and assigning them to the specified expression set (a value of DEFAULT for the operation argument).
  - Adding (or dropping) one or more attributes to (or from) the current list of parameters assigned to the expression set (values of ADD or DROP for the operation argument).

– Clearing the index parameters assigned to the expression set. This enables the user to start using default parameters or tune the parameters from scratch (a value of CLEAR for the operation argument).

Note: This procedure is useful only when an attribute set is shared across multiple expression sets. In all other cases, the defaults assigned to the attribute set can be tuned for the expression set using it.

- See "Creating an Index from Exact Parameters" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and XPINDEX_PARAMETERS Procedure in this chapter for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_DEF_INDEX_PARAMS and USER_EXPFIL_INDEX_PARAMS.

Examples

The following command synchronizes the expression set's index parameters with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               attr_list => null,
                               operation => 'DEFAULT');
END;
/
```

The following command adds a stored attribute to the expression set's index parameters.

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               attr_list =>
                                exf$attribute_list (
                                 exf$attribute (
                                   attr_name => 'CrashTestRating(Model, Year)',
                                   attr_oper => exf$indexoper('all'),
                                   attr_indexed => 'FALSE')),
                               operation => 'ADD');
END;
/
```

The following command clears the index parameters associated with the expression set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               attr_list => null,
                               operation => 'CLEAR');
END;
/
```

A subsequent index creation will use the default index parameters assigned to the corresponding attribute set.

MODIFY_OPERATOR_LIST Procedure

This procedure modifies the list of common operators associated with a certain attribute in the attribute set.

Syntax

```
DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   attr_oper  IN   EXF$INDEXOPER);
```

Parameters

Table 53–16 MODIFY_OPERATOR_LIST Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
attr_name	Name of the stored or indexed attribute being modified
attr_oper	New list of operators that are frequently used in the predicates with the attribute

Usage Notes

- The MODIFY_OPERATOR_LIST procedure modifies the operator list for the stored and indexed attributes defined in the attribute set's default index parameters. Existing Expression Filter indexes are not affected when an attribute's operator list is modified. The updated index defaults are used when a new Expression Filter index is created or when an existing index is rebuilt.
- Related views: USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following command modifies the operator list associated with the HorsePower(Model,Year) attribute defined in the Car4Sale attribute set.

```
BEGIN
  DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
    attr_set => 'Car4Sale',
    attr_name => 'HorsePower(Model, Year)',
    attr_oper => exf$indexoper('=','<','>', 'between'));
END;
/
```

REVOKE_PRIVILEGE Procedure

This procedure revokes an expression privilege previously granted by the owner.

Syntax

```
DBMS_EXPFIL.REVOKE_PRIVILEGE (
   expr_tab   IN  VARCHAR2,
   expr_col   IN  VARCHAR2,
   priv_type  IN  VARCHAR2,
   from_user  IN  VARCHAR2);
```

Parameters

Table 53–17 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
priv_type	Type of privilege to be revoked
from_user	User from whom the privilege is to be revoked

Usage Notes

- The REVOKE_PRIVILEGE procedure revokes an expression privilege previously granted by the owner.
- See GRANT_PRIVILEGE Procedure in this chapter and "Granting and Revoking Privileges" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The following command revokes the INSERT EXPRESSION privilege on the Interest column of the Consumer table from user SCOTT:

```
BEGIN
  DBMS_EXPFIL.REVOKE_PRIVILEGE (expr_tab  => 'Consumer',
                                 expr_col  => 'Interest',
                                 priv_type => 'INSERT EXPRESSION',
                                  from_user => 'SCOTT');
END;
/
```

SYNC_TEXT_INDEXES Procedure

This procedure synchronizes the indexes defined to process the predicates involving the CONTAINS operator in stored expressions.

Syntax

```
DBMS_EXPFIL.SYNC_TEXT_INDEXES (
     expr_tab   IN   VARCHAR2);
```

Parameters

Table 53–18 SYNC_TEXT_INDEXES Procedure Parameters

Parameter	Description
expr_tab	Name of table with expression columns containing text predicates

Usage Notes

- When an expression filter index is defined on a column storing expressions, any text predicates in the expressions are indexed using a CTXRULE index. Unlike the other types of indexes (bitmap for scalar and XML predicates or spatial for spatial predicates) used to process the predicates in the expression set, the CTXRULE index defined to process the text predicates is not transactional in nature. That is, when the text predicates are updated with DML operations on the table storing expressions, the new predicates are not automatically reflected in the corresponding CTXRULE index. This could result in inconsistent results until the CTXRULE index is synchronized. This procedure can be used to synchronize all the CTXRULE indexes associated with a table with one or more expression columns. This procedure identifies all the CTXRULE indexes and invokes the CTX_DDL.SYNC_INDEX procedure on each of these indexes.

  You must have EXECUTE privileges on the CTX_DDL package for successful synchronization of the text indexes.

Examples

The following command synchronizes the text indexes associated with the expression columns in the CONSUMER table:

```
BEGIN
  DBMS_EXPFIL.SYNC_TEXT_INDEXES (expr_tab => 'Consumer');
END;
/
```

UNASSIGN_ATTRIBUTE_SET Procedure

This procedure unassigns an attribute set from a column storing expressions.

Syntax

```
DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 53–19 UNASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
`expr_tab`	Name of table storing the expression set
`expr_col`	Name of column in the table that stores the expressions

Usage Notes

- A column of an expression datatype can be converted back to a `VARCHAR2` type by unassigning the attribute set. You can unassign an attribute set from a column storing expressions if an Expression Filter index is not defined on the column.
- See ASSIGN_ATTRIBUTE_SET Procedure in this chapter for information about assigning attribute sets.
- Related views: `USER_EXPFIL_EXPRESSION_SETS` and `USER_EXPFIL_INDEXES`.

Examples

The following command unassigns the attribute set previously assigned to the `Interest` column of the `Consumer` table. (See "Bulk Loading of Expression Data" in *Oracle Database Rules Manager and Expression Filter Developer's Guide*.)

```
BEGIN
  DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (expr_tab => 'Consumer',
                                      expr_col => 'Interest');
END;
/
```

VALIDATE_EXPRESSIONS Procedure

This procedure validates all the expressions in a set.

Syntax

```
DBMS_EXPFIL.VALIDATE_EXPRESSIONS (
   expr_tab      IN  VARCHAR2,
   expr_col      IN  VARCHAR2,
   exception_tab IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53–20 VALIDATE_EXPRESSIONS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
exception_tab	Name of the exception table. This table is created using the BUILD_EXCEPTIONS_TABLE procedure.

Usage Notes

- The expressions stored in a table may have references to schema objects like user-defined functions and tables. When these schema objects are dropped or modified, the expressions could become invalid and the subsequent evaluation (query with EVALUATE operator) could fail.
- The VALIDATE_EXPRESSIONS procedure validates all the expressions in a set. By default, the expression validation utility fails on the first expression that is invalid. Optionally, the caller can pass an exception table to store references to all the invalid expressions. In addition to validating expressions in the set, this procedure validates the parameters (stored and indexed attributes) of the associated index and the approved list of user-defined functions. Any errors in the index parameters or the user-defined function list are immediately reported to the caller.
- See "Evaluation Semantics" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and BUILD_EXCEPTIONS_TABLE Procedure in this chapter for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_ASET_FUNCTIONS, and USER_EXPFIL_PREDTAB_ATTRIBUTES.

Examples

The following command validates the expressions stored in the Interest column of the Consumer table.

```
BEGIN
  DBMS_EXPFIL.VALIDATE_EXPRESSIONS (expr_tab => 'Consumer',
                                    expr_col => 'Interest');
END;
/
```

XPINDEX_PARAMETERS Procedure

This procedure is used in conjunction with the INDEX_PARAMETERS procedure to fine-tune the XPath-specific index parameters for each expression set.

Syntax

```
DBMS_EXPFIL.XPINDEX_PARAMETERS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   xmlt_attr  IN   VARCHAR2,
   xptag_list IN   EXF$XPATH_TAGS,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 53–21 XPINDEX_PARAMETERS Procedure Parameters

Parameter	Description
exp_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
xmlt_attr	Name of the attribute with the XMLType datatype
xptag_list	An instance of EXF$XPATH_TAGS type with a partial list of XML elements and attributes
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- When an attribute set is shared by multiple expression sets, the INDEX_PARAMETERS procedure can be used to tune the simple (non-XPath) index parameters for each expression set. The XPINDEX_PARAMETERS procedure is used in conjunction with the INDEX_PARAMETERS procedure to fine-tune the XPath-specific index parameters for each expression set.
- See also INDEX_PARAMETERS Procedure in this chapter and "Index Tuning for XPath Predicates" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.
- Related views: USER_EXPFIL_ATTRIBUTES, USER_EXPFIL_DEF_INDEX_PARAMS, and USER_EXPFIL_INDEX_PARAMS.

> **Note:** The values assigned to the tag_name argument of exf$xpath_tag type are case-sensitive.

Examples

The following command synchronizes the expression set's index parameters (XPath and non-XPath) with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               attr_list => null,
                               operation => 'DEFAULT');
```

```
END;
/
```

The following command adds an XPath-specific index parameter to the expression set:

```
BEGIN
  DBMS_EXPFIL.XPINDEX_PARAMETERS(expr_tab   => 'Consumer',
                                 expr_col   => 'Interest',
                                 xmlt_attr  => 'Details',
                                 xptag_list =>
                                  exf$xpath_tags(
                                    exf$xpath_tag(tag_name    => 'GPS',
                                                  tag_indexed => 'TRUE',
                                                  tag_type    => NULL)),
                                 operation  => 'ADD');
END;
/
```

54

DBMS_FGA

The `DBMS_FGA` package provides fine-grained security functions.

This chapter contains the following topics:

- Using DBMS_FGA
  - Security Model
  - Operational Notes
- Summary of DBMS_FGA Subprograms

Using DBMS_FGA

- Security Model
- Operational Notes

Security Model

Execute privilege on `DBMS_FGA` is needed for administering audit policies. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module will be executed with the module owner's privilege.

Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering. For both the rule-based optimizer and the cost-based optimizer, you can refer to `DBA_FGA_AUDIT_TRAIL` to analyze the SQL text and corresponding bind variables that are issued.

Summary of DBMS_FGA Subprograms

Table 54–1 DBMS_FGA Package Subprograms

Subprogram	Description
ADD_POLICY Procedure on page 54-6	Creates an audit policy using the supplied predicate as the audit condition
DISABLE_POLICY Procedure on page 54-11	Disables an audit policy
DROP_POLICY Procedure on page 54-12	Drops an audit policy
ENABLE_POLICY Procedure on page 54-13	Enables an audit policy

ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition. The maximum number of FGA policies on any table or view object is 256.

Syntax

```
DBMS_FGA.ADD_POLICY(
   object_schema      VARCHAR2,
   object_name        VARCHAR2,
   policy_name        VARCHAR2,
   audit_condition    VARCHAR2,
   audit_column       VARCHAR2,
   handler_schema     VARCHAR2,
   handler_module     VARCHAR2,
   enable             BOOLEAN,
   statement_types    VARCHAR2,
   audit_trail        BINARY_INTEGER IN DEFAULT,
   audit_column_opts  BINARY_INTEGER IN DEFAULT);
```

Parameters

Table 54–2 ADD_POLICY Procedure Parameters

Parameter	Description	Default Value
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)	NULL
object_name	The name of the object to be audited.	-
policy_name	The unique name of the policy.	-
audit_condition	A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.	NULL
audit_column	The columns to be checked for access. These can include OLS hidden columns or object type columns. The default, NULL, causes audit if any column is accessed or affected.	NULL
handler_schema	The schema that contains the event handler. The default, NULL, causes the current schema to be used.	NULL
handler_module	The function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.	NULL
enable	Enables the policy if TRUE, which is the default.	TRUE
statement_types	The SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only.	SELECT
audit_trail	Destination (DB or XML) of fine grained audit records. Also specifies whether to populate LSQLTEXT and LSQLBIND in fga_log$.	DB+EXTENDED
audit_column_opts	Establishes whether a statement is audited when the query references *any* column specified in the audit_column parameter or only when *all* such columns are referenced.	ANY_COLUMNS

Usage Notes

- If object_schema is not specified, the current log-on user schema is assumed.

- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's `audit_condition`. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)
- The `audit_condition` must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. This condition can be NULL (or omitted), which is interpreted as `TRUE`, but it cannot contain the following elements:
  - Subqueries or sequences
  - Any direct use of `SYSDATE, UID, USER or USERENV` functions. However, a user-defined function and other SQL functions can use these functions to return the desired information.
  - Any use of the pseudo columns `LEVEL, PRIOR, or ROWNUM`.

  Specifying an audit condition of "1=1" to force auditing of all specified statements ("`statement_types`") affecting the specified column ("`audit_column`") is no longer needed to achieve this purpose. `NULL` will cause audit even if no rows were processed, so that all actions on a table with this policy are audited.
- The audit function (`handler_module`) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

  ```
  PROCEDURE <fname> ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
  VARCHAR2 )  AS ...
  ```

  where `fname` is the name of the procedure, `object_schema` is the name of the schema of the table audited, `object_name` is the name of the table to be audited, and `policy_name` is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.
- The `audit_trail` parameter specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named `LSQLTEXT` and `LSQLBIND`):
  - If audit_trail includes XML, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an `AUDIT_FILE_DEST` statement in SQL. (The default `AUDIT_FILE_DEST` is `$ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump` on Unix-based systems, and `$ORACLE_BASE\admin\$DB_UNIQUE_NAME\adump` on Windows systems.)
  - If audit_trail includes DB instead, then the audit records are written to the `SYS.FGA_LOG$` table in the database.
  - If audit_trail includes `EXTENDED`, then the query's SQL Text and SQL Bind variable information are included in the audit trail.
  - For example:

  * Setting audit_trail to DBMS_FGA.DB sends the audit trail to the SYS.FGA_LOG$ table in the database and omits SQL Text and SQL Bind.
  * Setting audit_trail to DBMS_FGA.DB + DBMS_FGA.EXTENDED sends the audit trail to the SYS.FGA_LOG$ table in the database and includes SQL Text and SQL Bind.
  * Setting audit_trail to DBMS_FGA.XML writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.
  * Setting audit_trail to DBMS_FGA.XML + DBMS_FGA.EXTENDED writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

  The audit_trail parameter appears in the ALL_AUDIT_POLICIES view.

- You can change the operating system destination using the following command:

  ```
  ALTER SYSTEM SET AUDIT_FILE_DEST = '<New Directory>' DEFERRED
  ```

- On many platforms, XML audit files are named <process_name>_<processId>.xml, for example, ora_2111.xml, or s002_11.xml. On Windows, the XML audit files are named <process_name>_<ThreadId>.xml (or <process_name>_ProcessId>.xml if the process is not running as a thread).
- The audit_column_opts parameter establishes whether a statement is audited
  - when the query references *any* column specified in the audit_column parameter (audit_column_opts = DBMS_FGA.ANY_COLUMNS), or
  - only when *all* such columns are referenced (audit_column_opts = DBMS_FGA.ALL_COLUMNS).

  The default is DBMS_FGA.ANY_COLUMNS.

  The ALL_AUDIT_POLICIES view also shows audit_column_opts.
- When audit_column_opts is set to DBMS_FGA.ALL_COLUMNS, a SQL statement is audited only when all the columns mentioned in audit_column have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

  Also, all these columns must refer to a single table/view or alias.

  Thus, if a SQL statement selects the columns from different table aliases, the statement will not be audited.

V$XML_AUDIT_TRAIL View

The new values for the audit_trail parameter (XML and XML+EXTENDED) cause fine-grained auditing records to be written to operating system files in XML format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

A new dynamic view, V$XML_AUDIT_TRAIL, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an .xml extension) in the AUDIT_FILE_DEST directory to be parsed and presented in relational table format.

The DBA_COMMON_AUDIT_TRAIL view includes the contents of the V$XML_AUDIT_TRAIL dynamic view for standard and fine-grained audit records.

Since the audit XML files are stored in files with extension .xml on all platforms, the dynamic view presents audit information similarly on all platforms, using the following schema:

Table 54–3 Elements in the V$XML_AUDIT_TRAIL Dynamic View

Element	Type
AUDIT_TYPE	VARCHAR2(18)
SESSION_ID	NUMBER
PROXY_SESSIONID	NUMBER
STATEMENTID	NUMBER
ENTRYID	NUMBER
EXTENDED_TIMESTAMP	TIMESTAMP(6) WITH TIME ZONE
GLOBAL_UID	VARCHAR2(32)
DB_USER	VARCHAR2(30)
CLIENT_ID	VARCHAR2(64)
EXT_NAME	VARCHAR2(4000)
OS_USER	VARCHAR2(255)
USERHOST	VARCHAR2(128)
OS_PROCESS	VARCHAR2(16)
TERMINAL	VARCHAR2(255)
INSTANCE_NUMBER	NUMBER
OBJECT_SCHEMA	VARCHAR2(30)
OBJECT_NAME	VARCHAR2(128)
POLICY_NAME	VARCHAR2(30)
STATEMENT_TYPE	VARCHAR2(28)
TRANSACTIONID	RAW(8)
SCN	NUMBER
COMMENT_TEXT	VARCHAR2(4000)
SQL_BIND	VARCHAR2(4000)
SQL_TEXT	VARCHAR2(4000)

Usage Notes

- Every XML audit record contains the elements AUDIT_TYPE and EXTENDED_TIMESTAMP, with the latter printed in UTC zone (with no timezone information). Values retrieved using V$XML_AUDIT_TRAIL view are converted to session timezone and printed.
- For SQL_TEXT and SQL_BIND element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such SQL_TEXT and SQL_BIND values.
- For large numbers of XML audit files, querying V$XML_AUDIT_TRAIL is faster when they are loaded into a database table using SQL*Loader or a similar tool. XML audit files are larger than the equivalent written to OS files when AUDIT_TRAIL=OS.

- Error handling is the same as when AUDIT_TRAIL=OS. If any error occurs in writing an audit record to disk, including the directory identified by AUDIT_FILE_DEST being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.

Examples

```
DBMS_FGA.ADD_POLICY (
   object_schema      =>  'scott',
   object_name        =>  'emp',
   policy_name        =>  'mypolicy1',
   audit_condition    =>  'sal < 100',
   audit_column       =>  'comm,sal',
   handler_schema     =>   NULL,
   handler_module     =>   NULL,
   enable             =>   TRUE,
   statement_types    =>  'INSERT, UPDATE',
   audit_trail        =>   DBMS_FGA.XML + DBMS_FGA.EXTENDED,
   audit_column_opts  =>   DBMS_FGA.ANY_COLUMNS);
```

DISABLE_POLICY Procedure

This procedure disables an audit policy.

Syntax

```
DBMS_FGA.DISABLE_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2 );
```

Parameters

Table 54–4 DISABLE_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

The default value for object_schema is NULL. (If NULL, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DISABLE_POLICY (
object_schema   =>  'scott',
object_name     =>  'emp',
policy_name     =>  'mypolicy1');
```

DROP_POLICY Procedure

This procedure drops an audit policy.

Syntax

```
DBMS_FGA.DROP_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2 );
```

Parameters

Table 54–5 DROP_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema of the object to be audited. (If `NULL`, the current log-on user schema is assumed.)
`object_name`	The name of the object to be audited.
`policy_name`	The unique name of the policy.

Usage Notes

The `DBMS_FGA` procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the `DBMS_FGA` procedures are part of the DDL transaction. The default value for object_schema is `NULL`. (If `NULL`, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DROP_POLICY (
object_schema   =>  'scott',
object_name     =>  'emp',
policy_name     =>  'mypolicy1');
```

ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```
DBMS_FGA.ENABLE_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2,
   enable         BOOLEAN);
```

Parameters

Table 54–6 ENABLE_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.
enable	Defaults to TRUE to enable the policy.

Examples

```
DBMS_FGA.ENABLE_POLICY (
object_schema    =>  'scott',
object_name      =>  'emp',
policy_name      =>  'mypolicy1',
enable           =>   TRUE);
```

55

DBMS_FILE_GROUP

The DBMS_FILE_GROUP package, one of a set of Oracle Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. This package can be used to create and manage file group repositories.

See Also: *Oracle Streams Concepts and Administration*

This chapter contains the following topics:

- Using DBMS_FILE_GROUP
  - Overview
  - Constants
- Summary of DBMS_FILE_GROUP Subprograms

Using DBMS_FILE_GROUP

This section contains topics which relate to using the `DBMS_FILE_GROUP` package.

- Overview
- Constants

Overview

The following terms pertain to the DBMS_FILE_GROUP package:

File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is expdat.dmp.
- The directory object that contains the file is db_files.
- The file type is DBMS_FILE_GROUP.EXPORT_DUMP_FILE.

Version

A **version** is a collection of related files. For example, a version might consist of a set of datafiles and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

File Group

A **file group** is a collection of versions. A file group can be used to logically group a set of versions. For example, a file group named financial_quarters can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as Q1FY04, Q2FY04, and so on.

Constants

The DBMS_FILE_GROUP package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_FILE_GROUP.EXPORT_DUMP_FILE.

Table 55–1 lists the parameters and enumerated constants.

Table 55–1 DBMS_FILE_GROUP Parameters with Enumerated Constants

Parameter	Option	Type	Description
file_type new_file_type	■ DATAFILE ■ EXPORT_DUMP_FILE ■ DATAPUMP_LOG_FILE	VARCHAR2(30)	DATAFILE is a datafile for a database. This constant can be specified as 'DATAFILE'. EXPORT_DUMP_FILE is a Data Pump export dump file. This constant can be specified as 'DUMPSET'. DATAPUMP_LOG_FILE is a Data Pump export log file. This constant can be specified as 'DATAPUMPLOG'.
max_versions retention_days	■ INFINITE	NUMBER	INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit.
privilege	System privilege specified in the GRANT_SYSTEM_PRIVILEGE procedure: ■ READ_ANY_FILE_GROUP ■ MANAGE_ANY_FILE_GROUP ■ MANAGE_FILE_GROUP Object privilege specified in the GRANT_OBJECT_PRIVILEGE procedure: ■ READ_ON_FILE_GROUP ■ MANAGE_ON_FILE_GROUP	BINARY_INTEGER	READ_ANY_FILE_GROUP grants the privilege to view information about any file group in any schema in the data dictionary. MANAGE_ANY_FILE_GROUP grants the privilege to create, manage, and drop any file group in any schema. MANAGE_FILE_GROUP grants the privilege to create, manage, and drop file groups in the user's schema. READ_ON_FILE_GROUP grants the privilege to view information about a specific file group in the data dictionary. MANAGE_ON_FILE_GROUP grants the privilege to manage a specific file group in a schema other than the user's schema.

Summary of DBMS_FILE_GROUP Subprograms

Table 55–2 DBMS_FILE_GROUP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 55-6	Adds a file to a version of a file group
ALTER_FILE Procedure on page 55-8	Alters a file in a version of a file group
ALTER_FILE_GROUP Procedure on page 55-10	Alters a file group
ALTER_VERSION Procedure on page 55-12	Alters a version of a file group
CREATE_FILE_GROUP Procedure on page 55-14	Creates a file group
CREATE_VERSION Procedure on page 55-16	Creates a version of a file group
DROP_FILE_GROUP Procedure on page 55-17	Drops a file group
DROP_VERSION Procedure on page 55-18	Drops a version of a file group
GRANT_OBJECT_PRIVILEGE Procedure on page 55-19	Grants object privileges on a file group to a user
GRANT_SYSTEM_PRIVILEGE Procedure on page 55-20	Grants system privileges for file group operations to a user
PURGE_FILE_GROUP Procedure on page 55-21	Purges a file group using the file group's retention policy
REMOVE_FILE Procedure on page 55-22	Removes a file from a version of a file group
REVOKE_OBJECT_PRIVILEGE Procedure on page 55-23	Revokes object privileges on a file group from a user
REVOKE_SYSTEM_PRIVILEGE Procedure on page 55-24	Revokes system privileges for file group operations from a user

Note: All subprograms commit unless specified otherwise.

ADD_FILE Procedure

This procedure adds a file to a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ADD_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  file_type        IN  VARCHAR2  DEFAULT NULL,
  file_directory   IN  VARCHAR2  DEFAULT NULL,
  version_name     IN  VARCHAR2  DEFAULT NULL,
  comments         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 55–3 ADD_FILE Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group that contains the version, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`file_name`	The name of the file being added to the version. Each file name in a version must be unique.

`file_type`	The file type. The following are reserved file types:
	■ If the file is a datafile, then enter the following:
	`'DATAFILE'`
	■ If the file is a Data Pump export dump file, then enter the following:
	`'DUMPSET'`
	Data Pump metadata is populated when a Data Pump export dump file is imported.
	■ If the file is a Data Pump export log file, then enter the following:
	`'DATAPUMPLOG'`
	If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify `NULL` to omit a file type description.
	See "Constants" on page 55-4 for more information about the reserved file types.

`file_directory`	The name of the directory object that corresponds to the directory containing the file. If `NULL`, then the procedure uses the default directory object for the version. If `NULL` and no default directory object exists for the version, then the procedure uses the default directory object for the file group. If `NULL` and no default directory object exists for the version or file group, then the procedure raises an error.

Table 55–3 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
version_name	The name of the version to which the file is added. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group. If NULL, then the procedure uses the version with the latest creation time for the file group.
comments	Comments about the file being added

Usage Notes

To run this procedure with either DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the file_type parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

> **See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE Procedure

This procedure alters a file in a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name     IN  VARCHAR2,
  file_name           IN  VARCHAR2,
  version_name        IN  VARCHAR2  DEFAULT NULL,
  new_file_name       IN  VARCHAR2  DEFAULT NULL,
  new_file_directory  IN  VARCHAR2  DEFAULT NULL,
  new_file_type       IN  VARCHAR2  DEFAULT NULL,
  remove_file_type    IN  VARCHAR2  DEFAULT 'N',
  new_comments        IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 55–4 ALTER_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
file_name	The name of the file being altered in the version
version_name	The name of the version that contains the file being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_file_name	The new name of the file if the file name is being changed. Each file name in a version must be unique. If NULL, then the procedure does not change the file name. **Note:** When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.
new_file_directory	The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed. If NULL, then the procedure does not change the directory object name. **Note:** When a non-NULL new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.

Table 55–4 (Cont.) ALTER_FILE Procedure Parameters

Parameter	Description
new_file_type	The file type. The following are reserved file types: ■ If the file is a datafile, then enter the following: 'DATAFILE' ■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' ■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG' If the file type is not one of the reserved file types, then enter a text description of the file type. If NULL, then the procedure does not change the file type. **See Also:** "Constants" on page 55-4 for more information about the reserved file types.
remove_file_type	If Y, then the procedure removes the file type. If Y and the new_file_type parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not remove the file type.
new_comments	New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments. If NULL, then the procedure does not change the existing comments.
remove_comments	If Y, then the procedure removes the comments for the file. If Y and the new_comments parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not change the existing comments.

Usage Notes

If the file type is changed to DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the new_file_type parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

> **See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE_GROUP Procedure

This procedure alters a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP(
  file_group_name           IN  VARCHAR2,
  keep_files                IN  VARCHAR2  DEFAULT NULL,
  min_versions              IN  NUMBER    DEFAULT NULL,
  max_versions              IN  NUMBER    DEFAULT NULL,
  retention_days            IN  NUMBER    DEFAULT NULL,
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 55–5 ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being altered, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. If NULL, then this parameter is not changed. **Note:** If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1. If NULL, then the procedure does not change the min_versions setting for the file group.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions. If NULL, then the procedure does not change the max_versions setting for the file group.

Table 55–5 (Cont.) ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can be used to specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist. If NULL, then the procedure does not change the retention_days setting for the file group.
new_default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory for the file group. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory for the file group.
new_comments	Comments about the file group. If non-NULL, then the new comments replace the existing comments for the file group. If NULL, then the procedure does not change the existing comments.
remove_comments	If Y, then the comments for the file group are removed. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not change the comments for the file group.

Usage Notes

If min_versions is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set min_versions to at least 2 if a version of the file group must be available at all times.

ALTER_VERSION Procedure

This procedure alters a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
  file_group_name           IN  VARCHAR2,
  version_name              IN  VARCHAR2  DEFAULT NULL,
  new_version_name          IN  VARCHAR2  DEFAULT NULL,
  remove_version_name       IN  VARCHAR2  DEFAULT 'N',
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 55–6 ALTER_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered. If '*' is specified, then the procedure alters all versions, and the new_version_name parameter must be NULL. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_version_name	The new name of the version. Do not specify a schema. The specified version name cannot be a positive integer or an asterisk ('*'). If NULL, then the procedure does not change the version name.
remove_version_name	If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the new_version_name parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the version name.
new_default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory.

Table 55–6 (Cont.) ALTER_VERSION Procedure Parameters

Parameter	Description
new_comments	Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.
remove_comments	If Y, then the procedure removes the comments for the version. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.

CREATE_FILE_GROUP Procedure

This procedure creates a file group.

Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP(
  file_group_name    IN  VARCHAR2,
  keep_files         IN  VARCHAR2  DEFAULT 'Y',
  min_versions       IN  NUMBER    DEFAULT 2,
  max_versions       IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days     IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory  IN  VARCHAR2  DEFAULT NULL,
  comments           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 55–7 CREATE_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. **Note:** If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions.
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can be used to specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist.
default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.
comments	Comments about the file group being created.

Usage Notes

If `min_versions` is set to `1`, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least `2` if a version of the file group must be available at all times.

CREATE_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the PURGE_FILE_GROUP procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the OUT parameter version_out, and the other does not.

See Also: "PURGE_FILE_GROUP Procedure" on page 55-21

Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name    IN  VARCHAR2,
  version_name       IN  VARCHAR2 DEFAULT NULL,
  default_directory  IN  VARCHAR2 DEFAULT NULL,
  comments           IN  VARCHAR2 DEFAULT NULL);

DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name    IN   VARCHAR2,
  version_name       IN   VARCHAR2 DEFAULT NULL,
  default_directory  IN   VARCHAR2 DEFAULT NULL,
  comments           IN   VARCHAR2 DEFAULT NULL,
  version_out        OUT  VARCHAR2);
```

Parameters

Table 55–8 CREATE_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group to which the new version is added, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk ('*').
default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added.
comments	Comments about the version being created
version_out	If the version_name parameter is set to a non-NULL value, then this parameter contains the specified version name. If the version_name parameter is set to NULL, then this parameter contains the generated version number.

DROP_FILE_GROUP Procedure

This procedure drops a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP(
  file_group_name  IN  VARCHAR2,
  keep_files       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 55–9 DROP_FILE_GROUP Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group being dropped, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`keep_files`	If `Y`, then the procedure retains the files in the file group on hard disk. If `N`, then the procedure deletes the files in the file group from hard disk. If `NULL`, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

DROP_VERSION Procedure

This procedure drops a version of a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  keep_files       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 55–10 DROP_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being dropped. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is dropped. If NULL, then the procedure uses the version with the oldest creation time for the file group. If '*', then the procedure drops all versions.
keep_files	If Y, then the procedure retains the files in the version on hard disk. If N, then the procedure deletes the files in the version from hard disk. If NULL, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name   IN  VARCHAR2,
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 55–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`object_name`	The name of the file group on which the privilege is granted, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`privilege`	The constant that specifies the privilege. See "Constants" on page 55-4 for valid privileges.
`grantee`	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
`grant_option`	If `TRUE`, then the specified user granted the specified privilege can grant this privilege to others. If `FALSE`, then the specified user granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

> **Note:** When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.
>
> If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object will allow access to any schema, including SYS. Set the O7_DICTIONARY_ACCESSIBILITY initialization parameter with caution.

Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 55–12 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The constant that specifies the privilege. See "Constants" on page 55-4 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

PURGE_FILE_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group except when purging a version will cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
  file_group_name  IN  VARCHAR2);
```

Parameter

Table 55–13 PURGE_FILE_GROUP Procedure Parameter

Parameter	Description
`file_group_name`	The name of the file group, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default. If `NULL` and this procedure is run by `SYS` user, then the procedure purges all file groups.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

REMOVE_FILE Procedure

This procedure removes a file from a version of a file group.

Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  keep_file        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 55–14 REMOVE_FILE Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group that contains the version, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`file_name`	The name of the file being removed from the version
`version_name`	The name of the version from which the file is removed. If a positive integer is specified as a `VARCHAR2` value, then the integer is interpreted as a version number. For example, if `'1'` is specified, then the file is removed from version 1 of the file group. If `NULL`, then the procedure uses the version with the latest creation time for the file group. If `'*'`, then the procedure removes the file from all versions.
`keep_file`	If `Y`, then the procedure retains the file on hard disk. If `N`, then the procedure deletes the file from hard disk. If `NULL`, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(
  object_name  IN  VARCHAR2,
  privilege    IN  BINARY_INTEGER,
  revokee      IN  VARCHAR2);
```

Parameters

Table 55–15 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`object_name`	The name of the file group on which the privilege is revoked, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`privilege`	The constant that specifies the privilege. See "Constants" on page 55-4 for valid privileges.
`revokee`	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(
  privilege  IN  BINARY_INTEGER,
  revokee    IN  VARCHAR2);
```

Parameters

Table 55–16 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The constant that specifies the privilege. See "Constants" on page 55-4 for valid privileges.
`revokee`	The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.

56

DBMS_FILE_TRANSFER

The DBMS_FILE_TRANSFER package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

See Also:

- *Oracle Database Administrator's Guide* for instructions about using file transfer
- *Oracle Streams Concepts and Administration* for applications of file transfer.

This chapter contains the following topic:

- Using DBMS_FILE_TRANSFER
  - Operating Notes
- Summary of DBMS_FILE_TRANSFER Subprograms

Using DBMS_FILE_TRANSFER

- Operating Notes

Operating Notes

Caution: DBMS_FILE_TRANSFER supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

If you want to use DBMS_FILE_TRANSFER for performing backups, note that you are implementing self-managed backups, and should therefore put the files in hot backup mode.

Summary of DBMS_FILE_TRANSFER Subprograms

Table 56–1 DBMS_FILE_TRANSFER Package Subprograms

Subprogram	Description
COPY_FILE Procedure on page 56-5	Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.
GET_FILE Procedure on page 56-7	Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM
PUT_FILE Procedure on page 56-9	Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system

COPY_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE(
   source_directory_object       IN  VARCHAR2,
   source_file_name              IN  VARCHAR2,
   destination_directory_object  IN  VARCHAR2,
   destination_file_name         IN  VARCHAR2);
```

Parameters

Table 56–2 COPY_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the CREATE DIRECTORY command).
source_file_name	The name of the file to copy. This file must exist in the source directory.
destination_directory_object	The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, +diskgroup1) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: +diskgroup1/dbs/control).
destination_file_name	The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM: ■ The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type) ■ The file type tag assigned to the file is COPY_FILE ■ The value of the destination_file_name argument becomes the file's alias name in the designated destination directory The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- `READ` privilege on the directory object specified in the `source_directory_object` parameter
- `WRITE` privilege on directory object specified in the `destination_directory_object` parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

> **See Also:** *Oracle Database Storage Administrator's Guide* for instructions about using file transfer

Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';

Directory created.

SQL>  BEGIN
   2    DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR','t_xdbtmp.f', 'DGROUP',
                                     't_xdbtmp.f');
   3  END;
   4  /

PL/SQL procedure successfully completed.

SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
   source_directory_object      IN  VARCHAR2,
   source_file_name             IN  VARCHAR2,
   source_database              IN  VARCHAR2,
   destination_directory_object IN  VARCHAR2,
   destination_file_name        IN  VARCHAR2);
```

Parameters

Table 56–3 GET_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.
source_database	The name of a database link to the remote database where the file is located.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.
destination_file_name	The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the source_directory_object parameter.
- The current user at the local database must have write privilege on the directory object specified in the destination_directory_object parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS ''^t_work^'';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- asumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
'a2back.dat' );

END ;
/
```

PUT_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.PUT_FILE(
   source_directory_object       IN  VARCHAR2,
   source_file_name              IN  VARCHAR2,
   destination_directory_object  IN  VARCHAR2,
   destination_file_name         IN  VARCHAR2,
   destination_database          IN  VARCHAR2);
```

Parameters

Table 56–4 PUT_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the local source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.
destination_file_name	The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.
destination_database	The name of a database link to the remote database to which the file is copied.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the source_directory_object parameter.
- The connected user at the destination database must have write privilege to the directory object specified in the destination_directory_object parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user;
Enter password: password

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
 DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                               'dbs2' ) ;
END ;
```

57

DBMS_FLASHBACK

Using DBMS_FLASHBACK, you can flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).

> **See Also:** For detailed information about DBMS_FLASHBACK:
>
> - *Oracle Database Advanced Application Developer's Guide*
> - *Oracle Database SQL Language Reference*.

This chapter contains the following topics:

- Using DBMS_FLASHBACK
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Operational Notes
  - Examples
- Summary of DBMS_FLASHBACK Subprograms

Using DBMS_FLASHBACK

- Overview
- Security Model
- Types
- Exceptions
- Operational Notes
- Examples

Overview

DBMS_FLASHBACK provides an interface for the user to view the database at a particular time in the past, with the additional capacity provided by transaction backout features that allow for selective removal of the effects of individual transactions. This should not be confused this with a flashback database which actually moves the database back in time.

When `DBMS_FLASHBACK` is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use `DBMS_FLASHBACK` for the following reasons:

- Self-service repair: If you accidentally delete rows from a table, you can recover the deleted rows.
- Packaged applications such as e-mail and voicemail: You can use Flashback to restore deleted e-mail by re-inserting the deleted message into the current message box.
- Decision support system (DSS) and online analytical processing (OLAP) applications: You can perform data analysis or data modeling to track seasonal demand.

Security Model

To use this package, a database administrator must grant `EXECUTE` privileges for `DBMS_FLASHBACK`.

Types

The following types are used by DBMS_FLASHBACK subprograms:

Table 57–1 DBMS_FLASHBACK

Type	Description
TXNAME_ARRAY	Creates a VARRAY for holding Transaction Names or Identifiers (XIDs

Exceptions

Table 57–2 DBMS_FLASHBACK Error Messages

Error	Description
ORA-08180	Time specified is too old.
ORA-08181	Invalid system change number specified.
ORA-08182	User cannot begin read-only or serializable transactions in Flashback mode.
ORA-08183	User cannot enable Flashback within an uncommitted transaction.
ORA-08184	User cannot enable Flashback within another Flashback session.
ORA-08185	SYS cannot enable Flashback mode.

Operational Notes

DBMS_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need.

If you need to perform a Flashback over a 24-hour period, the DBA should set the undo_retention parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the RETENTION GUARANTEE clause for the undo tablespace to ensure that unexpired undo is not discarded.UNDO_RETENTION is not in itself a complete guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, RETENTION GUARANTEE prevents this. For more information, see the *Oracle Database Administrator's Guide*

In a Flashback-enabled session, SYSDATE will not be affected; it will continue to provide the current time.

DBMS_FLASHBACK can be used within logon triggers to enable Flashback without changing the application code.

Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```
DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
   employee_no   number(5) PRIMARY KEY,
   employee_name varchar2(20),
   employee_mgr  number(5)
      CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
   salary        number,
   hiredate      date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20  seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
DECLARE
I NUMBER;
BEGIN
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly

Summary of DBMS_FLASHBACK Subprograms

Table 57–3 DBMS_FLASHBACK Package Subprograms

Subprogram	Description
DISABLE Procedure on page 57-12	Disables the Flashback mode for the entire session
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure on page 57-13	Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries will return data consistent as of the specified wall-clock time or SCN
ENABLE_AT_TIME Procedure on page 57-14	Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in `query_time`
GET_SYSTEM_CHANGE_NUMBER Function on page 57-15	Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots
TRANSACTION_BACKOUT Procedures on page 57-16	Provides the mechanism to backout a transaction

DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

```
DBMS_FLASHBACK.DISABLE;
```

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');
SELECT salary FROM emp where name = 'Joe'
EXECUTE dbms_flashback.disable;
```

ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number. In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (
   query_scn IN NUMBER);
```

Parameters

Table 57–4 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure Parameters

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in query_time.It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
   query_time   IN TIMESTAMP);
```

Parameters

Table 57–5 ENABLE_AT_TIME Procedure Parameters

Parameter	Description
query_time	This is an input parameter of type TIMESTAMP. A time stamp can be specified in the following ways: ■ Using the TIMESTAMP constructor EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TIMESTAMP '2001-01-09 12:31:00'). Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings. ■ Using the TO_TIMESTAMP function: EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS')) You provide the format you want to use. This example shows the TO_TIMESTAMP function for February 12, 2001, 2:35 PM. ■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M. ■ Note that if the query time contains a time zone, the time zone information is truncated.

GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER
 RETURN NUMBER;
```

TRANSACTION_BACKOUT Procedures

This procedure provides a mechanism to backout a set of transactions. The user can call these procedures with either transaction names or transaction identifiers (XIDS).

The procedure analyzes the transactional dependencies, perform DML's and generates an extensive report on the operation performed by the subprogram. This procedure does not commit the DML's performed as part of transaction backout. However it will hold all the required locks on rows and tables in the right form, so that no other dependencies can enter the system. To make the changes permanent the user needs to explicitly commit the transaction.

A report will be generated in the system tables DBA_FLASHBACK_TRANSACTION_STATE and DBA_FLASHBACK_TRANSACTION_REPORT.

Syntax

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numberofxids       NUMBER,
   xids               XID_ARRAY,
   options            NUMBER default NOCASCADE,
   timeHint           TIMESTAMP default MINTIME);

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numberofxids       NUMBER,
   xids               XID_ARRAY,
   options            NUMBER default NOCASCADE,
   scnHint            TIMESTAMP default 0   );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numberofxids      NUMBER,
   txnnames          TXNAME_ARRAY,
   options           NUMBER default NOCASCADE,
   timehint          TIMESTAMP MINTIME );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numberofxids     NUMBER,
   txnNames         TXNAME_ARRAY,
   options          NUMBER default NOCASCADE,
   scnHint          NUMBER 0);
```

Parameters

Table 57–6 TRANSACTION_BACKOUT Procedure Parameters

Parameter	Description
numberofxids	Number of transactions passed as input
xids	List of transaction IDs in the form of an array
txnnames	List of transaction names in the form of an array

Table 57–6 (Cont.) TRANSACTION_BACKOUT Procedure Parameters

Parameter	Description
options	Backout dependent transactions: ■ NOCASCADE - The user expects no dependency. If a dependency is found, this raises an error, with the first dependent transaction provided in the report. ■ NOCASCADE_FORCE - The user forcibly backs out the given transactions without considering the dependent transactions. The RDBMS executes the UNDO SQL for the given transactions in reverse order of their commit times. If no constraints break, and the result is satisfactory, the user can either COMMIT the changes or else ROLL BACK. ■ NONCONFLICT_ONLY - This option lets the user backout the changes to the non-conflicting rows of the given transactions. Note that a transaction dependency will happen due to a row conflict, whether either through WAW or primary/unique key constraints. If the user chooses to back out only the non-conflicting rows, this should not cause any problem with database consistency, although transaction atomicity is lost. As this is a recovery operation, the user can correct the data. ■ CASCADE - This will completely remove the given transactions including their dependents in a post order fashion (reverse order of commit times).
timehint	Time hint on the start of the transaction
scnhint	SCN hint on the start of the transaction

Usage Notes

- If transaction name is used, a time hint must be provided. The time hint should be a time before the start of all the given transactions to back out.
- If the SCN hint is provided, it must be before the start of the earliest transaction in the specified input set, or this will raise an error and terminate. If it is not provided and the transaction has committed within undo retention, the database system is able to determine the start time.

58

DBMS_FREQUENT_ITEMSET

The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- Summary of DBMS_FREQUENT_ITEMSET Subprograms

Summary of DBMS_FREQUENT_ITEMSET Subprograms

Table 58–1 DBMS_FREQUENT_ITEMSET Package Subprograms

Subprogram	Description
FI_HORIZONTAL Function on page 58-3	Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded
FI_TRANSACTIONAL Function on page 58-5	Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded

FI_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
   tranx_cursor         IN    SYSREFCURSOR,
   support_threshold    IN    NUMBER,
   itemset_length_min   IN    NUMBER,
   itemset_length_max   IN    NUMBER,
   including_items      IN    SYS_REFCURSOR DEFAULT NULL,
   excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
  RETURN TABLE OF ROW (
     itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
     support        NUMBER,
     length         NUMBER,
     total_tranx    NUMBER);
```

Parameters

Table 58–2 FI_HORIZONTAL Procedure Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns.Each column of cursor represents an item. All columns of the cursor must be of the same data type. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned.The default is NULL.

Return Values

Table 58–3 FI_HORIZONTAL Procedure Parameters

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER.

Example

Suppose you have a table horiz_table_in.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in horiz_table_in looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
                CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
                         FROM horiz_table_in),
                0.3,
                2,
                5,
                CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                                    ('apple','banana','orange'))),
                CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk')))));
```

FI_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
   tranx_cursor         IN    SYSREFCURSOR,
   support_threshold    IN    NUMBER,
   itemset_length_min   IN    NUMBER,
   itemset_length_max   IN    NUMBER,
   including_items      IN    SYS_REFCURSOR DEFAULT NULL,
   excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
  RETURN TABLE OF ROW (
     itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
     support        NUMBER,
     length         NUMBER,
     total_tranx    NUMBER);
```

Parameters

Table 58–4 FI_TRANSACTIONAL Procedure Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.

Return Values

Table 58–5 FI_TRANSACTIONAL Procedure Parameters

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.

Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table tranx_table_in looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of VARCHAR2(30), you must create a nested table of VARCHAR2(30):

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                cursor(SELECT tid, iid FROM tranx_table_in),
                0.6,
                2,
                5,
                NULL,
                NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                CURSOR(SELECT tid, iid FROM tranx_table_in),
```

```
              0.6,
              2,
              5,
             CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                                        ('apple','banana','orange'))),
             CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```
SELECT
  bt.setid, nt.*
FROM
(SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
 FROM table(
   DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
     CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
     NULL, NULL))) bt,
table(bt.itemset) nt;
```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the `NESTED_TABLE_FAST_INSERT` hint for performance:

```
CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */  INTO fq_nt
 SELECT cast(itemset as FI_VARCHAR_NT)
 FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL));
```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```
CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP
```

```
      FETCH freqC INTO coll_nt;
      EXIT WHEN freqC%NOTFOUND;
      num_rows := num_rows + 1;
      num_itms := num_itms + coll_nt.count;
    END LOOP;
  CLOSE freqC;
  DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
END;
/
```

59

DBMS_HM

This package contains constants and procedure declarations for health check management. Health Monitor provides facilities to run a check store and retrieve the reports through `DBMS_HM` package

> **See Also:** *Oracle Database Administrator's Guide* for more information about "Health Monitor"

This chapter contains the following topics:

- Using DBMS_HM
  - Security Model
- Summary of DBMS_HM Subprograms

Using DBMS_HM

- Security Model

Security Model

Users must have `EXECUTE` privilege to run the procedures of `DBMS_HM` package.

Summary of DBMS_HM Subprograms

Table 59–1 DBMS_HM Package Subprograms

Subprogram	Description
GET_RUN_REPORT Function on page 59-5	Returns the report for the specified checker run
RUN_CHECK Procedure on page 59-6	Runs the specified checker with the given arguments

GET_RUN_REPORT Function

This function returns the report for the specified checker run.

Syntax

```
DBMS_HM.GET_RUN_REPORT (
    run_name      IN  VARCHAR2,
    type           IN  VARCHAR2 := 'TEXT',
    level          IN  VARCHAR2 := 'BASIC',)
  RETURN CLOB;
```

Parameters

Table 59–2 GET_RUN_REPORT Function Parameters

Parameter	Description
`run_name`	Name of the check's run
`type`	Report format type. Possible values are `'HTML'`, `'XML'` and `'TEXT'`. Default report type is `'TEXT'`.
`level`	Details of report, possible value are `'BASIC'` and `'DETAIL'`. Caution: Currently only `'BASIC'` level is supported.

RUN_CHECK Procedure

This procedure runs the specified checker with the given arguments. It lets user to specify a name for the run, inputs needed and maximum timeout for the run. The run's report will be maintained persistently in database.

Syntax

```
DBMS_HM.RUN_CHECK (
   check_name     IN  VARCHAR2,
   run_name       IN  VARCHAR2 := NULL,
   timeout        IN  NUMBER := NULL,
   input_params   IN  VARCHAR2 := NULL);
```

Parameters

Table 59–3 RUN_CHECK Procedure Parameters

Parameter	Description
check_name	Name of the check to be invoked. Check names and their parameters can be accessed from the V$HM_CHECK and V$HM_CHECK_PARAM views. Users can run all checks which are not internal in nature: SELECT name FROM V$HM_CHECK WHERE INTERNAL_CHECK = 'N' retrieves the list of checks that can be run manually by users.
run_name	Name with which external users can uniquely identify this check's run. If NULL value is passed, then HM creates a unique name and associates with this check's run.
timeout	Maximum amount of time (in units of seconds), this checker run is allowed to run. HM will interrupt the run, if it the specified time elapses for the run. If NULL value is passed, HM doesn't impose any timeout limits on the run.
input_params	Input string: which consists of name, value pairs de-limited by a special character ';'. Example ('Data Block Integrity Check' invocation may take following type of input parameters. 'BLC_DF_NUM=1;BLC_BL_NUM=23456' Input parameters BLC_DF_NUM and BLC_BL_NUM have values '1' and '23456' respectively. Every check will have well defined set of inputs associated with it. These Input parameters, their types, default values and descriptions can be obtained using V$HM_CHECK_PARAM view. Example: The following query gets the list of parameters, their default values and descriptions for a 'Data Block Integrity Check' SELECT a.* FROM v$hm_check_param a, v$hm_check b WHERE a.check_id = b.id AND b.name = 'Data Block Integrity Check';

60

DBMS_HPROF

The DBMS_HPROF package provides an interface for profiling the execution of PL/SQL applications. It provides services for collecting the hierarchical profiler data, analyzing the raw profiler output and profiling information generation.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information about the "PL/SQL Hierarchical Profiler"

This chapter contains the following topic:

- Summary of DBMS_HPROF Subprograms

Summary of DBMS_HPROF Subprograms

This table list the package subprograms in alphabetical order.

Table 60–1 DBMS_HPROF Package Subprograms

Subprogram	Description
ANALYZE Function on page 60-3	Analyzes the raw profiler output and produces hierarchical profiler information in database tables
START_PROFILING Procedure on page 60-5	Starts hierarchical profiler data collection in the user's session
STOP_PROFILING Procedure on page 60-6	Stops profiler data collection in the user's session.s

ANALYZE Function

This function analyzes the raw profiler output and produces hierarchical profiler information in database tables.

Syntax

```
DBMS_HPROF.ANALYZE (
   location         VARCHAR2,
   filename         VARCHAR2,
   summary_mode     BOOLEAN     DEFAULT FALSE,
   trace            VARCHAR2    DEFAULT NULL,
   skip             PLS_INTEGER DEFAULT 0,
   collect          PLS_INTEGER DEFAULT NULL,
   run_comment      VARCHAR2    DEFAULT NULL)
  RETURN NUMBER;
```

Parameters

Table 60–2 ANALYZE Function Parameters

Parameter	Description
`location`	Name of a directory object. The raw profiler data file is read from the file system directory mapped to this directory object. Output files are also written to this directory.
`filename`	Name of the raw profiler data file to be analyzed. The file must exist in the directory specified by the `location` parameter.
`summary_mode`	By default (that is, when `summary_mode` is `FALSE`), the detailed analysis is done. When `summary_mode` is `TRUE`, only top-level summary information is generated into the database table.
`trace`	Analyze only the subtrees rooted at the specified trace entry. By default (when trace is `NULL`), the analysis/reporting is generated for the entire run. The trace entry must be specified in a special quoted qualified format (including the schema name, module name & function name) as in for example, '"`SCOTT`"."`PKG`"."`FOO`"' or '""."."__`plsql_vm`"'. If multiple overloads exist for the specified name, all of them will be analyzed.
`skip`	Used only when `trace` is specified. Analyze only the subtrees rooted at the specified trace, but ignore the first `skip` invocations to `trace`. The default value for `skip` is 0.
`collect`	Used only when `trace` is specified. Analyze `collect` number of invocations of traces (starting from `skip`+1'th invocation). By default only 1 invocation is collected.
`run_comment`	User-provided comment for this run

Return Values

A unique run identifier for this run of the analyzer. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

Usage Notes

- Use the `dbmshptab.sql` script located in the `rdbms/admin` directory to create the hierarchical profiler database tables and other data structures required for persistently storing the results of analyzing the raw profiler data.
- Running `dbmshptab.sql` drops the any previously created hierarchical profiler tables.

Examples

The following snippet installs the hierarchical profiler tables in HR schema.

```
connect HR/HR;
@?/rdbms/admin/dbmshptab.sql
```

START_PROFILING Procedure

This procedure starts hierarchical profiler data collection in the user's session.

Syntax

```
DBMS_HPROF.START_PROFILING (
   location    VARCHAR2 DEFAULT NULL,
   filename    VARCHAR2 DEFAULT NULL,
   max_depth   PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 60–3 START_PROFILING Procedure Parameters

Parameter	Description
`location`	Name of a directory object. The file system directory mapped to this directory object is where the raw profiler output is generated.
`filename`	Output filename for the raw profiler data. The file is created in the directory specified by the `location` parameter.
`max_depth`	By default (that is, when `max_depth` value is `NULL`) profile information is gathered for all functions irrespective of their call depth. When a non-`NULL` value is specified for `max_depth`, the profiler collects data only for functions up to a call depth level of `max_depth`.

Usage Notes

Even though the profiler does not individually track functions at depth greater than max_depth, the time spent in such functions is charged to the ancestor function at depth max_depth.

STOP_PROFILING Procedure

This procedure stops profiler data collection in the user's session. This subprogram also has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_HPROF.STOP_PROFILING;
```

61

DBMS_HS_PARALLEL

The DBMS_HS_PARALLEL PL/SQL package enables parallel processing for heterogeneous targets access. This package is designed to improve performance when retrieving data from a large foreign table.

DBMS_HS_PARALLEL is compiled with the authorization ID of CURRENT_USER, which uses invoker's rights. In other words, all procedures in this package are executed with the privileges of the calling user.

Following are the procedures of the DBMS_HS_PARALLEL package:

- LOAD_TABLE
- CREATE_TABLE_TEMPLATE
- CREATE_OR_REPLACE_VIEW
- DROP_VIEW

LOAD_TABLE

This procedure loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it will be created automatically.

Following is the syntax for LOAD_TABLE:

```
LOAD_TABLE (remote_table, database_link, oracle_table, truncate, parallel_degree,
row_count)
```

The following table describes the parameters for LOAD_TABLE:

Table 61–1 LOAD_TABLE Parameters

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	IN VARCHAR2	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
truncate	IN BOOLEAN	Determines whether the Oracle table is truncated before the data is loaded. The value is either TRUE or FALSE. The default value is TRUE which means the Oracle table is truncated first. When set to FALSE, the Oracle table will not be truncated before the data is loaded.
parallel_degree	IN NUMBER	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.
row_count	OUT NUMBER	Contains the number of rows just added with the load table operation.

Using LOAD_TABLE

This procedure only loads the remote table data into Oracle local table. It does not create a key, index, constraints or any other dependencies such as triggers. It is recommended that you create these dependencies after the table data is loaded as performance will improve greatly. You will need to decide whether to create the dependencies before or after the data is loaded based on your knowledge of the remote table data and dependencies.

If the local table does not exist, the `LOAD_TABLE` procedure creates a simple (non-partitioned) local table based on the exact column matching of the remote table after which the data is inserted into the local table.

If the remote table or the database link does not exist, an error message is returned.

If the local table is incompatible with the remote table, an error message is returned.

You need the `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `LOAD_TABLE` procedure.

If you encounter either the Oracle error message `ORA-12801: error signaled in parallel query server P003` or `ORA-00018: maximum number of session exceeded`, increase the `PROCESSES` and `SESSIONS` parameter in Oracle initialization parameter file.

One of the following is required for parallel processing:

- The remote table is range partitioned.
- Histogram information for a numeric column is available.
- There is a numeric index or primary key.

To drop the local table, use the `DROP TABLE` SQL statement.

CREATE_TABLE_TEMPLATE

This procedure writes out a CREATE TABLE template based on information gathered from the remote table. You can use the information to add any optimal Oracle CREATE TABLE clauses.

Following is the syntax for CREATE_TABLE_TEMPLATE:

```
CREATE_TABLE_TEMPLATE (remote_table, database_link, oracle_table, create_table_
template_string)
```

The following table describes the parameters for CREATE_TABLE_TEMPLATE:

Table 61–2 CREATE_TABLE_TEMPLATE Parameter

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	IN VARCHAR2	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
create_table_template_string	OUT VARCHAR2	Contains the Oracle CREATE TABLE SQL template when the procedure is returned.

CREATE_OR_REPLACE_VIEW

This procedure creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.

Following is the syntax for CREATE_VIEW:

```
CREATE_OR_REPLACE_VIEW (remote_table, database_link, oracle_view, parallel_degree)
```

The following table describes the parameters for CREATE_OR_REPLACE_VIEW:

Table 61–3 CREATE_VIEW Parameter

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_view	IN VARCHAR2	The name of the Oracle view. It is specified as [schema_name.]oracle_view_name. The default schema name is the current user. If the oracle_view parameter is not specified, the remote table name will be used as the view name.
parallel_degree	IN NUMBER	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.

Using CREATE_OR_REPLACE_VIEW

The specified Oracle view is created and future reference of this view utilizes internal database objects for parallel retrieval of remote non-Oracle table data. If the Oracle view already exists, the Oracle error message `ORA-00955: name is already used by an existing object` is raised.

This view is created as a read-only view. If you attempt to insert and update the view, the `Oracle error message ORA-01733: virtual column not allowed here` is raised.

If the remote table or the database link does not exist, the Oracle error message `ORA-00942: table or view does not exist` or `ORA-02019: connection description for remote database not found` is raised.

You need the `CREATE VIEW`, `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `CREATE_OR_REPLACE_VIEW` procedure.

If you encounter either the Oracle error message `ORA-12801: error signaled in parallel query server P003` or `ORA-00018: maximum number of session exceeded`, increase the `PROCESSES` and `SESSIONS` parameter in Oracle initialization parameter file.

Because the `CREATE_OR_REPLACE_VIEW` procedure creates some internal objects, use the `DROP_VIEW` procedure to drop the view and the internal objects. The SQL `DROP VIEW` statement only drops the view and not the internal objects.

DROP_VIEW

This procedure drops the view and internal objects created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not already been created by the CREATE_OR_REPLACE_VIEW procedure, an error message is returned.

Following is the syntax for DROP_VIEW:

```
DROP_VIEW (oracle_view)
```

The following table describes the parameters for DROP_VIEW:

Table 61–4 CREATE_VIEW Parameter

Parameter	Value	Description
oracle_view	IN VARCHAR2 NOT NULL	The name of the Oracle view created by the CREATE_VIEW procedure. If the view has not been created by the CREATE_VIEW procedure, an error is returned.

62

DBMS_HS_PASSTHROUGH

The pass-through SQL feature allows an application developer to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows for operations in statements for which there is no equivalent in Oracle.

You can run these statements directly at the non-Oracle system using the PL/SQL package `DBMS_HS_PASSTHROUGH`. Any statement executed with this package is run in the same transaction as regular "transparent" SQL statements.

This chapter discusses the following topic:

- Summary of DBMS_HS_PASSTHROUGH Subprograms

> **See Also:** *Oracle Database Heterogeneous Connectivity Administrator's Guide*

Summary of DBMS_HS_PASSTHROUGH Subprograms

Table 62–1 DBMS_HS_PASSTHROUGH Package Subprograms

Subprogram	Description
BIND_INOUT_VARIABLE Procedure on page 62-3	Binds IN OUT bind variables
BIND_INOUT_VARIABLE_ RAW Procedure on page 62-4	Binds IN OUT bind variables of data type RAW
BIND_OUT_VARIABLE Procedure on page 62-5	Binds an OUT variable with a PL/SQL program variable
BIND_OUT_VARIABLE_RAW Procedure on page 62-6	Binds an OUT variable of data type RAW with a PL/SQL program variable
BIND_VARIABLE Procedure on page 62-7	Binds an IN variable positionally with a PL/SQL program variable
BIND_VARIABLE_RAW Procedure on page 62-8	Binds IN variables of type RAW
CLOSE_CURSOR Procedure on page 62-9	Closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system
EXECUTE_IMMEDIATE Procedure on page 62-10	Runs a (non-SELECT) SQL statement immediately, without bind variables
EXECUTE_NON_QUERY Function on page 62-11	Runs a (non-SELECT) SQL statement
FETCH_ROW Function on page 62-12	Fetches rows from a query
GET_VALUE Procedure on page 62-13	Retrieves column value from SELECT statement, or retrieves OUT bind parameters
GET_VALUE_RAW Procedure on page 62-14	Similar to GET_VALUE, but for data type RAW
OPEN_CURSOR Function on page 62-15	Opens a cursor for running a passthrough SQL statement at the non-Oracle system
PARSE Procedure on page 62-16	Parses SQL statement at non-Oracle system

BIND_INOUT_VARIABLE Procedure

This procedure binds IN OUT bind variables.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE (
   c     IN     BINARY_INTEGER NOT NULL,
   p     IN     BINARY_INTEGER NOT NULL,
   v     IN OUT <dty>,
   n     IN     VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For binding IN OUT variables of data type RAW see BIND_INOUT_VARIABLE_RAW Procedure on page 62-4.

Parameters

Table 62–2 BIND_INOUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–3 BIND_INOUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_INOUT_VARIABLE_RAW Procedure

This procedure binds IN OUT bind variables of data type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (
   c      IN     BINARY_INTEGER NOT NULL,
   p      IN     BINARY_INTEGER NOT NULL,
   v      IN OUT RAW,
   n      IN     VARCHAR2);
```

Parameters

Table 62–4 BIND_INOUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–5 BIND_INOUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_OUT_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
   c      IN  BINARY_INTEGER NOT NULL,
   p      IN  BINARY_INTEGER NULL,
   v      OUT <dty>,
   n      IN  VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For binding OUT variables of data type RAW, see BIND_OUT_VARIABLE_RAW Procedure on page 62-6.

Parameters

Table 62–6 BIND_OUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–7 BIND_OUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_OUT_VARIABLE_RAW Procedure

This procedure binds an OUT variable of data type RAW with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (
   c     IN  BINARY_INTEGER NOT NULL,
   p     IN  BINARY_INTEGER NOT NULL,
   v     OUT RAW,
   n     IN  VARCHAR2);
```

Parameters

Table 62–8 BIND_OUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–9 BIND_OUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (
   c      IN BINARY_INTEGER NOT NULL,
   p      IN BINARY_INTEGER NOT NULL,
   v      IN <dty>,
   n      IN VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** To bind RAW variables use BIND_VARIABLE_RAW Procedure on page 62-8.

Parameters

Table 62–10 BIND_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable name.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–11 BIND_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined: WNDS, RNDS
```

BIND_VARIABLE_RAW Procedure

This procedure binds IN variables of type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (
   c    IN BINARY_INTEGER NOT NULL,
   p    IN BINARY_INTEGER NOT NULL,
   v    IN RAW,
   n    IN VARCHAR2);
```

Parameters

Table 62–12 BIND_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–13 BIND_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

CLOSE_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

Syntax

```
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (
   c IN BINARY_INTEGER NOT NULL);
```

Parameters

Table 62–14 CLOSE_CURSOR Procedure Parameters

Parameter	Description
c	Cursor to be released.

Exceptions

Table 62–15 CLOSE_CURSOR Procedure Exceptions

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

EXECUTE_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except SELECT can be run immediately. The statement must not contain any bind variables. The statement is passed in as a VARCHAR2 in the argument. Internally the SQL statement is run using the PASSTHROUGH SQL protocol sequence of OPEN_CURSOR, PARSE, EXECUTE_NON_QUERY, CLOSE_CURSOR.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (
   s IN VARCHAR2 NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 62–16 EXECUTE_IMMEDIATE Procedure Parameters

Parameter	Description
s	VARCHAR2 variable with the statement to be executed immediately.

Return Values

The number of rows affected by the execution of the SQL statement.

Exceptions

Table 62–17 EXECUTE_IMMEDIATE Procedure Exceptions

Exception	Description
ORA-28551	SQL statement is invalid.
ORA-28554	Max open cursors.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

EXECUTE_NON_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a SELECT statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (
   c IN BINARY_INTEGER NOT NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 62–18 EXECUTE_NON_QUERY Function Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.

Return Values

The number of rows affected by the SQL statement in the non-Oracle system

Exceptions

Table 62–19 EXECUTE_NON_QUERY Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	BIND_VARIABLE procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A NULL value was passed for a NOT NULL parameter.

FETCH_ROW Function

This function fetches rows from a result set. The result set is defined with a SQL SELECT statement. When there are no more rows to be fetched, the exception NO_DATA_FOUND is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

Syntax

```
DBMS_HS_PASSTHROUGH.FETCH_ROW (
   c   IN BINARY_INTEGER NOT NULL,
   f   IN BOOLEAN)
  RETURN BINARY_INTEGER;
```

Parameters

Table 62–20 FETCH_ROW Function Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
first	(Optional) Reexecutes SELECT statement. Possible values: – TRUE: reexecute SELECT statement. – FALSE: fetch the next row, or if run for the first time, then execute and fetch rows (default).

Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

Exceptions

Table 62–21 FETCH_ROW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

GET_VALUE Procedure

This procedure has two purposes:

- It retrieves the select list items of SELECT statements, after a row has been fetched.
- It retrieves the OUT bind values, after the SQL statement has been run.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE (
   c      IN  BINARY_INTEGER NOT NULL,
   p    IN  BINARY_INTEGER NOT NULL,
   v    OUT <dty>);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For retrieving values of data type RAW, see GET_VALUE_RAW Procedure on page 62-14.

Parameters

Table 62–22 GET_VALUE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable or select list item stores its value.

Exceptions

Table 62–23 GET_VALUE Procedure Exceptions

Exception	Description
ORA-1403	Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

GET_VALUE_RAW Procedure

This procedure is similar to GET_VALUE, but for data type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (
   c    IN  BINARY_INTEGER NOT NULL,
   p    IN  BINARY_INTEGER NOT NULL,
   v    OUT RAW);
```

Parameters

Table 62–24 GET_VALUE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable or select list item stores its value.

Exceptions

Table 62–25 GET_VALUE_RAW Procedure Exceptions

Exception	Description
ORA-1403	Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

OPEN_CURSOR Function

This function opens a cursor for running a pass-through SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure CLOSE_CURSOR.

Syntax

```
DBMS_HS_PASSTHROUGH.OPEN_CURSOR
  RETURN BINARY_INTEGER;
```

Return Values

The cursor to be used on subsequent procedure and function calls.

Exceptions

Table 62–26 OPEN_CURSOR Function Exceptions

Exception	Description
ORA-28554	Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' OPEN_CURSORS initialization parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

PARSE Procedure

This procedure parses SQL statement at non-Oracle system.

Syntax

```
DBMS_HS_PASSTHROUGH.PARSE (
   c       IN  BINARY_INTEGER NOT NULL,
   stmt    IN  VARCHAR2 NOT NULL);
```

Parameters

Table 62–27 PARSE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened using function OPEN_CURSOR.
stmt	Statement to be parsed.

Exceptions

Table 62–28 PARSE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28551	SQL statement is illegal.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

DBMS_JAVA

The DBMS_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

- Documentation of DBMS_JAVA

Documentation of DBMS_JAVA

For a complete description of this package within the context of DBMS_JAVA, see DBMS_JAVA in the *Oracle Database Java Developer's Guide.*

64

DBMS_IOT

The DBMS_IOT package creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command. DBMS_IOT can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the enable_constraint operation.

DBMS_IOT is not loaded during database installation. To install DBMS_IOT, run dbmsiotc.sql, available in the ADMIN directory.

This chapter contains the following topics:

- Summary of DBMS_IOT Subprograms

> **Note:** With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

Summary of DBMS_IOT Subprograms

Table 64–1 DBMS_IOT Package Subprograms

Subprogram	Description
BUILD_CHAIN_ROWS_TABLE Procedure on page 64-3	Creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command
BUILD_EXCEPTIONS_TABLE Procedure on page 64-4	Creates an exception table into which rows of an index-organized table that violate a constraint can be placed

BUILD_CHAIN_ROWS_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command.

Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (
   owner               IN VARCHAR2,
   iot_name            IN VARCHAR2,
   chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

Parameters

Table 64–2 BUILD_CHAIN_ROWS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
chainrow_table_name	Intended name for the chained-rows table.

Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

Examples

```
CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS','L','LC');
```

A chained-row table is created with the following columns:

```
Column Name                    Null?    Type
------------------------------ -------- ----
OWNER_NAME                              VARCHAR2(30)
TABLE_NAME                              VARCHAR2(30)
CLUSTER_NAME                            VARCHAR2(30)
PARTITION_NAME                          VARCHAR2(30)
SUBPARTITION_NAME                       VARCHAR2(30)
HEAD_ROWID                              ROWID
TIMESTAMP                               DATE
A                                       CHAR(16)
B                                       CHAR(16)
C                                       CHAR(16)
```

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates an exception table into which rows of an index-organized table that violate a constraint can be placed during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

Syntax

```
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (
   owner                 IN VARCHAR2,
   iot_name              IN VARCHAR2,
   exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

Parameters

Table 64–3 BUILD_EXCEPTIONS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
exceptions_table_name	Intended name for exception-table.

Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

Examples

```
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS','L','LE');
```

An exception table for the preceding index-organized table with the following columns:

```
Column Name                    Null?    Type
------------------------------ -------- ----
ROW_ID                                  VARCHAR2(30)
OWNER                                   VARCHAR2(30)
TABLE_NAME                              VARCHAR2(30)
CONSTRAINT                              VARCHAR2(30)
A                                       CHAR(16)
B                                       CHAR(16)
C                                       CHAR(16)
```

65

DBMS_JOB

The DBMS_JOB package schedules and manages jobs in the job queue.

> **Note:** The DBMS_JOB package has been superseded by the DBMS_SCHEDULER package. In particular, if you are administering jobs to manage system load, you should consider disabling DBMS_JOB by revoking the package execution privilege for users.
>
> For more information, see Chapter 114, "DBMS_SCHEDULER" and "Moving from DBMS_JOB to DBMS_SCHEDULER" in *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- Using DBMS_JOB
  - Security Model
  - Operational Notes
- Summary of DBMS_JOB Subprograms

Using DBMS_JOB

- Security Model
- Operational Notes

Security Model

No specific system privileges are required to use DBMS_JOB. No system privileges are available to manage DBMS_JOB. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted EXECUTE. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

Operational Notes

- Working with Oracle Real Application Clusters
- Stopping a Job

Working with Oracle Real Application Clusters

DBMS_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the DBMS_SCHEDULER package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

DBMS_JOB.SUBMIT

To submit a job to the job queue, use the following syntax:

```
DBMS_JOB.SUBMIT(
   job       OUT    BINARY_INTEGER,
   what      IN     VARCHAR2, NEXT_DATE IN DATE DEFAULTSYSDATE,
   interval  IN     VARCHAR2 DEFAULT 'NULL',
   no_parse  IN     BOOLEAN DEFAULT FALSE,
   instance  IN     BINARY_INTEGER DEFAULT ANY_INSTANCE,
   force     IN     BOOLEAN DEFAULT FALSE);
```

Use the parameters instance and force to control job and instance affinity. The default value of instance is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the instance value. Oracle displays error ORA-23319 if the instance value is a negative number or NULL.

The force parameter defaults to false. If force is TRUE, any positive integer is acceptable as the job instance. If force is FALSE, the specified instance must be running, or Oracle displays error number ORA-23428.

DBMS_JOB.INSTANCE

To assign a particular instance to execute a job, use the following syntax:

```
DBMS_JOB.INSTANCE(  JOB IN BINARY_INTEGER,
  instance                IN BINARY_INTEGER,
  force                   IN BOOLEAN DEFAULT FALSE);
```

The FORCE parameter in this example defaults to FALSE. If the instance value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of force. If the INSTANCE value is positive and the FORCE parameter is FALSE, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the force parameter is TRUE, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the instance value is negative or NULL.

DBMS_JOB.CHANGE

To alter user-definable parameters associated with a job, use the following syntax:

```
DBMS_JOB.CHANGE(  JOB IN BINARY_INTEGER,
```

```
   what                 IN VARCHAR2 DEFAULT NULL,
next_date             IN DATE DEFAULT NULL,
interval              IN VARCHAR2 DEFAULT NULL,
instance              IN BINARY_INTEGER DEFAULT NULL,
force                 IN BOOLEAN DEFAULT FALSE );
```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is `null` indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the `instance` number is negative.

DBMS_JOB.RUN

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If force is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if force is `FALSE` and the connected instance is the incorrect instance.

```
DBMS_JOB.RUN(
   job    IN BINARY_INTEGER,
   force  IN BOOLEAN DEFAULT FALSE);
```

Stopping a Job

Note that, once a job is started and running, there is no easy way to stop the job.

Summary of DBMS_JOB Subprograms

Table 65–1 DBMS_JOB Package Subprograms

Subprogram	Description
BROKEN Procedure on page 65-7	Disables job execution
CHANGE Procedure on page 65-8	Alters any of the user-definable parameters associated with a job
INSTANCE Procedure on page 65-9	Assigns a job to be run by a instance
INTERVAL Procedure on page 65-10	Alters the interval between executions for a specified job
NEXT_DATE Procedure on page 65-11	Alters the next execution time for a specified job
REMOVE Procedure on page 65-12	Removes specified job from the job queue
RUN Procedure on page 65-13	Forces a specified job to run
SUBMIT Procedure on page 65-14	Submits a new job to the job queue
USER_EXPORT Procedures on page 65-16	Re-creates a given job for export, or re-creates a given job for export with instance affinity
WHAT Procedure on page 65-17	Alters the job description for a specified job

BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

Syntax

```
DBMS_JOB.BROKEN (
   job       IN  BINARY_INTEGER,
   broken    IN  BOOLEAN,
   next_date IN  DATE DEFAULT SYSDATE);
```

Parameters

Table 65–2 BROKEN Procedure Parameters

Parameter	Description
job	Number of the job being run.
broken	Job broken: IN value is FALSE.
next_data	Date of the next refresh.

> **Note:** If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

Syntax

```
DBMS_JOB.CHANGE (
   job       IN  BINARY_INTEGER,
   what      IN  VARCHAR2,
   next_date IN  DATE,
   interval  IN  VARCHAR2,
   instance  IN  BINARY_INTEGER DEFAULT NULL,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 65–3 CHANGE Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`what`	PL/SQL procedure to run.
`next_date`	Date of the next refresh.
`interval`	Date function; evaluated immediately before the job starts running.
`instance`	When a job is submitted, specifies which instance can run the job. This defaults to `NULL`, which indicates that instance affinity is not changed.
`force`	If this is `FALSE`, then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception. If this is `TRUE`, then any positive integer is acceptable as the job instance.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
- If the parameters `what`, `next_date`, or `interval` are `NULL`, then leave that value as it is.

Example

```
BEGIN
   DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
   COMMIT;
END;
```

INSTANCE Procedure

This procedure changes job instance affinity.

Syntax

```
DBMS_JOB.INSTANCE (
   job        IN BINARY_INTEGER,
   instance   IN BINARY_INTEGER,
   force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 65–4 INSTANCE Procedure Parameters

Parameter	Description
job	Number of the job being run.
instance	When a job is submitted, a user can specify which instance can run the job.
force	If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

INTERVAL Procedure

This procedure changes how often a job runs.

Syntax

```
DBMS_JOB.INTERVAL (
   job       IN  BINARY_INTEGER,
   interval  IN  VARCHAR2);
```

Parameters

Table 65–5 INTERVAL Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`interval`	Date function, evaluated immediately before the job starts running.

Usage Notes

- If the job completes successfully, then this new date is placed in `next_date`. `interval` is evaluated by plugging it into the statement select `interval` into `next_date` from dual;
- The `interval` parameter must evaluate to a time in the future. Legal intervals include:

Interval	Description
`'sysdate + 7'`	Run once a week.
`'next_day(sysdate,''TUESDAY'')'`	Run once every Tuesday.
`'null'`	Run only once.

- If `interval` evaluates to `NULL` and if a job completes successfully, then the job is automatically deleted from the queue.
- You must issue a `COMMIT` statement immediately after the statement.

NEXT_DATE Procedure

This procedure changes when an existing job next runs.

Syntax

```
DBMS_JOB.NEXT_DATE (
   job       IN  BINARY_INTEGER,
   next_date IN  DATE);
```

Parameters

Table 65–6 NEXT_DATE Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`next_date`	Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.

Usage Notes

You must issue a `COMMIT` statement immediately after the statement.

REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

Syntax

```
DBMS_JOB.REMOVE (
   job       IN  BINARY_INTEGER );
```

Parameters

Table 65–7 REMOVE Procedure Parameters

Parameter	Description
job	Number of the job being run.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

Example

```
BEGIN
   DBMS_JOB.REMOVE(14144);
   COMMIT;
END;
```

RUN Procedure

This procedure runs job `JOB` now. It runs it even if it is broken.

Running the job recomputes `next_date`. See view `user_jobs`.

Syntax

```
DBMS_JOB.RUN (
   job       IN  BINARY_INTEGER,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 65–8 RUN Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`force`	If this is `TRUE`, then instance affinity is irrelevant for running jobs in the foreground process. If this is `FALSE`, then the job can be run in the foreground only in the specified instance.

Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

Caution: This re-initializes the current session's packages.

Exceptions

An exception is raised if `force` is `FALSE`, and if the connected instance is the wrong one.

SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

Syntax

```
DBMS_JOB.SUBMIT (
   job       OUT BINARY_INTEGER,
   what      IN  VARCHAR2,
   next_date IN  DATE DEFAULT sysdate,
   interval  IN  VARCHAR2 DEFAULT 'null',
   no_parse  IN  BOOLEAN DEFAULT FALSE,
   instance  IN  BINARY_INTEGER DEFAULT any_instance,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 65–9 SUBMIT Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`what`	PL/SQL procedure to run.
`next_date`	Next date when the job will be run.
`interval`	Date function that calculates the next time to run the job. The default is `NULL`. This must evaluate to a either a future point in time or `NULL`.
`no_parse`	A flag. The default is `FALSE`. If this is set to `FALSE`, then Oracle parses the procedure associated with the job. If this is set to `TRUE`, then Oracle parses the procedure associated with the job the first time that the job is run. For example, if you want to submit a job before you have created the tables associated with the job, then set this to `TRUE`.
`instance`	When a job is submitted, specifies which instance can run the job.
`force`	If this is `TRUE`, then any positive integer is acceptable as the job instance. If this is `FALSE` (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

Example

This submits a new job to the job queue. The job calls the procedure `DBMS_DDL.ANALYZE_OBJECT` to generate optimizer statistics for the table `DQUON.ACCOUNTS`. The statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```
VARIABLE jobno number;
BEGIN
```

```
   DBMS_JOB.SUBMIT(:jobno,
      'dbms_ddl.analyze_object(''TABLE'',
      ''DQUON'', ''ACCOUNTS'',
      ''ESTIMATE'', NULL, 50);'
      SYSDATE, 'SYSDATE + 1');
   COMMIT;
END;
/
Statement processed.
print jobno
JOBNO
----------
14144
```

USER_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (8*i* and after) and preserves the compatibility.

Syntax

```
DBMS_JOB.USER_EXPORT (
   job    IN     BINARY_INTEGER,
   mycall IN OUT VARCHAR2);

DBMS_JOB.USER_EXPORT (
   job      IN     BINARY_INTEGER,
   mycall   IN OUT VARCHAR2,
   myinst   IN OUT VARCHAR2);
```

Parameters

Table 65–10 USER_EXPORT Procedure Parameter

Parameter	Description
`job`	Number of the job being run.
`mycall`	Text of a call to re-create the given job.
`myinst`	Text of a call to alter instance affinity.

WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

Syntax

```
DBMS_JOB.WHAT (
   job       IN  BINARY_INTEGER,
   what      IN  VARCHAR2);
```

Parameters

Table 65–11 WHAT Procedure Parameters

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.

Usage Notes

- You must issue a COMMIT statement immediately after the statement.
- Some legal values of what (assuming the routines exist) are:
  - 'myproc(''10-JAN-82'', next_date, broken);'
  - 'scott.emppackage.give_raise(''JENKINS'', 30000.00);'
  - 'dbms_job.remove(job);'

66

DBMS_LDAP

The DBMS_LDAP package lets you access data from LDAP servers.

- Documentation of DBMS_LDAP

Documentation of DBMS_LDAP

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP` in the *Oracle Internet Directory Application Developer's Guide.*

67

DBMS_LDAP_UTL

The DBMS_LDAP_UTL package contains the Oracle Extension utility functions.

- Documentation of DBMS_LDAP_UTL

Documentation of DBMS_LDAP_UTL

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP_UTL` in the *Oracle Internet Directory Application Developer's Guide.*

68

DBMS_LIBCACHE

The DBMS_LIBCACHE package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

- Using DBMS_LIBCACHE
  - Overview
  - Security Model
- Summary of DBMS_LIBCACHE Subprograms

Using DBMS_LIBCACHE

- Overview
- Security Model

Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package `DBMS_LIBCACHE` for `SELECT` statements. The open and parse functions are executed in advance for PL/SQL and DML. For PL/SQL, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

Security Model

To execute DBMS_LIBCACHE you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, DBMS_LIBCACHE should be called for each.

Alternatively, DBMS_LIBCACHE may be called with the generic user PARSER. However, this user cannot parse the SQL that uses objects with access granted though roles. This is a standard PL/SQL security limitation.

Summary of DBMS_LIBCACHE Subprograms

Table 68–1 DBMS_LIBCACHE Package Subprograms

Subprogram	Description
COMPILE_FROM_REMOTE Procedure on page 68-6	Extracts SQL in batch from the source instance and compiles the SQL at the target instance

COMPILE_FROM_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

Syntax

```
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
   p_db_link                IN     dbms_libcache$def.db_link%type,
   p_username               IN     VARCHAR2 default null,
   p_threshold_executions   IN     NATURAL  default 3,
   p_threshold_sharable_mem IN     NATURAL  default 1000,
   p_parallel_degree        IN     NATURAL  default 1);
```

Parameters

Table 68–2 COMPILE_FROM_REMOTE Procedure Parameters

Parameter	Description
p_db_link	Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role SELECT_ON_CATALOG at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with dbms_libcache$def.ACCESS_METHOD = DB_LINK_METHOD
p_instance_name	(Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive.
p_username	Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single user_id, for example APPS, APPS is the parsing user_id that is recorded in the shared pool. To select only SQL statements parsed by APPS, enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example GL. If the username is supplied, it must be valid. The name is not case sensitive.
p_threshold_executions	The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.

Table 68–2 (Cont.) COMPILE_FROM_REMOTE Procedure Parameters

Parameter	Description
p_threshold_sharable_mem	The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.
p_parallel_degree	The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.

69

DBMS_LOB

The DBMS_LOB package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use DBMS_LOB to access and manipulation specific parts of a LOB or complete LOBs.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

This chapter contains the following topics:

- Using DBMS_LOB
  - Overview
  - Security Model
  - Constants
  - Datatypes
  - Rules and Limits
  - Operational Notes
  - Exceptions
- Summary of DBMS_LOB Subprograms

Using DBMS_LOB

- Overview
- Security Model
- Constants
- Datatypes
- Rules and Limits
- Operational Notes
- Exceptions

Overview

DBMS_LOB can read and modify BLOBs, CLOBs, and NCLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

Security Model

This package must be created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.

Any DBMS_LOB subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_LOB subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the AUTHID to indicate whether they want definer's rights or invoker's rights. For example:

```
CREATE PROCEDURE proc1 authid definer ...
```

or

```
CREATE PROCEDURE proc1 authid current_user ...
```

> **See Also:** For more information on AUTHID and privileges, see *Oracle Database PL/SQL Language Reference*

You can provide secure access to BFILEs using the DIRECTORY feature discussed in BFILENAME function in the *Oracle Database SecureFiles and Large Objects Developer's Guide* and the *Oracle Database SQL Language Reference*.

For information about the security model pertaining to temporary LOBs, see Operational Notes.

Constants

DBMS_LOB defines the following constants:

Table 69–1 DBMS_LOB Constants

Constant	Definition
FILE_READONLY	CONSTANT BINARY_INTEGER := 0;
LOB_READONLY	CONSTANT BINARY_INTEGER := 0;
LOB_READWRITE	CONSTANT BINARY_INTEGER := 1;
LOBMAXSIZE	CONSTANT INTEGER := 18446744073709551615;
SESSION	CONSTANT PLS_INTEGER := 10;
CALL	CONSTANT PLS_INTEGER := 12;

Table 69–2 DBMS_LOB Option Types

Constant	Definition
OPT_COMPRESS	CONSTANT BINARY_INTEGER := 1;
OPT_ENCRYPT	CONSTANT BINARY_INTEGER := 2;
OPT_DEDUPLICATE	CONSTANT BINARY_INTEGER := 4;

Table 69–3 DBMS_LOB Option Values

Constant	Definition
COMPRESS_OFF	CONSTANT BINARY_INTEGER := 0;
COMPRESS_ON	CONSTANT BINARY_INTEGER := 1;
ENCRYPT_OFF	CONSTANT BINARY_INTEGER := 0;
ENCRYPT_ON	CONSTANT BINARY_INTEGER := 2;
DEDUPLICATE_OFF	CONSTANT BINARY_INTEGER := 0;
DEDUPLICATE_ON	CONSTANT PLS_INTEGER := 4;

Datatypes

The DBMS_LOB package uses the datatypes shown in Table 69–4.

Table 69–4 Datatypes Used by DBMS_LOB

Type	Description
BLOB	Source or destination binary LOB.
RAW	Source or destination RAW buffer (used with BLOB).
CLOB	Source or destination character LOB (including NCLOB).
VARCHAR2	Source or destination character buffer (used with CLOB and NCLOB).
INTEGER	Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access.
BFILE	Large, binary object stored outside the database.

The DBMS_LOB package defines no special types.

An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets.

The clause ANY_CS in the specification of DBMS_LOB subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

Rules and Limits

- General Rules and Limits
- Rules and Limits Specific to External Files (BFILEs)
- Maximum LOB Size
- Maximum Buffer Size

General Rules and Limits

- The following rules apply in the specification of subprograms in this package:
  - `length`, `offset`, and `amount` parameters for subprograms operating on `BLOB`s and `BFILE`s must be specified in terms of *bytes*.
  - `length`, `offset`, and `amount` parameters for subprograms operating on `CLOB`s must be specified in terms of *characters*.
- A subprogram raises an `INVALID_ARGVAL` exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
  1. Only positive, absolute offsets from the beginning of `LOB` data are permitted: Negative offsets from the tail of the `LOB` are not permitted.
  2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as `amount`, `offset`, `newlen`, `nth`, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
  3. The value of `offset`, `amount`, `newlen`, `nth` must not exceed the value `lobmaxsize` 18446744073709551615 (2^{64}) in any `DBMS_LOB` subprogram.
  4. For `CLOB`s consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed (`lobmaxsize/character_width_in_bytes`) characters .

     For example, if the `CLOB` consists of 2-byte characters, such as:

     ```
     JA16SJISFIXED
     ```

     Then, the maximum `amount` value should not exceed:

     ```
     18446744073709551615/2 = 9223372036854775807
     ```
- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for `RAW` and `VARCHAR2` parameters used in `DBMS_LOB` subprograms. For example, if you declare a variable to be:

  ```
  charbuf VARCHAR2(3000)
  ```

  Then, `charbuf` can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for `DBMS_LOB` subprograms for `CLOB`s and `NCLOB`s.
- The `%CHARSET` clause indicates that the form of the parameter with `%CHARSET` must match the form of the `ANY_CS` parameter to which it refers.

  For example, in `DBMS_LOB` subprograms that take a `VARCHAR2` buffer parameter, the form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. If the input `LOB` parameter is of type `NCLOB`, then the buffer must contain `NCHAR`

data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For DBMS_LOB subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be NCLOBs, or they must both be CLOBs.

- If the value of amount plus the offset exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

  Under these input conditions, read subprograms, such as READ, COMPARE, INSTR, and SUBSTR, read until End of Lob/File is reached. For example, for a READ operation on a BLOB or BFILE, if the user specifies offset value of 3 GB and an amount value of 2 GB on a LOB that is 4GB in size, then READ returns only 1GB (4GB-3GB) bytes.

- Functions with NULL or invalid input values for parameters return a NULL. Procedures with NULL values for destination LOB parameters raise exceptions.
- Operations involving patterns as parameters, such as COMPARE, INSTR, and SUBSTR do not support regular expressions or special matching characters (such as % in the LIKE operator in SQL) in the pattern parameter or substrings.
- The End Of LOB condition is indicated by the READ procedure using a NO_DATA_FOUND exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The READ buffer for the last read contains 0 bytes.
- For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.
- Unless otherwise stated, the default value for an offset parameter is 1, which indicates the first byte in the BLOB or BFILE data, and the first character in the CLOB or NCLOB value. No default values are specified for the amount parameter — you must input the values explicitly.
- You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as APPEND, COPY, ERASE, TRIM, or WRITE. These subprograms do not implicitly lock the row containing the LOB.

Rules and Limits Specific to External Files (BFILEs)

- The subprograms COMPARE, INSTR, READ, SUBSTR, FILECLOSE, FILECLOSEALL and LOADFROMFILE operate only on an *opened* BFILE locator; that is, a successful FILEOPEN call must precede a call to any of these subprograms.
- For the functions FILEEXISTS, FILEGETNAME and GETLENGTH, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the DIRECTORY object and the file.
- DBMS_LOB does not support any concurrency control mechanism for BFILE operations.
- In the event of several open files in the session whose closure has not been handled properly, you can use the FILECLOSEALL subprogram to close all files opened in the session and resume file operations from the beginning.
- If you are the creator of a DIRECTORY, or if you have system privileges, then use the CREATE OR REPLACE, DROP, and REVOKE statements in SQL with extreme caution.

  If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to

invoke a program or anonymous block that calls FILECLOSEALL, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after *both* normal and abnormal termination of operations on the BFILE.

  In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than SESSION_MAX_OPEN_FILES.

  In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the BFILE variable in its most current state.

  After the exception transfers program control outside the PL/SQL program block, all references to the open BFILEs are lost. The result is a larger open file count which may or may not exceed the SESSION_MAX_OPEN_FILES value.

  For example, consider a READ operation past the end of the BFILE value, which generates a NO_DATA_FOUND exception:

```
-- This assumes a directory 'DDD' whose path is already known
DECLARE
       fil BFILE:= bfilename('DDD', 'filename.foo');
       pos INTEGER;
       amt BINARY_INTEGER;
       buf RAW(40);
BEGIN
       SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
       dbms_lob.open(fil, dbms_lob.lob_readonly);
       amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
       dbms_lob.read(fil, amt, pos, buf);
       dbms_output.put_line('Read F1 past EOF: '||
           utl_raw.cast_to_varchar2(buf));
       dbms_lob.close(fil);
END;

ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10
```

  After the exception has occurred, the BFILE locator variable file goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```
DECLARE
     fil BFILE;
     pos INTEGER;
     amt BINARY_INTEGER;
     buf RAW(40);
BEGIN
     SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
     dbms_lob.open(fil, dbms_lob.lob_readonly);
     amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
     dbms_lob.read(fil, amt, pos, buf);
     dbms_output.put_line('Read F1 past EOF: '||
          utl_raw.cast_to_varchar2(buf));
     dbms_lob.close(fil);
     exception
```

```
      WHEN no_data_found
      THEN
        BEGIN
          dbms_output.put_line('End of File reached. Closing file');
          dbms_lob.fileclose(fil);
          -- or dbms_lob.filecloseall if appropriate
        END;
END;
      /

Statement processed.
End of File reached. Closing file
```

In general, you should ensure that files opened in a PL/SQL block using `DBMS_LOB` are closed before normal or abnormal termination of the block.

Maximum LOB Size

The maximum size for LOBs supported by the database is equal to the value of the blocksize of the tablespace the LOB column resides in times the value 2^{32}-1 (4294967295). This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

Maximum Buffer Size

The maximum buffer size, 32767 bytes, is represented by `maxbufsize`.

Operational Notes

All DBMS_LOB subprograms work based on LOB locators. For the successful completion of DBMS_LOB subprograms, you must provide an input locator that represents a LOB that already exists in the database tablespaces or external file system. See also Chapter 1 of *Oracle Database SecureFiles and Large Objects Developer's Guide.*

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.

- Internal LOBs
- External LOBs
- Temporary LOBs

Internal LOBs

To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

External LOBs

For an external LOB (BFILE) to be represented by a LOB locator, you must:

- Ensure that a DIRECTORY object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the DIRECTORY object and the filename of the external LOB you are adding to the BFILENAME function to create a LOB locator for your external LOB.

Once you have completed these tasks, you can insert or update a row containing a LOB column using the given LOB locator.

After the LOBs are defined and created, you can then SELECT from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to DBMS_LOB for access to the LOB value.

For details on the different ways to do this, you must refer to the section of the *Oracle Database SecureFiles and Large Objects Developer's Guide* that describes "Accessing External LOBs (BFILEs)."

Temporary LOBs

The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either BLOBs, CLOBs, or NCLOBs.

A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as CACHE/ NOCACHE. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and rollbacks are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL DBMS_LOB package, PRO*C, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the EMPTY_BLOB or EMPTY_CLOB functions that are supported for permanent LOBs. The EMPTY_BLOB function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the DBMS_LOB package by using the appropriate FREETEMPORARY or OCIDurationEnd statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and DBMS_LOB statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or DBMS_LOB COPY command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a v$ view called V$TEMPORARY_LOBS, which contains information about how many temporary LOBs exist for each session. V$ views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using V$TEMPORARY_LOBS in conjunction with DBA_SEGMENTS, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in DBMS_LOB return NULL if any of the input parameters are NULL. All procedures in DBMS_LOB raise an exception if the LOB locator is input as NULL.
2. Operations based on CLOBs do not verify if the character set IDs of the parameters (CLOB parameters, VARCHAR2 buffers and patterns, and so on) match. It is the user's responsibility to ensure this.
3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.
4. Temporary LOBs still adhere to value semantics in order to be consistent with permanent LOBs and to try to conform to the ANSI standard for LOBs. As a result, each time a user does an OCILobLocatatorAssign, or the equivalent assignment in PL/SQL, the database makes a copy of the temporary LOB.

   Each locator points to its own LOB value. If one locator is used to create a temporary LOB, and then is assigned to another LOB locator using OCILobLOcatorAssign in OCI or through an assignment operation in PL/SQL, then the database copies the original temporary LOB and causes the second locator to point to the copy.

   In order for users to modify the same LOB, they must go through the same locator. In OCI, this can be accomplished fairly easily by using pointers to locators and assigning the pointers to point to the same locator. In PL/SQL, the same LOB variable must be used to update the LOB to get this effect.

   The following example shows a place where a user incurs a copy, or at least an extra round-trip to the server.

```
DECLARE
  a blob;
  b blob;
BEGIN
  dbms_lob.createtemporary(b, TRUE);
  -- the following assignment results in a deep copy
  a := b;
END;
```

   The PL/SQL compiler makes temporary copies of actual arguments bound to OUT or IN OUT parameters. If the actual parameter is a temporary LOB, then the temporary copy is a deep (value) copy.

   The following PL/SQL block illustrates the case where the user incurs a deep copy by passing a temporary LOB as an IN OUT parameter.

```
DECLARE
  a blob;
  procedure foo(parm IN OUT blob) is
  BEGIN
   ...
  END;
```

```
BEGIN
  dbms_lob.createtemporary(a, TRUE);
  -- the following call results in a deep copy of the blob a
  foo(a);
END;
```

To minimize deep copies on PL/SQL parameter passing, use the `NOCOPY` compiler hint where possible.

The duration parameter passed to `dbms_lob.createtemporary()` is a hint. The duration of the new temp `LOB` is the same as the duration of the locator variable in PL/SQL. For example, in the preceding program block, the program variable `a` has the duration of the residing frame. Therefore at the end of the block, memory of `a` will be freed at the end of the function.

If a PL/SQL package variable is used to create a temp `LOB`, it will have the duration of the package variable, which has a duration of `SESSION`.

```
BEGIN
   y clob;
  END;
/
BEGIN
   dbms_lob.createtemporary(package.y, TRUE);
END;
```

See Also: *Oracle Database PL/SQL Language Reference* for more information on `NOCOPY` syntax

Exceptions

Table 69–5 DBMS_LOB Exceptions

Exception	Code	Description
ACCESS_ERROR	22925	You are trying to write too much data to the LOB: LOB size is limited to 4 gigabytes.
BUFFERING_ENABLED	22279	Cannot perform operation with LOB buffering enabled
INVALID_ARGVAL	21560	The argument is expecting a non-NULL, valid value but the argument value passed in is NULL, invalid, or out of range.
INVALID_DIRECTORY	22287	The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access.
NO_DATA_FOUND		ENDOFLOB indicator for looping read operations. This is not a hard error.
NOEXIST_DIRECTORY	22285	The directory leading to the file does not exist.
NOPRIV_DIRECTORY	22286	The user does not have the necessary access privileges on the directory or the file for the operation.
OPEN_TOOMANY	22290	The number of open files has reached the maximum limit.
OPERATION_FAILED	22288	The operation attempted on the file failed.
QUERY_WRITE	14553	Cannot perform a LOB write inside a query or PDML slave
SECUREFILE_BADLOB	43856	A non-SECUREFILE LOB type was used in a SECUREFILE only call
SECUREFILE_BADPARAM	43857	An invalid argument was passed to a SECUREFILE subprogram
SECUREFILE_ MARKERASED	43861	The mark provided to a FRAGMENT_* operation has been deleted
SECUREFILE_ OUTOFBOUNDS	43883	Attempted to perform a FRAGMENT_* operation past the LOB end
SECUREFILE_ WRONGTYPE	43854	A BASICFILE LOB was used in subprogram that can be used with only SECUREFILE LOB
UNOPENED_FILE	22289	The file is not open for the required operation to be performed.
VALUE_ERROR	6502	PL/SQL error for invalid values to subprogram's parameters.

Summary of DBMS_LOB Subprograms

Table 69–6 DBMS_LOB Package Subprograms

Subprogram	Description
APPEND Procedures on page 69-18	Appends the contents of the source LOB to the destination LOB
CLOSE Procedure on page 69-19	Closes a previously opened internal or external LOB
COMPARE Functions on page 69-20	Compares two entire LOBs or parts of two LOBs
CONVERTTOBLOB Procedure on page 69-22	Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets
CONVERTTOCLOB Procedure on page 69-25	Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets
COPY Procedures on page 69-28	Copies all, or part, of the source LOB to the destination LOB
CREATETEMPORARY Procedures on page 69-30	Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace
ERASE Procedures on page 69-31	Erases all or part of a LOB
FILECLOSE Procedure on page 69-33	Closes the file
FILECLOSEALL Procedure on page 69-34	Closes all previously opened files
FILEEXISTS Function on page 69-35	Checks if the file exists on the server
FILEGETNAME Procedure on page 69-36	Gets the directory object name and file name
FILEISOPEN Function on page 69-37	Checks if the file was opened using the input BFILE locators
FILEOPEN Procedure on page 69-38	Opens a file
FRAGMENT_DELETE Procedure on page 69-39	Deletes the data at the given offset for the given length from the LOB
FRAGMENT_INSERT Procedures on page 69-40	Inserts the given data (limited to 32K) into the LOB at the given offset
FRAGMENT_MOVE Procedure on page 69-41	Moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the given offset to the new offset specified
FRAGMENT_REPLACE Procedures on page 69-42	Replaces the data at the given offset with the given data (not to exceed 32k)
FREETEMPORARY Procedures on page 69-44	Frees the temporary BLOB or CLOB in the default temporary tablespace

Table 69–6 (Cont.) DBMS_LOB Package Subprograms

Subprogram	Description
GETCHUNKSIZE Functions on page 69-46	Returns the amount of space used in the `LOB` chunk to store the `LOB` value
GETLENGTH Functions on page 69-47	Gets the length of the LOB value
GETOPTIONS Functions on page 69-48	Obtains settings corresponding to the `option_types` field for a particular LOB
GET_STORAGE_LIMIT Function on page 69-45	Returns the storage limit for LOBs in your database configuration
INSTR Functions on page 69-49	Returns the matching position of the *nth* occurrence of the pattern in the `LOB`
ISOPEN Functions on page 69-51	Checks to see if the `LOB` was already opened using the input locator
ISTEMPORARY Functions on page 69-52	Checks if the locator is pointing to a temporary `LOB`
LOADBLOBFROMFILE Procedure on page 69-53	Loads `BFILE` data into an internal `BLOB`
LOADCLOBFROMFILE Procedure on page 69-55	Loads `BFILE` data into an internal `CLOB`
LOADFROMFILE Procedure on page 69-59	Loads `BFILE` data into an internal `LOB`
OPEN Procedures on page 69-61	Opens a `LOB` (internal, external, or temporary) in the indicated mode
READ Procedures on page 69-63	Reads data from the `LOB` starting at the specified offset
SETOPTIONS Procedures on page 69-65	Enables CSCE features on a per-LOB basis, overriding the default LOB column settings
SUBSTR Functions on page 69-66	Returns part of the `LOB` value starting at the specified offset
TRIM Procedures on page 69-68	Trims the `LOB` value to the specified shorter length
WRITE Procedures on page 69-70	Writes data to the `LOB` from a specified offset
WRITEAPPEND Procedures on page 69-72	Writes a buffer to the end of a `LOB`

APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

There are two overloaded APPEND procedures.

Syntax

```
DBMS_LOB.APPEND (
   dest_lob IN OUT  NOCOPY BLOB,
   src_lob  IN             BLOB);

DBMS_LOB.APPEND (
   dest_lob IN OUT  NOCOPY CLOB  CHARACTER SET ANY_CS,
   src_lob  IN             CLOB  CHARACTER SET dest_lob%CHARSET);
```

Parameters

Table 69–7 APPEND Procedure Parameters

Parameter	Description
dest_lob	Locator for the internal LOB to which the data is to be appended.
src_lob	Locator for the internal LOB from which the data is to be read.

Exceptions

Table 69–8 APPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Either the source or the destination LOB is NULL.
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

Syntax

```
DBMS_LOB.CLOSE (
   lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (
   lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (
   file_loc   IN OUT NOCOPY BFILE);
```

Parameters

Table 69–9 CLOSE Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Exceptions

No error is returned if the BFILE exists but is not opened. An error is returned if the LOB is not open.

Usage Notes

CLOSE requires a round-trip to the server for both internal and external LOBs. For internal LOBs, CLOSE triggers other code that relies on the close call, and for external LOBs (BFILEs), CLOSE actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

Syntax

```
DBMS_LOB.COMPARE (
   lob_1            IN BLOB,
   lob_2            IN BLOB,
   amount           IN INTEGER := DBMS_LOB.LOBMAXSIZE,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.COMPARE (
   lob_1            IN CLOB  CHARACTER SET ANY_CS,
   lob_2            IN CLOB  CHARACTER SET lob_1%CHARSET,
   amount           IN INTEGER := DBMS_LOB.LOBMAXSIZE,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.COMPARE (
   lob_1            IN BFILE,
   lob_2            IN BFILE,
   amount           IN INTEGER,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 69–10 COMPARE Function Parameters

Parameter	Description
lob_1	LOB locator of first target for comparison.
lob_2	LOB locator of second target for comparison.
amount	Number of bytes (for BLOBs) or characters (for CLOBs/NCLOBSs) to compare.
offset_1	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.
offset_2	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.

Return Values

- INTEGER: Zero if the comparison succeeds, nonzero if not.
- NULL, if
  - amount < 1
  - amount > LOBMAXSIZE

- offset_1 or offset_2 < 1
  - offset_1 or offset_2 > LOBMAXSIZE

Usage Notes

You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

COMPARE returns zero if the data exactly matches over the range specified by the offset and amount parameters. Otherwise, a nonzero INTEGER is returned.

For fixed-width *n*-byte CLOBs, if the input amount for COMPARE is specified to be greater than (DBMS_LOB.LOBMAXSIZE/*n*), then COMPARE matches characters in a range of size (DBMS_LOB.LOBMAXSIZE/*n*), or Max(length(clob1), length(clob2)), whichever is lesser.

Exceptions

Table 69–11 COMPARE Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOBLOB(
  dest_lob       IN OUT     NOCOPY  BLOB,
  src_clob       IN         CLOB CHARACTER SET ANY_CS,
  amount         IN         INTEGER,
  dest_offset    IN OUT     INTEGER,
  src_offset     IN OUT     INTEGER,
  blob_csid      IN         NUMBER,
  lang_context   IN OUT     INTEGER,
  warning        OUT        INTEGER);
```

Parameters

Table 69–12 CONVERTTOBLOB Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of characters to convert from the source LOB. If you want to copy the entire LOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the LOB.
dest_offset	(IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in bytes after the end of the write.
src_offset	(IN) Offset in characters in the source LOB for the start of the read. (OUT) Offset in characters in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 69–12 (Cont.) CONVERTTOBLOB Procedure Parameters

Parameter	Description
warning	(OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.

Usage Notes

Preconditions

Before calling the CONVERTTOBLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults

All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 69–13 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.

Table 69–13 DBMS_LOB.CONVERTTOBLOB Typical Values

Parameter	Value	Description
amount	LOBMAXSIZE (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
blob_csid	DEFAULT_CSID (IN)	default CSID, use same CSID as source LOB
lang_context	DEFAULT_LANG_CTX (IN)	default language context
warning	NO_WARNING (OUT)	no warning message, success
	WARN_INCONVERTIBLE_CHAR (OUT)	character in source cannot be properly converted

General Notes

You must specify the desired character set for the destination LOB in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the desired character set is the same as the source LOB character set.

You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The amount and src_offset values are in

characters and the dest_offset is in bytes. To convert the entire LOB, you can specify LOBMAXSIZE for the amount parameter.

Exceptions

Table 69–14 gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

Table 69–14 CONVERTTOBLOB Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOCLOB(
   dest_lob       IN OUT NOCOPY  CLOB CHARACTER SET ANY_CS,
   src_blob       IN             BLOB,
   amount         IN             INTEGER,
   dest_offset    IN OUT         INTEGER,
   src_offset     IN OUT         INTEGER,
   blob_csid      IN             NUMBER,
   lang_context   IN OUT         INTEGER,
   warning        OUT            INTEGER);
```

Parameters

Table 69–15 CONVERTTOCLOB Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of bytes to convert from the source LOB. If you want to copy the entire BLOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the BLOB.
dest_offset	(IN) Offset in characters in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in characters after the end of the write. This offset always points to the beginning of the first complete character after the end of the write.
src_offset	(IN) Offset in bytes in the source LOB for the start of the read. (OUT) Offset in bytes in the source LOB right after the end of the read.
blob_csid	The character set ID of the source data
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 69–15 (Cont.) CONVERTTOCLOB Procedure Parameters

Parameter	Description
warning	Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.

Usage Notes

Preconditions

Before calling the CONVERTTOCLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the CONVERTTOCLOB procedure. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults

All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 69–16 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.

Table 69–16 DBMS_LOB.CONVERTTOCLOB Typical Values

Parameter	Value	Description
amount	LOBMAXSIZE (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	DEFAULT_CSID (IN)	default CSID, use destination CSID
lang_context	DEFAULT_LANG_CTX (IN)	default language context
warning	NO_WARNING (OUT)	no warning message, success
	WARN_INCONVERTIBLE_CHAR (OUT)	character in source cannot be properly converted

General Notes

You must specify the character set of the source data in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the BLOB contains character data in the same character set as the destination CLOB.

You must specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BLOB. The amount and src_offset values are in bytes and the dest_offset is in characters. To convert the entire BLOB, you can specify LOBMAXSIZE for the amount parameter.

Exceptions

Table 69–17 CONVERTTOCLOB Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

Syntax

```
DBMS_LOB.COPY (
  dest_lob    IN OUT NOCOPY BLOB,
  src_lob     IN            BLOB,
  amount      IN            INTEGER,
  dest_offset IN            INTEGER := 1,
  src_offset  IN            INTEGER := 1);

DBMS_LOB.COPY (
  dest_lob    IN OUT NOCOPY CLOB  CHARACTER SET ANY_CS,
  src_lob     IN            CLOB  CHARACTER SET dest_lob%CHARSET,
  amount      IN            INTEGER,
  dest_offset IN            INTEGER := 1,
  src_offset  IN            INTEGER := 1);
```

Parameters

Table 69–18 COPY Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the copy target.
src_lob	LOB locator of source for the copy.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to copy.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.
src_offset	Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.

Exceptions

Table 69–19 COPY Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or invalid.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1 - src_offset or dest_offset > LOBMAXSIZE - amount < 1 - amount > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

Usage Notes

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the src_offset to the end of the source LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

Syntax

```
DBMS_LOB.CREATETEMPORARY (
   lob_loc IN OUT NOCOPY BLOB,
   cache   IN            BOOLEAN,
   dur     IN            PLS_INTEGER := DBMS_LOB.SESSION);

DBMS_LOB.CREATETEMPORARY (
   lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   cache   IN            BOOLEAN,
   dur     IN            PLS_INTEGER := 10);
```

Parameters

Table 69–20 CREATETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
cache	Specifies if LOB should be read into buffer cache or not.
dur	1 of 3 predefined duration values (SESSION, TRANSACTION, or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session, transaction or call. If dur is omitted, then the session duration is used.

See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure
- *Oracle Database PL/SQL Language Reference* for more information about NOCOPY and passing temporary lobs as parameters

ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

Syntax

```
DBMS_LOB.ERASE (
   lob_loc           IN OUT   NOCOPY   BLOB,
   amount            IN OUT   NOCOPY   INTEGER,
   offset            IN                INTEGER := 1);

DBMS_LOB.ERASE (
   lob_loc           IN OUT   NOCOPY   CLOB CHARACTER SET ANY_CS,
   amount            IN OUT   NOCOPY   INTEGER,
   offset            IN                INTEGER := 1);
```

Parameters

Table 69–21 ERASE Procedure Parameters

Parameter	Description
lob_loc	Locator for the LOB to be erased.For more information, see Operational Notes.
amount	Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.
offset	Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).

Usage Notes

Note: The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "TRIM Procedures" on page 69-68.

When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.

The actual number of bytes or characters erased can differ from the number you specified in the amount parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the amount parameter.

Exceptions

Table 69–22 ERASE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any input parameter is NULL.
INVALID_ARGVAL	Either: - amount < 1 or amount > LOBMAXSIZE - offset < 1 or offset > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave

Table 69–22 (Cont.) ERASE Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- "TRIM Procedures" on page 69-68
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILECLOSE Procedure

This procedure closes a BFILE that has already been opened through the input locator.

> **Note:** The database has only read-only access to BFILEs. This means that BFILEs cannot be written through the database.

Syntax

```
DBMS_LOB.FILECLOSE (
    file_loc IN OUT NOCOPY BFILE);
```

Parameters

Table 69–23 FILECLOSE Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE to be closed.

Exceptions

Table 69–24 FILECLOSE Procedure Exceptions

Exception	Description
VALUE_ERROR	NULL input value for file_loc.
UNOPENED_FILE	File was not opened with the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- "FILEOPEN Procedure" on page 69-38
- "FILECLOSEALL Procedure" on page 69-34
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILECLOSEALL Procedure

This procedure closes all `BFILE`s opened in the session.

Syntax

```
DBMS_LOB.FILECLOSEALL;
```

Exceptions

Table 69–25 FILECLOSEALL Procedure Exception

Exception	Description
`UNOPENED_FILE`	No file has been opened in the session.

See Also:

- "FILEOPEN Procedure" on page 69-38
- "FILECLOSE Procedure" on page 69-33
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEEXISTS Function

This function finds out if a given BFILE locator points to a file that actually exists on the server's file system.

Syntax

```
DBMS_LOB.FILEEXISTS (
   file_loc     IN    BFILE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–26 FILEEXISTS Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

Table 69–27 FILEEXISTS Function Return Values

Return	Description
0	Physical file does not exist.
1	Physical file exists.

Exceptions

Table 69–28 FILEEXISTS Function Exceptions

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- "FILEISOPEN Function" on page 69-37.
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator. This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the dir_alias buffer is 30, and for the entire path name, it is 2000.

Syntax

```
DBMS_LOB.FILEGETNAME (
   file_loc   IN    BFILE,
   dir_alias  OUT   VARCHAR2,
   filename   OUT   VARCHAR2);
```

Parameters

Table 69–29 FILEGETNAME Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE
dir_alias	Directory object name
filename	Name of the BFILE

Exceptions

Table 69–30 FILEGETNAME Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	dir_alias or filename are NULL.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEISOPEN Function

This function finds out whether a BFILE was opened with the given FILE locator.

Syntax

```
DBMS_LOB.FILEISOPEN (
   file_loc   IN    BFILE)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–31 FILEISOPEN Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

INTEGER: 0 = file is not open, 1 = file is open

Usage Notes

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

Exceptions

Table 69–32 FILEISOPEN Function Exceptions

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- "FILEEXISTS Function" on page 69-35
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

Syntax

```
DBMS_LOB.FILEOPEN (
   file_loc   IN OUT NOCOPY  BFILE,
   open_mode  IN             BINARY_INTEGER := file_readonly);
```

Parameters

Table 69–33 FILEOPEN Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE.
open_mode	File access is read-only.

Exceptions

Table 69–34 FILEOPEN Procedure Exceptions

Exception	Description
VALUE_ERROR	file_loc or open_mode is NULL.
INVALID_ARGVAL	open_mode is not equal to FILE_READONLY.
OPEN_TOOMANY	Number of open files in the session exceeds session_max_open_files.
NOEXIST_DIRECTORY	Directory associated with file_loc does not exist.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- "FILECLOSE Procedure" on page 69-33
- "FILECLOSEALL Procedure" on page 69-34
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FRAGMENT_DELETE Procedure

This procedure deletes the data at the specified offset for the given length from the LOB without having to rewrite all the data in the LOB following the specified offset.

Syntax

```
DBMS_LOB.FRAGMENT_DELETE (
   lob_loc     IN OUT NOCOPY BLOB,
   amount      IN            INTEGER,
   offset      IN            INTEGER);

DBMS_LOB.FRAGMENT_DELETE (
   lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount      IN            INTEGER,
   offset      IN            INTEGER);
```

Parameters

Table 69–35 FRAGMENT_DELETE Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be removed from the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the deletion

Exceptions

Table 69–36 FRAGMENT_DELETE Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

FRAGMENT_INSERT Procedures

This function inserts the given data (limited to 32K) into the LOB at the given offset.

Syntax

```
DBMS_LOB.FRAGMENT_INSERT (
   lob_loc     IN OUT NOCOPY BLOB,
   amount      IN            INTEGER,
   offset      IN            INTEGER,
   buffer      IN            RAW);

DBMS_LOB.FRAGMENT_INSERT (
   lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount      IN            INTEGER,
   offset      IN            INTEGER,
   buffer      IN            VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 69–37 FRAGMENT_INSERT Procedure Parameters

Parameter	Description
lob_loc	LOB locator.For more information, see Operational Notes.
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be inserted from the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the insertion
buffer	Data to insert into the LOB

Exceptions

Table 69–38 FRAGMENT_INSERT Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

FRAGMENT_MOVE Procedure

This procedure moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the given offset to the new offset specified.

Syntax

```
DBMS_LOB.FRAGMENT_MOVE (
   lob_loc       IN OUT NOCOPY BLOB,
   amount        IN            INTEGER,
   src_offset    IN            INTEGER,
   dest_offset   IN            INTEGER);

DBMS_LOB.FRAGMENT_MOVE (
   lob_loc       IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount        IN            INTEGER,
   src_offset    IN            INTEGER,
   dest_offset   IN            INTEGER);
```

Parameters

Table 69–39 FRAGMENT_MOVE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be moved in the LOB
src_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
dest_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to remove the data

Exceptions

Table 69–40 FRAGMENT_MOVE Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

Usage Notes

- All offsets are pre-move offsets.
- Offsets of more than 1 past the end of the LOB are not permitted.

FRAGMENT_REPLACE Procedures

This procedure replaces the data at the given offset with the given data (not to exceed 32k).

Syntax

```
DBMS_LOB.FRAGMENT_REPLACE (
   lob_loc     IN OUT NOCOPY BLOB,
   old_amount  IN            INTEGER,
   new_amount  IN            INTEGER,
   offset      IN            INTEGER,
   buffer      IN            RAW);

DBMS_LOB.FRAGMENT_REPLACE (
   lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   old_amount  IN           INTEGER,
   new_amount  IN           INTEGER,
   offset      IN           INTEGER,
   buffer      IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 69–41 FRAGMENT_REPLACE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
old_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be replaced in the LOB
new_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to written to the LOB
offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
buffer	Data to insert into the LOB

Exceptions

Table 69–42 FRAGMENT_REPLACE Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

Usage Notes

Invoking this procedure is equivalent to deleting the old amount of bytes/characters at offset and then inserting the new amount of bytes/characters at offset.

FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in the default temporary tablespace.

Syntax

```
DBMS_LOB.FREETEMPORARY (
   lob_loc  IN OUT  NOCOPY BLOB);

DBMS_LOB.FREETEMPORARY (
   lob_loc  IN OUT  NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 69–43 FREETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator.For more information, see Operational Notes.

Usage Notes

- When a new temporary LOB is created, and there is currently no temporary LOB in use with the same duration (session, transaction, call), a new temporary LOB segment is created. When the temporary LOB is freed, the space it consumed is released to the temporary segment. If there are no other temporary LOBs for the same duration, the temporary segment is also freed.
- After the call to FREETEMPORARY, the LOB locator that was freed is marked as invalid.
- If an invalid LOB locator is assigned to another LOB locator using OCILobLocatorAssign in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

GET_STORAGE_LIMIT Function

This function returns the LOB storage limit for the given LOB.

Syntax

```
DBMS_LOB.GET_STORAGE_LIMIT (
   lob_loc  IN CLOB CHARACTER SET ANY_CS)
 RETURN INTEGER;

DBMS_LOB.GET_STORAGE_LIMIT (
   lob_loc  IN BLOB)
 RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(get_storage_limit, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–44 GET_STORAGE_LIMIT Function Parameters

Parameter	Description
`lob_loc`	`LOB` locator. For more information, see Operational Notes.

Return Value

The value returned from this function is the maximum allowable size for given LOB locator. For `BLOB`s, the return value depends on the block size of the tablespace the LOB resides in and is calculated as (2^{32})-1 (4294967295) times the block size of the tablespace. For `CLOB`s/`NCLOB`s, the value returned will be the(2^{32})-1 (4294967295) times the block size of the tablespace divided by the character width of the `CLOB`/`NCLOB`.

Usage

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for details on LOB storage limits

GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, a multiple of tablespace blocks in bytes. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value.

This function returns the amount of space used in the LOB chunk to store the LOB value.

Syntax

```
DBMS_LOB.GETCHUNKSIZE (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.GETCHUNKSIZE (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(getchunksize, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–45 GETCHUNKSIZE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Return Values

The value returned for BLOBs is in terms of bytes. The value returned for CLOBs is in terms of characters.

Usage Notes

With regard to basic LOB files, performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the WRITE until you have enough for a chunk, instead of issuing several WRITE calls for the same chunk.

These tactics of performance improvement do not apply to securefiles.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

Exceptions

Table 69–46 GETCHUNKSIZE Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

Syntax

```
DBMS_LOB.GETLENGTH (
   lob_loc    IN  BLOB)
  RETURN INTEGER;

DBMS_LOB.GETLENGTH (
   lob_loc    IN  CLOB   CHARACTER SET ANY_CS)
  RETURN INTEGER;

DBMS_LOB.GETLENGTH (
   file_loc    IN  BFILE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 69–47 GETLENGTH Function Parameter

Parameter	Description
file_loc	The file locator for the LOB whose length is to be returned.

Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob_loc is NULL. An error is returned in the following cases for BFILEs:

- lob_loc does not have the necessary directory and operating system privileges
- lob_loc cannot be read because of an operating system read error

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

Exceptions

Table 69–48 GETLENGHTH Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

GETOPTIONS Functions

This function obtains settings corresponding to the `option_type` field for a particular LOB.

Syntax

```
DBMS_LOB.GETOPTIONS (
   lob_loc             IN     BLOB,
   option_types        IN     PLS_INTEGER)
 RETURN PLS_INTEGER;

DBMS_LOB.GETOPTIONS (
  lob_loc             IN     CLOB HARACTER SET ANY_CS,
  option_types        IN     PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 69–49 GETOPTIONS Function Parameter

Parameter	Description
`lob_loc`	Locator for the `LOB` to be examined. For more information, see Operational Notes.
`option_type`	See DBMS_LOB Option Types on page 69-5

Return Values

The return values are a combination of `COMPRESS_ON`, `ENCRYPT_ON` and `DEDUPLICATE_ON` (see DBMS_LOB Option Values on page 69-5) depending on which option types (see DBMS_LOB Option Types on page 69-5) are passed in.

Exceptions

Table 69–50 GETOPTIONS Procedure Exceptions

Exception	Description
`SECUREFILE_BADLOB`	Unsupported object type for the operation
`INVALID_ARGVAL`	A parameter value was invalid
`QUERY_WRITE`	Cannot perform operation during a query
`BUFFERING_ENABLED`	Cannot perform operation with LOB buffering enabled
`SECUREFILE_BADLOB`	A non-`SECUREFILE` LOB was used in a `SECUREFILE` LOB only call
`SECUREFILE_WRONGTYPE`	A `BASICFILE` LOB was used in a `SECUREFILE` LOB only call

INSTR Functions

This function returns the matching position of the *nth* occurrence of the pattern in the LOB, starting from the offset you specify.

Syntax

```
DBMS_LOB.INSTR (
   lob_loc    IN   BLOB,
   pattern    IN   RAW,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.INSTR (
   lob_loc    IN   CLOB      CHARACTER SET ANY_CS,
   pattern    IN   VARCHAR2  CHARACTER SET lob_loc%CHARSET,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.INSTR (
   file_loc   IN   BFILE,
   pattern    IN   RAW,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 69–51 INSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
pattern	Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs.The maximum size of the pattern is 16383 bytes.
offset	Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)
nth	Occurrence number, starting at 1.

Return Values

Table 69–52 INSTR Function Return Values

Return	Description
INTEGER	Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.

Table 69–52 (Cont.) INSTR Function Return Values

Return	Description
NULL	Either: -any one or more of the IN parameters was NULL or INVALID. -offset < 1 or offset > LOBMAXSIZE. -nth < 1. -nth > LOBMAXSIZE.

Usage Notes

The form of the VARCHAR2 buffer (the pattern parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

Exceptions

Table 69–53 INSTR Function Exceptions for BFILES

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

See Also:

- "SUBSTR Functions" on page 69-66
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

Syntax

```
DBMS_LOB.ISOPEN (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
   file_loc IN BFILE)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–54 ISOPEN Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
file_loc	File locator.

Return Values

The return value will be 1 if the LOB is open, 0 otherwise.

Usage Notes

For BFILES, openness is associated with the locator. If the input locator was never passed to OPEN, the BFILE is not considered to be opened by this locator. However, a different locator may have opened the BFILE. More than one OPEN can be performed on the same BFILE using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, ISOPEN requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.

For external LOBs (BFILEs), ISOPEN also requires a round-trip, because that's where the state is kept.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

ISTEMPORARY Functions

This function determines whether a LOB instance is temporary.

Syntax

```
DBMS_LOB.ISTEMPORARY (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.ISTEMPORARY (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–55 ISTEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Return Values

The return value will be 1 if the LOB is temporary is open, 0 otherwise.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as LOADFROMFILE, and returns the new offsets.

Syntax

```
DBMS_LOB.LOADBLOBFROMFILE (
   dest_lob    IN OUT NOCOPY BLOB,
   src_bfile   IN            BFILE,
   amount      IN            INTEGER,
   dest_offset IN OUT        INTEGER,
   src_offset  IN OUT        INTEGER);
```

Parameters

Table 69–56 LOADBLOBFROMFILE Procedure Parameters

Parameter	Description
dest_lob	BLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in bytes for BLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect

performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for IN/OUT parameter or provide a default value for the IN parameter. Here is a summary of the constants and the defaults that can be used.

Table 69–57 Suggested Values of the Parameter

Parameter	Default Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Constants defined in DBMSLOB.SQL

```
lobmaxsize                    CONSTANT INTEGER        := DBMS_LOB.LOBMAXSIZE;
```

Exceptions

Table 69–58 LOADBLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the BLOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

Syntax

```
DBMS_LOB.LOADCLOBFROMFILE (
   dest_lob       IN OUT NOCOPY   NOCOPY CLOB CHARACTER SET ANY_CS,
   src_bfile      IN              BFILE,
   amount         IN              INTEGER,
   dest_offset    IN OUT          INTEGER,
   src_offset     IN OUT          INTEGER,
   bfile_csid     IN              NUMBER,
   lang_context   IN OUT          INTEGER,
   warning        OUT             INTEGER);
```

Parameters

Table 69–59 LOADCLOBFROMFILE Procedure Parameters

Parameter	Description
dest_lob	CLOB/NCLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. Use DBMS_LOB.LOBMAXSIZE of load until the end of the BFILE.
dest_offset	(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read . (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.
bfile_csid	Character set id of the source (BFILE) file.
lang_context	(IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call

Table 69–59 (Cont.) LOADCLOBFROMFILE Procedure Parameters

Parameter	Description
warning	(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined the constant value DBMS_LOB.WARN_INCONVERTIBLE_CHAR.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.
- csid=0 indicates the default behavior that uses database csid for CLOB and national csid for NCLOB in the place of source csid. Conversion is still necessary if it is of varying width
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

  If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

The source BFILE can contain data in the Unicode character set. The Unicode standard defines many encoding schemes that provide mappings from Unicode characters to sequences of bytes. Table 69–60, " Supported Unicode Encoding Schemes" lists Unicode encodings schemes supported by this subprogram.

Table 69–60 Supported Unicode Encoding Schemes

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-8	AL32UTF8	873
UTF-16BE	AL16UTF16	2000

Table 69–60 (Cont.) Supported Unicode Encoding Schemes

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-16LE	AL16UTF16LE	2002
CESU-8	UTF8	871
UTF-EBCDIC	UTFE	872
UTF-16	UTF16	1000

All three UTF-16 encoding schemes encode Unicode characters as 2-byte unsigned integers. Integers can be stored in big-endian or in little-endian byte order. The UTF-16BE encoding scheme defines big-endian data. The UTF-16LE scheme defines little-endian data. The UTF-16 scheme requires that the source BFILE contains the Byte Order Mark (BOM) character in the first two bytes to define the byte order. The BOM code is 0xFEFF. If the code is stored as {0xFE, 0xFF}, the data is interpreted as big-endian. If it is stored as {0xFF, 0xFE}, the data is interpreted as little-endian.

In UTF-8 and in CESU-8 encodings the Byte Order Mark is stored as {0xEF, 0xBB, 0xBF}. With any of the Unicode encodings, the corresponding BOM sequence at the beginning of the file is recognized and not loaded into the destination LOB.

Constants

Here is a summary of the constants and the suggested values that can be used.

Table 69–61 Suggested Values of the Parameter

Parameter	Suggested Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	0 (IN)	default csid, use destination csid
lang_context	0 (IN)	default language context
warning	0 (OUT)	no warning message, everything is ok

Constants defined in DBMSLOB.SQL

```
lobmaxsize                CONSTANT INTEGER       := 18446744073709551615;
warn_inconvertible_char   CONSTANT INTEGER       := 1;
default_csid              CONSTANT INTEGER       := 0;
default_lang_ctx          CONSTANT INTEGER       := 0;
no_warning                CONSTANT INTEGER       := 0;
```

Exceptions

Table 69–62 LOADCLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.

Table 69–62 (Cont.) LOADCLOBFROMFILE Procedure Exceptions

Exception	Description
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the CLOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADFROMFILE Procedure

This procedure copies all, or a part of, a source external LOB (BFILE) to a destination internal LOB.

Syntax

```
DBMS_LOB.LOADFROMFILE (
   dest_lob    IN OUT NOCOPY BLOB,
   src_file    IN            BFILE,
   amount      IN            INTEGER,
   dest_offset IN            INTEGER  := 1,
   src_offset  IN            INTEGER  := 1);
```

Parameters

Table 69–63 LOADFROMFILE Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the target for the load.
src_file	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.
src_offset	Offset in bytes in the source BFILE (origin: 1) for the start of the load.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is either in bytes or characters for BLOBs and CLOBs respectively.

> **Note:** The input BFILE must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary BFILE data is loaded into a CLOB. The BFILE data must already be in the same character set as the CLOB in the database. No error checking is performed to verify this.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.

Note: If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using DBMS_LOB.LOADFROMFILE, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use sql*loader instead of LOADFROMFILE to load data into a CLOB or NCLOB because sql*loader will provide the necessary character set conversions.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Exceptions

Table 69–64 LOADFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

Syntax

```
DBMS_LOB.OPEN (
   lob_loc   IN OUT NOCOPY BLOB,
   open_mode IN            BINARY_INTEGER);

DBMS_LOB.OPEN (
   lob_loc   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   open_mode IN            BINARY_INTEGER);

DBMS_LOB.OPEN (
   file_loc  IN OUT NOCOPY BFILE,
   open_mode IN            BINARY_INTEGER := file_readonly);
```

Parameters

Table 69–65 OPEN Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
open_mode	Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY.

Usage Notes

> **Note:** If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILEs), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the buffer parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the amount parameter. If the input offset points past the End of LOB, then amount is set to 0, and a NO_DATA_FOUND exception is raised.

Syntax

```
DBMS_LOB.READ (
   lob_loc   IN             BLOB,
   amount    IN OUT  NOCOPY INTEGER,
   offset    IN             INTEGER,
   buffer    OUT            RAW);

DBMS_LOB.READ (
   lob_loc   IN             CLOB CHARACTER SET ANY_CS,
   amount    IN OUT  NOCOPY INTEGER,
   offset    IN             INTEGER,
   buffer    OUT            VARCHAR2 CHARACTER SET lob_loc%CHARSET);

DBMS_LOB.READ (
   file_loc   IN             BFILE,
   amount    IN OUT   NOCOPY INTEGER,
   offset    IN             INTEGER,
   buffer    OUT            RAW);
```

Parameters

Table 69–66 READ Procedure Parameters

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).
buffer	Output buffer for the read operation.

Exceptions

Table 69–67 lists exceptions that apply to any LOB instance. Table 69–68 lists exceptions that apply only to BFILEs.

Table 69–67 READ Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL.

Table 69–67 (Cont.) READ Procedure Exceptions

Exception	Description
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE - offset < 1 - offset > LOBMAXSIZE - amount is greater, in bytes or characters, than the capacity of buffer.
NO_DATA_FOUND	End of the LOB is reached, and there are no more bytes or characters to read from the LOB: amount has a value of 0.

Table 69–68 READ Procedure Exceptions for BFILEs

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.READ from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

SETOPTIONS Procedures

This procedure enables/disables CSCE features on a per-LOB basis, overriding the default LOB column settings.

Syntax

```
DBMS_LOB.SETOPTIONS (
   lob_loc             IN     BLOB,
   option_types        IN     PLS_INTEGER,
   options             IN     PLS_INTEGER);

DBMS_LOB.SETOPTIONS (
  lob_loc              IN     CLOB CHARACTER SET ANY_CS,
  option_types         IN     PLS_INTEGER,
  options              IN     PLS_INTEGER);
```

Parameters

Table 69–69 SETOPTIONS Procedure Parameter

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see Operational Notes.
option_type	See DBMS_LOB Option Types on page 69-5
options	See DBMS_LOB Option Values on page 69-5

Exceptions

Table 69–70 SETOPTIONS Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

Usage Notes

DBMS_LOB.SETOPTIONS cannot be used to enable or disable encryption on individual LOBs.

SUBSTR Functions

This function returns amount bytes or characters of a LOB, starting from an absolute offset from the beginning of the LOB.

For fixed-width n-byte CLOBs, if the input amount for SUBSTR is greater than (32767/n), then SUBSTR returns a character buffer of length (32767/n), or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, n is the maximum byte-width used for characters in the CLOB.

Syntax

```
DBMS_LOB.SUBSTR (
   lob_loc     IN    BLOB,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN RAW;

DBMS_LOB.SUBSTR (
   lob_loc     IN    CLOB   CHARACTER SET ANY_CS,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;

DBMS_LOB.SUBSTR (
   file_loc     IN    BFILE,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 69–71 SUBSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to be read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).

Return Values

Table 69–72 SUBSTR Function Return Values

Return	Description
RAW	Function overloading that has a BLOB or BFILE in parameter.
VARCHAR2	CLOB version.

Table 69–72 (Cont.) SUBSTR Function Return Values

Return	Description
NULL	Either: - any input parameter is NULL - amount < 1 - amount > 32767 - offset < 1 - offset > LOBMAXSIZE

Exceptions

Table 69–73 SUBSTR Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.SUBSTR from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

See Also:

- "INSTR Functions" on page 69-49
- "READ Procedures" on page 69-63
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the newlen parameter. Specify the length in bytes for BLOBs, and specify the length in characters for CLOBs.

> **Note:** The TRIM procedure decreases the length of the LOB to the value specified in the newlen parameter.

If you attempt to TRIM an empty LOB, then nothing occurs, and TRIM returns no error. If the new length that you specify in newlen is greater than the size of the LOB, then an exception is raised.

Syntax

```
DBMS_LOB.TRIM (
   lob_loc         IN OUT  NOCOPY BLOB,
   newlen          IN              INTEGER);

DBMS_LOB.TRIM (
   lob_loc         IN OUT  NOCOPY CLOB CHARACTER SET ANY_CS,
   newlen          IN              INTEGER);
```

Parameters

Table 69–74 TRIM Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB whose length is to be trimmed. For more information, see Operational Notes.
newlen	New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.

Exceptions

Table 69–75 TRIM Procedure Exceptions

Exception	Description
VALUE_ERROR	lob_loc is NULL.
INVALID_ARGVAL	Either: - new_len < 0 - new_len > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit

or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- "ERASE Procedures" on page 69-31
- "WRITEAPPEND Procedures" on page 69-72
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the buffer parameter.

WRITE replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

Syntax

```
DBMS_LOB.WRITE (
   lob_loc  IN OUT NOCOPY  BLOB,
   amount   IN             INTEGER,
   offset   IN             INTEGER,
   buffer   IN             RAW);

DBMS_LOB.WRITE (
   lob_loc  IN OUT  NOCOPY CLOB   CHARACTER SET ANY_CS,
   amount   IN             INTEGER,
   offset   IN             INTEGER,
   buffer   IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 69–76 WRITE Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB to be written to. For more information, see Operational Notes
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to write
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation.
buffer	Input buffer for the write

Exceptions

Table 69–77 WRITE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE - offset < 1 - offset > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Table 69–77 (Cont.) WRITE Procedure Exceptions

Exception	Description
SECUREFILE_OUTOFBOUNDS	Attempted to perform a write operation past the end of a LOB having FRAGMENT_* on it

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.WRITE from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- "APPEND Procedures" on page 69-18
- "COPY Procedures" on page 69-28
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the buffer parameter.

Syntax

```
DBMS_LOB.WRITEAPPEND (
   lob_loc IN OUT NOCOPY BLOB,
   amount  IN            INTEGER,
   buffer  IN            RAW);

DBMS_LOB.WRITEAPPEND (
   lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount  IN            INTEGER,
   buffer  IN            VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 69–78 WRITEAPPEND Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB to be written to. For more information, see Operational Notes
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to write
buffer	Input buffer for the write

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

Exceptions

Table 69–79 WRITEAPPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.WRITEAPPEND from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

DBMS_LOCK

The DBMS_LOCK package provides an interface to Oracle Lock Management services. You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

> **See Also:** For more information, and an example of how to use the DBMS_LOCK package, see "About User Locks" in *Oracle Database Advanced Application Developer's Guide*

This chapter contains the following topics:

- Using DBMS_LOCK
  - Overview
  - Security Model
  - Constants
  - Rules and Limits
  - Operational Notes
- Summary of DBMS_LOCK Subprograms

Using DBMS_LOCK

- Overview
- Security Model
- Constants
- Rules and Limits
- Operational Notes

Overview

Some uses of user locks:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

Security Model

There might be operating system-specific limits on the maximum number of total locks available. This *must* be considered when using locks or making this package available to other users. Consider granting the `EXECUTE` privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant `EXECUTE` privilege to specific users. An example of a cover package is documented in the `DBMS_LOCK.SQL` package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.

Constants

The DBMS_LOCK package uses the constants shown in Table 70–1.

Table 70–1 DBMS_LOCK Constants

Name	Alternate Name(s)	Type	Value	OEM Abbreviation	Description
NL_MODE	NuL1	INTEGER	1	-	-
SS_MODE	Sub Shared	INTEGER	2	ULRS	This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object.
SX_MODE	■ Sub eXclusive ■ Row Exclusive Mode	INTEGER	3	ULRX	This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object.
S_MODE	■ Shared ■ Row Exclusive Mode ■ Intended Exclusive	INTEGER	4	ULRSX	-
SSX_MODE	■ Shared Sub eXclusive ■ Share Row Exclusive Mode	INTEGER	5	-	This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.
X_MODE	Exclusive	INTEGER	6	ULX	-

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

Rules and Limits

When another process holds "held", an attempt to get "get" does the following:

Table 70–2 Lock Compatibility

HELD MODE	GET NL	GET SS	GET SX	GET S	GET SSX	GET X
NL	Success	Success	Success	Success	Success	Success
SS	Success	Success	Success	Success	Success	Fail
SX	Success	Success	Success	Fail	Fail	Fail
S	Success	Success	Fail	Success	Fail	Fail
SSX	Success	Success	Fail	Fail	Fail	Fail
X	Success	Fail	Fail	Fail	Fail	Fail

```
maxwait  constant integer := 32767;
```

The constant `maxwait` waits forever.

Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views. User locks are automatically released when a session terminates.The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

`DBMS_LOCK` is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

Summary of DBMS_LOCK Subprograms

Table 70–3 DBMS_LOCK Package Subprograms

Subprogram	Description
ALLOCATE_UNIQUE Procedure on page 70-9	Allocates a unique lock ID to a named lock.
CONVERT Function on page 70-11	Converts a lock from one mode to another.
RELEASE Function on page 70-12	Releases a lock.
REQUEST Function on page 70-13	Requests a lock of a specific mode.
SLEEP Procedure on page 70-14	Puts a procedure to sleep for a specific time.

ALLOCATE_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) given a lock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (
   lockname         IN  VARCHAR2,
   lockhandle       OUT VARCHAR2,
   expiration_secs  IN  INTEGER   DEFAULT 864000);
```

Parameters

Table 70–4 ALLOCATE_UNIQUE Procedure Parameters

Parameter	Description
lockname	Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA$; these are reserved for products supplied by Oracle.
lockhandle	Returns the handle to the lock ID generated by ALLOCATE_UNIQUE. You can use this handle in subsequent calls to REQUEST, CONVERT, and RELEASE. A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. LOCKHANDLE can be up to VARCHAR2 (128). All sessions using a lock handle returned by ALLOCATE_UNIQUE with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another.
expiration_specs	Number of seconds to wait after the last ALLOCATE_UNIQUE has been performed on a given lock, before permitting that lock to be deleted from the DBMS_LOCK_ALLOCATED table. The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to ALLOCATE_UNIQUE may delete expired locks to recover space.

Usage Notes

If you choose to identify locks by name, you can use ALLOCATE_UNIQUE to generate a unique lock identification number for these named locks.

The first session to call ALLOCATE_UNIQUE with a new lock name causes a unique lock ID to be generated and stored in the dbms_lock_allocated table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least expiration_secs (defaults to 10 days) past the last call to ALLOCATE_UNIQUE with the given lock name. After this time, the row in the dbms_lock_allocated table for this lock name may be deleted in order to recover space. ALLOCATE_UNIQUE performs a commit.

Note: Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a given name.

Exceptions

`ORA-20000,ORU-10003`: Unable to find or insert lock <`lockname`> into catalog `dbms_lock_allocated`.

CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.CONVERT(
   id         IN INTEGER ||
   lockhandle IN VARCHAR2,
   lockmode   IN INTEGER,
   timeout    IN NUMBER DEFAULT MAXWAIT)
  RETURN INTEGER;
```

Parameters

Table 70–5 CONVERT Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	New mode that you want to assign to the given lock. For the available modes and their associated integer identifiers, see Constants on page 70-5.
timeout	Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).

Return Values

Table 70–6 CONVERT Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Don't own lock specified by id or lockhandle
5	Illegal lock handle

RELEASE Function

This function explicitly releases a lock previously acquired using the REQUEST function. Locks are automatically released at the end of a session. RELEASE is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.RELEASE (
   id         IN INTEGER)
  RETURN INTEGER;

DBMS_LOCK.RELEASE (
   lockhandle IN VARCHAR2)
  RETURN INTEGER;
```

Parameters

Table 70–7 RELEASE Function Parameter

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.

Return Values

Table 70–8 RELEASE Function Return Values

Return Value	Description
0	Success
3	Parameter error
4	Do not own lock specified by id or lockhandle
5	Illegal lock handle

REQUEST Function

This function requests a lock with a given mode. REQUEST is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.REQUEST(
   id                IN  INTEGER ||
   lockhandle        IN  VARCHAR2,
   lockmode          IN  INTEGER DEFAULT X_MODE,
   timeout           IN  INTEGER DEFAULT MAXWAIT,
   release_on_commit IN  BOOLEAN DEFAULT FALSE)
  RETURN INTEGER;
```

The current default values, such as X_MODE and MAXWAIT, are defined in the DBMS_LOCK package specification.

Parameters

Table 70–9 REQUEST Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	Mode that you are requesting for the lock. For the available modes and their associated integer identifiers, see Constants on page 70-5.
timeout	Number of seconds to continue trying to grant the lock. If the lock cannot be granted within this time period, then the call returns a value of 1 (timeout).
release_on_commit	Set this parameter to TRUE to release the lock on commit or roll-back. Otherwise, the lock is held until it is explicitly released or until the end of the session.

Return Values

Table 70–10 REQUEST Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Already own lock specified by id or lockhandle
5	Illegal lock handle

SLEEP Procedure

This procedure suspends the session for a given period of time.

Syntax

```
DBMS_LOCK.SLEEP (
   seconds  IN NUMBER);
```

Parameters

Table 70–11 SLEEP Procedure Parameters

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

71

DBMS_LOGMNR

The DBMS_LOGMNR package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

> **See Also:** *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

- Using DBMS_LOGMNR
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- Summary of DBMS_LOGMNR Subprograms

Using DBMS_LOGMNR

This section contains the following topics, which relate to using the `DBMS_LOGMNR` package:

- Overview
- Security Model
- Constants
- Views
- Operational Notes

Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.

> **See Also:** Chapter 72, "DBMS_LOGMNR_D" for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR package.

Constants

The DBMS_LOGMNR package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_LOGMNR.NEW.

Table 71–1 describes the constants for the ADD_LOGFILE options flag in the DBMS_LOGMNR package.

Table 71–1 Constants for ADD_LOGFILE Options Flag

Constant	Description
NEW	Implicitly calls the DBMS_LOGMNR.END_LOGMNR procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.
ADDFILE	Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified.

Table 71–2 describes the constants for the START_LOGMNR options flag in the DBMS_LOGMNR package.

Table 71–2 Constants for START_LOGMNR Options Flag

Constant	Description
COMMITTED_DATA_ONLY	If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on). If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).
SKIP_CORRUPTION	Directs a select operation on the V$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.
DDL_DICT_TRACKING	If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open. This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9*i*.

Table 71–2 (Cont.) Constants for START_LOGMNR Options Flag

Constant	Description
DICT_FROM_ONLINE_CATALOG	Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed. This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files. Expect to see a value of 2 in the STATUS column of the V$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.
DICT_FROM_REDO_LOGS	If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.
NO_SQL_DELIMITER	If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.
NO_ROWID_IN_STMT	If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled. When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.
PRINT_PRETTY_SQL	If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.
CONTINUOUS_MINE	Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files. It also requires that the database be mounted and that archiving be enabled. Beginning with Oracle Database release 10.1, the CONTINUOUS_MINE options is supported for use in an Oracle Real Application Clusters (RAC) environment.

Views

The DBMS_LOGMNR package uses the views listed in the section on Accessing LogMiner Operational Information in Views in *Oracle Database Utilities*.

Operational Notes

A **LogMiner session** begins with a call to `DBMS_LOGMNR.ADD_LOGFILE` or `DBMS_LOGMNR.START_LOGMNR` (the former if you plan to specify log files explicitly; the latter if you plan to use continuous mining). The session ends with a call to `DBMS_LOGMNR.END_LOGMNR`. Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue SQL `SELECT` statements against the `V$LOGMNR_CONTENTS` view to retrieve the data of interest.

Summary of DBMS_LOGMNR Subprograms

Table 71–3 DBMS_LOGMNR Package Subprograms

Subprogram	Description
ADD_LOGFILE Procedure on page 71-10	Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session
COLUMN_PRESENT Function on page 71-12	Call this function for any row returned from the `V$LOGMNR_CONTENTS` view to determine if undo or redo column values exist for the column specified by the `column_name` input parameter to this function
END_LOGMNR Procedure on page 71-14	Finishes a LogMiner session
MINE_VALUE Function on page 71-15	Call this function for any row returned from the `V$LOGMNR_CONTENTS` view to retrieve the undo or redo column value of the column specified by the `column_name` input parameter to this function
REMOVE_LOGFILE Procedure on page 71-17	Removes a redo log file from the list of redo log files for LogMiner to process
START_LOGMNR Procedure on page 71-18	Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to `DBMS_LOGMNR.ADD_LOGFILE`)

ADD_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

Syntax

```
DBMS_LOGMNR.ADD_LOGFILE (
   LogFileName     IN VARCHAR2,
   options         IN BINARY_INTEGER default ADDFILE );
```

Parameters

Table 71–4 ADD_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.
options	Does one of the following: ■ Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW) ■ Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE) See Table 71–1, " Constants for ADD_LOGFILE Options Flag".

Exceptions

Table 71–5 ADD_LOGFILE Procedure Exceptions

Exception	Description
ORA-01284	Specified file cannot be opened.
ORA-01287	Specified file is from a different database incarnation.
ORA-01289	Specified file has already been added to the list. Duplicate redo log files cannot be added.
ORA-01290	Specified file is not in the current list and therefore cannot be removed from the list.
ORA-01324	Specified file cannot be added to the list because there is a DB_ID mismatch.

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- Unless you specify the CONTINUOUS_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD_LOGFILE procedure to specify the list of redo log files to analyze.
- If you are not using the CONTINUOUS_MINE option and you want to analyze more than one redo log file, you must call the ADD_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.

- Both archived and online redo log files can be mined.
- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)
- To analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

COLUMN_PRESENT Function

This function is designed to be used in conjunction with the MINE_VALUE function.

If the MINE_VALUE function returns a NULL value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a NULL value.

To distinguish between these two cases, use the COLUMN_PRESENT function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

Syntax

```
DBMS_LOGMNR.COLUMN_PRESENT (
     sql_redo_undo      IN  RAW,
     column_name        IN  VARCHAR2 default '') RETURN NUMBER;
```

Parameters

Table 71–6 COLUMN_PRESENT Function Parameters

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

Return Values

Table 71–7 describes the return values for the COLUMN_PRESENT function. The COLUMN_PRESENT function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of NULL values returned by the DBMS_LOGMNR.MINE_VALUE function.

Table 71–7 Return Values for COLUMN_PRESENT Function

Return	Description
0	Specified column is not present in this row of V$LOGMNR_CONTENTS.
1	Column is present in this row of V$LOGMNR_CONTENTS.

Exceptions

Table 71–8 COLUMN_PRESENT Function Exceptions

Exception	Description
ORA-01323	Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Value specified for the column_name parameter is not a fully qualified column name.

Usage Notes

- To use the COLUMN_PRESENT function, you must have successfully started LogMiner.
- The COLUMN_PRESENT function must be invoked in the context of a select operation on the V$LOGMNR_CONTENTS view.
- The COLUMN_PRESENT function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be NULL).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be NULL).

END_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the `NEW` option.

Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

Exceptions

Table 71–9 END_LOGMNR Procedure Exception

Exception	Description
`ORA-01307`	No LogMiner session is currently active. The `END_LOGMNR` procedure was called without adding any log files or before the `START_LOGMNR` procedure was called

MINE_VALUE Function

This function facilitates queries based on a column's data value. This function takes two arguments. The first one specifies whether to mine the redo (REDO_VALUE) or undo (UNDO_VALUE) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The MINE_VALUE function always returns a string that can be converted back to the original datatype.

Syntax

```
DBMS_LOGMNR.MINE_VALUE (
     sql_redo_undo      IN  RAW,
     column_name        IN  VARCHAR2 default '') RETURN VARCHAR2;
```

Parameters

Table 71–10 MINE_VALUE Function Parameters

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

Return Values

Table 71–11 Return Values for MINE_VALUE Function

Return	Description
NULL	The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.
NON-NULL	The column is contained within the self-describing record; the value is returned in string format.

Exceptions

Table 71–12 MINE_VALUE Function Exceptions

Exception	Description
ORA-01323	Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Invalid identifier. The value specified for the column_name parameter was not a fully qualified column name.

Usage Notes

- To use the MINE_VALUE function, you must have successfully started LogMiner.
- The MINE_VALUE function must be invoked in the context of a select operation from the V$LOGMNR_CONTENTS view.

- The MINE_VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be null).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be null).

REMOVE_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

> **Note:** This procedure replaces the REMOVEFILE constant that was an option on the ADD_LOGFILE procedure prior to Oracle Database 10*g*.

Syntax

```
DBMS_LOGMNR.REMOVE_LOGFILE (
   LogFileName     IN VARCHAR2);
```

Parameters

Table 71–13 REMOVE_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.

Exceptions

Table 71–14 REMOVE_LOGFILE Procedure Exception

Exception	Description
ORA-01290	Cannot remove unlisted log file

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the ADD_LOGFILE procedure must match the database ID and RESETLOGS SCN of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.

START_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

Syntax

```
DBMS_LOGMNR.START_LOGMNR (
   startScn           IN NUMBER default 0,
   endScn             IN NUMBER default 0,
   startTime          IN DATE default '01-jan-1988',
   endTime            IN DATE default '31-dec-2110',
   DictFileName       IN VARCHAR2 default '',
   Options            IN BINARY_INTEGER default 0 );
```

Parameters

Table 71–15 START_LOGMNR Procedure Parameters

Parameter	Description
startScn	Directs LogMiner to return only redo records with an SCN greater than or equal to the startScn specified. This fails if there is no redo log file containing the specified startScn value. (You can query the FILENAME, LOW_SCN, and NEXT_SCN columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of SCN values contained in each redo log file.)
endScn	Directs LogMiner to return only redo records with an SCN less than or equal to the endScn specified. If you specify an endScn value that is beyond the value in any redo log file, then LogMiner will use the greatest endScn value in the redo log file that contains the most recent changes. (You can query the FILENAME, LOW_SCN, and NEXT_SCN columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of SCN values contained in each redo log file.)
startTime	Directs LogMiner to return only redo records with a timestamp greater than or equal to the startTime specified. This fails if there is no redo log file containing the specified startTime value. (You can query the FILENAME, LOW_TIME, and HIGH_TIME columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if startScn is specified. See the Usage Notes for additional information.
endTime	Directs LogMiner to return only redo records with a timestamp less than or equal to the endTime specified. If you specify an endTime value that is beyond the value in any redo log file, then LogMiner will use the greatest endTime in the redo log file that contains the most recent changes. You can query the FILENAME, LOW_TIME, and HIGH_TIME columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if endScn is specified. See the Usage Notes for additional information.

Table 71–15 (Cont.) START_LOGMNR Procedure Parameters

Parameter	Description
DictFileName	Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct SQL_REDO and SQL_UNDO columns in V$LOGMNR_CONTENTS, as well as to fully translate SEG_NAME, SEG_OWNER, SEG_TYPE_NAME, TABLE_NAME, and TABLE_SPACE columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the DBMS_LOGMNR_D.BUILD procedure.) You need to specify this parameter only if neither DICT_FROM_REDO_LOGS nor DICT_FROM_ONLINE_CATALOG is specified.
options	See Table 71–2, " Constants for START_LOGMNR Options Flag".

Exceptions

Table 71–16 START_LOGMNR Procedure Exceptions

Exception	Description
ORA-01280	Internal error encountered.
ORA-01281	startScn or endScn parameter value is not a valid SCN, or endScn is less than startScn.
ORA-01282	value for the startTime parameter was greater than the value specified for the endTime parameter, or there was no redo log file that was compatible with the date range specified with the startTime and endTime parameters.
ORA-01283	Options parameter specified is invalid.
ORA-01284	LogMiner dictionary file specified in the DictFileName parameter has a full path length greater than 256 characters, or the file cannot be opened.
ORA-01285	Error reading specified file.
ORA-01291	Redo log files that are needed to satisfy the user's requested SCN or time range are missing.
ORA-01292	No log file has been specified for the current LogMiner session.
ORA-01293	Mounted database required for specified LogMiner options.
ORA-01294	Error occurred while processing information in the specified dictionary file, possible corruption.
ORA-01295	Specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed.
ORA-01296	Character set mismatch between specified LogMiner dictionary and log files.
ORA-01297	Redo version mismatch between LogMiner dictionary and log files.
ORA-01299	Specified LogMiner dictionary corresponds to a different database incarnation.
ORA-01300	Writable database required for specified LogMiner options.

Usage Notes

- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system. See *Oracle Database Utilities* and

Chapter 72, "DBMS_LOGMNR_D" in this manual for more information about the LogMiner dictionary.

- After executing the START_LOGMNR procedure, you can query the following views:
  - V$LOGMNR_CONTENTS - contains history of information in redo log files
  - V$LOGMNR_DICTIONARY - contains current information about the LogMiner dictionary file extracted to a flat file
  - V$LOGMNR_PARAMETERS - contains information about the LogMiner session

  (You can query the V$LOGMNR_LOGS view after a redo log file list has been added to the list of files that LogMiner is to mine.)
- Parameters and options are not persistent across calls to DBMS_LOGMNR.START_LOGMNR. You must specify all desired parameters and options (including SCN and time ranges) each time you call DBMS_LOGMNR.START_LOGMNR
- Be aware that specifying redo log files using a timestamp is not precise.
- The CONTINUOUS_MINE option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the CONTINUOUS_MINE option:
  - The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the V$ARCHIVED_LOGS view to determine which redo log file entries will be found by LogMiner.

    Even if an entry is listed in the database control file (and the V$ARCHIVED_LOGS view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be not available.
  - If you specify the CONTINUOUS_MINE option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the V$LOGMNR_CONTENTS view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.
  - LogMiner can mine online redo logs. However, if the CONTINUOUS_MINE option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.
- Keep the following in mind regarding starting and ending times or SCN ranges:

- If you specify neither a startTime nor a startScn parameter, LogMiner will set the startScn parameter to use the lowest SCN value from the redo log file that contains the oldest changes.
- If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.
- If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.
- If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR without the CONTINUOUS_MINE option, and you specify:
  * 0 for the startTime or startScn value, then the lowest SCN in the LogMiner redo log file list will be used as the startScn
  * A nonzero number for the startTime or startScn value, then an error is returned
  * 0 or a nonzero number for the endTime or endScn value, then the highest SCN in the LogMiner redo log file list will be used as the endScn
- If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR with the CONTINUOUS_MINE option, and you specify:
  * 0 for the startTime or startScn value, then an error is returned.
  * A startTime or startScn value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the V$LOGMNR_CONTENTS view.
  * An endTime or endScn parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the V$LOGMNR_CONTENTS view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
  * 0 for the endTime or endScn parameter value, then LogMiner includes the online redo log files when it mines. When you query the V$LOGMNR_CONTENTS view, rows will be returned from this view as changes are made to the database, and will not stop until you enter CTL+C or you terminate the PL/SQL cursor.

72

DBMS_LOGMNR_D

The DBMS_LOGMNR_D package, one of a set of LogMiner packages, contains two subprograms:

- The BUILD procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The SET_TABLESPACE procedure re-creates all LogMiner tables in an alternate tablespace.

  The **LogMiner data dictionary** consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the **LogMiner dictionary** throughout the LogMiner documentation.

  See Also: *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

- Using DBMS_LOGMNR_D
  - Overview
  - Security Model
- Summary of DBMS_LOGMNR_D Subprograms

Using DBMS_LOGMNR_D

This section contains the following topics, which relate to using the `DBMS_LOGMNR_D` package:

- Overview
- Security Model

Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you. LogMiner gives you three options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.

> **See Also:** DBMS_LOGMNR for information on the package subprograms used in running a LogMiner session.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR_D package.

Summary of DBMS_LOGMNR_D Subprograms

Table 72–1 DBMS_LOGMNR_D Package Subprograms

Subprogram	Description
BUILD Procedure on page 72-6	Extracts the LogMiner dictionary to either a flat file or one or more redo log files
SET_TABLESPACE Procedure on page 72-9	Re-creates all LogMiner tables in an alternate tablespace

BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

Syntax

```
DBMS_LOGMNR_D.BUILD (
     dictionary_filename  IN  VARCHAR2,
     dictionary_location  IN  VARCHAR2,
     options              IN  NUMBER);
```

Parameters

Table 72–2 BUILD Procedure Parameters

Parameter	Description
dictionary_filename	Specifies the name of the LogMiner dictionary file.
dictionary_location	Specifies the path to the LogMiner dictionary file directory.
options	Specifies that the LogMiner dictionary is written to either a flat file (STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).

Exceptions

Table 72–3 BUILD Procedure Exceptions

Exception	Description
ora-01302	Dictionary build options are missing or incorrect. This error is returned under the following conditions: ■ If the value of the OPTIONS parameter is not one of the supported values (STORE_IN_REDO_LOGS, STORE_IN_FLAT_FILE) or is not specified ■ If the STORE_IN_REDO_LOGS option is not specified and neither the dictionary_filename nor the dictionary_location parameter is specified ■ If the STORE_IN_REDO_LOGS option is specified and either the dictionary_filename or the dictionary_location parameter is specified
ora-01308	Initialization parameter UTL_FILE_DIR is not set.
ora-01336	Specified dictionary file cannot be opened. This error is returned under the following conditions: ■ The specified value for the dictionary_location does not exist. ■ The UTL_FILE_DIR initialization parameter is not set to have access to the dictionary_location ■ The dictionary file is read-only.

Usage Notes

- To extract the LogMiner dictionary to a flat file, you must supply a filename and location.

To extract the LogMiner dictionary to the redo log files, specify only the STORE_IN_REDO_LOGS option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

- If you do not specify any parameters, an error is returned.
- If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
- If you specify a filename and location, as well as the STORE_IN_FLAT_FILE option, the LogMiner dictionary is extracted to a flat file with the specified name.
- If you do not specify a filename and location, but do specify the STORE_IN_REDO_LOGS option, the LogMiner dictionary is extracted to the redo log files.
- If you specify a filename and location, as well as the STORE_IN_REDO_LOGS option, an error is returned.
- If you do not specify a filename and location, but do specify the STORE_IN_FLAT_FILE option, an error is returned.

- Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9*i* release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
- Do not run the DBMS_LOGMNR_D.BUILD procedure if there are any ongoing DDL operations.
- The database must be open when you run the DBMS_LOGMNR_D.BUILD procedure.
- When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:
  - You must specify a directory for use by the PL/SQL procedure. To do so, set the initialization parameter UTL_FILE_DIR in the initialization parameter file. For example:

    ```
    UTL_FILE_DIR = /oracle/dictionary
    ```

    After setting the parameter, you must shut down and restart the database for this parameter to take effect. If you do not set this parameter, the procedure will fail.
  - You must ensure that no DDL operations occur while the LogMiner dictionary build is running. Otherwise, the LogMiner dictionary file may not contain a consistent snapshot of the database dictionary.

  Be aware that the DDL_DICT_TRACKING option to the DBMS_LOGMNR.START_LOGMNR procedure is not supported for flat file dictionaries created prior to Oracle9*i*. If you attempt to use the DDL_DICT_TRACKING option with a LogMiner database extracted to a flat file prior to Oracle9*i*, the ORA-01330 error (problem loading a required build table) is returned.
- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:

- The DBMS_LOGMNR_D.BUILD procedure must be run on a system that is running Oracle9*i* or later.
- Archivelog mode must be enabled in order to generate usable redo log files.
- The COMPATIBLE parameter in the initialization parameter file must be set to 9.2.0 or higher.
- The database to which LogMiner is attached must be Oracle9*i* or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers. See *Oracle Database Utilities* for information about using supplemental logging with LogMiner.

Examples

Example 1: Extracting the LogMiner Dictionary to a Flat File

The following example extracts the LogMiner dictionary file to a flat file named dictionary.ora in a specified path (/oracle/database).

```
SQL> EXECUTE dbms_logmnr_d.build('dictionary.ora', -
     '/oracle/database/', -
     options => dbms_logmnr_d.store_in_flat_file);
```

Example 2: Extracting the LogMiner Dictionary to the Redo Log Files

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -
     options => dbms_logmnr_d.store_in_redo_logs);
```

SET_TABLESPACE Procedure

By default, all LogMiner tables are created to use the SYSAUX tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to an alternate tablespace.

Syntax

```
DBMS_LOGMNR_D.SET_TABLESPACE (
     new_tablespace        IN VARCHAR2);
```

Parameters

Table 72–4 SET_TABLESPACE Parameter

Parameter	Description
new_tablespace	A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter.

Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the SYSTEM tablespace. Oracle encourages such users to consider using the SET_TABLESPACE procedure to move the tables to the SYSAUX tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

  See Also: *Oracle Database Concepts* and *Oracle Database SQL Language Reference* for information about tablespaces and how to create them

Example: Using the DBMS_LOGMNR_D.SET_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the DBMS_LOGMNR_D.SET_TABLESPACE procedure.

```
SQL> CREATE TABLESPACE  logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'
     SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;

SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```

73

DBMS_LOGSTDBY

The DBMS_LOGSTDBY package provides subprograms for configuring and managing the logical standby database environment.

> **See Also:** *Oracle Data Guard Concepts and Administration* for more information about SQL Apply and logical standby databases

This chapter contains the following topics:

- Using DBMS_LOGSTDBY
  - Overview
  - Operational Notes
- Summary of DBMS_LOGSTDBY Subprograms

Using DBMS_LOGSTDBY

This section contains topics which relate to using the `DBMS_LOGSTDBY` package.

- Overview
- Operational Notes

Overview

The DBMS_LOGSTDBY package helps you manage the SQL Apply (logical standby database) environment. The subprograms in the DBMS_LOGSTDBY package help you to accomplish the following main objectives:

- Manage configuration parameters used by SQL Apply.

  For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.
- Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.
- Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.
- Allow controlled access to tables in the logical standby database that may require maintenance.

Operational Notes

Privileges and Security

A prototype role, LOGSTDBY_ADMINISTRATOR, is created by default with RESOURCE, and EXECUTE on DBMS_LOGSTDBY privileges. If you choose to use this role, consider granting ALTER DATABASE and ALTER SESSION privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard. Oracle recommends using an account with DBA privileges to perform administration tasks on logical standby databases.

The six procedures associated with skipping transactions (SKIP and UNSKIP, SKIP_ERROR and UNSKIP_ERROR, and SKIP_TRANSACTION and UNSKIP_TRANSACTION) all require DBA privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where SKIP procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, SYS).

Summary of DBMS_LOGSTDBY Subprograms

Table 73–1 DBMS_LOGSTDBY Package Subprograms

Subprogram	Description
APPLY_SET Procedure on page 73-6	Sets the values of various parameters that configure and maintain SQL Apply
APPLY_UNSET Procedure on page 73-9	Restores the default values of various parameters that configure and maintain SQL Apply
BUILD Procedure on page 73-10	Ensures supplemental logging is enabled properly and builds the LogMiner dictionary
INSTANTIATE_TABLE Procedure on page 73-11	Creates and populates a table in the standby database from a corresponding table in the primary database
MAP_PRIMARY_SCN Function on page 73-13	Maps an SCN relevant to the primary database to a corresponding SCN at the logical standby database. The mapped SCN is conservative in nature, and can thus be used to flash back the logical standby database to compensate for a flashback database operation performed at the primary database.
PREPARE_FOR_NEW_PRIMARY Procedure on page 73-14	Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency
PURGE_SESSION Procedure on page 73-16	Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply
REBUILD Procedure on page 73-17	Records relevant metadata (including the LogMiner dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process
SET_TABLESPACE Procedure on page 73-18	Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the `SYSAUX` tablespace.
SKIP Procedure on page 73-19	Specifies rules that control database operations that should not be applied to the logical standby database
SKIP_ERROR Procedure on page 73-27	Specifies rules regarding what action to take upon encountering errors
SKIP_TRANSACTION Procedure on page 73-31	Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database.
UNSKIP Procedure on page 73-33	Deletes rules specified by the `SKIP` procedure
UNSKIP_ERROR Procedure on page 73-35	Deletes rules specified by the `SKIP_ERROR` procedure
UNSKIP_TRANSACTION Procedure on page 73-37	Deletes rules specified by the `SKIP_TRANSACTION` procedure

APPLY_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. All parameters, except for PRESERVE_COMMIT_ORDER, can be changed without having to stop SQL Apply.

Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
     parameter          IN VARCHAR,
     value              IN VARCHAR);
```

Parameters

Table 73–2 APPLY_SET Procedure Parameters

Parameter	Description
APPLY_SERVERS	Controls the number of APPLIER processes used to apply changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.
EVENT_LOG_DEST	Controls where SQL Apply records the occurrence of an interesting event. It takes the following values: ■ DEST_ALL - All events will be recorded in the DBA_LOGSTDBY_EVENTS view and in the alert log. ■ DEST_EVENTS_TABLE - All events that contain information about user data will be recorded only in the DBA_LOGSTDBY_EVENTS view. This is the default value. For example, if SQL Apply receives an ORA-1403 error, the whole event is recorded in the DBA_LOGSTDBY_EVENTS view. Whereas, the alert log records only that SQL Apply stopped because of ORA-1403. No information regarding the user table or offending statement is logged in the alert log. However, if you stop the SQL Apply engine, it gets recorded in both the DBA_LOGSTDBY_EVENTS view and in the alert log. Note that this parameter affects the behavior of the following parameters: RECORD_APPLIED_DDL, RECORD_SKIP_DDL, RECORD_SKIP_ERRORS, and RECORD_UNSUPPORTED_OPERATIONS. For example, if RECORD_APPLIED_DDL is set to TRUE, but EVENT_LOG_DEST is set to DEST_EVENTS_TABLE, then the applied DDL string will only be recorded in the DBA_LOGSTDBY_EVENTS view.
LOG_AUTO_DEL_RETENTION_TARGET	This parameter setting is only meaningful if LOG_AUTO_DELETE has been set to TRUE. The value you supply for this parameter controls how long (in minutes) a remote archived log that is received from the primary database will be retained at the logical standby database once all redo records contained in the log have been applied at the logical standby database. The default value is 1440 minutes.
LOG_AUTO_DELETE	Automatically deletes archived redo log files once they have been applied on the logical standby database. Set to TRUE to enable automatic deletion of archived redo log files, and FALSE to disable automatic deletion.The default value is TRUE.

Table 73–2 (Cont.) APPLY_SET Procedure Parameters

Parameter	Description
MAX_EVENTS_RECORDED	Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value. The default value is 10,000.
MAX_SERVERS	Number of processes that SQL Apply uses to read and apply redo. The default value is 9. The maximum number allowed is 2048.
MAX_SGA	Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower. The maximum size allowed is 4095 megabytes.
PREPARE_SERVERS	Controls the number of PREPARER processes used to prepare changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.
PRESERVE_COMMIT_ORDER	TRUE: Transaction are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting. FALSE: Transactions are applied out of order from how they were committed on the primary database, and no attempt is made to provide read-consistent results. Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened in the primary database. See the Usage Notes for details and recommendations. You cannot modify this parameter while SQL Apply is running.
RECORD_APPLIED_DDL	Controls whether DDL statements that have been applied to the logical standby database are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting.
RECORD_SKIP_DDL	Controls whether skipped DDL statements are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.

Table 73–2 (Cont.) APPLY_SET Procedure Parameters

Parameter	Description
RECORD_SKIP_ERRORS	Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.
RECORD_UNSUPPORTED_OPERATIONS	Captures information about transactions running on the primary database that will not be supported by a logical standby database. This procedure records its information as events in the DBA_LOGSTDBY_EVENTS table.

If a parameter is changed while SQL Apply is running, the change will take effect at some point in the future. In such a case, an informational row is inserted into the DBA_LOGSTDBY_EVENTS view at the time the parameter change takes effect.

Additionally, if you are modifying a parameter while SQL Apply is running on a RAC configuration, you must be connected to the same instance where SQL Apply is running.

Exceptions

Table 73–3 APPLY_SET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- Use the APPLY_UNSET procedure to restore the default settings of a parameter.
- See *Oracle Data Guard Concepts and Administration* for help with tuning SQL Apply and for information about setting appropriate values for different parameters.

Examples

To record DDLs in the DBA_LOGSTDBY_EVENTS view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

APPLY_UNSET Procedure

Use the APPLY_UNSET procedure to restore the default values of the parameters that you changed with the APPLY_SET procedure.

Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (
     parameter          IN VARCHAR);
```

Parameters

The parameter information for the APPLY_UNSET procedure is the same as that described for the APPLY_SET procedure. See Table 73–2 for complete parameter information.

Exceptions

Table 73–4 APPLY_UNSET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- Use the APPLY_SET procedure to specify a nondefault value for a parameter.

Examples

If you previously specified that applied DDLs show up in the DBA_LOGSTDBY_EVENTS view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply. This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

Syntax

```
DBMS_LOGSTDBY.BUILD;
```

Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- `DBMS_LOGSTDBY.BUILD` should be run only once for each logical standby database you want to create. You do not need to use DBMS_LOGSTDBY.BUILD for each RAC instance.

Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```

INSTANTIATE_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database. The table requires the name of the database link (dblink) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the INSTANTIATE_TABLE procedure to:

- Add a table to a standby database.
- Re-create a table in a standby database.

Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (
     schema_name         IN VARCHAR2,
     table_name          IN VARCHAR2,
     dblink              IN VARCHAR2);
```

Parameters

Table 73–5 INSTANTIATE_TABLE Procedure Parameters

Parameter	Description
schema_name	Name of the schema
table_name	Name of the table to be created or re-created in the standby database
dblink	Name of the database link account that has privileges to read and lock the table in the primary database, as well as the SELECT_CATALOG_ROLE on the primary database

Exceptions

Table 73–6 INSTANTIATE_TABLE Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress
ORA-16276	Specified database link does not correspond to primary database
ORA-16277	Specified table is not supported by logical standby database
ORA-16278	Specified table has a multi-object skip rule defined

Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until SQL Apply encounters redo that occurred after the table was instantiated from the primary. The SCN at which the table was instantiated from the primary database is available in the DBA_LOGSTDBY_EVENTS view.

- The specified table must be a table that is supported by logical standby (that is, it does not appear in the DBA_LOGSTDBY_UNSUPPORTED_TABLES view on the primary database).
- If there are any skip rules that specifically name this table (without any wildcards), those skip rules will be dropped as part of INSTANTIATE_TABLE, so that the table will be properly maintained by SQL Apply in the future. If there are skip rules that indirectly reference this table (match a skip rule with a wildcard in the schema_name or table_name, and have a TABLE, DML, or SCHEMA_DDL statement type), INSTANTIATE_TABLE will fail with an ORA-16278 error. Any multiobject skip rules that pertain to the table must be dropped or changed before re-attempting the INSTANTIATE_TABLE call.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-
     SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -
     DBLINK => 'INSTANTIATE_TBL_LINK');
```

MAP_PRIMARY_SCN Function

Returns an SCN on the standby that predates the supplied SCN from the primary database by at least 5 minutes. This function can be used to determine a safe SCN to use in a compensating flashback database operation at the logical standby database, following a flashback database operation or a point-in-time recovery operation at the primary database.

Syntax

```
DBMS_LOGSTDBY.MAP_PRIMARY_SCN(primary_scn NUMBER) RETURN NUMBER;
```

Exceptions

Table 73–7 MAP_PRIMARY_SCN Function Exceptions

Exception	Description
ORA-20001	Primary SCN is before mapped range
ORA-20002	SCN mapping requires PRESERVE_COMMIT_ORDER to be TRUE

Usage Notes

Use this function to get a conservative SCN at the logical standby database that corresponds to an SCN at the primary database. This function is useful in the context of doing compensating flashback database operations at the logical standby following a flashback database or a point-in-time recovery operation done at the primary database.

PREPARE_FOR_NEW_PRIMARY Procedure

The PREPARE_FOR_NEW_PRIMARY procedure must be invoked at a logical standby database following a failover if that standby database was not the target of the failover operation. Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the alert.log. These logs must be copied to the logical standby and registered using the ALTER DATABASE REGISTER LOGICAL LOGFILE statement.

Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
           FORMER_STANDBY_TYPE         IN VARCHAR2,
           DBLINK                      IN VARCHAR2);
```

Parameters

Table 73–8 PREPARE_FOR_NEW_PRIMARY Procedure Parameters

Parameter	Description
FORMER_STANDBY_TYPE	The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database.
DBLINK	The name of a database link to the new primary database

Exceptions

Table 73–9 PREPARE_FOR_NEW_PRIMARY Procedure Exceptions

Exception	Description
ORA-16104	Invalid Logical Standby option.
ORA-16109	Failed to apply log data from previous primary.

Usage Notes

- This routine is intended only for logical standby systems.
- This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully.
- Log files displayed in the alert log will be referred to as *terminal logs*. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally.
- Upon manual registration of the terminal logs, users should complete the process by calling either START LOGICAL STANDBY APPLY if the new primary database was formerly a physical standby database or START LOGICAL STANDBY APPLY NEW PRIMARY if the new primary database was formerly a logical standby database.
- See the alert log for more details regarding the reasons for any exception.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (  -
                FORMER_STANDBY_TYPE => 'LOGICAL',    -
                DBLINK => 'dblink_to_newprimary');
```

PURGE_SESSION Procedure

Identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply. Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

Syntax

```
DBMS_LOGSTDBY.PURGE_SESSION;
```

Exceptions

Table 73–10 PURGE_SESSION Procedure Exceptions

Exception	Description
ORA-01309	Invalid session

Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the DBA_LOGMNR_PURGED_LOG view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10*g* Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the LOG_AUTO_DELETE parameter described in the DBMS_LOGSTDBY.APPLY_SET procedure described on page 73-6.

Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:

```
SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;
```

2. Query the DBA_LOGMNR_PURGED_LOG view to list the archived redo log files that can be removed:

```
SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;

FILE_NAME
   -----------------------------------
   /boston/arc_dest/arc_1_40_509538672.log
   /boston/arc_dest/arc_1_41_509538672.log
   /boston/arc_dest/arc_1_42_509538672.log
   /boston/arc_dest/arc_1_43_509538672.log
   /boston/arc_dest/arc_1_44_509538672.log
   /boston/arc_dest/arc_1_45_509538672.log
   /boston/arc_dest/arc_1_46_509538672.log
   /boston/arc_dest/arc_1_47_509538672.log
```

3. Use operating system-specific commands to delete archived redo log files from the file system.

REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner dictionary) in the redo stream required for other logical standby databases.

Syntax

```
DBMS_LOGSTDBY.REBUILD;
```

Usage Notes

- LogMiner dictionary information is logged in the redo log files.
- The standby redo log files (if present) are archived.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

SET_TABLESPACE Procedure

Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the SYSAUX tablespace. SQL Apply cannot be running when you invoke this procedure.

Syntax

```
DBMS_LOGSTDBY.SET_TABLESPACE(
           NEW_TABLESPACE IN VARCHAR2)
```

Parameters

Table 73–11 SET_TABLE SPACE Procedure Parameters

Parameter	Description
NEW_TABLESPACE	Name of the new tablespace where metadata tables will reside.

Exceptions

Table 73–12 SET_TABLESPACE Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress

Examples

To move metadata tables to a new tablespace named LOGSTDBY_TBS, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

SKIP Procedure

The SKIP procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database. For example, the SKIP procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

Syntax

```
DBMS_LOGSTDBY.SKIP (
     stmt                    IN VARCHAR2,
     schema_name             IN VARCHAR2 DEFAULT NULL,
     object_name             IN VARCHAR2 DEFAULT NULL,
     proc_name               IN VARCHAR2 DEFAULT NULL,
     use_like                IN BOOLEAN DEFAULT TRUE,
     esc                     IN CHAR1 DEFAULT NULL);
```

Parameters

Table 73–13 SKIP Procedure Parameters

Parameter	Description
stmt	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 73–14 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter. The keyword PL/SQL is used for the execution of Oracle-supplied packages which are supported for replication. See *Oracle Data Guard Concepts and Administration* for information about supported packages.
schema_name	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.
object_name	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.

Table 73–13 (Cont.) SKIP Procedure Parameters

Parameter	Description
proc_name	Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: 'schema.package.procedure' This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement. For DDLs, SQL Apply calls the stored procedure with the following call signature: ■ IN STATEMENT VARCHAR2 -- The SQL statement that matches the filter ■ IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter ■ IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable ■ IN NAME VARCHAR2 -- The object_name of the filter, if applicable ■ IN XIDUSN NUMBER -- Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ OUT SKIP_ACTION NUMBER -- Action to be taken by SQL Apply upon completion of this routine. Valid values are: SKIP_ACTION_APPLY -- Execute the statement SKIP_ACTION_SKIP -- Skip the statement SKIP_ACTION_ERROR -- Halt apply so the DBA can take appropriate steps (for example, take compensating action) SKIP_ACTION_REPLACE -- Execute the replacement statement supplied in the NEW_STATEMENT output parameter For PL/SQL, SQL Apply calls the stored procedure with the following call signature: ■ IN STATEMENT VARCHAR2 -- The SQL statement that matches the filter ■ IN PACKAGE_SCHEMA VARCHAR2 -- The schema of the package being skipped (for example, SYS or XDB) ■ IN PACKAGE_NAME VARCHAR2 -- The name of the package being skipped (for example, DBMS_RLS) ■ IN PROCEDURE_NAME VARCHAR2 – The name of the procedure being skipped (for example, ADD_POLICY) ■ IN CURRENT_SCHEMA VARCHAR2 – The name of the current schema in which the PL/SQL was executed on the primary ■ IN XIDUSN NUMBER – Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ IN EXIT_STATUS – 0 (Zero) if the PL/SQL succeeded on the primary, or 1

Table 73–13 (Cont.) SKIP Procedure Parameters

Parameter	Description

proc_name (cont.)	■ OUT SKIP_ACTION NUMBER -- Action to be taken by SQL Apply upon completion of this routine. Valid return values are:
	SKIP_ACTION_APPLY -- Execute the statement
	SKIP_ACTION_APPLY -- Execute the statement
	SKIP_ACTION_ERROR – Raise an error which halts apply so that the DBA can take appropriate steps
	Note 1: SKIP_ACTION_REPLACE is not supported for PL/SQL.
	Note 2: SQL Apply calls the skip handler when the procedure's exit is processed.
	Note 3: The use_like parameter must be set to FALSE for PL/SQL since wildcarding PL/SQL is not supported.
	The following example shows how to have a conditional skip rule on DBMS_RLS.DROP_POLICY:
	`Create or replace procedure sec_mgr.skip_drop_policy (`
	`statement in varchar2,`
	`pkgown in varchar2,`
	`pkgname in varchar2,`
	`procnm in varchar2,`
	`cuser in varchar2,`
	`xidusn in number,`
	`xidslt in number,`
	`xidsqn in number,`
	`exstatus in number,`
	`skip_action out number) Is`
	`Begin`
	`If 0 = exstatus Then`
	`Insert Into sec_mgr.logit Values`
	`('Success: '||pkgown||'.'||pkgname||'.'||procnm|| ' by '||cuser);`
	`If cuser != 'TESTSCHEMA' Then`
	`skip_action := DBMS_LOGSTDBY.SKIP_ACTION_APPLY;`
	`Else`
	`skip_action := DBMS_LOGSTDBY.SKIP_ACTION_SKIP;`
	`End If;`
	`End If;`
	`End skip_drop_policy;`
	`Execute dbms_logstdby.skip('PL/SQL', 'SYS', 'DBMS_RLS', 'DROP_POLICY', 'SEC_MGR.SKIP_DROP_POLICY', FALSE);`

use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the *Oracle Database SQL Language Reference*.
esc	Identifies an escape character (such as the character "/") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See*Oracle Database SQL Language Reference* for more information about pattern matching.

Usage Notes

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104: invalid Logical Standby option requested error:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'DML', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'DML_HANDLER');
```

  Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the SCHEMA_DDL event for the HR.EMPLOYEES table, and a rule for the ALTER TABLE event for the HR.EMPLOYEES table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'SCHEMA DDL', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'SCHEMA_DDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'TABLE_ALTER_HANDLER');
```

  On encountering an ALTER TABLE statement, the schema_ddl_handler procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement.

  Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the following example will result in the empddl_handler procedure being invoked upon encountering the ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMP%', -
     proc_name => 'EMPDDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'EMPLOYEE_DDL_HANDLER');
```

- Use the SKIP procedure with caution, particularly when skipping DDL statements. If a CREATE TABLE statement is skipped, for example, you must also specify other DDL statements that refer to that table in the SKIP procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.
- Before calling the SKIP procedure, SQL Apply must be halted. Do this by issuing an ALTER DATABASE STOP LOGICAL STANDBY APPLY statement. Once all desired filters have been specified, issue an ALTER DATABASE START LOGICAL

STANDBY APPLY IMMEDIATE statement to start SQL Apply using the new filter settings.

- See the UNSKIP procedure on page 73-33 for information about reversing (undoing) the settings of the SKIP procedure.
- For USER statements, the SCHEMA_NAME parameter will be the user and specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is supplied, it must already exist in DBA_PROCEDURES and it must execute with DEFINER rights. If the procedure is declared with INVOKER rights, the ORA-1031: insufficient privileges message will be returned.
- If the procedure returns a REPLACEMENT statement, the REPLACEMENT statement will be executed using the SYSTEM and OBJECT privileges of the owner of the procedure.
- The PL/SQL block of a SKIP procedure cannot contain transaction control statements (for example, COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction.

Skip Statement Options

Table 73–14 lists the supported values for the stmt parameter of the SKIP procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. In addition, any of the SQL statements listed in the sys.audit_actions table (shown in the right column of Table 73–14) are also valid values. Note that keywords are generally defined by database object.

Table 73–14 Supported Values for the stmt Parameter

Keyword	Associated SQL Statements
There is no keyword for this group of SQL statements.	GRANT REVOKE
CLUSTER	AUDIT CLUSTER CREATE CLUSTER DROP CLUSTER TRUNCATE CLUSTER
CONTEXT	CREATE CONTEXT DROP CONTEXT
DATABASE LINK	CREATE DATABASE LINK CREATE PUBLIC DATABASE LINK DROP DATABASE LINK DROP PUBLIC DATABASE LINK
DIMENSION	ALTER DIMENSION CREATE DIMENSION DROP DIMENSION
DIRECTORY	CREATE DIRECTORY DROP DIRECTORY
DML	Includes DML statements on a table (for example: INSERT, UPDATE, and DELETE)
INDEX	ALTER INDEX CREATE INDEX DROP INDEX

Table 73–14 (Cont.) Supported Values for the `stmt` ***Parameter***

Keyword	Associated SQL Statements
NON_SCHEMA_DDL	*All DDL that does not pertain to a particular schema* **Note:** SCHEMA_NAME and OBJECT_NAME must be null
PL/SQL[1]	Execute Oracle-supplied package.
PROCEDURE[2]	ALTER FUNCTION ALTER PACKAGE ALTER PACKAGE BODY ALTER PROCEDURE CREATE FUNCTION CREATE LIBRARY CREATE PACKAGE CREATE PACKAGE BODY CREATE PROCEDURE DROP FUNCTION DROP LIBRARY DROP PACKAGE DROP PACKAGE BODY DROP PROCEDURE
PROFILE	ALTER PROFILE CREATE PROFILE DROP PROFILE
ROLE	ALTER ROLE CREATE ROLE DROP ROLE SET ROLE
ROLLBACK STATEMENT	ALTER ROLLBACK SEGMENT CREATE ROLLBACK SEGMENT DROP ROLLBACK SEGMENT
SCHEMA_DDL	*All DDL statements that create, modify, or drop schema objects (for example: tables, indexes, and columns)* **Note:** SCHEMA_NAME and OBJECT_NAME must *not* be null
SEQUENCE	ALTER SEQUENCE CREATE SEQUENCE DROP SEQUENCE
SYNONYM	CREATE PUBLIC SYNONYM CREATE SYNONYM DROP PUBLIC SYNONYM DROP SYNONYM
SYSTEM AUDIT	AUDIT *SQL_statements* NOAUDIT *SQL_statements*
TABLE	CREATE TABLE ALTER TABLE DROP TABLE TRUNCATE TABLE
TABLESPACE	CREATE TABLESPACE DROP TABLESPACE ALTER TABLESPACE

Table 73–14 (Cont.) Supported Values for the `stmt` *Parameter*

Keyword	Associated SQL Statements
TRIGGER	ALTER TRIGGER CREATE TRIGGER DISABLE ALL TRIGGERS DISABLE TRIGGER DROP TRIGGER ENABLE ALL TRIGGERS ENABLE TRIGGER
TYPE	ALTER TYPE ALTER TYPE BODY CREATE TYPE CREATE TYPE BODY DROP TYPE DROP TYPE BODY
USER	ALTER USER CREATE USER DROP USER
VIEW	CREATE VIEW DROP VIEW
VIEW	CREATE VIEW DROP VIEW

[1] See *Oracle Data Guard Concepts and Administration* for information about supported packages.

[2] Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

Exceptions

Table 73–15 DBMS_LOGSTDBY.SKIP Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical standby apply must be stopped to allow this operation.
ORA-16104	Invalid logical standby option requested.
ORA-16203	"Unable to interpret SKIP procedure return values." Indicates that a SKIP procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the DBA_LOGSTDBY_EVENTS view.
ORA-16236	Logical standby metadata operation in progress.

Examples

Example 1 Skipping all DML and DDL changes made to a schema

The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the HR schema.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'SCHEMA DDL', -
     schema_name => 'HR', -
```

```
     table_name => '%', -
     proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'DML', -
     schema_name => 'HR', -
     table_name => '%', -
     proc_name => null);
```

Example 2 Creating a procedure to handle different file system organization

For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a `SKIP` procedure to handle DDL statements with file specifications transparently.

The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

1. Create the `SKIP` procedure to handle tablespace DDL statements:

```
CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl (

  old_stmt  IN  VARCHAR2,
  stmt_typ  IN  VARCHAR2,
  schema    IN  VARCHAR2,
  name      IN  VARCHAR2,
  xidusn    IN  NUMBER,
  xidslt    IN  NUMBER,
  xidsqn    IN  NUMBER,
  action    OUT NUMBER,
  new_stmt  OUT VARCHAR2
) AS
BEGIN

-- All primary file specification that contains a directory
-- /usr/orcl/primary/dbs
-- should go to /usr/orcl/stdby directory specification

  new_stmt = replace(old_stmt,
                     '/usr/orcl/primary/dbs',
                     '/usr/orcl/stdby');

  action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;

EXCEPTION
  WHEN OTHERS THEN
    action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;
    new_stmt := NULL;
END handle_tbs_ddl;
```

2. Register the `SKIP` procedure with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', -
             proc_name => 'SYS.HANDLE_TBS_DDL');
```

SKIP_ERROR Procedure

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine if the error should cause SQL Apply to stop. All errors to be skipped are stored in system tables that describe how exceptions should be handled.

Syntax

```
DBMS_LOGSTDBY.SKIP_ERROR (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2,
     object_name               IN VARCHAR2,
     proc_name                 IN VARCHAR2,
     use_like                  IN BOOLEAN,
     esc                       IN CHAR1);
```

Parameters

Table 73–16 SKIP_ERROR Procedure Parameters

Parameter	Description
`stmt`	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 73–14 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
`schema_name`	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the `stmt` parameter. If not applicable, this value must be set to `NULL`.
`object_name`	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the `stmt`. If not applicable, this value must be set to `NULL`.

Table 73–16 (Cont.) SKIP_ERROR Procedure Parameters

Parameter	Description
proc_name	Name of a stored procedure to call when SQL Apply determines a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: '"schema"."package"."procedure"' This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement. SQL Apply calls the stored procedure with the following call signature: ■ IN STATEMENT VARCHAR(4000) -- The first 4K of the statement ■ IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter ■ IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable ■ IN NAME VARCHAR2 -- The object_name of the filter, if applicable ■ IN XIDUSN NUMBER -- Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ IN ERROR VARCHAR(4000) -- Text of error to be recorded (optional) ■ OUT NEW_ERROR VARCHAR(4000) -- Null or modified error text
use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the *Oracle Database SQL Language Reference*.
esc	Identifies an escape character (such as the characters "%" or "_") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See*Oracle Database SQL Language Reference* for more information about pattern matching.

Usage Notes

- A stored procedure provided to the SKIP_ERROR procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.
- Running this stored procedure affects the error being written in the STATUS column of the DBA_LOGSTDBY_EVENTS table. The STATUS_CODE column remains unchanged. If the stored procedure is to have no effect, that is, apply will be stopped, then the NEW_ERROR is written to the events table. To truly have no effect, set NEW_ERROR to ERROR in the procedure.
- If the stored procedure requires that a shutdown be avoided, then you must set NEW_ERROR to NULL.
- This procedure requires DBA privileges to execute.

- For USER statements, the SCHEMA_NAME parameter will be the user and you should specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is specified, it must already exist in DBA_PROCEDURES and it must execute with DEFINERS rights. If the procedure is declared with INVOKERS rights, the ORA-1031: insufficient privileges message will be returned.
- The PL/SQL block of a SKIP_ERROR procedure cannot contain transaction control statements (for example: COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

Exceptions

Table 73–17 SKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Examples

To skip errors on GRANT statements on SYS or HR schemas, define a procedure handle_error_ddl and register it. In the following example, assume that handle_error_ddl is a free-standing procedure in the SYS schema.

1. Create the error-handler procedure:

```
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl (
  old_stmt    IN  VARCHAR2,
  stmt_type   IN  VARCHAR2,
  schema      IN  VARCHAR2,
  name        IN  VARCHAR2,
  xidusn      IN  NUMBER,
  xidslt      IN  NUMBER,
  xidsqn      IN  NUMBER,
  error       IN  VARCHAR2,
  new_stmt    OUT VARCHAR2
) AS

BEGIN
  -- Default to what we already have
  new_stmt := old_stmt;

  -- Ignore any GRANT errors on SYS or HR schemas
IF ((INSTR(UPPER(old_stmt),'GRANT')) > 0) OR
((INSTR(UPPER(old_stmt),'REVOKE')) > 0)
  THEN
    IF schema IS NULL
    OR (schema IS NOT NULL AND
          (UPPER(schema) = 'SYS'  OR UPPER(schema) = 'HR' ))
```

```
    THEN
      new_stmt := NULL;
      -- record the fact that we just skipped an error on 'SYS' or 'HR' schemas
      -- code not shown here
    END IF;
  END IF;

END handle_error_ddl;
/
```

2. Register the error handler with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
     statement => 'NON_SCHEMA_DDL', -
     schema_name => NULL, -
     object_name => NULL, -
     proc_name => 'SYS.HANDLE_ERROR_DDL');
```

SKIP_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

Syntax

```
DBMS_LOGSTDBY.SKIP_TRANSACTION (
     XIDUSN                IN NUMBER,
     XIDSLT NUMBER         IN NUMBER,
     XIDSQN NUMBER         IN NUMBER);
```

Parameters

Table 73–18 SKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN NUMBER	Transaction ID undo segment number of the transaction being skipped
XIDSLT NUMBER	Transaction ID slot number of the transaction being skipped
XIDSQN NUMBER	Transaction ID sequence number of the transaction being skipped

Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

> **CAUTION: `SKIP_TRANSACTION` is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the `V$LOGMNR_CONTENTS` view and have taken compensating actions at the logical standby database. `SKIP_TRANSACTION` is not the appropriate procedure to invoke to skip DML changes to a table.**
>
> **To skip a DML failure, use a `SKIP` procedure, such as `SKIP('DML','MySchema','MyFailed Table').` Using the `SKIP_TRANSACTION` procedure for DML transactions may skip changes for other tables, thus logically corrupting them.**

- This procedure requires DBA privileges to execute.
- Use the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.
- Also, see the ALTER DATABASE START LOGICAL STANDBY SKIP FAILED TRANSACTION statement in *Oracle Database SQL Language Reference*.

Exceptions

Table 73–19 SKIP_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Examples

To skip a DDL transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-
     XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

UNSKIP Procedure

Use the UNSKIP procedure to delete rules specified earlier with the SKIP procedure. The parameters specified in the UNSKIP procedure must match exactly for it to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2,
     object_name               IN VARCHAR2);
```

Parameters

The parameter information for the UNSKIP procedure is the same as that described for the SKIP procedure. See Table 73–13 on page 73-19 for complete parameter information.

Exceptions

Table 73–20 UNSKIP Procedure Exceptions

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

CAUTION: If DML changes for a table have been skipped and not compensated for, you must follow the call to the UNSKIP procedure with a call to the INSTANTIATE_TABLE procedure to synchronize this table with those maintained by SQL Apply.

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema_name or the object_name parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the UNSKIP procedure, and you will need a distinct UNSKIP procedure call to delete each rule that was previously specified.

  For example, assume you have specified the following two rules to skip applying DML statements to the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMPLOYEE', -
     PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMPTEMP', -
     PROC_NAME => null);
```

In the following example, the wildcard in the TABLE_NAME parameter cannot be used to delete the rules that were specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMP%');
```

In fact, this UNSKIP procedure matches neither of the rules, because the wildcard character in the TABLE_NAME parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding SKIP rule.

UNSKIP_ERROR Procedure

Use the UNSKIP_ERROR procedure to delete rules specified earlier with the SKIP_ERROR procedure. The parameters specified in the UNSKIP_ERROR procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_ERROR (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2,
     object_name               IN VARCHAR2);
```

Parameters

The parameter information for the UNSKIP_ERROR procedure is the same as that described for the SKIP_ERROR procedure. See Table 73–16 for complete parameter information.

Exceptions

Table 73–21 UNSKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema_name or the object_name parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the UNSKIP_ERROR procedure, and you need a distinct UNSKIP_ERROR procedure call to delete each rule that you previously specified.

  For example, assume you have specified the following two rules to handle the HR.EMPLOYEE and HR.EMPTEMP tables:

  ```
  SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
       SCHEMA_NAME => 'HR', -
       OBJECT_NAME => 'EMPLOYEE', -
       PROC_NAME => 'hr_employee_handler');
  SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
       SCHEMA_NAME => 'HR', -
       OBJECT_NAME => 'EMPTEMP', -
       PROC_NAME => 'hr_tempemp_handler');
  ```

  In this case, the following UNSKIP procedure cannot be used to delete the rules that you have specified:

  ```
  SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML',-
       SCHEMA_NAME => 'HR', -
       OBJECT_NAME => 'EMP%');
  ```

In fact, the UNSKIP procedure will match neither of the rules, because the wildcard character in the OBJECT_NAME parameter will not be expanded.

Example

To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

```
DBMS_LOGSTDBY.UNSKIP_ERROR ( -
      statement => 'NON_SCHEMA_DDL', -
      schema_name => NULL, -
      object_name => NULL);
```

UNSKIP_TRANSACTION Procedure

Use the UNSKIP_TRANSACTION procedure to delete rules specified earlier with the SKIP_TRANSACTION procedure. The parameters specified in the UNSKIP_TRANSACTION procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
     XIDUSN           NUMBER,
     XIDSLT           NUMBER,
     XIDSQN           NUMBER);
```

Parameters

Table 73–22 UNSKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN	Transaction ID undo segment number of the transaction being skipped
XIDSLT	Transaction ID slot number of the transaction being skipped
XIDSQN	Transaction ID sequence number of the transaction being skipped

Exceptions

Table 73–23 UNSKIP_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Query the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

74

DBMS_METADATA

The DBMS_METADATA package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

> **See Also:** *Oracle Database Utilities* for more information and for examples of using the Metadata API

This chapter contains the following topics:

- Using DBMS_METADATA
  - Overview
  - Security Model
  - Rules and Limits
- Data Structures - Object and Table Types
- Subprogram Groupings
  - Subprograms for Retrieving Multiple Objects From the Database
  - Subprograms for Submitting XML to the Database
- Summary of All DBMS_METADATA Subprograms

Using DBMS_METADATA

This section contains topics which relate to using the `DBMS_METADATA` package.

- Overview
- Security Model
- Rules and Limits

Overview

You can use the DBMS_METADATA package to retrieve metadata and also to submit XML.

- Retrieving Metadata
- Submitting XML

Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

DBMS_METADATA provides the following retrieval interfaces:

- For programmatic use: OPEN, SET_FILTER, SET_COUNT, GET_QUERY, SET_PARSE_ITEM, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, FETCH_xxx, and CLOSE retrieve multiple objects.
- For use in SQL queries and for browsing: GET_XML and GET_DDL return metadata for a single named object. The GET_DEPENDENT_XML, GET_DEPENDENT_DDL, GET_GRANTED_XML, and GET_GRANTED_DDL interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

Submitting XML

If you are submitting XML, you specify:

- The type of object
- Optional transform parameters to modify the object (for example, changing the object's owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: OPENW, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, SET_PARSE_ITEM, CONVERT, PUT, and CLOSE.

Security Model

The object views of the Oracle metadata model implement security as follows:

- Nonprivileged users can see the metadata of only their own objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to `PUBLIC`.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program invokers-rights.
- For all objects that have passwords (for example, db links, users, and roles), the following rules apply:
  - A user who has the `SELECT_CATALOG_ROLE` can see all metadata for an object except the passwords for that object.
  - The `SYS` user, users who have the `EXP_FULL_DATABASE` role, and users who own an object can see all metadata for that object, including passwords.

Rules and Limits

In an Oracle Shared Server (OSS) environment, the DBMS_METADATA package must disable session migration and connection pooling. This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the MAX_SHARED_SERVERS initialization parameter.

Data Structures - Object and Table Types

The DBMS_METADATA package defines, in the SYS schema, the following OBJECT and TABLE types.

```
CREATE TYPE sys.ku$_parsed_item AS OBJECT (
  item            VARCHAR2(30),
  value           VARCHAR2(4000),
  object_row      NUMBER )
/

CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;

CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item
/

CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;

CREATE TYPE sys.ku$_ddl AS OBJECT (
   ddlText        CLOB,
parsedItem sys.ku$_parsed_items )
/

CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;

CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl
/

CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;

CREATE TYPE sys.ku$_multi_ddl AS OBJECT (
   object_row     NUMBER,
   ddls           sys.ku$_ddls )
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;

CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR
                          sys.ku$_multi_ddls;

CREATE TYPE sys.ku$_ErrorLine IS OBJECT (
   errorNumber    NUMBER,
   errorText      VARCHAR2(2000) )
/

CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;

CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine
/
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;

CREATE TYPE sys.ku$_SubmitResult AS OBJECT (
   ddl          sys.ku$_ddl,
   errorLines   sys.ku$_ErrorLines );
/
```

```
CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult
/

CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;
```

Subprogram Groupings

The DBMS_METADATA subprograms are used to retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- Table 74–1 provides a summary, in alphabetical order, of DBMS_METADATA subprograms used to retrieve multiple objects from a database.
- Table 74–2 provides a summary, in alphabetical order, of DBMS_METADATA subprograms used to submit XML metadata to a database.

Subprograms for Retrieving Multiple Objects From the Database

Table 74–1 lists the subprograms used for retrieving multiple objects from the database.

Table 74–1 DBMS_METADATA Subprograms for Retrieving Multiple Objects

Subprogram	Description
ADD_TRANSFORM Function on page 74-12	Specifies a transform that `FETCH_xxx` applies to the XML representation of the retrieved objects
CLOSE Procedure on page 74-15	Invalidates the handle returned by `OPEN` and cleans up the associated state
FETCH_xxx Functions and Procedures on page 74-18	Returns metadata for objects meeting the criteria established by `OPEN`, `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on
GET_QUERY Function on page 74-25	Returns the text of the queries that are used by `FETCH_xxx`
GET_xxx Functions on page 74-21	Fetches the metadata for a specified object as XML or DDL, using only a single call
OPEN Function on page 74-26	Specifies the type of object to be retrieved, the version of its metadata, and the object model
SET_COUNT Procedure on page 74-35	Specifies the maximum number of objects to be retrieved in a single `FETCH_xxx` call
SET_FILTER Procedure on page 74-36	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 74-46	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 74-49	Specifies parameters to the XSLT stylesheets identified by `transform_handle`

Subprograms for Submitting XML to the Database

Table 74–2 lists the subprograms used for submitting XML to the database.

Table 74–2 DBMS_METADATA Subprograms for Submitting XML

Subprogram	Description
ADD_TRANSFORM Function on page 74-12	Specifies a transform for the XML documents
CLOSE Procedure on page 74-15	Closes the context opened with `OPENW`
CONVERT Functions and Procedures on page 74-16	Converts an XML document to DDL
OPENW Function on page 74-32	Opens a write context
PUT Function on page 74-33	Submits an XML document to the database
SET_PARSE_ITEM Procedure on page 74-46	Specifies an object attribute to be parsed
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 74-49	`SET_TRANSFORM_PARAM` specifies a parameter to a transform `SET_REMAP_PARAM` specifies a remapping for a transform

Summary of All DBMS_METADATA Subprograms

Table 74–3 DBMS_METADATA Package Subprograms

Subprogram	Description
ADD_TRANSFORM Function on page 74-12	Specifies a transform that FETCH_xxx applies to the XML representation of the retrieved objects
CLOSE Procedure on page 74-15	Invalidates the handle returned by OPEN and cleans up the associated state
CONVERT Functions and Procedures on page 74-16	Converts an XML document to DDL.
FETCH_xxx Functions and Procedures on page 74-18	Returns metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on
GET_xxx Functions on page 74-21	Fetches the metadata for a specified object as XML or DDL, using only a single call
GET_QUERY Function on page 74-25	Returns the text of the queries that are used by FETCH_xxx
OPEN Function on page 74-26	Specifies the type of object to be retrieved, the version of its metadata, and the object model
OPENW Function on page 74-32	Opens a write context
PUT Function on page 74-33	Submits an XML document to the database
SET_COUNT Procedure on page 74-35	Specifies the maximum number of objects to be retrieved in a single FETCH_xxx call
SET_FILTER Procedure on page 74-36	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 74-46	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 74-49	Specifies parameters to the XSLT stylesheets identified by transform_handle

ADD_TRANSFORM Function

This function is used for both retrieval and submission:

- When this procedure is used to retrieve objects, it specifies a transform that FETCH_xxx applies to the XML representation of the retrieved objects.
- When used to submit objects, it specifies a transform that CONVERT or PUT applies to the XML representation of the submitted objects. It is possible to add more than one transform.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 74-9
- Subprograms for Submitting XML to the Database on page 74-10

Syntax

```
DBMS_METADATA.ADD_TRANSFORM (
   handle       IN NUMBER,
   name         IN VARCHAR2,
   encoding     IN VARCHAR2 DEFAULT NULL,
   object_type  IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 74–4 ADD_TRANSFORM Function Parameters

Parameters	Description
handle	The handle returned from OPEN when this transform is used to retrieve objects. Or the handle returned from OPENW when this transform is used in the submission of XML metadata.
name	The name of the transform. If name contains a period, colon, or forward slash, it is interpreted as the URL of a user-supplied XSLT script. See *Oracle XML DB Developer's Guide*. Otherwise, name designates a transform implemented by DBMS_METADATA. The following transforms are defined: ■ DDL - the document is transformed to DDL that creates the object. The output of this transform is *not* an XML document. ■ MODIFY - The document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged.
encoding	The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left NULL and the URL is external to the database, UTF-8 encoding is assumed. If left NULL and the URL is internal to the database (that is, it begins with /oradb/), then the encoding is assumed to be the database character set.

Table 74–4 (Cont.) ADD_TRANSFORM Function Parameters

Parameters	Description
object_type	The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata. 1. When you use ADD_TRANFORM to retrieve objects, the following definition of object_type applies: Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur: ■ if object_type is omitted, the transform applies to all object types within the heterogeneous collection ■ if object_type is specified, the transform only applies to that specific object type within the collection If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type. 2. When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, the caller would normally leave this parameter NULL in the ADD_TRANSFORM calls.

Return Values

The opaque handle that is returned is used as input to SET_TRANSFORM_PARAM and SET_REMAP_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.
- You can call ADD_TRANSFORM more than once to apply multiple transforms to XML documents. Transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.
- The output of the DDL transform is *not* an XML document. Therefore, no transform should be added after the DDL transform.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. ADD_TRANSFORM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to ADD_TRANSFORM for the current OPEN context are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:

- `encoding` is specified even though name is not a URL
- `object_type` is not part of the collection designated by handle

CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by OPEN (or OPENW) and cleans up the associated state.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 74-9
- Subprograms for Submitting XML to the Database on page 74-10

Syntax

```
DBMS_METADATA.CLOSE (
   handle  IN NUMBER);
```

Parameters

Table 74–5 CLOSE Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).

Usage Notes

Note: The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by OPEN or (OPENW).

- If a call to FETCH_xxx returns NULL, indicating no more objects, a call to CLOSE is made transparently. In this case, you can still call CLOSE on the handle and not get an exception. (The call to CLOSE is not required.)
- If you know that only one specific object will be returned, you should explicitly call CLOSE after the single FETCH_xxx call to free resources held by the handle.

Exceptions

- INVALID_ARGVAL. The value for the handle parameter is NULL or invalid.

CONVERT Functions and Procedures

The CONVERT functions and procedures transform input XML documents. The CONVERT functions return creation DDL. The CONVERT procedures return either XML or DDL, depending on the specified transforms.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Submitting XML to the Database on page 74-10

Syntax

The CONVERT functions are as follows:

```
DBMS_METADATA.CONVERT (
   handle   IN NUMBER,
   document IN sys.XMLType)
 RETURN sys.ku$_multi_ddls;

DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN CLOB)
 RETURN sys.ku$_multi_ddls;
```

The CONVERT procedures are as follows:

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN sys.XMLType,
  result   IN OUT NOCOPY CLOB);

DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN CLOB,
  result   IN OUT NOCOPY CLOB);
```

Parameters

Table 74–6 CONVERT Subprogram Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata of the type of the OPENW handle.
result	The converted document.

Return Values

DDL to create the object(s).

Usage Notes

You can think of CONVERT as the second half of FETCH_xxx, either FETCH_DDL (for the function variants) or FETCH_CLOB (for the procedure variants). There are two differences:

- FETCH_xxx gets its XML document from the database, but CONVERT gets its XML document from the caller
- FETCH_DDL returns its results in a sys.ku$_ddls nested table, but CONVERT returns a sys.ku$_multi_ddls nested table

The transforms specified with ADD_TRANSFORM are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the parsedItems column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. No transform was specified. The DDL transform was not specified (function variants only).
- INCOMPATIBLE_DOCUMENT. The version of the XML document is not compatible with this version of the software.

FETCH_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. See "Usage Notes" on page 74-19 for the variants.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 74-9

Syntax

The FETCH functions are as follows:

```
DBMS_METADATA.FETCH_XML (
   handle  IN NUMBER)
RETURN sys.XMLType;
```

> **See Also:** *Oracle XML DB Developer's Guide* for a description of XMLType

```
DBMS_METADATA.FETCH_DDL (
   handle  IN NUMBER)
RETURN sys.ku$_ddls;

DBMS_METADATA.FETCH_CLOB (
   handle       IN NUMBER,
   cache_lob    IN BOOLEAN DEFAULT TRUE,
   lob_duration IN PLS INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The FETCH procedures are as follows:

```
DBMS_METADATA.FETCH_CLOB (
   handle  IN NUMBER,
   doc     IN OUT NOCOPY CLOB);

DBMS_METADATA.FETCH_XML_CLOB (
   handle  IN NUMBER,
   doc     IN OUT NOCOPY CLOB,
   parsed_items OUT sys.ku$_parsed_items,
   object_type_path OUT VARCHAR2);
```

Parameters

Table 74–7 FETCH_xxx Function Parameters

Parameters	Description
handle	The handle returned from OPEN.
cache_lob	TRUE=read LOB into buffer cache
lob_duration	The duration for the temporary LOB created by FETCH_CLOB, either DBMS_LOB.SESSION (the default) or DBMS_LOB.CALL.
doc	The metadata for the objects, or NULL if all objects have been returned.

Table 74–7 (Cont.) FETCH_xxx Function Parameters

Parameters	Description
parsed_items	A nested table containing the items specified by SET_PARSE_ITEM. If SET_PARSE_ITEM was not called, a NULL is returned.
object_type_path	For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to FETCH_XXX. If handle designates a homogeneous object type, a NULL is returned.

Return Values

The metadata for the objects or NULL if all objects have been returned.

Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to OPEN that returned the handle, and subsequent calls to SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. Each call to FETCH_xxx returns the number of objects specified by SET_COUNT (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to FETCH_xxx return NULL and cause the stream created by OPEN to be transparently closed.

There are several different FETCH_xxx functions and procedures:

- The FETCH_XML function returns the XML metadata for an object as an XMLType. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The FETCH_DDL function returns the DDL (to create the object) in a sys.ku$_ddls nested table. It assumes that the DDL transform has been specified. Each row of the sys.ku$_ddls nested table contains a single DDL statement in the ddlText column; if requested, parsed items for the DDL statement will be returned in the parsedItems column. Multiple DDL statements may be returned under the following circumstances:
  - When you call SET_COUNT to specify a count greater than 1
  - When an object is transformed into multiple DDL statements. For example, A TYPE object that has a DDL transform applied to it can be transformed into both CREATE TYPE and CREATE TYPE BODY statements. A TABLE object can be transformed into a CREATE TABLE, and one or more ALTER TABLE statements
- The FETCH_CLOB function simply returns the object, transformed or not, as a CLOB. By default, the CLOB is read into the buffer cache and has session duration, but these defaults can be overridden with the cache_lob and lob_duration parameters.
- The FETCH_CLOB procedure returns the objects by reference in an IN OUT NOCOPY parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.
- The FETCH_XML_CLOB procedure returns the XML metadata for the objects as a CLOB in an IN OUT NOCOPY parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.

- All LOBs returned by FETCH_xxx are temporary LOBs. You must free the LOB. If the LOB is supplied as an IN OUT NOCOPY parameter, you must also create the LOB.
- If SET_PARSE_ITEM was called, FETCH_DDL and FETCH_XML_CLOB return attributes of the object's metadata (or the DDL statement) in a sys.ku$_parsed_items nested table. For FETCH_XML_CLOB, the nested table is an OUT parameter. For FETCH_DDL, it is a column in the returned sys.ku$_ddls nested table. Each row of the nested table corresponds to an item specified by SET_PARSE_ITEM and contains the following columns:
  - item—the name of the attribute as specified in the name parameter to SET_PARSE_ITEM.
  - value—the attribute value, or NULL if the attribute is not present in the DDL statement.
  - object-row—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by FETCH_xxx, (because SET_COUNT specified a count greater than 1) then object_row=1 for all items for the first object, 2 for the second, and so on.
- The rows of the sys.ku$_parsed_items nested table are ordered by ascending object_row, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on item.
- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be NULL.
- If SET_PARSE_ITEM was not called, NULL is returned as the value of the parsed items nested table.
- It is expected that the same variant of FETCH_xxx will be called for all objects selected by OPEN. That is, programs will not intermix calls to FETCH_XML, FETCH_DDL, FETCH_CLOB, and so on using the same OPEN handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.
- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the FETCH_xxx calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. Either FETCH_XML was called when the DDL transform had been specified, or FETCH_DDL was called when the DDL transform had *not* been specified.

GET_xxx Functions

The following GET_xxx functions let you fetch metadata for objects with a single call:

- GET_XML
- GET_DDL
- GET_DEPENDENT_XML
- GET_DEPENDENT_DDL
- GET_GRANTED_XML
- GET_GRANTED_DDL

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 74-9

Syntax

```
DBMS_METADATA.GET_XML (
object_type     IN VARCHAR2,
name            IN VARCHAR2,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA.GET_DDL (
object_type     IN VARCHAR2,
name            IN VARCHAR2,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL')
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_XML (
object_type        IN VARCHAR2,
base_object_name   IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version            IN VARCHAR2 DEFAULT 'COMPATIBLE',
model              IN VARCHAR2 DEFAULT 'ORACLE',
transform          IN VARCHAR2 DEFAULT NULL,
object_count       IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_DDL (
object_type         IN VARCHAR2,
base_object_name    IN VARCHAR2,
base_object_schema  IN VARCHAR2 DEFAULT NULL,
version             IN VARCHAR2 DEFAULT 'COMPATIBLE',
model               IN VARCHAR2 DEFAULT 'ORACLE',
transform           IN VARCHAR2 DEFAULT 'DDL',
object_count        IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_XML (
```

```
object_type     IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL,
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_DDL (
object_type     IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL',
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;
```

Parameters

Table 74–8 GET_xxx Function Parameters

Parameter	Description
object_type	The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.
name	The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified See Table 74–17 for a list of filters.
schema	The object schema. It is used internally in a SCHEMA filter. The default is the current user.
version	The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.
model	The object model to use. This parameter takes the same values as the OPEN model parameter.
transform	The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.
base_object_name	The base object name. It is used internally in a BASE_OBJECT_NAME filter.
base_object_schema	The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.
grantee	The grantee. It is used internally in a GRANTEE filter. The default is the current user.
object_count	The maximum number of objects to return. See SET_COUNT Procedure on page 74-35.

Return Values

The metadata for the specified object as XML or DDL.

Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML or DDL.
  - GET_xxx is used to fetch named objects, especially schema objects (tables, views).
  - GET_DEPENDENT_xxx is used to fetch dependent objects (audits, object grants).
  - GET_GRANTED_xxx is used to fetch granted objects (system grants, role grants).
- For some object types you can use more than one function. For example, you can use GET_xxx to fetch an index by name, or GET_DEPENDENT_xxx to fetch the same index by specifying the table on which it is defined.
- GET_xxx only returns a single named object.
- For GET_DEPENDENT_xxx and GET_GRANTED_xxx, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)
- If the DDL transform is specified, session-level transform parameters are inherited.
- If you invoke these functions from SQL*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT_NOT_FOUND. The specified object was not found in the database.

Examples

Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE','EMP','SCOTT')
FROM DUAL;
```

Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses SET_TRANSFORM_PARAM (with the handle value = DBMS_METADATA.SESSION_TRANSFORM meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
```

```
SET PAGESIZE 0
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM,'STORAGE',false);
SELECT DBMS_METADATA.GET_DDL('TABLE',u.table_name)
     FROM USER_ALL_TABLES u
     WHERE u.nested='NO'
     AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM,'DEFAULT');
```

Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT',
    'EMPLOYEES','HR') FROM DUAL;
```

Example: Fetch the DDL For All System Grants Granted To SCOTT

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT','SCOTT')
    FROM DUAL;
```

GET_QUERY Function

This function returns the text of the queries that are used by FETCH_xxx. This function assists in debugging.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 74-9

Syntax

```
DBMS_METADATA.GET_QUERY (
   handle  IN NUMBER)
 RETURN VARCHAR2;
```

Parameters

Table 74–9 GET_QUERY Function Parameters

Parameter	Description
handle	The handle returned from OPEN. It cannot be the handle for a heterogeneous object type.

Return Values

The text of the queries that will be used by FETCH_xxx.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for the handle parameter.

OPEN Function

This function specifies the type of object to be retrieved, the version of its metadata, and the object model. The return value is an opaque context handle for the set of objects to be used in subsequent calls.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 74-9

Syntax

```
DBMS_METADATA.OPEN (
   object_type  IN VARCHAR2,
   version      IN VARCHAR2 DEFAULT 'COMPATIBLE',
   model        IN VARCHAR2 DEFAULT 'ORACLE',
   network_link IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 74–10 Open Function Parameters

Parameter	Description
`object_type`	The type of object to be retrieved. Table 74–11 lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see `model` in this table). The Attributes column in Table 74–11 specifies some object type attributes: ■ Schema objects, such as tables, belong to schemas. ■ Named objects have unique names (if they are schema objects, the name is unique to the schema). ■ Dependent objects, such as indexes, are defined with reference to a base schema object. ■ Granted objects are granted or assigned to a user or role and therefore have a named grantee. ■ Heterogeneous object types denote a collection of related objects of different types. See Table 74–12 for a listing of object types returned for the heterogeneous object type. These attributes are relevant when choosing object selection criteria. See "SET_FILTER Procedure" on page 74-36 for more information.
`version`	The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows: `COMPATIBLE` (default)—the version of the metadata corresponds to the database compatibility level. `LATEST`—the version of the metadata corresponds to the database version. A specific database version. The value cannot be lower than 9.2.0.

Table 74–10 (Cont.) Open Function Parameters

Parameter	Description
model	Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported.
network_link	The name of a database link to the database whose metadata is to be retrieved. If NULL (the default), metadata is retrieved from the database on which the caller is running

Table 74–11 provides the name, meaning, attributes, and notes for the DBMS_METADATA package object types. In the attributes column, S represents a schema object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

Table 74–11 DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
AQ_QUEUE	queues	SND	Dependent on table
AQ_QUEUE_TABLE	additional metadata for queue tables	ND	Dependent on table
AQ_TRANSFORM	transforms	SN	None
ASSOCIATION	associate statistics	D	None
AUDIT	audits of SQL statements	DG	Modeled as dependent, granted object. The base object name is the statement audit option name (for example, ALTER SYSTEM). There is no base object schema. The grantee is the user or proxy whose statements are audited.
AUDIT_OBJ	audits of schema objects	D	None
CLUSTER	clusters	SN	None
COMMENT	comments	D	None
CONSTRAINT	constraints	SND	Does not include: ▪ primary key constraint for IOT ▪ column NOT NULL constraints ▪ certain REF SCOPE and WITH ROWID constraints for tables with REF columns
CONTEXT	application contexts	N	None
DATABASE_EXPORT	all metadata objects in a database	H	Corresponds to a full database export
DB_LINK	database links	SN	Modeled as schema objects because they have owners. For public links, the owner is PUBLIC. For private links, the creator is the owner.
DEFAULT_ROLE	default roles	G	Granted to a user by ALTER USER
DIMENSION	dimensions	SN	None
DIRECTORY	directories	N	None
FGA_POLICY	fine-grained audit policies	D	Not modeled as named object because policy names are not unique.

Table 74–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
FUNCTION	stored functions	SN	None
INDEX_STATISTICS	precomputed statistics on indexes	D	The base object is the index's table.
INDEX	indexes	SND	None
INDEXTYPE	indextypes	SN	None
JAVA_SOURCE	Java sources	SN	None
JOB	jobs	S	None
LIBRARY	external procedure libraries	SN	None
MATERIALIZED_VIEW	materialized views	SN	None
MATERIALIZED_ VIEW_LOG	materialized view logs	D	None
OBJECT_GRANT	object grants	DG	None
OPERATOR	operators	SN	None
PACKAGE	stored packages	SN	By default, both package specification and package body are retrieved. See "SET_ FILTER Procedure" on page 74-36.
PACKAGE_SPEC	package specifications	SN	None
PACKAGE_BODY	package bodies	SN	None
PROCEDURE	stored procedures	SN	None
PROFILE	profiles	N	None
PROXY	proxy authentications	G	Granted to a user by ALTER USER
REF_CONSTRAINT	referential constraint	SND	None
REFRESH_GROUP	refresh groups	SN	None
RESOURCE_COST	resource cost info		None
RLS_CONTEXT	driving contexts for enforcement of fine-grained access-control policies	D	Corresponds to the DBMS_RLS.ADD_ POLICY_CONTENT procedure
RLS_GROUP	fine-grained access-control policy groups	D	Corresponds to the DBMS_RLS.CREATE_ GROUP procedure
RLS_POLICY	fine-grained access-control policies	D	Corresponds to DBMS_RLS.ADD_ GROUPED_POLICY. Not modeled as named objects because policy names are not unique.
RMGR_CONSUMER_ GROUP	resource consumer groups	SN	Data Pump does not use these object types. Instead, it exports resource manager objects as procedural objects.
RMGR_INTITIAL_ CONSUMER_GROUP	assign initial consumer groups to users	G	None
RMGR_PLAN	resource plans	SN	None
RMGR_PLAN_ DIRECTIVE	resource plan directives	D	Dependent on resource plan
ROLE	roles	N	None

Table 74–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
ROLE_GRANT	role grants	G	None
ROLLBACK_SEGMENT	rollback segments	N	None
SCHEMA_EXPORT	all metadata objects in a schema	H	Corresponds to user-mode export.
SEQUENCE	sequences	SN	None
SYNONYM	synonyms	See notes	Private synonyms are schema objects. Public synonyms are not, but for the purposes of this API, their schema name is PUBLIC. The name of a synonym is considered to be the synonym itself. For example, in CREATE PUBLIC SYNONYM FOO FOR BAR, the resultant object is considered to have name FOO and schema PUBLIC.
SYSTEM_GRANT	system privilege grants	G	None
TABLE	tables	SN	None
TABLE_DATA	metadata describing row data for a table, nested table, or partition	SND	For partitions, the object name is the partition name. For nested tables, the object name is the storage table name. The base object is the top-level table to which the table data belongs. For nested tables and partitioning, this is the top-level table (*not* the parent table or partition). For nonpartitioned tables and non-nested tables this is the table itself.
TABLE_EXPORT	metadata for a table and its associated objects	H	Corresponds to table-mode export
TABLE_STATISTICS	precomputed statistics on tables	D	None
TABLESPACE	tablespaces	N	None
TABLESPACE_QUOTA	tablespace quotas	G	Granted with ALTER USER
TRANSPORTABLE_EXPORT	metadata for objects in a transportable tablespace set	H	Corresponds to transportable tablespace export
TRIGGER	triggers	SND	None
TRUSTED_DB_LINK	trusted links	N	None
TYPE	user-defined types	SN	By default, both type and type body are retrieved. See "SET_FILTER Procedure" on page 74-36.
TYPE_SPEC	type specifications	SN	None
TYPE_BODY	type bodies	SN	None
USER	users	N	None
VIEW	views	SN	None
XMLSCHEMA	XML schema	SN	The object's name is its URL (which may be longer than 30 characters). Its schema is the user who registered it.

Table 74–12 lists the types of objects returned for the major heterogeneous object types. For SCHEMA_EXPORT, certain object types are only returned if the INCLUDE_USER filter is specified at TRUE. In the table, such object types are marked INCLUDE_USER.

Table 74–12 Object Types Returned for the Heterogeneous Object Type

Object Type	DATABASE_ EXPORT	SCHEMA_ EXPORT	TABLE_ EXPORT	TRANSPORTABLE_ EXPORT
ASSOCIATION	Yes	No	No	No
AUDIT	Yes	No	No	No
AUDIT_OBJ	Yes	Yes	Yes	Yes
CLUSTER	Yes	Yes	No	Yes
COMMENT	Yes	Yes	Yes	Yes

TRUSTED_DB_LINK	Yes	No	No	No
TYPE	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
TYPE_SPEC	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
TYPE_BODY	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
USER	Yes	INCLUDE_USER	No	No
VIEW	Yes	Yes	No	No
XMLSCHEMA	Yes	Yes	No	No

Return Values

An opaque handle to the class of objects. This handle is used as input to SET_FILTER, SET_COUNT, ADD_TRANSFORM, GET_QUERY, SET_PARSE_ITEM, FETCH_xxx, and CLOSE.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OBJECT_PARAM. The version or model parameter was not valid for the object_type.

OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Submitting XML to the Database on page 74-10

Syntax

```
DBMS_METADATA.OPENW
  (object_type  IN VARCHAR2,
  version       IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model         IN VARCHAR2 DEFAULT 'ORACLE')
 RETURN NUMBER;
```

Parameters

Table 74–13 OPENW Function Parameters

Parameter	Description
`object_type`	The type of object to be submitted. Valid types names and their meanings are listed in Table 74–11. The type cannot be a heterogeneous object type.
`version`	The version of DDL to be generated by the `CONVERT` function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows: ▪ `COMPATIBLE` - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher. ▪ `LATEST` - The version of the DDL corresponds to the database version. ▪ A specific database version. The value cannot be lower than 9.2.0.
`model`	Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by `DBMS_METADATA`.

Return Values

An opaque handle to write context. This handle is used as input to the `ADD_TRANSFORM`, `CONVERT`, `PUT`, and `CLOSE` procedures.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The `model` parameter was not valid for the `object_type`.

PUT Function

This function submits an XML document containing object metadata to the database to create the object.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Submitting XML to the Database on page 74-10

Syntax

```
DBMS_METADATA.PUT (
   handle     IN             NUMBER,
   document   IN             sys.XMLType,
   flags      IN             NUMBER,
   results    IN OUT NOCOPY  sys.ku$_SubmitResults)
  RETURN BOOLEAN;

DBMS_METADATA.PUT (
   handle     IN             NUMBER,
   document   IN             CLOB,
   flags      IN             NUMBER,
   results    IN OUT NOCOPY  sys.ku$_SubmitResults)
 RETURN BOOLEAN;
```

Parameters

Table 74–14 PUT Function Parameters

Parameter	Description
`handle`	The handle returned from `OPENW`.
`document`	The XML document containing object metadata for the type of the `OPENW` handle.
`flags`	Reserved for future use
`results`	Detailed results of the operation.

Return Values

`TRUE` if all SQL operations succeeded; `FALSE` if there were any errors.

Usage Notes

The `PUT` function converts the XML document to DDL just as `CONVERT` does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with `CONVERT`, the DDL transform must be specified. The DDL statements and associated parse items are returned in the `sys.ku$_SubmitResults` nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in `OPENW`.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. The DDL transform was not specified.
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

SET_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single FETCH_xxx call. By default, each call to FETCH_xxx returns one object. You can use the SET_COUNT procedure to override this default. If FETCH_xxx is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single FETCH_xxx operation only returns objects of a single object type.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 74-9

Syntax

```
DBMS_METADATA.SET_COUNT (
   handle           IN NUMBER,
   value            IN NUMBER,
   object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 74–15 SET_COUNT Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN.
value	The maximum number of objects to retrieve.
object_type_path	A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: ■ if object_type_path is omitted, the count applies to all object types within the heterogeneous collection ■ if object_type_path is specified, the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_COUNT was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_COUNT for the current OPEN context are permitted.
- INCONSISTENT_ARGS. object_type parameter is not consistent with handle.

SET_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 74-9

Syntax

```
DBMS_METADATA.SET_FILTER (
   handle           IN NUMBER,
   name             IN VARCHAR2,
   value            IN VARCHAR2,
   object_type_path IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_FILTER (
   handle            IN NUMBER,
   name              IN VARCHAR2,
   value             IN BOOLEAN DEFAULT TRUE,
   object_type_path  IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_FILTER (
   handle            IN NUMBER,
   name              IN VARCHAR2,
   value             IN NUMBER,
   object_type_path  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 74–16 SET_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN.
name	The name of the filter. For each filter, Table 74–17 lists the object_type it applies to, its name, its datatype (text or Boolean) and its meaning or effect (including its default value, if any). The Datatype column of Table 74–17 also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.)) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (*not* a double quote) are needed to represent an apostrophe. For example, an example of a NAME_EXPR filter in PL/SQL is as follows: `'IN (''DEPT'',''EMP'')'` The filter value is combined with a particular object attribute to produce a WHERE condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.
value	The value of the filter. Text, Boolean, and Numeric filters are supported.

Table 74–16 (Cont.) SET_FILTER Procedure Parameters

Parameter	Description
object_type_path	A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See Table 74–18 for a listing of some of the values for this parameter.

Table 74–17 describes the object type, name, datatype, and meaning of the filters available with the SET_FILTER procedure.

Table 74–17 SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Named objects	NAME	text	Objects with this exact name are selected.
Named objects	NAME_EXPR	text expression	The filter value is combined with the object attribute corresponding to the object name to produce a WHERE condition in the query that fetches the objects. By default, all named objects of object_type are selected.
Named objects	EXCLUDE_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the object name to specify objects that are to be excluded from the set of objects fetched. By default, all named objects of the object type are selected.
Schema objects	SCHEMA	text	Objects in this schema are selected. If the object type is SYNONYM, specify PUBLIC to select public synonyms.
Schema objects	SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's schema. The default is determined as follows: - if BASE_OBJECT_SCHEMA is specified, then objects in that schema are selected; - otherwise, objects in the current schema are selected.
PACKAGE, TYPE	SPECIFICATION	Boolean	If TRUE, retrieve the package or type specification. Defaults to TRUE.
PACKAGE, TYPE	BODY	Boolean	If TRUE, retrieve the package or type body. Defaults to TRUE.
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE	text	Objects in this tablespace (or having a partition in this tablespace) are selected.

Table 74–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE, CLUSTER, INDEX,TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_ EXPORT	TABLESPACE_ EXPR	text expression	The filter value is combined with the attribute corresponding to the object's tablespace (or in the case of a partitioned table or index, the partition's tablespaces). By default, objects in all tablespaces are selected.
TABLE, objects dependent on tables	PRIMARY	Boolean	If TRUE, retrieve primary tables (that is, tables for which the secondary object bit in obj$ is clear. Defaults to TRUE.
TABLE, objects dependent on tables	SECONDARY	Boolean	If TRUE, retrieve secondary tables (that is, tables for which the secondary object bit in obj$ is set). Defaults to TRUE.
Dependent Objects	BASE_OBJECT_ NAME	text	Objects are selected that are defined or granted on objects with this name. Specify SCHEMA for triggers on schemas. Specify DATABASE for database triggers. Column-level comments cannot be selected by column name; the base object name must be the name of the table, view, or materialized view containing the column.
Dependent Objects	BASE_OBJECT_ SCHEMA	text	Objects are selected that are defined or granted on objects in this schema. If BASE_OBJECT_NAME is specified with a value other than SCHEMA or DATABASE, this defaults to the current schema.
Dependent Objects	BASE_OBJECT_ NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object. Not valid for schema and database triggers.
Dependent Objects	EXCLUDE_BASE_ OBJECT_NAME_ EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object to specify objects that are to be excluded from the set of objects fetched. Not valid for schema and database triggers.
Dependent Objects	BASE_OBJECT_ SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the schema of the base object.
Dependent Objects	BASE_OBJECT_ TYPE	text	The object type of the base object.
Dependent Objects	BASE_OBJECT_ TYPE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object type of the base object. By default no filtering is done on object type.
Dependent Objects	BASE_OBJECT_ TABLESPACE	text	The tablespace of the base object.
Dependent Objects	BASE_OBJECT_ TABLESPACE_ EXPR	text expression	The filter value is combined with the attribute corresponding to the tablespaces of the base object. By default, no filtering is done on the tablespace.
INDEX, TRIGGER	SYSTEM_ GENERATED	Boolean	If TRUE, select indexes or triggers even if they are system-generated. If FALSE, omit system-generated indexes or triggers. Defaults to TRUE.
Granted Objects	GRANTEE	text	Objects are selected that are granted to this user or role. Specify PUBLIC for grants to PUBLIC.
Granted Objects	PRIVNAME	text	The name of the privilege or role to be granted. For TABLESPACE_QUOTA, only UNLIMITED can be specified.

Table 74–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Granted Objects	PRIVNAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the privilege or role name. By default, all privileges/roles are returned.
Granted Objects	GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name.
Granted Objects	EXCLUDE_ GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name to specify objects that are to be excluded from the set of objects fetched.
OBJECT_GRANT	GRANTOR	text	Object grants are selected that are granted by this user.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME	text	A name longer than 30 characters. Objects with this exact name are selected. If the object name is 30 characters or less, the NAME filter must be used.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME_EXPR	text	The filter value is combined with the attribute corresponding to the object's long name. By default, no filtering is done on the long name of an object.
All objects	CUSTOM_FILTER	text	The text of a WHERE condition. The condition is appended to the query that fetches the objects. By default, no custom filter is used. The other filters are intended to meet the needs of the majority of users. Use CUSTOM_FILTER when no defined filters exists for your purpose. Of necessity such a filter depends on the detailed structure of the UDTs and views used in the query. Because filters may change from version to version, upward compatibility is not guaranteed.
SCHEMA_EXPORT	SCHEMA	text	The schema whose objects are selected.
SCHEMA_EXPORT	SCHEMA_EXPR	text expression	The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches schema objects, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches dependent objects. By default the current user's objects are selected.
SCHEMA_EXPORT	INCLUDE_USER	Boolean	If TRUE, retrieve objects containing privileged information about the user. For example, USER, PASSWORD_HISTORY, TABLESPACE_QUOTA. Defaults to FALSE.
TABLE_EXPORT	SCHEMA	text	Objects (tables and their dependent objects) in this schema are selected.
TABLE_EXPORT	SCHEMA_EXPR	text expression	The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches the tables, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches the tables' dependent objects. By default the current user's objects are selected.

Table 74–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE_EXPORT	NAME	text	The table with this exact name is selected along with its dependent objects.
TABLE_EXPORT	NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default all tables in the selected schemas are selected, along with their dependent objects.
Heterogeneous objects	BEGIN_WITH	text	The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.
Heterogeneous objects	BEGIN_AFTER	text	The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.
Heterogeneous objects	END_BEFORE	text	The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.
Heterogeneous objects	END_WITH	text	The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.
Heterogeneous objects	INCLUDE_PATH_EXPR, EXCLUDE_PATH_EXPR	text expression	For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 74–18 for valid path names that can be used with these filters. BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.

Usage Notes

- Each call to SET_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are ANDed together, so you can use multiple SET_FILTER calls to refine the set of objects to be returned. For example to specify that you want the object named EMP in schema SCOTT, do the following:

```
SET_FILTER(handle,'SCHEMA','SCOTT');
SET_FILTER(handle,'NAME','EMP');
```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

```
SET_FILTER(handle,'NAME_EXPR','>=''FELIX''');
```

```
SET_FILTER(handle,'NAME_EXPR','<=''OSCAR''');
```

- With SET_FILTER, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is SYS or has SELECT_CATALOG_ROLE, then any object can be retrieved; otherwise, only the following can be retrieved:
  - Schema objects owned by the current user
  - Public synonyms
  - System privileges granted to the current user or to PUBLIC
  - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as PUBLIC).
  - SCHEMA_EXPORT where the name is the current user
  - TABLE_EXPORT where SCHEMA is the current user

  If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

  In stored procedures, functions, and definers-rights packages, roles (such as SELECT_CATALOG_ROLE) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of SELECT_CATALOG_ROLE), you must make the program invokers-rights.
- For heterogeneous object types, the BEGIN_WITH and BEGIN_AFTER filters allow restart on an object type boundary. Appropriate filter values are returned by the FETCH_XML_CLOB procedure.

  Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for SCHEMA_EXPORT the NAME filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a NAME_EXPR filter explicitly for the TABLE object type path. Table 74–18 lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS.) See Table 74–17 for filters defined for each path name. These path names are valid in the INCLUDE_PATH_EXPR and EXCLUDE_PATH_EXPR filters. Path names marked with an asterisk (*) are *only* valid in those filters; they cannot be used as values of the SET_FILTER object_type_path parameter.

Table 74–18 Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	AUDIT_OBJ	Object audits on the selected tables
TABLE_EXPORT	COMMENT	Table and column comments for the selected tables
TABLE_EXPORT	CONSTRAINT	Constraints (including referential constraints) on the selected tables
TABLE_EXPORT	*GRANT	Object grants on the selected tables

Table 74–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	INDEX	Indexes (including domain indexes) on the selected tables
TABLE_EXPORT	OBJECT_GRANT	Object grants on the selected tables
TABLE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on the selected tables
TABLE_EXPORT	STATISTICS	Statistics on the selected tables
TABLE_EXPORT	TABLE_DATA	Row data for the selected tables
TABLE_EXPORT	TRIGGER	Triggers on the selected tables
SCHEMA_EXPORT	ASSOCIATION	Statistics type associations for objects in the selected schemas
SCHEMA_EXPORT	AUDIT_OBJ	Audits on all objects in the selected schemas
SCHEMA_EXPORT	CLUSTER	Clusters in the selected schemas and their indexes
SCHEMA_EXPORT	COMMENT	Comments on all objects in the selected schemas
SCHEMA_EXPORT	CONSTRAINT	Constraints (including referential constraints) on all objects in the selected schemas
SCHEMA_EXPORT	DB_LINK	Private database links in the selected schemas
SCHEMA_EXPORT	DEFAULT_ROLE	Default roles granted to users associated with the selected schemas
SCHEMA_EXPORT	DIMENSION	Dimensions in the selected schemas
SCHEMA_EXPORT	FUNCTION	Functions in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	*GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters in the selected schemas
SCHEMA_EXPORT	INDEXTYPE	Indextypes in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JAVA_SOURCE	Java sources in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JOB	Jobs in the selected schemas
SCHEMA_EXPORT	LIBRARY	External procedure libraries in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW	Materialized views in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs on tables in the selected schemas
SCHEMA_EXPORT	OBJECT_GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	OPERATOR	Operators in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE	Packages (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE_BODY	Package bodies in the selected schemas
SCHEMA_EXPORT	PACKAGE_SPEC	Package specifications in the selected schemas
SCHEMA_EXPORT	PASSWORD_HISTORY	The password history for users associated with the selected schemas

Table 74–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
SCHEMA_EXPORT	PROCEDURE	Procedures in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the selected schemas
SCHEMA_EXPORT	REFRESH_GROUP	Refresh groups in the selected schemas
SCHEMA_EXPORT	SEQUENCE	Sequences in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	STATISTICS	Statistics on tables and indexes in the selected schemas
SCHEMA_EXPORT	SYNONYM	Private synonyms in the selected schemas
SCHEMA_EXPORT	TABLE	Tables in the selected schemas and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
SCHEMA_EXPORT	TABLE_DATA	Row data for tables in the selected schemas
SCHEMA_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users associated with the selected schemas
SCHEMA_EXPORT	TRIGGER	Triggers on tables in the selected schemas
SCHEMA_EXPORT	TYPE	Types (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	TYPE_BODY	Type bodies in the selected schemas
SCHEMA_EXPORT	TYPE_SPEC	Type specifications in the selected schemas
SCHEMA_EXPORT	USER	User definitions for users associated with the selected schemas
SCHEMA_EXPORT	VIEW	Views in the selected schemas and their dependent objects (grants, constraints, comments, audits)
DATABASE_EXPORT	ASSOCIATION	Statistics type associations for objects in the database
DATABASE_EXPORT	AUDIT	Audits of SQL statements
DATABASE_EXPORT	AUDIT_OBJ	Audits on all objects in the database
DATABASE_EXPORT	CLUSTER	Clusters and their indexes
DATABASE_EXPORT	COMMENT	Comments on all objects
DATABASE_EXPORT	CONSTRAINT	Constraints (including referential constraints)
DATABASE_EXPORT	CONTEXT	Application contexts
DATABASE_EXPORT	DB_LINK	Private and public database links
DATABASE_EXPORT	DEFAULT_ROLE	Default roles granted to users in the database
DATABASE_EXPORT	DIMENSION	Dimensions in the database
DATABASE_EXPORT	DIRECTORY	Directory objects in the database
DATABASE_EXPORT	FGA_POLICY	Fine-grained audit policies
DATABASE_EXPORT	FUNCTION	Functions
DATABASE_EXPORT	* GRANT	Object and system grants
DATABASE_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters
DATABASE_EXPORT	INDEXTYPE	Indextypes and their dependent grants and audits

Table 74–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	JAVA_SOURCE	Java sources and their dependent grants and audits
DATABASE_EXPORT	JOB	Jobs
DATABASE_EXPORT	LIBRARY	External procedure libraries
DATABASE_EXPORT	MATERIALIZED_VIEW	Materialized views
DATABASE_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs
DATABASE_EXPORT	OBJECT_GRANT	All object grants in the database
DATABASE_EXPORT	OPERATOR	Operators and their dependent grants and audits
DATABASE_EXPORT	PACKAGE	Packages (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	PACKAGE_BODY	Package bodies
DATABASE_EXPORT	PACKAGE_SPEC	Package specifications
DATABASE_EXPORT	PASSWORD_HISTORY	Password histories for database users
DATABASE_EXPORT	*PASSWORD_VERIFY_FUNCTION	The password complexity verification function
DATABASE_EXPORT	PROCEDURE	Procedures and their dependent grants and objects
DATABASE_EXPORT	PROFILE	Profiles
DATABASE_EXPORT	PROXY	Proxy authentications
DATABASE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the database
DATABASE_EXPORT	REFRESH_GROUP	Refresh groups
DATABASE_EXPORT	*RESOURCE_ COST	Resource cost information
DATABASE_EXPORT	RLS_CONTEXT	Fine-grained access-control driving contexts
DATABASE_EXPORT	RLS_GROUP	Fine-grained access-control policy groups
DATABASE_EXPORT	RLS_POLICY	Fine-grained access-control policies
DATABASE_EXPORT	ROLE	Roles
DATABASE_EXPORT	ROLE_GRANT	Role grants to users in the database
DATABASE_EXPORT	ROLLBACK_SEGMENT	Rollback segments
DATABASE_EXPORT	*SCHEMA (named object)	Database schemas including for each schema all related and dependent objects: user definitions and their attributes (default roles, role grants, tablespace quotas, and so on), objects in the schema (tables, view, packages, types, and so on), and their dependent objects (grants, audits, indexes, constraints, and so on). The NAME and NAME_EXPR filters can be used with this object type path name to designate the database schemas to be fetched.
DATABASE_EXPORT	SEQUENCE	Sequences
DATABASE_EXPORT	STATISTICS	Statistics on tables and indexes
DATABASE_EXPORT	SYNONYM	Public and private synonyms
DATABASE_EXPORT	SYSTEM_GRANT	System privilege grants

Table 74–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	TABLE	Tables and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
DATABASE_EXPORT	TABLE_DATA	Row data for all tables
DATABASE_EXPORT	TABLESPACE	Tablespace definitions
DATABASE_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users in the database
DATABASE_EXPORT	TRIGGER	Triggers on the database, on schemas, and on schema objects
DATABASE_EXPORT	TRUSTED_DB_LINK	Trusted links
DATABASE_EXPORT	TYPE	Types (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	TYPE_BODY	Type bodies
DATABASE_EXPORT	TYPE_SPEC	Type specifications
DATABASE_EXPORT	USER	User definitions
DATABASE_EXPORT	VIEW	Views

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_FILTER was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_FILTER are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:
  - filter name not valid for the object type associated with the OPEN context
  - filter name not valid for the object_type_path
  - object_type_path not part of the collection designated by handle
  - filter value is the wrong datatype

SET_PARSE_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 74-9
- Subprograms for Submitting XML to the Database on page 74-10

Syntax

The following syntax applies when SET_PARSE_ITEM is used for object retrieval:

```
DBMS_METADATA.SET_PARSE_ITEM (
   handle       IN  NUMBER,
   name         IN  VARCHAR2,
   object_type  IN  VARCHAR2 DEFAULT NULL);
```

The following syntax applies when SET_PARSE_ITEM is used for XML submission:

```
DBMS_METADATA.SET_PARSE_ITEM (
   handle     IN NUMBER,
   name        IN VARCHAR2);
```

Parameters

Table 74–19 SET_PARSE_ITEM Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).
name	The name of the object attribute to be parsed and returned. See Table 74–20 for the attribute object type, name, and meaning.
object_type	Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: ▪ if object_type is omitted, the parse item applies to all object types within the heterogeneous collection ▪ if object_type is specified, the parse item only applies to that specific object type within the collection This parameter only applies when SET_PARSE_ITEM is used for object retrieval.

Table 74–20 describes the object type, name, and meaning of the items available in the SET_PARSE_ITEM procedure.

Table 74–20 SET_PARSE_ITEM: Parse Items

Object Type	Name	Meaning
All objects	VERB	If FETCH_XML_CLOB is called, no value is returned. If FETCH_DDL is called, then for every row in the sys.ku$_ddls nested table returned by FETCH_DDL the verb in the corresponding ddlText is returned. If the ddlText is a SQL DDL statement, then the SQL verb (for example, CREATE, GRANT, AUDIT) is returned. If the ddlText is a procedure call (for example, DBMS_AQADM.CREATE_QUEUE_TABLE()) then the package.procedure-name is returned.
All objects	OBJECT_TYPE	If FETCH_XML_CLOB is called, an object type name from Table 74–11 is returned. If FETCH_DDL is called and the ddlText is a SQL DDL statement whose verb is CREATE or ALTER, the object type as used in the DDL statement is returned (for example, TABLE, PACKAGE_BODY, and so on). Otherwise, an object type name from Table 74–11 is returned.
Schema objects	SCHEMA	The object schema is returned. If the object is not a schema object, no value is returned.
Named objects	NAME	The object name is returned. If the object is not a named object, no value is returned.
TABLE, TABLE_DATA, INDEX	TABLESPACE	The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a TABLE_DATA object, this is always the tablespace where the rows are stored.
TRIGGER	ENABLE	If the trigger is enabled, ENABLE is returned. If the trigger is disabled, DISABLE is returned.
OBJECT_GRANT, TABLESPACE_QUOTA	GRANTOR	The grantor is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_NAME	The name of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_SCHEMA	The schema of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_TYPE	The object type of the base object is returned. If the object is not a dependent object, no value is returned.
Granted objects	GRANTEE	The grantee is returned. If the object is not a granted object, no value is returned.

Usage Notes

These notes apply when using SET_PARSE_ITEM to retrieve objects.

By default, the FETCH_xxx routines return an object's metadata as XML or creation DDL. By calling SET_PARSE_ITEM you can request that individual attributes of the object be returned as well.

You can call SET_PARSE_ITEM multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the sys.ku$_parsed_items nested table.

For TABLE_DATA objects, the following parse item return values are of interest:

If Object Is	NAME, SCHEMA	BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA
nonpartitioned table	table name, schema	table name, schema
table partition	partition name, schema	table name, schema
nested table	storage table name, schema	name and schema of top-level table (*not* the parent nested table)

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA and BASE_OBJECT_TYPE parse items for secondary TABLE objects return the name, schema, and type of the domain index.

See Also:

- "FETCH_xxx Functions and Procedures" on page 74-18
- *Oracle Database Utilities* for information about using the Metadata API

By default, the CONVERT and PUT procedures simply transform an object's XML metadata to DDL. By calling SET_PARSE_ITEM you can request that individual attributes of the object be returned as well.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_PARSE_ITEM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_PARSE_ITEM are permitted.
- INCONSISTENT_ARGS. The attribute name is not valid for the object type associated with the OPEN context.

SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures

These procedures are used for both retrieval and submission. SET_TRANSFORM_PARAM and SET_REMAP_PARAM specify parameters to the XSLT stylesheet identified by transform_handle. Use them to modify or customize the output of the transform.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 74-9
> - Subprograms for Submitting XML to the Database on page 74-10

Syntax

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN VARCHAR2,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN BOOLEAN DEFAULT TRUE,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN NUMBER,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_REMAP_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   old_value          IN VARCHAR2,
   new_value          IN VARCHAR2,
   object_type        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 74–21 describes the parameters for the SET_TRANSFORM_PARAM and SET_REMAP_PARAM procedures.

Table 74–21 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
transform_handle	Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session. Note that the handle returned by OPEN is not a valid transform handle. For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.

Table 74–21 (Cont.) SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
name	The name of the parameter. Table 74–22 lists the transform parameters defined for the DDL transform, specifying the object_type it applies to, its datatype, and its meaning or effect. This includes its default value, if any, and whether the parameter is additive. Table 74–23 describes the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure. Table 74–24 describes the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.
value	The value of the transform. This parameter is valid only for SET_TRANSFORM_PARAM.
old_value	The old value for the remapping. This parameter is valid only for SET_REMAP_PARAM.
new_value	The new value for the remapping. This parameter is valid only for SET_REMAP_PARAM.
object_type	Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply: ▪ If object_type is omitted, the parameter applies to all applicable object types within the heterogeneous collection. ▪ If object_type is specified, the parameter only applies to that object type. This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.

Table 74–22 describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the SET_TRANSFORM_PARAM procedure.

Table 74–22 SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	PRETTY	BOOLEAN	If TRUE, format the output with indentation and line feeds. Defaults to TRUE.
All objects	SQLTERMINATOR	BOOLEAN	If TRUE, append a SQL terminator (; or /) to each DDL statement. Defaults to FALSE.
TABLE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
TABLE	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	CONSTRAINTS	BOOLEAN	If TRUE, emit all non-referential table constraints. Defaults to TRUE.
TABLE	REF_CONSTRAINTS	BOOLEAN	If TRUE, emit all referential constraints (foreign keys). Defaults to TRUE.

Table 74–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
TABLE	CONSTRAINTS_AS_ALTER	BOOLEAN	If TRUE, emit table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE.
TABLE	OID	BOOLEAN	If TRUE, emit the OID clause for object tables. Defaults to FALSE.
TABLE	SIZE_BYTE_KEYWORD	BOOLEAN	If TRUE, emit the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE.
TABLE, INDEX	PARTITIONING	BOOLEAN	If TRUE, emit partitioning clauses; if FALSE, suppress them. Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER, TABLESPACE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if SEGMENT_ ATTRIBUTES is FALSE.) Defaults to TRUE.
TYPE	SPECIFICATION	BOOLEAN	If TRUE, emit the type specification. Defaults to TRUE.
TYPE	BODY	BOOLEAN	If TRUE, emit the type body. Defaults to TRUE.
TYPE	OID	BOOLEAN	If TRUE, emit the OID clause. Defaults to FALSE.
PACKAGE	SPECIFICATION	BOOLEAN	If TRUE, emit the package specification. Defaults to TRUE.
PACKAGE	BODY	BOOLEAN	If TRUE, emit the package body. Defaults to TRUE.
VIEW	FORCE	BOOLEAN	If TRUE, use the FORCE keyword in the CREATE VIEW statement. Defaults to TRUE.
OUTLINE	INSERT	BOOLEAN	If TRUE, emit the INSERT statements into the OL$ dictionary tables that will create the outline and its hints. If FALSE, emit a CREATE OUTLINE statement. Defaults to FALSE. Note: This object type is being deprecated.
All objects	DEFAULT	BOOLEAN	Calling SET_TRANSFORM_PARAM with this parameter set to TRUE has the effect of resetting all parameters for the transform to their default values. Setting this FALSE has no effect. There is no default.

Table 74–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	INHERIT	BOOLEAN	If TRUE, inherits session-level parameters. Defaults to FALSE. If an application calls ADD_TRANSFORM to add the DDL transform, then by default the only transform parameters that apply are those explicitly set for that transform handle. This has no effect if the transform handle is the session transform handle.
ROLE	REVOKE_FROM	Text	The name of a user from whom the role must be revoked. If this is a non-null string and if the CREATE ROLE statement grants you the role, a REVOKE statement is emitted after the CREATE ROLE. Note: When you issue a CREATE ROLE statement, Oracle may grant you the role. You can use this transform parameter to undo the grant. Defaults to null string.
TABLESPACE	REUSE	BOOLEAN	If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. Defaults to FALSE.
CLUSTER, INDEX, ROLLBACK_SEGMENT, TABLE, TABLESPACE	PCTSPACE	NUMBER	A number representing the percentage by which space allocation for the object type is to be modified. The value is the number of one-hundreths of the current allocation. For example, 100 means 100%. If the object type is TABLESPACE, the following size values are affected: - in file specifications, the value of SIZE - MINIMUM EXTENT - EXTENT MANAGEMENT LOCAL UNIFORM SIZE For other object types, INITIAL and NEXT are affected.

Table 74–23 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure.

Table 74–23 SET_TRANSFORM_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
All objects	OBJECT_ROW	NUMBER	A number designating the object row for an object. The object in the document that corresponds to this number will be copied to the output document. This parameter is additive. By default, all objects are copied to the output document.

Table 74–24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.

Table 74–24 SET_REMAP_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
LIBRARY, TABLESPACE, DIRECTORY	REMAP_DATAFILE	Text	Objects in the document will have their filespecs renamed as follows: any filespec matching old_value will be changed to new_value. Filespecs should *not* be enclosed in quotes. This parameter is additive. By default, filespecs are not renamed.
Schema Objects, Dependent Objects, Granted Objects, USER	REMAP_SCHEMA	Text	Any schema object in the document whose name matches old_value will have its schema name changed to new_value. Any dependent object whose base object schema name matches old_value will have its base object schema name changed to new_value. Any granted object whose grantee name matches old_value will have its grantee name changed to new_value. Any user whose name matches old_value will have its name changed to new_value. This parameter is additive. By default, schemas are not remapped.
TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, TABLESPACE_QUOTA	REMAP_TABLESPACE	Text	Objects in the document will have their tablespaces renamed as follows: any tablespace name matching old_value will be changed to new_value. This parameter is additive. By default, tablespaces are not remapped.
Named objects and all objects dependent on named objects	REMAP_NAME	Text	Any named object in the document whose name matches old_value will have its name changed to new_value. Any dependent object whose base object name matches old_value will have its base schema name changed to new_value. This parameter is additive. By default, names are not remapped. (Use REMAP_TABLESPACE to remap the name of a TABLESPACE object.)

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. Either SET_TRANSFORM_PARAM or SET_REMAP_PARAM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_TRANSFORM_PARAM or SET_REMAP_PARAM are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. This can mean the following:

- The transform parameter `name` is not valid for the object type associated with the `OPEN` context or for the transform associated with the transform handle.
- The transform applies to all object types in a heterogeneous collection, but `object_type` is not part of the collection.

Usage Notes

XSLT allows parameters to be passed to stylesheets. You call `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` to specify the value of a parameter to be passed to the stylesheet identified by `transform_handle`.

Normally, if you call `SET_TRANSFORM_PARAMETER` multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the `STORAGE` transform parameter to `TRUE`.

```
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',false);
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the `OBJECT_ROW` parameter to the `MODIFY` transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',5);
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',8);
```

The `REMAP_TABLESPACE` parameter is also additive. If you specify the following, then tablespaces TBS1 and TBS3 are changed to TBS2 and TBS4, respectively.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS3','TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS2','TBS3');
```

> **Note:** The number of remap parameters that can be specified for a MODIFY transform is limited to ten. That is, you can specify up to ten `REMAP_DATAFILE` parameters, up to ten `REMAP_SCHEMA` parameters and so on. Additional instances are ignored. To work around this, you can perform another `DBMS_METADATA.ADD_TRANSFORM` and specify additional remap parameters.

The `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant `SESSION_TRANSFORM` as the handle of the DDL transform at the session level. You can call `SET_TRANSFORM_PARAM` using `DBMS_METADATA.SESSION_TRANSFORM` as the transform handle to set transform parameters for the whole session. `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET GRANTED_DDL` inherit these parameters when they invoke the DDL transform.

> **Note:** The enumerated constant must be prefixed with the package name `DBMS_METADATA.SESSION_TRANSFORM`.

75

DBMS_MGD_ID_UTL

The DBMS_MGD_ID_UTL package contains various functions and procedures that make up several utility subprograms:

- A logging utility that sets and gets Java and PL/SQL logging levels.
- A proxy utility consisting of two procedures used to set and unset the host and port of the proxy server.
- A metadata utility consisting of functions and procedures used for managing metadata.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information.

This chapter describes each of these utility subprograms and contains the following topics:

- Using DBMS_MGD_ID_UTL
  - Constants
  - Exceptions
- Summary of DBMS_MGD_ID_UTL Subprograms

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

Using DBMS_MGD_ID_UTL

- Constants
- Exceptions

Constants

DBMS_MGD_ID_UTL uses the constants shown in Table 75–1.

Table 75–1 DBMS_MGD_ID_UTL Constants

Name	Value
Installed Category IDs and Names	
EPC_ENCODING_CATEGORY_ID	1
EPC_ENCODING_CATEGORY_NAME	EPC
Logging Levels	
LOGGING_LEVEL_OFF	0
LOGGING_LEVEL_SEVERE	1
LOGGING_LEVEL_WARNING	2
LOGGING_LEVEL_INFO	3
LOGGING_LEVEL_FINE	4
LOGGING_LEVEL_FINER	5
LOGGING_LEVEL_FINEST	6
LOGGING_LEVEL_ALL	7

Exceptions

DBMS_MGD_ID_UTL uses the exceptions shown in Table 75–2.

Table 75–2 Exceptions Raised by DBMS_MGD_ID_UTL Package

Name	Error Code	Description
TDTJavaException	-55200	During the tag data translation, a Java exception was raised.
TDTCategoryNotFound	-55201	The specified category was not found.
TDTSchemeNotFound	-55202	During the tag data translation, the specified scheme was not found.
TDTLevelNotFound	-55203	During the tag data translation, the specified level was not found.
TDTOptionNotFound	-55204	During the tag data translation, the specified option was not found.
TDTFieldValidationException	-55205	During the tag data translation, the validation operation failed on a field.
TDTUndefinedField	-55206	During the tag data translation, an undefined field was detected.
TDTRuleEvaluationFailed	-55207	During the tag data translation, the rule evaluation operation failed.
TDTTooManyMatchingLevels	-55208	During the tag data translation, too many matching levels were found.

Summary of DBMS_MGD_ID_UTL Subprograms

Table 75–3 describes the utility subprograms in the `DBMS_MGD_ID_UTL` package.

All the values and names passed to the procedures defined in the `DBMS_MGD_ID_UTL` package are case insensitive unless otherwise mentioned. In order to preserve the case, double quotation marks should be used around the values.

Table 75–3 DBMS_MGD_ID_UTL Package Subprograms

Subprogram	Description
ADD_SCHEME Procedure	Adds a tag data translation scheme to an existing category
CREATE_CATEGORY Function	Creates a new category or a new version of a category
EPC_TO_ORACLE_SCHEME Function	Converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML
GET_CATEGORY_ID Function	Returns the category ID given the category name and the category version
GET_COMPONENTS Function	Returns all relevant separated component names separated by semicolon (';') for the specified scheme
GET_ENCODINGS Function	Returns a list of semicolon (';') separated encodings (formats) for the specified scheme
GET_JAVA_LOGGING_LEVEL Function	Returns an integer representing the current Java trace logging level
GET_PLSQL_LOGGING_LEVEL Function	Returns an integer representing the current PL/SQL trace logging level
GET_SCHEME_NAMES Function	Returns a list of semicolon (';') separated scheme names for the specified category
GET_TDT_XML Function	Returns the Oracle tag data translation XML for the specified scheme
GET_VALIDATOR Function	Returns the Oracle tag data translation schema
REFRESH_CATEGORY Function	Refreshes the metadata information on the Java stack for the specified category
REMOVE_CATEGORY Procedure	Removes a category including all the related TDT XML if the value of `category_version` is NULL
REMOVE_PROXY Procedure	Unsets the host and port of the proxy server
REMOVE_SCHEME Procedure	Removes a tag data translation scheme from a category
SET_JAVA_LOGGING_LEVEL Procedure	Sets the Java logging level
SET_PLSQL_LOGGING_LEVEL Procedure	Sets the PL/SQL tracing logging level
SET_PROXY Procedure	Sets the host and port of the proxy server for Internet access
VALIDATE_SCHEME Function	Validates the input tag data translation XML against the Oracle tag data translation schema

ADD_SCHEME Procedure

This procedure adds a tag data translation scheme to an existing category.

Syntax

```
procedure DBMS_MGD_ID_UTL.ADD_SCHEME (
              category_id IN  VARCHAR2,
              tdt_xml     IN  CLOB);
```

Parameters

Table 75–4 ADD_SCHEME Procedure Parameters

Parameter	Description
category_id	Category ID
tdt_xml	Tag data translation XML

Usage Notes

None.

Examples

The following example creates a category, adds a contractor scheme and an employee scheme to the MGD_SAMPLE_CATEGORY category, validates the MGD_SAMPLE_CATEGORY scheme, tests the tag translation of the contractor scheme and the employee scheme, then removes the contractor scheme, tests the tag translation of the contractor scheme and this returns the expected exception for the removed contractor scheme, tests the tag translation of the employee scheme and this returns the expected values, then removes the MGD_SAMPLE_CATEGORY category:

```

```

CREATE_CATEGORY Function

This function creates a new category or a new version of a category.

Syntax

```
function DBMS_MGD_ID_UTL.CREATE_CATEGORY (
              category_name    IN  VARCHAR2,
              category_version IN  VARCHAR2,
              agency           IN  VARCHAR2,
              URI              IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 75–5 CREATE_CATEGORY Function Parameters

Parameter	Description
`category_name`	Name of category
`category_version`	Category version
`agency`	Organization that owns the category. For example, EPCglobal owns the category 'EPC'.
`URI`	URI that provides additional information about the category

Usage Notes

The return value is the category ID.

Examples

See the ADD_SCHEME Procedure for an example of creating the MGD_SAMPLE_CATEGORY category.

EPC_TO_ORACLE_SCHEME Function

This function converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML.

Syntax

```
function DBMS_MGD_ID_UTL.EPC_TO_ORACLE_SCHEME (
              xml_scheme IN CLOB)
RETURN CLOB;
```

Parameters

Table 75–6 EPC_TO_ORACLE_SCHEME Function Parameters

Parameter	Description
xml_scheme	Name of EPC tag scheme to be converted

Usage Notes

The return value is the contents of the CLOB containing the Oracle tag data translation XML.

Examples

The following example converts standard EPCglobal Tag Data Translation (TDT) files into Oracle TDT files:

```
--Contents of MGD_ID_DOC2.sql
-----------------------------
-- EPC_TO_ORACLE_SCHEME   --
-----------------------------
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');

BEGIN
 DBMS_JAVA.set_output(1000000);
 DBMS_OUTPUT.ENABLE(1000000);
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_SEVERE);
END;
/

GET_CATEGORY_ID Function

This function returns the category ID for a given category name and category version.

Syntax

```
function DBMS_MGD_ID_UTL.GET_CATEGORY_ID (
              category name     IN  VARCHAR2,
              category_version  IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 75–7 GET_CATEGORY_ID Function Parameters

Parameter	Description
`category_name`	Name of category
`category_version`	Category version

Usage Notes

- If the value of `category_version` is NULL, then the ID of the latest version of the specified category is returned.
- The return value is the category ID for the specified category name.

Examples

The following example returns a category ID given a category name and its version:

```
-- Contents of get_category1.sql file
SELECT DBMS_MGD_ID_UTL.get_category_id('EPC', NULL) FROM DUAL;

SQL> @get_category1.sql
.
.
.
DBMS_MGD_ID_UTL.GET_CATEGORY_ID('EPC',NULL)
--------------------------------------------------------------------------------
1
.
.
.
```

GET_COMPONENTS Function

This function returns all relevant separated component names separated by semicolon (';') for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_COMPONENTS (
              category_id IN VARCHAR2,
              scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 75–8 GET_COMPONENTS Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

The return value contains the component names separated by a semicolon (';') for the specified scheme.

Examples

The following example gets the components:

```
--Contents of get_components.sql
DECLARE
  id             mgd_id;
  getcomps       VARCHAR2(1000);
  getencodings   VARCHAR2(1000);
  getschemenames VARCHAR2(1000);
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 getcomps := DBMS_MGD_ID_UTL.get_components(1,'SGTIN-64');
 dbms_output.put_line('Component names are: ' || getcomps);
 getencodings := DBMS_MGD_ID_UTL.get_encodings(1,'SGTIN-64');
 dbms_output.put_line('Encodings are: ' || getencodings);
 getschemenames := DBMS_MGD_ID_UTL.get_scheme_names(1);
 dbms_output.put_line('Scheme names are: ' || getschemenames);
END;
/
SHOW ERRORS;

SQL> @get_components.sql

GET_ENCODINGS Function

This function returns a list of semicolon (';') separated encodings (formats) for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_ENCODINGS (
              category_id IN VARCHAR2,
              scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 75–9 GET_ENCODINGS Function Parameters

Parameter	Description
`category_id`	Category ID
`scheme_name`	Name of scheme

Usage Notes

The return value contains the encodings separated by a semicolon (';') for the specified scheme.

Examples

See the GET_COMPONENTS Function for an example.

GET_JAVA_LOGGING_LEVEL Function

This function returns an integer representing the current trace logging level.

Syntax

```
function DBMS_MGD_ID_UTL.GET_JAVA_LOGGING_LEVEL RETURN INTEGER;
```

Parameters

None.

Usage Notes

The return value is the integer value denoting the current Java logging level.

Examples

The following example gets the Java logging level.

```
--Contents of getjavaloggінglevel.sql
DECLARE
     loglevel   NUMBER;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  loglevel := DBMS_MGD_ID_UTL.get_java_logging_level();
  dbms_output.put_line('Java logging level = ' ||loglevel);
END;
/
SHOW ERRORS;

GET_PLSQL_LOGGING_LEVEL Function

This function returns an integer representing the current PL/SQL trace logging level.

Syntax

```
function DBMS_MGD_ID_UTL.GET_PLSQL_LOGGING_LEVEL RETURN INTEGER;
PRAGMA restrict_references(get_plsql_logging_level, WNDS);
```

Parameters

None.

Usage Notes

The return value is the integer value denoting the current PL/SQL logging level.

Examples

The following example gets the PL/SQL logging level.

```
--Contents of getplsqlloggінglevel.sql
DECLARE
     loglevel   NUMBER;
BEGIN
  DBMS_MGD_ID_UTL.set_plsql_logging_level(0);
  loglevel := DBMS_MGD_ID_UTL.get_plsql_logging_level();
  dbms_output.put_line('PL/SQL logging level = ' ||loglevel);
END;
/
SHOW ERRORS;

SQL> @getplsqlloggінglevel.sql
.
.
.
PL/SQL logging level = 0
PL/SQL procedure successfully completed.
.
.
.
```

GET_SCHEME_NAMES Function

This function returns a list of semicolon (';') separated scheme names for the specified category.

Syntax

```
function DBMS_MGD_ID_UTL.GET_SCHEME_NAMES (
              category_id IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 75–10 GET_SCHEME_NAMES Function Parameters

Parameter	Description
`category_id`	Category ID

Usage Notes

The return value contains the scheme names for the specified category ID.

Examples

See the GET_COMPONENTS Function for an example.

GET_TDT_XML Function

This function returns the Oracle tag data translation XML for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_TDT_XML (
              category_id  IN VARCHAR2,
              scheme_name  IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 75–11 GET_TDT_XML Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

The return value contains the Oracle tag data translation XML for the specified scheme.

Examples

The following example gets the Oracle TDT XML for the specified scheme:

```
--Contents of get_tdtxml.sql
DECLARE
  gettdtxml      CLOB;

BEGIN
  gettdtxml := DBMS_MGD_ID_UTL.get_tdt_xml(1,'SGTIN-64');
  dbms_output.put_line('Length of tdt XML is '||DBMS_LOB.GETLENGTH(gettdtxml));
  dbms_output.put_line(DBMS_LOB.SUBSTR(gettdtxml, DBMS_LOB.GETLENGTH(gettdtxml), 1));
END;
/

GET_VALIDATOR Function

This function returns the Oracle tag data translation schema.

Syntax

```
function DBMS_MGD_ID_UTL.GET_VALIDATOR RETURN CLOB;
```

Parameters

None.

Usage Notes

The return value contains the Oracle tag data translation schema.

Examples

This example returns the Oracle TDT schema.

```
--Contents of get_validator.sql

REFRESH_CATEGORY Function

This function refreshes the metadata information on the Java stack for the specified category. This function must be called before using MGD_ID functions.

Syntax

```
function DBMS_MGD_ID_UTL.REFRESH_CATEGORY (
              category_id  IN VARCHAR2);
```

Parameters

Table 75–12 REFRESH_CATEGORY Function Parameters

Parameter	Description
category_id	Category ID

Usage Notes

None.

Examples

The following example refreshes the metadata information for the EPC category ID.

```
--Contents of tostring3.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('..Testing to_string');
 DBMS_OUTPUT.PUT_LINE('test to_string');
   id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970',
'scheme=GID-96');
      DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
      DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @tostring3.sql

PL/SQL procedure successfully completed.
```

REMOVE_CATEGORY Procedure

This procedure removes a category including all the related TDT XML. This procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Removes a category based on the specified category ID.

```
procedure DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
              category_id  IN VARCHAR2);
```

Removes a category based on the specified category name and category version.

```
procedure DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
              category_name    IN VARCHAR2,
              category_version IN VARCHAR2);
```

Parameters

Table 75–13 REMOVE_CATEGORY Procedure Parameters

Parameter	Description
`category_id`	Category ID
`category_name`	Name of category
`category_version`	Category version

Usage Notes

If the value of `category_version` is NULL, all versions for the specified category will be removed.

Examples

See the ADD_SCHEME Procedure for an example of removing a category.

REMOVE_PROXY Procedure

This procedure unsets the host and port of the proxy server.

Syntax

```
procedure DBMS_MGD_ID_UTL.REMOVE_PROXY;
```

Parameters

None.

Usage Notes

None.

Examples

See the REFRESH_CATEGORY Function for an example.

REMOVE_SCHEME Procedure

This procedure removes a tag data translation scheme from a category.

Syntax

```
procedure DBMS_MGD_ID_UTL.REMOVE_SCHEME (
              category_id  IN  VARCHAR2,
              scheme_name  IN  VARCHAR2);
```

Parameters

Table 75–14 REMOVE_SCHEME Procedure Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

None.

Examples

See the ADD_SCHEME Procedure for an example of removing a scheme.

SET_JAVA_LOGGING_LEVEL Procedure

This procedure sets the Java trace logging level.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_JAVA_LOGGING_LEVEL (
              logginglevel IN  INTEGER);
```

Parameters

Table 75–15 SET_JAVA_LOGGING_LEVEL Procedure Parameters

Parameter	Description
`logginglevel`	Logging level. The Java logging level can be one of the following values in descending order: ■ LOGGING_LEVEL_OFF CONSTANT INTEGER := 0 ■ LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1 ■ LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2 ■ LOGGING_LEVEL_INFO CONSTANT INTEGER := 3 ■ LOGGING_LEVEL_FINE CONSTANT INTEGER := 4 ■ LOGGING_LEVEL_FINER CONSTANT INTEGER := 5 ■ LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6 ■ LOGGING_LEVEL_ALL CONSTANT INTEGER := 7

Usage Notes

None.

Examples

See the GET_JAVA_LOGGING_LEVEL Function for an example.

SET_PLSQL_LOGGING_LEVEL Procedure

This procedure sets the PL/SQL trace logging level.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_PLSQL_LOGGING_LEVEL (
              level IN INTEGER);
PRAGMA restrict_references(set_plsql_logging_level, WNDS);
```

Parameters

Table 75–16 SET_PLSQL_LOGGING_LEVEL Procedure Parameters

Parameter	Description
`level`	Logging level. The PL/SQL logging level can be one of the following values in descending order: ■ LOGGING_LEVEL_OFF CONSTANT INTEGER := 0 ■ LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1 ■ LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2 ■ LOGGING_LEVEL_INFO CONSTANT INTEGER := 3 ■ LOGGING_LEVEL_FINE CONSTANT INTEGER := 4 ■ LOGGING_LEVEL_FINER CONSTANT INTEGER := 5 ■ LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6 ■ LOGGING_LEVEL_ALL CONSTANT INTEGER := 7

Usage Notes

None.

Examples

See the GET_PLSQL_LOGGING_LEVEL Function for an example.

SET_PROXY Procedure

This procedure sets the host and port of the proxy server for Internet access. This procedure must be called if the database server accesses the Internet using a proxy server. Internet access is necessary because some rules need to look up the Object Naming Service (ONS) table to get the company prefix index.

This procedure does not need to be called, if you are only using schemes that do not contain any rules requiring Internet access.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_PROXY (
               proxt_host   IN  VARCHAR2,
               proxy_port   IN  VARCHAR2);
```

Parameters

Table 75–17 SET_PROXY Procedure Parameters

Parameter	Description
proxy_host	Name of host
proxy_port	Host port number

Usage Notes

None.

Examples

See the REFRESH_CATEGORY Function for an example.

VALIDATE_SCHEME Function

This function validates the input tag data translation XML against the Oracle tag data translation schema.

Syntax

```
function DBMS_MGD_ID_UTL.VALIDATE_SCHEME (
             xml_scheme IN CLOB)
RETURN VARCHAR2;
```

Parameters

Table 75–18 VALIDATE_SCHEME Function Parameters

Parameter	Description
xml_scheme	Scheme to be validated.

Usage Notes

The return value contains the components names for the specified scheme.

Examples

See the ADD_SCHEME Procedure or the EPC_TO_ORACLE_SCHEME Function for an example.

76

DBMS_MGWADM

DBMS_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

Note: You must run the catmgw.sql script to load the Messaging Gateway packages and types into the database.

See Also: *Oracle Streams Advanced Queuing User's Guide* contains information on loading database objects and using DBMS_MGWADM

This chapter contains the following topics:

- Using DBMS_MGWADM
  - Constants
  - Deprecated Subprograms
- Data Structures
- Summary of DBMS_MGWADM Subprograms

Using DBMS_MGWADM

- Deprecated Subprograms
- Constants

Deprecated Subprograms

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g Release 1having been superseded by improved technology:

- ADD_SUBSCRIBER Procedure - use instead CREATE_JOB Procedure
- ALTER_PROPAGATION_SCHEDULE Procedure - use instead ALTER_JOB Procedure
- ALTER_SUBSCRIBER Procedure - use instead ALTER_JOB Procedure
- DB_CONNECT_INFO Procedure - use instead ALTER_AGENT Procedures
- DISABLE_PROPAGATION_SCHEDULE Procedure - use instead DISABLE_JOB Procedure
- ENABLE_PROPAGATION_SCHEDULE Procedure - use instead ENABLE_JOB Procedure
- REMOVE_SUBSCRIBER Procedure - use instead REMOVE_JOB Procedure
- RESET_SUBSCRIBER Procedure - use instead RESET_JOB Procedure
- SCHEDULE_PROPAGATION Procedure - use instead CREATE_JOB Procedure
- UNSCHEDULE_PROPAGATION Procedure - use instead REMOVE_JOB Procedure

Constants

- DBMS_MGWADM Constants—Cleanup Actions on page 76-4
- DBMS_MGWADM Constants—Force Values on page 76-4
- DBMS_MGWADM Constants—Logging Levels on page 76-4
- DBMS_MGWADM Constants—Named Property Constants on page 76-5
- DBMS_MGWADM Constants—Other Constants on page 76-5
- DBMS_MGWADM Constants—Propagation Types on page 76-6
- DBMS_MGWADM Constants—Queue Domain Types on page 76-6
- DBMS_MGWADM Constants—Shutdown Modes on page 76-6
- DBMS_MGWADM Constants—WebSphere MQ Interface Types on page 76-6
- DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures on page 76-6
- DBMS_MGWADM Constants—conntype Argument of CREATE_AGENT and ALTER_AGENT Procedures on page 76-6

Table 76–1 DBMS_MGWADM Constants—Cleanup Actions

Name	Type	Description
CLEAN_STARTUP_STATE	CONSTANT BINARY_INTEGER	Sets the Messaging Gateway agent to a known state so that it can be started
CLEAN_LOG_QUEUES	CONSTANT BINARY_INTEGER	Messaging Gateway agent will clean log queues for all configured messaging system links
RESET_SUB_MISSING_LOG_REC	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record
RESET_SUB_MISSING_MESSAGE	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message

Table 76–2 DBMS_MGWADM Constants—Force Values

Name	Type	Description
FORCE	CONSTANT BINARY_INTEGER	Represents a forced action
NO_FORCE	CONSTANT BINARY_INTEGER	Represents a normal, nonforced action

Table 76–3 DBMS_MGWADM Constants—Logging Levels

Name	Type	Description
BASIC_LOGGING	CONSTANT BINARY_INTEGER	The standard (the least) information written to the log file

Table 76–3 (Cont.) DBMS_MGWADM Constants—Logging Levels

Name	Type	Description
TRACE_DEBUG_LOGGING	CONSTANT BINARY_INTEGER	The greatest information written to the log file
TRACE_HIGH_LOGGING	CONSTANT BINARY_INTEGER	The third level of detail of logging information written to the log file
TRACE_LITE_LOGGING	CONSTANT BINARY_INTEGER	The second level detail of logging information written to the log file

Table 76–4 DBMS_MGWADM Constants—Named Property Constants

Name	Type	Description
MGWPROP_PREFIX	CONSTANT VARCHAR2	A constant (MGWPROP$_) for the reserved property name prefix
MGWPROP_REMOVE	CONSTANT VARCHAR2	A constant (MGWPROP$_REMOVE) for the reserved property name used to remove an existing property
MGWPROP_REMOVE_ALL	CONSTANT VARCHAR2	A constant (MGWPROP$_REMOVE_ALL) for the reserved property name used to remove all properties

Table 76–5 DBMS_MGWADM Constants—Other Constants

Name	Type	Description
JMS_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS connections will be used to access JMS destinations in a domain-independent manner that supports a unified messaging model
JMS_QUEUE_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS queue connections will be used to access JMS destinations
JMS_TOPIC_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS topic connections will be used to access JMS destinations
NO_CHANGE	CONSTANT VARCHAR2	Indicates that an existing value should be preserved (not changed). This is used for certain APIs where the desire is to change one or more parameters but leave others unchanged.
DEFAULT_AGENT	CONSTANT VARCHAR2	Name of the Messaging Gateway default agent

Table 76–6 DBMS_MGWADM Constants—Propagation Types

Name	Type	Description
INBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for non-Oracle to Oracle Streams AQ propagation. The propagation source is a queue in a foreign (non-Oracle) messaging system and the destination is a local Oracle Streams AQ queue.
OUTBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for Oracle Streams AQ to non-Oracle propagation. The propagation source is a local Oracle Streams AQ queue and the destination is a queue in a foreign (non-Oracle) messaging system.

Table 76–7 DBMS_MGWADM Constants—Queue Domain Types

Name	Type	Description
DOMAIN_QUEUE	CONSTANT BINARY_INTEGER	Represents a queue destination. A JMS queue (point-to-point model) is classified as a queue.
DOMAIN_TOPIC	CONSTANT BINARY_INTEGER	Represents a topic destination. A JMS topic (publish-subscribe model) is classified as a topic.

Table 76–8 DBMS_MGWADM Constants—Shutdown Modes

Name	Type	Description
SHUTDOWN_IMMEDIATE	CONSTANT BINARY_INTEGER	Represents the immediate shutdown mode
SHUTDOWN_NORMAL	CONSTANT BINARY_INTEGER	Represents the normal shutdown mode

Table 76–9 DBMS_MGWADM Constants—WebSphere MQ Interface Types

Name	Type	Description
MQSERIES_BASE_JAVA_INTERFACE	CONSTANT BINARY_INTEGER	Represents the Base Java interface for the WebSphere MQ messaging system

Table 76–10 DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures

Name	Type	Description
AGENT_JAVA_PROP	CONSTANT PLS_INTEGER	Used for an agent option used to set a Java System property
MSGLINK_OPTION	CONSTANT PLS_INTEGER	Used for a messaging system link option
JOB_OPTION	CONSTANT PLS_INTEGER	Used for a propagation job option

Table 76–11 DBMS_MGWADM Constants—conntype Argument of CREATE_AGENT and ALTER_AGENT Procedures

Name	Type	Description
JDBC_OCI	CONSTANT VARCHAR2	Used to specify the JDBC OCI driver
JDBC_THIN	CONSTANT VARCHAR2	Used to specify the JDBC Thin driver

Data Structures

The DBMS_MGWADM package defines the following OBJECT types.

Object Types

- SYS.MGW_MQSERIES_PROPERTIES Object Type
- SYS.MGW_PROPERTIES Object Type
- SYS.MGW_PROPERTY Object Type
- SYS.MGW_TIBRV_PROPERTIES Object Type

SYS.MGW_MQSERIES_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

Syntax

```
TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (
   queue_manager       VARCHAR2(64),
   hostname            VARCHAR2(64),
   port                INTEGER,
   channel             VARCHAR2(64),
   interface_type      INTEGER,
   max_connections     INTEGER,
   username            VARCHAR2(64),
   password            VARCHAR2(64),
   inbound_log_queue   VARCHAR2(64),
   outbound_log_queue  VARCHAR2(64),

-- Methods
STATIC FUNCTION construct
RETURN SYS.MGW_MQSERIES_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_MQSERIES_PROPERTIES );
```

Attributes

Table 76–12 SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
queue_manager	The name of the WebSphere MQ queue manager
hostname	The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified.
port	The port number. This is used only for client connections; that is, when hostname is not NULL.
channel	The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL.
interface_type	The type of messaging interface to use. Values: ■ DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used. ■ DBMS_MGWADM.JMS_CONNECTION if the link is to be used to access JMS destinations in a unified, domain-independent manner. ■ DBMS_MGWADM.JMS_QUEUE_CONNECTION if the link is to be used for accessing JMS queues ■ DBMS_MGWADM.JMS_TOPIC_CONNECTION if the link is to be used for accessing JMS topics.
max_connections	The maximum number of messaging connections to the WebSphere MQ messaging system
username	The username used for authentication to the WebSphere MQ messaging system

Table 76–12 (Cont.) SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
password	The password used for authentication to the WebSphere MQ messaging system
inbound_log_queue	The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source: ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.
outbound_log_queue	The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination: ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.

Methods

Table 76–13 SYS.MGW_MQSERIES_PROPERTIES Methods

Method	Description
construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL
alter_construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 data type are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other data types are assigned a value of NULL.

SYS.MGW_PROPERTIES Object Type

This type specifies an array of properties.

Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

Attributes

Table 76–14 SYS.MGW_PROPERTIES Attributes

Attribute	Description
`name`	Property name
`value`	Property value

Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the `MGWPROP$_` prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
- You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- Add or modify property

  ```
  MGW_PROPERTY.NAME = property_name
  MGW_PROPERTY.VALUE = property_value
  ```

  If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- Remove property

  ```
  MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
  MGW_PROPERTY.VALUE = name_of_property_to_remove
  ```

  No action is taken if the property name does not exist in the original list.

- Remove all properties

  ```
  MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
  MGW_PROPERTY.VALUE = not used
  ```

See Also: "The DBMS_MGWADM package defines constants to represent the reserved property names on Table 76–4, " DBMS_MGWADM Constants—Named Property Constants"

SYS.MGW_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
   name  VARCHAR2(500),
   value VARCHAR2(4000),

-- Methods
STATIC FUNCTION construct    --- (1)
RETURN SYS.MGW_PROPERTY,

STATIC FUNCTION construct(   --- (2)
   p_name   IN VARCHAR2,
   p_value  IN VARCHAR2)
RETURN SYS.MGW_PROPERTY );
```

Attributes

Table 76–15 SYS.MGW_PROPERTY Attributes

Attribute	Description
`name`	Property name
`value`	Property value

Methods

Table 76–16 SYS.MGW_PROPERTY Methods

Method	Description
`construct --- (1)`	Constructs a new `MGW_PROPERTY` instance. All attributes are assigned a value of `NULL`
`construct --- (2)`	Constructs a new `MGW_PROPERTY` instance initialized using the given parameters

SYS.MGW_TIBRV_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

Syntax

```
TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
   service   VARCHAR2(128),
   daemon    VARCHAR2(128),
   network   VARCHAR2(256),
   cm_name   VARCHAR2(256),
   cm_ledger VARCHAR2(256),

-- Methods
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_TIBRV_PROPERTIES );
```

Attributes

Table 76–17 SYS.MGW_TIBRV_PROPERTIES Attributes

Attribute	Description
`service`	The service parameter for the rvd transport
`daemon`	The daemon parameter for the rvd transport
`network`	The network parameter for the rvd transport
`cm_name`	The CM correspondent name. Reserved for future use.
`cm_ledger`	The CM ledger file name. Reserved for future use.

Methods

Table 76–18 SYS.MGW_TIBRV_PROPERTIES Methods

Method	Description
`construct`	Constructs a new `SYS.MGW_TIBRV_PROPERTIES` instance. All attributes will be assigned a value of `NULL`.
`alter_construct`	Constructs a new `SYS.MGW_TIBRV_PROPERTIES` instance. This function is useful for altering the properties of an existing messaging link. All attributes having a `VARCHAR2` data type will be assigned a value of `DBMS_MGWADM.NO_CHANGE`. Attributes of other data types will be assigned a value of `NULL`.

Summary of DBMS_MGWADM Subprograms

Table 76–19 DBMS_MGWADM Package Subprograms

Subprogram	Description
ADD_SUBSCRIBER Procedure on page 76-16	Adds a subscriber used to consume messages from a source queue for propagation to a destination
ALTER_AGENT Procedures on page 76-20	Alters Messaging Gateway agent parameters
ALTER_JOB Procedure on page 76-22	Alters the properties of a propagation job
ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous on page 76-24	Alters the properties of a TIB/Rendezvous messaging system link
ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ on page 76-25	Alters the properties of a WebSphere MQ messaging system link
ALTER_PROPAGATION_ SCHEDULE Procedure on page 76-26	Alters a propagation schedule
ALTER_SUBSCRIBER Procedure on page 76-27	Alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination
CLEANUP_GATEWAY Procedures on page 76-29	Cleans up Messaging Gateway
CREATE_AGENT Procedure on page 76-32	Creates a Messaging Gateway agent that will be used to process propagation jobs
CREATE_JOB Procedure on page 76-34	Creates a job used to propagate message from a source to a destination
CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous on page 76-38	Creates a messaging system link to a TIB/Rendezvous messaging system
CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ on page 76-39	Creates a messaging system link to a WebSphere MQ messaging system
DB_CONNECT_INFO Procedure on page 76-40	Configures connection information used by the Messaging Gateway agent for connections to Oracle Database
DISABLE_JOB Procedure on page 76-41	Disables a propagation job
DISABLE_PROPAGATION_ SCHEDULE Procedure on page 76-42	Disables a propagation schedule
ENABLE_JOB Procedure on page 76-43	Enables a propagation job
ENABLE_PROPAGATION_ SCHEDULE Procedure on page 76-44	Enables a propagation schedule
REGISTER_FOREIGN_QUEUE Procedure on page 76-45	Registers a non-Oracle queue entity in Messaging Gateway

Table 76–19 (Cont.) DBMS_MGWADM Package Subprograms

Subprogram	Description
REMOVE_AGENT Procedure on page 76-46	Removes a Messaging Gateway agent
REMOVE_JOB Procedure on page 76-47	Removes a propagation job
REMOVE_MSGSYSTEM_LINK Procedure on page 76-48	Removes a messaging system link for a non-Oracle messaging system
REMOVE_OPTION Procedure on page 76-49	Removes a Messaging Gateway configuration option
REMOVE_SUBSCRIBER Procedure on page 76-51	Removes a subscriber used to consume messages from a source queue for propagation to a destination
RESET_JOB Procedure on page 76-52	Resets the propagation error state for a propagation job
RESET_SUBSCRIBER Procedure on page 76-53	Resets the propagation error state for a subscriber
SCHEDULE_PROPAGATION Procedure on page 76-54	Schedules message propagation from a source to a destination
SET_LOG_LEVEL Procedures on page 76-56	Dynamically alters the Messaging Gateway agent logging level
SET_OPTION Procedure on page 76-57	Sets a Messaging Gateway configuration option
SHUTDOWN Procedures on page 76-59	Shuts down the Messaging Gateway agent
STARTUP Procedures on page 76-60	Starts the Messaging Gateway agent
UNREGISTER_FOREIGN_QUEUE Procedure on page 76-61	Removes a non-Oracle queue entity in Messaging Gateway
UNSCHEDULE_PROPAGATION Procedure on page 76-62	Removes a propagation schedule

ADD_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

Note: This subprogram has been deprecated as a result of improved technology (see CREATE_JOB Procedure on page 76-34), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ADD_SUBSCRIBER(
   subscriber_id     IN VARCHAR2,
   propagation_type  IN BINARY_INTEGER,
   queue_name        IN VARCHAR2,
   destination       IN VARCHAR2,
   rule              IN VARCHAR2 DEFAULT NULL,
   transformation    IN VARCHAR2 DEFAULT NULL,
   exception_queue   IN VARCHAR2 DEFAULT NULL
   options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

Parameters

Table 76–20 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Specifies a user-defined name that identifies this subscriber
propagation_type	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation
queue_name	Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If NULL, then the Oracle Streams AQ payload type must be supported by Messaging Gateway.

Table 76–20 (Cont.) ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.

Usage Notes

> **See Also:** "Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Streams Advanced Queuing User's Guide* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

> **See Also:** For additional information regarding subscriber options
>
> - "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide*
> - "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide*

OUTBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- queue_name specifies the local Oracle Streams AQ queue that is the propagation source. This must have a syntax of schema.queue.
- destination specifies the foreign queue to which messages are propagated. This must have a syntax of registered_queue@message_link.
- rule specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Streams AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used.
- transformation specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway.

  Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a

known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Streams AQ interface is used, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$_agent('MGW_`*`subscriber_id`*`',NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_`*`subscriber_id`*. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Streams AQ queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type.

  Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.
- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

ALTER_AGENT Procedures

This procedure configures Messaging Gateway agent parameters.

Syntax

```
DBMS_MGWADM.ALTER_AGENT (
   max_connections  IN  BINARY_INTEGER DEFAULT NULL,
   max_memory       IN  BINARY_INTEGER DEFAULT NULL,
   max_threads      IN  BINARY_INTEGER DEFAULT NULL,
   service          IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );

DBMS_MGWADM.ALTER_AGENT (
   agent_name      IN   VARCHAR2,
   username        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   password        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   database        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   conntype        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   max_memory      IN   PLS_INTEGER DEFAULT NULL,
   max_threads     IN   PLS_INTEGER DEFAULT NULL,
   service         IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   initfile        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   comment         IN   VARCHAR2  DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 76–21 ALTER_AGENT Procedure Parameters

Parameter	Description
max_connections	The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged. **Caution: This parameter has been deprecated**.
max_memory	The maximum heap size, in MB, used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.
max_threads	The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In a RAC environment, this means that the Messaging Gateway agent will run on only those database instances that are assigned to the service. If NULL, the job class used by this agent will be altered to belong to the default service which is mapped to every instance. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.
username	Specifies the username used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. If a username is specified then a password must also be specified.
password	Specifies the password used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. A password must be specified if a username is specified.

Table 76–21 (Cont.) ALTER_AGENT Procedure Parameters

Parameter	Description
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. Oracle strongly recommends that a connect string, rather than NULL, be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database, DBMS_MGWADM.JDBC_OCI or DBMS_MGWADM.JDBC_THIN. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full pathname of the file. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
comment	Optional comments for this agent. NULL if a comment is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.

Note: The max_connections parameter included in previous versions of this subprogram has been deprecated and is non-operational

Usage Notes

- Default values for these configuration parameters are set when the Messaging Gateway agent is installed.
- Changes to the max_memory and max_threads parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.
- The service parameter is used to set an Oracle Scheduler job class attribute. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is NULL, the job class will belong to an internal service that is mapped to all instances.
- The max_connections parameter is being deprecated as of the Oracle RDBMS 11g release. The number of messaging connections used by the Messaging Gateway Agent is based on the value of the max_threads parameter.
- The username, password, and database parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the user and grant it the role MGW_AGENT_ROLE.

ALTER_JOB Procedure

This procedure alters the properties of a propagation job.

Syntax

```
DBMS_MGWADM.ALTER_JOB (
   job_name          IN   VARCHAR2,
   rule              IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   transformation    IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   exception_queue   IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   poll_interval     IN   PLS_INTEGER DEFAULT 0,
   options           IN   SYS.MGW_PROPERTIES DEFAULT NULL,
   comments          IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 76–22 ALTER_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job
rule	Specifies an optional subscription rule used to dequeue messages from the propagation source. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. In cases in which no exception queue is associated with the job, propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
poll_interval	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL, 0, or value > 0: ■ If zero (default), the current value will not be changed. ■ If NULL, the current value will be reset and the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.

Table 76–22 (Cont.) ALTER_JOB Procedure Parameters

Parameter	Description
options	Optional job properties. If NULL, no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of job options.
comments	An optional comment for this agent, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, the current value will not be changed.

Usage Notes

- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- The subscriber rule cannot be altered when propagating from a JMS source. Instead, the propagation job must be dropped and re-created with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be DBMS_MGWADM.NO_CHANGE (the default value).
- The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner; add a new property, replace an existing property, remove an existing property or remove all properties.

See Also:

- SYS.MGW_PROPERTY Object Type on page 76-12 for more information about the options parameter

ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

Alters the properties of a TIB/Rendezvous messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
   linkname      IN  VARCHAR2,
   properties    IN  SYS.MGW_TIBRV_PROPERTIES,
   options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment       IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 76–23 ALTER_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameters	Description
`linkname`	The messaging system link name
`properties`	Basic properties for a TIB/Rendezvous messaging system link. If `NULL`, then no link properties will be changed.
`options`	Optional link properties. If `NULL`, then no options will be changed. If not `NULL`, then the properties specified in this list are combined with the current options properties to form a new set of link options.
`comment`	A user-specified description, or `NULL` if one is not desired. If `DBMS_MGWADM.NO_CHANGE`, then the current value will not be changed.

Usage Notes

To retain an existing value for a messaging link property with a `VARCHAR2` data type, specify `DBMS_MGWADM.NO_CHANGE` for that particular property. To preserve an existing value for a property of another data type, specify `NULL` for that property.

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: SYS.MGW_PROPERTIES Object Type on page 76-10

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
   linkname   IN  VARCHAR2,
   properties IN  SYS.MGW_MQSERIES_PROPERTIES,
   options    IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment    IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

Parameters

Table 76–24 ALTER_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameters	Description
`linkname`	The messaging system link name
`properties`	Basic properties for a WebSphere MQ messaging system link. If it is `NULL`, then no link properties are changed.
`options`	Optional link properties. `NULL` if no options are changed. If not `NULL`, then the properties specified in this list are combined with the current options properties to form a new set of link options.
`comment`	An optional description or `NULL` if not desired. If `DBMS_MGWADM.NO_CHANGE` is specified, then the current value is not changed.

Usage Notes

To retain an existing value for a messaging link property with a `VARCHAR2` data type, specify `DBMS_MGWADM.NO_CHANGE` for that particular property. To preserve an existing value for a property of another data type, specify `NULL` for that property.

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: SYS.MGW_PROPERTIES Object Type on page 76-10

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters a propagation schedule.

> **Note:** This subprogram has been deprecated as a result of improved technology (see ALTER_JOB Procedure on page 76-22), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2,
   duration     IN NUMBER DEFAULT NULL,
   next_time    IN VARCHAR2 DEFAULT NULL,
   latency      IN NUMBER DEFAULT NULL);
```

Parameters

Table 76–25 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
`schedule_id`	Identifies the propagation schedule to be altered
`duration`	Reserved for future use
`next_time`	Reserved for future use
`latency`	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: `NULL` or value > 0. If `latency` is `NULL`, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

ALTER_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

> **Note:** This subprogram has been deprecated as a result of improved technology (see ALTER_JOB Procedure on page 76-22), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_SUBSCRIBER (
   subscriber_id    IN VARCHAR2,
   rule             IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   transformation   IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   exception_queue  IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   options          IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

Parameters

Table 76–26 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be altered
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.

Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

CLEANUP_GATEWAY Procedures

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The MGW_GATEWAY view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

Syntax

```
DBMS_MGWADM.CLEANUP_GATEWAY(
   action       IN   BINARY_INTEGER,
   sarg         IN   VARCHAR2 DEFAULT NULL);

DBMS_MGWADM.CLEANUP_GATEWAY(
   agent_name   IN   VARCHAR2,
   action       IN   BINARY_INTEGER,
   sarg         IN   VARCHAR2 DEFAULT NULL );
```

Parameters

Table 76–27 CLEANUP_GATEWAY Procedure Parameters

Parameter	Description
action	The cleanup action to be performed. Values: ■ DBMS_MGWADM.CLEAN_STARTUP_STATE for Messaging Gateway start up state recovery ■ DBMS_MGWADM.CLEAN_LOG_QUEUES for log queue cleanup ■ DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC for propagation job recovery due to missing log record ■ DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE for propagation job recovery due to missing message
sarg	Optional argument whose meaning depends on the value specified for action. This should be NULL if it is not used for the specified action.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

Usage Notes

CLEAN_STARTUP_STATE

sarg is not used and must be NULL.

The CLEAN_STARTUP_STATE action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The CLEAN_STARTUP_STATE action may be needed when the MGW_GATEWAY view shows that the AGENT_STATUS value is something other than NOT_STARTED or START_SCHEDULED, and the AGENT_PING value is UNREACHABLE for an extended period of time.

If the AGENT_STATUS value is BROKEN, then the Messaging Gateway agent cannot be started until the problem has been resolved and the CLEAN_STARTUP_STATE action used to reset the agent status. A BROKEN status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the Scheduler job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to NOT_STARTED.

Execution of this command fails if:

- The agent status is NOT_STARTED or START_SCHEDULED.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is STARTING.
- The Messaging Gateway agent is successfully contacted.

  The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

> **Note:** Terminate any Messaging Gateway agent process that may still be running after a CLEAN_STARTUP_STATE action has been successfully performed. This should be done before calling DBMS_MGWADM.STARTUP to start Messaging Gateway. The process is usually named extprocmgwextproc.

CLEAN_LOG_QUEUES

sarg is not used and must be NULL.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

> **Note:** The CLEAN_LOG_QUEUES action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

RESET_SUB_MISSING_LOG_REC

sarg specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be NULL.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

Caution: If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

RESET_SUB_MISSING_MESSAGE

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that propagation job. The procedure will fail if the Messaging Gateway agent is not running.

CREATE_AGENT Procedure

This procedure creates a Messaging Gateway agent that will be used to process propagation jobs.

Syntax

```
DBMS_MGWADM.CREATE_AGENT (
   agent_name     IN   VARCHAR2,
   username       IN   VARCHAR2 DEFAULT NULL,
   password       IN   VARCHAR2 DEFAULT NULL,
   database       IN   VARCHAR2 DEFAULT NULL,
   conntype       IN   VARCHAR2 DEFAULT DBMS_MGWADM.JDBC_OCI,
   max_memory     IN   PLS_INTEGER DEFAULT 64,
   max_threads    IN   PLS_INTEGER DEFAULT 1,
   service        IN   VARCHAR2 DEFAULT NULL,
   initfile       IN   VARCHAR2 DEFAULT NULL,
   comment        IN   VARCHAR2  DEFAULT NULL );
```

Parameters

Table 76–28 CREATE_AGENT Procedure Parameters

Parameter	Description
agent_name	A name used to identify the agent
username	Specifies the username used for connections to the Oracle Database
password	Specifies the password used for connections to the Oracle Database. A password must be specified if a username is specified.
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. A value can be specified only if username is specified. Oracle strong recommends that a connect string, rather than NULL be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database.Values: DBMS_MGWADM.JDBC_OCI, DBMS_MGWADM.JDBC_THIN
max_memory	Specifies the maximum heap size, in MB, used by the Messaging Gateway agent
max_threads	Specifies the number of messaging threads that the Messaging Gateway agent creates. This determines the number of propagation jobs that the agent can concurrently process.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In a RAC environment, this means that the Messaging Gateway agent will only run on those database instances that are assigned to the service. If NULL, then the job class will belong to the default service which is mapped to every instance.
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full pathname of the file.
comment	An optional comment for this agent. NULL if one is not desired.

Usage Notes

- The Messaging Gateway automatically configures a default agent when Messaging Gateway is installed. The name of the default agent is `DEFAULT_AGENT`. This procedure can be used to create additional agents.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the database user and grant it the role `MGW_AGENT_ROLE`. It is not mandatory that the connection information be specified when this procedure is called but it must be set before the agent can be started.
- The `service` parameter is used to create an Oracle Scheduler job class. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is `NULL`, the job class will belong to an internal service that is mapped to all instances.

CREATE_JOB Procedure

This procedure creates a job used to propagate message from a source to a destination.

Syntax

```
DBMS_MGWADM.CREATE_JOB (
   job_name           IN   VARCHAR2,
   propagation_type   IN   PLS_INTEGER,
   source             IN   VARCHAR2,
   destination        IN   VARCHAR2,
   rule               IN   VARCHAR2 DEFAULT NULL,
   transformation     IN   VARCHAR2 DEFAULT NULL,
   exception_queue    IN   VARCHAR2 DEFAULT NULL,
   poll_interval      IN   PLS_INTEGER DEFAULT NULL,
   options            IN   SYS.MGW_PROPERTIES DEFAULT NULL,
   enabled            IN   BOOLEAN DEFAULT TRUE,
   comments           IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 76–29 CREATE_JOB Procedure Parameters

Parameter	Description
job_name	A user defined name to identify the propagation job
propagation_type	Specifies the type of message propagation. ■ DBMS_MGWADM.OUTBOUND_PROPAGATION for Oracle Streams AQ to non-Oracle propagation. ■ DBMS_MGWADM.INBOUND_PROPAGATION for non-Oracle to Oracle Streams AQ propagation.
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used to dequeue messages from the source queue. This should be NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If no transformation is specified the Oracle Streams AQ payload type must be supported by Messaging Gateway.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, an exception queue will not be used and propagation will stop if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.

Table 76–29 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
poll_interval	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If NULL, then the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.
options	Optional job properties, NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.
enabled	Specifies whether this propagation job is enabled after creation. Values: TRUE, FALSE. ■ If TRUE (default), the job will be enabled after it is created. ■ If FALSE, the job will be disabled after it is created. A propagation job must be enabled and the Messaging Gateway agent running before messages can be propagated.
comments	An optional comment for this job. NULL if one is not desired.

Usage Notes

- The job must be enabled and Messaging Gateway agent started in order for messages to be propagated.
- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

OUTBOUND_PROPAGATION Jobs

The parameters for an outbound propagation job are interpreted as follows:

- source specifies the local Oracle Streams AQ queue that is the propagation source. This must have syntax of schema.queue. This can be either a multiple consumer queue or a single consumer queue.
- destination specifies the non-Oracle queue to which messages are propagated. This must have syntax of registered_queue@message_link.
- rule specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Stream AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used. This parameter must be NULL if the native Oracle Stream AQ interface is used and the propagation source is a single consumer queue.
- transformation specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway. The full transformation name (schema.name) should be used if one is specified.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the non-Oracle messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. The syntax must be `schema.queue`.

  If the native Oracle Streams AQ interface is used and the source is a multiple consumer queue, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not the Messaging Gateway agent is running. The local subscriber will be of the form `sys.aq$_agent('MGW_job_name', NULL, NULL)`.

  If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_job_name`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

  The exception queue has the following conditions:

  – The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.

  – The payload type of the source queue and exception queue must match.

  – The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE`. Enqueue restrictions prevent Messaging Gateway from using an Oracle Streams AQ queue of type `DBMS_AQADM.EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Jobs

The parameters for an inbound propagation job are interpreted as follows:

- `source` specifies the non-Oracle queue that is the propagation source. The syntax must be `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. The syntax must be `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the non-Oracle messaging system. This should be `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type. The full transformation name (`schema.name`) should be used if one is specified

  Messaging Gateway propagation dequeues messages from the non-Oracle messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a registered non-Oracle queue to which messages are moved if an exception occurs. The syntax must be `registered_queue@message_link`.

  Whether or not a subscriber is needed for the source queue depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then the Messaging Gateway agent will create it. If the agent is not

running when this procedure is called, then the subscriber will be created on the non-Oracle messaging system the next time the agent starts.

The exception queue has the following conditions:

- The exception queue must be a registered non-Oracle queue.
- The source queue and exception queue must use the same messaging system link.

CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous

Creates a link to a TIB/Rendezvous messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
   linkname     IN  VARCHAR2,
   properties   IN  SYS.MGW_TIBRV_PROPERTIES,
   options      IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment      IN  VARCHAR2 DEFAULT NULL );

DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
   linkname     IN  VARCHAR2,
   agent_name   IN  VARCHAR2,
   properties   IN  SYS.MGW_TIBRV_PROPERTIES,
   options      IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment      IN  VARCHAR2 DEFAULT NULL );
```

Parameters

Table 76–30 CREATE_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameter	Description
`linkname`	A user-defined name to identify this messaging system link
`properties`	Basic properties of a TIB/Rendezvous messaging system link.
`options`	Optional link properties. `NULL` if there are none. These are less frequently used configuration properties supported by the messaging system
`comment`	A user-specified description. `NULL` if one is not desired.
`agent_name`	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. `DBMS_MGWADM.DEFAULT_AGENT` specifies the default agent.

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

> **See Also:** "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
   linkname    IN VARCHAR2,
   properties  IN SYS.MGW_MQSERIES_PROPERTIES,
   options     IN SYS.MGW_PROPERTIES DEFAULT NULL,
   comment     IN VARCHAR2 DEFAULT NULL);

DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
   linkname    IN VARCHAR2,
   agent_name  IN  VARCHAR2,
   properties  IN SYS.MGW_MQSERIES_PROPERTIES,
   options     IN SYS.MGW_PROPERTIES DEFAULT NULL,
   comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 76–31 CREATE_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameter	Description
`linkname`	A user-defined name to identify the messaging system link
`properties`	Basic properties of a WebSphere MQ messaging system link
`options`	Optional link properties. `NULL` if there are none. These are less frequently used configuration properties supported by the messaging system.
`comment`	A user-specified description. `NULL` if one is not desired
`agent_name`	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. `DBMS_MGWADM.DEFAULT_AGENT` specifies the default agent.

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

> **See Also:** "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

DB_CONNECT_INFO Procedure

This procedure configures connection information used by the Messaging Gateway default agent for connections to Oracle Database.

> **Note:** This subprogram has been deprecated as a result of improved technology (see ALTER_AGENT Procedures on page 76-20), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (
   username      IN VARCHAR2,
   password      IN VARCHAR2,
   database      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 76–32 DB_CONNECT_INFO Procedure Parameters

Parameter	Description
username	The username used for connections to Oracle Database. NULL is not allowed
password	The password used for connections to Oracle Database. NULL is not allowed
database	The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from tnsnames.ora.

Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role MGW_AGENT_ROLE, and then call this procedure to configure Messaging Gateway. Role MGW_AGENT_ROLE is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Streams AQ queues, and perform certain Oracle Streams AQ administration tasks.

DISABLE_JOB Procedure

This procedure disables a propagation job.

Syntax

```
DBMS_MGWADM.DISABLE_JOB (
   job_name  IN VARCHAR2);
```

Parameters

Table 76–33 DISABLE_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Note: This subprogram has been deprecated as a result of improved technology (see DISABLE_JOB Procedure on page 76-41), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2);
```

Parameters

Table 76–34 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be disabled

ENABLE_JOB Procedure

This procedure enables a propagation job.

Syntax

```
DBMS_MGWADM.ENABLE_JOB (
   job_name  IN VARCHAR2 );
```

Parameters

Table 76–35 ENABLE_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a propagation schedule.

Note: This subprogram has been deprecated as a result of improved technology (see ENABLE_JOB Procedure on page 76-43), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2 );
```

Parameters

Table 76–36 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be enabled

REGISTER_FOREIGN_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE(
   name            IN VARCHAR2,
   linkname        IN VARCHAR2,
   provider_queue  IN VARCHAR2 DEFAULT NULL,
   domain          IN INTEGER DEFAULT NULL,
   options         IN SYS.MGW_PROPERTIES DEFAULT NULL,
   comment         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 76–37 REGISTER_FOREIGN_QUEUE Procedure Parameters

Parameters	Description
name	The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.
linkname	The link name for the messaging system on which this queue exists
provider_queue	The message provider (native) queue name. If NULL, then the value provided for the name parameter is used as the provider queue name.
domain	The domain type of the queue. NULL means the domain type is automatically determined based on the messaging system of the queue. DBMS_MGWADM.DOMAIN_QUEUE is for a queue (point-to-point model). DBMS_MGWADM.DOMAIN_TOPIC is for a topic (publish-subscribe model).
options	Optional queue properties
comment	A user-specified description. Can be NULL.

Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

> **See Also:** For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically "Optional Foreign Queue Configuration Properties" in *Oracle Streams Advanced Queuing User's Guide*.

REMOVE_AGENT Procedure

This procedure removes a Messaging Gateway agent.

Syntax

```
DBMS_MGWADM.REMOVE_AGENT(
   agent_name   IN   VARCHAR2 );
```

Parameters

Table 76–38 REMOVE_AGENT Procedure Parameters

Parameters	Description
agent_name	Identifies the Messaging Gateway agent

Usage Notes

All messaging system links associated with this Messaging Gateway agent must be removed and the agent must be stopped before it can be removed. The Messaging Gateway default agent cannot be removed.

REMOVE_JOB Procedure

This procedure removes a propagation job.

Syntax

```
DBMS_MGWADM.REMOVE_JOB(
   job_name   IN   VARCHAR2,
   force      IN   PLS_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

Parameters

Table 76–39 REMOVE_JOB Procedure Parameters

Parameters	Description
job_name	Identifies the propagation job
force	Specifies whether the procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this propagation job. Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE ■ NO_FORCE (default) means the job is not removed if Messaging Gateway is unable to clean up successfully ■ FORCE means the job is removed even though all cleanup actions may not be done

Usage Notes

- The Messaging Gateway agent uses various resources of the Oracle Database and the non-Oracle messaging system for its propagation work. These resources need to be released when the job is removed. For example, Messaging Gateway may create a durable subscriber on the source queue that should be removed when the job is removed. Therefore, this procedure should normally be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this job.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue when the propagation source is a multiple consumer queue.

REMOVE_MSGSYSTEM_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

Syntax

```
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(
   linkname  IN VARCHAR2);
```

Parameters

Table 76–40 REMOVE_MSGSYSTEM_LINK Procedure Parameters

Parameters	Description
`linkname`	The messaging system link name

Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

REMOVE_OPTION Procedure

This procedure removes a Messaging Gateway configuration option. It can be used to remove an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.REMOVE_OPTION (
   target_type   IN   PLS_INTEGER,
   target_name   IN   VARCHAR2,
   option_name   IN   VARCHAR2);
```

Parameters

Table 76–41 REMOVE_OPTION Procedure Parameters

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: ■ DBMS_MGWADM.AGENT_JAVA_PROP to remove a Java System property for a Messaging Gateway agent ■ DBMS_MGWADM.MSGLINK_OPTION to remove a messaging link option ■ DBMS_MGWADM.JOB_OPTION to remove a propagation job option
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.

See Also: Table 76–10, " DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures" on page 76-6 regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target

The procedure removes an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target_name specifies the name of the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT can be used for the default agent.
- option_name specifies the Java System property
- encrypted can be either TRUE or FALSE

DBMS_MGWADM.MSGLINK_OPTION Target

The procedure removes a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS_MGWADM.ALTER_MSGSYSTEM_LINK and using the options parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the message system link
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

DBMS_MGWADM.JOB_OPTION Target

The procedure removes a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the options parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

REMOVE_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

> **Note:** This subprogram has been deprecated as a result of improved technology (see REMOVE_JOB Procedure on page 76-47), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.REMOVE_SUBSCRIBER (
   subscriber_id  IN VARCHAR2,
   force          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

Parameters

Table 76–42 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be removed
force	Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber. Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE ■ NO_FORCE means the subscriber is not removed if Messaging Gateway is unable to clean up successfully (default) ■ FORCE means the subscriber is removed even though all cleanup actions may not be done

Usage Notes

- The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue.

RESET_JOB Procedure

This procedure resets the propagation error state for a propagation job.

Syntax

```
DBMS_MGWADM.RESET_JOB (
   job_name   IN   VARCHAR2);
```

Parameters

Table 76–43 RESET_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job

Usage Notes

This procedure can be used to reset a propagation job that has been set to a failed state and propagation activities have been stopped. The administrator should correct the problem and then call this procedure to allow the agent to retry the propagation job. The STATUS field of the MGW_JOBS view indicates the job status.

RESET_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

> **Note:** This subprogram has been deprecated as a result of improved technology (see RESET_JOB Procedure on page 76-52), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (
   subscriber_id  IN VARCHAR2 );
```

Parameters

Table 76–44 RESET_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber

SCHEDULE_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination. The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

Note: This subprogram has been deprecated as a result of improved technology (see CREATE_JOB Procedure on page 76-34), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.SCHEDULE_PROPAGATION (
   schedule_id       IN VARCHAR2,
   propagation_type  IN BINARY_INTEGER,
   source            IN VARCHAR2,
   destination       IN VARCHAR2,
   start_time        IN DATE DEFAULT SYSDATE,
   duration          IN NUMBER DEFAULT NULL,
   next_time         IN VARCHAR2 DEFAULT NULL,
   latency           IN NUMBER DEFAULT NULL);
```

Parameters

Table 76–45 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Specifies a user-defined name that identifies the schedule
propagation_type	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation.
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
start_time	Reserved for future use
duration	Reserved for future use
next_time	Reserved for future use
latency	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

For outbound propagation, parameters are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue from which messages are propagated. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- `source` specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

SET_LOG_LEVEL Procedures

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (
   log_level    IN   BINARY_INTEGER);

DBMS_MGWADM.SET_LOG_LEVEL (
   agent_name   IN   VARCHAR2,
   log_level    IN   BINARY_INTEGER);
```

Parameters

Table 76–46 SET_LOG_LEVEL Procedure Parameters

Parameter	Description
`log_level`	Level at which the Messaging Gateway agent logs information. `DBMS_MGWADM.BASIC_LOGGING` generates the least information while `DBMS_MGWADM.TRACE_DEBUG_LOGGING` generates the most information.
`agent_name`	Identifies the Messaging Gateway agent. `DBMS_MGWADM.DEFAULT_AGENT` specifies the default agent.

See Also: Table 76–3, " DBMS_MGWADM Constants—Logging Levels" on page 76-4 for details on the `log_level` parameter

SET_OPTION Procedure

This procedure sets a Messaging Gateway configuration option. It can be used to set an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.SET_OPTION (
   target_type   IN   PLS_INTEGER,
   target_name   IN   VARCHAR2,
   option_name   IN   VARCHAR2,
   option_value  IN   VARCHAR2,
   encrypted     IN   BOOLEAN DEFAULT FALSE );
```

Parameters

Table 76–47 SET_OPTION Procedure Parameters

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: ■ DBMS_MGWADM.AGENT_JAVA_PROP to set a Java System property for a Messaging Gateway agent ■ DBMS_MGWADM.MSGLINK_OPTION to set a messaging link option ■ DBMS_MGWADM.JOB_OPTION to set a propagation job option
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.
option_value	Option value
encrypted	Indicates whether the value should be stored as encrypted: ■ TRUE if the value should be stored in an encrypted form ■ FALSE if the value should be stored in a cleartext form

See Also: Table 76–10, " DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures" on page 76-6 regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target

The procedure will store an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target_name specifies the name of the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT can be used for the default agent.
- option_name specifies the Java System property

- encrypted can be either TRUE or FALSE

DBMS_MGWADM.MSGLINK_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS_MGWADM.ALTER_MSGSYSTEM_LINK and using the options parameter to set an option.

The parameters are interpreted as follows:

- target_name specifies the name of the message system link
- option_name specifies the option to set
- encrypted must be FALSE

DBMS_MGWADM.JOB_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway propagation job. This is equivalent to calling DBMS_MGWADM.ALTER_JOB and using the options parameter to set an option.

The parameters are interpreted as follows:

- target_name specifies the name of the propagation job
- option_name specifies the option to set
- encrypted must be FALSE

SHUTDOWN Procedures

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

Syntax

```
DBMS_MGWADM.SHUTDOWN (
   sdmode      IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);

DBMS_MGWADM.SHUTDOWN (
   agent_name  IN VARCHAR2);
```

Parameters

Table 76–48 SHUTDOWN Procedure Parameters

Parameter	Description
sdmode	The shutdown mode. The only value currently supported is DBMS_MGWADM.SHUTDOWN_NORMAL for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

Usage Notes

The Messaging Gateway default agent is shut down if no agent name is specified.

STARTUP Procedures

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

Syntax

```
DBMS_MGWADM.STARTUP(
   instance       IN  BINARY_INTEGER DEFAULT 0,
   force          IN  BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);

DBMS_MGWADM.STARTUP(
   agent_name     IN  VARCHAR2);
```

Parameters

Table 76–49 STARTUP Procedure Parameters

Parameter	Description
instance	Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance. **Caution: This parameter has been deprecated**.
force	If this is DBMS_MGWADM.FORCE, then any positive integer is acceptable as the job instance. If this is DBMS_MGWADM.NO_FORCE (the default), then the specified instance must be running; otherwise the routine raises an exception. **Caution: This parameter has been deprecated**.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

Usage Notes

- The Messaging Gateway default agent will be started if an agent name is not specified.
- The force and instance parameters are no longer used and will be ignored. If the instance affinity parameters were being used to start the default agent on a specific instance, the administrator will need to create a database service and then assign that service to the default agent using the DBMS_MGWADM.ALTER_AGENT procedure.
- The Messaging Gateway agent cannot be started until an agent user has been configured by the DBMS_MGWADM.CREATE_AGENT or DBMS_MGWADM.ALTER_AGENT subprograms.

UNREGISTER_FOREIGN_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE(
   name         IN VARCHAR2,
   linkname     IN VARCHAR2);
```

Parameters

Table 76–50 UNREGISTER_FOREIGN_QUEUE Procedure Parameters

Parameter	Description
name	The queue name
linkname	The link name for the messaging system on which the queue exists

Usage Notes

- This procedure does not remove the physical queue in the non-Oracle messaging system.
- All propagation jobs, subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a propagation job, subscriber, or propagation schedule references the non-Oracle queue.

UNSCHEDULE_PROPAGATION Procedure

This procedure removes a propagation schedule.

> **Note:** This subprogram has been deprecated as a result of improved technology (see REMOVE_JOB Procedure on page 76-52), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (
   schedule_id   IN VARCHAR2 );
```

Parameters

Table 76–51 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be removed

77

DBMS_MGWMSG

DBMS_MGWMSG provides:

- Object types used by the canonical message types to convert message bodies.
- Methods, constants, and subprograms for working with Messaging Gateway message types.

> **See Also:** Chapter 76, "DBMS_MGWADM" which describes the Messaging Gateway administrative interface, DBMS_MGWADM

This chapter contains the following topics:

- Using DBMS_MGWMSG
  - Security Model
  - Constants
  - Types
- Summary of DBMS_MGWMSG Subprograms

Using DBMS_MGWMSG

- Security Model
- Constants
- Types

Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS_MGWMSG package as well as the canonical types. The DBMS_MGWMSG packages and object types are owned by SYS.

Note: You must run the catmgw.sql script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Streams Advanced Queuing User's Guide* for information on loading database objects and using DBMS_MGWMSG.

Constants

Table 77–1 DBMS_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW_NAME_VALUE_T Object

Value	Constant
TEXT_VALUE	CONSTANT BINARY_INTEGER := 1
RAW_VALUE	CONSTANT BINARY_INTEGER := 2
BOOLEAN_VALUE	CONSTANT BINARY_INTEGER := 3
BYTE_VALUE	CONSTANT BINARY_INTEGER := 4
SHORT_VALUE	CONSTANT BINARY_INTEGER := 5
INTEGER_VALUE	CONSTANT BINARY_INTEGER := 6
LONG_VALUE	CONSTANT BINARY_INTEGER := 7
FLOAT_VALUE	CONSTANT BINARY_INTEGER := 8
DOUBLE_VALUE	CONSTANT BINARY_INTEGER := 9
DATE_VALUE	CONSTANT BINARY_INTEGER := 10

Table 77–2 DBMS_MGWMSG Constants: Boolean Values—Constants Representing a Boolean as a Numeric Value

Value	Constant
BOOLEAN_FALSE	CONSTANT BINARY_INTEGER := 0
BOOLEAN_TRUE	CONSTANT BINARY_INTEGER := 1

Table 77–3 DBMS_MGWMSG Constants: Case Comparisons

Value	Constant
CASE_SENSITIVE	CONSTANT BINARY_INTEGER := 0
CASE_INSENSITIVE	CONSTANT BINARY_INTEGER := 1

Table 77–4 Constants for the TIB/Rendezvous field type

Value	Constant
TIBRVMSG_BOOL	CONSTANT INTEGER := 1
TIBRVMSG_F32	CONSTANT INTEGER := 2
TIBRVMSG_F64	CONSTANT INTEGER := 3
TIBRVMSG_I8	CONSTANT INTEGER := 4
TIBRVMSG_I16	CONSTANT INTEGER := 5
TIBRVMSG_I32	CONSTANT INTEGER := 6
TIBRVMSG_I64	CONSTANT INTEGER := 7
TIBRVMSG_IPADDR32	CONSTANT INTEGER := 8
TIBRVMSG_IPPORT16	CONSTANT INTEGER := 9
TIBRVMSG_DATETIME	CONSTANT INTEGER := 10
TIBRVMSG_F32ARRAY	CONSTANT INTEGER := 11

Table 77–4 (Cont.) Constants for the TIB/Rendezvous field type

Value	Constant
TIBRVMSG_F64ARRAY	CONSTANT INTEGER := 12
TIBRVMSG_I8ARRAY	CONSTANT INTEGER := 13
TIBRVMSG_I16ARRAY	CONSTANT INTEGER := 14
TIBRVMSG_I32ARRAY	CONSTANT INTEGER := 15
TIBRVMSG_I64ARRAY	CONSTANT INTEGER := 16
TIBRVMSG_OPAQUE	CONSTANT INTEGER := 17
TIBRVMSG_STRING	CONSTANT INTEGER := 18
TIBRVMSG_XML	CONSTANT INTEGER := 19

Types

- SYS.MGW_NAME_VALUE_T Type
- SYS.MGW_NAME_VALUE_T Type-Attribute Mapping
- SYS.MGW_NAME_TYPE_ARRAY_T Type
- SYS.MGW_TEXT_VALUE_T Type
- SYS.MGW_RAW_VALUE_T Type
- SYS.MGW_BASIC_MSG_T Type
- SYS.MGW_NUMBER_ARRAY_T Type
- SYS.MGW_TIBRV_FIELD_T Type
- SYS.MGW_TIBRV_MSG_T Type

SYS.MGW_NAME_VALUE_T Type

This type specifies a named value. The `name` attribute, `type` attribute, and one of the `<>_value` attributes are typically not `NULL`.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
   name               VARCHAR2(250),
   type               INTEGER,
   integer_value      INTEGER,
   number_value       NUMBER,
   text_value         VARCHAR2(4000),
   raw_value          RAW(2000),
   date_value         DATE,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BOOLEAN (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BYTE (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_SHORT (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_INTEGER (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_LONG (
   name   IN VARCHAR2,
```

```
   value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
   name   IN VARCHAR2,

   value  IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
   name   IN VARCHAR2,
   value  IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
   name   IN VARCHAR2,
   value  IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );
```

Attributes

Table 77–5 SYS.MGW_NAME_VALUE_T Attributes

Attribute	Description
`name`	Name associated with the value
`type`	Value type. Refer to the `DBMS_MGWMSG.<>_VALUE` constants in Table 77–1. This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value.
`integer_value`	Stores a numeric integer value
`number_value`	Stores a numeric float or large integer value
`text_value`	Stores a text value
`raw_value`	Stores a `RAW` (bytes) value
`date_value`	Stores a date value

SYS.MGW_NAME_VALUE_T Type-Attribute Mapping

Table 77–6 shows the mapping between the value type and the attribute used to store the value.

Table 77–6 SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
`DBMS_MGWMSG.TEXT_VALUE`	`text_value`
`DBMS_MGWMSG.RAW_VALUE`	`raw_value`
`DBMS_MGWMSG.BOOLEAN_VALUE`	`integer_value`

Table 77–6 (Cont.) SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
DBMS_MGWMSG.BYTE_VALUE	integer_value
DBMS_MGWMSG.SHORT_VALUE	integer_value
DBMS_MGWMSG.INTEGER_VALUE	integer_value
DBMS_MGWMSG.LONG_VALUE	number_value
DBMS_MGWMSG.FLOAT_VALUE	number_value
DBMS_MGWMSG.DOUBLE_VALUE	number_value
DBMS_MGWMSG.DATE_VALUE	date_value

CONSTRUCT Method

This method constructs a new SYS.MGW_NAME_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

CONSTRUCT_*TYPE* Methods

These methods construct a new SYS.MGW_NAME_VALUE_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>_value attributes, as shown in the mappings in Table 77–6.

Syntax

```
STATIC FUNCTION CONSTRUCT_<> (
   name   IN VARCHAR2,
   value  IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

Usage Notes

The construct_boolean method sets the value to either DBMS_MGWMSG.BOOLEAN_TRUE or DBMS_MGWMSG.BOOLEAN_FALSE.

SYS.MGW_NAME_TYPE_ARRAY_T Type

This type specifies an array of name-value pairs. An object of SYS.MGW_NAME_VALUE_ARRAY_T type can have up to 1024 elements.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
  AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```

SYS.MGW_TEXT_VALUE_T Type

This type specifies a TEXT value. It can store a large value as a CLOB or a smaller value (size <= 4000) as VARCHAR2. Only one of the < >_ value attributes should be set.

Syntax

```
TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
   small_value VARCHAR2(4000),
```

```
   large_value CLOB,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T);
```

Attributes

Table 77–7 SYS.MGW_TEXT_VALUE_T Attributes

Attribute	Description
small_value	Small TEXT value. Used for values <= 4000.
large_value	Large TEXT value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new SYS.MGW_TEXT_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;
```

SYS.MGW_RAW_VALUE_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >_value attributes.

Syntax

```
TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
   small_value RAW(2000),
   large_value BLOB,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T);
```

Attributes

Table 77–8 SYS.MGW_RAW_VALUE_T Attributes

Attribute	Description
small_value	Small RAW (bytes) value <= 2000
large_value	Large RAW value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new SYS.MGW_RAW_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
```

```
RETURN SYS.MGW_RAW_VALUE_T;
```

SYS.MGW_BASIC_MSG_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
   header     SYS.MGW_NAME_VALUE_ARRAY_T,
   text_body  SYS.MGW_TEXT_VALUE_T,
   raw_body   SYS.MGW_RAW_VALUE_T,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T);
```

Attributes

Table 77–9 SYS.MGW_BASIC_MSG_T Attributes

Attribute	Description
header	Message header information as an array of name-value pairs
text_body	Message body for a TEXT message
raw_body	Message body for a RAW (bytes) message

CONSTRUCT Method

This method constructs a new SYS.MGW_BASIC_MSG_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

SYS.MGW_NUMBER_ARRAY_T Type

A type that specifies an array of numbers.

Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

SYS.MGW_TIBRV_FIELD_T Type

A type representing a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW_TIBRV_MSG_T instance.

Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
   field_name       VARCHAR2(256),
   field_id         INTEGER,
   field_type       INTEGER,
   number_value     NUMBER,
   number_array_value  SYS.MGW_NUMBER_ARRAY_T,
```

```
  text_value       VARCHAR2(4000),
  raw_value        RAW(2000),
  date_value       DATE,
  clob_value       CLOB,
  blob_value       BLOB);
```

Attributes

Table 77–10 SYS.MGW_TIBRV_FIELD_T Attributes

Attribute	Description
field_name	Field name. This will be NULL if the field has no name.
field_id	Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message.
field_type	Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.
number_value	Used to store a numeric value
number_array_value	Used to store a numeric array value
text_value	Used to store a small text value
raw_value	Used to store a small raw value
date_value	Used to store a date value
clob_value	Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.
blob_value	Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.

SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Table 77–11 describes the mapping in type SYS.MGW_TIBRV_FIELD_T between the field type and attribute used to store the value.

Table 77–11 SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_BOOL	number_value
TIBRVMSG_F32	number_value
TIBRVMSG_F64	number_value
TIBRVMSG_I8	number_value
TIBRVMSG_I16	number_value
TIBRVMSG_I32	number_value
TIBRVMSG_I64	number_value
TIBRVMSG_IPADDR32	text_value
TIBRVMSG_IPPORT16	number_value
TIBRVMSG_DATETIME	date_value

Table 77–11 (Cont.) SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_F32ARRAY	number_array_value
TIBRVMSG_F64ARRAY	number_array_value
TIBRVMSG_I8ARRAY	number_array_value
TIBRVMSG_I16ARRAY	number_array_value
TIBRVMSG_I32ARRAY	number_array_value
TIBRVMSG_I64ARRAY	number_array_value
TIBRVMSG_OPAQUE	raw_value or blob_value
TIBRVMSG_STRING	text_value or clob_value
TIBRVMSG_XML	raw_value or blob_value

SYS.MGW_TIBRV_MSG_T Type

A type representing a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

Syntax

```
TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
   send_subject    VARCHAR2(256),
   reply_subject   VARCHAR2(256),
   cm_time_limit   NUMBER,
   cm_sender_name  VARCHAR2(256),
   cm_sequence_num NUMBER,
   fields          SYS.MGW_TIBRV_IFIELDS_T,
   clob_data1      CLOB,
   clob_data2      CLOB,
   clob_data3      CLOB,
   blob_data1      BLOB,
   blob_data2      BLOB,
   blob_data3      BLOB,

STATIC FUNCTION construct

```

Attributes

Table 77–12 SYS.MGW_TIBRV_MSG_T Type Attributes

Attribute	Description
send_subject	Send subject name
reply_subject	Reply subject name
cm_time_limit	Time limit for a certified message
cm_sender_name	Sender name of a certified message
cm_sequence_num	Sequence number of a certified message
fields	Collection of message fields
clob_data1	Used to store a large text value
clob_data2	Used to store a large text value
clob_data3	Used to store a large text value
blob_data1	Used to store a large raw value
blob_data2	Used to store a large raw value
blob_data3	Used to store a large raw value

Construct Method

Constructs a new SYS.MGW_TIBRV_MSG_T instance. All attributes are set to NULL.

Syntax

```
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;
```

ADD_<> Procedures

Adds a new field to the message.

Syntax

```
MEMBER PROCEDURE ADD_<> (
   name  IN  VARCHAR2,
   id    IN  INTEGER,
   value IN  datatype );
```

Parameters

Table 77–13 SYS.MGW_TIBRV_MSG_T ADD_<> Method Parameters

Parameter	Description
name	Field name
id	Field identifier
value	Field data

Table 77–14 shows, for each add method, the field type that will be assigned and valid values for the field data.

Table 77–14 MGW_TIBRV_MSG_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_bool	TIBRVMSG_BOOL	Valid values: 0 (false), 1 (true)
add_f32	TIBRVMSG_F32	n/a
add_f64	TIBRVMSG_F64	n/a
add_i8	TIBRVMSG_I8	Valid range: -128...127
add_i16	TIBRVMSG_I16	Valid range: -32768...32767
add_i32	TIBRVMSG_I32	Valid range: -2147483648... 2147483647
add_i64	TIBRVMSG_I64	n/a
add_ipaddr32	TIBRVMSG_IPADDR32	n/a
add_ipport16	TIBRVMSG_IPPORT16	n/a
add_datetime	TIBRVMSG_DATETIME	n/a
add_f32array	TIBRVMSG_F32ARRAY	n/a
add_f64array	TIBRVMSG_F64ARRAY	n/a
add_i8array	TIBRVMSG_I8ARRAY	Valid range: -128...127
add_i16array	TIBRVMSG_I16ARRAY	Valid range: -32768...32767
add_i32array	TIBRVMSG_I32ARRAY	Valid range: -2147483648... 2147483647
add_i64array	TIBRVMSG_I64ARRAY	n/a
add_opaque	TIBRVMSG_OPAQUE	Value stored as RAW if size < 2000; otherwise value stored in BLOB
add_string	TIBRVMSG_STRING	Value stored as VARCHAR2 if size < 4000; otherwise value stored in CLOB

Table 77–14 (Cont.) MGW_TIBRV_MSG_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_xml	TIBRVMSG_XML	Value stored as RAW if size < 2000; otherwise value stored in BLOB

SET_<> Methods

Accessor methods to set an instance attribute to a specific value.

Syntax

```
MEMBER PROCEDURE SET_<> (
  value IN datatype );
```

Parameters

Table 77–15 SYS.MGW_TIBRV_MSG_T SET_<> Method Parameters

Parameter	Description
value	Value to be assigned

GET_<> Methods

Accessor methods to retrieve the value for an instance attribute.

Syntax

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

Parameters

None

Return Values

Returns the attribute value.

GET_FIELD_COUNT Procedure

Gets the number of message fields.

Syntax

```
MEMBER PROCEDURE get_field_count
RETURN INTEGER;
```

Parameters

None

Return Values

Returns the number of fields, or zero (0) if there are none.

GET_FIELD Procedure

Retrieves field information for the field having a given field collection index. This method should only be called if the GET_FIELD_COUNT Procedure returns a

nonzero value and idx must specify a valid collection index; that is, 1<=idx<=get_field_count().

Syntax

```
MEMBER PROCEDURE get_field (
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 77–16 SYS.MGW_TIBRV_MSG_T GET_FIELD Procedure Parameters

Parameter	Description
idx	Specifies the 1-based field collection index of the field to retrieve

Note: A 1-based index begins at one (1) instead of zero (0).

Return Values

Returns the field information.

GET_FIELD_BY_NAME Procedure

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

Syntax

```
MEMBER PROCEDURE get_field_by_name (
   name  IN   VARCHAR2 )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 77–17 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_NAME Procedure Parameters

Parameter	Description
name	Specifies the field name to search for. This can be NULL to find the first field that does not have a field name.

Return Values

Returns the field information, or NULL if no match was found.

GET_FIELD_BY_ID Procedure

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or NULL, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

Syntax

```
MEMBER PROCEDURE get_field_by_id (
   id   IN  INTEGER )
```

```
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 77–18 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_ID Procedure Parameters

Parameter	Description
id	Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.

Return Values

Returns the field information, or NULL if no match was found.

FIND_FIELD_NAME Procedure

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

Syntax

```
MEMBER PROCEDURE find_field_name (
   name      IN  VARCHAR2,
   start_idx IN  INTEGER )
RETURN INTEGER;
```

Parameters

Table 77–19 SYS.MGW_TIBRV_MSG_T FIND_FIELD_NAME Procedure Parameters

Parameter	Description
name	Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.
start_idx	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

FIND_FIELD_ID Procedure

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

Syntax

```
MEMBER PROCEDURE find_field_id (
     id        IN  INTEGER,
     start_idx IN INTEGER )
RETURN    INTEGER;
```

Parameters

Table 77–20 SYS.MGW_TIBRV_MSG_T FIND_FIELD_ID Procedure Parameters

Parameter	Description
`id`	Specifies the field identifier to search for. This can be zero (0) or `NULL` to find a field that does not have an identifier.
`start_idx`	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

Summary of DBMS_MGWMSG Subprograms

Table 77–21 DBMS_MGWMSG Package Subprograms

Subprogram	Description
LCR_TO_XML Function on page 77-22	Converts a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD) to a SYS.XMLTYPE object
NVARRAY_ADD Procedure on page 77-23	Appends a name-value element to the end of a name-value array
NVARRAY_FIND_NAME Function on page 77-24	Searches a name-value array for the element with the name you specify in p_name
NVARRAY_FIND_NAME_TYPE Function on page 77-25	Searches a name-value array for an element with the name and value type you specify
NVARRAY_GET Function on page 77-26	Gets the name-value element of the name you specify in p_name from a name-value array
NVARRAY_GET_BOOLEAN Function on page 77-27	Gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type
NVARRAY_GET_BYTE Function on page 77-28	Gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type
NVARRAY_GET_DATE Function on page 77-29	Gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type
NVARRAY_GET_DOUBLE Function on page 77-30	Gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type
NVARRAY_GET_FLOAT Function on page 77-31	Gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type
NVARRAY_GET_INTEGER Function on page 77-32	Gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type
NVARRAY_GET_LONG Function on page 77-33	Gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type
NVARRAY_GET_RAW Function on page 77-34	Gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type
NVARRAY_GET_SHORT Function on page 77-35	Gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type
NVARRAY_GET_TEXT Function on page 77-36	Gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type
XML_TO_LCR Function on page 77-37	Converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD)

LCR_TO_XML Function

This function converts a SYS.ANYDATA object encapsulating a row LCR (Logical Change Record, in this case a LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD) to a SYS.XMLTYPE object.

See Also: XML_TO_LCR Function on page 77-37

Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
   p_anydata IN SYS.ANYDATA )
 RETURN SYS.XMLTYPE;
```

Parameters

Table 77–22 LCR_TO_XML Function Parameters

Parameter	Description
p_anydata	An ANYDATA object to be converted

Return Values

Returns a SYS.XMLTYPE object.

Usage Notes

An exception is raised if the encapsulated type p_anydata is not an LCR.

NVARRAY_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (
   p_array  IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,
   p_value  IN     SYS.MGW_NAME_VALUE_T );
```

Parameters

Table 77–23 NVARRAY_ADD Procedure Parameters

Parameter	Description
p_array	On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance.
p_value	The value to add. If NULL, then p_array is not changed.

NVARRAY_FIND_NAME Function

This function searches a name-value array for the element with the name you specify in `p_name`.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 77–24 NVARRAY_FIND_NAME Function Parameters

Parameters	Description
`p_array`	The name-value array to search
`p_name`	The name to find
`p_compare`	Name comparison method. Values are `CASE_SENSITIVE` and `CASE_INSENSITIVE`.

Return Values

Returns a positive integer that is the array index of the matching element or zero (`0`) if the specified name is not found.

NVARRAY_FIND_NAME_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_type     IN BINARY_INTEGER
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 77–25 NVARRAY_FIND_NAME_TYPE Function Parameters

Parameter	Description
p_array	The name-value array to search
p_name	The name to find
p_type	The value type. Refer to the value type constants in Table 77–1 on page 77-4.
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

NVARRAY_GET Function

This function gets the name-value element of the name you specify in `p_name` from a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN SYS.MGW_NAME_VALUE_T;
```

Parameters

Table 77–26 NVARRAY_GET Function Parameters

Parameter	Description
`p_array`	The name-value array
`p_name`	The value name
`p_compare`	Name comparison method. Values are `CASE_SENSITIVE` and `CASE_INSENSITIVE`.

Return Values

Returns the matching element, or `NULL` if the specified name is not found.

NVARRAY_GET_BOOLEAN Function

This function gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 77–27 NVARRAY_GET_BOOLEAN Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_BYTE Function

This function gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 77–28 NVARRAY_GET_BYTE Function

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DATE Function

This function gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

Parameters

Table 77–29 NVARRAY_GET_DATE Function Parameters

Parameters	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DOUBLE Function

This function gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DOUBLE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 77–30 NVARRAY_GET_DOUBLE Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_FLOAT Function

This function gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_FLOAT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 77–31 NVARRAY_GET_FLOAT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_INTEGER Function

This function gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 77–32 NVARRAY_GET_INTEGER Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_LONG Function

This function gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 77–33 NVARRAY_GET_LONG Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_RAW Function

This function gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

Parameters

Table 77–34 NVARRAY_GET_RAW Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_SHORT Function

This function gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 77–35 NVARRAY_GET_SHORT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_TEXT Function

This function gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_TEXT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN VARCHAR2;
```

Parameters

Table 77–36 NVARRAY_GET_TEXT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

XML_TO_LCR Function

This function converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD).

See Also: LCR_TO_XML Function on page 77-22

Syntax

```
DBMS_MGWMSG.XML_TO_LCR (
   p_xmldata IN SYS.XMLTYPE )
 RETURN SYS.ANYDATA;
```

Parameters

Table 77–37 XML_TO_LCR Function Parameters

Parameter	Description
p_xmldata	An XMLTYPE object representing an LCR

Return Values

Returns a SYS.ANYDATA object.

Usage Notes

An exception is raised if p_xmldata cannot be converted to an LCR.

78

DBMS_MONITOR

The DBMS_MONITOR package let you use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- Summary of DBMS_MONITOR Subprograms

Summary of DBMS_MONITOR Subprograms

Table 78–1 DBMS_MONITOR Package Subprograms

Subprogram	Description
CLIENT_ID_STAT_DISABLE Procedure on page 78-3	Disables statistic gathering previously enabled for a given Client Identifier
CLIENT_ID_STAT_ENABLE Procedure on page 78-4	Enables statistic gathering for a given Client Identifier
CLIENT_ID_TRACE_DISABLE Procedure on page 78-5	Disables the trace previously enabled for a given Client Identifier globally for the database
CLIENT_ID_TRACE_ENABLE Procedure on page 78-6	Enables the trace for a given Client Identifier globally for the database
DATABASE_TRACE_DISABLE Procedure on page 78-7	Disables SQL trace for the whole database or a specific instance
DATABASE_TRACE_ENABLE Procedure on page 78-8	Enables SQL trace for the whole database or a specific instance
SERV_MOD_ACT_STAT_ DISABLE Procedure on page 78-9	Disables statistic gathering enabled for a given combination of Service Name, `MODULE` and `ACTION`
SERV_MOD_ACT_STAT_ ENABLE Procedure on page 78-10	Enables statistic gathering for a given combination of Service Name, `MODULE` and `ACTION`
SERV_MOD_ACT_TRACE_ DISABLE Procedure on page 78-12	Disables the trace for ALL enabled instances for a or a given combination of Service Name, `MODULE` and `ACTION` name globally
SERV_MOD_ACT_TRACE_ ENABLE Procedure on page 78-13	Enables SQL tracing for a given combination of Service Name, `MODULE` and `ACTION` globally unless an `instance_name` is specified
SESSION_TRACE_DISABLE Procedure on page 78-15	Disables the previously enabled trace for a given database session identifier (SID) on the local instance
SESSION_TRACE_ENABLE Procedure on page 78-16	Enables the trace for a given database session identifier (SID) on the local instance

CLIENT_ID_STAT_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V$CLIENT_STATS view enabled by the CLIENT_ID_STAT_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(
   client_id            IN   VARCHAR2);
```

Parameters

Table 78–2 CLIENT_ID_STAT_DISABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is disabled

Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

CLIENT_ID_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier. Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V$CLIENT_STATS views.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(
   client_id            IN   VARCHAR2);
```

Parameters

Table 78–3 CLIENT_ID_STAT_ENABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is enabled

Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

CLIENT_ID_TRACE_DISABLE Procedure

This procedure will disable tracing enabled by the `CLIENT_ID_TRACE_ENABLE` Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
 client_id    IN  VARCHAR2);
```

Parameters

Table 78–4 CLIENT_ID_TRACE_DISABLE Procedure Parameters

Parameter	Description
`client_id`	Client Identifier for which SQL tracing is disabled

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

CLIENT_ID_TRACE_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
 client_id    IN  VARCHAR2,
 waits        IN  BOOLEAN DEFAULT TRUE,
 binds        IN  BOOLEAN DEFAULT FALSE,
 plan_stat    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–5 CLIENT_ID_TRACE_ENABLE Procedure Parameters

Parameter	Description
client_id	Database Session Identifier for which SQL tracing is enabled
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,
FALSE);
```

DATABASE_TRACE_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE(
   instance_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–6 DATABASE_TRACE_DISABLE Procedure Parameters

Parameter	Description
instance_name	Disables tracing for the named instance

DATABASE_TRACE_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE(
   waits          IN BOOLEAN DEFAULT TRUE,
   binds          IN BOOLEAN DEFAULT FALSE,
   instance_name  IN VARCHAR2 DEFAULT NULL,
   plan_stat      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–7 DATABASE_TRACE_ENABLE Procedure Parameters

Parameter	Description
`waits`	If `TRUE`, wait information will be present in the trace
`binds`	If `TRUE`, bind information will be present in the trace
`instance_name`	If set, restricts tracing to the named instance
`plan_stat`	Frequency at which we dump row source statistics. Value should be '`NEVER`', '`FIRST_EXECUTION`' (equivalent to `NULL`) or '`ALL_EXECUTIONS`'.

SERV_MOD_ACT_STAT_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V$SERV_MOD_ACT_STATS view. Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2,
   action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 78–8 SERV_MOD_ACT_STAT_DISABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which statistic aggregation is disabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.

SERV_MOD_ACT_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION. Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V$SERV_MOD_ACT_STATS view.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2,
   action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 78–9 SERV_MOD_ACT_STAT_ENABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which statistic aggregation is enabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.

Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL_ACTIONS for a module specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1','PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE('APPS1','GLEDGER','DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.

- For all actions in the PAYROLL Module.
- For the DEBIT_ENTRY Action within the GLEDGER Module.

SERV_MOD_ACT_TRACE_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
   service_name    IN  VARCHAR2,
   module_name     IN  VARCHAR2,
   action_name     IN  VARCHAR2 DEFAULT ALL_ACTIONS,
   instance_name   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–10 SERV_MOD_ACT_TRACE_DISABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which tracing is disabled.
module_name	Name of the MODULE. An additional qualifier for the service
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name.
instance_name	If set, this restricts tracing to the named instance_name

Usage Notes

Specifying NULL for the module_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
            DBMS_MONITOR.ALL_MODULES,  DBMS_MONITOR.ALL_ACTIONS,TRUE,
FALSE,NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONs):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1','PAYROLL',
            DBMS_MONITOR.ALL_ACTIONS,TRUE,FALSE,NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1','PAYROLL');
```

SERV_MOD_ACT_TRACE_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2 DEFAULT ANY_MODULE,
   action_name     IN VARCHAR2 DEFAULT ANY_ACTION,
   waits           IN BOOLEAN DEFAULT TRUE,
   binds           IN BOOLEAN DEFAULT FALSE,
   instance_name   IN VARCHAR2 DEFAULT NULL,
   plan_stat       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–11 SERV_MOD_ACT_TRACE_ENABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which SQL trace is enabled
module_name	Name of the MODULE for which SQL trace is enabled. An optional additional qualifier for the service. If omitted, SQL trace is enabled or all modules and actions in a given service.
action_name	Name of the ACTION for which SQL trace is enabled. An optional additional qualifier for the Service and MODULE name. If omitted, SQL trace is enabled for all actions in a given module.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
instance_name	If set, this restricts tracing to the named instance_name
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONs. Using the ALL_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The instance_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.

- Specifying NULL for the module_name parameter means that statistics will be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
            DBMS_MONITOR.ALL_MODULES,  DBMS_MONITOR.ALL_ACTIONS,TRUE,
FALSE,NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONs):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1','PAYROLL',
            DBMS_MONITOR.ALL_ACTIONS,TRUE,FALSE,NULL);
```

SESSION_TRACE_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
   session_id      IN     BINARY_INTEGER DEFAULT NULL,
   serial_num      IN     BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 78–12 SESSION_TRACE_DISABLE Procedure Parameters

Parameter	Description
session_id	Name of the service for which SQL trace is disabled
serial_num	Serial number for this session

Usage Notes

If serial_num is NULL but session_id is specified, a session with a given session_id is no longer traced irrespective of its serial number. If both session_id and serial_num are NULL, the current user session is no longer traced. It is illegal to specify NULL session_id and non-NULL serial_num. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

SESSION_TRACE_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE(
    session_id   IN  BINARY_INTEGER DEFAULT NULL,
    serial_num   IN  BINARY_INTEGER DEFAULT NULL,
    waits        IN  BOOLEAN DEFAULT TRUE,
    binds        IN  BOOLEAN DEFAULT FALSE,
    plan_stat    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–13 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
session_id	Database Session Identifier for which SQL trace is enabled. If omitted (or NULL), the user's own session is assumed.
serial_num	Serial number for this session. If omitted (or NULL), only the session ID is used to determine a session.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If serial_num is NULL but session_id is specified, a session with a given session_id is traced irrespective of its serial number. If both session_id and serial_num are NULL, the current user session is traced. It is illegal to specify NULL session_id and non-NULL serial_num. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

79

DBMS_MVIEW

DBMS_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

Note: DBMS_MVIEW is a synonym for DBMS_SNAPSHOT.

See Also:

- *Oracle Database Advanced Replication* for more information about using materialized views in a replication environment
- *Oracle Database Data Warehousing Guide* for more information about using materialized views in a data warehousing environment

This chapter contains the following topics:

- Using DBMS_MVIEW
  - Operational Notes
  - Rules and Limits
- Summary of DBMS_MVIEW Subprograms

Using DBMS_MVIEW

This section contains topics which relate to using the `DBMS_MVIEW` package.

- Rules and Limits

Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN..END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

Rules and Limits

The EXPLAIN_REWRITE procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the EXPLAIN_MVIEW procedure.

Summary of DBMS_MVIEW Subprograms

Table 79–1 DBMS_MVIEW Package Subprograms

Subprogram	Description
BEGIN_TABLE_ REORGANIZATION Procedure on page 79-6	Performs a process to preserve materialized view data needed for refresh
END_TABLE_ REORGANIZATION Procedure on page 79-7	Ensures that the materialized view data for the master table is valid and that the master table is in the proper state
ESTIMATE_MVIEW_SIZE Procedure on page 79-8	Estimates the size of a materialized view that you might create, in bytes and rows
EXPLAIN_MVIEW Procedure on page 79-9	Explains what is possible with a materialized view or potential materialized view
EXPLAIN_REWRITE Procedure on page 79-10	Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views
I_AM_A_REFRESH Function on page 79-12	Returns the value of the `I_AM_REFRESH` package state
PMARKER Function on page 79-13	Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)
PURGE_DIRECT_LOAD_LOG Procedure on page 79-14	Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)
PURGE_LOG Procedure on page 79-15	Purges rows from the materialized view log
PURGE_MVIEW_FROM_LOG Procedure on page 79-16	Purges rows from the materialized view log
REFRESH Procedures on page 79-17	Refreshes one or more materialized views that are not members of the same refresh group
REFRESH_ALL_MVIEWS Procedure on page 79-19	Refreshes all materialized views that do not reflect changes to their master table or master materialized view
REFRESH_DEPENDENT Procedures on page 79-20	Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views
REGISTER_MVIEW Procedure on page 79-22	Enables the administration of individual materialized views
UNREGISTER_MVIEW Procedure on page 79-24	Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view

BEGIN_TABLE_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (
   tabowner    IN   VARCHAR2,
   tabname     IN   VARCHAR2);
```

Parameters

Table 79–2 BEGIN_TABLE_REORGANIZATION Procedure Parameters

Parameter	Description
`tabowner`	Owner of the table being reorganized
`tabname`	Name of the table being reorganized

END_TABLE_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (
   tabowner    IN   VARCHAR2,
   tabname     IN   VARCHAR2);
```

Parameters

Table 79–3 END_TABLE_REORGANIZATION Procedure Parameters

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

ESTIMATE_MVIEW_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_MVIEW.ESTIMATE_MVIEW_SIZE (
   stmt_id       IN  VARCHAR2,
   select_clause IN  VARCHAR2,
   num_rows      OUT NUMBER,
   num_bytes     OUT NUMBER);
```

Parameters

Table 79–4 ESTIMATE_MVIEW_SIZE Procedure Parameters

Parameter	Description
`stmt_id`	Arbitrary string used to identify the statement in an `EXPLAIN PLAN`
`select_clause`	The `SELECT` statement to be analyzed
`num_rows`	Estimated cardinality
`num_bytes`	Estimated number of bytes

EXPLAIN_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call DBMS_MVIEW.EXPLAIN_MVIEW, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the SELECT string or CREATE MATERIALIZED VIEW statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called MV_CAPABILITIES_TABLE, which is the default, or to an array called MSG_ARRAY.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to MV_CAPABILITIES_TABLE.
- The second version is for explaining an existing or potential materialized view with output to a VARRAY.

Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
   mv            IN VARCHAR2,
   statement_id  IN VARCHAR2:= NULL);

DBMS_MVIEW.EXPLAIN_MVIEW (
   mv          IN VARCHAR2,
   msg_array   OUT SYS.ExplainMVArrayType);
```

Parameters

Table 79–5 EXPLAIN_MVIEW Procedure Parameters

Parameter	Description
mv	The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a SELECT statement or a CREATE MATERIALIZED VIEW statement for a potential materialized view.
statement_id	A client-supplied unique identifier to associate output rows with specific invocations of EXPLAIN_MVIEW
msg_array	The PL/SQL VARRAY that receives the output. Use this parameter to direct EXPLAIN_MVIEW's output to a PL/SQL VARRAY rather than MV_CAPABILITIES_TABLE.

Usage Notes

You must run the utlxmv.sql script to create MV_CAPABILITIES_TABLE in the current schema prior to calling EXPLAIN_MVIEW except when you direct output to a VARRAY. The script is found in the ADMIN directory.

EXPLAIN_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used. Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the EXPLAIN_REWRITE statement is never actually executed.

A demo file, xrwutl.sql, is available to help format the output from EXPLAIN_REWRITE.

Syntax

You can obtain the output from DBMS_MVIEW.EXPLAIN_REWRITE in two ways. The first is to use a table, while the second is to create a VARRAY. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query           VARCHAR2,
    mv              VARCHAR2(30),
    statement_id    VARCHAR2(30));
```

You can create an output table called REWRITE_TABLE by executing the utlxrw.sql script.

The query parameter is a text string representing the SQL query. The parameter, mv, is a fully qualified materialized view name in the form of schema.mv. This is an optional parameter. When it is not specified, EXPLAIN_REWRITE returns any relevant messages regarding all the materialized views considered for rewriting the given query. When schema is omitted and only mv is specified, EXPLAIN_REWRITE looks for the materialized view in the current schema.

If you want to direct the output of EXPLAIN_REWRITE to a VARRAY instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query           [VARCHAR2 | CLOB],
    mv               VARCHAR2(30),
    output_array     SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, EXPLAIN_REWRITE can be easily invoked with the EXECUTE command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL BEGIN... END block, as shown in the examples in /rdbms/demo/smxrw*.

You can also use EXPLAIN_REWRITE with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views mv1, mv2, and mv3 could be used to rewrite the query, query_txt, and, if not, why not, use EXPLAIN_REWRITE as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the EXPLAIN_REWRITE procedure.

Parameters

Table 79–6 EXPLAIN_REWRITE Procedure Parameters

Parameter	Description
query	SQL SELECT statement to be explained
mv	The fully qualified name of an existing materialized view in the form of SCHEMA.MV. For multiple materialized views, you can provide a comma-delimited list of names.
statement_id	A client-supplied unique identifier to distinguish output messages
msg_array	The PL/SQL VARRAY that receives the output. Use this parameter to direct EXPLAIN_REWRITE's output to a PL/SQL VARRAY.

Usage Notes

To obtain the output into a table, you must run the utlxrw.sql script before calling EXPLAIN_REWRITE. This script creates a table named REWRITE_TABLE in the current schema.

I_AM_A_REFRESH Function

This function returns the value of the `I_AM_REFRESH` package state.

Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH
   RETURN BOOLEAN;
```

Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

Syntax

```
DBMS_MVIEW.PMARKER(
   rid IN ROWID)
 RETURN NUMBER;
```

Parameters

Table 79–7 PMARKER Procedure Parameters

Parameter	Description
rid	The rowid of a row entry in a master table

PURGE_DIRECT_LOAD_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information

Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG();
```

PURGE_LOG Procedure

This procedure purges rows from the materialized view log.

Syntax

```
DBMS_MVIEW.PURGE_LOG (
   master         IN   VARCHAR2,
   num            IN   BINARY_INTEGER := 1,
   flag           IN   VARCHAR2       := 'NOP');
```

Parameters

Table 79–8 PURGE_LOG Procedure Parameters

Parameter	Description
`master`	Name of the master table or master materialized view.

`num`	Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:
	`DBMS_MVIEW.PURGE_LOG('master_table', 2);`
	To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:
	`DBMS_MVIEW.PURGE_LOG('master_table',9999);`
	This statement completely purges the materialized view log that corresponds to `master_table` if fewer than 9999 materialized views are based on `master_table`. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.

`flag`	Specify `delete` to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter `num`. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view: `DBMS_MVIEW.PURGE_LOG('master_table',1,'delete');`

PURGE_MVIEW_FROM_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by its `mview_id` or the combination of the `mviewowner`, `mviewname`, and the `mviewsite`. If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
   mview_id       IN   BINARY_INTEGER  |
   mviewowner     IN   VARCHAR2,
   mviewname      IN   VARCHAR2,
   mviewsite      IN   VARCHAR2);
```

Note: This procedure is overloaded. The `mview_id` parameter is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

Parameters

Table 79–9 PURGE_MVIEW_FROM_LOG Procedure Parameters

Parameter	Description
`mview_id`	If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the `mview_id` parameter. Query the `DBA_BASE_TABLE_MVIEWS` view at the materialized view log site for a listing of materialized view IDs. Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (`DBA_REGISTERED_MVIEWS`).
`mviewowner`	If you do not specify an `mview_id`, enter the owner of the target materialized view using the `mviewowner` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view owners.
`mviewname`	If you do not specify an `mview_id`, enter the name of the target materialized view using the `mviewname` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view names.
`mviewsite`	If you do not specify an `mview_id`, enter the site of the target materialized view using the `mviewsite` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view sites.

Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

REFRESH Procedures

This procedure refreshes a list of materialized views.

Syntax

```
DBMS_MVIEW.REFRESH (
   { list                 IN     VARCHAR2,
   | tab                  IN     DBMS_UTILITY.UNCL_ARRAY,}
   method                 IN     VARCHAR2       := NULL,
   rollback_seg           IN     VARCHAR2       := NULL,
   push_deferred_rpc      IN     BOOLEAN        := true,
   refresh_after_errors   IN     BOOLEAN        := false,
   purge_option           IN     BINARY_INTEGER := 1,
   parallelism            IN     BINARY_INTEGER := 0,
   heap_size              IN     BINARY_INTEGER := 0,
   atomic_refresh         IN     BOOLEAN        := true,
   nested                 IN     BOOLEAN        := false);
```

Note: This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 79–10 REFRESH Procedure Parameters

Parameter	Description
`list | tab`	Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type `DBMS_UTILITY.UNCL_ARRAY`, where each element is the name of a materialized view.

`method`	A string of refresh methods indicating how to refresh the listed materialized views. An `f` indicates fast refresh, `?` indicates force refresh, `C` or `c` indicates complete refresh, and `A` or `a` indicates always refresh. `A` and `C` are equivalent. `P` or `p` refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
	
	If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following `EXECUTE` statement within SQL*Plus:
	
	`DBMS_MVIEW.REFRESH`
	`('countries_mv,regions_mv,hr.employees_mv','cf');`
	
	This statement performs a complete refresh of the `countries_mv` materialized view, a fast refresh of the `regions_mv` materialized view, and a default refresh of the `hr.employees` materialized view.

`rollback_seg`	Name of the materialized view site rollback segment to use while refreshing materialized views

Table 79–10 (Cont.) REFRESH Procedure Parameters

Parameter	Description
`push_deferred_rpc`	Used by updatable materialized views only. Set this parameter to `true` if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.
`refresh_after_errors`	If this parameter is `true`, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the `DEFERROR` view for the materialized view's master table or master materialized view. If this parameter is `true` and `atomic_refresh` is `false`, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
`purge_option`	If you are using the parallel propagation mechanism (in other words, parallelism is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set purge to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to `0` and occasionally execute `PUSH` with this parameter set to `2` to reduce the queue.
`parallelism`	0 specifies serial propagation. *n* > 1 specifies parallel propagation with *n* parallel processes. 1 specifies parallel propagation using only one parallel process.
`heap_size`	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. Note**:** Do not set this parameter unless directed to do so by Oracle Support Services.
`atomic_refresh`	If this parameter is set to `true`, then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to `false`, then each of the materialized views is refreshed in a separate transaction.
`nested`	If `true`, then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REFRESH_ALL_MVIEWS Procedure

This procedure refreshes all materialized views that have the following properties:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
   number_of_failures     OUT   BINARY_INTEGER,
   method                 IN    VARCHAR2         := NULL,
   rollback_seg           IN    VARCHAR2         := NULL,
   refresh_after_errors   IN    BOOLEAN          := false,
   atomic_refresh         IN    BOOLEAN          := true);
```

Parameters

Table 79–11 REFRESH_ALL_MVIEWS Procedure Parameters

Parameter	Description
number_of_ failures	Returns the number of failures that occurred during processing
method	A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
