refresh_after_ errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.

REFRESH_DEPENDENT Procedures

This procedure refreshes all materialized views that have the following properties:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
   number_of_failures     OUT    BINARY_INTEGER,
   { list                 IN     VARCHAR2,
   | tab                  IN     DBMS_UTILITY.UNCL_ARRAY,}
   method                 IN     VARCHAR2    := NULL,
   rollback_seg           IN     VARCHAR2    := NULL,
   refresh_after_errors   IN     BOOLEAN     := false,
   atomic_refresh         IN     BOOLEAN     := true,
   nested                 IN     BOOLEAN     := false);
```

Note: This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 79–12 REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
number_of_ failures	Returns the number of failures that occurred during processing
list | tab	Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type DBMS_ UTILITY.UNCL_ARRAY, where each element is the name of a table.

Table 79–12 (Cont.) REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
method	A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables. If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus: `DBMS_MVIEW.REFRESH_DEPENDENT ('employees,deptartments,hr.regions','cf');` performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.
nested	If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
   mviewowner  IN   VARCHAR2,
   mviewname   IN   VARCHAR2,
   mviewsite   IN   VARCHAR2,
   mview_id    IN   DATE | BINARY_INTEGER,
   flag        IN   BINARY_INTEGER,
   qry_txt     IN   VARCHAR2,
   rep_type    IN   BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

Parameters

Table 79–13 REGISTER_MVIEW Procedure Parameters

Parameter	Description
mviewowner	Owner of the materialized view.
mviewname	Name of the materialized view.
mviewsite	Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.
mview_id	The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.
flag	A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter: DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view.
qry_txt	The first 32,000 bytes of the materialized view definition query.

Table 79–13 (Cont.) REGISTER_MVIEW Procedure Parameters

Parameter	Description
rep_type	Version of the materialized view. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site ■ DBMS_MVIEW.REG_V8_SNAPSHOT if the materialized view is at an Oracle database version 8.x or higher site DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site

Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview_id, flag, and qry_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

UNREGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (
   mviewowner      IN   VARCHAR2,
   mviewname       IN   VARCHAR2,
   mviewsite       IN   VARCHAR2);
```

Parameters

Table 79–14 UNREGISTER_MVIEW Procedure Parameters

Parameters	Description
mviewowner	Owner of the materialized view
mviewname	Name of the materialized view
mviewsite	Name of the materialized view site

80

DBMS_NETWORK_ACL_ADMIN

The DBMS_NETWORK_ACL_ADMIN package provides the interface to administer the network Access Control List (ACL).

> **See Also:** For more information, see "Managing Fine-grained Access to External Network Services" in Oracle Database Security Guide

The chapter contains the following topics:

- Using DBMS_NETWORK_ACL_ADMIN
  - Examples
- Summary of DBMS_NETWORK_ACL_ADMIN Subprograms

Using DBMS_NETWORK_ACL_ADMIN

- Examples

Examples

Example1

Grant the connect and resolve privileges for host www.us.oracle.com to SCOTT.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(acl         => 'www.xml',
                                    description => 'WWW ACL',
                                    principal   => 'SCOTT',
                                    is_grant    => true,
                                    privilege   => 'connect');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(acl       => 'www.xml',
                                       principal => 'SCOTT',
                                       is_grant  => true,
                                       privilege => 'resolve');

  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(acl  => 'www.xml',
                                    host => 'www.us.oracle.com');
END;
/
COMMIT;
```

Example 2

Grant the resolve privilege for www.us.oracle.com to ADAMS. Since an ACL for www.us.oracle.com exists already, just add the privilege for ADAMS.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(acl       => 'www.xml',
                                       principal => 'ADAMS',
                                       is_grant  => true,
                                       privilege => 'resolve');
END;
/
COMMIT;
```

Example 3

Assign the ACL www.xml to www-proxy.us.oracle.com so that SCOTT and ADAMS can access www-proxy.us.oracle.com also.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(acl  => 'www.xml',
                                    host => 'www-proxy.us.oracle.com');
END;
/
COMMIT;
```

Example 4

Unassign the ACL from www.us.oracle.com so that no access to www.us.oracle.com is allowed.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(host => 'www.us.oracle.com');
END;
/
COMMIT;
```

Example 5

The DOMAINS Function in the DBMS_NETWORK_ACL_UTLILITY package returns all the domains a host belongs to. It can be used in conjunction with the CHECK_PRIVILEGE_ACLID Function in this package to determine the privilege assignments affecting a user's permission to access a network host. The function DOMAIN_LEVEL Function in the DBMS_NETWORK_ACL_UTILITY package returns the level of each domain and can be used to order the ACL assignments by their precedence.

For example, for SCOTT's permission to connect to www.us.oracle.com:

```
SELECT host, lower_port, upper_port, acl,
   DECODE(
       DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
          1, 'GRANTED', 0, 'DENIED', null) privilege
   FROM dba_network_acls
  WHERE host IN
    (SELECT * FROM
       TABLE(DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com')))
 ORDER BY DBMS_NETWORK_ACL_UTLITITY.DOMAIN_LEVEL(host) desc, lower_port,
                                          upper_port;

HOST                 LOWER_PORT UPPER_PORT         ACL          PRIVILEGE
-------------------- ---------- ---------- -------------------- ---------
www.us.oracle.com            80         80 /sys/acls/www.xml    GRANTED
www.us.oracle.com          3000       3999 /sys/acls/www.xml    GRANTED
www.us.oracle.com                          /sys/acls/www.xml    GRANTED
*.oracle.com                               /sys/acls/all.xml
*                                          /sys/acls/all.xml
```

Example 6

For example, for SCOTT's permission to do domain name resolution for www.us.oracle.com:

```
SELECT host, acl,
  DECODE(
       DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', NULL) privilege
  FROM dba_network_acls
 WHERE host IN
   (SELECT * FROM
      TABLE(DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com'))) and
   lower_port IS NULL AND upper_port IS NULL
ORDER BY DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) desc;

HOST                          ACL          PRIVILEGE
-------------------- -------------------- ---------
www.us.oracle.com    /sys/acls/www.xml    GRANTED
*.oracle.com         /sys/acls/all.xml
*                    /sys/acls/all.xml
```

Note that the 'resolve' privilege takes effect only in ACLs assigned without any port range (when lower_port and upper_port are NULL). For this reason, we do not include lower_port and upper_port columns in the query.

Summary of DBMS_NETWORK_ACL_ADMIN Subprograms

Table 80–1 DBMS_NETWORK_ACL_ADMIN Package Subprograms

Subprogram	Description
ADD_PRIVILEGE Procedure on page 80-6	Adds a privilege to grant or deny the network access to the user in an access control list (ACL)
ASSIGN_ACL Procedure on page 80-8	Assigns an access control list (ACL) to a network host, and optionally specific to a TCP port range
CHECK_PRIVILEGE Function on page 80-10	Checks if a privilege is granted to or denied from the user in an access control list (ACL)
CHECK_PRIVILEGE_ACLID Function on page 80-11	Checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list
CREATE_ACL Procedure on page 80-12	Creates an access control list (ACL) with an initial privilege setting
DELETE_PRIVILEGE Procedure on page 80-13	Deletes a privilege in an access control list (ACL)
DROP_ACL Procedure on page 80-14	Drops an access control list (ACL)
UNASSIGN_ACL Procedure on page 80-15	Unassigns the access control list (ACL) currently assigned to a network host.

ADD_PRIVILEGE Procedure

This procedure adds a privilege to grant or deny the network access to the user. The access control entry (ACE) will be created if it does not exist.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
   acl             IN VARCHAR2,
   principal       IN VARCHAR2,
   is_grant        IN BOOLEAN,
   privilege       IN VARCHAR2,
   position        IN PLS_INTEGER DEFAULT NULL,
   start_date      IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL,
   end_date        IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL );
```

Parameters

Table 80–2 ADD_PRIVILEGE Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "/sys/acls".
`principal`	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
`is_grant`	Network privilege to be granted or denied - `'connect | resolve'` (case sensitive). A database user needs the `connect` privilege to an external network host computer if he or she is connecting using the `UTL_TCP`, `UTL_HTTP`, `UTL_SMTP`, and `UTL_MAIL` utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the `UTL_INADDR` package, grant the database user the `resolve` privilege.
`privilege`	Network privilege to be granted or denied
`position`	Position (1-based) of the ACE. If a non-`NULL` value is given, the privilege will be added in a new ACE at the given position and there should not be another ACE for the principal with the same `is_grant` (grant or deny). If a `NULL` value is given, the privilege will be added to the ACE matching the principal and the `is_grant` if one exists, or to the end of the ACL if the matching ACE does not exist.
`start_date`	Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date. The `start_date` will be ignored if the privilege is added to an existing ACE.
`end_state`	End date of the access control entry (ACE). When specified, the ACE will expire after the specified date. The `end_date` must be greater than or equal to the `start_date`. The `end_date` will be ignored if the privilege is added to an existing ACE.

Usage Notes

To remove the permission, use the DELETE_PRIVILEGE Procedure.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
```

```
        acl         => 'us-oracle-com-permissions.xml',
        principal   => 'ST_USERS',
        is_grant    =>  TRUE,
        privilege   => 'connect')
END;
```

ASSIGN_ACL Procedure

This procedure assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (
   acl         IN VARCHAR2,
   host        IN VARCHAR2,
   lower_port  IN PLS_INTEGER DEFAULT NULL,
   upper_port  IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 80–3 ASSIGN_ACL Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "`/sys/acls`".
`host`	Host to which the ACL will be assigned. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive.
`lower_port`	Lower bound of a TCP port range if not `NULL`
`upper_port`	Upper bound of a TCP port range. If `NULL`, lower_port is assumed.

Usage Notes

- Only one ACL can be assigned to any host computer, domain, or IP subnet, and if specified, the TCP port range. When you assign a new access control list to a network target, Oracle Database unassigns the previous access control list that was assigned to the same target. However, Oracle Database does not drop the access control list. You can drop the access control list by using the DROP_ACL Procedure. To remove an access control list assignment, use the UNASSIGN_ACL Procedure.
- The ACL assigned to a domain takes a lower precedence than the other ACLs assigned sub-domains, which take a lower precedence than the ACLs assigned to the individual hosts. So for a given host say "www.us.oracle.com", the following domains are listed in decreasing precedences:

  - www.us.oracle.com

  - *.us.oracle.com

  - *.oracle.com

  - *.com

  - *

  In the same way, the ACL assigned to an subnet takes a lower precedence than the other ACLs assigned smaller subnets, which take a lower precedence than the ACLs assigned to the individual IP addresses. So for a given IP address say "192.168.0.100", the following subnets are listed in decreasing precedences:

  - 192.168.0.100

- 192.168.0.*

- 192.168.*

- 192.*

- *

- The port range is applicable only to the "connect" privilege assignments in the ACL. The "resolve" privilege assignments in an ACL have effects only when the ACL is assigned to a host without a port range.

  For the "connect" privilege assignments, an ACL assigned to the host without a port range takes a lower precedence than other ACLs assigned to the same host with a port range.

- When specifying a TCP port range, both lower_port and upper_port must not be `NULL` and `upper_port` must be greater than or equal to `lower_port`. The port range must not overlap with any other port ranges for the same host assigned already.

- To remove the assignment, use UNASSIGN_ACL Procedure.

Examples

```
BEGIN
   DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(
     acl         => 'us-oracle-com-permissions.xml',
     host        => '*.us.oracle.com',
     lower_port  => 80);
END;
```

CHECK_PRIVILEGE Function

This function checks if a privilege is granted to or denied from the user in an ACL.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (
   acl             IN VARCHAR2,
   user            IN VARCHAR2,
   privilege       IN VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 80–4 CHECK_PRIVILEGE Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "/sys/acls".
`user`	User to check against. If the user is `NULL`, the invoker is assumed. The username is case-sensitive as in the `USERNAME` column of the `ALL_USERS` view.
`privilege`	Network privilege to check

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; `NULL` when the privilege is neither granted or denied.

Examples

```
SELECT DECODE(
  DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE(
       'us-oracle-com-permissions.xml', 'SCOTT', 'resolve'),
  1, 'GRANTED', 0, 'DENIED', NULL) PRIVILEGE
FROM DUAL;
```

CHECK_PRIVILEGE_ACLID Function

This function checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID (
   aclid           IN RAW,
   user            IN VARCHAR2 DEFAULT NULL)
   privilege       IN VARCHAR2,
 RETURN NUMBER;
```

Parameters

Table 80–5 CHECK_PRIVILEGE_ACLID Function Parameters

Parameter	Description
`aclid`	Object ID of the ACL
`user`	User to check against. If the user is `NULL`, the invoker is assumed. The username is case-sensitive as in the `USERNAME` column of the `ALL_USERS` view.
`privilege`	Network privilege to check

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; `NULL` when the privilege is neither granted or denied.

CREATE_ACL Procedure

This procedure creates an access control list (ACL) with an initial privilege setting. An ACL must have at least one privilege setting. The ACL has no access control effect unless it is assigned to network target.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CREATE_ACL (
   acl             IN VARCHAR2,
   description     IN VARCHAR2,
   principal       IN VARCHAR2,
   is_grant        IN BOOLEAN,
   privilege       IN VARCHAR2,
   start_date      IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
   end_date        IN TIMESTAMP WITH TIMEZONE DEFAULT NULL );
```

Parameters

Table 80–6 CREATE_ACL Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "/sys/acls".
`description`	Description attribute in the ACL
`principal`	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
`is_grant`	Privilege is granted or not (denied)
`privilege`	Network privilege to be granted or denied - `'connect | resolve'` (case sensitive). A database user needs the `connect` privilege to an external network host computer if he or she is connecting using the `UTL_TCP`, `UTL_HTTP`, `UTL_SMTP`, and `UTL_MAIL` utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the `UTL_INADDR` package, grant the database user the `resolve` privilege.
`start_date`	Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date.
`end_state`	End date of the access control entry (ACE). When specified, the ACE will expire after the specified date. The `end_date` must be greater than or equal to the `start_date`.

Usage Notes

To drop the access control list, use the DROP_ACL Procedure.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
     acl          => 'us-oracle-com-permissions.xml',
     description  => 'Network permissions for *.us.oracle.com',
     principal    => 'SCOTT',
     is_grant     => TRUE,
     privilege    => 'connect');
END;
```

DELETE_PRIVILEGE Procedure

This procedure deletes a privilege in an access control list.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (
   acl           IN VARCHAR2,
   principal     IN VARCHAR2,
   is_grant      IN BOOLEAN DEFAULT NULL,
   privilege     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 80–7 DELETE_PRIVILEGE Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "/sys/acls".
`principal`	Principal (database user or role) for whom all the ACE will be deleted
`is_grant`	Privilege is granted or not (denied). If a null value is given, the deletion is applicable to both granted or denied privileges.
`privilege`	Network privilege to be deleted. If a `NULL` value is given, the deletion is applicable to all privileges.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE(
        acl         => 'us-oracle-com-permissions.xml',
        principal   => 'ST_USERS')
END;
```

DROP_ACL Procedure

This procedure drops an access control list (ACL).

Syntax

```
DBMS_NETWORK_ACL_ADMIN.DROP_ACL (
   acl           IN VARCHAR2);
```

Parameters

Table 80–8 DROP_ACL Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".

Examples

```
BEGIN
   DBMS_NETWORK_ACL_ADMIN.DROP_ACL(
      acl => 'us-oracle-com-permissions.xml');
END;
```

UNASSIGN_ACL Procedure

This procedure unassigns the access control list (ACL) currently assigned to a network host.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL (
   acl         IN VARCHAR2 DEFAULT NULL,
   host        IN VARCHAR2 DEFAULT NULL,
   lower_port  IN PLS_INTEGER DEFAULT NULL,
   upper_port  IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 80–9 UNASSIGN_ACL Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls". If acl is NULL, any ACL assigned to the host will be unassigned.
host	Host from which the ACL will be removed. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. If host is null, the ACL will be unassigned from any host. If both host and acl are NULL, all ACL assignments will be deleted.
lower_port	Lower bound of a TCP port range if not NULL
upper_port	Upper bound of a TCP port range. If NULL, lower_port is assumed.

Examples

```
BEGIN
   DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(
     host        => '*.us.oracle.com',
     lower_port  => 80);
END;
```

81

DBMS_NETWORK_ACL_UTILITY

The DBMS_NETWORK_ACL_UTILITY package provides utilities to the interface for administering the network Access Control List (ACL).

> **See Also:** For more information, see "Managing Fine-grained Access to External Network Services" in Oracle Database Security Guide

The chapter contains the following topics:

- Using DBMS_NETWORK_ACL_UTILITY
  - Examples
- Summary of DBMS_NETWORK_ACL_UTILITY Subprograms

Using DBMS_NETWORK_ACL_UTILITY

- Examples

Examples

The DOMAINS Function in this package returns all the domains a host belongs to. It can be used in conjunction with the CHECK_PRIVILEGE_ACLID Function in the DBMS_NETWORK_ACL_ADMIN pacakge to determine the privilege assignments affecting a user's permission to access a network host. The function DOMAIN_LEVEL Function in this package returns the level of each domain and can be used to order the ACL assignments by their precedence.

Example 1

For example, for SCOTT's permission to connect to www.us.oracle.com:

```
SELECT host, lower_port, upper_port, acl,
   DECODE(
       DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
          1, 'GRANTED', 0, 'DENIED', null) privilege
   FROM dba_network_acls
  WHERE host IN
    (SELECT * FROM
       TABLE(DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com')))
 ORDER BY DBMS_NETWORK_ACL_UTLITITY.DOMAIN_LEVEL(host) desc, lower_port,
                                          upper_port;

HOST                 LOWER_PORT UPPER_PORT         ACL          PRIVILEGE
-------------------- ---------- ---------- -------------------- ---------
www.us.oracle.com            80         80 /sys/acls/www.xml    GRANTED
www.us.oracle.com          3000       3999 /sys/acls/www.xml    GRANTED
www.us.oracle.com                          /sys/acls/www.xml    GRANTED
*.oracle.com                               /sys/acls/all.xml
*                                          /sys/acls/all.xml
```

Example 2

For example, for SCOTT's permission to do domain name resolution for www.us.oracle.com:

```
SELECT host, lower_port, upper_port, acl,
  DECODE(
       DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', null) privilege
  FROM dba_network_acls
 WHERE host IN
   (SELECT * FROM
      TABLE(DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com'))) and
   lower_port IS NULL AND upper_port IS NULL
ORDER BY DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) desc;

HOST                 LOWER_PORT UPPER_PORT         ACL          PRIVILEGE
-------------------- ---------- ---------- -------------------- ---------
www.us.oracle.com                          /sys/acls/www.xml    GRANTED
*.oracle.com                               /sys/acls/all.xml
*                                          /sys/acls/all.xml
```

Note that the "resolve" privilege takes effect only in ACLs assigned without any port range (when `lower_port` and `upper_port` are `NULL`). For this reason, we do not include `lower_port` and `upper_port` columns in the query.

Summary of DBMS_NETWORK_ACL_UTILITY Subprograms

Table 81–1 DBMS_NETWORK_ACL_UTILITY Package Subprograms

Subprogram	Description
DOMAIN_LEVEL Function on page 81-5	Returns the domain level of the given host name, domain, or subnet
DOMAINS Function on page 81-6	For a given host, this function returns the domains whose ACL assigned will be used to determine if a user has the privilege to access the given host or not.

DOMAIN_LEVEL Function

This function returns the domain level of the given host name, domain, or subnet.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL (
    host  IN VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 81–2 DOMAIN_LEVEL Function Parameters

Parameter	Description
host	Network host, domain, or subnet

Return Values

The domain level of the given host, domain, or subnet.

Examples

```
SELECT DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL('www.us.oracle.com') FROM DUAL;
```

DOMAINS Function

For a given host, this function returns the domains whose ACL assigned will be used to determine if a user has the privilege to access the given host or not. When the IP address of the host is given, return the subnets instead.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAINS (
    host  IN VARCHAR2)
  RETURN DOMAIN_TABLE PIPELINED;
```

Parameters

Table 81–3 DOMAINS Function Parameters

Parameter	Description
host	Network host

Return Values

The domains or subnets for the given host.

Examples

```
SELECT * FROM TABLE (DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com'));
```

82

DBMS_OBFUSCATION_TOOLKIT

DBMS_OBFUSCATION_TOOLKIT enables an application to encrypt data using either the Data Encryption Standard (DES) or the Triple DES algorithms.

This chapter contains the following topics:

- Using DBMS_OBFUSCATION_TOOLKIT
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_OBFUSCATION Subprograms

Using DBMS_OBFUSCATION_TOOLKIT

- Overview
- Security Model
- Operational Notes

Overview

The Data Encryption Standard (DES), also known as the Data Encryption Algorithm (DEA) by the American National Standards Institute (ANSI) and DEA-1 by the International Standards Organization (ISO), has been a worldwide encryption standard for over 20 years. The banking industry has also adopted DES-based standards for transactions between private financial institutions, and between financial institutions and private individuals. DES will eventually be replaced by a new Advanced Encryption Standard (AES).

DES is a symmetric key cipher; that is, the same key is used to encrypt data as well as decrypt data. DES encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm ignores 8 bits of the 64-bit key that is supplied; however, you must supply a 64-bit key to the algorithm.

Triple DES (3DES) is a far stronger cipher than DES; the resulting ciphertext (encrypted data) is much harder to break using an exhaustive search: 2**112 or 2**168 attempts instead of 2**56 attempts. Triple DES is also not as vulnerable to certain types of cryptanalysis as is DES.

Security Model

Oracle installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed. The package also grants access to the `PUBLIC` role so no explicit grant needs to be done.

Operational Notes

- Key Management
- Storing the Key in the Database
- Storing the Key in the Operating System
- User-Supplied Keys

Key Management

Key management, including both generation and secure storage of cryptographic keys, is one of the most important aspects of encryption. If keys are poorly chosen or stored improperly, then it is far easier for a malefactor to break the encryption. Rather than using an exhaustive key search attack (that is, cycling through all the possible keys in hopes of finding the correct decryption key), cryptanalysts typically seek weaknesses in the choice of keys, or the way in which keys are stored.

Key generation is an important aspect of encryption. Typically, keys are generated automatically through a random-number generator. Provided that the random number generation is cryptographically secure, this can be an acceptable form of key generation. However, if random numbers are not cryptographically secure, but have elements of predictability, the security of the encryption may be easily compromised.

The `DBMS_OBFUSCATION_TOOLKIT` package includes tools for generating random material that can be used for encryption keys, but it does not provide a mechanism for maintaining them. Care must be taken by the application developer to ensure the secure generation and storage of encryption keys used with this package. Furthermore, the encryption and decryption done by the `DBMS_OBFUSCATION_TOOLKIT` takes place on the server, not the client. If the key is passed over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire. See *Oracle Database Advanced Security Administrator's Guide* for information about configuring and using network encryption for Oracle Net.

Key storage is one of the most important, yet difficult aspects of encryption and one of the hardest to manage properly. To recover data encrypted with a symmetric key, the key must be accessible to the application or user seeking to decrypt data. The key needs to be easy enough to retrieve that users can access encrypted data when they need to without significant performance degradation. The key also needs to be secure enough that it is not easily recoverable by unauthorized users trying to access encrypted data that they are not supposed to see.

The three options available are:

- Store the key in the database
- Store the key in the operating system
- Have the user manage the key

Storing the Key in the Database

Storing the keys in the database cannot always provide bullet-proof security if you are trying to protect data against the DBA accessing encrypted data (since an all-privileged DBA can access tables containing encryption keys), but it can provide security against the casual snooper, or against someone compromising the database files on the operating system. Furthermore, the security you can obtain by storing keys in the database does not have to be bullet-proof in order to be extremely useful.

For example, suppose you want to encrypt an employee's social security number, one of the columns in table EMP. You could encrypt each employee's SSN using a key which is stored in a separate column in EMP. However, anyone with SELECT access on the EMP table could retrieve the encryption key and decrypt the matching social security number. Alternatively, you could store the encryption keys in another table, and use a package to retrieve the correct key for the encrypted data item, based on a primary key-foreign key relationship between the tables.

You can envelope both the `DBMS_OBFUSCATION_TOOLKIT` package and the procedure to retrieve the encryption keys supplied to the package. Furthermore, the encryption key itself could be transformed in some way (for example, XORed with the foreign key to the EMP table) so that the key itself is not stored in easily recoverable form.

Oracle recommends using the wrap utility of PL/SQL to obfuscate the code within a PL/SQL package itself that does the encryption. That prevents people from breaking the encryption by looking at the PL/SQL code that handles keys, calls encrypting routines, and so on. In other words, use the wrap utility to obfuscate the PL/SQL packages themselves. This scheme is secure enough to prevent users with `SELECT` access to `EMP` from reading unencrypted sensitive data, and a DBA from easily retrieving encryption keys and using them to decrypt data in the `EMP` table. It can be made more secure by changing encryption keys regularly, or having a better key storage algorithm (so the keys themselves are encrypted, for example).

Storing the Key in the Operating System

Storing keys in a flat file in the operating system is another option. You can make callouts from PL/SQL, which you can use to retrieve encryption keys. If you store keys in a file and make callouts to retrieve the keys, the security of your encrypted data is only as secure as the protection of the key file on the operating system. Of course, a user retrieving keys from the operating system would have to be able to either access the Oracle database files (to decrypt encrypted data), or be able to gain access to the table in which the encrypted data is stored as a legitimate user.

User-Supplied Keys

If you ask a user to supply the key, it is crucial that you use network encryption, such as that provided by Oracle Advanced Security, so the key is not passed from client to server in the clear. The user must remember the key, or your data is not recoverable.

Summary of DBMS_OBFUSCATION Subprograms

Table 82–1 DBMS_OBFUSCATION Package Subprograms

Subprogram	Description
DES3DECRYPT Procedures and Functions on page 82-8	Generates the decrypted form of the input data
DES3ENCRYPT Procedures and Functions on page 82-10	Generates the encrypted form of the input data by passing it through the Triple DES encryption algorithm
DES3GETKEY Procedures and Functions on page 82-8	Takes a random value and uses it to generate an encryption key, using Triple DES
DESDECRYPT Procedures and Functions on page 82-13	Generates the decrypted form of the input data
DESENCRYPT Procedures and Functions on page 82-15	Generates the encrypted form of the input data
DESGETKEY Procedures and Functions on page 82-17	Takes a random value and uses it to generate an encryption key
MD5 Procedures and Functions on page 82-18	Generates MD5 hashes of data

DES3DECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

For a discussion of the initialization vector that you can use with this procedure, see the section, "DES3ENCRYPT Procedures and Functions" on page 82-10.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input             IN   RAW,
   key               IN   RAW,
   decrypted_data    OUT  RAW,
   which             IN   PLS_INTEGER  DEFAULT TwoKeyMode
   iv                IN   RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input_string      IN   VARCHAR2,
   key_string        IN   VARCHAR2,
   decrypted_string  OUT  VARCHAR2,
   which             IN   PLS_INTEGER  DEFAULT TwoKeyMode
   iv_string         IN   VARCHAR2     DEFAUTL NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input         IN  RAW,
   key           IN  RAW,
   which         IN  PLS_INTEGER DEFAULT TwoKeyMode
   iv            IN  RAW         DEFAULT NULL)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input_string  IN  VARCHAR2,
   key_string    IN  VARCHAR2,
   which         IN  PLS_INTEGER DEFAULT TwoKeyMode
   iv_string     IN  VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 82–2 DES3DECRYPT Parameters for Raw Data

Parameter	Description
`input`	Data to be decrypted
`key`	Decryption key
`decrypted_data`	Decrypted data
`which`	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
`iv`	Initialization vector
`input_string`	String to be decrypted
`key_string`	Decryption key string
`decrypted_ string`	Decrypted string
`iv_string`	Initialization vector

Usage Notes

If the input data or key given to the DES3DECRYPT procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DES3DECRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit." ORA-28233 is NOT applicable for the DES3DECRYPT function.

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the WHICH parameter, ORA-28236 "Invalid Triple DES mode" is generated. Only the values 0 (TwoKeyMode) and 1 (ThreeKeyMode) are valid.

Restrictions

You must supply a single key of either 128 bits for a 2-key implementation (of which only 112 are used), or a single key of 192 bits for a 3-key implementation (of which 168 bits are used). Oracle automatically truncates the supplied key into 56-bit lengths for decryption. This key length is fixed and cannot be altered.

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3ENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data by passing it through the Triple DES (3DES) encryption algorithm.

Oracle's implementation of 3DES supports either a 2-key or 3-key implementation, in outer cipher-block-chaining (CBC) mode.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input           IN     RAW,
   key             IN     RAW,
   encrypted_data  OUT    RAW,
   which           IN     PLS_INTEGER  DEFAULT TwoKeyMode
   iv              IN     RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input_string      IN     VARCHAR2,
   key_string        IN     VARCHAR2,
   encrypted_string  OUT    VARCHAR2,
   which             IN     PLS_INTEGER  DEFAULT TwoKeyMode
   iv_string         IN     VARCHAR2     DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input        IN RAW,
   key          IN RAW,
   which        IN PLS_INTEGER DEFAULT TwoKeyMode
   iv           IN RAW         DEFAULT NULL)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input_string  IN VARCHAR2,
   key_string    IN VARCHAR2,
   which         IN PLS_INTEGER DEFAULT TwoKeyMode
   iv_string     IN VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 82–3 DES3ENCRYPT Parameters Procedure and Function

Parameter	Description
`input`	Data to be encrypted.
`key`	Encryption key.
`encrypted_data`	Encrypted data.
`which`	If = 0, (default), then `TwoKeyMode` is used. If = 1, then `ThreeKeyMode` is used.
iv	Initialization vector.
`input_string`	String to be encrypted.
`key_string`	Encryption key string.
`encrypted_ string`	Encrypted string.
iv_string	Initialization vector.

Usage Notes

If you are using Oracle's 3DES interface with a 2-key implementation, you must supply a single key of 128 bits as an argument to the DES3ENCRYPT procedure. With a 3-key implementation, you must supply a single key of 192 bits. Oracle then breaks the supplied key into two 64-bit keys. As with DES, the 3DES algorithm throws away 8 bits of each derived key. However, you must supply a single 128-bit key for the 2-key 3DES implementation or a single 192-bit key for the 3-key 3DES implementation; otherwise the package will raise an error. The DES3ENCRYPT procedure uses the 2-key implementation by default.

You also have the option of providing an *initialization vector* (IV) with the DES3ENCRYPT procedure. An IV is a block of random data prepended to the data you intend to encrypt. The IV has no meaning. It is there to make each message unique. Prepending an IV to your input data avoids starting encrypted blocks of data with common header information, which may give cryptanalysts information they can use to decrypt your data.

If the input data or key given to the PL/SQL DES3ENCRYPT procedure is empty, then the procedure raises the error `ORA-28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the DES3ENCRYPT procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double encrypt data using the DES3ENCRYPT procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the `which` parameter, `ORA-28236 "Invalid Triple DES mode"` is generated. Only the values 0 (`TwoKeyMode`) and 1 (`ThreeKeyMode`) are valid.

Restrictions

The DES3ENCRYPT procedure has two restrictions. The first is that the DES key length for encryption is fixed at 128 bits (for 2-key DES) or 192 bits (for 3-key DES); you cannot alter these key lengths.

The second is that you cannot execute multiple passes of encryption using 3DES. (Note: the 3DES algorithm itself encrypts data multiple times; however, you cannot call the DES3ENCRYPT function itself more than once to encrypt the same data using 3DES.)

> **Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3GETKEY Procedures and Functions

These subprograms take a random value and uses it to generate an encryption key. For Triple DES, you specify the mode so that the returned key has the proper length.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN   PLS_INTEGER DEFAULT TwoKeyMode,
   seed         IN   RAW,
   key          OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN   PLS_INTEGER DEFAULT TwoKeyMode,
   seed_string  IN   VARCHAR2,
   key          OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which  IN  PLS_INTEGER DEFAULT TwoKeyMode,
   seed   IN  RAW)
 RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN  PLS_INTEGER DEFAULT TwoKeyMode,
   seed_string  IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 82–4 DES3GETKEY Procedure and Function Parameters

Parameter	Description
`which`	If = 0, (default), then `TwoKeyMode` is used. If = 1, then `ThreeKeyMode` is used.
`seed`	A value at least 80 characters long.
`key`	Encryption key.
`seed_string`	A value at least 80 characters long.
`key`	Encryption key.

DESDECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input             IN   RAW,
   key               IN   RAW,
   decrypted_data    OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input_string      IN   VARCHAR2,
   key_string        IN   VARCHAR2,
   decrypted_string  OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input            IN  RAW,
   key              IN  RAW)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input_string     IN  VARCHAR2,
   key_string       IN  VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 82–5 DESDECRYPT Procedure and Function Parameters

Parameter	Description
`input`	Data to be decrypted.
`key`	Decryption key.
`decrypted_data`	Decrypted data.
`input_string`	String to be decrypted.
`key_string`	Decryption key string.
`decrypted_string`	Decrypted string.

Usage Notes

If the input data or key given to the PL/SQL `DESDECRYPT` function is empty, then Oracle raises `ORA error 28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the `DESDECRYPT` function is not a multiple of 8 bytes, Oracle raises `ORA error 28232 "Invalid input size for Obfuscation toolkit."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

> **Note:** `ORA-28233` is not applicable to the `DESDECRYPT` function.

Restrictions

The DES key length for encryption is fixed at 64 bits (of which 56 bits are used); you cannot alter this key length.

Note: The key length limitation is a requirement of U.S. regulations governing the export of cryptographic products.

DESENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input            IN    RAW,
   key              IN    RAW,
   encrypted_data   OUT   RAW);

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input_string     IN    VARCHAR2,
   key_string       IN    VARCHAR2,
   encrypted_string OUT   VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input         IN  RAW,
   key           IN  RAW)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input_string  IN  VARCHAR2,
   key_string    IN  VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 82–6 DESENCRYPT Procedure and Function Parameters

Parameter	Description
`input`	Data to be encrypted.
`key`	Encryption key.
`encrypted_data`	Encrypted data.
`input_string`	String to be encrypted.
`key_string`	Encryption key string.
`encrypted_string`	Encrypted string.

Usage Notes

The DES algorithm encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm throws away 8 bits of the supplied key (the particular bits which are thrown away is beyond the scope of this documentation). However, when using the algorithm, you must supply a 64-bit key or the package will raise an error.

If the input data or key given to the PL/SQL DESEncrypt procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit".

If the input data given to the `DESENCRYPT` procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double-encrypt data using the `DESENCRYPT` procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Restrictions

The `DESENCRYPT` procedure has the following restrictions:

- The DES key length for encryption is fixed at 56 bits; you cannot alter this key length.
- You cannot execute multiple passes of encryption. That is, you cannot re-encrypt previously encrypted data by calling the function twice.

> **Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DESGETKEY Procedures and Functions

These subprograms take a random value and use it to generate an encryption key.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed         IN   RAW,
   key          OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed_string  IN   VARCHAR2,
   key          OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed IN RAW)
 RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed_string IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 82–7 DESGETKEY Procedure and Function Parameters

Parameter	Description
`seed`	A value at least 80 characters long.
`key`	Encryption key.
`seed_string`	A value at least 80 characters long.
`key`	Encryption key.

MD5 Procedures and Functions

These subprograms generate MD5 hashes of data. The MD5 algorithm ensures data integrity by generating a 128-bit cryptographic message digest value from given data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.MD5(
   input            IN   RAW,
   checksum         OUT  raw_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input_string     IN   VARCHAR2,
   checksum_string  OUT  varchar2_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input         IN  RAW)
  RETURN raw_checksum;

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input_string  IN  VARCHAR2)
  RETURN varchar2_checksum;
```

Parameters

Table 82–8 MD5 Procedure and Function Parameters

Parameter Name	Description
`input`	Data to be hashed
`checksum`	128-bit cryptographic message digest
`input_string`	Data to be hashed
`checksum_ string`	128-bit cryptographic message digest

83

DBMS_ODCI

`DBMS_ODCI` package contains a single user function related to the use of Data Cartridges.

See Also:

- *Oracle Database Data Cartridge Developer's Guide*

This chapter contains the following topic:

- Summary of DBMS_ODCI Subprograms

Summary of DBMS_ODCI Subprograms

Table 83–1 DBMS_ODCI Package Subprograms

Subprogram	Description
ESTIMATE_CPU_UNITS Function on page 83-3	Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)

ESTIMATE_CPU_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, ESTIMATE_CPU_UNITS considers the speed of a single processor.

Syntax

```
DBMS_ODCI.ESTIMATE_CPU_UNITS(
   elapsed_time     NUMBER)
  RETURN NUMBER;
```

Parameters

Parameter	Description
elapsed_time	The elapsed time in seconds that it takes to execute a function.

Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by ESTIMATE_CPU_UNITS; multiply the number returned by ESTIMATE_CPU_UNITS by 1,000.

84

DBMS_OFFLINE_OG

The `DBMS_OFFLINE_OG` package contains the public interface for offline instantiation of master groups.

This chapter contains the following topics:

- Documentation of DBMS_OFFLINE_OG

Documentation of DBMS_OFFLINE_OG

For a complete description of this package within the context of Replication, see DBMS_OFFLINE_OG in the *Oracle Database Advanced Replication Management API Reference*.

85

DBMS_OUTLN

The DBMS_OUTLN package, synonymous with OUTLN_PKG, contains the functional interface for subprograms associated with the management of stored outlines.

> **See Also:** For more information about using the DBMS_OUTLN package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

Note: Stored outlines will be desupported in a future release in favor of SQL plan management. In Oracle Database 11g Release 1 (11.1), stored outlines continue to function as in past releases. However, Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines.

If you have existing existing stored outlines, please consider migrating them to SQL plan baselines by using the LOAD_PLANS_FROM_CURSOR_CACHE Functions or LOAD_PLANS_FROM_SQLSET Function of the DBMS_SPM package. When the migration is complete, you should disable or remove the stored outlines.

This chapter contains the following topics:

- Using DBMS_OUTLN
  - Overview
  - Security Model
- Summary of DBMS_OUTLN Subprograms

Using DBMS_OUTLN

- Overview
- Security Model

Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline.The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Stored outlines will be de-supported in a future release in favor of SQL plan management. As of 11g R1, stored outlines continue to function as in past releases, but Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines.

If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the LOAD_PLANS_FROM_CURSOR_CACHE Functions or the LOAD_PLANS_FROM_SQLSET Function of the DBMS_SPM package. When the migration is complete, you should disable or remove the stored outlines.

Security Model

DBMS_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

Summary of DBMS_OUTLN Subprograms

Table 85–1 DBMS_OUTLN Package Subprograms

Subprogram	Description
CLEAR_USED Procedure on page 85-6	Clears the outline 'used' flag
CREATE_OUTLINE Procedure on page 85-7	Generates outlines from the shared cursor identified by hash value and child number
DROP_BY_CAT Procedure on page 85-8	Drops outlines that belong to a specified category
DROP_UNUSED Procedure on page 85-9	Drops outlines that have never been applied in the compilation of a SQL statement
EXACT_TEXT_SIGNATURES Procedure on page 85-10	Updates outline signatures to those that compute based on exact text matching
UPDATE_BY_CAT Procedure on page 85-11	Changes the category of outlines in one category to a new category
UPDATE_SIGNATURES Procedure on page 85-12	Updates outline signatures to the current version's signature

CLEAR_USED Procedure

This procedure clears the outline 'used' flag.

Syntax

```
DBMS_OUTLN.CLEAR_USED (
   name     IN     VARCHAR2);
```

Parameters

Table 85–2 CLEAR_USED Procedure Parameters

Parameter	Description
name	Name of the outline.

CREATE_OUTLINE Procedure

This procedure generates an outline from the shared cursor identified by hash value and child number.

Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (
   hash_value    IN NUMBER,
   child_number  IN NUMBER,
   category      IN VARCHAR2 DEFAULT 'DEFAULT');
```

Parameters

Table 85–3 CREATE_OUTLINE Procedure Parameters

Parameter	Description
`hash_value`	Hash value identifying the target shared cursor.
`child_number`	Child number of the target shared cursor.
`category`	Category in which to create outline (optional).

DROP_BY_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the DEFAULT category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

Syntax

```
DBMS_OUTLN.DROP_BY_CAT (
   cat VARCHAR2);
```

Parameters

Table 85–4 DROP_BY_CAT Procedure Parameters

Parameter	Description
cat	Category of outlines to drop.

Usage Notes

This procedure purges a category of outlines in a single call.

Examples

This example drops all outlines in the DEFAULT category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

DROP_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

EXACT_TEXT_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

Syntax

```
DBMS.OUTLN.EXACT_TEXT_SIGNATURES;
```

Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

UPDATE_BY_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

Syntax

```
DBMS.OUTLN.UPDATE_BY_CAT (
   oldcat    VARCHAR2 default 'DEFAULT',
   newcat    VARCHAR2 default 'DEFAULT');
```

Parameters

Table 85–5 UPDATE_BY_CAT Procedure Parameters

Parameter	Description
`oldcat`	The current category of outlines.
`newcat`	The new category of outlines.

UPDATE_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

Syntax

```
DBMS.OUTLN.UPDATE_SIGNATURES;
```

Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

86

DBMS_OUTLN_EDIT

The DBMS_OUTLN_EDIT package is an invoker's rights package.

> **See Also:** For more information about using the DBMS_OUTLN_EDIT package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

This chapter contains the following topic:

- Summary of DBMS_OUTLN_EDIT Subprograms

Summary of DBMS_OUTLN_EDIT Subprograms

Table 86–1 DBMS_OUTLN_EDIT Package Subprograms

Subprogram	Description
CHANGE_JOIN_POS Procedure on page 86-3	Changes the join position for the hint identified by outline name and hint number to the position specified by `newpos`
CREATE_EDIT_TABLES Procedure on page 86-4	Creates outline editing tables in calling a user's schema
DROP_EDIT_TABLES Procedure on page 86-5	Drops outline editing tables in calling the user's schema
GENERATE_SIGNATURE Procedure on page 86-6	Generates a signature for the specified SQL text
REFRESH_PRIVATE_OUTLINE Procedure on page 86-7	Refreshes the in-memory copy of the outline, synchronizing its data with the edits made to the outline hints

CHANGE_JOIN_POS Procedure

This function changes the join position for the hint identified by outline name and hint number to the position specified by `newpos`.

Syntax

```
DBMS_OUTLN_EDIT.CHANGE_JOIN_POS (
   name     VARCHAR2
   hintno   NUMBER
   newpos   NUMBER);
```

Parameters

Table 86–2 CHANGE_JOIN_POS Procedure Parameters

Parameter	Description
`name`	Name of the private outline to be modified.
`hintno`	Hint number to be modified.
`newpos`	New join position for the target hint.

CREATE_EDIT_TABLES Procedure

This procedure creates outline editing tables in calling a user's schema.

Syntax

```
DBMS_OUTLN_EDIT.CREATE_EDIT_TABLES;
```

Usage Notes

Beginning with Oracle Database 10g Release 1 (10.1) you will not need to use this statement because the outline editing tables will already exist as temporary tables in the `SYSTEM` schema.

DROP_EDIT_TABLES Procedure

This procedure drops outline editing tables in calling the user's schema.

Syntax

```
DBMS_OUTLN_EDIT.DROP_EDIT_TABLES;
```

GENERATE_SIGNATURE Procedure

This procedure generates a signature for the specified SQL text.

Syntax

```
DBMS_OUTLN.GENERATE_SIGNATURE (
   sqltxt      IN   VARCHAR2,
   signature   OUT  RAW);
```

Parameters

Table 86–3 GENERATE_SIGNATURE Procedure Parameters

Parameter	Description
sqltxt	The specified SQL.
signature	The signature to be generated.

REFRESH_PRIVATE_OUTLINE Procedure

This procedure refreshes the in-memory copy of the outline, synchronizing its data with the edits made to the outline hints.

Syntax

```
DBMS_OUTLN_EDIT.REFRESH_PRIVATE_OUTLINE (
   name  IN  VARCHAR2);
```

Parameters

Table 86–4 REFRESH_PRIVATE_OUTLINE Procedure Parameters

Parameter	Description
name	Name of the private outline to be refreshed.

87

DBMS_OUTPUT

The DBMS_OUTPUT package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- Using DBMS_OUTPUT
  - Overview
  - Security Model
  - Operational Notes
  - Exceptions
  - Rules and Limits
  - Examples
- Data Structures
  - TABLE Types
  - OBJECT Types
- Summary of DBMS_OUTPUT Subprograms

Using DBMS_OUTPUT

This section contains topics which relate to using the `DBMS_OUTPUT` package.

- Overview
- Security Model
- Operational Notes
- Exceptions
- Rules and Limits
- Examples

Overview

The package is typically used for debugging, or for displaying messages and reports to SQL*DBA or SQL*Plus (such as are produced by applying the SQL command `DESCRIBE` to procedures).

The PUT Procedure and PUT_LINE Procedure in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the GET_LINE Procedure and GET_LINES Procedure.

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

Security Model

The `dbmsotpt.sql` script must be run as user `SYS`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

Operational Notes

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL*Plus, the buffered messages are ignored.
- SQL*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.
- Typing `SET SERVEROUTPUT ON` in SQL*Plus has the effect of invoking

  ```
  DBMS_OUTPUT.ENABLE (buffer_size => NULL);
  ```

  with no limit on the output.
- You should generally avoid having application code invoke either the DISABLE Procedure or ENABLE Procedure because this could subvert the attempt of an external tool like SQL*Plus to control whether or not to display output.

Note: Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

Exceptions

DBMS_OUTPUT subprograms raise the application error ORA-20000, and the output procedures can return the following errors:

Table 87–1 DBMS_OUTPUT Errors

Error	Description
ORU-10027:	Buffer overflow
ORU-10028:	Line length overflow

Rules and Limits

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

Examples

Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here:'||:new.col||' is the new value');
```

If you have enabled the DBMS_OUTPUT package, then the text produced by this PUT_LINE would be buffered, and you could, after executing the statement (presumably some INSERT, DELETE, or UPDATE that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
   DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to GET_LINE until status comes back as nonzero. For better performance, you should use calls to GET_LINES Procedure which can return an array of lines.

Example 2: Debugging Stored Procedures and Triggers

The DBMS_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in "Example 3: Retrieving Information About an Object" on page 87-9.

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the PUT_LINE procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
   CURSOR emp_cursor IS
      SELECT sal, comm FROM emp WHERE deptno = dnum;
   total_wages    NUMBER(11, 2) := 0;
   counter        NUMBER(10) := 1;
BEGIN

   FOR emp_record IN emp_cursor LOOP
      emp_record.comm := NVL(emp_record.comm, 0);
      total_wages := total_wages + emp_record.sal
         + emp_record.comm;
      DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
         '; Wages = '|| TO_CHAR(total_wages));    /* Debug line */
      counter := counter + 1; /* Increment debug counter */
   END LOOP;
   /* Debug line */
   DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
     TO_CHAR(total_wages));
   RETURN total_wages;

END dept_salary;
```

Assume the EMP table contains the following rows:

```
EMPNO          SAL     COMM     DEPT
-----        ------- -------- -------
1002           1500      500       20
1203           1000                30
1289           1000                10
```

```
1347          1000      250      20
```

Assume the user executes the following statements in SQL*Plus:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250

PL/SQL procedure successfully executed.
```

Example 3: Retrieving Information About an Object

In this example, the user has used the EXPLAIN PLAN command to retrieve information about the execution plan for a statement and has stored it in PLAN_TABLE. The user has also assigned a statement ID to this statement. The example EXPLAIN_OUT procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```
 /*****************************************************************/
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                 */
/*****************************************************************/
CREATE OR REPLACE PROCEDURE explain_out
   (statement_id IN VARCHAR2) AS

   -- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

   CURSOR explain_rows IS
      SELECT level, id, position, operation, options,
         object_name
      FROM plan_table
      WHERE statement_id = explain_out.statement_id
      CONNECT BY PRIOR id = parent_id
         AND statement_id = explain_out.statement_id
      START WITH id = 0
       ORDER BY id;

BEGIN

   -- Loop through information retrieved from PLAN_TABLE:

   FOR line IN explain_rows LOOP

      -- At start of output, include heading with estimated cost.

      IF line.id = 0 THEN
         DBMS_OUTPUT.PUT_LINE ('Plan for statement '
            || statement_id
            || ', estimated cost = ' || line.position);
      END IF;

      -- Output formatted information. LEVEL determines indention level.

      DBMS_OUTPUT.PUT_LINE (lpad(' ',2*(line.level-1)) ||
```

```
            line.operation || ' ' || line.options || ' ' ||
            line.object_name);
      END LOOP;

END;
```

See Also: Chapter 207, "UTL_FILE"

Data Structures

The DBMS_OUTPUT package declares 2 collection types for use with the GET_LINES Procedure.

TABLE Types

CHARARR Table Type

OBJECT Types

DBMSOUTPUT_LINESARRAY Object Type

CHARARR Table Type

This package type is to be used with the GET_LINES Procedure to obtain text submitted through the PUT Procedure and PUT_LINE Procedure.

Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

DBMSOUTPUT_LINESARRAY Object Type

This package type is to be used with the GET_LINES Procedure to obtain text submitted through the PUT Procedure and PUT_LINE Procedure.

Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS
     VARRAY(2147483647) OF VARCHAR2(32767);
```

Summary of DBMS_OUTPUT Subprograms

Table 87–2 DBMS_OUTPUT Package Subprograms

Subprogram	Description
DISABLE Procedure on page 87-15	Disables message output
ENABLE Procedure on page 87-16	Enables message output
GET_LINE Procedure on page 87-17	Retrieves one line from buffer
GET_LINES Procedure on page 87-18	Retrieves an array of lines from buffer
NEW_LINE Procedure on page 87-19	Terminates a line created with `PUT`
PUT Procedure on page 87-20	Places a line in the buffer
PUT_LINE Procedure on page 87-21	Places partial line in buffer

Note: The PUT Procedure that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

DISABLE Procedure

This procedure disables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`, and purges the buffer of any remaining information.

As with the ENABLE Procedure, you do not need to call this procedure if you are using the `SERVEROUTPUT` option of SQL*Plus.

Syntax

```
DBMS_OUTPUT.DISABLE;
```

Pragmas

```
pragma restrict_references(disable,WNDS,RNDS);
```

ENABLE Procedure

This procedure enables calls to PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. Calls to these procedures are ignored if the DBMS_OUTPUT package is not activated.

Syntax

```
DBMS_OUTPUT.ENABLE (
   buffer_size IN INTEGER DEFAULT 20000);
```

Pragmas

```
pragma restrict_references(enable,WNDS,RNDS);
```

Parameters

Table 87–3 ENABLE Procedure Parameters

Parameter	Description
buffer_size	Upper limit, in bytes, the amount of buffered information. Setting buffer_size to NULL specifies that there should be no limit.

Usage Notes

- It is not necessary to call this procedure when you use the SET SERVEROUTPUT option of SQL*Plus.
- If there are multiple calls to ENABLE, then buffer_size is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies buffer_size (NOT NULL).
- NULL is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

GET_LINE Procedure

This procedure retrieves a single line of buffered information.

Syntax

```
DBMS_OUTPUT.GET_LINE (
   line    OUT VARCHAR2,
   status  OUT INTEGER);
```

Parameters

Table 87–4 GET_LINE Procedure Parameters

Parameter	Description
`line`	Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as `VARCHAR2 (32767)` to avoid the risk of "`ORA-06502`: PL/SQL: numeric or value error: character string buffer too small".
`status`	If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

GET_LINES Procedure

This procedure retrieves an array of lines from the buffer.

Syntax

```
DBMS_OUTPUT.GET_LINES (
   lines       OUT     CHARARR,
   numlines    IN OUT  INTEGER);

DBMS_OUTPUT.GET_LINES (
   lines       OUT     DBMSOUTPUT_LINESARRAY,
   numlines    IN OUT INTEGER);
```

Parameters

Table 87–5 GET_LINES Procedure Parameters

Parameter	Description
`lines`	Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the `VARRAY` overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.
`numlines`	Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

NEW_LINE Procedure

This procedure puts an end-of-line marker. The GET_LINE Procedure and the GET_LINES Procedure return "lines" as delimited by "newlines". Every call to the PUT_LINE Procedure or NEW_LINE Procedure generates a line that is returned by `GET_LINE(S)`.

Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

PUT Procedure

This procedure places a partial line in the buffer.

> **Note:** The PUT procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT (
    item IN VARCHAR2);
```

Parameters

Table 87–6 PUT and PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 87–7 PUT and PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

  For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

PUT_LINE Procedure

This procedure places a line in the buffer.

> **Note:** The PUT_LINE procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT_LINE (
   item IN VARCHAR2);
```

Parameters

Table 87–8 PUT and PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 87–9 PUT and PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

  For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
   2 DBMS_OUTPUT.PUT_LINE ('hello');
   3 DBMS_LOCK.SLEEP (10);
   4 END;
```

DBMS_PCLXUTIL

The DBMS_PCLXUTIL package provides intra-partition parallelism for creating partition-wise local indexes. DBMS_PCLXUTIL circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one slave process for each partition is used.

> **See Also:** There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- Using DBMS_PCLXUTIL
  - Overview
  - Operational Notes
  - Rules and Limits
- Summary of DBMS_PCLXUTIL Subprograms

Using DBMS_PCLXUTIL

- Overview
- Operational Notes
- Rules and Limits

Overview

DBMS_PCLXUTIL uses the DBMS_JOB package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with DBMS_JOB), in combination with intra-partition parallelism using the parallel query slave processes.

DBMS_PCLXUTIL works with both range and range-hash composite partitioning.

The DBMS_PCLXUTIL package can be used during the following DBA tasks:

1. Local index creation

   The procedure BUILD_PART_INDEX assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the UNUSABLE option.

   ```
   CREATE INDEX <idx_name> on <tab_name>(...) local(...) unusable;
   ```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure BUILD_PART_INDEX causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

2. Local index maintenance

   By marking desired partitions usable or unusable, the BUILD_PART_INDEX procedure also enables selective rebuilding of local indexes. The force_opt parameter provides a way to override this and build local indexes for all partitions.

   ```
   ALTER INDEX <idx_name> local(...) unusable;
   ```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using force_opt = TRUE:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the DBMS_OUTPUT package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

Operational Notes

DBMS_PCLXUTIL submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the INIT.ORA parameter JOB_QUEUE_PROCESSES correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

Rules and Limits

> **Note:** For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8*i*.

Because DBMS_PCLXUTIL uses the DBMS_JOB package, you must be aware of the following limitations pertaining to DBMS_JOB:

- You must decide appropriate values for the job_queue_processes initialization parameter. Clearly, if the job processes are not started before calling BUILD_PART_INDEX(), then the package will not function properly. The background processes are specified by the following init.ora parameters:

  ```
  job_queue_processes=n   #the number of background processes = n
  ```

- Failure conditions are reported only in the trace files (a DBMS_JOB limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the j*.trc trace files.

Summary of DBMS_PCLXUTIL Subprograms

Table 88–1 DBMS_PCLXUTIL Package Subprograms

Subprogram	Description
BUILD_PART_INDEX Procedure on page 88-7	Provides intra-partition parallelism for creating partition-wise local indexes

BUILD_PART_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (
   jobs_per_batch  IN NUMBER   DEFAULT 1,
   procs_per_job   IN NUMBER   DEFAULT 1,
   tab_name        IN VARCHAR2 DEFAULT NULL,
   idx_name        IN VARCHAR2 DEFAULT NULL,
   force_opt       IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 88–2 BUILD_PART_INDEX Procedure Parameters

Parameter	Description
jobs_per_batch	The number of concurrent partition-wise "local index builds".
procs_per_job	The number of parallel query slaves to be utilized for each local index build (1 <= procs_per_job <= max_slaves).
tab_name	The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).
idx_name	The name given to the local index (an exception is raised if a local index is not created on the table tab_name).
force_opt	If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.

Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD_PART_INDEX(2,4,'PROJECT','IDX',TRUE) produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);
Statement processed.
INFO: Job #21 created for partition PROJ002 with 4 slaves
INFO: Job #22 created for partition PROJ001 with 4 slaves
```

DBMS_PIPE

The DBMS_PIPE package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

- Using DBMS_PIPE
  - Overview
  - Security Model
  - Constants
  - Operational Notes
  - Exceptions

Using DBMS_PIPE

- Overview
- Security Model
- Constants
- Operational Notes
- Exceptions
- Examples

Overview

Pipe functionality has several potential applications:

- External service interface: You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- Independent transactions: The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- Alerters (non-transactional): You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "`SELECT FOR UPDATE`" to make sure it read the correct data.
- Debugging: Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- Concentrator: This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either Public Pipes or Private Pipes.

Constants

```
maxwait   constant integer := 86400000; /* 1000 days */
```

This is the maximum time to wait attempting to send or receive a message.

Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

> **Caution: Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.**

The operation of DBMS_PIPE is considered with regard to the following topics:

- Public Pipes
- Writing and Reading Pipes
- Private Pipes

Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the `CREATE_PIPE` function with the `private` flag set to `FALSE`. You must deallocate explicitly-created pipes by calling the `REMOVE_PIPE` function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

Writing and Reading Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have `EXECUTE` permission on the `DBMS_PIPE` package, and they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the `PACK_MESSAGE` procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the `SEND_MESSAGE` function, designating the pipe name to be used to send the message. When `SEND_MESSAGE` is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the `RECEIVE_MESSAGE` function, designating the pipe name from which to receive the message. The process then calls the `UNPACK_MESSAGE` procedure to access each of the items in the message.

Private Pipes

You explicitly create a private pipe by calling the `CREATE_PIPE` function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the `REMOVE_PIPE` function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, CREATE_PIPE returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as SYSDBA

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to PACK_MESSAGE before calling SEND_MESSAGE. Similarly, you must call RECEIVE_MESSAGE to retrieve the message before accessing the items in the message by calling UNPACK_MESSAGE.

Exceptions

DBMS_PIPE package subprograms can return the following errors:

Table 89–1 DBMS_PIPE Errors

Error	Description
ORA-23321:	Pipename may not be null. This can be returned by the CREATE_PIPE function, or any subprogram that takes a pipe name as a parameter.
ORA-23322:	Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.

Examples

- Example 1: Debugging - PL/SQL
- Example 3: Execute System Commands
- Example 4: External Service Interface

Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status  NUMBER;
BEGIN
  DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
  DBMS_PIPE.PACK_MESSAGE(msg);
  status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
  IF status != 0 THEN
    raise_application_error(-20099, 'Debug error');
  END IF;
END debug;
```

Example 2: Debugging - Pro*C

The following Pro*C code receives messages from the PLSQL_DEBUG pipe in the previous example, and displays the messages. If the Pro*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
   VARCHAR username[20];
   int     status;
   int     msg_length;
   char    retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{

-- Prepare username:
   strcpy(username.arr, "SCOTT/TIGER");
   username.len = strlen(username.arr);

   EXEC SQL WHENEVER SQLERROR DO sql_error();
   EXEC SQL CONNECT :username;

   printf("connected\n");

-- Start an endless loop to look for and print messages on the pipe:
   FOR (;;)
```

```
   {
      EXEC SQL EXECUTE
         DECLARE
            len INTEGER;
            typ INTEGER;
            sta INTEGER;
            chr VARCHAR2(2000);
         BEGIN
            chr := '';
            sta := dbms_pipe.receive_message('plsql_debug');
            IF sta = 0 THEN
               DBMS_PIPE.UNPACK_MESSAGE(len);
               DBMS_PIPE.UNPACK_MESSAGE(chr);
            END IF;
            :status := sta;
            :retval := chr;
            IF len IS NOT NULL THEN
               :msg_length := len;
            ELSE
               :msg_length := 2000;
            END IF;
         END;
      END-EXEC;
      IF (status == 0)
         printf("\n%.*s\n", msg_length, retval);
      ELSE
         printf("abnormal status, value is %d\n", status);
   }
}

void sql_error()
{
   char msg[1024];
   int rlen, len;
   len = sizeof(msg);
   sqlglm(msg, &len, &rlen);
   printf("ORACLE ERROR\n");
   printf("%.*s\n", rlen, msg);
   exit(1);
}
```

Example 3: Execute System Commands

This example shows PL/SQL and Pro*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro*C program that is listening for them.

The Pro*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro*C program processes it, carrying out the required action, such as executing a UNIX command through the *system*() call or executing a SQL command using embedded SQL.

`DAEMON.SQL` is the source code for the PL/SQL package. This package contains procedures that use the `DBMS_PIPE` package to send and receive message to and from the Pro*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the `STOP` command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL*Plus or Enterprise Manager. For example:

```
SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');
```

On a UNIX system, this causes the Pro*C daemon to execute the command *system*("*ls -la*").

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL DAEMON package:

```
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                       timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
  RETURN NUMBER IS

    status       NUMBER;
    result       VARCHAR2(20);
    command_code NUMBER;
    pipe_name    VARCHAR2(30);
  BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SYSTEM');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20010,
        'Execute_system: Error while sending.  Status = ' ||
         status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20011,
        'Execute_system: Error while receiving.
         Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
```

```
    RAISE_APPLICATION_ERROR(-20012,
      'Execute_system: Done not received.');
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(command_code);
  DBMS_OUTPUT.PUT_LINE('System command executed.  result = ' ||
                       command_code);
  RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
                     timeout NUMBER DEFAULT 10)
RETURN NUMBER IS

  status       NUMBER;
  result       VARCHAR2(20);
  command_code NUMBER;
  pipe_name    VARCHAR2(30);

BEGIN
  pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

  DBMS_PIPE.PACK_MESSAGE('SQL');
  DBMS_PIPE.PACK_MESSAGE(pipe_name);
  DBMS_PIPE.PACK_MESSAGE(command);
  status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20020,
      'Execute_sql: Error while sending.  Status = ' || status);
  END IF;

  status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);

  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20021,
      'execute_sql: Error while receiving.
       Status = ' || status);
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(result);
  IF result <> 'done' THEN
    RAISE_APPLICATION_ERROR(-20022,
      'execute_sql: done not received.');
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(command_code);
  DBMS_OUTPUT.PUT_LINE
      ('SQL command executed.  sqlcode = ' || command_code);
  RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
  status NUMBER;
BEGIN
  DBMS_PIPE.PACK_MESSAGE('STOP');
  status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20030,
      'stop: error while sending.  status = ' || status);
  END IF;
```

```
  END stop;
END daemon;
```

daemon.pc Example. This is the code for the Pro*C daemon. You must precompile this using the Pro*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.

> **Note:** To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=scott/tiger sqlcheck=semantics
```

Then C-compile and link in the normal way.

```
#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
  char *uid = "scott/tiger";
  int status;
  VARCHAR command[20];
  VARCHAR value[2000];
  VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
  char msg_buffer[512];
  int msg_length;
  int buffer_size = 512;

  EXEC SQL WHENEVER SQLERROR CONTINUE;
  sqlglm(msg_buffer, &buffer_size, &msg_length);
  printf("Daemon error while connecting:\n");
  printf("%.*s\n", msg_length, msg_buffer);
  printf("Daemon quitting.\n");
  exit(1);
}

void
sql_error()
{
  char msg_buffer[512];
  int msg_length;
  int buffer_size = 512;

  EXEC SQL WHENEVER SQLERROR CONTINUE;
  sqlglm(msg_buffer, &buffer_size, &msg_length);
  printf("Daemon error while executing:\n");
  printf("%.*s\n", msg_length, msg_buffer);
  printf("Daemon continuing.\n");
}
main()
{
command.len = 20; /*initialize length components*/
```

```
value.len = 2000;
return_name.len  = 30;
  EXEC SQL WHENEVER SQLERROR DO connect_error();
  EXEC SQL CONNECT :uid;
  printf("Daemon connected.\n");

  EXEC SQL WHENEVER SQLERROR DO sql_error();
  printf("Daemon waiting...\n");
  while (1) {
    EXEC SQL EXECUTE
      BEGIN
        :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
        IF :status = 0 THEN
          DBMS_PIPE.UNPACK_MESSAGE(:command);
        END IF;
      END;
    END-EXEC;
    IF (status == 0)
    {
      command.arr[command.len] = '\0';
      IF (!strcmp((char *) command.arr, "STOP"))
      {
        printf("Daemon exiting.\n");
        break;
      }

      ELSE IF (!strcmp((char *) command.arr, "SYSTEM"))
      {
        EXEC SQL EXECUTE
          BEGIN
            DBMS_PIPE.UNPACK_MESSAGE(:return_name);
            DBMS_PIPE.UNPACK_MESSAGE(:value);
          END;
        END-EXEC;
        value.arr[value.len] = '\0';
        printf("Will execute system command '%s'\n", value.arr);

        status = system(value.arr);
        EXEC SQL EXECUTE
          BEGIN
            DBMS_PIPE.PACK_MESSAGE('done');
            DBMS_PIPE.PACK_MESSAGE(:status);
            :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
          END;
        END-EXEC;

        IF (status)
        {
          printf
           ("Daemon error while responding to system command.");
          printf("  status: %d\n", status);
        }
      }
      ELSE IF (!strcmp((char *) command.arr, "SQL")) {
        EXEC SQL EXECUTE
          BEGIN
            DBMS_PIPE.UNPACK_MESSAGE(:return_name);
            DBMS_PIPE.UNPACK_MESSAGE(:value);
          END;
        END-EXEC;
```

```
      value.arr[value.len] = '\0';
      printf("Will execute sql command '%s'\n", value.arr);

      EXEC SQL WHENEVER SQLERROR CONTINUE;
      EXEC SQL EXECUTE IMMEDIATE :value;
      status = sqlca.sqlcode;

      EXEC SQL WHENEVER SQLERROR DO sql_error();
      EXEC SQL EXECUTE
        BEGIN
          DBMS_PIPE.PACK_MESSAGE('done');
          DBMS_PIPE.PACK_MESSAGE(:status);
          :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
        END;
      END-EXEC;

      IF (status)
      {
        printf("Daemon error while responding to sql command.");
        printf("  status: %d\n", status);
      }
    }
    ELSE
    {
      printf
        ("Daemon error: invalid command '%s' received.\n",
          command.arr);
    }
  }
  ELSE
  {
    printf("Daemon error while waiting for signal.");
    printf("  status = %d\n", status);
  }
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);
```

Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

```
protocol_version      VARCHAR2        - '1', 10 bytes or less
returnpipe            VARCHAR2        - 30 bytes or less
service               VARCHAR2        - 30 bytes or less
arg1                  VARCHAR2/NUMBER/DATE
   ...
argn                  VARCHAR2/NUMBER/DATE
```

The recommended format for returning the result is:

```
success               VARCHAR2        - 'SUCCESS' if OK,
                                        otherwise error message
arg1                  VARCHAR2/NUMBER/DATE
   ...
```

```
  argn                  VARCHAR2/NUMBER/DATE
```

The "stock price request server" would do, using OCI or PRO* (in pseudo-code):

```
<loop forever>
  BEGIN dbms_stock_server.get_request(:stocksymbol); END;
  <figure out price based on stocksymbol (probably from some radio
        signal), set error if can't find such a stock>
  BEGIN dbms_stock_server.return_price(:error, :price); END;
```

A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```
CREATE OR REPLACE PACKAGE dbms_stock_server IS
  PROCEDURE get_request(symbol OUT VARCHAR2);
  PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
  returnpipe    VARCHAR2(30);

  PROCEDURE returnerror(reason VARCHAR2) IS
    s INTEGER;
  BEGIN
    dbms_pipe.pack_message(reason);
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:' || to_char(s) ||
        ' sending on pipe');
    END IF;
  END;

  PROCEDURE get_request(symbol OUT VARCHAR2) IS
    protocol_version VARCHAR2(10);
    s                INTEGER;
    service          VARCHAR2(30);
  BEGIN
    s := dbms_pipe.receive_message('stock_service');
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:' || to_char(s) ||
        'reading pipe');
    END IF;
    dbms_pipe.unpack_message(protocol_version);
    IF protocol_version <> '1' THEN
      raise_application_error(-20000, 'Bad protocol: ' ||
        protocol_version);
    END IF;
    dbms_pipe.unpack_message(returnpipe);
    dbms_pipe.unpack_message(service);
    IF service != 'getprice' THEN
      returnerror('Service ' || service || ' not supported');
    END IF;
    dbms_pipe.unpack_message(symbol);
  END;

  PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
    s INTEGER;
```

```
  BEGIN
    IF errormsg is NULL THEN
      dbms_pipe.pack_message('SUCCESS');
      dbms_pipe.pack_message(price);
    ELSE
      dbms_pipe.pack_message(errormsg);
    END IF;
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:'||to_char(s)||
        ' sending on pipe');
    END IF;
  END;
END;
```

The procedure called by the client is:

```
CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
    RETURN VARCHAR2 IS
  s        INTEGER;
  price    VARCHAR2(20);
  errormsg VARCHAR2(512);
BEGIN
  dbms_pipe.pack_message('1');  -- protocol version
  dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
  dbms_pipe.pack_message('getprice');
  dbms_pipe.pack_message(symbol);
  s := dbms_pipe.send_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
      ' sending on pipe');
  END IF;
  s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
      ' receiving on pipe');
  END IF;
  dbms_pipe.unpack_message(errormsg);
  IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
  END IF;
  dbms_pipe.unpack_message(price);
  RETURN price;
END;
```

You would typically only `GRANT EXECUTE` on `DBMS_STOCK_SERVICE` to the stock service application server, and would only `GRANT EXECUTE` on `stock_request` to those users allowed to use the service.

Summary of DBMS_PIPE Subprograms

Table 89–2 DBMS_PIPE Package Subprograms

Subprogram	Description
CREATE_PIPE Function on page 89-19	Creates a pipe (necessary for private pipes)
NEXT_ITEM_TYPE Function on page 89-21	Returns datatype of next item in buffer
PACK_MESSAGE Procedures on page 89-22	Builds message in local buffer
PURGE Procedure on page 89-24	Purges contents of named pipe
RECEIVE_MESSAGE Function on page 89-25	Copies message from named pipe into local buffer
REMOVE_PIPE Function on page 89-28	Removes the named pipe
RESET_BUFFER Procedure on page 89-27	Purges contents of local buffer
SEND_MESSAGE Function on page 89-29	Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist
UNIQUE_SESSION_NAME Function on page 89-31	Returns unique session name
UNPACK_MESSAGE Procedures on page 89-32	Accesses next item in buffer

CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

Syntax

```
DBMS_PIPE.CREATE_PIPE (
   pipename     IN VARCHAR2,
   maxpipesize  IN INTEGER DEFAULT 8192,
   private      IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

Parameters

Table 89–3 CREATE_PIPE Function Parameters

Parameter	Description
`pipename`	Name of the pipe you are creating. You must use this name when you call `SEND_MESSAGE` and `RECEIVE_MESSAGE`. This name must be unique across the instance. Caution: Do not use pipe names beginning with `ORA$`. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.
`maxpipesize`	The maximum size allowed for the pipe, in bytes. The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default `maxpipesize` is 8192 bytes. The `maxpipesize` for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of `SEND_MESSAGE` with larger values cause the `maxpipesize` to be increased. Callers with a smaller value use the existing, larger value.
`private`	Uses the default, `TRUE`, to create a private pipe. Public pipes can be implicitly created when you call `SEND_MESSAGE`.

Return Values

Table 89–4 CREATE_PIPE Function Return Values

Return	Description
0	Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
ORA-23322	Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 89–5 CREATE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

NEXT_ITEM_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call NEXT_ITEM_TYPE.

Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

Return Values

Table 89–6 NEXT_ITEM_TYPE Function Return Values

Return	Description
0	No more items
6	NUMBER
9	VARCHAR2
11	ROWID
12	DATE
23	RAW

PACK_MESSAGE Procedures

This procedure builds your message in the local message buffer. To send a message, first make one or more calls to PACK_MESSAGE. Then, call SEND_MESSAGE to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type VARCHAR2, NCHAR, NUMBER, DATE., RAW and ROWID items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message.The overhead for all types other than VARCHAR is 4 bytes.

Syntax

```
DBMS_PIPE.PACK_MESSAGE (
   item  IN  VARCHAR2);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  NCHAR);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  NUMBER);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  DATE);

DBMS_PIPE.PACK_MESSAGE_RAW (
   item  IN  RAW);

DBMS_PIPE.PACK_MESSAGE_ROWID (
   item  IN  ROWID);
```

Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

Parameters

Table 89–7 PACK_MESSAGE Procedure Parameters

Parameter	Description
item	Item to pack into the local message buffer.

Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call SEND_MESSAGE to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling PURGE lets you free the memory associated with an implicitly-created pipe.

Syntax

```
DBMS_PIPE.PURGE (
   pipename  IN  VARCHAR2);
```

Pragmas

```
pragma restrict_references(purge,WNDS,RNDS);
```

Parameters

Table 89–8 PURGE Procedure Parameters

Parameter	Description
pipename	Name of pipe from which to remove all messages. The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive.

Usage Notes

Because PURGE calls RECEIVE_MESSAGE, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an ORA-23322 (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

Exceptions

Permission error if pipe belongs to another user.

RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
   pipename     IN VARCHAR2,
   timeout      IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(receive_message,WNDS,RNDS);
```

Parameters

Table 89–9 RECEIVE_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to receive a message. Names beginning with ORA$ are reserved for use by Oracle
timeout	Time to wait for a message, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking.

Return Values

Table 89–10 RECEIVE_MESSAGE Function Return Values

Return	Description
0	Success
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer. (This should not happen.)
3	An interrupt occurred.
ORA-23322	User has insufficient privileges to read from the pipe.

Usage Notes

To receive a message from a pipe, first call RECEIVE_MESSAGE. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call RECEIVE_MESSAGE does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to UNPACK_MESSAGE to access the individual items in the message. The UNPACK_MESSAGE procedure is

overloaded to unpack items of type DATE, NUMBER, VARCHAR2, and there are two additional procedures to unpack RAW and ROWID items. If you do not know the type of data that you are attempting to unpack, then call NEXT_ITEM_TYPE to determine the type of the next item in the buffer.

Exceptions

Table 89–11 RECEIVE_MESSAGE Function Exceptions

Exception	Description
Null pipe name	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

RESET_BUFFER Procedure

This procedure resets the PACK_MESSAGE and UNPACK_MESSAGE positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

Syntax

```
DBMS_PIPE.RESET_BUFFER;
```

Pragmas

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

REMOVE_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by SEND_MESSAGE are automatically removed when empty. However, pipes created explicitly by CREATE_PIPE are removed only by calling REMOVE_PIPE, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling PURGE on an implicitly-created pipe.

Syntax

```
DBMS_PIPE.REMOVE_PIPE (
   pipename  IN  VARCHAR2)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

Parameters

Table 89–12 REMOVE_PIPE Function Parameters

Parameter	Description
pipename	Name of pipe that you want to remove.

Return Values

Table 89–13 REMOVE_PIPE Function Return Values

Return	Description
0	Success If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.
ORA-23322	Insufficient privileges. If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.

Exceptions

Table 89–14 REMOVE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.

SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to PACK_MESSAGE. You can create a pipe explicitly using CREATE_PIPE, otherwise, it is created implicitly.

Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename     IN VARCHAR2,
    timeout      IN INTEGER DEFAULT MAXWAIT,
    maxpipesize  IN INTEGER DEFAULT 8192)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(send_message,WNDS,RNDS);
```

Parameters

Table 89–15 SEND_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to place the message. If you are using an explicit pipe, then this is the name that you specified when you called CREATE_PIPE. Caution: Do not use pipe names beginning with 'ORA$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.
timeout	Time to wait while attempting to place a message on a pipe, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days).
maxpipesize	Maximum size allowed for the pipe, in bytes. The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value simply use the existing, larger value. Specifying maxpipesize as part of the SEND_MESSAGE procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional maxpipesize parameter to override the creation pipe size specifications.

Return Values

Table 89–16 SEND_MESSAGE Function Return Values

Return	Description
0	Success. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
1	Timed out. This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.
3	An interrupt occurred. If the pipe was implicitly created and is empty, then it is removed.
ORA-23322	Insufficient privileges. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 89–17 SEND_MESSAGE Function Exception

Exception	Description
Null pipe name	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

UNIQUE_SESSION_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the `PIPENAME` parameter for your `SEND_MESSAGE` and `RECEIVE_MESSAGE` calls.

Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

UNPACK_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call UNPACK_MESSAGE.

> **Note:** The UNPACK_MESSAGE procedure is overloaded to return items of type VARCHAR2, NCHAR, NUMBER, or DATE. There are two additional procedures to unpack RAW and ROWID items.

Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT VARCHAR2);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT NCHAR);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT NUMBER);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT DATE);

DBMS_PIPE.UNPACK_MESSAGE_RAW (
   item  OUT RAW);

DBMS_PIPE.UNPACK_MESSAGE_ROWID (
   item  OUT ROWID);
```

Pragmas

```
pragma restrict_references(unpack_message,WNDS,RNDS);
pragma restrict_references(unpack_message_raw,WNDS,RNDS);
pragma restrict_references(unpack_message_rowid,WNDS,RNDS);
```

Parameters

Table 89–18 UNPACK_MESSAGE Procedure Parameters

Parameter	Description
item	Argument to receive the next unpacked item from the local message buffer.

Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

90

DBMS_PREDICTIVE_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining.

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

> **See Also:** *Oracle Data Mining Concepts* for an overview of Oracle predictive analytics, including information about the Oracle Spreadsheet Add-In for Predictive Analytics.

This chapter contains the following topics:

- Using DBMS_PREDICTIVE_ANALYTICS
  - Overview
- Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

Using DBMS_PREDICTIVE_ANALYTICS

This section contains topics that relate to using the `DBMS_PREDICTIVE_ANALYTICS` package.

- Overview

Overview

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

`DBMS_PREDICTIVE_ANALYTICS` automates parts of step 3 — 5 of this process.

Predictive analytics procedures analyze and prepare the input data, create and test mining models using the input data, and then use the input data for scoring. The results of scoring are returned to the user. The models and supporting objects are not preserved after the operation completes.

Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

Table 90–1 DBMS_PREDICTIVE_ANALYTICS Package Subprograms

Subprogram	Purpose
EXPLAIN Procedure on page 90-5	Ranks attributes in order of influence in explaining a target column.
PREDICT Procedure on page 90-7	Predicts the value of a target column based on values in the input data.
PROFILE Procedure on page 90-9	Generates rules that identify the records that have the same target value.

EXPLAIN Procedure

The EXPLAIN procedure identifies the attributes that are important in explaining the variation in values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train a model that calculates the attribute importance.

> **Note:** EXPLAIN supports DATE and TIMESTAMP data types in addition to the numeric, character, and nested data types supported by Oracle Data Mining models.
>
> Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide.*

The EXPLAIN procedure creates a result table that lists the attributes in order of their explanatory power. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (
     data_table_name     IN VARCHAR2,
     explain_column_name IN VARCHAR2,
     result_table_name   IN VARCHAR2,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 90–2 EXPLAIN Procedure Parameters

Parameter	Description
data_table_name	Name of input table or view
explain_column_name	Name of the column to be explained
result_table_name	Name of the table where results are saved
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The EXPLAIN procedure creates a result table with the columns described in Table 90–3.

Table 90–3 EXPLAIN Procedure Result Table

Column Name	Data Type	Description
ATTRIBUTE_NAME	VARCHAR2(30)	Name of a column in the input data; all columns except the explained column are listed in the result table.
EXPLANATORY_VALUE	NUMBER	Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1. An individual column's explanatory value is independent of other columns in the input table. The values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column. An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for PREDICT. In practice, an explanatory power equal to 1 is rarely returned.
RANK	NUMBER	Ranking of explanatory power. Rows with equal values for explanatory_value have the same rank. Rank values are not skipped in the event of ties.

Example

The following example performs an EXPLAIN operation on the SUPPLEMENTARY_DEMOGRAPHICS table of Sales History.

```
--Perform EXPLAIN operation
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
        data_table_name      => 'supplementary_demographics',
        explain_column_name  => 'home_theater_package',
        result_table_name    => 'demographics_explain_result');
END;
/
--Display results
SELECT * FROM demographics_explain_result;

ATTRIBUTE_NAME                          EXPLANATORY_VALUE       RANK
--------------------------------------- ----------------- ----------
Y_BOX_GAMES                                    .524311073          1
YRS_RESIDENCE                                  .495987246          2
HOUSEHOLD_SIZE                                 .146208506          3
AFFINITY_CARD                                    .0598227          4
EDUCATION                                      .018462703          5
OCCUPATION                                     .009721543          6
FLAT_PANEL_MONITOR                              .00013733          7
PRINTER_SUPPLIES                                       0          8
OS_DOC_SET_KANJI                                       0          8
BULK_PACK_DISKETTES                                    0          8
BOOKKEEPING_APPLICATION                                0          8
COMMENTS                                               0          8
CUST_ID                                                0          8
```

The results show that Y_BOX_GAMES, YRS_RESiDENCE, and HOUSEHOLD_SIZE are the best predictors of HOME_THEATER_PACKAGE.

PREDICT Procedure

The PREDICT procedure predicts the values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train and test a model that makes the predictions.

> **Note:** PREDICT supports DATE and TIMESTAMP data types in addition to the numeric, character, and nested data types supported by Oracle Data Mining models.
>
> Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide.*

The PREDICT procedure creates a result table that contains a predicted target value for every record. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
    accuracy                OUT NUMBER,
    data_table_name         IN VARCHAR2,
    case_id_column_name     IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 90–4 PREDICT Procedure Parameters

Parameter	Description
accuracy	Output parameter that returns the predictive confidence, a measure of the accuracy of the predicted values. The predictive confidence for a categorical target is the most common target value; the predictive confidence for a numerical target is the mean.
data_table_name	Name of the input table or view.
case_id_column_name	Name of the column that uniquely identifies each case (record) in the input data.
target_column_name	Name of the column to predict.
result_table_name	Name of the table where results will be saved.
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The PREDICT procedure creates a result table with the columns described in Table 90–5.

Table 90–5 PREDICT Procedure Result Table

Column Name	Data Type	Description
Case ID column name	VARCHAR2 or NUMBER	The name of the case ID column in the input data.
PREDICTION	VARCHAR2 or NUMBER	The predicted value of the target column for the given case.
PROBABILITY	NUMBER	For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains NULL.

Predictions are returned for all cases whether or not they contained target values in the input.

Predicted values for known cases may be interesting in some situations. For example, you could perform deviation analysis to compare predicted values and actual values.

Example

The following example performs a PREDICT operation and displays the first 10 predictions. The results show an accuracy of 79% in predicting whether each customer has an affinity card.

```
--Perform PREDICT operation
DECLARE
    v_accuracy NUMBER(10,9);
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PREDICT(
        accuracy             => v_accuracy,
        data_table_name      => 'supplementary_demographics',
        case_id_column_name  => 'cust_id',
        target_column_name   => 'affinity_card',
        result_table_name    => 'pa_demographics_predict_result');
    DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/

Accuracy = .788696903

--Display results
SELECT * FROM pa_demographics_predict_result WHERE rownum < 10;

   CUST_ID PREDICTION PROBABILITY
---------- ---------- -----------
    101501          1  .834069848
    101502          0  .991269965
    101503          0   .99978311
    101504          1  .971643388
    101505          1  .541754127
    101506          0  .803719133
    101507          0  .999999303
    101508          0  .999999987
    101509          0  .999953074
```

PROFILE Procedure

The PROFILE procedure generates rules that describe the cases (records) from the input data. For example, if a target column CHURN has values 'Yes' and 'No', PROFILE generates a set of rules describing the expected outcomes. Each profile includes a rule, record count, and a score distribution.

The input data must contain some cases where the target value is known (not NULL). These cases are used by the procedure to build a model that calculates the rules.

> **Note:** PROFILE does not support nested types or dates.
>
> Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide.*

The PROFILE procedure creates a result table that specifies rules (profiles) and their corresponding target values. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PROFILE (
     data_table_name           IN VARCHAR2,
     target_column_name        IN VARCHAR2,
     result_table_name         IN VARCHAR2,
     data_schema_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 90–6 PROFILE Procedure Parameters

Parameter	Description
data_table_name	Name of the table containing the data to be analyzed.
target_column_name	Name of the target column.
result_table_name	Name of the table where the results will be saved.
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The PROFILE procedure creates a result table with the columns described in Table 90–7.

Table 90–7 PROFILE Procedure Result Table

Column Name	Data Type	Description
PROFILE_ID	NUMBER	A unique identifier for this profile (rule).
RECORD_COUNT	NUMBER	The number of records described by the profile.
DESCRIPTION	SYS.XMLTYPE	The profile rule. See "XML Schema for Profile Rules".

XML Schema for Profile Rules

The DESCRIPTION column of the result table contains XML that conforms to the following XSD:

```
<xs:element name="SimpleRule">
  <xs:complexType>
    <xs:sequence>
      <xs:group ref="PREDICATE"/>
      <xs:element ref="ScoreDistribution" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="id" type="xs:string" use="optional"/>
    <xs:attribute name="score" type="xs:string" use="required"/>
    <xs:attribute name="recordCount" type="NUMBER" use="optional"/>
  </xs:complexType>
</xs:element>
```

Example

This example generates a rule describing customers who are likely to use an affinity card (target value is 1) and a set of rules describing customers who are not likely to use an affinity card (target value is 0). The rules are based on only two predictors: education and occupation.

```
SET serveroutput ON
SET trimspool ON
SET pages 10000
SET long 10000
SET pagesize 10000
SET linesize 150
CREATE VIEW cust_edu_occ_view AS
              SELECT cust_id, education, occupation, affinity_card
              FROM sh.supplementary_demographics;
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PROFILE(
         DATA_TABLE_NAME    => 'cust_edu_occ_view',
         TARGET_COLUMN_NAME => 'affinity_card',
         RESULT_TABLE_NAME  => 'profile_result');
END;
/
EXEC dbms_xdb_print.setPrintMode(dbms_xdb_print.PRINT_PRETTY, 2);
```

This example generates eight rules in the result table `profile_result`. Seven of the rules suggest a target value of 0; one rule suggests a target value of 1. The `score` attribute on a rule identifies the target value.

This `SELECT` statement returns all the rules in the result table.

```
SELECT a.profile_id, a.record_count, a.description.getstringval()
 FROM profile_result a;
```

This `SELECT` statement returns the rules for a target value of 0.

```
SELECT *
  FROM profile_result t
  WHERE extractvalue(t.description, '/SimpleRule/@score') = 0;
```

To obtain more readable output, you can cut and paste the XML for a rule into a text file, save it with the .xml extension, and view the rule in a browser. The eight rules generated by this example are displayed as follows.

```
<SimpleRule id="1" score="0" recordCount="443">

DBMS_PREPROCESSOR

The DBMS_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics

- Using DBMS_PREPROCESSOR
  - Overview
  - Operating Notes
- Data Structures
  - Table Types
- Summary of DBMS_PREPROCESSOR Subprograms

Using DBMS_PREPROCESSOR

- Overview
- Operating Notes

Overview

There are three styles of subprograms.

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a `VARCHAR2` string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a `VARCHAR2` index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is `VALID` and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single `VARCHAR2` string in the second style, or as a `VARCHAR2` index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the `VARCHAR2` length limit.

Operating Notes

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be VALID. Likewise, the source text passed in as a VARCHAR2 string or a VARCHAR2 index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.
- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as CREATE OR REPLACE. In general, the input source should be syntactically prepared in a way as if it were obtained from the ALL_SOURCE view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

  ```
  anonymous block   (BEGIN | DECLARE) ...
  package           PACKAGE <name> ...
  package body      PACKAGE BODY <name> ...
  procedure         PROCEDURE <name> ...
  function          FUNCTION <name> ...
  type              TYPE <name> ...
  type body         TYPE BODY <name> ...
  trigger           (BEGIN | DECLARE) ...
  ```

  If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.
- If the text of a wrapped PL/SQL unit is obtained from the ALL_SOURCE view, the keyword WRAPPED always immediately follows the name of the unit, as in this example:

  ```
  PROCEDURE "some proc" WRAPPED
  a000000
  b2
  ...
  ```

  If such source text is presented to one of the GET_POST_PROCESSED_SOURCE Functions or to one of the PRINT_POST_PROCESSED_SOURCE Procedures, the exception DBMS_PREPROCESSOR.WRAPPED_INPUT is raised.

Data Structures

The DBMS_PREPROCESSOR package defines a TABLE type.

Table Types

SOURCE_LINES_T Table Type

SOURCE_LINES_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

Syntax

```
TYPE source_lines_t IS
    TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_PREPROCESSOR Subprograms

Table 91–1 DBMS_PREPROCESSOR Package Subprograms

Subprogram	Description
GET_POST_PROCESSED_SOURCE Functions on page 91-8	Returns the post-processed source text
PRINT_POST_PROCESSED_SOURCE Procedures on page 91-10	Prints post-processed source text

GET_POST_PROCESSED_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   object_type    VARCHAR2,
   schema_name    VARCHAR2,
   object_name    VARCHAR2);
  RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   source        VARCHAR2);
  RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   source        source_lines_t);
  RETURN source_lines_t;
```

Parameters

Table 91–2 GET_POST_PROCESSED_SOURCE Function Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object.The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

Return Values

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

Exceptions

Table 91–3 GET_POST_PROCESSED_SOURCE Function Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.
ORA-06502	Numeric or value error: ■ Character string buffer too small ■ A line is too long (> 32767 bytes)

PRINT_POST_PROCESSED_SOURCE Procedures

This overloaded procedure calls DBMS_OUTPUT.PUT_LINE to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   object_type    VARCHAR2,
   schema_name    VARCHAR2,
   object_name    VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   source        VARCHAR2);
```

Prints post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   source        source_lines_t);
```

Parameters

Table 91–4 PRINT_POST_PROCESSED_SOURCE Procedure Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object.The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

Exceptions

Table 91–5 PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.

Table 91–5 (Cont.) PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-06502	Numeric or value error: ■ Character string buffer too small ■ A line is too long (> 32767 bytes)

Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

92

DBMS_PROFILER

The DBMS_PROFILER package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- Using DBMS_PROFILER
  - Overview
  - Security Model
  - Operational Notes
  - Exceptions
- Summary of DBMS_PROFILER Subprograms

Using DBMS_PROFILER

- Overview
- Security Model
- Operational Notes
- Exceptions

Overview

This package enables the collection of profiler (perfoprmance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

> **Note:** It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in Table 92–1, Table 92–2, and Table 92–3.

Table 92–1 Columns in Table PLSQL_PROFILER_RUNS

Column	Datatype	Definition
runid	NUMBER PRIMARY KEY	Unique run identifier from plsql_profiler_ runnumber
related_run	NUMBER	Runid of related run (for client/server correlation)
run_owner	VARCHAR2(32),	User who started run
run_date	DATE	Start time of run
run_comment	VARCHAR2(2047)	User provided comment for this run
run_total_ time	NUMBER	Elapsed time for this run in nanoseconds
run_system_ info	VARCHAR2(2047)	Currently unused
run_comment1	VARCHAR2(2047)	Additional comment
spare1	VARCHAR2(256)	Unused

Table 92–2 Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
runid	NUMBER	Primary key, references plsql_profiler_runs,
unit_number	NUMBER	Primary key, internally generated library unit #
unit_type	VARCHAR2(32)	Library unit type
unit_owner	VARCHAR2(32)	Library unit owner name
unit_name	VARCHAR2(32)	Library unit name timestamp on library unit
unit_ timestamp	DATE	In the future will be used to detect changes to unit between runs

Table 92–2 (Cont.) Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
total_time	NUMBER	Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools.
spare1	NUMBER	Unused
spare2	NUMBER	Unused

Table 92–3 Columns in Table PLSQL_PROFILER_DATA

Column	Datatype	Definition
runid	NUMBER	Primary key, unique (generated) run identifier
unit_number	NUMBER	Primary key, internally generated library unit number
line#	NUMBER	Primary key, not null, line number in unit
total_occur	NUMBER	Number of times line was executed
total_time	NUMBER	Total time spent executing line in nanoseconds
min_time	NUMBER	Minimum execution time for this line in nanoseconds
max_time	NUMBER	Maximum execution time for this line in nanoseconds
spare1	NUMBER	Unused
spare2	NUMBER	Unused
spare3	NUMBER	Unused
spare4	NUMBER	Unused

With Oracle database version 8.x, a sample textual report writer(profrep.sql) is provided with the PL/SQL demo scripts.

Security Model

The profiler only gathers data for units for which a user has CREATE privilege; you cannot use the package to profile units for which EXECUTE ONLY access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled DEBUG. Oracle advises that modules that are being profiled should be compiled DEBUG, since this provides additional information about the unit in the database.

Note: DBMS_PROFILER treats any program unit that is compiled in NATIVE mode as if you do not have CREATE privilege, that is, you will not get any output.

Operational Notes

- Typical Run
- Two Methods of Exception Generation

Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a *"run"*. A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

A typical run involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

> **Note:** The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures.

Flushing the collected data involves storing collected data in database tables. The tables should already exist in the profiler user's schema. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, *"warm up"* the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the SYSADMIN should use a modified `PROFLOAD.SQL` script which:

- Creates the profiler tables and sequence
- Grants SELECT/INSERT/UPDATE on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

Note: Do not alter the actual fields of the tables.

See Also: "FLUSH_DATA Function and Procedure" on page 92-10.

Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

Exceptions

Table 92–4 DBMS_PROFILER Exceptions

Exception	Description
version_mismatch	Corresponds to error_version.
profiler_error	Corresponds to either "error_param" or "error_io".

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'

  ```
  error_param constant binary_integer := 1;
  ```

- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'

  ```
  error_io    constant binary_integer := 2;
  ```

- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the DBMS_PROFILER package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.

  ```
  error_version constant binary_integer := -1;
  ```

Summary of DBMS_PROFILER Subprograms

Table 92–5 DBMS_PROFILER Package Subprograms

Subprogram	Description
FLUSH_DATA Function and Procedure on page 92-10	Flushes profiler data collected in the user's session
GET_VERSION Procedure on page 92-11	Gets the version of this API
INTERNAL_VERSION_CHECK Function on page 92-12	Verifies that this version of the `DBMS_PROFILER` package can work with the implementation in the database
PAUSE_PROFILER Function and Procedure on page 92-13	Pauses profiler data collection
RESUME_PROFILER Function and Procedure on page 92-14	Resumes profiler data collection
START_PROFILER Functions and Procedures on page 92-15	Starts profiler data collection in the user's session
STOP_PROFILER Function and Procedure on page 92-16	Stops profiler data collection in the user's session

FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

> **Note:** Use the PROFTAB.SQL script to create the tables and other data structures required for persistently storing the profiler data.

Syntax

```
DBMS_PROFILER.FLUSH_DATA
  RETURN BINARY_INTEGER;

DBMS_PROFILER.FLUSH_DATA;
```

GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (
   major  OUT BINARY_INTEGER,
   minor  OUT BINARY_INTEGER);
```

Parameters

Table 92–6 GET_VERSION Procedure Parameters

Parameter	Description
major	Major version of DBMS_PROFILER.
minor	Minor version of DBMS_PROFILER.

INTERNAL_VERSION_CHECK Function

This function verifies that this version of the `DBMS_PROFILER` package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK
  RETURN BINARY_INTEGER;
```

PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```
DBMS_PROFILER.PAUSE_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.PAUSE_PROFILER;
```

RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```
DBMS_PROFILER.RESUME_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.RESUME_PROFILER;
```

START_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the START_PROFILER function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

Syntax

```
DBMS_PROFILER.START_PROFILER(
   run_comment   IN VARCHAR2 := sysdate,
   run_comment1  IN VARCHAR2 :='',
   run_number    OUT BINARY_INTEGER)
 RETURN BINARY_INTEGER;

DBMS_PROFILER.START_PROFILER(
   run_comment IN VARCHAR2 := sysdate,
   run_comment1 IN VARCHAR2 :='')
RETURN BINARY_INTEGER;

DBMS_PROFILER.START_PROFILER(
   run_comment   IN VARCHAR2 := sysdate,
   run_comment1  IN VARCHAR2 :='',
   run_number    OUT BINARY_INTEGER);

DBMS_PROFILER.START_PROFILER(
   run_comment IN VARCHAR2 := sysdate,
   run_comment1 IN VARCHAR2 :='');
```

Parameters

Table 92–7 START_PROFILER Function Parameters

Parameter	Description
run_comment	Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.
run_number	Stores the number of the run so you can store and later recall the run's data.
run_comment1	Allows you to make interesting comments about the run.

STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_PROFILER.STOP_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.STOP_PROFILER;
```

93

DBMS_PROPAGATION_ADM

The DBMS_PROPAGATION_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and propagations

This chapter contains the following topic:

- Summary of DBMS_PROPAGATION_ADM Subprograms

Summary of DBMS_PROPAGATION_ADM Subprograms

Table 93–1 DBMS_PROPAGATION_ADM Package Subprograms

Subprogram	Description
ALTER_PROPAGATION Procedure on page 93-3	Adds, alters, or removes a rule set for a propagation
CREATE_PROPAGATION Procedure on page 93-5	Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation
DROP_PROPAGATION Procedure on page 93-8	Drops a propagation
START_PROPAGATION Procedure on page 93-10	Starts a propagation
STOP_PROPAGATION Procedure on page 93-11	Stops a propagation

Note: All subprograms commit unless specified otherwise.

ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

> **See Also:** *Oracle Streams Concepts and Administration* and Chapter 113, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
   propagation_name          IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 93–2 ALTER_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.
rule_set_name	The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named prop_rules, enter hr.prop_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then the procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then the procedure removes any existing positive rule set.
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages. If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified propagation. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

Table 93–2 (Cont.) ALTER_PROPAGATION Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages. If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages. If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified propagation. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION(
   propagation_name           IN  VARCHAR2,
   source_queue               IN  VARCHAR2,
   destination_queue          IN  VARCHAR2,
   destination_dblink         IN  VARCHAR2  DEFAULT NULL,
   rule_set_name              IN  VARCHAR2  DEFAULT NULL,
   negative_rule_set_name     IN  VARCHAR2  DEFAULT NULL,
   queue_to_queue             IN  BOOLEAN   DEFAULT NULL,
   original_propagation_name  IN  VARCHAR2  DEFAULT NULL,
   auto_merge_threshold       IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 93–3 CREATE_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner. **Note:** The propagation_name setting cannot be altered after the propagation is created.
source_queue	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue	The name of the destination queue, specified as [*schema_name.*]*queue_name*. For example, to specify a destination queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_dblink	The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue. If NULL, then the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.

Table 93–3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named prop_rules, enter hr.prop_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue. If you specify NULL, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.
negative_rule_set_name	The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages. If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue. If you specify NULL, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set. If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.
queue_to_queue	If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Table 93–3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
original_propagation_name	Specify the original propagation name if the propagation being created is part of a split and merge operation initiated by the SPLIT_STREAMS procedure in the DBMS_STREAMS_ADM package. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream using the MERGE_STREAMS procedure in the DBMS_STREAMS_ADM package. Specify NULL if the propagation being created is not part of a split and merge operation. **See Also:** "SPLIT_STREAMS Procedure" on page 130-156 and "MERGE_STREAMS Procedure" on page 130-115
auto_merge_theshold	Specify a positive number if both of the following conditions are met: ■ The propagation being created is part of a split and merge operation initiated by the SPLIT_STREAMS procedure in the DBMS_STREAMS_ADM package. ■ The stream will be merged back to the original stream automatically. Specify NULL if either of the following conditions are met: ■ The propagation being created is not part of a split and merge operation. ■ The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically. **See Also:** "SPLIT_STREAMS Procedure" on page 130-156 and "MERGE_STREAMS Procedure" on page 130-115

Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

See Also:

- Chapter 113, "DBMS_RULE_ADM"
- *Oracle Streams Concepts and Administration* for more information about propagations, the privileges required to propagate messages, propagation jobs, and propagation schedules

DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
   propagation_name       IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 93–4 DROP_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

Note: When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

START_PROPAGATION Procedure

This procedure starts a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(
   propagation_name  IN  VARCHAR2);
```

Parameter

Table 93–5 START_PROPAGATION Procedure Parameter

Parameter	Description
`propagation_name`	The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

STOP_PROPAGATION Procedure

This procedure stops a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
   propagation_name  IN  VARCHAR2,
   force             IN  BOOLEAN  DEFAULT FALSE);
```

Parameter

Table 93–6 STOP_PROPAGATION Procedure Parameter

Parameter	Description
propagation_name	The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.
force	If TRUE, then the procedure stops the propagation and clears the statistics for the propagation. If FALSE, then the procedure stops the propagation without clearing the statistics for the propagation.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the propagation is not started upon database instance startup.

94

DBMS_RANDOM

The DBMS_RANDOM package provides a built-in random number generator. DBMS_RANDOM is not intended for cryptography.

This chapter contains the following topics:

- Using DBMS_RANDOM
  - Security Model
  - Operational Notes
- Summary of DBMS_RANDOM Subprograms

Using DBMS_RANDOM

- Security Model
- Operational Notes

Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session.

Operational Notes

- `DBMS_RANDOM.RANDOM` produces integers in [-2^^31, 2^^31).
- `DBMS_RANDOM.VALUE` produces numbers in [0,1) with 38 digits of precision.

DBMS_RANDOM can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, userid, and process id if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

Summary of DBMS_RANDOM Subprograms

Table 94–1 DBMS_RANDOM Package Subprograms

Subprogram	Description
INITIALIZE Procedure on page 94-6	Initializes the package with a seed value
NORMAL Function on page 94-7	Returns random numbers in a normal distribution
RANDOM Procedure on page 94-8	Generates a random number
SEED Procedures on page 94-9	Resets the seed
STRING Function on page 94-10	Gets a random string
TERMINATE Procedure on page 94-11	Terminates package
VALUE Functions on page 94-12	This function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number x, where x is greater than or equal to `low` and less than `high`

Note: The INITIALIZE Procedure, RANDOM Procedure and the TERMINATE Procedure are all obsolete and, while currently supported, are included in this release for legacy reasons only.

INITIALIZE Procedure

This procedure initializes the generator (but see Usage Notes).

Syntax

```
DBMS_RANDOM.INITIALIZE (
   val  IN  BINARY_INTEGER);
```

Pragmas

```
PRAGMA restrict_references (initialize, WNDS)
```

Parameters

Table 94–2 INITIALIZE Procedure Parameters

Parameter	Description
val	The seed number used to generate a random number.

Usage Notes

This procedure is obsolete as it simply calls the SEED Procedures on page 94-9.

NORMAL Function

This function returns random numbers in a standard normal distribution.

Syntax

```
DBMS_RANDOM.NORMAL
  RETURN NUMBER;
```

Pragmas

```
PRAGMA restrict_references (normal, WNDS)
```

Return Values

Table 94–3 NORMAL Procedure Parameters

Parameter	Description
number	Returns a random number.

RANDOM Procedure

This procedure generates a random number (but see Usage Notes).

Syntax

```
DBMS_RANDOM.RANDOM
   RETURN binary_integer;
```

Pragmas

```
PRAGMA restrict_references (random, WNDS)
```

Return Values

Table 94–4 RANDOM Procedure Parameters

Parameter	Description
`binary_integer`	Returns a random integer greater or equal to -power(2,31) and less than power(2,31).

Usage Notes

This procedure is obsolete and, although it is currently supported, it should not be used.

SEED Procedures

This procedure resets the seed.

Syntax

```
DBMS_RANDOM.SEED (
   seed  IN  BINARY_INTEGER);

DBMS_RANDOM.SEED (
   seed  IN  VARCHAR2);
```

Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

Parameters

Table 94–5 SEED Procedure Parameters

Parameter	Description
seed	Seed number or string used to generate a random number.

Usage Notes

The seed can be a string up to length 2000.

STRING Function

This function gets a random string.

Syntax

```
DBMS_RANDOM.STRING
   opt  IN  CHAR,
   len  IN  NUMBER)
  RETURN VARCHAR2;
```

Pragmas

```
PRAGMA restrict_references (string, WNDS)
```

Parameters

Table 94–6 STRING Function Parameters

Parameter	Description
opt	Specifies what the returning string looks like: ■ 'u', 'U' - returning string in uppercase alpha characters ■ 'l', 'L' - returning string in lowercase alpha characters ■ 'a', 'A' - returning string in mixed case alpha characters ■ 'x', 'X' - returning string in uppercase alpha-numeric characters ■ 'p', 'P' - returning string in any printable characters. Otherwise the returning string is in uppercase alpha characters.
len	The length of the returning string.

Return Values

Table 94–7 STRING Function Return Values

Parameter	Description
VARCHAR2	Returns a VARCHAR2.

TERMINATE Procedure

When you are finished with the package, call the TERMINATE procedure (but see Usage Notes)

Syntax

```
DBMS_RANDOM.TERMINATE
```

Usage Notes

This procedure performs no function and, although it is currently supported, it is obsolete and should not be used.

VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number x, where x is greater than or equal to `low` and less than `high`.

Syntax

```
DBMS_RANDOM.VALUE
  RETURN NUMBER;

DBMS_RANDOM.VALUE(
  low  IN  NUMBER,
  high IN  NUMBER)
RETURN NUMBER;
```

Parameters

Table 94–8 VALUE Function Parameters

Parameter	Description
`low`	The lowest number in a range from which to generate a random number. The number generated may be equal to `low`.
`high`	The highest number below which to generate a random number. The number generated will be less than `high`.

Return Values

Table 94–9 VALUE Function Return Values

Parameter	Description
`NUMBER`	Returns an Oracle Number.

95

DBMS_RECTIFIER_DIFF

The DBMS_RECTIFIER_DIFF package provides an interface used to detect and resolve data inconsistencies between two replicated sites.

- Documentation of DBMS_RECTIFIER_DIFF

Documentation of DBMS_RECTIFIER_DIFF

For a complete description of this package within the context of Replication, see DBMS_RECTIFIER_DIFF in the *Oracle Database Advanced Replication Management API Reference*.

96

DBMS_REDEFINITION

The DBMS_REDEFINITION package provides an interface to perform an online redefinition of tables.

> **See Also:** *Oracle Database Administrator's Guide* for more information about online redefinition of tables

This chapter contains the following topics:

- Using DBMS_REDEFINITION
  - Overview
  - Constants
  - Operational Notes
- Summary of DBMS_REDEFINITION Subprograms

Using DBMS_REDEFINITION

- Overview
- Constants
- Operational Notes

Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

Constants

The DBMS_REDEFINITION package uses the constantsshown in Table 96–1, " DBMS_REDEFINITION Constants":

Table 96–1 DBMS_REDEFINITION Constants

Constant	Type	Value	Description
CONS_CONSTRAINT	PLS_INTEGER	3	Used to specify that dependent object type is a constraint
CONS_INDEX	PLS_INTEGER	2	Used to specify that dependent object type is a index
CONS_MVLOG	PLS_INTEGER	10	Used to (un)register a materialized view log, as a dependent object of the table, via the REGISTER_DEPENDENT_OBJECT Procedureand the UNREGISTER_DEPENDENT_OBJECT Procedure.
CONS_ORIG_PARAMS	PLS_INTEGER	1	Used to specify that indexes should be cloned with their original storage parameters
CONS_TRIGGER	PLS_INTEGER	4	Used to specify that dependent object type is a trigger
CONS_USE_PK	BINARY_INTEGER	1	Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)
CONS_USE_ROWID	BINARY_INTEGER	2	Used to indicate that the redefinition should be done using rowids

Operational Notes

- CONS_USE_PK and CONS_USE_ROWID are constants used as input to the "options_flag" parameter in both the START_REDEF_TABLE Procedure and CAN_REDEF_TABLE Procedure. CONS_USE_ROWID is used to indicate that the redefinition should be done using rowids while CONS_USE_PK implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- CONS_INDEX, CONS_MVLOG, CONS_TRIGGER and CONS_CONSTRAINT are used to specify the type of the dependent object being (un)registered in REGISTER_DEPENDENT_OBJECT Procedure and UNREGISTER_DEPENDENT_OBJECT Procedure (parameter "dep_type").

  CONS_INDEX ==> dependent object is of type INDEX

  CONS_TRIGGER ==> dependent object is of type TRIGGER

  CONS_CONSTRAINT==> dependent object type is of type CONSTRAINT

  CONS_MVLOG ==> dependent object is of type MATERIALIZED VIEW LOG
- CONS_ORIG_PARAMS as used as input to the "copy_indexes" parameter in COPY_TABLE_DEPENDENTS Procedure. Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

Rules and Limits

For information about various rules and limits that apply to implementation of this package, see the *Oracle Database Administrator's Guide*.

Summary of DBMS_REDEFINITION Subprograms

Table 96–2 DBMS_REDEFINITION Package Subprograms

Subprogram	Description
ABORT_REDEF_TABLE Procedure on page 96-8	Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process
CAN_REDEF_TABLE Procedure on page 96-9	Determines if a given table can be redefined online
COPY_TABLE_DEPENDENTS Procedure on page 96-10	Copies the dependent objects of the original table onto the interim table
FINISH_REDEF_TABLE Procedure on page 96-12	Completes the redefinition process.
REGISTER_DEPENDENT_OBJECT Procedure on page 96-13	Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table
START_REDEF_TABLE Procedure on page 96-14	Initiates the redefinition process
SYNC_INTERIM_TABLE Procedure on page 96-15	Keeps the interim table synchronized with the original table
UNREGISTER_DEPENDENT_OBJECT Procedure on page 96-16	Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table

ABORT_REDEF_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process. This procedure can also be used to terminate the redefinition process any time after the START_REDEF_TABLE Procedure has been called and before the FINISH_REDEF_TABLE Procedure is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (
   uname       IN VARCHAR2,
   orig_table  IN VARCHAR2,
   int_table   IN VARCHAR2,
  part_name    IN  VARCHAR2 := NULL);
```

Parameters

Table 96–3 ABORT_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
   uname         IN  VARCHAR2,
   tname        IN  VARCHAR2,
   options_flag  IN  PLS_INTEGER := 1,
   part_name     IN  VARCHAR2 := NULL);
```

Parameters

Table 96–4 CAN_REDEF_TABLE Procedure Parameters

Parameter	Description
`uname`	The schema name of the table
`tname`	The name of the table to be re-organized
`options_flag`	Indicates the type of redefinition method to use. ■ If `dbms_redefinition.cons_use_pk`, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having `NOT NULL` constraints). The default method of redefinition is using primary keys. ■ If `dbms_redefinition.cons_use_rowid`, the redefinition is done using rowids.
`part_name`	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. `NULL` implies the entire table is being redefined.

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS(
   uname                   IN  VARCHAR2,
   orig_table              IN  VARCHAR2,
   int_table               IN  VARCHAR2,
   copy_indexes            IN  PLS_INTEGER := 1,
   copy_triggers           IN  BOOLEAN     := TRUE,
   copy_constraints        IN  BOOLEAN     := TRUE,
   copy_privileges         IN  BOOLEAN     := TRUE,
   ignore_errors           IN  BOOLEAN     := FALSE,
   num_errors              OUT PLS_INTEGER,
   copy_statistics         IN  BOOLEAN     := FALSE,
   copy_mvlog              IN  BOOLEAN     := FALSE);
```

Parameters

Table 96–5 COPY_TABLE_DEPENDENTS Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table being redefined.
int_table	The name of the interim table.
copy_indexes	A flag indicating whether to copy the indexes ■ 0 - do not copy any index ■ dbms_redefinition.cons_orig_params – copy the indexes using the physical parameters of the source indexes
copy_triggers	TRUE = clone triggers, FALSE = do nothing
copy_constraints	TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints
copy_privileges	TRUE = clone privileges, FALSE = do nothing
ignore_errors	TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.
num_errors	The number of errors that occurred while cloning dependent objects
copy_statistics	TRUE = copy statistics, FALSE = do nothing
copy_mvlog	TRUE = copy materialized view log, FALSE = do nothing

Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the COPY_TABLE_DEPENDENTS Procedure again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the REGISTER_DEPENDENT_OBJECT Procedure.
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process. Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (
   uname       IN VARCHAR2,
   orig_table  IN VARCHAR2,
   int_table   IN VARCHAR2,
   part_name   IN  VARCHAR2 := NULL);
```

Parameters

Table 96–6 FINISH_REDEF_TABLE Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

Syntax

```
DBMS_REDEFINITION.REGISTER_DEPEPENDENT_OBJECT(
   uname             IN VARCHAR2,
   orig_table        IN VARCHAR2,
   int_table         IN VARCHAR2,
   dep_type          IN  PLS_INTEGER,
   dep_owner         IN VARCHAR2,
   dep_orig_name     IN VARCHAR2,
   dep_int_name      IN  VARCHAR2);
```

Parameters

Table 96–7 REGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA_REDEFINITION_ERRORS if an entry exists for that object.

START_REDEF_TABLE Procedure

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
   uname          IN VARCHAR2,
   orig_table     IN VARCHAR2,
   int_table      IN VARCHAR2,
   col_mapping    IN VARCHAR2 := NULL,
   options_flag   IN BINARY_INTEGER := 1,
   orderby_cols   IN VARCHAR2 := NULL,
   part_name     IN  VARCHAR2 := NULL);
```

Parameters

Table 96–8 START_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
col_mapping	The mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition.
options_flag	Indicates the type of redefinition method to use. ■ If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys. ■ If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids.
orderby_cols	This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
   uname          IN  VARCHAR2,
   orig_table     IN  VARCHAR2,
   int_table      IN  VARCHAR2,
   part_name      IN  VARCHAR2 := NULL);
```

Parameters

Table 96–9 SYNC_INTERIM_TABLE Procedure Parameters

Parameter	Description
`uname`	The schema name of the table.
`orig_table`	The name of the table to be redefined.
`int_table`	The name of the interim table.
`part_name`	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. `NULL` implies the entire table is being redefined.

Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the FINISH_REDEF_TABLE Procedure before completing the online redefinition.
- This procedure can be called between long running operations (such as `CREATE INDEX`) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

UNREGISTER_DEPENDENT_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPEPENDENT_OBJECT(
   uname              IN VARCHAR2,
   orig_table        IN VARCHAR2,
   int_table         IN VARCHAR2,
   dep_type          IN PLS_INTEGER,
   dep_owner         IN VARCHAR2,
   dep_orig_name     IN VARCHAR2,
   dep_int_name      IN  VARCHAR2);
```

Parameters

Table 96–10 UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

97

DBMS_REFRESH

The DBMS_REFRESH package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time.

- Documentation of DBMS_REFRESH

Documentation of DBMS_REFRESH

For a complete description of this package within the context of Replication, see `DBMS_REFRESH` in the *Oracle Database Advanced Replication Management API Reference*.

98

DBMS_REPAIR

The DBMS_REPAIR package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

> **See Also:** For detailed information about using the DBMS_REPAIR package, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

- Using DBMS_REPAIR
  - Overview
  - Security Model
  - Constants
  - Operating Notes
  - Exceptions
  - Examples
- Summary of DBMS_REPAIR Subprograms

Using DBMS_REPAIR

- Overview
- Security Model
- Constants
- Operating Notes
- Exceptions
- Examples

Overview

Note: The DBMS_REPAIR package is intended for use by database administrators only. It is not intended for use by application developers.

Security Model

The package is owned by `SYS`. Execution privilege is not granted to other users.

Constants

The DBMS_REPAIR package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_REPAIR.TABLE_OBJECT.

Table 98–1 lists the parameters and the enumerated constants.

Table 98–1 DBMS_REPAIR Parameters with Enumerated Constants

Parameter	Option	Type	Description
object_type	■ TABLE_OBJECT ■ INDEX_OBJECT ■ CLUSTER_OBJECT	BINARY_ INTEGER	-
action	■ CREATE_ACTION ■ DROP_ACTION ■ PURGE_ACTION	BINARY_ INTEGER	-
table_type	■ REPAIR_TABLE ■ ORPHAN_TABLE	BINARY_ INTEGER	-
flags	■ SKIP_FLAG ■ NOSKIP_FLAG	BINARY_ INTEGER	-
object_id	■ ALL_INDEX_ID := 0	BINARY_ INTEGER	Clean up all objects that qualify
wait_for_lock	■ LOCK_WAIT := 1 ■ LOCK_NOWAIT := 0	BINARY_ INTEGER	Specifies whether to try getting DML locks on underlying table [[sub]partition] object

Note: The default table_name will be REPAIR_TABLE when table_type is REPAIR_TABLE, and will be ORPHAN_KEY_TABLE when table_type is ORPHAN_TABLE.

Operating Notes

The procedure to create the ORPHAN_KEYS_TABLE is similar to the one used to create the REPAIR_TABLE.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the CHECK_OBJECT Procedure would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN_' prefix. The following code is also legal:

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;
```

When invoking the CHECK_OBJECT Procedure the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the ADMIN_TABLES Procedure or CREATE_ACTION.

Other actions in the ADMIN_TABLES Procedure can be used to purge/delete the REPAIR_TABLE and the ORPHAN_KEYS_TABLE.

Exceptions

Table 98–2 DBMS_REPAIR Exceptions

Exception	Description	Action
942	Reported by DBMS_REPAIR.ADMIN_TABLES during a DROP_ACTION when the specified table doesn't exist.	-
955	Reported by DBMS_REPAIR.CREATE_ACTION when the specified table already exists.	-
24120	An invalid parameter was passed to the specified DBMS_REPAIR procedure.	Specify a valid parameter value or use the parameter's default.
24122	An incorrect block range was specified.	Specify correct values for the BLOCK_START and BLOCK_END parameters.
24123	An attempt was made to use the specified feature, but the feature is not yet implemented.	Do not attempt to use the feature.
24124	An invalid ACTION parameter was specified.	Specify CREATE_ACTION, PURGE_ACTION or DROP_ACTION for the ACTION parameter.
24125	An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since DBMS_REPAIR.CHECK_OBJECT was run.	Use DBMS_REPAIR.ADMIN_TABLES to purge the repair table and run DBMS_REPAIR.CHECK_OBJECT to determine whether there are any corrupt blocks to be fixed.
24127	TABLESPACE parameter specified with an ACTION other than CREATE_ACTION.	Do not specify TABLESPACE when performing actions other than CREATE_ACTION.
24128	A partition name was specified for an object that is not partitioned.	Specify a partition name only if the object is partitioned.
24129	An attempt was made to pass a table name parameter without the specified prefix.	Pass a valid table name parameter.
24130	An attempt was made to specify a repair or orphan table that does not exist.	Specify a valid table name parameter.
24131	An attempt was made to specify a repair or orphan table that does not have a correct definition.	Specify a table name that refers to a properly created table.
24132	An attempt was made to specify a table name is greater than 30 characters long.	Specify a valid table name parameter.

Examples

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */

EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');

/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/

EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

Summary of DBMS_REPAIR Subprograms

Table 98–3 DBMS_REPAIR Package Subprograms

Subprogram	Description
ADMIN_TABLES Procedure on page 98-10	Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions
CHECK_OBJECT Procedure on page 98-11	Detects and reports corruptions in a table or index
DUMP_ORPHAN_KEYS Procedure on page 98-13	Reports on index entries that point to rows in corrupt data blocks
FIX_CORRUPT_BLOCKS Procedure on page 98-14	Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT
ONLINE_INDEX_CLEAN Function on page 98-15	Performs a manual cleanup of failed or interrupted online index builds or rebuilds
REBUILD_FREELISTS Procedure on page 98-16	Rebuilds an object's freelists
SEGMENT_FIX_STATUS Procedure on page 98-17	Fixes the corrupted state of a bitmap entry
SKIP_CORRUPT_BLOCKS Procedure on page 98-18	Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered

ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
   table_name  IN   VARCHAR2,
   table_type  IN   BINARY_INTEGER,
   action      IN   BINARY_INTEGER,
   tablespace  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 98–4 ADMIN_TABLES Procedure Parameters

Parameter	Description
table_name	Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.
table_type	Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See "Constants" on page 98-5.
action	Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See "Constants" on page 98-5.
tablespace	Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.

CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   relative_fno      IN  BINARY_INTEGER DEFAULT NULL,
   block_start       IN  BINARY_INTEGER DEFAULT NULL,
   block_end         IN  BINARY_INTEGER DEFAULT NULL,
   corrupt_count     OUT BINARY_INTEGER);
```

Parameters

Table 98–5 CHECK_OBJECT Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be checked.
object_name	Name of the table or index to be checked.
partition_name	Partition or subpartition name to be checked. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See "Constants" on page 98-5.
repair_table_name	Name of the repair table to be populated. The table must exist in the SYS schema. Use the ADMIN_TABLES Procedure to create a repair table. The default name is REPAIR_TABLE.
flags	Reserved for future use.
relative_fno	Relative file number: Used when specifying a block range.
block_start	First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.
block_end	Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of block_start or block_end is specified, then the other defaults to the first or last block in the file respectively.
corrupt_count	Number of corruptions reported.

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT INDEX_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   orphan_table_name IN  VARCHAR2       DEFAULT 'ORPHAN_KEYS_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   key_count         OUT BINARY_INTEGER);
```

Parameters

Table 98–6 DUMP_ORPHAN_KEYS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Object name.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. The default is INDEX_OBJECT See "Constants" on page 98-5.
repair_table_name	Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.
orphan_table_name	Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.
flags	Reserved for future use.
key_count	Number of index entries processed.

FIX_CORRUPT_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the CHECK_OBJECT Procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   fix_count         OUT BINARY_INTEGER);
```

Parameters

Table 98–7 FIX_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object with corrupt blocks to be fixed.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See "Constants" on page 98-5.
repair_table_name	Name of the repair table with the repair directives. Must exist in the SYS schema.
flags	Reserved for future use.
fix_count	Number of blocks fixed.

ONLINE_INDEX_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds. This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns `TRUE` if all indexes specified were cleaned up and `FALSE` if one or more indexes could not be cleaned up.

Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
   object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
   wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
 RETURN BOOLEAN;
```

Parameters

Table 98–8 ONLINE_INDEX_CLEAN Function Parameters

Parameter	Description
`object_id`	Object id of index to be cleaned up. The default cleans up all object ids that qualify.
`wait_for_lock`	This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If `LOCK_NOWAIT` is specified, then the lock get does not retry.

REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object. All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (
   schema_name    IN VARCHAR2,
   object_name    IN  VARCHAR2,
   partition_name IN VARCHAR2 DEFAULT NULL,
   object_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

Table 98–9 REBUILD_FREELISTS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object whose freelists are to be rebuilt.
partition_name	Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See"Constants" on page 98-5.

SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
   segment_owner   IN VARCHAR2,
   segment_name    IN VARCHAR2,
   segment_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
   file_number     IN BINARY_INTEGER DEFAULT NULL,
   block_number    IN BINARY_INTEGER DEFAULT NULL,
   status_value    IN BINARY_INTEGER DEFAULT NULL,
   partition_name  IN VARCHAR2 DEFAULT NULL,);
```

Parameters

Table 98–10 SEGMENT_FIX_STATUS Procedure Parameters

Parameter	Description
schema_owner	Schema name of the segment.
segment_name	Segment name.
partition_name	Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.
segment_type	Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.
file_number	(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
block_number	(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
status_value	(optional) The value to which the block status described by the file_number and block_number will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values: ■ 1 = block is full ■ 2 = block is 0-25% free ■ 3 = block is 25-50% free ■ 4 = block is 50-75% free ■ 5 = block is 75-100% free The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.

SKIP_CORRUPT_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

> **Note:** When Oracle performs an index range scan on a corrupt index after DBMS_REPAIR.SKIP_CORRUPT_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
   schema_name  IN VARCHAR2,
   object_name  IN VARCHAR2,
   object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
   flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 98–11 SKIP_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
`schema_name`	Schema name of the object to be processed.
`object_name`	Name of the object.
`object_type`	Type of the object to be processed. This must be either `TABLE_OBJECT` (default) or `CLUSTER_OBJECT`. See "Constants" on page 98-5.
`flags`	If `SKIP_FLAG` is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If `NOSKIP_FLAG` is specified, then scans that encounter software corrupt blocks return an `ORA-1578`. See"Constants" on page 98-5.

99

DBMS_REPCAT

The DBMS_REPCAT package provides routines to administer and update the replication catalog and environment.

- Documentation of DBMS_REPCAT

Documentation of DBMS_REPCAT

For a complete description of this package within the context of Replication, see `DBMS_REPCAT` in the *Oracle Database Advanced Replication Management API Reference.*

100

DBMS_REPCAT_ADMIN

The DBMS_REPCAT_ADMIN package enables you to create users with the privileges needed by the symmetric replication facility.

- Documentation of DBMS_REPCAT_ADMIN

Documentation of DBMS_REPCAT_ADMIN

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_ADMIN` in the *Oracle Database Advanced Replication Management API Reference*.

101

DBMS_REPCAT_INSTANTIATE

The `DBMS_REPCAT_INSTANTIATE` package instantiates deployment templates.

- Documentation of DBMS_REPCAT_INSTANTIATE

Documentation of DBMS_REPCAT_INSTANTIATE

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_INSTANTIATE` in the *Oracle Database Advanced Replication Management API Reference*.

102

DBMS_REPCAT_RGT

The DBMS_REPCAT_RGT package controls the maintenance and definition of refresh group templates.

- Documentation of DBMS_REPCAT_RGT

Documentation of DBMS_REPCAT_RGT

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_RGT` in the *Oracle Database Advanced Replication Management API Reference*.

103

DBMS_REPUTIL

The `DBMS_REPUTIL` package contains subprograms to generate shadow tables, triggers, and packages for table replication, as well as subprograms to generate wrappers for replication of standalone procedure invocations and packaged procedure invocations. This package is referenced only by the generated code.

- Documentation of DBMS_REPUTIL

Documentation of DBMS_REPUTIL

For a complete description of this package within the context of Replication, see `DBMS_REPUTIL` in the *Oracle Database Advanced Replication Management API Reference*.

104

DBMS_RESCONFIG

The `DBMS_RESCONFIG` package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about "Resource Configuration".

This chapter contains the following topics:

- Using DBMS_RESCONFIG
  - Overview
- Summary of DBMS_RESCONFIG Subprograms

Using DBMS_RESCONFIG

- Overview

Overview

The DBMS_RESCONFIG package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

Summary of DBMS_RESCONFIG Subprograms

This table list the package subprograms in alphabetical order.

Table 104–1 DBMS_RESCONFIG Package Subprograms

Subprogram	Description
ADDREPOSITORYRESCONFIG Procedure on page 104-5	Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list
ADDRESCONFIG Procedure on page 104-6	Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list
APPENDRESCONFIG Procedure on page 104-7	Appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list
DELETEREPOSITORYRESCONFIG Procedure on page 104-8	Removes the configuration at the given position in the repository's configuration list.
DELETERESCONFIG Procedures on page 104-9	Removes the configuration at the given position in the target resource's configuration list. I
GETLISTENERS Function on page 104-10	Returns the list of listeners applicable for a given resource
GETREPOSITORYRESCONFIG Function on page 104-11	Returns the resource configuration at the specified position of the repository's configuration list
GETREPOSITORYRESCONFIGPATHS Function on page 104-12	Returns a list of resource configuration paths defined for the repository
GETRESCONFIG Function on page 104-13	Returns the resource configuration at the specified position of the target resource's configuration list
GETRESCONFIGPATHS Function on page 104-14	Returns a list of resource configuration paths defined in the target resource's configuration list

ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG(
   rcpath     IN   VARCHAR2,
   pos        IN   PLS_INTEGER := NULL);
```

Parameters

Table 104–2 ADDREPOSITORYRESCONFIG Function Parameters

Parameter	Description
`rcpath`	Absolute path of the resource configuration to be inserted. An exception is raised if `rcpath` already exists in the target's configuration list.
`pos`	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (`pos` < 0 or `pos` > the size of the target resource's configuration list).

Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `XDBADMIN` role and `READ` privilege on the resource configuration to be inserted; otherwise, an error is returned.

ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
   respath    IN   VARCHAR2,
   rcpath     IN   VARCHAR2,
   pos        IN   PLS_INTEGER := NULL);
```

Parameters

Table 104–3 ADDRESCONFIG Function Parameters

Parameter	Description
`respath`	Absolute path of the target resource
`rcpath`	Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.
`pos`	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (`pos` < 0 or `pos` > the size of the target resource's configuration list).

Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
   respath       IN   VARCHAR2,
   rcpath        IN   VARCHAR2,
   appendOption  IN   PLS_INTEGER);
```

Parameters

Table 104–4 ADDRESCONFIG Function Parameters

Parameter	Description
respath	Absolute path of the target resource
rcpath	Absolute path of the resource configuration to be appended at the end of the target's configuration list. If rcpath already exists in the list then nothing is appended.
appendOption	Either APPEND_RESOURCE or APPEND_RECURSIVE. If APPEND_RESOURCE is specified then only the target resource is affected. If APPEND_RECURSIVE is specified then the target resource and all its descendents will be affected.

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have WRITE-CONFIG privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

Syntax

```
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG(
   pos           IN   PLS_INTEGER);
```

Parameters

Table 104–5 DELETEREPOSITORYRESCONFIG Function Parameters

Parameter	Description
`pos`	The index of the configuration to be removed. An exception is raised if the index is out of range (`pos` < 0 or `pos` >= the size of the target resource's configuration list).

Usage Notes

- Users must have `XDBADMIN` role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.

DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

Syntax

```
DBMS_RESCONFIG.DELETERESCONFIG(
   respath       IN   VARCHAR2,
   pos           IN   PLS_INTEGER);

DBMS_RESCONFIG.DELETERESCONFIG(
   respath        IN  VARCHAR2,
   rcpath         IN  VARCHAR2,
   deleteOption   IN  PLS_INTEGER);
```

Parameters

Table 104–6 DELETERESCONFIG Function Parameters

Parameter	Description
`respath`	Absolute path of the target resource
`pos`	The index of the configuration to be removed. An exception is raised if the index is out of range (`pos` < 0 or `pos` >= the size of the target resource's configuration list).
`rcpath`	Absolute path of the resource configuration to be deleted if found in list.
`deleteOption`	Either `DELETE_RESOURCE` or `DELETE_RECURSIVE`. If `DELETE_RESOURCE` is specified then only the configuration list of the target resource is affected. If `DELETE_RECURSIVE` is specified then the configuration list of the target resource and all its descendents will be affected.

Usage Notes

Users must have `WRITE-CONFIG` privilege on the target resource to execute this.

GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the `<event-listeners>` element of the `XDBResconfig.xsd` schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the `EXTRACT` operator to retrieve the listeners defined for a specific event.

Syntax

```
DBMS_RESCONFIG.GETLISTENERS(
   path    IN   VARCHAR2)
 RETURN XMLTYPE;
```

Parameters

Table 104–7 GETLISTENERS Function Parameters

Parameter	Description
`path`	Absolute path of the target resource

Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG(
   pos    IN   PLS_INTEGER)
 RETURN XMLTYPE;
```

Parameters

Table 104–8 GETREPOSITORYRESCONFIG Function Parameters

Parameter	Description
pos	Index of element to return. An exception is raised if the index is out of range (pos < 0 or pos >= the size of the repository's configuration list).

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS
 RETURN XDB$STRING_LIST_T;
```

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIG(
   respath IN VARCHAR2,
   pos IN PLS_INTEGER)
 RETURN XMLTYPE;
```

Parameters

Table 104–9 GETRESCONFIG Function Parameters

Parameter	Description
`respath`	Absolute path of the target resource
`pos`	Index of element to return. An exception is raised if the index is out of range (`pos` < 0 or `pos` >= the size of the target resource's configuration list).

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIGPATHS(
   respath IN VARCHAR2)
 RETURN XDB$STRING_LIST_T;
```

Parameters

Table 104–10 GETRESCONFIGPATHS Function Parameters

Parameter	Description
`respath`	Absolute path of the target resource

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

105

DBMS_RESOURCE_MANAGER

The DBMS_RESOURCE_MANAGER package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

> **See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

- Using DBMS_RESOURCE_MANAGER
  - Deprecated Subprograms
  - Security Model
  - Constants
- Summary of DBMS_RESOURCE_MANAGER Subprograms

Using DBMS_RESOURCE_MANAGER

- Deprecated Subprograms
- Security Model
- Constants

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11*g*:

- SET_INITIAL_CONSUMER_GROUP Procedure

Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures. The procedures to grant and revoke this privilege are in the package Chapter 106, "DBMS_RESOURCE_MANAGER_PRIVS".

Constants

Table 105–1 DBMS_RESOURCE_MANAGER Constants

Constant	Definition
CLIENT_MACHINE	CONSTANT VARCHAR2(30):= 'CLIENT_MACHINE';
CLIENT_OS_USER	CONSTANT VARCHAR2(30):= 'CLIENT_OS_USER';
CLIENT_PROGRAM	CONSTANT VARCHAR2(30):= 'CLIENT_PROGRAM';
MODULE_NAME	CONSTANT VARCHAR2(30):= 'MODULE_NAME';
MODULE_NAME_ACTION	CONSTANT VARCHAR2(30):= 'MODULE_NAME_ACTION';
ORACLE_USER	CONSTANT VARCHAR2(30):= 'ORACLE_USER'
SERVICE_MODULE	CONSTANT VARCHAR2(30):= 'SERVICE_MODULE';
SERVICE_MODULE_ACTION	CONSTANT VARCHAR2(30):= 'SERVICE_MODULE_ ACTION';
SERVICE_NAME	CONSTANT VARCHAR2(30):= 'SERVICE_NAME';
PERFORMANCE_CLASS	CONSTANT VARCHAR2(30):= 'PERFORMANCE_CLASS';

Summary of DBMS_RESOURCE_MANAGER Subprograms

Table 105–2 DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
CALIBRATE_IO Procedure on page 105-8	Calibrates the I/O capabilities of storage
CLEAR_PENDING_AREA Procedure on page 105-11	Clears the work area for the resource manager
CREATE_CONSUMER_GROUP Procedure on page 105-12	Creates entries which define resource consumer groups
CREATE_PENDING_AREA Procedure on page 105-13	Creates a work area for changes to resource manager objects
CREATE_PLAN Procedure on page 105-15	Creates entries which define resource plans
CREATE_PLAN_DIRECTIVE Procedure on page 105-16	Creates resource plan directives
CREATE_SIMPLE_PLAN Procedure on page 105-20	Creates a single-level resource plan containing up to eight consumer groups in one step
DELETE_CONSUMER_GROUP Procedure on page 105-22	Deletes entries which define resource consumer groups
DELETE_PLAN Procedure on page 105-23	Deletes the specified plan as well as all the plan directives it refers to
DELETE_PLAN_CASCADE Procedure on page 105-24	Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)
DELETE_PLAN_DIRECTIVE Procedure on page 105-25	Deletes resource plan directives
SET_CONSUMER_GROUP_MAPPING Procedure on page 105-26	Adds, deletes, or modifies pairs for the login and run-time attribute mappings
SET_CONSUMER_GROUP_MAPPING_PRI Procedure on page 105-27	Creates the session attribute mapping priority list
SET_INITIAL_CONSUMER_GROUP Procedure on page 105-28	Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram)
SUBMIT_PENDING_AREA Procedure on page 105-29	Submits pending changes for the resource manager
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure on page 105-30	Changes the resource consumer group of a specific session
SWITCH_CONSUMER_GROUP_FOR_USER Procedure on page 105-31	Changes the resource consumer group for all sessions with a given user name
SWITCH_PLAN Procedure on page 105-32	Sets the current resource manager plan

Table 105–2 (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
UPDATE_CONSUMER_GROUP Procedure on page 105-33	Updates entries which define resource consumer groups
UPDATE_PLAN Procedure on page 105-34	Updates entries which define resource plans
UPDATE_PLAN_DIRECTIVE Procedure on page 105-35	Updates resource plan directives
VALIDATE_PENDING_AREA Procedure on page 105-39	Validates pending changes for the resource manage

CALIBRATE_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the V$IO_CALIBRATION_STATUS view and results for a successful calibration run are located in DBA_RSRC_IO_CALIBRATE table.

Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (
   num_physical_disks      IN  PLS_INTEGER DEFAULT 1,
   max_latency             IN  PLS_INTEGER DEFAULT 20,
   max_iops                OUT PLS_INTEGER,
   max_mbps                OUT PLS_INTEGER,
   actual_latency          OUT PLS_INTEGER);
```

Parameters

Table 105–3 CALIBRATE_IO Procedure Parameters

Parameter	Description
num_physical_disks	Approximate number of physical disks in the database storage
max_latency	Maximum tolerable latency in milliseconds for database-block-sized IO requests
max_iops	Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads.
max_mbps	Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads.
actual_latency	Average latency of database-block-sized I/O requests at max_iops rate, expressed in milliseconds

Usage Notes

- Only users with the SYSDBA privilege can run this procedure. Qualified users must also turn on timed_statistics, and ensure asynch_io is enabled for datafiles. This can be achieved by setting filesystemio_options to either ASYNCH or SETALL. One can also query the asynch_io status by means of the following SQL statement:

```
col name format a50
SELECT name, asynch_io FROM v$datafile f,v$iostat_file i
  WHERE f.file#        = i.file_no
  AND   filetype_name  = 'Data File'
 /
```

- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.
- For an Oracle Real Application Clusters (RAC) database, the workload is simultaneously generated from all instances.

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about calibration

Examples

Example of using I/O Calibration procedure

```
SET SERVEROUTPUT ON
DECLARE
  lat  INTEGER;
  iops INTEGER;
  mbps INTEGER;
BEGIN
-- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
   DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);

  DBMS_OUTPUT.PUT_LINE ('max_iops = ' || iops);
  DBMS_OUTPUT.PUT_LINE ('latency  = ' || lat);
  dbms_output.put_line('max_mbps = ' || mbps);
end;
/
```

View for I/O calibration results

```
SQL> desc V$IO_CALIBRATION_STATUS
  Name                                      Null?    Type
  ----------------------------------------- -------- ----------------------------
  STATUS                                             VARCHAR2(13)
  CALIBRATION_TIME                                   TIMESTAMP(3)

SQL> desc gv$io_calibration_status
  Name                                      Null?    Type
  ----------------------------------------- -------- ----------------------------
  INST_ID                                            NUMBER
  STATUS                                             VARCHAR2(13)
  CALIBRATION_TIME                                   TIMESTAMP(3)

Column explanation:
-------------------
STATUS:
  IN PROGRESS   : Calibration in Progress (Results from previous calibration
                  run displayed, if available)
  READY         : Results ready and available from earlier run
  NOT AVAILABLE : Calibration results not available.

CALIBRATION_TIME: End time of the last calibration run
```

DBA table that stores I/O Calibration results

```
SQL> desc DBA_RSRC_IO_CALIBRATE
  Name                                      Null?    Type
  ----------------------------------------- -------- ----------------------------
  START_TIME                                         TIMESTAMP(6)
  END_TIME                                           TIMESTAMP(6)
  MAX_IOPS                                           NUMBER
  MAX_MBPS                                           NUMBER
  MAX_PMBPS                                          NUMBER
  LATENCY                                            NUMBER
  NUM_PHYSICAL_DISKS                                 NUMBER

comment on table DBA_RSRC_IO_CALIBRATE is
'Results of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.START_TIME is
```

```
'start time of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.END_TIME is
'end time of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_IOPS is
'maximum number of data-block read requests that can be sustained per second'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_MBPS is
'maximum megabytes per second of maximum-sized read requests that can be
sustained'
/
comment on column DBA_RSRC_IO_CALIBRATE.MAX_PMBPS is
'maximum megabytes per second of large I/O requests that
can be sustained by a single process'
/
comment on column DBA_RSRC_IO_CALIBRATE.LATENCY is
'latency for data-block read requests'
/
comment on column DBA_RSRC_IO_CALIBRATE.NUM_PHYSICAL_DISKS is
'number of physical disks in the storage subsystem (as specified by user)'
/
```

CLEAR_PENDING_AREA Procedure

This procedure clears pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

CREATE_CONSUMER_GROUP Procedure

This procedure creates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (
   consumer_group  IN VARCHAR2,
   comment         IN VARCHAR2,
   cpu_mth         IN VARCHAR2 DEFAULT NULL,
   mgmt_mth        IN VARCHAR2 DEFAULT 'ROUND-ROBIN');
```

Parameters

Table 105–4 CREATE_CONSUMER_GROUP Procedure Parameters

Parameter	Description
consumer_group	The name of the consumer group.
comment	The user's comment.
cpu_mth	Name of CPU resource allocation method (deprecated)
mgmt_mth	Name of CPU resource allocation method

CREATE_PENDING_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you has made are valid. You do not have to do your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

> **Note:** Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

The following rules must be adhered to, and they are checked whenever the validate or submit procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- For Oracle8*i*, the plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 32 plan directives coming from any given plan (that is, no plan can have more than 32 children).
- There cannot be more than 32 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema.This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix the problem(s) and reissue the validate or submit procedures.

CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
   plan                       IN   VARCHAR2,
   comment                    IN   VARCHAR2,
   cpu_mth                    IN   VARCHAR2 DEFAULT NULL, -- deprecated
   active_sess_pool_mth       IN   VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
   parallel_degree_limit_mth  IN   VARCHAR2 DEFAULT
                                      'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
   queueing_mth               IN   VARCHAR2 DEFAULT 'FIFO_TIMEOUT',
   mgmt_mth                   IN   VARCHAR2 DEFAULT 'EMPHASIS');
```

Parameters

Table 105–5 CREATE_PLAN Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
comment	User's comment.
cpu_mth	Allocation method for CPU resources (deprecated)
active_sess_pool_mth	The Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.
parallel_degree_limit_mth	The resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.
queueing_mth	The Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available
mgmt_mth	The resource allocation method for specifying how much resources (e.g. CPU or I/O) each consumer group or sub-plan gets ■ EMPHASIS - for multi-level plans that use percentages to specify how I/O is resources are distributed among consumer groups. ■ RATIO - for single-level plans that use ratios to specify how I/O is resources are distributed.

Usage Notes

If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

CREATE_PLAN_DIRECTIVE Procedure

This procedure creates resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
   plan                      IN VARCHAR2,
   group_or_subplan          IN VARCHAR2,
   comment                   IN VARCHAR2,
   cpu_p1                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p2                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p3                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p4                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p5                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p6                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p7                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p8                    IN NUMBER   DEFAULT NULL, -- deprecated
   active_sess_pool_p1       IN NUMBER   DEFAULT NULL,
   queueing_p1               IN NUMBER   DEFAULT NULL,
   parallel_degree_limit_p1  IN NUMBER   DEFAULT NULL,
   switch_group              IN VARCHAR2 DEFAULT NULL,
   switch_time               IN NUMBER   DEFAULT NULL,
   switch_estimate           IN BOOLEAN  DEFAULT FALSE,
   max_est_exec_time         IN NUMBER   DEFAULT NULL,
   undo_pool                 IN NUMBER   DEFAULT NULL,
   max_idle_time             IN NUMBER   DEFAULT NULL,
   max_idle_blocker_time     IN NUMBER   DEFAULT NULL,
   switch_time_in_call       IN NUMBER   DEFAULT NULL, -- deprecated
   mgmt_p1                   IN NUMBER   DEFAULT NULL,
   mgmt_p2                   IN NUMBER   DEFAULT NULL,
   mgmt_p3                   IN NUMBER   DEFAULT NULL,
   mgmt_p4                   IN NUMBER   DEFAULT NULL,
   mgmt_p5                   IN NUMBER   DEFAULT NULL,
   mgmt_p6                   IN NUMBER   DEFAULT NULL,
   mgmt_p7                   IN NUMBER   DEFAULT NULL,
   mgmt_p8                   IN NUMBER   DEFAULT NULL,
   switch_io_megabytes       IN NUMBER   DEFAULT NULL,
   switch_io_reqs            IN NUMBER   DEFAULT NULL,
   switch_for_call           IN BOOLEAN  DEFAULT NULL);
```

Parameters

Table 105–6 CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
`plan`	The name of the resource plan.
`group_or_subplan`	The name of the consumer group or subplan.
`comment`	Comment for the plan directive.
`cpu_p1`	First parameter for the CPU resources allocation method (deprecated use `mgmt_p1` instead)
`cpu_p2`	Second parameter for the CPU resources allocation method (deprecated use `mgmt_p2` instead)
`cpu_p3`	Third parameter for the CPU resources allocation method (deprecated use `mgmt_p3` instead)

Table 105–6 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
cpu_p4	Fourth parameter for the CPU resources allocation method (deprecated use mgmt_p4 instead)
cpu_p5	Fifth parameter for the CPU resources allocation method (deprecated use mgmt_p5 instead)
cpu_p6	Sixth parameter for the CPU resources allocation method (deprecated use mgmt_p6 instead)
cpu_p7	Seventh parameter for the CPU resources allocation method (deprecated use mgmt_p7 instead)
cpu_p8	Eighth parameter for the CPU resources allocation method (deprecated use mgmt_p8 instead)
active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
parallel_degree_ limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
switch_group	Specifies consumer group to switch to, once a switch condition is met. If the group name is 'CANCEL_SQL', then the current call is canceled when the switch condition is met. If the group name is 'KILL_SESSION', then the session is killed when the switch condition is met. Default is NULL.
switch_time	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
max_est_exec_time	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
undo_pool	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
max_idle_blocker_ time	The maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource.
switch_time_in_call	Deprecated. If this parameter is specified, switch_time will be effectively set to switch_time_in_call and switch_ for_call will be effectively set to TRUE.
mgmt_p1	Resource allocation value for level 1 (replaces cpu_p1): ■ EMPHASIS - specifies the resource percentage at the first level ■ RATIO - specifies the weight of resource usage

Table 105–6 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
mgmt_p2	Resource allocation value for level 2 (replaces cpu_p2) ■ EMPHASIS - specifies the resource percentage at the second level ■ RATIO - non-applicable
mgmt_p3	Resource allocation value for level 3 (replaces cpu_p3) ■ EMPHASIS - specifies the resource percentage at the third level ■ RATIO - non-applicable
mgmt_p4	Resource allocation value for level 4 (replaces cpu_p4) ■ EMPHASIS - specifies the resource percentage at the fourth level ■ RATIO - non-applicable
mgmt_p5	Resource allocation value for level 5 (replaces cpu_p5) ■ EMPHASIS - specifies the resource percentage at the fifth level ■ RATIO - non-applicable
mgmt_p6	Resource allocation value for level 6 (replaces cpu_p6) ■ EMPHASIS - specifies the resource percentage at the sixth level ■ RATIO - non-applicable
mgmt_p7	Resource allocation value for level 7 (replaces cpu_p7) ■ EMPHASIS - specifies the resource percentage at the seventh level ■ RATIO - non-applicable
mgmt_p8	Resource allocation value for level 8 (replaces cpu_p8) ■ EMPHASIS - specifies the resource percentage at the eighth level ■ RATIO - non-applicable
switch_io_megabytes	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited.
switch_io_reqs	Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited.
switch_for_call	Specifies that if an action is taken because of the switch_time, switch_io_megabytes, or switch_io_reqs parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is FALSE, which means that the original consumer group is not restored at the end of the top call.

Usage Notes

- All parameters default to NULL. However, for the EMPHASIS CPU resource allocation method, this case would starve all the users.

- For `max_idle_time` and `max_idle_blocker_time`, `PMON` will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using `switch_time_in_call`, the resource usage of one client will not affect a future client that happens to be executed on the same session.

CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the CREATE_CONSUMER_GROUP and CREATE_RESOURCE_PLAN_DIRECTIVES procedures separately.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
   simple_plan      IN  VARCHAR2  DEFAULT NULL,
   consumer_group1  IN  VARCHAR2  DEFAULT NULL,
   group1_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group2  IN  VARCHAR2  DEFAULT NULL,
   group2_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group3  IN  VARCHAR2  DEFAULT NULL,
   group3_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group4  IN  VARCHAR2  DEFAULT NULL,
   group4_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group5  IN  VARCHAR2  DEFAULT NULL,
   group5_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group6  IN  VARCHAR2  DEFAULT NULL,
   group6_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group7  IN  VARCHAR2  DEFAULT NULL,
   group7_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group8  IN  VARCHAR2  DEFAULT NULL,
   group8_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   group1_percent   IN  NUMBER    DEFAULT NULL,
   group2_percent   IN  NUMBER    DEFAULT NULL,
   group3_percent   IN  NUMBER    DEFAULT NULL,
   group4_percent   IN  NUMBER    DEFAULT NULL,
   group5_percent   IN  NUMBER    DEFAULT NULL,
   group6_percent   IN  NUMBER    DEFAULT NULL,
   group7_percent   IN  NUMBER    DEFAULT NULL,
   group8_percent   IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 105–7 CREATE_SIMPLE_PLAN Procedure Parameters

Parameter	Description
simple_plan	The name of the resource plan.
consumer_group1	Name of the consumer group
group1_cpu	Percentage for group (deprecated)
consumer_group2	Name of the consumer group
group2_cpu	Percentage for group (deprecated)
consumer_group3	Name of the consumer group
group3_cpu	Percentage for group (deprecated)
consumer_group4	Name of the consumer group
group4_cpu	Percentage for group (deprecated)
consumer_group5	Name of the consumer group
group5_cpu	Percentage for group (deprecated)

Table 105–7 (Cont.) CREATE_SIMPLE_PLAN Procedure Parameters

Parameter	Description
consumer_group6	Name of the consumer group
group6_cpu	Percentage for group (deprecated)
consumer_group7	Name of the consumer group
group7_cpu	Percentage for group (deprecated)
consumer_group8	Name of the consumer group
group8_cpu	Percentage for group (deprecated)
group1_percent	Percentage of resources allocated for this consumer group
group2_percent	Percentage of resources allocated for this consumer group
group3_percent	Percentage of resources allocated for this consumer group
group4_percent	Percentage of resources allocated for this consumer group
group5_percent	Percentage of resources allocated for this consumer group
group6_percent	Percentage of resources allocated for this consumer group
group7_percent	Percentage of resources allocated for this consumer group
group8_percent	Percentage of resources allocated for this consumer group

DELETE_CONSUMER_GROUP Procedure

This procedure delete entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (
   consumer_group IN VARCHAR2);
```

Parameters

Table 105–8 DELETE_CONSUMER_GROUP Procedure Parameters

Parameters	Description
consumer_group	The name of the consumer group to be deleted.

DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (
   plan IN VARCHAR2);
```

Parameters

Table 105–9 DELETE_PLAN Procedure Parameters

Parameter	Description
plan	The name of the resource plan to delete.

DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (
   plan IN VARCHAR2);
```

Parameters

Table 105–10 DELETE_PLAN_CASCADE Procedure Parameters

Parameters	Description
plan	The name of the plan.

Usage Notes

If DELETE_PLAN_CASCADE encounters any error, then it rolls back, and nothing is deleted.

DELETE_PLAN_DIRECTIVE Procedure

This procedure deletes resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (
   plan              IN VARCHAR2,
   group_or_subplan  IN VARCHAR2);
```

Parameters

Table 105–11 DELETE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
`plan`	The name of the resource plan.
`group_or_subplan`	The name of the group or subplan.

SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING(
   attribute       IN VARCHAR2,
   value            IN VARCHAR2,
   consumer_group  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 105–12 SET_CONSUMER_GROUP_MAPPING Procedure Parameters

Parameters	Description
`attribute`	The mapping attribute to add/modify. It can be one of the Constants listed.
`value`	The attribute value to match.
`consumer_group`	The name of the mapped consumer group, or `NULL` to delete a mapping.

Usage Notes

If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the `consumer_group` argument is `NULL`, then any mapping from the given attribute and value will be deleted.

SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI(
   explicit               IN NUMBER,
   oracle_user            IN NUMBER,
   service_name           IN NUMBER,
   client_os_user         IN NUMBER,
   client_program         IN NUMBER,
   client_machine         IN NUMBER,
   module_name            IN NUMBER,
   module_name_action     IN NUMBER,
   service_module         IN NUMBER,
   service_module_action  IN NUMBER);
```

Parameters

Table 105–13 SET_CONSUMER_GROUP_MAPPING_PRI Procedure Parameters

Parameters	Description
`explicit`	The priority of the explicit mapping.
`oracle_user`	The priority of the Oracle user name mapping.
`service_name`	The priority of the client service name mapping.
`client_os_user`	The priority of the client operating system user name mapping.
`client_program`	The priority of the client program mapping.
`client_machine`	The priority of the client machine mapping.
`module_name`	The priority of the application module name mapping.
`module_name_action`	The priority of the application module name and action mapping.
`service_module`	The priority of the service name and application module name mapping.
`module_name_action`	The priority of the service name, application module name, and application action mapping.

Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
  - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 10. Together, they establish an ordering where 1 is the highest priority and 10 is the lowest.

SET_INITIAL_CONSUMER_GROUP Procedure

> **Note:** This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs. This procedure sets the initial resource consumer group for a user.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
   user           IN VARCHAR2,
   consumer_group IN VARCHAR2);
```

Parameters

Table 105–14 SET_INITIAL_CONSUMER_GROUP Procedure Parameters

Parameters	Description
`user`	The name of the user.
`consumer_group`	The user's initial consumer group.

Usage Notes

The `ADMINISTER_RESOURCE_MANAGER` or the `ALTER USER` system privilege are required to be able to execute this procedure. The user, or `PUBLIC`, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

> **Note:** These semantics are similar to those for `ALTER USER DEFAULT ROLE`.

If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: `DEFAULT_CONSUMER_GROUP`.

`DEFAULT_CONSUMER_GROUP` has switch privileges granted to `PUBLIC`; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have `DEFAULT_CONSUMER_GROUP` as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to `DEFAULT_CONSUMER_GROUP`.

SUBMIT_PENDING_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

> **Note:** A call to SUBMIT_PENDING_AREA may fail even if VALIDATE_PENDING_AREA succeeds. This may happen if a plan being deleted is loaded by an instance after a call to VALIDATE_PENDING_AREA, but before a call to SUBMIT_PENDING_AREA.

Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (
   session_id      IN NUMBER,
   session_serial  IN NUMBER,
   consumer_group  IN VARCHAR2);
```

Parameters

Table 105–15 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure Parameters

Parameter	Description
session_id	SID column from the view V$SESSION.
session_serial	SERIAL# column from view V$SESSION.
consumer_group	The name of the consumer group to switch to.

SWITCH_CONSUMER_GROUP_FOR_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also change the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
   user            IN VARCHAR2,
   consumer_group  IN VARCHAR2);
```

Parameters

Table 105–16 SWITCH_CONSUMER_GROUP_FOR_USER Procedure Parameters

Parameter	Description
`user`	The name of the user.
`consumer_group`	The name of the consumer group to switch to.

Usage Notes

The SWITCH_CONSUMER_GROUP_FOR_SESS Procedure and `SWITCH_CONSUMER_GROUP_FOR_USER` procedures let you to raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.

These procedures cause the session to be moved into the newly specified consumer group immediately.

SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
   plan_name                    IN   VARCHAR2,
   sid                          IN   VARCHAR2 DEFAULT '*',
   allow_scheduler_plan_switches IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 105–17 SWITCH_PLAN Procedure Parameters

Parameter	Description
`plan_name`	The name of the plan to which to switch. Passing in an empty string ('') for the `plan_name`, disables the resource manager
`sid`	The `sid` parameter is relevant only in a Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the `sid` of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.
`allow_scheduler_ plan_switches`	`FALSE` - disables automated plan switches by the job scheduler at window boundaries. To re-enable automated plan switches, switch_plan must be called again by the administrator with `allow_scheduler_plan_switches` set to `TRUE`. By default automated plan switches by the job scheduler are enabled.

UPDATE_CONSUMER_GROUP Procedure

This procedure updates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
   consumer_group  IN VARCHAR2,
   new_comment     IN VARCHAR2 DEFAULT NULL,
   new_cpu_mth     IN VARCHAR2 DEFAULT NULL,
   new_mgmt_mth    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 105–18 UPDATE_CONSUMER_GROUP Procedure Parameter

Parameter	Description
consumer_group	The name of consumer group
new_comment	New user's comment
new_cpu_mth	Name of new method for CPU resource allocation (deprecated)
new_mgmt_mth	Name of new method for CPU resource allocation

Usage Notes

If the parameters to the UPDATE_CONSUMER_GROUP procedure are not specified, then they remain unchanged in the data dictionary.

UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
   plan                              IN VARCHAR2,
   new_comment                       IN VARCHAR2 DEFAULT NULL,
   new_cpu_mth                       IN VARCHAR2 DEFAULT NULL, -- deprecated
   new_active_sess_pool_mth          IN VARCHAR2 DEFAULT NULL,
   new_parallel_degree_limit_mth     IN VARCHAR2 DEFAULT NULL,
   new_queueing_mth                  IN VARCHAR2 DEFAULT NULL,
   new_queueing_mth                  IN VARCHAR2 DEFAULT NULL,
   new_mgmt_mth                      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 105–19 UPDATE_PLAN Procedure Parameters

Parameter	Description
`plan`	The name of resource plan.
`new_comment`	New user's comment.
`new_cpu_mth`	The name of new allocation method for CPU resources (deprecated).
`new_active_sess_pool_mth`	The name of new method for maximum active sessions.
`new_parallel_degree_limit_mth`	The name of new method for degree of parallelism.
`new_queueing_mth`	Specifies type of queuing policy to use with active session pool feature.
`new_mgmt_mth`	The resource allocation method for specifying how much resources (e.g. CPU or I/O) each consumer group or sub-plan gets ▪ `EMPHASIS` - for multi-level plans that use percentages to specify how I/O is resources are distributed among consumer groups. ▪ `RATIO` - for single-level plans that use ratios to specify how I/O is resources are distributed.

Usage Notes

- If the parameters to UPDATE_PLAN Procedure are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

UPDATE_PLAN_DIRECTIVE Procedure

This procedure updates resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
   plan                          IN VARCHAR2,
   group_or_subplan              IN VARCHAR2,
   new_comment                   IN VARCHAR2 DEFAULT NULL,
   new_cpu_p1                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p2                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p3                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p4                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p5                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p6                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p7                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p8                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_active_sess_pool_p1       IN NUMBER   DEFAULT NULL,
   new_queueing_p1               IN NUMBER   DEFAULT NULL,
   new_parallel_degree_limit_p1  IN NUMBER   DEFAULT NULL,
   new_switch_group              IN VARCHAR2 DEFAULT NULL,
   new_switch_time               IN NUMBER   DEFAULT NULL,
   new_switch_estimate           IN BOOLEAN  DEFAULT FALSE,
   new_max_est_exec_time         IN NUMBER   DEFAULT NULL,
   new_undo_pool                 IN NUMBER   DEFAULT NULL,
   new_max_idle_time             IN NUMBER   DEFAULT NULL,
   new_max_idle_blocker_time     IN NUMBER   DEFAULT NULL,
   switch_time_in_call           IN NUMBER   DEFAULT NULL, -- deprecated
   mgmt_p1                       IN NUMBER   DEFAULT NULL,
   mgmt_p2                       IN NUMBER   DEFAULT NULL,
   mgmt_p3                       IN NUMBER   DEFAULT NULL,
   mgmt_p4                       IN NUMBER   DEFAULT NULL,
   mgmt_p5                       IN NUMBER   DEFAULT NULL,
   mgmt_p6                       IN NUMBER   DEFAULT NULL,
   mgmt_p7                       IN NUMBER   DEFAULT NULL,
   mgmt_p8                       IN NUMBER   DEFAULT NULL,
   switch_io_megabytes           IN NUMBER   DEFAULT NULL,
   switch_io_reqs                IN NUMBER   DEFAULT NULL,
   switch_for_call               IN BOOLEAN  DEFAULT NULL);
```

Parameters

Table 105–20 UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the consumer group or subplan.
new_comment	Comment for the plan directive.
new_cpu_p1	First parameter for the CPU resources allocation method ((deprecated - use new_mgmt_p1 instead)
new_cpu_p2	Parameter for the CPU resources allocation method ((deprecated - use new_mgmt_p2 instead)
new_cpu_p3	Parameter for the CPU resources allocation method (deprecated - use new_mgmt_p3 instead)

Table 105–20 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
new_cpu_p4	Parameter for the CPU resources allocation method (deprecated- use new_mgmt_p4 instead)
new_cpu_p5	Parameter for the CPU resources allocation method (deprecated - use new_mgmt_p5 instead)
new_cpu_p6	Parameter for the CPU resources allocation method (deprecated- use new_mgmt_p6 instead)
new_cpu_p7	Parameter for the CPU resources allocation method (deprecated- use new_mgmt_p7 instead)
new_cpu_p8	Parameter for the CPU resources allocation method (deprecated- use new_mgmt_p8 instead)
new_active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
new_queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
new_switch_group	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited. Switches to another group once a switch condition is met.
new_switch_time	Specifies consumer group to which this session is switched if other switch criteria is met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
new_switch_estimate	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
new_max_est_exec_time	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
new_undo_pool	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
new_parallel_degree_limit_p1	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
new_max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
new_max_idle_blocker_time	The maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource.
new_switch_time_in_call	Deprecated. If this parameter is specified, new_switch_time will be effectively set to new_switch_time_in_call and new_switch_for_call will be effectively set to TRUE.
new_mgmt_p1	Resource allocation value for level 1 (replaces new_cpu_p1): ■ EMPHASIS - specifies the resource percentage at the first level ■ RATIO - specifies the weight of resource usage

Table 105–20 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
new_mgmt_p2	Resource allocation value for level 2 (replaces new_cpu_p2) ■ EMPHASIS - specifies the resource percentage at the second level ■ RATIO - non-applicable
new_mgmt_p3	Resource allocation value for level 3 (replaces new_cpu_p3) ■ EMPHASIS - specifies the resource percentage at the third level ■ RATIO - non-applicable
new_mgmt_p4	Resource allocation value for level 4 (replaces new_cpu_p4) ■ EMPHASIS - specifies the resource percentage at the fourth level ■ RATIO - non-applicable
new_mgmt_p5	Resource allocation value for level 5 (replaces new_cpu_p5) ■ EMPHASIS - specifies the resource percentage at the fifth level ■ RATIO - non-applicable
new_mgmt_p6	Resource allocation value for level 6 (replaces new_cpu_p6) ■ EMPHASIS - specifies the resource percentage at the sixth level ■ RATIO - non-applicable
new_mgmt_p7	Resource allocation value for level 7 (replaces new_cpu_p7) ■ EMPHASIS - specifies the resource percentage at the seventh level ■ RATIO - non-applicable
new_mgmt_p8	Resource allocation value for level 8 (replaces new_cpu_p8) ■ EMPHASIS - specifies the resource percentage at the eighth level ■ RATIO - non-applicable
new_switch_io_megabytes	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited.
new_switch_io_reqs	Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited.
new_switch_for_call	Specifies that if an action is taken because of the new_switch_time, new_switch_io_megabytes, or new_switch_io_reqs parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is FALSE, which means that the original consumer group is not restored at the end of the top call.

Usage Notes

- If the parameters for UPDATE_PLAN_DIRECTIVE are left unspecified, then they remain unchanged in the data dictionary.

- For `new_max_idle_time` and `new_max_idle_blocker_time`, `PMON` will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.

VALIDATE_PENDING_AREA Procedure

This procedure validates pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

106

DBMS_RESOURCE_MANAGER_PRIVS

The `DBMS_RESOURCE_MANAGER_PRIVS` package maintains privileges associated with the Resource Manager.

> **See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

- Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

Table 106–1 DBMS_RESOURCE_MANAGER_PRIVS Package Subprograms

Subprogram	Description
GRANT_SWITCH_ CONSUMER_GROUP Procedure on page 106-3	Grants the privilege to switch to resource consumer groups
GRANT_SYSTEM_PRIVILEGE Procedure on page 106-4	Performs a grant of a system privilege
REVOKE_SWITCH_ CONSUMER_GROUP Procedure on page 106-5	Revokes the privilege to switch to resource consumer groups.
REVOKE_SYSTEM_PRIVILEGE Procedure on page 106-6	Performs a revoke of a system privilege

GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
   grantee_name   IN VARCHAR2,
   consumer_group IN VARCHAR2,
   grant_option   IN BOOLEAN);
```

Parameters

Table 106–2 GRANT_SWITCH_CONSUMER_GROUP Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
consumer_group	Name of consumer group.
grant_option	TRUE if grantee should be allowed to grant access, FALSE otherwise.

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the grant_option parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

See Also: Chapter 105, "DBMS_RESOURCE_MANAGER"

Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
 'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
  dbms_resource_manager.oracle_user, 'scott','mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
   grantee_name   IN VARCHAR2,
   privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
   admin_option   IN BOOLEAN);
```

Parameters

Table 106–3 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
privilege_name	Name of the privilege to be granted.
admin_option	TRUE if the grant is with admin_option, FALSE otherwise.

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: ADMINISTER_RESOURCE_MANAGER. Database administrators have this system privilege with the ADMIN option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the ADMIN option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called scott without the ADMIN option:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
 grantee_name => 'scott',
 privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
 admin_option => FALSE);
END;
/
```

REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
   revokee_name   IN VARCHAR2,
   consumer_group IN VARCHAR2);
```

Parameters

Table 106–4 REVOKE_SWITCH_CONSUMER_GROUP Procedure Parameter

Parameter	Description
revokee_name	Name of user/role from which to revoke access.
consumer_group	Name of consumer group.

Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the DEFAULT_CONSUMER_GROUP consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from PUBLIC, then any users who could previously only use the consumer group through PUBLIC will not be able to switch to that consumer group.

Examples

The following example revokes the privileges to switch to mail_maintenance_group from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
 'scott', 'mail_maintenance_group');
END;
/
```

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
   revokee_name   IN VARCHAR2,
   privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

Parameters

Table 106–5 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
revokee_name	Name of the user or role from whom privilege is to be revoked.
privilege_name	Name of the privilege to be revoked.

Examples

The following call revokes the ADMINISTER_RESOURCE_MANAGER from user scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```

107

DBMS_RESULT_CACHE

The DBMS_RESULT_CACHE package provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache. Both these caches use the same infrastructure. Therefore, for example, DBMS_RESULT_CACHE.BYPASS determines whether both caches are bypassed or both caches are used, and DBMS_RESULT_CACHE.FLUSH flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about "Using the Cross-Session PL/SQL Function Result Cache"
- *Oracle Database Performance Tuning Guide* for more information about "Result Cache Concepts"

This chapter contains the following topics:

- Using DBMS_RESULT_CACHE
  - Constants
- Summary of DBMS_RESULT_CACHE Subprograms

Using DBMS_RESULT_CACHE

- Constants

Constants

Table 107–1 DBMS_RESULT_CACHE Constants

Constant	Definition
STATUS_CLSD	CONSTANT VARCHAR(10) := 'CLOSED';
STATUS_OPEN	CONSTANT VARCHAR(10) := 'OPEN';
STATUS_SYNC	CONSTANT VARCHAR(10) := 'SYNC';

Summary of DBMS_RESULT_CACHE Subprograms

Table 107–2 DBMS_RESULT_CACHE Package Subprograms

Subprogram	Description
BYPASS Procedure on page 107-5	Sets the bypass mode for the Result Cache
FLUSH Function & Procedure on page 107-6	Attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics
INVALIDATE Functions & Procedures on page 107-7	Invalidates all the result-set objects that dependent upon the specified dependency object
INVALIDATE_OBJECT Functions & Procedures on page 107-8	Invalidates the specified result-set object(s)
MEMORY_REPORT Procedure on page 107-9	Produces the memory usage report for the Result Cache
STATUS Function on page 107-10	Checks the status of the Result Cache

BYPASS Procedure

This procedure sets the bypass mode for the Result Cache:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

Syntax

```
DBMS_RESULT_CACHE.BYPASS (
   bypass_mode IN BOOLEAN);
```

Parameters

Table 107–3 BYPASS Procedure Parameters

Parameter	Description
bypass_mode	■ TRUE => Result Cache usage is bypassed ■ FALSE => Result Cache usage is turned on

Usage Notes

This operation is database instance specific.

Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated with the result cache function are not automatically flushed (if the instance is not restarted/bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.

   ```
   BEGIN
      DBMS_RESULT_CACHE.BYPASS(TRUE);
      DBMS_RESULT_CACHE.FLUSH;
   END;
   /
   ```

   This step must be performed on each instance if in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.
3. Resume use of the result cache, by turning off the cache bypass mode.

   ```
   BEGIN
      DBMS_RESULT_CACHE.BYPASS(FALSE);
   END;
   /
   ```

   This step must be performed on each instance if in a Oracle Real Application Clusters environment.

FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

Syntax

```
DBMS_RESULT_CACHE.FLUSH (
   retainMem  IN  BOOLEAN DEFAULT FALSE,
   retainSta  IN  BOOLEAN DEFAULT FALSE)
  RETURN BOOLEAN;

DBMS_RESULT_CACHE.FLUSH (
   retainMem  IN  BOOLEAN DEFAULT FALSE,
   retainSta  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 107–4 FLUSH Function & Procedure Parameters

Parameter	Description
`retainMem`	■ `TRUE` => retains the free memory in the cache ■ `FALSE` (default) => releases the free memory to the system
`retainSta`	■ `TRUE` => retains the existing cache statistics ■ `FALSE` (default) => clears the existing cache statistics

Return Values

`TRUE` if successful in removing all the objects.

INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE (
   owner        IN  VARCHAR2,
   name         IN  VARCHAR2)
 RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE (
   owner       IN  VARCHAR2,
   name        IN  VARCHAR2);

DBMS_RESULT_CACHE.INVALIDATE (
  object_id    IN BINARY_INTEGER)
 RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE (
   object_id    IN BINARY_INTEGER);
```

Parameters

Table 107–5 INVALIDATE Function & Procedure Parameters

Parameter	Description
owner	Schema name
name	Object name
object_id	Dictionary object number

Return Values

The number of objects invalidated.

INVALIDATE_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
   id          IN  BINARY_INTEGER)
 RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
   id          IN  BINARY_INTEGER);

DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  cache_id     IN  VARCHAR2)
 RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
   cache_id   IN  VARCHAR2);
```

Parameters

Table 107–6 INVALIDATE Function & Procedure Parameters

Parameter	Description
`id`	Address of the cache object in the Result Cache
`cache_id`	Cache-id

Return Values

The number of objects invalidated.

MEMORY_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.MEMORY_REPORT (
   detailed   IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 107–7 MEMORY_REPORT Procedure Parameters

Parameter	Description
`detailed`	■ `TRUE` => produces a more detailed report ■ `FALSE` (default) => produces the standard report

Usage Notes

Invoking this procedure from SQL*Plus requires that the serveroutput be turned on.

STATUS Function

This function checks the status of the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.STATUS
   RETURN VARCHAR2;
```

Return Values

One of the following values:

- `STATUS_CLSD` - Cache is not available
- `STATUS_OPEN` - Cache is available
- `STATUS_SYNC` - Cache is available, but synchronizing with RAC nodes

108

DBMS_RESUMABLE

With the DBMS_RESUMABLE package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- Using DBMS_RESUMABLE
  - Operational Notes
- Summary of DBMS_RESUMABLE Subprograms

Using DBMS_RESUMABLE

- Operational Notes

Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

Summary of DBMS_RESUMABLE Subprograms

Table 108–1 DBMS_RESUMABLE Package Subprograms

Subprogram	Description
ABORT Procedure on page 108-5	Aborts a suspended resumable space allocation
GET_SESSION_TIMEOUT Function on page 108-6	Returns the current timeout value of the resumable space allocations for a session with `session_id`
GET_TIMEOUT Function on page 108-7	Returns the current timeout value of resumable space allocations for the current session
SET_SESSION_TIMEOUT Procedure on page 108-8	Sets the timeout of resumable space allocations for a session with `session_id`
SET_TIMEOUT Procedure on page 108-9	Sets the timeout of resumable space allocations for the current session
SPACE_ERROR_INFO Function on page 108-10	Looks for space-related errors in the error stack, otherwise returning `FALSE`

ABORT Procedure

This procedure aborts a suspended resumable space allocation. The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

Syntax

```
DBMS_RESUMABLE.ABORT (
   session_id  IN NUMBER);
```

Parameters

Table 108–2 ABORT Procedure Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.

Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (
   session_id  IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 108–3 GET_SESSION_TIMEOUT Function Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.

Return Values

Table 108–4 GET_SESSION_TIMEOUT Function Return Values

Return Value	Description
`NUMBER`	The current timeout value of resumable space allocations for a session with session_id.The timeout is returned in seconds.

Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT
 RETURN NUMBER;
```

Return Values

Table 108–5 GET_TIMEOUT Function Return Values

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for the current session. The returned value is in seconds.

Usage Notes

If the current session is not resumable enabled, the GET_TIMEOUT function returns -1.

SET_SESSION_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`. The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (
   session_id  IN NUMBER,
   timeout     IN NUMBER);
```

Parameters

Table 108–6 SET_SESSION_TIMEOUT Procedure Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.
`timeout`	The timeout of the resumable space allocation.

SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (
   timeout  IN NUMBER);
```

Parameters

Table 108–7 SET_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The timeout of the resumable space allocation.

SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack. If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
   error_type        OUT VARCHAR2,
   object_type       OUT VARCHAR2,
   object_owner      OUT VARCHAR2,
   table_space_name  OUT VARCHAR2,
   object_name       OUT VARCHAR2,
   sub_object_name   OUT VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 108–8 SPACE_ERROR_INFO Function Parameters

Parameter	Description
`error_type`	The space error type. It will be one of the following: ■ `NO MORE SPACE` ■ `MAX EXTENTS REACHED` ■ `SPACE QUOTA EXCEEDED`
`object_type`	The object type. It will be one of the following: ■ TABLE ■ INDEX ■ CLUSTER ■ TABLE SPACE ■ ROLLBACK SEGMENT ■ UNDO SEGMENT ■ LOB SEGMENT ■ TEMP SEGMENT ■ INDEX PARTITION ■ TABLE PARTITION ■ LOB PARTITION ■ TABLE SUBPARTITION ■ INDEX SUBPARTITION ■ LOB SUBPARTITION The type can also be `NULL` if it does not apply.
`object_owner`	The owner of the object. `NULL` if it cannot be determined.
`table_space_name`	The table space where the object resides. `NULL` if it cannot be determined.
`object_name`	The name of rollback segment, temp segment, table, index, or cluster.
`sub_object_name`	The partition name or sub-partition name of `LOB, TABLE,` or `INDEX. NULL` if it cannot be determined.

109

DBMS_RLMGR

The `DBMS_RLMGR` package contains various procedures to create and manage rules and rule sessions by the Rules Manager.

> **See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topic:

- Summary of Rules Manager Subprograms

Summary of Rules Manager Subprograms

Table 109–1 describes the subprograms in the DBMS_RLMGR package.

All the values and names passed to the procedures defined in the DBMS_RLMGR package are case insensitive unless otherwise mentioned. In order to preserve the case, double quotation marks should be used around the values.

Table 109–1 DBMS_RLMGR Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the event structure (also the Expression Filter attribute set)
ADD_EVENT Procedures	Adds an event to a rule class in an active session
ADD_FUNCTIONS Procedure	Adds a Function, a Type, or a Package to the approved list of functions with an event structure (also the Expression Filter attribute set)
ADD_RULE Procedure	Adds a rule to the rule class
CONDITION_REF Function	Retrieves the primitive rule condition reference from a rule condition for composite events
CONSUME_EVENT Function	Consumes an event using its identifiers and prepares the corresponding rule for action execution
CONSUME_PRIM_EVENTS Function	Consumes one or more primitive events with all or none semantics
CREATE_CONDITIONS_TABLE Procedure	Creates a repository for the primitive rule conditions that can be shared by multiple rules from the same or different rule classes
CREATE_EVENT_STRUCT Procedure	Creates an event structure
CREATE_EXPFIL_INDEXES Procedure	Creates expression filter indexes for the rule class if the default indexes have been dropped
CREATE_INTERFACE Procedure	Creates a rule class interface package to directly operate on the rule class
CREATE_RULE_CLASS Procedure	Creates a rule class
DELETE_RULE Procedure	Deletes a rule from a rule class
DROP_CONDITIONS_TABLE Procedure	Drops the conditions table
DROP_EVENT_STRUCT Procedure	Drops an event structure
DROP_EXPFIL_INDEXES Procedure	Drops Expression Filter indexes for the rule conditions
DROP_INTERFACE Procedure	Drops the rule class interface package
DROP_RULE_CLASS Procedure	Drops a rule class
EXTEND_EVENT_STRUCT Procedure	Adds an attribute to the primitive event structure
GET_AGGREGATE_VALUE Function	Retrieves the aggregate value computed for a collection event
GRANT_PRIVILEGE Procedure	Grants a privilege on a rule class to another user
PROCESS_RULES Procedure	Process the rules for a given event

Table 109–1 (Cont.) DBMS_RLMGR Package Subprograms

Subprogram	Description
PURGE_EVENTS Procedure	Resets the rule class by removing all the events associated with the rule class and purging any state information pertaining to rules matching some events
RESET_SESSION Procedure	Starts a new rule session within a database session
REVOKE_PRIVILEGE Procedure	Revokes a privilege on a rule class from a user
SYNC_TEXT_INDEXES Procedure	Synchronizes the indexes defined to process the predicates involving the CONTAINS operator in rule conditions

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to an event structure, which is also the Expression Filter attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
              event_struct   IN   VARCHAR2,
              attr_name      IN   VARCHAR2,
              attr_type      IN   VARCHAR2,
              attr_defvl     IN   VARCHAR2 default NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the event structure:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
              event_struct   IN   VARCHAR2,
              attr_name      IN   VARCHAR2,
              tab_alias      IN   rlm$table_alias);
```

Allows addition of text attributes to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
              event_struct   IN   VARCHAR2,
              attr_name      IN   VARCHAR2,
              attr_type      IN   VARCHAR2,
              text_pref      IN   EXF$TEXT);
```

Parameters

Table 109–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
`event_struct`	Name of the event structure or attribute set to which this attribute is added
`attr_name`	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
`attr_type`	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
`tab_alias`	The type that identifies the database table to which the attribute is aliased
`attr_defv1`	Default value for the elementary attribute
`text_pref`	Text preferences such as LEXER and WORDLIST specification

Usage Notes

- This procedure adds an elementary attribute to an event structure. The event structure is internally managed as the Expression Filter attribute set. If the event structure was originally created from an existing object type, then additional attributes cannot be added.

Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions, which is equivalent to an event structure that is used for a rule class.

- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a `ROWID` from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more information about table aliases, see Appendix A in *Oracle Database Rules Manager and Expression Filter Developer's Guide*.
- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ ATTRIBUTES.
- This procedure with a text preference bound to the `text_pref` argument creates a text attribute in the attribute set. The data type for such an attribute should be a VARCHAR2 or a CLOB. The preferences specified for a text attribute are used to process the predicates involving CONTAINS operator on the attributes. The valid preferences are those that are valid in the PARAMETERS clause of CTXRULE index creation. See *Oracle Text Application Developer's Guide* for the syntax.

Examples

The following commands adds two elementary attributes to an attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'HRAttrSet',
                        ATTR_NAME => 'HRREP',
                        attr_type => 'VARCHAR2');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'HRAttrSet',
                        ATTR_NAME => 'DEPT',
                        TAB_ALIAS => RLM$TABLE_ALIAS('DEPT'));
END;
```

The following commands create an attribute set with each hotel reservation including some additional information, described as the `AddlInfo` attribute of CLOB datatype. Rule conditions specified for this event structure can include text predicates on this attribute.

```
BEGIN
  DBMS_RLMGR.CREATE_EVENT_STRUCT (EVENT_STRUCT => 'AddFlight');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'AddHotel',
                        ATTR_NAME => 'CustId',
                        ATTR_TYPE => 'NUMBER');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'AddHotel',
                        ATTR_NAME => 'Type',
                        ATTR_TYPE => 'VARCHAR2(20)');
  . . .
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'AddHotel',
                        ATTR_NAME => 'AddlInfo',
```

```
                                ATTR_TYPE => 'CLOB',
                                TEXT_PREF => EXF$TEXT('LEXER hotelreserv_lexer'));
END;
```

ADD_EVENT Procedures

This procedure adds a primitive event to a rule class in an active rule session. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds a string representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
   rule_class      IN VARCHAR2,
   event_inst      IN VARCHAR2,
   event_type      IN VARCHAR2 default null);
```

Adds an AnyData representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
   rule_class      IN VARCHAR2,
   event_inst      IN sys.AnyData);
```

Parameters

Table 109–3 ADD_EVENT Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to add a primitive or a simple event to a rule class within an active rule session. By default, a rule session is the same as the database session. Optionally, multiple (sequential) rule sessions can be started within a database session by using the RESET_SESSION or PROCESS_RULES procedures.
- When the rule class is configured for simple events (consisting of only one primitive event structure), the event_type argument for the ADD_EVENT procedure can be ignored. Also, when the AnyData format of the event instance is passed, the event type information is embedded in the AnyData instance. In all other cases, the name of the primitive event structure being added to the rule class should be assigned to the event_type argument.
- For a valid event instance, the ADD_EVENT procedure processes the rules in the rule class and captures the results in the rule class results view (configured at the time of rule class creation). These results are preserved until the end of the rule session.
- When schema extended name is used for the rule class, you should have PROCESS RULES privilege on the rule class. See the GRANT_PRIVILEGE Procedure for additional information. The value specified for the event_type argument is always resolved in the rule class owner's schema and should not use schema extended names. When a composite event structure is configured with a table alias

primitive event type, the name of the corresponding table should be assigned to the `event_type` argument.

Examples

The following commands add two events to the CompTravelPromo rule class that is configured for two types of primitive events (AddFlight and AddRentalCar).

```
BEGIN
 DBMS_RLMGR.ADD_EVENT(rule_class => 'CompTravelPromo',
                      event_inst =>
                         AddFlight.getVarchar(987, 'Abcair', 'Boston',
                                              'Orlando', '01-APR-2003', '08-APR-2003'),
                      event_type => 'AddFlight');

DBMS_RLMGR.ADD_EVENT(rule_class => 'Scott.CompTravelPromo',
                      event_inst =>
                         AnyData.convertObject(
                                        AddRentalCar(987, 'Luxury', '03-APR-2003',
                                                     '08-APR-2003', NULL)));
END;
/
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the event structure, which is also the Expression Filter attribute set.

Syntax

```
DBMS_RLMGR.ADD_FUNCTIONS (
   event_struct   IN   VARCHAR2,
   funcs_name     IN   VARCHAR2);
```

Parameters

Table 109–4 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
`event_struct`	Name of the event structure to which the functions are added
`funcs_name`	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle supplied SQL functions for use in the rule conditions. If the expression set refers to a user-defined function, the expression set must be explicitly added to the attribute set.
- The `ADD_FUNCTIONS` procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list.
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the rule condition are considered valid. The conditional expression can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding functions to an attribute set.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ASET_FUNCTIONS`

Examples

The following commands add two functions to the attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_FUNCTIONS (attr_set   => 'Car4Sale',
                            funcs_name => 'HorsePower');
  DBMS_RLMGR.ADD_FUNCTIONS (attr_set   => 'Car4Sale',
                            funcs_name => 'Scott.CrashTestRating');
END;
/
```

ADD_RULE Procedure

This procedure adds new rules to a rule class.

Syntax

```
DBMS_RLMGR.ADD_RULE (
   rule_class      IN  VARCHAR2,
   rule_id         IN  VARCHAR2,
   rule_cond       IN  VARCHAR2,
   actprf_nml      IN  VARCHAR2 DEFAULT NULL,
   actprf_vall     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 109–5 ADD_RULE Procedure Parameters

Parameter	Description
`rule_class`	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
`rule_id`	Unique identifier for the rule within the rule class
`rule_cond`	The condition for the rule. The condition uses the variables defined in the rule class's event structure.
`actprf_nml`	The list of action preference names for which values will be assigned through the `actprf_vall` argument
`actprf_vall`	The list of action preference values for the names list assigned to the `actprf_nml` argument

Usage Notes

- This procedure is used to add new rules to the rule class. The rule condition passed to the `ADD_RULE` procedure is validated using the event structure associated with the rule class. The action preferences names list is a subset of action preference categories configured during rule class creation.
- When schema extended name is used for the rule class, you should have `ADD RULE` privilege on the rule class. See the GRANT_PRIVILEGE Procedure for more information.
- Alternately, the owner of the rule class can add the rules using SQL `INSERT` statement on the rule class table (that shares the same name as the rule class). Note that the owner of the rule class can also grant direct DML privileges on the rule class table to other users.

  Note: The AUTOCOMMIT property of the rule class is ignored if the new rules are added using the SQL INSERT statement instead of the ADD_RULE procedure.

- See the CREATE_RULE_CLASS Procedure procedure for the structure of the rule class table.

Examples

The following command adds a rule to the rule class.

```
BEGIN
DBMS_RLMGR.ADD_RULE (
           rule_class => 'CompTravelPromo',
           rule_id => 'AB_AV_FL',
           rule_cond =>
             '<condition>
                 <and join="Flt.CustId = Car.CustId">
                    <object name="Flt">
                      Airline=''Abcair'' and ToCity=''Orlando''
                    </object>
                    <object name="Car">
                      CarType = ''Luxury''
                    </object>
                  </and>
               </condition>' ,
             actprf_nml => 'PromoType, OfferedBy',
             actprf_vall => '''RentalCar'', ''Acar''');
END;
```

With proper privileges, the following SQL INSERT statement can be used to add the rule to the rule class.

```
INSERT INTO CompTravelPromo (rlm$ruleid, rlm$rulecond, PromoType, OfferedBy)
  VALUES ('AB_AV_FL',
          '<condition>
             <and join="Flt.CustId = Car.CustId">
               <object name="Flt">
                   Airline=''Abcair'' and ToCity=''Orlando''
               </object>
               <object name="Car">
                   CarType = ''Luxury''
               </object>
             </and>
           </condition>',
          'RentalCar','Acar');
```

CONDITION_REF Function

This function retrieves the primitive rule condition reference from a rule condition for composite events.

Syntax

```
DBMS_RLMGR.CONDITION_REF (
     rule_cond IN   VARCHAR2,
     eventnm   IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 109–6 CONDITION_REF Procedure Parameters

Parameter	Description
`rule_cond`	Rule condition in XML format
`eventnm`	Name of the event for which the reference should be retrieved

Usage Notes

- For a rule condition in XML format, with a root `<condition>` element, this function retrieves the reference to a shared conditional expression on a particular primitive event.
- This function can be used in a query operating on the rule class table to find all the references to a given primitive rule condition. To speed-up such queries, one or more functional indexes are defined on the `rlm$rulecond` column of the rule class table using this function signature. In order to make use of the index for a lookup query, the value assigned to the `eventnm` argument should be case sensitive.

Examples

The following command joins the rule class table with the primitive conditions table to identify all the rule conditions that have references to the shareable primitive conditions (the query uses a functional index defined on the `rlm$rulecond` column). This query identifies all the rule conditions that refer to any shared conditions stored in the FlightConditions table.

```
select ctp.rlm$ruleid from CompTravelPromo ctp, FlightConditions fc
where dbms_rlmgr.condition_ref(ctp.rlm$rulecond, 'FLT') = fc.rlm$condid;
```

CONSUME_EVENT Function

This function consumes an event and prepares the corresponding rule for action execution. This is required only when the action (or rule execution) is carried by the user's application and not in the callback.

Syntax

```
DBMS_RLMGR.CONSUME_EVENT (
   rule_class       IN VARCHAR2,
   event_ident      IN VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 109–7 CONSUME_EVENT Function Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifier obtained from the corresponding rule class results view (or arguments of the action callback procedure in the case of rule class configured for RULE based consumption policy)

Returns

The function returns:

- 1 -- If the event is successfully consumed.
- 0 -- If the event is expired (owing to duration policy) or consumed by another session prior to this call.

Usage Notes

- When an EXCLUSIVE consumption policy is set for the events in a rule class, an event must be deleted from the system immediately after the rule it matched is executed (action is executed). When the rule action is carried in the rule class callback procedure by calling the PROCESS_RULES procedure, the rule manager automatically handles the consumption of the events. However, when you request the results from matching events with rules in a rule class results view using the ADD_EVENT procedure, you should take appropriate action to indicate the exact rule-event combination that is to be used for rule execution. The CONSUME_EVENT procedure performs the required housekeeping services when the unique identifier for the event used in a rule execution is passed in.
- Since there could be a time lag between fetching the rule class matching results and the execution of the user initiated action, the application should execute the action only if the CONSUME_EVENT call succeeds in consuming the event. This avoids any race condition with parallel sessions trying to consume the same events. When the event is successfully consumed, this call returns 1. In all other cases, it returns 0. A return value of 0 implies that the event is already consumed by another session and hence it is not available for this session.
- The CONSUME_EVENT procedure deletes the events configured with EXCLUSIVE consumption policy and does nothing for events configured for 4 consumption policy.

- Unlike the EXCLUSIVE and SHARED consumption policies, which are determined at the rule class level, a RULE consumption policy can be used to determine the consumption of an event on a rule by rule basis. That is a subset of the rules in a rule class may be configured such that when they are matched, the event is deleted from the system. At the same time the other set of rules could leave the event in the system even after executing the corresponding action. In this scenario, the action callback procedure implemented by the application developer can call CONSUME_EVENT function (with appropriate arguments) to conditionally consume the event for certain rules. Also see the use of CONSUME_PRIM_EVENTS Function for rule classes configured for RULE consumption policy

Examples

The following commands identify an event that is used for a rule execution and consumes it using its identifier.

```
var eventid VARCHAR(40);
var evtcnsmd NUMBER;

BEGIN
  SELECT rlm$eventid INTO :eventid FROM MatchingPromos WHERE rownum < 2;

  -- carry the required action for a rule matched by the above event --
  :evtcnsmd := DBMS_RLMGR.CONSUME_EVENT(rule_class  => 'TravelPromotion',
                                        event_ident => :eventid);
END;
```

CONSUME_PRIM_EVENTS Function

This function consumes a set of primitive events with all or nothing semantics in the case of a rule class configured with RULE based consumption policy.

Syntax

```
DBMS_RLMGR.CONSUME_PRIM_EVENTS (
   rule_class       IN VARCHAR2,
   event_idents     IN RLM$EVENTIDS)
 RETURN NUMBER;
```

Parameters

Table 109–8 CONSUME_PRIM_EVENTS Function Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifiers obtained from the corresponding rule class results view or the arguments of the action callback procedure

Returns

The function returns:

- 1 -- If all the events, the identifiers for which are passed in, are successfully consumed.
- 0 -- If one or more primitive event could not be consumed.

Usage Notes

- When the rule class is configured for RULE based consumption policy, the CONSUME_PRIM_EVENTS function can be used to consume one or more primitive events that constitute a composite event. This operation will succeed only when all the events passed in are still valid and are available for consumption. Any user initiated action should be implemented after checking the return value of the CONSUME_PRIM_EVENTS call.

Examples

The following commands show the body of the action callback procedure for a rule class configured for RULE consumption policy. This demonstrates the use of CONSUME_PRIM_EVENTS procedure to consume the events before executing the action for the matched rules.

```
create or replace procedure PromoAction (
      Flt        AddFlight,
      Flt_EvtId  ROWID,    --- rowid for the flight primitive event
      Car        AddRentalCar,
      Car_EvtId  ROWID,
      rlm$rule   TravelPromotions%ROWTYPE) is
  evtcnsmd   NUMBER;
BEGIN
  evtcnsmd := DBMS_RLMGR.CONSUME_PRIM_EVENTS(
                   rule_class   => 'TravelPromotions',
                   event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));
```

```
  if (evtcnsmd = 1) then
    -- consume operation was successful; perform the action ---
    OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
  end if;
END;
/
```

CREATE_CONDITIONS_TABLE Procedure

This procedure creates a conditions table, which is a repository for the primitive rule conditions that can be shared by multiple rules from the same or different rule classes. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Creates a conditions table to store shareable primitive conditions defined for a primitive event.

```
DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
     cond_table    IN  VARCHAR2,
     pevent_struct IN  VARCHAR2,
     stg_clause    IN  VARCHAR2 DEFAULT NULL);
```

Creates a conditions table to store shareable primitive conditions defined for a relational table identified through table aliases.

```
DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
     cond_table    IN  VARCHAR2,
     tab_alias     IN  rlm$table_alias,
     stg_clause    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 109–9 CREATE_CONDITIONS_TABLE Procedure Parameters

Parameter	Description
pevent_struct	Primitive event structure for which the shareable primitive rule conditions are defined
cond_table	Name of the table storing the primitive rule conditions
stg_clause	Storage clause for the conditions table
tab_alias	Type that identifies the database table for which the shareable primitive rule conditions are defined

Usage Notes

- This procedure creates a relational table to store the primitive rule conditions that can be shared by multiple rules. The table is created with the user specified name and it has a VARCHAR2 column to store the unique identifier for each primitive rule condition (rlm$condid), an expression data type column to store the conditional expressions (rlm$condition), and a VARCHAR2 column to store the descriptions for the primitive rule conditions in plain text (rlm$conddesc).
- Once the table is created, the primitive rule condition can be added or modified using standard DML operations on the conditions table. The conditions table is configured to validate the primitive rule conditions (in the rlm$condition column) using the primitive event structure specified for the pevent_struct argument.
- A rule class configured with a primitive event structure can include some rule conditions that refer to rows in the conditions table using corresponding identifiers.

Examples

The following command creates a conditions table that can store shareable primitive rule conditions for the AddRentalCar event structure:

```
BEGIN
  DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
    cond_table    => 'FlightConditions',
    pevent_struct => 'AddFlight',
    stg_clause    => 'TABLESPACE TBS_1');
END;
/
```

CREATE_EVENT_STRUCT Procedure

This procedure creates an event structure.

Syntax

```
DBMS_RLMGR.CREATE_EVENT_STRUCT  (
   event_struct  IN  VARCHAR2);
```

Parameters

Table 109–10 CREATE_EVENT_ STRUCT Procedure Parameter

Parameter	Description
event_struct	Name of the event structure to be created in the current schema

Usage Notes

- This procedure creates a dummy the event structure in the current schema. One or more attributes can be added to this event structure using the ADD_ELEMENTARY_ATTRIBUTE procedure.

Examples

The following command creates the event structure.

```
BEGIN
  DBMS_RLMGR.CREATE_EVENT_STRUCT(event_struct => 'AddFlight');
END;
```

CREATE_EXPFIL_INDEXES Procedure

This procedure creates expression filter indexes for the rule class if the default indexes have been dropped. If a representative set of rules is stored in the rule class table, the indexes can be tuned for these expressions by collecting statistics.

Syntax

```
DBMS_RLMGR.CREATE_EXPFIL_INDEXES  (
   rule_class  IN  VARCHAR2,
   coll_stats  IN  VARCHAR2 default 'NO');
```

Parameters

Table 109–11 CREATE_EXPFIL_INDEXES Procedure Parameter

Parameter	Description
rule_class	Name of the rule class
coll_stats	To collect expression statistics for building the indexes

Usage Notes

- Expression filter indexes are used to identify the rule conditions in a rule class for appropriate events. The default indexes created at the time of rule class creation assume that all types of predicates (equality, inequality, etc) involving scalar attributes in an event structure are equally likely. The performance of a rule class can be improved by tuning the expression filter indexes for a specific workload. This is achieved either by collecting statistics on a representative workload or by identifying the most common predicate constructs with some domain knowledge.
- The default expression filter indexes created for the rule class can be dropped using the DBMS_RLMGR.DROP_EXPFIL_INDEXES API. Once the indexes are dropped, they can be recreated using the DBMS_RLMGR.CREATE_EXPFIL_INDEXES API. When the coll_stats argument of the CREATE_EXPFIL_INDEXES API is set to YES, rule condition statistics are collected for the most common predicate constructs and the indexes are created using these statistics. Alternately, a domain expert can manually set the index parameters by identifying the most common and discriminating predicate constructs and then create the indexes with these parameters. Note that the index parameters can be set for each of the primitive event structures associated with the rule class. The index parameters can be assigned to the event structure (which is also the Expression Filter attribute set) using the DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS API. When the coll_stats argument of the CREATE_EXPFIL_INDEXES API is set to NO, the expression filter indexes created for the rule class make use of the default index parameters associated with each primitive event structure. (See Section 11 "Indexing Expressions" from Application Developer's Guide Rules Manager and Expression Filter for additional information on tuning the Expression Filter indexes for better performance).
- Related views: USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following commands collect the statistics for the rules defined in the `CompTravelPromo` rule class and create the expression filter indexes that are based on the most common predicates in the set.

```
BEGIN
DBMS_RLMGR.CREATE_EXPFIL_INDEXES (rule_class => 'CompTravelPromo',
                                  coll_stats => 'yes');
END;
/
```

This is an Expression Filter tuning example where the domain knowledge is used to assign specific index parameters. The following commands associate specific index parameters to the `AddFlight` event structure such that the expression filter index created for corresponding expressions are optimized accordingly. The subsequent `CREATE_EXPFIL_INDEXES` step makes use of these index parameters.

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS('AddFlight',
    exf$attribute_list (
       exf$attribute (attr_name => 'Airline',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'ToCity',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'Depart',
                      attr_oper => exf$indexoper('=','<','>','>=','<='),
                      attr_indexed => 'FALSE')
    )
  );
  -- create the indexes after assigning the index parameters --
  DBMS_RLMGR.CREATE_EXPFIL_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

CREATE_INTERFACE Procedure

This procedure creates a rule class interface package that can be used to directly operate on the rule class for efficiency and ease of use.

Syntax

```
DBMS_RLMGR.CREATE_INTERFACE  (
   rule_class   IN  VARCHAR2,
   interface_nm IN  VARCHAR2);
```

Parameters

Table 109–12 CREATE_INTERFACE Procedure Parameter

Parameter	Description
`rule_class`	Name of the rule class for which the interface package is created
`interface_nm`	Name of the PL/SQL package that acts as the interface to the rule application

Usage Notes

- The common set of DBMS_RLMGR procedures used for runtime operations such as processing the rules for some events, consuming the events and resetting the session make use of the rule class name passed in as one of the arguments and associate them to the corresponding operations on the rule class. The overhead involved in this step can be avoided by creating a rule class interface package that is used to directly operate on the rule class.
- The rule class interface package is a PL/SQL package that has procedures/functions to process rules (PROCESS_RULES), add event (ADD_EVENT), consume events (CONSUME_EVENT, CONSUME_PRIM_EVENTS) and reset rule session (RESET_SESSION). The operational characteristics of these procedures and functions are the same as those of DBMS_RLMGR procedures and functions with matching names with two exceptions. Since the rule class interface package is created for a specific rule class, the rule class name is implicit and it need not be passed in as an argument to the procedures and functions of the rule class interface package. Additionally, the rule class interface package has separate PROCESS_RULES and ADD_EVENT procedures to accept each primitive event type configured with the rule class. This is in contrast to the same procedures in the DBMS_RLMGR package, which are generalized to accept the event instances only as a VARCHAR or an AnyData instance.

Examples

The following commands create the rule class interface package for the `CompTravelPromo` rule class.

```
BEGIN
  DBMS_RLMGR.CREATE_INTERFACE  (rule_class   => 'CompTravelPromo',
                                interface_nm => 'TravelPromoRules');
END;
```

The following commands make use of the interface created in previous step to process the rules for an instance of `AddFlight` event.

```
BEGIN
```

```
  TravelPromoRules.process_rules (event_inst =>
            AddFlight(987, 'Abcair', 'Boston', 'Orlando',
                                     '01-APR-2003', '08-APR-2003');
END;
```

CREATE_RULE_CLASS Procedure

This procedure creates a rule class.

Syntax

```
DBMS_RLMGR.CREATE_RULE_CLASS  (
   rule_class      IN  VARCHAR2,
   event_struct    IN  VARCHAR2,
   action_cbk      IN  VARCHAR2,
   actprf_spec     IN  VARCHAR2  default null,
   rslt_viewnm     IN  VARCHAR2  default null,
   rlcls_prop      IN  VARCHAR2  default <simple/>);
```

Parameters

Table 109–13 CREATE_RULE_CLASS Procedure Parameters

Parameter	Description
rule_class	Name of the rule class to be created in the current schema
event_struct	Name of the object type or an Expression Filter attribute set in the current schema that represents the event structure for the rule class
action_cbk	Name of the action callback procedure to be created for the rule class
actprf_spec	Specification (name and SQL datatype pairs) for the action preferences associated with the rule class
rlst_viewnm	Name of rule class results view that lists the matching events and rules within a session. A view with this name is created in the current schema.
rlcls_prop	XML document for setting the rule class properties. By default, the rule class created is for simple events (non-composite).

Usage Notes

- For successful creation of a rule class, you should have sufficient privileges to create views, object types, tables, packages, and procedures.
- This command creates the rule class and its dependent objects in the user's schema. For this operation to succeed the name specified for the event structure should refer to an existing object type or an Expression Filter attribute set in the user's schema. When an object type is used for an event structure, the CREATE_RULE_CLASS procedure implicitly creates an attribute set for the object type. In the case of a rule class configured for composite events, the previous procedure also creates attribute sets for the object types that are directly embedded in the event structure's object type (or the attribute set). A maximum of 32 embedded objects (and/or table aliases) can be specified with an event structure that is used for a composite rule class. The types of dependent objects created with this procedure and their structure depend on the properties of the rule class and its event structure. The minimum set of dependent objects created for a rule class is as follows:
  - Rule class table – A rule class table that shares the name of the rule class is created in the user's schema to store the rule definitions (rule identifiers, rule conditions, rule descriptions, and action preferences). This table implicitly has four columns, rlm$ruleid, rlm$rulecond, rlm$enabled, and rlm$ruledesc to store the rule identifiers, rule conditions, rule states, and rule descriptions respectively. In addition to these four columns, the rule class

table has few columns according to the rule classes' action preference specification. For example, if a TravelPromotion rule class uses 'PromoType VARCHAR(20), OfferedBy VARCHAR(20)' as its action preference specification (assigned to actpref_spec argument), the rule class table is created with the following structure.

```
TABLE TravelPromotion (
      rlm$ruleid VARCHAR(100),     -- rule identifier column --
      PromoType VARCHAR(20),       -- action preference 1 --
      OfferedBy VARCHAR(20),       -- action preference 2 --
      rlm$rulecond VARCHAR(4000),  -- rule condition --
      rlm$ruledesc VARCHAR(1000),  -- rule description --
      rlm$enabled CHAR(1));        -- rule status --
```

The rule class table structure varies from one rule class to another based on the exact list of action preference categories specified for the rule class.

– Action Callback Procedure – The skeleton for the action callback procedure with the given name is created in the user's schema and it is associated with the rule class. During rule evaluation, the callback procedure is called for each matching rule and event. You should implement the body of the action callback procedure to perform the appropriate action for each rule. The exact action for a rule can be determined based on the event that matched the rule and rule definition along with its action preferences. This information is passed to the action callback procedure through its arguments. Hence, the argument list for the action callback procedure depends on the event structure associated with the rule class and the rule class itself.

  In the case of a rule class configured for simple events (<simple/> assigned to the properties of the rule class), the event that matches a rule is passed through a rlm$event argument that is declared to be of the same type as the event structure. Additionally, the rule definitions are passed to the action callback procedure using an rlm$rule argument that is declared as ROWTYPE of the corresponding rule class table. For example, the structure of the PromoAction action callback procedure created for a TravelPromotion rule class configured for a simple (non-composite) AddFlight event structure is as follows:

```
PROCEDURE PromoAction (rlm$event AddFlight,
                       rlm$rule TravlePromotion%ROWTYPE);
```

  In the case of a rule class created for composite events (<composite/> assigned to the properties of the rule class), the action callback procedure is created to pass each primitive event as a separate argument. For example, the CompPromoAction action callback procedure created for a rule class CompTravelPromo configured for a composite event with AddFlight and AddRentalCar primitive events are shown as follows:

```
-- composite event structure --
TYPE TSCompEvent (Flt AddFlight,
                  Car AddRentalCar);
-- corresponding action callback procedure --
PROCEDURE PromoAction (Flt AddFlight,
                       Car AddRentalCar,
                       rlm$rule CompTravelPromo%ROWTYPE)
```

  Note that the action callback procedure includes additional arguments when the rule class is configured for the RULE consumption policy or when the rule class is enabled for one or more collection events. The arguments in these

cases include the identifiers for the events (ROWID data type) in addition to the event instances. These event identifiers can be used to further operate on the matched rules. For example, in the case of the rule class configured for rule consumption, the event identifiers are used to consume the events with DBMS_RLMGR.CONSUME_PRIM_EVENTS function. In the case of rule class enabled for collection events, the same identifiers for the collection events can be used to fetch specific aggregate values with the DBMS_RLMGR.GET_AGGREGATE_VALUE function.

– Rule class results view – A view to display the results from matching some events with rules is created in the same schema as the rule class. By default, this view is created with a system-generated name. Optionally, the rule class creator can specify a name for this view with the `rlst_viewnm` argument of the `CREATE_RULE_CLASS` procedure. When the events are added to the rule manager within a rule session using the `ADD_EVENT` procedure, the list of matching events and rules are displayed in the rule class results view.

  The structure of the view defined for the rule class results depends on the event structure and the action preferences configured with the rule class. Minimally, the view has three columns to display the system generated event identifier (rlm$evenetid), the identifier of the rule it matches (rlm$ruleid), and the rule condition (rlm$rulecond). Additionally, it has columns to display the event information and the rule action preferences.

  In the case of a rule class configured for simple events, the event information is displayed as rlm$event that is declared to be of the event structure type. So, a MatchingPromos view created for the TravelPromotion rule class configured for a simple AddFlight event structure is as follows:

```
VIEW MatchingPromos (
    rlm$eventid ROWID,
    rlm$event AddFlight,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

  In the case of a rule class configured for composite events, the primitive events matching a rule are displayed separately using corresponding columns. For the above CompTravelPromo rule class, a MatchingCompPromos view is created with the following structure.

```
VIEW MatchingCompPromos (
    rlm$eventid ROWID,
    Flt AddFlight,
    Car AddRentalCar,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30),   -- action preference 1 --
    OffredBy VARCHAR(30),    -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

  The values from the rlm$eventid column are used to enforce rule class consumption policies when the corresponding rule is executed. See the CONSUME_EVENT Function procedure for more information.

Examples

The following commands create a rule class for simple events (of AddFlight type).

```
CREATE or REPLACE TYPE AddFlight AS OBJECT (
                  CustId NUMBER,
                  Airline VARCHAR(20),
                  FromCity VARCHAR(30),
                  ToCity VARCHAR(30),
                  Depart DATE,
                  Return DATE);
BEGIN
  DBMS_RLMGR.CREATE_RULE_CLASS (
              rule_class   => 'TravelPromotion', -- rule class name --
              event_struct => 'AddFlight', -- event struct name --
              action_cbk    => 'PromoAction', -- callback proc name --
              rslt_viewnm   => 'MatchingPromos', -- results view --
              actprf_spec   => 'PromoType VARCHAR(20),
                                OfferedBy VARCHAR(20)');
END;
```

The following commands create a rule class for composite events consisting of two primitive events (AddFlight and AddRentalCar).

```
CREATE or REPLACE TYPE TSCompEvent (Flt AddFlight,
                                    Car AddRentalCar);
BEGIN
  DBMS_RLMGR.CREATE_RULE_CLASS (
              rule_class    => 'CompTravelPromo', -- rule class name --
              event_struct  => 'TSCompEvent', -- event struct name --
              action_cbk    => 'CompPromoAction', -- callback proc name --
              rslt_viewnm   => 'MatchingCompPromos', -- results view --
              actprf_spec   => 'PromoType VARCHAR(20),
                                OfferedBy VARCHAR(20)',
              properties    => '<composite/>');
END;
```

DELETE_RULE Procedure

This procedure deletes a rule from a rule class.

Syntax

```
DBMS_RLMGR.DELETE_RULE (
   rule_class    IN    VARCHAR2,
   rule_id       IN    VARCHAR2);
```

Parameters

Table 109–14 DELETE_RULE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Identifier for the rule to be deleted

Usage Notes

- This procedure is used to delete a rule from the rule class. The identifier for the rule to be deleted can be obtained by querying the rule class table (that shares the same name as the rule class). Alternately, the owner of the rule class can use a SQL DELETE statement on one rule class table to delete a rule.
- When schema extended name is used for the rule class, you should have DELETE RULE privilege on the rule class. See the GRANT_PRIVILEGE Procedure procedure for more information.

> **Note:** AUTOCOMMIT property of the rule class is ignored if the rules are deleted with the SQL DELETE statement instead of the DELETE_RULE procedure.

- See the CREATE_RULE_CLASS Procedure procedure for the structure of the rule class table.

Examples

The following command deletes a rule from the rule class.

```
BEGIN
  DBMS_RLMGR.DELETE_RULE (
           rule_class  => 'CompTravelPromo',
           rule_id     => 'AB_AV_FL');
END;
```

Alternately, the following SQL DELETE statement can be issued to delete the above rule from the rule class.

```
DELETE FROM CompTravelPromo WHERE rlm$ruleid = 'AB_AV_FL';
```

DROP_CONDITIONS_TABLE Procedure

This procedure drops the conditions table.

Syntax

```
DBMS_RLMGR.DROP_CONDITIONS_TABLE (
     cond_table IN   VARCHAR2);
```

Parameters

Table 109–15 DROP_CONDITIONS_TABLE Procedure Parameters

Parameter	Description
cond_table	Name of conditions table in the user schema

Usage Notes

- This procedure drops the table that stores the shareable conditional expressions. If one of the conditional expressions in this table is used to form a rule condition in a rule class, the drop operation fails with an appropriate error.

Examples

The following command drops the conditions table:

```
BEGIN
  DBMS_RLMGR.DROP_CONDITIONS_TABLE (cond_table => 'FlightConditions');
END;
/
```

DROP_EVENT_STRUCT Procedure

This procedure drops an event structure.

Syntax

```
DBMS_RLMGR.DROP_EVENT_STRUCT  (
   event_struct  IN  VARCHAR2);
```

Parameters

Table 109–16 DROP_EVENT_ STRUCT Procedure Parameter

Parameter	Description
event_struct	Name of event structure in the current schema

Usage Notes

- This procedure drops the event structure from the current schema. This drops all the dependent objects created to manage the event structure.

Examples

The following command drops the event structure.

```
BEGIN
  DBMS_RLMGR.DROP_EVENT_STRUCT(event_struct => 'AddFlight');
END;
```

DROP_EXPFIL_INDEXES Procedure

This procedure drops the expression filter indexes created for a rule class.

Syntax

```
DBMS_RLMGR.DROP_EXPFIL_INDEXES  (
   rule_class  IN  VARCHAR2);
```

Parameters

Table 109–17 DROP_EXPFIL_INDEXES Procedure Parameter

Parameter	Description
rule_class	Name of the rule class

Usage Notes

This procedure drops all the expression filter indexes associated with a rule class. The indexes can be recreated using the DBMS_RLMGR.CREATE_EXPFIL_INDEXES call.

Examples

The following command drops the expression filter indexes created for the CompTravelPromo rule class.

```
BEGIN
DBMS_RLMGR.DROP_EXPFIL_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

DROP_INTERFACE Procedure

This procedure drops the rule class interface package created for a rules application.

Syntax

```
DBMS_RLMGR.DROP_INTERFACE  (
   interface_nm  IN  VARCHAR2);
```

Parameters

Table 109–18 DROP_INTERFACE Procedure Parameter

Parameter	Description
interface_nm	Name of the PL/SQL package that acts as the interface to the rule application

Usage Notes

This procedure drops the rule class interface package created with the DBMS_RLMGR.CREATE_INTERFACE call.

Examples

The following command drops the rule class interface package TravelPromoRules.

```
BEGIN
  DBMS_RLMGR.DROP_INTERFACE (interface_nm => 'TravelPromoRules'
END;
```

DROP_RULE_CLASS Procedure

This procedure drops a rule class.

Syntax

```
DBMS_RLMGR.DROP_RULE_CLASS  (
   rule_class  IN  VARCHAR2);
```

Parameters

Table 109–19 DROP_RULE_CLASS Procedure Parameter

Parameter	Description
rule_class	Name of rule class in the current schema

Usage Notes

- This procedure drops the rule class from the current schema. This drops all the dependent objects created to manage the rule class. Because an event structure in a user's schema can be shared across multiple rule classes, the event structure is not dropped with this command. The DROP_EVENT_STRUCTURE API should be used for the composite event as well as the individual primitive events to cleanup unused event structures.

Examples

The following command drops the rule class.

```
BEGIN
  DBMS_RLMGR.DROP_RULE_CLASS(rule_class => 'CompTravelPromo');
END;
```

EXTEND_EVENT_STRUCT Procedure

This is used to extend the primitive event structure used by one or more rule classes by adding a new attribute.

Syntax

```
DBMS_RLMGR.EXTEND_EVENT_STRUCT (
          event_struct    IN   VARCHAR2,
          attr_name       IN   VARCHAR2,
          attr_type       IN   VARCHAR2,
          attr_defvl      IN   VARCHAR2 default NULL);
```

Parameters

Table 109–20 EXTEND_EVENT_ STRUCT Procedure Parameter

Parameter	Description
`event_struct`	Name of the event structure to which this attribute is added
`attr_name`	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
`attr_type`	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
`attr_defvl`	Default value for the elementary attribute

Usage Notes

- This procedure is used to extend a primitive event structure already associated with a rule class to include a new attribute. This procedure is mostly used to migrate a fully developed rules application to use extended event structures and it should not be used in the place of ADD_ELEMENTARY_ATTRIBUTE call. Unlike the ADD_ELEMENTARY_ATTRIBUTE call, which builds an event structure one attribute at a time, the EXTEND_EVENT_STRUCT call evolves the object type associated with the event structure to include the new attributes and performs some maintenance operations on the dependent objects.
- The usage of the EXTEND_EVENT_STRUCT call is similar to that of the ADD_ELEMENTARY_ATTRIBUTE call with the same set of arguments. Table alias attributes and attributes of text and spatial data types cannot be added to the event structure using the EXTEND_EVENT_STRUCT call.

Examples

The following commands add an attribute to the `AddRentalCar` event structure that is used by the `CompTravelPromo` rule class.

```
BEGIN
  DBMS_RLMGR.EXTEND_EVENT_STRUCT (
        event_struct   => 'AddRentalCar',
        attr_name      => 'PrefMemberId',
        attr_type      => 'VARCHAR2(30)');
END;
```

GET_AGGREGATE_VALUE Function

This function retrieves the aggregate value computed for a collection event.

Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE  (
   rule_class      IN  VARCHAR2,
   event_ident     IN  VARCHAR2,
   aggr_func       IN  VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 109–21 GET_AGGREGATE_VALUE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class for the collection event
event_ident	System-generated identifier for the collection event
aggr_func	Signature for the aggregate value to be retrieved

Usage Notes

- When a rule condition with `collection` construct matches a set of events, an instance representing the collection event and a system-generated identifier for the collection event are passed into the action callback procedure. This event identifier can be used to fetch any aggregate values that are computed as part of the collection event evaluation.
- Within a collection construct in a rule condition, the aggregate functions can be included in the HAVING clause or in the COMPUTE clause. For example, the following rule condition computes three aggregate values for `sum(amount)`, `count(*)`, and `max(amount)`. At the time of action execution, these values can be obtained using the identifier for the collection event that represents all the instance of BankTransaction with the same subjectId (the attribute on which the events are grouped).

  ```
  <condition>
     <collection name="bank" groupby="subjectId"
                 having="sum(amount) > 10000"
                 compute="max(amount), count(*)"/>
  </condition>
  ```

- The signature for the aggregate function is bound to the `aggr_func` argument of the GET_AGGREGATE_VALUE function to fetch the specific aggregate value. If the value is a NUMBER or a DATE datatype, the equivalent VARCHAR representation is returned. If an attempt was made to fetch an aggregate value that is never computed as part of the collection event, a NULL value is returned.

Examples

The following example shows a sample implementation of the action callback procedure that prints the computed aggregate values as part of action execution. In this particular case, the BankTransaction primitive event is enabled for collections.

```
CREATE OR REPLACE PROCEDURE LAWENFORCEMENTCBK (
   bank                banktransaction,
   bankcollid          rowid,
```

```
   transport            transportation,
   fldrpt               fieldreport,
   rlm$rule             LawEnforcementRC%ROWTYPE) IS
   aggrval              VARCHAR(30);
begin
  dbms_ouput.put_line('Mathing Rule :'||rlm$rule.rlm$ruleid||chr(10));

  if (bank is not null) then
   dbms_ouput.put_line('-->Bank Transactions by ('||bank.subjectId||')'||chr(10);

   aggrval := dbms_rlmgr.get_aggregate_value(rule_class  =>'LawEnforcementRC',
                                             event_ident => bankcollid,
                                             aggr_func   => 'sum(amount)');
   if (aggrval is not null) then
     dbms_ouput.put_line('---> Sum of the amounts is :'||aggrval||chr(10));
   end if;
   . . .
  end if;
end;
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on a rule class to another user.

Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE  (
   rule_class      IN  VARCHAR2,
   priv_type       IN  VARCHAR2,
   to_user         IN  VARCHAR2);
```

Parameters

Table 109–22 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class in the current schema
priv_type	Type of rule class privilege to be granted
to_user	User to whom the privilege is to be granted

Usage Notes

- This procedure grants appropriate privileges to a user who is not the owner of the rule class. The types of privileges that can be granted to a user are:
  - PROCESS RULES: A user with PROCESS RULES privilege on a rule class can process the rules in the rule class using the PROCESS_RULES procedure or the ADD_EVENT procedure. Also, the user with this privilege can select from the corresponding rule class results view.
  - ADD RULE: A user with ADD RULE privilege on a rule class can add rules to a rule class. Alternatively, the owner of the rule class can grant INSERT privileges on one rule class table to other users.
  - DELETE RULE: A user with DELETE RULE privilege on a rule class can delete rules from a rule class. Alternatively, the owner of the rule class can grant DELETE privileges on one rule class table to other users.
  - ALL: Granting the ALL privilege on a rule class is equivalent to granting all the above privileges on the rule class to the user.
- The owner of the rule class always has privileges to drop a rule class, process rules in a rule class, add rules and delete rules from a rules class. Only the owner of the rule class can drop a rule class and this privilege cannot be granted to another user.
- A user should also have EXECUTE privileges on the primitive event types associated with a rule class in order to make use of the corresponding rule class results view

Examples

The following command grants PROCESS RULES privilege on TravelPromo rule class to the user SCOTT.

```
BEGIN
  DBMS_RLMGR.GRANT_PRIVILEGE(rule_class => 'TravelPromo',
                             priv_type => 'PROCESS RULES',
```

```
                                        to_user => 'SCOTT');
END;
```

PROCESS_RULES Procedure

This procedure processes the rules for a given event. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Processes the rules for a string representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES  (
   rule_class    IN  VARCHAR2,
   event_inst    IN  VARCHAR2,
   event_type    IN  VARCHAR2 default null);
```

Processes the rules for an AnyData representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES  (
   rule_class    IN  VARCHAR2,
   event_inst    IN  sys.AnyData);
```

Parameters

Table 109–23 PROCESS_RULES Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to process the rules in a rule class for an event instance assigned to the event_inst argument.
- In the case of a rule class configured for simple events (non-composite), the event instance is an instantiation of the corresponding event structure. The rules are evaluated (conclusively) for this event and the corresponding action callback procedure is called for each matching rule. If the event does not match any rule, no further action is performed. If the event matches two or more rules, the ordering clause configured for the rule class is used to order them accordingly to invoke the action callback procedure. If the rule class is configured for EXCLUSIVE consumption policy, once the first rule in this order is executed (and the corresponding action callback procedure is called), the rest of the rules that matched the event are ignored.
- In the case of a rule class configured for composite events, the event instance assigned to the event_inst argument is an instantiation of one of the primitive type within the composite event. When the instance is represented as a string, the corresponding type name should be assigned to the event_type argument. The PROCESS_RULES call on a rule class configured for composite events performs

various actions depending on the state of the rule class and the kind of rules in the rule class.

- The rules operating only on the primitive event passed in are evaluated conclusively and the action callback procedure is called for the matching rules, as described in previous paragraph.
- In the case of a rule operating on more than one primitive event, the event instance passed through `PROCESS_RULES` procedure could match only a part of the rule.
  * If there is (are) another primitive event instance(s) that matches the rest of the rule, the current event instance is combined with the other instance(s) to form a complete composite event that matches a rule in the rule class. So, the event instance assigned to the `event_inst` argument of the PROCESS_RULES procedure could be combined with various other primitive events (previously processed) to evaluate one or more rules conclusively. The rule classes' action callback procedure is called for each such combination of primitive events (composite event) and the rule. The ordering clause for the rule class and the consumption policy for the primitive events in taken into account while invoking the action callback procedure.
  * If there is no other primitive event that matches the rest of the rule, the current event instance and its (incremental) evaluation results are recorded in the database. These results are preserved until either the event is consumed or deleted from the system owing to the duration policy used for the rule class.

Examples

The following command processes the rules in the TravelPromotion rule class for the given events.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES (
               rule_class => 'TravelPromotion',
               event_inst =>
                 AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                                      '01-APR-2003', '08-APR-2003'));
END;
```

The following commands process the rules in the `CompTravelPromo` rule class for the two primitive events shown.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES(
               rule_class => 'CompTravelPromo',
               event_inst =>
                 AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                                      '01-APR-2003', '08-APR-2003'),
               event_type => 'AddFlight');
  DBMS_RLMGR.PROCESS_RULES(
               rule_class => 'Scott.CompTravelPromo',
               event_inst =>
                  AnyData.convertObject(AddRentalCar(987, 'Luxury', '03-APR-2003',
                                        '08-APR-2003', NULL)));
END;
```

PURGE_EVENTS Procedure

This procedure resets the incremental state maintained by the rule class by removing all the events associated with the rule class and purging any state information pertaining to rules matching some events.

Syntax

```
DBMS_RLMGR.PURGE_EVENTS (
     rule_class IN   VARCHAR2);
```

Parameters

Table 109–24 PURGE_EVENTS Procedure Parameters

Parameter	Description
rule_class	Name of rule class in the current schema

Usage Notes

- This procedure is used while developing rules applications using Rules Manager. The rules defined in the rule class can be tested with hypothetical events and these events can all be removed by issuing this procedure call. This call cleans up all the events in the events repository and purges any partial state information associated with the matching rules.

Examples

The following command removes the events associated with the CompTravelPromo rule class:

```
BEGIN
  DBMS_RLMGR.PURGE_EVENTS (rule_class => 'CompTravelPromo');
END;
/
```

RESET_SESSION Procedure

This procedure starts a new session and thus discards the results in the rule class results view.

Syntax

```
DBMS_RLMGR.RESET_SESSION  (
   rule_class  IN  VARCHAR2);
```

Parameters

Table 109–25 RESET_SESSION Procedure Parameter

Parameter	Description
`rule_class`	Name of rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.

Usage Notes

- When the `ADD_EVENT` procedure is used to add events to the rule class, the results from matching rules with events are recorded in the rule class results view. By default, these results are reset at the end of the database session. Alternately, the RESET_SESSION Procedure can be used to reset and start a new rule session within a database session.
- This procedure is only applicable while using ADD_EVENT Procedures to evaluate the rules.

Examples

The following command resets a rule class session.

```
BEGIN
  DBMS_RLMGR.RESET_SESSION(
             rule_class => 'CompTravelPromo');
END;
```

REVOKE_PRIVILEGE Procedure

This procedure revokes privileges on a rule class from another user.

Syntax

```
DBMS_RLMGR.REVOKE_PRIVILEGE  (
   rule_class      IN  VARCHAR2,
   priv_type       IN  VARCHAR2,
   from_user       IN  VARCHAR2);
```

Parameters

Table 109–26 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class in the current schema
priv_type	Type of rule class privilege to be revoked
from_user	User from whom the privilege is to be revoked

Usage Notes

- This procedure revokes appropriate privileges from a user. The types of privileges that can be revoked are the same as the types listed in the GRANT_PRIVILEGE Procedure description. Rule class privileges cannot be revoked from the owner of the rule class.

Examples

The following command revokes PROCESS RULES privilege on TravelPromo rule class from the user SCOTT.

```
BEGIN
  DBMS_RLMGR.REVOKE_PRIVILEGE(rule_class  => 'TravelPromo',
                              priv_type   => 'PROCESS RULES',
                              from_user   => 'SCOTT');
END;
```

SYNC_TEXT_INDEXES Procedure

This procedure synchronizes the indexes defined to process the predicates involving the CONTAINS operator in rule conditions.

Syntax

```
DBMS_RLMGR.SYNC_TEXT_INDEXES (
     rule_class IN   VARCHAR2);
```

Parameters

Table 109–27 SYNC_TEXT_INDEXES Procedure Parameters

Parameter	Description
rule_class	Name of the rule class in the current schema

Usage Notes

- When a rule class is configured for events with one or more text attributes, the text predicates in the corresponding rule conditions are processed using CTXRULE indexes. Unlike other types of indexes (bitmap for scalar and XML predicates or spatial for spatial predicates) used to process other types of predicates in the rule conditions, the CTXRULE indexes are not transactional in nature. That is, if the text predicates in a rule condition are modified in a database transaction, the new predicates are not automatically reflected in the corresponding CTXRULE index. This could result in inconsistent results while matching events with the rule conditions. All the CTXRULE indexes associated with a rule class can be synchronized with the latest rule conditions using this procedure.

  You must have EXECUTE privileges on the CTX_DDL package for successful synchronization of the text indexes.

Examples

The following command synchronizes any text indexes associated CompTravelPromo rule class:

```
BEGIN
  DBMS_RLMGR.SYNC_TEXT_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

110

DBMS_RLS

The DBMS_RLS package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD). DBMS_RLS is available with the Enterprise Edition only.

> **See Also:** *Oracle Database Security Guide* for usage information on DBMS_RLS.

This chapter contains the following topics:

- Using DBMS_RLS
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_RLS Subprograms

Using DBMS_RLS

- Overview
- Security Model
- Operational Notes

Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (
   'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select');
```

Whenever the EMPLOYEES table, under the HR schema, is referenced in a query or subquery (SELECT), the server calls the EMP_SEC function (under the HR schema). This function returns a predicate specific to the current user for the EMP_POLICY policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: INDEX, SELECT, INSERT, UPDATE, or DELETE.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, P1 (for example, where SAL > 10000, or even a subquery) is the predicate returned from the EMP_SEC function. The server treats the EMPLOYEES table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require EXECUTE privilege on the policy function, because the server makes the call with the function definer's right.

> **Note:** The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no JOIN, ORDER BY, GROUP BY, and so on.

DBMS_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the EMP_POLICY with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', FALSE);
```

Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

Operational Notes

The DBMS_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from v$vpd_policies.

A synonym can reference only a view or a table.

Summary of DBMS_RLS Subprograms

Table 110–1 DBMS_RLS Subprograms Package Subprograms

Subprogram	Description
ADD_GROUPED_POLICY Procedure on page 110-7	Adds a policy associated with a policy group
ADD_POLICY Procedure on page 110-9	Adds a fine-grained access control policy to a table, view, or synonym
ADD_POLICY_CONTEXT Procedure on page 110-13	Adds the context for the active application
CREATE_POLICY_GROUP Procedure on page 110-14	Creates a policy group
DELETE_POLICY_GROUP Procedure on page 110-15	Deletes a policy group
DISABLE_GROUPED_POLICY Procedure on page 110-16	Disables a row-level group security policy
DROP_GROUPED_POLICY Procedure on page 110-17	Drops a policy associated with a policy group
DROP_POLICY Procedure on page 110-18	Drops a fine-grained access control policy from a table, view, or synonym
DROP_POLICY_CONTEXT Procedure on page 110-19	Drops a driving context from the object so that it will have one less driving context
ENABLE_GROUPED_POLICY Procedure on page 110-20	Enables or disables a row-level group security policy
ENABLE_POLICY Procedure on page 110-21	Enables or disables a fine-grained access control policy
REFRESH_GROUPED_POLICY Procedure on page 110-22	Reparses the SQL statements associated with a refreshed policy
REFRESH_POLICY Procedure on page 110-23	Causes all the cached statements associated with the policy to be reparsed

ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY(
   object_schema         VARCHAR2,
   object_name           VARCHAR2,
   policy_group          VARCHAR2,
   policy_name           VARCHAR2,
   function_schema       VARCHAR2,
   policy_function       VARCHAR2,
   statement_types       VARCHAR2,
   update_check          BOOLEAN,
   enabled               BOOLEAN,
   static_policy         IN BOOLEAN  FALSE,
   policy_type           IN BINARY_INTEGER NULL,
   long_predicate        IN BOOLEAN  FALSE,
   sec_relevant_cols     IN VARCHAR2,
   sec_relevant_cols_opt IN BINARY_INTEGER NULL);
```

Parameters

Table 110–2 ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.
policy_name	The name of the policy; must be unique for the same table or view.
function_schema	The schema owning the policy function.
policy_function	The name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.
enable	Indicates if the policy is enable when it is added. The default is TRUE.
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 110–4. Specifying any of these policy types overrides the value of static_policy.

Table 110–2 (Cont.) ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes.Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
sec_relevant_cols_opt	Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See "Usage Notes" on page 110-11 for restrictions and additional information about this option.

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the CREATE_POLICY_GROUP Procedure on page 110-14.
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, SYS_DEFAULT, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with EXEMPT ACCESS POLICY system privilege.
- If no object_schema is specified, the current log-on user schema is assumed.

ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 110-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ADD_POLICY (
   object_schema            IN VARCHAR2 NULL,
   object_name              IN VARCHAR2,
   policy_name              IN VARCHAR2,
   function_schema          IN VARCHAR2 NULL,
   policy_function          IN VARCHAR2,
   statement_types          IN VARCHAR2 NULL,
   update_check             IN BOOLEAN  FALSE,
   enable                   IN BOOLEAN  TRUE,
   static_policy            IN BOOLEAN  FALSE,
   policy_type              IN BINARY_INTEGER NULL,
   long_predicate           IN BOOLEAN  FALSE,
   sec_relevant_cols        IN VARCHAR2,
   sec_relevant_cols_opt    IN BINARY_INTEGER NULL);
```

Parameters

Table 110–3 ADD_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_ schema is specified, the current log-on user schema is assumed.
object_name	Name of table, view, or synonym to which the policy is added.
policy_name	Name of policy to be added. It must be unique for the same table or view.
function_schema	Schema of the policy function (current default schema, if NULL).
policy_function	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	Optional argument for INSERT or UPDATE statement types. The default is FALSE. Setting update_check to TRUE causes the server to also check the policy against the value after insert or update.
enable	Indicates if the policy is enabled when it is added. The default is TRUE.

Table 110–3 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 110–4. Specifying any of these policy types overrides the value of static_policy.
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes.Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
sec_relevant_cols_opt	Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See "Usage Notes" on page 110-11 for restrictions and additional information about this option.

Table 110–4 DBMS_RLS.ADD_POLICY Policy Types

Policy Type	Description
STATIC	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object.
SHARED_STATIC	Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
CONTEXT_SENSITIVE	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
SHARED_CONTEXT_SENSITIVE	Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
DYNAMIC	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function on each statement parsing or execution. Applies to only one object.

Usage Notes

- SYS is free of any security policy.
- If no object_schema is specified, the current log-on user schema is assumed.
- The policy functions which generate dynamic predicates are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table of view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```

- The policy functions must have the purity level of WNDS (write no database state).

  See Also: The *Oracle Database Advanced Application Developer's Guide* has more details about the RESTRICT_REFERENCES pragma.

- Dynamic predicates generated out of different policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.
- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with sec_relevant_cols_opt => dbms_rls.ALL_ROWS) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as NULL. The restrictions for this option are as follows:
  - Only applies to SELECT statements
  - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
  - If your application performs calculations, or does not expect NULL values, then you should use the default behavior of column-level VPD, which is specified with the sec_relevant_cols parameter.
  - If you use UPDATE AS SELECT with this option, then only the values in the columns you are allowed to see will be updated.
  - This option may prevent some rows from displaying. For example:

    ```
    select * from employees
    where salary = 10
    ```

    This query may not return rows if the salary column returns a NULL value because the column masking option has been set.

Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```
BEGIN
dbms_rls.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hr_policy',
function_schema =>'hr',
policy_function => 'hrfun',
statement_types =>'select,index',
policy_type => dbms_rls.CONTEXT_SENSITIVE,
sec_relevant_cols=>'salary,birthdate,ssn');
END;
/
```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```
BEGIN
dbms_rls.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hosting_policy',
function_schema =>'hr',
policy_function => 'subfun',
policy_type => dbms_rls.SHARED_STATIC);
END;
/
```

ADD_POLICY_CONTEXT Procedure

This procedure adds the context for the active application.

Syntax

```
DBMS_RLS.ADD_POLICY_CONTEXT (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   namespace       VARCHAR2,
   attribute       VARCHAR2);
```

Parameters

Table 110–5 ADD_POLICY_CONTEXT Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym to which the policy is added.
`namespace`	The namespace of the driving context
`attribute`	The attribute of the driving context.

Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- If no object_schema is specified, the current log-on user schema is assumed.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `hr.employees` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_
group','policy1','SYS', 'HR.ACCESS');
```

CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   policy_group    VARCHAR2);
```

Parameters

Table 110–6 CREATE_POLICY_GROUP Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym.
`object_name`	Name of the table, view, or synonym to which the policy is added.
`policy_group`	Name of the policy group that the policy belongs to.

Usage Notes

The group must be unique for each table or view.

DELETE_POLICY_GROUP Procedure

This procedure deletes a policy group.

Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (
  object_schema   VARCHAR2,
  object_name     VARCHAR2,
  policy_group    VARCHAR2);
```

Parameters

Table 110–7 DELETE_POLICY_GROUP Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.

Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   group_name      VARCHAR2,
   policy_name     VARCHAR2);
```

Parameters

Table 110–8 ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy to be enabled or disabled.

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE_GROUPED_POLICY procedure is executed with "enable" set to FALSE.

DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   policy_group    VARCHAR2,
   policy_name     VARCHAR2);
```

Parameters

Table 110–9 DROP_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym to which the policy is dropped.
`policy_group`	The name of the policy group that the policy belongs to.
`policy_name`	The name of the policy.

DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 110-5

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.DROP_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   policy_name     IN VARCHAR2);
```

Parameters

Table 110–10 DROP_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view or synonym (current default schema if `NULL`)..
`object_name`	Name of the table, view, or synonym for which the policy is dropped.
`policy_name`	Name of policy to be dropped from table, view, or synonym.

DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   namespace       VARCHAR2,
   attribute       VARCHAR2);
```

Parameters

Table 110–11 DROP_POLICY_CONTEXT Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym to which the policy is dropped.
`namespace`	The namespace of the driving context.
`attribute`	The attribute of the driving context.

ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   group_name      VARCHAR2,
   policy_name     VARCHAR2,
   enable          BOOLEAN);
```

Parameters

Table 110–12 ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy to be enabled or disabled.
`enable`	`TRUE` enables the policy; `FALSE` disables the policy.

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 110-5

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ENABLE_POLICY (
   object_schema IN VARCHAR2 NULL,
   object_name   IN VARCHAR2,
   policy_name   IN VARCHAR2,
   enable        IN BOOLEAN);
```

Parameters

Table 110–13 ENABLE_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing table, view, or synonym (current default schema if `NULL`).
`object_name`	Name of table, view, or synonym with which the policy is associated.
`policy_name`	Name of policy to be enabled or disabled.
`enable`	`TRUE` to enable the policy, `FALSE` to disable the policy.

REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   group_name      VARCHAR2,
   policy_name     VARCHAR2);
```

Parameters

Table 110–14 REFRESH_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy.

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.

REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 110-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.REFRESH_POLICY (
   object_schema IN VARCHAR2 NULL,
   object_name   IN VARCHAR2 NULL,
   policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 110–15 REFRESH_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym.
`object_name`	Name of table, view, or synonym with which the policy is associated.
`policy_name`	Name of policy to be refreshed.

Usage Notes

The procedure returns an error if it tries to refresh a disabled policy.

111

DBMS_ROWID

The DBMS_ROWID package lets you create ROWIDs and obtain information about ROWIDs from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other ROWID components without writing code to interpret the base-64 character external ROWID. DBMS_ROWID is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

> **Note:** DBMS_ROWID is not to be used with universal ROWIDs (UROWIDs).

This chapter contains the following topics:

- Using DBMS_ROWID
  - Security Model
  - Types
  - Exceptions
  - Operational Notes
  - Examples
- Summary of DBMS_ROWID Subprograms

Using DBMS_ROWID

- Security Model
- Types
- Exceptions
- Operational Notes
- Examples

Security Model

This package runs with the privileges of calling user, rather than the package owner `SYS`.

Types

- Extension and Restriction Types
- Verification Types
- Object Types
- Conversion Types

Extension and Restriction Types

The types are as follows:

- RESTRICTED—restricted ROWID
- EXTENDED—extended ROWID

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

Note: Extended ROWIDs are only used in Oracle database version 8.X*i* and higher.

Verification Types

Table 111–1 Verification Types

Result	Description
VALID	Valid ROWID
INVALID	Invalid ROWID

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

Object Types

Table 111–2 Object Types

Result	Description
UNDEFINED	Object Number not defined (for restricted ROWIDs)

For example:

```
rowid_object_undefined constant integer := 0;
```

Conversion Types

Table 111–3 Conversion Types

Result	Description
INTERNAL	Convert to/from column of ROWID type

Table 111–3 (Cont.) Conversion Types

Result	Description
EXTERNAL	Convert to/from string format

For example:

```
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
```

Exceptions

Table 111–4 Exceptions

Exception	Description
ROWID_INVALID	Invalid rowid format
ROWID_BAD_BLOCK	Block is beyond end of file

For example:

```
ROWID_INVALID exception;
   pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
   pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

Operational Notes

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SLQ ROWID, either restricted or extended, as required.
- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

  Note: ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
   FROM emp
   WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict_references, it could mean the violation is due to:
  - A problem with the current procedure or function
  - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
  - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```
DECLARE
  object_no   INTEGER;
  row_id      ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
    WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
```

Summary of DBMS_ROWID Subprograms

Table 111–5 DBMS_ROWID Package Subprograms

Subprogram	Description
ROWID_BLOCK_NUMBER Function on page 111-10	Returns the block number of a `ROWID`
ROWID_CREATE Function on page 111-11	Creates a `ROWID`, for testing only
ROWID_INFO Procedure on page 111-12	Returns the type and components of a `ROWID`
ROWID_OBJECT Function on page 111-13	Returns the object number of the extended `ROWID`
ROWID_RELATIVE_FNO Function on page 111-14	Returns the file number of a `ROWID`
ROWID_ROW_NUMBER Function on page 111-15	Returns the row number
ROWID_TO_ABSOLUTE_FNO Function on page 111-16	Returns the absolute file number associated with the `ROWID` for a row in a specific table
ROWID_TO_EXTENDED Function on page 111-17	Converts a `ROWID` from restricted format to extended
ROWID_TO_RESTRICTED Function on page 111-19	Converts an extended `ROWID` to restricted format
ROWID_TYPE Function on page 111-20	Returns the `ROWID` type: 0 is restricted, 1 is extended
ROWID_VERIFY Function on page 111-21	Checks if a `ROWID` can be correctly extended by the `ROWID_TO_EXTENDED` function

ROWID_BLOCK_NUMBER Function

This function returns the database block number for the input ROWID.

Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (
   row_id      IN   ROWID,
   ts_type_in  IN   VARCHAR2 DEFAULT 'SMALLFILE')
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 111–6 ROWID_BLOCK_NUMBER Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs.

Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')
   FROM some_table
   WHERE key_value = 42);
```

ROWID_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

Syntax

```
DBMS_ROWID.ROWID_CREATE (
   rowid_type    IN NUMBER,
   object_number IN NUMBER,
   relative_fno  IN NUMBER,
   block_number  IN NUMBER,
   row_number    IN NUMBER)
  RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 111–7 ROWID_CREATE Function Parameters

Parameter	Description
rowid_type	Type (restricted or extended). Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.
object_number	Data object number (rowid_object_undefined for restricted).
relative_fno	Relative file number.
block_number	Block number in this file.
row_number	Returns row number in this block.

Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj_number now contains 9999.

ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID. This is a procedure, and it cannot be used in a SQL statement.

Syntax

```
DBMS_ROWID.ROWID_INFO (
   rowid_in         IN   ROWID,
   rowid_type       OUT  NUMBER,
   object_number    OUT  NUMBER,
   relative_fno     OUT  NUMBER,
   block_number     OUT  NUMBER,
   row_number       OUT  NUMBER);
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 111–8 ROWID_INFO Procedure Parameters

Parameter	Description
rowid_in	ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.
rowid_type	Returns type (restricted/extended).
object_number	Returns data object number (rowid_object_undefined for restricted).
relative_fno	Returns relative file number.
block_number	Returns block number in this file.
row_number	Returns row number in this block.

See Also: "ROWID_TYPE Function" on page 111-20

Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

```
DBMS_ROWID.ROWID_INFO (
   my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

ROWID_OBJECT Function

This function returns the data object number for an extended ROWID. The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```
DBMS_ROWID.ROWID_OBJECT (
   rowid_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 111–9 ROWID_OBJECT Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Note: The ROWID_OBJECT_UNDEFINED constant is returned for restricted ROWIDs.

Examples

```
SELECT dbms_rowid.rowid_object(ROWID)
   FROM emp
   WHERE empno = 7499;
```

ROWID_RELATIVE_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (
   rowid_id      IN   ROWID,
   ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 111–10 ROWID_RELATIVE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs.

Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE
   file_number    INTEGER;
   rowid_val      ROWID;
BEGIN
   SELECT ROWID INTO rowid_val
     FROM dept
     WHERE loc = 'Boston';
   file_number :=
     dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...
```

ROWID_ROW_NUMBER Function

This function extracts the row number from the `ROWID IN` parameter.

Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (
   row_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 111–11 ROWID_ROW_NUMBER Function Parameters

Parameter	Description
`row_id`	`ROWID` to be interpreted.

Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)
   FROM emp
   WHERE ename = 'ALLEN';
```

ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table. The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (
   row_id      IN ROWID,
   schema_name IN VARCHAR2,
   object_name IN VARCHAR2)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

Parameters

Table 111–12 ROWID_TO_ABSOLUTE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
schema_name	Name of the schema which contains the table.
object_name	Table name.

Examples

```
DECLARE
   abs_fno        INTEGER;
   rowid_val      CHAR(18);
   object_name    VARCHAR2(20) := 'EMP';
BEGIN
    SELECT ROWID INTO rowid_val
     FROM emp
     WHERE empno = 9999;
     abs_fno := dbms_rowid.rowid_to_absolute_fno(
     rowid_val, 'SCOTT', object_name);
```

Note: For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format. Later, it may be removed from this package into a different place.

Syntax

```
DBMS_ROWID.ROWID_TO_EXTENDED (
   old_rowid       IN ROWID,
   schema_name     IN VARCHAR2,
   object_name     IN VARCHAR2,
   conversion_type IN INTEGER)
  RETURN ROWID;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

Parameters

Table 111–13 ROWID_TO_EXTENDED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted.
schema_name	Name of the schema which contains the table (optional).
object_name	Table name (optional).
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID_COL that holds ROWIDs (restricted), and a column TABLE_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
   SET rowid_col =
   dbms_rowid.rowid_to_extended (
      rowid_col, 'SCOTT", TABLE_COL, 0);
```

Usage Notes

If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID_TO_EXTENDED returns a value, however, does not guarantee that the

converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.

If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.

If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the INVALID_ROWID exception is raised. If they do match, the input ROWID is returned.

> **See Also:** The ROWID_VERIFY Function has a method to determine if a given ROWID can be converted to the extended format.

ROWID_TO_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
   old_rowid       IN ROWID,
   conversion_type IN INTEGER)
  RETURN ROWID;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 111–14 ROWID_TO_RESTRICTED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted.
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

ROWID_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

Syntax

```
DBMS_ROWID.ROWID_TYPE (
   rowid_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_type,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 111–15 ROWID_TYPE Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
   my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

ROWID_VERIFY Function

This function verifies the ROWID. It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

> **Note:** You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (
   rowid_in        IN ROWID,
   schema_name     IN VARCHAR2,
   object_name     IN VARCHAR2,
   conversion_type IN INTEGER
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 111–16 ROWID_VERIFY Function Parameters

Parameter	Description
rowid_in	ROWID to be verified.
schema_name	Name of the schema which contains the table.
object_name	Table name.
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

Examples

Considering the schema in the example for the ROWID_TO_EXTENDED function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
   FROM SCOTT.RIDS
   WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

DBMS_RULE

The DBMS_RULE package contains subprograms that enable the evaluation of a rule set for a specified event.

See Also:

- Chapter 237, "Rule TYPEs" for more information about the types used with the DBMS_RULE package
- Chapter 113, "DBMS_RULE_ADM" and *Oracle Streams Concepts and Administration* for more information about this package and rules

This chapter contains the following topics:

- Using DBMS_RULE
  - Security Model
- Summary of DBMS_RULE Subprograms

Using DBMS_RULE

This section contains topics which relate to using the `DBMS_RULE` package.

- Security Model

Security Model

PUBLIC is granted EXECUTE privilege on this package.

Summary of DBMS_RULE Subprograms

Table 112–1 DBMS_RULE Package Subprograms

Subprogram	Description
CLOSE_ITERATOR Procedure on page 112-5	Closes an open iterator
EVALUATE Procedures on page 112-6	Evaluates the rules in the specified rule set that use the evaluation context specified
GET_NEXT_HIT Function on page 112-10	Returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator; returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

Syntax

```
DBMS_RULE.CLOSE_ITERATOR(
  iterator  IN  BINARY_INTEGER);
```

Parameter

Table 112–2 CLOSE_ITERATOR Procedure Parameter

Parameter	Description
iterator	The iterator to be closed

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

See Also: "EVALUATE Procedures" on page 112-6

EVALUATE Procedures

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

Syntax

```
DBMS_RULE.EVALUATE(
  rule_set_name        IN   VARCHAR2,
  evaluation_context   IN   VARCHAR2,
  event_context        IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values         IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values        IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values      IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values     IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  stop_on_first_hit    IN   BOOLEAN                      DEFAULT FALSE,
  simple_rules_only    IN   BOOLEAN                      DEFAULT FALSE,
  true_rules           OUT  SYS.RE$RULE_HIT_LIST,
  maybe_rules          OUT  SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE(
  rule_set_name         IN   VARCHAR2,
  evaluation_context    IN   VARCHAR2,
  event_context         IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values          IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values         IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values       IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values      IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  simple_rules_only     IN   BOOLEAN                      DEFAULT FALSE,
  true_rules_iterator   OUT  BINARY_INTEGER,
  maybe_rules_iterator  OUT  BINARY_INTEGER);
```

Parameters

Table 112–3 EVALUATE Procedure Parameters

Parameter	Description
`rule_set_name`	Name of the rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to evaluate all of the rules in a rule set named `hr_rules` in the `hr` schema, enter `hr.hr_rules` for this parameter. If the schema is not specified, then the schema of the current user is used.
`evaluation_context`	An evaluation context name in the form `[`*`schema_name`*`.]`*`evaluation_context_name`*. If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.
`event_context`	A list of name-value pairs that identify events that cause evaluation

Table 112–3 (Cont.) EVALUATE Procedure Parameters

Parameter	Description
table_values	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
column_values	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in table_values.
variable_values	A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
attribute_values	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in variable_values.
stop_on_first_hit	If TRUE, then the rules engine stops evaluation as soon as it finds a TRUE rule. If TRUE and there are no TRUE rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to TRUE given more data. If FALSE, then the rules engine continues to evaluate rules even after it finds a TRUE rule.
simple_rules_only	If TRUE, then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If FALSE, then evaluates all rules.
true_rules	Receives the output of the EVALUATE procedure into a varray of RE$RULE_HIT_LIST type. If no rules evaluate to TRUE, then true_rules is empty. If at least one rule evaluates to TRUE and stop_on_first_hit is TRUE, then true_rules contains one rule that evaluates to TRUE. If stop_on_first_hit is FALSE, then true_rules contains all rules that evaluate to TRUE.
maybe_rules	If all rules can be evaluated completely, without requiring any additional data, then maybe_rules is empty. If stop_on_first_hit is TRUE, then if there is at least one rule that may evaluate to TRUE given more data, and no rules evaluate to TRUE, then maybe_rules contains one rule that may evaluate to TRUE. If stop_on_first_hit is FALSE, then maybe_rules contains all rules that may evaluate to TRUE given more data.
true_rules_iterator	Contains the iterator for accessing rules that are TRUE
maybe_rules_iterator	Contains the iterator for accessing rules that may be TRUE given additional data or the ability to issue SQL

Usage Notes

> **Note:** Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of `1` for attribute `"a.b"` of variable `"x"`, a rule with the following rule condition can be returned as `TRUE`, without a value for table `"tab"`:

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- `TRUE` rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.
- `MAYBE` rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute `"x.a.b"` is specified, but no value is specified for the variable `"x"`, the attribute `"a"`, or the attribute `"a.b"`.
  - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

  Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free

resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

Note: The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

See Also:

- Chapter 237, "Rule TYPEs" for more information about the types used with the `DBMS_RULE` package
- "GET_NEXT_HIT Function" on page 112-10
- "CLOSE_ITERATOR Procedure" on page 112-5

GET_NEXT_HIT Function

This function returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator. The function returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

Syntax

```
DBMS_RULE.GET_NEXT_HIT(
  iterator  IN  BINARY_INTEGER)
RETURN SYS.RE$RULE_HIT;
```

Parameter

Table 112–4 GET_NEXT_HIT Function Parameter

Parameter	Description
iterator	The iterator from which the rule that evaluated to TRUE or MAYBE is retrieved

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns NULL, it is closed automatically. If an open iterator is no longer needed, then use the CLOSE_ITERATOR procedure in the DBMS_RULE package to close it.

Note: This function raises an error if the rule set being evaluated was modified after the call to the DBMS_RULE.EVALUATE procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

DBMS_RULE_ADM

The DBMS_RULE_ADM package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

See Also:

- Chapter 237, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package
- Chapter 112, "DBMS_RULE" and *Oracle Streams Concepts and Administration* for more information about this package and rules

This chapter contains the following topics:

- Using DBMS_RULE_ADM
  - Security Model
- Summary of DBMS_RULE_ADM Subprograms

Using DBMS_RULE_ADM

This section contains topics which relate to using the `DBMS_RULE_ADM` package.

- Security Model

Security Model

User group PUBLIC is granted EXECUTE privilege on this package.

See Also: *Oracle Database Security Guide* for more information about user group PUBLIC

Summary of DBMS_RULE_ADM Subprograms

Table 113–1 DBMS_RULE_ADM Package Subprograms

Subprogram	Description
ADD_RULE Procedure on page 113-5	Adds the specified rule to the specified rule set
ALTER_EVALUATION_CONTEXT Procedure on page 113-7	Alters a rule evaluation context
ALTER_RULE Procedure on page 113-10	Changes one or more aspects of the specified rule
CREATE_EVALUATION_CONTEXT Procedure on page 113-12	Creates a rule evaluation context
CREATE_RULE Procedure on page 113-14	Creates a rule with the specified name
CREATE_RULE_SET Procedure on page 113-16	Creates a rule set with the specified name
DROP_EVALUATION_CONTEXT Procedure on page 113-17	Drops the rule evaluation context with the specified name
DROP_RULE Procedure on page 113-18	Drops the rule with the specified name
DROP_RULE_SET Procedure on page 113-19	Drops the rule set with the specified name
GRANT_OBJECT_PRIVILEGE Procedure on page 113-20	Grants the specified object privilege on the specified object to the specified user or role
GRANT_SYSTEM_PRIVILEGE Procedure on page 113-22	Grants the specified system privilege to the specified user or role
REMOVE_RULE Procedure on page 113-24	Removes the specified rule from the specified rule set
REVOKE_OBJECT_PRIVILEGE Procedure on page 113-26	Revokes the specified object privilege on the specified object from the specified user or role
REVOKE_SYSTEM_PRIVILEGE Procedure on page 113-27	Revokes the specified system privilege from the specified user or role

Note: All subprograms commit unless specified otherwise.

ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
   rule_name           IN  VARCHAR2,
   rule_set_name       IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2   DEFAULT NULL,
   rule_comment        IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 113–2 ADD_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are adding to the rule set, specified as [*schema_name.*]*rule_name*. For example, to add a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set to which you are adding the rule, specified as [*schema_name.*]*rule_set_name*. For example, to add the rule to a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An evaluation context name in the form [*schema_name.*]*evaluation_context_name*. If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
rule_comment	Optional description, which can contain the reason for adding the rule to the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_RULE privilege on the rule
- Have EXECUTE_ANY_RULE system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  remove_table_aliases         IN  BOOLEAN                    DEFAULT FALSE,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  remove_variable_types        IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  remove_evaluation_function   IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                    DEFAULT FALSE);
```

Parameters

Table 113–3 ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are altering, specified as [*schema_name.*]*evaluation_context_name*. For example, to alter an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	If NULL and remove_table_aliases is FALSE, then the procedure retains the existing table aliases. If NULL and remove_table_aliases is TRUE, then the procedure removes the existing table aliases. If non-NULL, then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
remove_table_aliases	If TRUE and table_aliases is NULL, then the procedure removes the existing table aliases for the evaluation context. If TRUE and table_aliases is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove table aliases.
variable_types	If NULL and remove_variable_types is FALSE, then the procedure retains the variable types. If NULL and remove_variable_types is TRUE, then the procedure removes the existing variable types. If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.

Table 113–3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
remove_variable_types	If TRUE and variable_types is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and variable_types is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the variable types.
evaluation_function	If NULL and remove_evaluation_function is FALSE, then the procedure retains the existing evaluation function. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation function. If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function. An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See "CREATE_EVALUATION_CONTEXT Procedure" on page 113-12for more information about evaluation functions.
remove_evaluation_function	If TRUE and evaluation_function is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and evaluation_function is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation function.
evaluation_context_comment	If NULL and remove_eval_context_comment is FALSE, then the procedure retains the existing evaluation context comment. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation context comment. If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment. An evaluation context comment is an optional description of the rule evaluation context.
remove_eval_context_comment	If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation context comment.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user

- Have `ALTER_ANY_EVALUATION_CONTEXT` system privilege

See Also: Chapter 237, "Rule TYPEs" for more information about the types used with the `DBMS_RULE_ADM` package

ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
   rule_name                  IN  VARCHAR2,
   condition                  IN  VARCHAR2        DEFAULT NULL,
   evaluation_context         IN  VARCHAR2        DEFAULT NULL,
   remove_evaluation_context  IN  BOOLEAN         DEFAULT FALSE,
   action_context             IN  SYS.RE$NV_LIST  DEFAULT NULL,
   remove_action_context      IN  BOOLEAN         DEFAULT FALSE,
   rule_comment               IN  VARCHAR2        DEFAULT NULL,
   remove_rule_comment        IN  BOOLEAN         DEFAULT FALSE);
```

Parameters

Table 113–4 ALTER_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are altering, specified as [*schema_name.*]*rule_name*. For example, to alter a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
evaluation_context	An evaluation context name in the form [*schema_name.*]*evaluation_context_name*. If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
remove_evaluation_context	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the evaluation_context parameter is non-NULL, then this parameter should be set to FALSE.
action_context	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
remove_action_context	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the action_context parameter is non-NULL, then this parameter should be set to FALSE.
rule_comment	If non-NULL, then the existing comment of the rule is replaced by the specified comment.

Table 113–4 (Cont.) ALTER_RULE Procedure Parameters

Parameter	Description
remove_rule_comment	If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the rule_comment parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE privilege on the rule
- Have ALTER_ANY_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

> **See Also:** Chapter 237, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package

CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL);
```

Parameters

Table 113–5 CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are creating, specified as [*schema_name.*]*evaluation_context_name*. For example, to create an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
variable_types	A list of variables for the evaluation context
evaluation_function	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See "Usage Notes" for more information about the evaluation function.
evaluation_context_comment	An optional description of the rule evaluation context.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have CREATE_EVALUATION_CONTEXT_OBJ system privilege
- Have CREATE_ANY_EVALUATION_CONTEXT system privilege

> **See Also:** Chapter 237, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name       IN   VARCHAR2,
```

```
  evaluation_context  IN   VARCHAR2,
  event_context       IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values        IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values       IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values     IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values    IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  stop_on_first_hit   IN   BOOLEAN                      DEFAULT FALSE,
  simple_rules_only   IN   BOOLEAN                      DEFAULT FALSE,
  true_rules          OUT  SYS.RE$RULE_HIT_LIST,
  maybe_rules         OUT  SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

Note: Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.
- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE(
   rule_name           IN  VARCHAR2,
   condition           IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2        DEFAULT NULL,
   action_context      IN  SYS.RE$NV_LIST  DEFAULT NULL,
   rule_comment        IN  VARCHAR2        DEFAULT NULL);
```

Parameters

Table 113–6 CREATE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are creating, specified as [*schema_name.*]*rule_name*. For example, to create a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. A condition evaluates to TRUE or FALSE and can be any condition allowed in the WHERE clause of a SELECT statement. For example, the following is a valid rule condition: department_id = 30 **Note:** Do not include the word "WHERE" in the condition.
evaluation_context	An optional evaluation context name in the form [*schema_name.*]*evaluation_context_name*, which is associated with the rule. If the schema is not specified, then the current user is the default. If evaluation_context is not specified, then the rule inherits the evaluation context from its rule set.
action_context	The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
rule_comment	An optional description of the rule

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the CREATE_RULE_OBJ system privilege
- Have CREATE_ANY_RULE system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

> **See Also:** Chapter 237, "Rule TYPEs" for more information about the types used with the `DBMS_RULE_ADM` package

CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
   rule_set_name       IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2  DEFAULT NULL,
   rule_set_comment    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 113–7 CREATE_RULE_SET Procedure Parameters

Parameter	Description
`rule_set_name`	The name of the rule set you are creating, specified as `[`*`schema_name.`*`]`*`rule_set_name`*. For example, to create a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default.
`evaluation_context`	An optional evaluation context name in the form `[`*`schema_name.`*`]`*`evaluation_context_name`*, which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
`rule_set_comment`	An optional description of the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT(
   evaluation_context_name  IN  VARCHAR2,
   force                    IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 113–8 DROP_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are dropping, specified as [*schema_name.*]*evaluation_context_name*.
	For example, to drop an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
force	If TRUE, then the procedure removes the rule evaluation context from all rules and rule sets that use it.
	If FALSE and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context.
	If FALSE and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception.
	Caution: Setting force to TRUE can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the ADD_RULE procedure, then the rule cannot be evaluated.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have DROP_ANY_EVALUATION_CONTEXT system privilege

DROP_RULE Procedure

This procedure drops a rule.

Syntax

```
DBMS_RULE_ADM.DROP_RULE(
   rule_name  IN  VARCHAR2,
   force      IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 113–9 DROP_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are dropping, specified as [*schema_name.*]*rule_name*. For example, to drop a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
force	If TRUE, then the procedure removes the rule from all rule sets that contain it. If FALSE and no rule sets contain the rule, then the procedure drops the rule. If FALSE and one or more rule sets contain the rule, then the procedure raises an exception.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have DROP_ANY_RULE system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the REMOVE_RULE procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
   rule_set_name  IN  VARCHAR2,
   delete_rules   IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 113–10 DROP_RULE_SET Procedure Parameters

Parameter	Description
rule_set_name	The name of the rule set you are dropping, specified as [*schema_name.*]*rule_set_name*. For example, to drop a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
delete_rules	If TRUE, then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If FALSE, then the procedure does not drop the rules in the rule set.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have DROP_ANY_RULE_SET system privilege
- Be the owner of the rule set

> **Note:** The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
   privilege     IN  BINARY_INTEGER,
   object_name   IN  VARCHAR2,
   grantee       IN  VARCHAR2,
   grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 113–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the object privilege to grant to the grantee on the object. See "Usage Notes" on page 113-20 for the available object privileges.
`object_name`	The name of the object for which you are granting the privilege to the grantee, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, to grant the privilege on a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
`grantee`	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
`grant_option`	If `TRUE`, then the specified user or users granted the specified privilege can grant this privilege to others. If `FALSE`, then the specified user or users granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have `EXECUTE` privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

Table 113–12 lists the object privileges.

Table 113–12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT	Alter and execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE	Alter and execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET	Alter and execute a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT	Alter a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE	Alter a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET	Alter a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT	Execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE	Execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET	Execute a particular rule set in another user's schema

Examples

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name  => 'strmadmin.hr_dml',
    grantee      => 'hr',
    grant_option => FALSE);
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
   privilege     IN  BINARY_INTEGER,
   grantee       IN  VARCHAR2,
   grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 113–13 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the system privilege to grant to the grantee.
`grantee`	The name of the user or role for which the privilege is granted
`grant_option`	If `TRUE`, then the specified user or users granted the specified privilege can grant the system privilege to others. If `FALSE`, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

Usage Notes

Table 113–14 lists the system privileges.

Table 113–14 System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
`SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT`	Alter any evaluation context owned by any user
`SYS.DBMS_RULE_ADM.ALTER_ANY_RULE`	Alter any rule owned by any user
`SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET`	Alter any rule set owned by any user
`SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT`	Create a new evaluation context in any schema
`SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ`	Create a new evaluation context in the grantee's schema
`SYS.DBMS_RULE_ADM.CREATE_ANY_RULE`	Create a new rule in any schema
`SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ`	Create a new rule in the grantee's schema
`SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET`	Create a new rule set in any schema
`SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ`	Create a new rule set in the grantee's schema
`SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT`	Drop any evaluation context in any schema
`SYS.DBMS_RULE_ADM.DROP_ANY_RULE`	Drop any rule in any schema
`SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET`	Drop any rule set in any schema

Table 113–14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

For example, to grant the strmadmin user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee      => 'strmadmin',
    grant_option => FALSE);
END;
/
```

Note: When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object will allow access to any schema, including SYS.

REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
   rule_name                IN  VARCHAR2,
   rule_set_name            IN  VARCHAR2,
   evaluation_context       IN  VARCHAR2  DEFAULT NULL,
   all_evaluation_contexts  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 113–15 REMOVE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are removing from the rule set, specified as [*schema_name.*]*rule_name*. For example, to remove a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set from which you are removing the rule, specified as [*schema_name.*]*rule_set_name*. For example, to remove the rule from a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context_name	The name of the evaluation context associated with the rule you are removing, specified as [*schema_name.*]*evaluation_context_name*. For example, to specify an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default. If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the ADD_RULE procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error. Specify NULL if you did not specify an evaluation context when you added the rule to the rule set. If you specify NULL and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.
all_evaluation_contexts	If TRUE, then the procedure removes the rule from the rule set with all of its associated evaluation contexts. If FALSE, then the procedure only removes the rule with the specified evaluation context. This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Note: This procedure does not drop a rule from the database. To drop a rule from the database, use the DROP_RULE procedure.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE(
   privilege    IN  BINARY_INTEGER,
   object_name  IN  VARCHAR2,
   revokee      IN  VARCHAR2);
```

Parameters

Table 113–16 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the object privilege on the object to revoke from the revokee. See "GRANT_OBJECT_PRIVILEGE Procedure" on page 113-20 for a list of the object privileges.
`object_name`	The name of the object for which you are revoking the privilege from the revokee, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, to revoke an object privilege on a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
`revokee`	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(
   privilege  IN  BINARY_INTEGER,
   revokee    IN  VARCHAR2);
```

Parameters

Table 113–17 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the system privilege to revoke from the revokee. See "GRANT_SYSTEM_PRIVILEGE Procedure" on page 113-22 for a list of the system privileges.
`revokee`	The name of the user or role from which the privilege is revoked

114

DBMS_SCHEDULER

The DBMS_SCHEDULER package provides a collection of scheduling functions and procedures that are callable from any PL/SQL program.

> **See Also:** *Oracle Database Administrator's Guide* for more information regarding how to use DBMS_SCHEDULER

This chapter contains the following topics:

- Data Structures
- Using DBMS_SCHEDULER
  - Rules and Limits
  - Operational Notes
- Summary of DBMS_SCHEDULER Subprograms

Data Structures

The DBMS_SCHEDULER package defines OBJECT types and TABLE types.

OBJECT Types

- JOBARG Object Type
- JOB Object Type
- JOBATTR Object Type
- SCHEDULER$_STEP_TYPE Object Type

TABLE Types

- JOBARG_ARRAY Table Type
- JOB_ARRAY Table Type
- JOBATTR_ARRAY Table Type
- SCHEDULER$_STEP_TYPE_LIST Table Type

JOBARG Object Type

This type is used by the JOB and JOBATTR object types. It represents a job argument in a batch of job arguments.

Syntax

```
TYPE jobarg IS OBJECT (
   arg_position         NUMBER,
   arg_text_value       VARCHAR2(4000),
   arg_anydata_value    ANYDATA,
   arg_operation        VARCHAR2(5);
```

Attributes

Table 114–1 JOBARG Object Type Attributes

Attribute	Description
arg_position	Position of the argument
arg_text_value	Value of the argument if the type is VARCHAR2
arg_anydata_value	Value of the argument if the type is AnyData
arg_operation	Type of the operation: ■ SET ■ RESET

JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_value           IN VARCHAR2)
   RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_value           IN ANYDATA)
   RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_reset           IN BOOLEAN DEFAULT FALSE)
   RETURN SELF AS RESULT;
```

Parameters

Table 114–2 JOBARG Constructor Function Parameters

Parameter	Description
`arg_position`	Position of the argument
`arg_value`	Value of the argument
`arg_reset`	If `arg_reset` is `TRUE`, then the argument at that position is reset. Setting `arg_reset` to `FALSE` (which is the default) will create an argument with a NULL value.

JOBARG_ARRAY Table Type

Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

JOB Object Type

This type is used by the CREATE_JOBS procedure and represents a job in a batch of jobs.

Syntax

```
TYPE job IS OBJECT (
   job_name             VARCHAR2(100),
   job_class            VARCHAR2(32),
   job_style            VARCHAR2(11),
   job_template         VARCHAR2(100)
   program_action       VARCHAR2(4000),
   action_type          VARCHAR2(20),
   schedule_name        VARCHAR2(65),
   repeat_interval      VARCHAR2(4000),
   schedule_limit       INTERVAL DAY(2) TO SECOND(6),
   start_date           TIMESTAMP(6) WITH TIME ZONE,
   end_date             TIMESTAMP(6) WITH TIME ZONE,
   event_condition      VARCHAR2(4000),
   queue_spec           VARCHAR2(100),
   number_of_args       NUMBER,
   arguments            JOBARG_ARRAY,
   priority             NUMBER,
   job_weight           NUMBER,
   max_run_duration     INTERVAL DAY(2) TO SECOND(6),
   max_runs             NUMBER,
   max_failures         NUMBER,
   logging_level        NUMBER,
   restartable          VARCHAR2(5),
   stop_on_window_exit  VARCHAR2(5),
   raise_events         NUMBER,
   comments             VARCHAR2(240),
   auto_drop            VARCHAR2(5),
   enabled              VARCHAR2(5),
   follow_default_tz    VARCHAR2(5),
   parallel_instances   VARCHAR2(5),
   aq_job               VARCHAR2(5),
   instance_id          NUMBER);
```

Object Attributes

Table Table 114–3 describes the attributes of the JOB object type. For more information about these attributes, see "SET_ATTRIBUTE Procedure" on page 114-99.

Table 114–3 JOB Object Type Attributes

Attribute	Description
job_name	Name of the job
job_class	Name of the job class
job_style	Style of the job: ■ REGULAR ■ LIGHTWEIGHT
job_template	Job template. The name of the program (or stored procedure) that specifies the job action.
program_action	Inline job action

Table 114–3 (Cont.) JOB Object Type Attributes

Attribute	Description
action_type	Job action type
schedule_name	Name of the schedule that specifies when the job has to execute
repeat_interval	Inline time-based schedule
schedule_limit	Time from the scheduled execution time that the job should be run
start_date	Start date of the job
end_date	End date of the job
event_condition	Event condition for event-based jobs
queue_spec	Queue specification for event-based jobs
number_of_args	Number of job arguments
arguments	Array of job arguments
priority	Job priority
job_weight	Weight of the job
max_run_duration	Maximum run duration of the job
max_runs	Maximum number of runs before the job is marked as completed
max_failures	Maximum number of failures to tolerate before the job is marked as broken
logging_level	Job logging level
restartable	Indicates whether the job is restartable (TRUE) or not (FALSE)
stop_on_window_exit	Indicates whether the job should be stopped when the window it is running in ends (TRUE) or not (FALSE)
raise_events	State changes on which events should be raised
comments	Comments on the job
auto_drop	Indicates whether the job should be dropped once completed (TRUE) or not (FALSE)
enabled	Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)
follow_default_tz	If TRUE, the job start time is recomputed when the default timezone name changes. (Summer/winter transitions do not change the default timezone name.)
parallel_instances	For event-based jobs only. If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel.
aq_job	For internal use only.
instance_id	The instance ID of the instance that the job must run on.

JOB Constructor Function

This constructor function constructs a job object.

Syntax

```
constructor function job (
```

```
job_name            IN VARCHAR2,
job_style           IN VARCHAR2 DEFAULT 'REGULAR',
job_template        IN VARCHAR2 DEFAULT NULL,
program_action      IN VARCHAR2 DEFAULT NULL,
action_type         IN VARCHAR2 DEFAULT NULL,
schedule_name       IN VARCHAR2 DEFAULT NULL,
repeat_interval     IN VARCHAR2 DEFAULT NULL,
event_condition     IN VARCHAR2 DEFAULT NULL,
queue_spec          IN VARCHAR2 DEFAULT NULL,
start_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
end_date            IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
number_of_args      IN NATURAL DEFAULT NULL,
arguments           IN JOBARG_ARRAY DEFAULT NULL,
job_class           IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
schedule_limit      IN INTERVAL DAY TO SECOND DEFAULT NULL,
priority            IN NATURAL DEFAULT NULL,
job_weight          IN NATURAL DEFAULT NULL,
max_run_duration    IN INTERVAL DAY TO SECOND DEFAULT NULL,
max_runs            IN NATURAL DEFAULT NULL,
max_failures        IN NATURAL DEFAULT NULL,
logging_level       IN NATURALN DEFAULT 64,
restartable         IN BOOLEAN DEFAULT FALSE,
stop_on_window_exit IN BOOLEAN DEFAULT FALSE,
raise_events        IN NATURAL DEFAULT NULL,
comments            IN VARCHAR2 DEFAULT NULL,
auto_drop           IN BOOLEAN DEFAULT TRUE,
enabled             IN BOOLEAN DEFAULT FALSE,
follow_default_tz   IN BOOLEAN DEFAULT FALSE,
parallel_instances  IN BOOLEAN DEFAULT FALSE,
aq_job              IN BOOLEAN DEFAULT FALSE,
instance_id         IN NATURAL DEFAULT NULL)
RETURN SELF AS RESULT;
```

JOB_ARRAY Table Type

Syntax

```
TYPE job_array IS TABLE OF job;
```

JOBATTR Object Type

This type is used by the SET_JOB_ATTRIBUTES procedure and represents a job attribute in a batch of job attributes.

Syntax

```
TYPE jobattr IS OBJECT (
   job_name            VARCHAR2(100),
   attr_name           VARCHAR2(30),
   char_value          VARCHAR2(4000),
   char_value2         VARCHAR2(4000),
   args_value          JOBARG_ARRAY,
   num_value           NUMBER,
   timestamp_value     TIMESTAMP(6) WITH TIME ZONE,
   interval_value      INTERVAL DAY(2) TO SECOND(6);
```

Attributes

Table 114–4 JOBATTR Object Type Attributes

Attribute	Description
job_name	Name of the job
attr_name	Name of the attribute
char_value	Value of the argument if the type is VARCHAR2
char_value2	Second VARCHAR2 attribute value
args_value	Value of the argument if the type is a JOBARG array
num_value	Value of the argument if the type is NUMBER
timestamp_value	Value of the argument if the type is TIMESTAMP WITH TIME ZONE
interval_value	Value of the argument if the type is INTERVAL DAY TO SECOND

JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: VARCHAR2, NUMBER, TIMESTAMP WITH TIME ZONE, INTERVAL DAY TO SECOND, and an array of JOBARG types.

Syntax

```
constructor function jobattr (
   job_name            IN VARCHAR2,
   attr_name           IN VARCHAR2,
   attr_value          IN VARCHAR2,
   attr_value2         IN VARCHAR2 DEFAULT NULL)
   RETURN SELF AS RESULT;

constructor function jobattr (
   job_name            IN VARCHAR2,
   attr_name           IN VARCHAR2,
   attr_value          IN [NUMBER, BOOLEAN,
                           TIMESTAMP WITH TIME ZONE,
                           INTERVAL DAY TO SECOND, JOBARG_ARRAY])
```

```
   RETURN SELF AS RESULT;

constructor function jobattr (
   job_name            IN VARCHAR2,
   attr_name           IN VARCHAR2)
   RETURN SELF AS RESULT;
```

Parameters

Table 114–5 JOBATTR Constructor Function Parameters

Parameter	Description
`job_name`	Name of the job
`attr_name`	Name of the argument
`attr_value`	Value of the argument
`attr_value2`	Most attributes have only one value associated with them, but some can have two. The `attr_value2` argument is for this optional second value.

JOBATTR_ARRAY Table Type

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

SCHEDULER$_STEP_TYPE Object Type

This type is used by RUN_CHAIN to return a List of chain steps with an initial state.

Syntax

```
TYPE scheduler$_step_type IS OBJECT (
   step_name  VARCHAR2(32),
   step_type  VARCHAR2(32));
```

Attributes

Table 114–6 SCHEDULER$_STEP_TYPE Object Type

Attribute	Description
step_name	Name of the step
step_type	State of the step

SCHEDULER$_STEP_TYPE_LIST Table Type

Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

Using DBMS_SCHEDULER

This section contains topics which relate to using the `DBMS_SCHEDULER` package.

- Rules and Limits
- Operational Notes

Rules and Limits

The following rules apply when using the DBMS_SCHEDULER package:

- Only SYS can do anything in SYS schema.
- Several of the procedures accept comma-delimited lists of object names. When a list of names is provided, the Scheduler will stop executing the list on the very first object that returns an error. This means that the Scheduler will not perform the task on the objects in the list after the one that caused the error. For example, consider the statement DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3'); If job3 could not be stopped, then job1 and job2 will be stopped, but the jobs in jobclass1, jobclass2, and jobclass3 will not be stopped.
- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

Operational Notes

The Scheduler uses a rich **calendaring syntax** to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

Calendaring Syntax

The calendaring syntax is as follows:

```
repeat_interval = regular_schedule | combined_schedule

regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause][";" periods_clause]
[";" byperiod_clause]

combined_schedule = schedule_list [";" include_clause]
[";" exclude_clause] [";" intersect_clause]

frequency_clause = "FREQ" "=" ( predefined_frequency | user_defined_frequency )
predefined_frequency = "YEARLY" | "MONTHLY" | "WEEKLY" | "DAILY" |
   "HOURLY" | "MINUTELY" | "SECONDLY"
user_defined_frequency = named_schedule

interval_clause = "INTERVAL" "=" intervalnum
   intervalnum = 1 through 99
bymonth_clause = "BYMONTH" "=" monthlist
   monthlist = monthday ( "," monthday)*
   month = numeric_month | char_month
   numeric_month = 1 | 2 | 3 ...  12
   char_month = "JAN" | "FEB" | "MAR" | "APR" | "MAY" | "JUN" |
   "JUL" | "AUG" | "SEP" | "OCT" | "NOV" | "DEC"
byweekno_clause = "BYWEEKNO" "=" weeknumber_list
   weeknumber_list = weeknumber ( "," weeknumber)*
   weeknumber = [minus] weekno
   weekno = 1 through 53
byyearday_clause = "BYYEARDAY" "=" yearday_list
   yearday_list = yearday ( "," yearday)*
   yearday = [minus] yeardaynum
   yeardaynum = 1 through 366
bydate_clause = "BYDATE" "=" date_list
   date_list = date ( "," date)*
   date = [YYYY]MMDD [ offset | span ]
bymonthday_clause = "BYMONTHDAY" "=" monthday_list
   monthday_list = monthday ( "," monthday)*
   monthday = [minus] monthdaynum
   monthdaynum = 1 through 31
byday_clause = "BYDAY" "=" byday_list
   byday_list = byday ( "," byday)*
   byday = [weekdaynum] day
   weekdaynum = [minus] daynum
   daynum = 1 through 53 /* if frequency is yearly */
```

```
   daynum = 1 through 5  /* if frequency is monthly */
   day = "MON" | "TUE" | "WED" | "THU" | "FRI" | "SAT" | "SUN"
byhour_clause = "BYHOUR" "=" hour_list
   hour_list = hour ( "," hour)*
   hour = 0 through 23
byminute_clause = "BYMINUTE" "=" minute_list
   minute_list = minute ( "," minute)*
   minute = 0 through 59
bysecond_clause = "BYSECOND" "=" second_list
   second_list = second ( "," second)*
   second = 0 through 59
bysetpos_clause = "BYSETPOS" "=" setpos_list
   setpos_list = setpos ("," setpos)*
   setpos = [minus] setpos_num
   setpos_num = 1 through 9999

include_clause = "INCLUDE" "=" schedule_list
exclude_clause = "EXCLUDE" "=" schedule_list
intersect_clause = "INTERSECT" "=" schedule_list
schedule_list = schedule_clause ("," schedule_clause)*
schedule_clause = named_schedule [ offset ]
named_schedule = [schema "."] schedule
periods_clause = "PERIODS" "=" periodnum
byperiod_clause = "BYPERIOD" "=" period_list
period_list = periodnum ("," periodnum)*
periodnum = 1 through 100

offset = ("+" | "-") ["OFFSET:"] duration_val
span = ("+" | "-" | "^") "SPAN:" duration_val
duration_val = dur-weeks | dur_days
dur_weeks = numofweeks "W"
dur_days = numofdays "D"
numofweeks = 1 through 53
numofdays = 1 through 376
minus = "-"
```

In calendaring syntax, * means 0 or more.

Table 114–7 Values for repeat_interval

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 999.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.

Table 114–7 (Cont.) Values for repeat_interval

Name	Description
BYWEEKNO	This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. That last definition is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th. The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year. As an example, in the year 1998 the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01; and January 1st, 1999, is in the ISO week 1998-53. byweekno is only valid for YEARLY. Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY;BYWEEKNO=53;BYMONTH=1".
BYYEARDAY	This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.
BYDATE	This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause is the following: BYDATE=0115,0315,0615,0915,1215,20060115 The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10: BYDATE=0110+SPAN:5D The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of n days or weeks centered around the supplied date. If n is an even number, it is adjusted up to the next odd number. Offsets adjust the supplied date by adding or subtracting n days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.
BYMONTHDAY	This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.
BYDAY	This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.
BYHOUR	This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.
BYMINUTE	This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.

Table 114–7 (Cont.) Values for repeat_interval

Name	Description
BYSECOND	This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.
BYSETPOS	This selects one or more items by position in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be: `FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1` Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies. The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.
INCLUDE	This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure.
EXCLUDE	This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the CREATE_SCHEDULE procedure.

INTERSECT	This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.
	For example, assume that the named schedule `last_sat` indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule `end_qtr` indicates the last day of each quarter in 2005:
	`3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005`
	The following calendaring expression results in these dates:
	`3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005`
	`FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr`
	In this example, the terms FREQ=MONTHLY; BYMONTHDAY=-1 indicate the last day of each month.

Table 114–7 (Cont.) Values for repeat_interval

Name	Description
PERIODS	This identifies the number of periods that together form one cycle of a user defined frequency. It is used in the repeat_interval expression of the schedule that defines the user defined frequency. It is mandatory when the repeat_interval expression in the main schedule contains a BYPERIOD clause. The following example defines the quarters of a fiscal year. FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
BYPERIOD	This selects periods from a user defined frequency. For example, if a main schedule names a user defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause BYPERIOD=2,4 in the main schedule selects the 2nd and 4th fiscal quarters.

Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules

  For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule. You can follow the initial list of individual schedules with include, exclude, and intersect clauses to create more complex combinations.

- Embedding other schedules into the main schedule using include, exclude, and intersect clauses

  With this method, the embedded schedules inherit certain attributes from the main schedule.

  – Timestamps generated by the INCLUDE clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the INTERVAL clause, the BYPERIOD clause, or the BYMONTH clause for freq=monthly.

  – Days that are added by the INCLUDE clause follow the hourly/minutely/secondly execution pattern of the main schedule.

  – When the INCLUDE clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See "Start Dates and Repeat Intervals", later in this section.) For example, a repeat_interval of FREQ=MONTHLY;INCLUDE=HOLIDAY executes only on holidays and not on the month/day defaults retrieved from the start date.

  The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
  'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
  'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

  In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the INTERVAL clause. If the start date of the main schedule is 1/1/2005, then 2/20 isn't added. On the dates that are added, the embedded schedule follows the

execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User Defined Frequencies

Instead of using predefined frequencies like DAILY, WEEKLY, MONTHLY, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following repeat_interval expression is used in a schedule named fiscal_year that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the fiscal_year schedule as a user defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user defined frequency do not have to be equal in length. In the main schedule, the BYSETPOS clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the BYPERIOD clause in the main schedule. To enable this, the schedule that is used as the user defined frequency must include a PERIODS clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the repeat_interval clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the repeat_interval. For example, if the specified frequency is yearly and there is no BYMONTH or BYMONTHDAY clause in the repeat interval, the month and day on which to run the job are retrieved from the start date. Similarly, if frequency is monthly but there is no BYMONTHDAY clause in the repeat interval, the day of the month on which to run the job is retrieved from the start date. If present, BYHOUR, BYMINUTE, and BYSECOND defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the INCLUDE, EXCLUDE, or INTERSECT clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are.

The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly

is expanded internally to:

freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a repeat_interval of FREQ=YEARLY;BYDATE=0701.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

```
is expanded internally to:

freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an INCLUDE clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semi-colon, and each clause can be present at most once, with the exception of the include, exclude, and intersect clauses.
- Spaces are allowed between syntax elements and the strings are case insensitive.
- The list of values for a specific BY clause do not need to be ordered.
- When not enough BY clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "FREQ=YEARLY" with a start date of 02/15/2003 becomes "FREQ=YEARLY;BYMONTH=FEB; BYMONTHDAY=15", which means every year on the 15th of February.

  "FREQ=YEARLY;BYMONTH=JAN,JUL" with start date 01/21/2003 becomes "FREQ=YEARLY;BYMONTH=JAN,JUL;BYMONTHDAY=21", which means every year on January 21 and July 21.
- The byweekno clause is only allowed if the frequency is YEARLY. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a BYDAY clause. For example, "FREQ=YEARLY;BYWEEKNO=2" with a start date of 01/01/2003 will return:

  ```
  01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
  01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
  ```

  Note that when the byweekno clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "FREQ=YEARLY;BYWEEKNO=1,53" for the specified week numbers in 2004, it will return the dates:

  ```
  12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
  12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
  ```

- For those BY clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying BYMONTHDAY=31 will not give you the last day of every month, because not every month has 31 days. Instead, BYMONTHDAY=-1 will give you the last day of the month.

  This is not supported for BY clauses that are fixed in size. In other words, BYMONTH, BYHOUR, BYMINUTE, and BYSECOND are not supported.
- The basic values for the BYDAY clause are the days of the week. When the frequency is YEARLY, or MONTHLY, you are allowed to specify a positive or negative number in front of each day of the week. In the case of YEARLY,

BYDAY=40MON, indicates the 40th Monday of the year. In the case of MONTHLY, BYDAY=-2SAT, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.
- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the start_date argument. If jobs must follow daylight savings adjustments you must make sure that you specify a region name for the time zone of the start_date. For example specifying the start_date time zone as 'US/Eastern' in New York will make sure that daylight saving adjustments are automatically applied. If instead the time zone of the start_date is set to an absolute offset, such as '-5:00', daylight savings adjustments are not followed and your job execution will be off by an hour half of the year.
- When start_date is NULL, the Scheduler will determine the time zone for the repeat interval as follows:

  1. It will check whether the session time zone is a region name. The session time zone can be set by either:
     - Issuing an ALTER SESSION statement, for example:

       ```
       SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
       ```

     - Setting the ORA_SDTZ environment variable.
  2. If the session time zone is an absolute offset instead of a region name, the Scheduler will use the value of the DEFAULT_TIMEZONE Scheduler attribute. For more information, see the SET_SCHEDULER_ATTRIBUTE Procedure.
  3. If the DEFAULT_TIMEZONE attribute is NULL, the Scheduler will use the time zone of systimestamp when the job or window is enabled.

BYSETPOS Clause Rules

- The BYSETPOS clause is the last clause to be evaluated. It is processed after all other BY clauses and the INCLUDE, EXCLUDE and INTERSECT clauses have been evaluated.
- The INTERVAL clause does not change the size of the period to which the BYSETPOS clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which BYSETPOS is applied is generated from a month, not a quarter. The only impact of the INTERVAL clause is

to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY;INTERVAL=3;BYDAY=MON,TUE,WED,THU,FRI;BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which BYSETPOS is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

  ```
  FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
  ```

  on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

BYDATE Clause Rules

- If dates in the BYDATE clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the BY clauses in the calendaring expression. For example, if repeat_interval is defined as

  ```
  freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
  ```

  then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

EXCLUDE Clause Rules

- Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, jan_fifteen is a named schedule that resolves to the single date of 01/15:

  ```
  freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
       exclude=jan_fifteenth
  ```

  In this case, all three instances of the job are removed for 01/15.

OFFSET Rules

- You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute JOB2 exactly 15 days after every occurrence of JOB1, add +OFFSET:15D to the schedule of JOB1, as follows:

  ```
  BEGIN
  dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
    'job1_schedule+OFFSET:15D');
  END;
  /
  ```

  Note that negative offsets to named schedules are not supported.

Example: Putting It All Together

This example demonstrates the use of user defined frequencies, spans, offsets, and the BYSETPOS and INCLUDE clauses. (Note that the OFFSET: keyword in an offset clause is optional.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
 dbms_scheduler.create_schedule('year_start', repeat_interval=>
       'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
 dbms_scheduler.create_schedule('retail_fiscal_year',
        to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
         'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
 dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
  'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
    BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

Summary of DBMS_SCHEDULER Subprograms

Table 114–8 DBMS_SCHEDULER Package Subprograms

Subprogram	Description
ADD_EVENT_QUEUE_SUBSCRIBER Procedure on page 114-30	Adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE
ADD_WINDOW_GROUP_MEMBER Procedure on page 114-31	Adds a window to an existing window group
ALTER_CHAIN Procedure on page 114-32	Alters specified steps of a chain
ALTER_RUNNING_CHAIN Procedure on page 114-33	Alters specified steps of a running chain
CLOSE_WINDOW Procedure on page 114-35	Closes an open window prematurely
COPY_JOB Procedure on page 114-36	Copies an existing job
CREATE_CHAIN Procedure on page 114-37	Creates a chain, which is a named series of programs that are linked together for a combined objective
CREATE_CREDENTIAL Procedure on page 114-38	Creates a credential
CREATE_EVENT_SCHEDULE Procedure on page 114-39	Creates an event schedule, which is a schedule that starts a job based on the detection of an event
CREATE_JOB Procedures on page 114-41	Creates a single job
CREATE_JOB_CLASS Procedure on page 114-46	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
CREATE_JOBS Procedure on page 114-48	Creates multiple jobs
CREATE_PROGRAM Procedure on page 114-49	Creates a program
CREATE_SCHEDULE Procedure on page 114-51	Creates a schedule
CREATE_WINDOW Procedures on page 114-52	Creates a window, which provides a way to automatically activate different resource plans at different times
CREATE_WINDOW_GROUP Procedure on page 114-54	Creates a window group
DEFINE_ANYDATA_ARGUMENT Procedure on page 114-55	Defines a program argument whose value is of a complex type and must be passed encapsulated in an AnyData object
DEFINE_CHAIN_EVENT_STEP Procedure on page 114-56	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: DEFINE_CHAIN_STEP.
DEFINE_CHAIN_RULE Procedure on page 114-57	Adds a rule to an existing chain

Table 114–8 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
DEFINE_CHAIN_STEP Procedure on page 114-60	Defines a chain step, which can be a program or another (nested) chain. See also: `DEFINE_CHAIN_EVENT_STEP`.
DEFINE_METADATA_ ARGUMENT Procedure on page 114-61	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument
DEFINE_PROGRAM_ ARGUMENT Procedures on page 114-63	Defines a program argument whose value can be passed as a string literal to the program
DISABLE Procedure on page 114-65	Disables a program, job, chain, window, or window group
DROP_CHAIN Procedure on page 114-68	Drops an existing chain
DROP_CHAIN_RULE Procedure on page 114-69	Removes a rule from an existing chain
DROP_CHAIN_STEP Procedure on page 114-70	Drops a chain step
DROP_CREDENTIAL Procedure on page 114-71	Drops a credential
DROP_JOB Procedure on page 114-72	Drops a job or all jobs in a job class
DROP_JOB_CLASS Procedure on page 114-73	Drops a job class
DROP_PROGRAM Procedure on page 114-74	Drops a program
DROP_PROGRAM_ ARGUMENT Procedures on page 114-75	Drops a program argument
DROP_SCHEDULE Procedure on page 114-76	Drops a schedule
DROP_WINDOW Procedure on page 114-77	Drops a window
DROP_WINDOW_ GROUP Procedure on page 114-78	Drops a window group
ENABLE Procedure on page 114-79	Enables a program, job, chain, window, or window group
EVALUATE_ CALENDAR_STRING Procedure on page 114-80	Evaluates the calendar string and tells you what the next execution date of a job or window will be
EVALUATE_RUNNING_ CHAIN Procedure on page 114-82	Forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied
GENERATE_JOB_NAME Function on page 114-83	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named `sally1`, `sally2`, and so on
GET_ATTRIBUTE Procedure on page 114-84	Retrieves the value of an attribute of an object
GET_FILE Procedure on page 114-85	Retrieves a file from a host

Table 114–8 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
GET_SCHEDULER_ATTRIBUTE Procedure on page 114-87	Retrieves the value of a Scheduler attribute
OPEN_WINDOW Procedure on page 114-88	Opens a window prematurely. The window is opened immediately for the duration
PURGE_LOG Procedure on page 114-89	Purges specific rows from the job and window logs
PUT_FILE Procedure on page 114-90	Saves a file to one or more hosts
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure on page 114-91	Unsubscribes a user from the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`
REMOVE_WINDOW_GROUP_MEMBER Procedure on page 114-92	Removes a window from an existing window group. This fails if the specified window is not a member of the given group
RESET_JOB_ARGUMENT_VALUE Procedures on page 114-93	Resets the current value assigned to an argument defined with the associated program
RUN_CHAIN Procedures on page 114-94	Immediately runs a chain by creating a run-once job
RUN_JOB Procedure on page 114-96	Runs a job immediately
SET_AGENT_REGISTRATION_PASS Procedure on page 114-98	Sets the agent registration password for a database
SET_ATTRIBUTE Procedure on page 114-99	Changes an attribute of a job, schedule, or other Scheduler object
SET_ATTRIBUTE_NULL Procedure on page 114-112	Changes an attribute of an object to `NULL`
SET_JOB_ANYDATA_VALUE Procedures on page 114-113	Sets the value of a job argument encapsulated in an `AnyData` object
SET_JOB_ARGUMENT_VALUE Procedures on page 114-114	Sets the value of a job argument
SET_JOB_ATTRIBUTES Procedure on page 114-115	Sets the value of a job attribute
SET_SCHEDULER_ATTRIBUTE Procedure on page 114-116	Sets the value of a Scheduler attribute
STOP_JOB Procedure on page 114-118	Stops a currently running job or all jobs in a job class

ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE, and grants the user permission to dequeue from this queue using the designated agent.

Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
   subscriber_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–9 ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Streams Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If NULL, an agent is created and assigned the user name of the calling user.

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

ADD_WINDOW_GROUP_MEMBER Procedure

This procedure adds one or more windows to an existing window group.

Syntax

```
DBMS_SCHEDULER.ADD_WINDOW_GROUP_MEMBER (
   group_name              IN VARCHAR2,
   window_list             IN VARCHAR2);
```

Parameters

Table 114–10 ADD_WINDOW_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the window group
window_list	The name of the window or windows

Usage Notes

If an already open window is added to a window group, the Scheduler will not pick up jobs that point to this window group until the next window in the window group opens.

Adding a window to a group requires the MANAGE SCHEDULER privilege.

Note that a window group cannot be a member of another window group.

ALTER_CHAIN Procedure

This procedure alters specified steps of a chain. This affects all future runs of the specified steps.

Syntax

```
DBMS_SCHEDULER.ALTER_CHAIN (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   attribute               IN VARCHAR2,
   value                   IN BOOLEAN);
```

Parameters

Table 114–11 ALTER_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step or a comma-separated list of steps to alter. This cannot be NULL.
attribute	The attribute of the steps to change. This must be one of: 'PAUSE', 'SKIP', or 'RESTART_ON_RECOVERY' ■ 'PAUSE'—If the PAUSE attribute is set TRUE for a step, after the step has run, its state will be changed to PAUSED (and the completed attribute will remain FALSE). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state will be set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute will be set to TRUE. Setting PAUSE will have no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. ■ 'SKIP'—If the SKIP attribute is set TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED. ■ 'RESTART_ON_RECOVERY'—If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If this attribute is set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues.
value	The value to set for the attribute. This must be one of: TRUE, FALSE.

Usage Notes

Altering a chain requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

ALTER_RUNNING_CHAIN Procedure

This procedure alters specified steps of a running chain. This will affect only steps of this running instance of the chain.

Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
   job_name                IN VARCHAR2,
   step_name               IN VARCHAR2,
   attribute               IN VARCHAR2,
   value                   IN [BOOLEAN|VARCHAR2]);
```

Parameters

Table 114–12 ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
job_name	The name of the job that is running the chain
step_name	The name of the step or a comma-separated list of steps to alter. If this is set to NULL and attribute is PAUSE or SKIP, then all steps of the running chain will be altered.
attribute	The attribute of the steps to change. This must be one of: 'PAUSE', 'SKIP', 'RESTART_ON_RECOVERY', or 'STATE'. ■ 'PAUSE'—If the PAUSE attribute is set TRUE for a step, after the step has run, its state will be changed to PAUSED (and the completed attribute will remain false). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state will be set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute will be set to TRUE. Setting PAUSE will have no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE will be set to TRUE for all steps of this running chain. ■ 'SKIP'—If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If step_name is set to NULL, SKIP will be set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step will immediately change to state PAUSED. ■ 'RESTART_ON_RECOVERY'—If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If this attribute is set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. ■ 'STATE'—This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following: 'NOT_STARTED', 'SUCCEEDED', 'FAILED *error_code*' If the state is being changed to FAILED, an error code must be included (this must be a positive integer).
value	The value to set for the attribute. This must be one of: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED *error_code*'

Usage Notes

Altering a running chain requires alter privileges on the job which is running (either by being the owner, or by having `ALTER` privileges on the job or by having the `CREATE ANY JOB` system privilege).

CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler will switch the resource plan to the one that was in effect outside the window or in the case of overlapping windows to another window.

Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
   window_name             IN VARCHAR2);
```

Parameters

Table 114–13 CLOSE_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running will not stop when the window it is running in closes unless the attribute stop_on_window_close was set to TRUE for the job. However, the resources allocated to the job may change because the resource plan may change.

When a running job has a window group as its schedule, the job will not be stopped when its window is closed if another window that is also a member of the same window group then becomes active. This is the case even if the job has the attribute stop_on_window_close set to TRUE.

Closing a window requires the MANAGE SCHEDULER privilege.

COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```
DBMS_SCHEDULER.COPY_JOB (
   old_job                IN VARCHAR2,
   new_job                IN VARCHAR2);
```

Parameters

Table 114–14 COPY_JOB Procedure Parameters

Parameter	Description
old_job	The name of the existing job
new_job	The name of the new job

Usage Notes

Copying a job requires privileges to create a job in the schema of the new job (the CREATE JOB system privilege if it is in the user's own schema, and the CREATE ANY JOB system privilege otherwise). If the old job is not in the user's own schema, then he needs to additionally have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, `myschema.myname`).

A chain is always created disabled and must be enabled with the ENABLE Procedure before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
   chain_name              IN VARCHAR2,
   rule_set_name           IN VARCHAR2 DEFAULT NULL,
   evaluation_interval     IN INTERVAL DAY TO SECOND DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–15 CREATE_CHAIN Procedure Parameters

Parameter	Description
`chain_name`	The name of the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, so there must not already be a table or other object with this name and schema.
`rule_set_name`	In the normal case, no rule set should be passed in. The Scheduler will automatically create a rule set and associated empty evaluation context. You then use `DEFINE_CHAIN_RULE` to add rules and `DROP_CHAIN_RULE` to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created will be of the form `SCHED_RULESET${N}` and the evaluation context created will be of the form `SCHED_EVCTX${N}` See *Oracle Streams Concepts and Administration* for information on rules and rule sets.
`evaluation_interval`	If this is `NULL`, reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non-`NULL` value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at `NULL` if possible. `evaluation_interval` cannot be less than a minute or greater than a day.
`comments`	An optional comment describing the purpose of the chain

Usage Notes

Creating a chain in one's own schema requires the `CREATE JOB` system privilege. Creating a chain in a different schema requires the `CREATE ANY JOB` system privilege. If no `rule_set_name` is given, a rule set and evaluation context will be created in the schema that the chain is being created in, so the user will need to have the privileges required to create these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

CREATE_CREDENTIAL Procedure

This procedure creates a stored username/password pair in a database object called a credential.

Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
   credential_name         IN VARCHAR2,
   username                IN VARCHAR2,
   password                IN VARCHAR2,
   database_role           IN VARCHAR2 DEFAULT NULL,
   windows_domain          IN VARCHAR2 DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–16 CREATE_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	This is the name that will be used to refer to the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double-quotes.
username	This is the user name that will be used to login to the operating system to run a job if this credential is chosen. This cannot be set to NULL.
password	This is the password that will be used to login to the remote operating system to run a job if this credential is chosen. This cannot be set to NULL and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views.
database_role	Reserved for future use.
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain will be converted to uppercase automatically.
comments	This is a text string that can be used to describe the credential. This field is not used by the Scheduler.

Usage Notes

Credentials reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a credential in a schema other than your own, you must have the CREATE ANY JOB privilege.

The user name is case sensitive. It cannot contain double quotes or spaces.

CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
   schedule_name           IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–17 CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
schedule_name	This attribute specifies a unique identifier for the schedule. The name has to be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the date on which this schedule becomes valid. Occurrences of the event before this date are ignored in the context of this schedule.
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with tab.user_data. For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.
queue_spec	This argument specifies the queue into which events that start this particular job will be enqueued (the **source queue**). If the source queue is a secure queue, the queue_spec argument is a string containing a pair of values of the form *queue_name*, *agent name*. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
end_date	The date after which jobs will not run and windows will not open. An event schedule that has no end_date is valid forever. end_date has to be after the start_date. If this is not the case, then an error will be generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in one's own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying schema.schedule_name. Once a schedule has been created, it

can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

CREATE_JOB Procedures

This procedure creates a single job (regular or lightweight).

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name             IN VARCHAR2,
   job_type             IN VARCHAR2,
   job_action           IN VARCHAR2,
   number_of_arguments  IN PLS_INTEGER              DEFAULT 0,
   start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval      IN VARCHAR2                 DEFAULT NULL,
   end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class            IN VARCHAR2                 DEFAULT 'DEFAULT_JOB_CLASS',
   enabled              IN BOOLEAN                  DEFAULT FALSE,
   auto_drop            IN BOOLEAN                  DEFAULT TRUE,
   comments             IN VARCHAR2                 DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name               IN VARCHAR2,
   program_name           IN VARCHAR2,
   schedule_name          IN VARCHAR2,
   job_class              IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                IN BOOLEAN               DEFAULT FALSE,
   auto_drop              IN BOOLEAN               DEFAULT TRUE,
   comments               IN VARCHAR2              DEFAULT NULL,
   job_style              IN VARCHAR2              DEFAULT 'REGULAR');
```

Creates a job using a named program object and an inlined schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name             IN VARCHAR2,
   program_name         IN VARCHAR2,
   start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval      IN VARCHAR2                 DEFAULT NULL,
   end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class            IN VARCHAR2                 DEFAULT 'DEFAULT_JOB_CLASS',
   enabled              IN BOOLEAN                  DEFAULT FALSE,
   auto_drop            IN BOOLEAN                  DEFAULT TRUE,
   comments             IN VARCHAR2                 DEFAULT NULL,
   job_style               IN VARCHAR2              DEFAULT 'REGULAR');
```

Creates a job using a named schedule object and an inlined program:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name               IN VARCHAR2,
   schedule_name          IN VARCHAR2,
   job_type               IN VARCHAR2,
   job_action             IN VARCHAR2,
   number_of_arguments    IN PLS_INTEGER       DEFAULT 0,
   job_class              IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                IN BOOLEAN           DEFAULT FALSE,
   auto_drop              IN BOOLEAN           DEFAULT TRUE,
```

```
   comments                IN VARCHAR2          DEFAULT NULL);
```

Creates a job using an inlined program and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   job_type                IN VARCHAR2,
   job_action              IN VARCHAR2,
   number_of_arguments     IN PLS_INTEGER       DEFAULT 0,
   start_date              IN TIMESTAMP WITH TIME ZONE,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL);
```

Creates a job using a named program object and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   program_name            IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL,
   job_style               IN VARCHAR2              DEFAULT 'REGULAR');
```

Parameters

Table 114–18 CREATE_JOB Procedure Parameters

Parameter	Description
job_name	This attribute specifies the name of the job and uniquely identifies the job. The name has to be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name. If job_name is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the GENERATE_JOB_NAME procedure to generate a name and then use the output in the CREATE_JOB procedure. The GENERATE_JOB_NAME procedure call generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" on page 114-83 for more information.

Table 114–18 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_type	This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. The supported values are: ■ 'PLSQL_BLOCK' This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0. ■ 'STORED_PROCEDURE' This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. ■ 'EXECUTABLE' This specifies that the job is a job external to the database. External jobs are anything that can be executed from the operating system's command line. Anydata arguments are not supported with a job or program type of EXECUTABLE. The job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run. ■ 'CHAIN' This specifies that the job is a chain. Arguments are not supported for a chain, so number_of_arguments must be 0.
job_action	This attribute specifies the action of the job. The following actions are possible: For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, my_proc(); or BEGIN my_proc(); END; or DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END;. Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: DECLARE ... BEGIN job_action END; This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 114–30 on page 114-61 for details on available metadata attributes. For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. PL/SQL procedures with INOUT or OUT arguments are not supported as job_action when the job or program type is STORED_PROCEDURE. For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance. For a chain, the action is the name of a Scheduler chain object. You have to specify the schema of the chain if it resides in a different schema than the job. If job_action is not specified for an inline program, an error is generated when creating the job.

Table 114–18 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
number_of_arguments	This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.
program_name	The name of the program associated with this job. If the program is of type EXECUTABLE, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.
start_date	This attribute specifies the first date on which this job is scheduled to start. If start_date and repeat_interval are left null, then the job is scheduled to run as soon as the job is enabled. For repeating jobs that use a calendaring expression to specify the repeat interval, start_date is used as a reference date. The first time the job will be scheduled to run is the first match of the calendaring expression that is on or after the current date. The Scheduler cannot guarantee that a job will execute on an exact time because the system may be overloaded and thus resources unavailable.
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with tab.user_data. For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.
queue_spec	This argument specifies the queue into which events that start this particular job will be enqueued (the **source queue**). If the source queue is a secure queue, the queue_spec argument is a string containing a pair of values of the form *queue_name*, *agent name*. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
repeat_interval	This attribute specifies how often the job should repeat. You can specify the repeat interval by using calendaring or PL/SQL expressions. The expression specified is evaluated to determine the next time the job should run. If repeat_interval is not specified, the job will run only once at the specified start date. See "Calendaring Syntax" on page 114-17 for further information.
schedule_name	The name of the schedule, window, or window group associated with this job.
end_date	This attribute specifies the date after which the job will expire and will no longer be executed. When end_date is reached, the job is disabled. The STATE of the job will be set to COMPLETED, and the enabled flag will be set to FALSE. If no value for end_date is specified, the job will repeat forever unless max_runs or max_failures is set, in which case the job stops when either value is reached. The value for end_date must be after the value for start_date. If it is not, an error is generated when the job is enabled.
comments	This attribute specifies a comment about the job. By default, this attribute is NULL.
job_style	Style of the job to create. This argument can have one of the following values: ■ REGULAR - a regular job will be created. This is the default. ■ LIGHTWEIGHT - a persistent lightweight job will be created

Table 114–18 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
enabled	This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured and the job exists as a database object but the Scheduler will ignore it and the job coordinator will not pick the job for processing. In order for the job coordinator to process the job, the job has to be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.
auto_drop	This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been disabled. A job is considered completed if: ▪ Its end date (or its schedule's end date) has passed ▪ It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. ▪ It is not a repeating job and has run once A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE. If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure. By default, jobs are created with auto_drop set to TRUE.

Usage Notes

Jobs are created disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

To create a job in your own schema, you need to have the CREATE JOB privilege. A user with the CREATE ANY JOB privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires EXECUTE privileges for that class or program.

Not all possible job attributes can be set with CREATE_JOB. Some must be set after the job is created. For example, job arguments must be set with the SET_JOB_ARGUMENT_VALUE Procedures or the SET_JOB_ANYDATA_VALUE Procedures. Other job attributes, such as job_priority and max_runs, are set with the SET_ATTRIBUTE Procedure.

To create multiple jobs efficiently, use the CREATE_JOBS procedure.

Note: The Scheduler runs event-based jobs for each occurrence of an event that matches the job's event condition. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the SYS schema.

Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
   job_class_name            IN VARCHAR2,
   resource_consumer_group   IN VARCHAR2 DEFAULT NULL,
   service                   IN VARCHAR2 DEFAULT NULL,
   logging_level             IN PLS_INTEGER
                                DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
   log_history               IN PLS_INTEGER DEFAULT NULL,
   comments                  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–19 CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
job_class_name	The name of the class being created. A schema other than SYS cannot be specified. This attribute specifies the name of the job class and uniquely identifies the job class. The name has to be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.
resource_consumer_group	This attribute specifies the resource consumer group this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with will determine the resources that will be allocated to the job class. If the resource consumer group that a job class is associated with is dropped, the job class will then be associated with the default resource consumer group. If no resource consumer group is specified, the job class is associated with the default resource consumer group. If the specified resource consumer group does not exist when creating the job class, an error occurs.
service	This attribute specifies the database service that the jobs in this class will have affinity to. In a RAC environment, this means that the jobs in this class will only run on those database instances that are assigned to the specific service. Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING for details. If both the resource_consumer_group and service attributes are specified, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence. If no service is specified, the job class will belong to the default service, which means it will have no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service. If the specified service does not exist when creating the job class, then an error occurs.

Table 114–19 (Cont.) CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
logging_ level	This attribute specifies how much information is logged. The three possible options are: ■ DBMS_SCHEDULER.LOGGING_OFF No logging will be performed for any jobs in this class. ■ DBMS_SCHEDULER.LOGGING_RUNS The Scheduler will write detailed information to the job log for all runs of each job in this class. This is the default. ■ DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler will record all operations performed on all jobs in this class. In other words, every time a job is created, enabled, disabled, altered, and so on will be recorded in the log.
log_history	This enables you to control the amount of logging the Scheduler performs. To prevent the job log and the window log from growing indiscriminately, the Scheduler has an attribute that specifies how much history (in days) to keep. Once a day, the Scheduler will automatically purge all log entries from both the job log as well as the window log that are older than the specified history. The default is 30 days. You can change the default by using the SET_SCHEDULER_ATTRIBUTE procedure. For example, to change it to 90 days, issue the following statement: `DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE ('log_history','90');` The range of valid values is 1 through 999.
comments	This attribute is for an optional comment about the job class. By default, this attribute is NULL.

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE SCHEDULER system privilege.

CREATE_JOBS Procedure

This procedure creates multiple jobs (regular or lightweight) and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
   job_array         IN JOB_ARRAY,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 114–20 CREATE_JOBS Procedure Parameters

Parameter	Description
job_array	The array of job definitions. See "Data Structures" on page 114-2 for a description of the JOB_ARRAY and JOB data types.
commit_semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous creates that were successful are committed to disk. This is the default. ■ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. ■ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts to create the rest of the jobs on the list and commits all the creates that were successful.

Usage Notes

This procedure allows for the creation of a large number of jobs in the context of a single transaction. To realize the desired performance gains, the jobs to create must be grouped into batches of sufficient size. Calling CREATE_JOBS with a small array size may not be much faster than calling CREATE_JOB once for each job.

CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (
   program_name             IN VARCHAR2,
   program_type             IN VARCHAR2,
   program_action           IN VARCHAR2,
   number_of_arguments      IN PLS_INTEGER DEFAULT 0,
   enabled                  IN BOOLEAN DEFAULT FALSE,
   comments                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–21 CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_name	This attribute specifies a unique identifier for the program. The name has to be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
program_type	This attribute specifies the type of program you are creating. If it is not specified then you will get an error. There are three supported values for program_type: ■ 'PLSQL_BLOCK' This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0. ■ 'STORED_PROCEDURE' This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported. ■ 'EXECUTABLE' This specifies that the program is external to the database. External programs implies anything that can be executed from the operating system's command line. AnyData arguments are not supported with job or program type EXECUTABLE.

Table 114–21 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_action	This attribute specifies the action of the program. The following actions are possible: For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, `my_proc();` or `BEGIN my_proc(); END;` or `DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END;`. Note that the Scheduler wraps `job_action` in its own block and passes the following to PL/SQL for execution: `DECLARE ... BEGIN job_action END;` This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except `event_message` in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 114–30 on page 114-61 for details on available metadata attributes. For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance. If `program_action` is not specified, an error is generated If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: `job_name`, `job_owner`, `job_start`, `window_start`, `window_end`. For more information on these, see the information regarding `define_metadata_argument`.
number_of_arguments	This attribute specifies the number of arguments the program takes. If this parameter is not specified then the default will be 0. A program can have a maximum of 255 arguments. If the `program_type` is `PLSQL_BLOCK`, this field is ignored.
enabled	This flag specifies whether the program should be created enabled or not. If the flag is set to `TRUE`, then validity checks will be made and the program will be created `ENABLED` should all the checks be successful. By default, this flag is set to `FALSE`, which means that the program is not created enabled. You can also call the `ENABLE` procedure to enable the program before it can be used.
comments	A comment about the program. By default, this attribute is `NULL`.

Usage Notes

To create a program in his own schema, a user needs the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the enabled field is set to `TRUE`). It cannot be executed by a job until it is enabled.

For other users to use your programs, they must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
   schedule_name          IN VARCHAR2,
   start_date             IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
   repeat_interval        IN VARCHAR2,
   end_date               IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
   comments               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–22 CREATE_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	This attribute specifies a unique identifier for the schedule. The name has to be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the first date on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date. It depends on the repeat interval specified. start_date is used to determine the first instance of the schedule. If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval, if it is not specified.
repeat_interval	This attribute specifies how often the schedule should repeat. It is expressed using calendaring syntax. See "Calendaring Syntax" on page 114-17 for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.
end_date	The date after which jobs will not run and windows will not open. A non-repeating schedule that has no end_date will be valid forever. end_date has to be after the start_date. If this is not the case, then an error will be generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in one's own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying schema.schedule_name. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

CREATE_WINDOW Procedures

This procedure creates a recurring time window and associates it with a resource plan. The window can then be used to schedule jobs, which run under the associated resource plan.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
   window_name             IN VARCHAR2,
   resource_plan           IN VARCHAR2,
   schedule_name           IN VARCHAR2,
   duration                IN INTERVAL DAY TO SECOND,
   window_priority         IN VARCHAR2 DEFAULT 'LOW',
   comments                IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
   window_name             IN VARCHAR2,
   resource_plan           IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval         IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   duration                IN INTERVAL DAY TO SECOND,
   window_priority         IN VARCHAR2 DEFAULT 'LOW',
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–23 CREATE_WINDOW Procedure Parameters

Parameter	Description
window_name	This attribute uniquely identifies the window. The name has to be unique in the SQL namespace. All windows are in the SYS schema, so you can optionally preface the window name with 'SYS.'
resource_plan	This attribute specifies the resource plan that is automatically activated when the window opens. When the window closes, the system switches to the appropriate resource plan, which in most cases is the resource plan that was in effect before the window opened, but can also be the resource plan of yet another window. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window. If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.

Table 114–23 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
start_date	This attribute specifies the first date on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created. For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.
duration	This attribute specifies how long the window will be open for. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if none is specified when creating the window, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.
schedule_name	The name of the schedule associated with the window.
repeat_interval	This attribute specifies how often the window should repeat. It is expressed using the Scheduler's calendaring syntax. See "Calendaring Syntax" on page 114-17 for more information. A PL/SQL expression cannot be used to specify the repeat interval for a window. The expression specified is evaluated to determine the next time the window should open. If no repeat_interval is specified, the window will open only once at the specified start date.
end_date	This attribute specifies the date after which the window will no longer open. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window will be set to FALSE. A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified then the window will keep repeating forever. The end_date has to be after the start_date. If this is not the case, then an error is generated when the window is created.
window_priority	This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority will be used to determine which window will be opened. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, which implies that the low priority window does not open if it overlaps with a high priority window. By default, a window is created with a priority of 'LOW'.
comments	This attribute specifies an optional comment about the window. By default, this attribute is NULL.

Usage Notes

Creating a window requires the MANAGE SCHEDULER privilege. Windows always reside in the SYS schema.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the ALTER SYSTEM SET RESOURCE_MANAGER_PLAN statement or the DBMS_RESOURCE_MANAGER.SWITCH_PLAN package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and "SWITCH_PLAN Procedure" on page 105-32.

CREATE_WINDOW_GROUP Procedure

This procedure creates a new window group.

Syntax

```
DBMS_SCHEDULER.CREATE_WINDOW_GROUP (
   group_name            IN VARCHAR2,
   window_list           IN VARCHAR2 DEFAULT NULL,
   comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–24 CREATE_WINDOW_GROUP Procedure Parameters

Parameter	Description
group_name	The name of the window group
window_list	A list of the windows assigned to the window group. If a window that does not exist is specified, an error is generated and the window group is not created. Windows can also be added using the ADD_WINDOW_GROUP_MEMBER procedure. A window group cannot be a member of another window group. Can be NULL.
comments	A comment about the window group

Usage Notes

Creating a window group requires the MANAGE SCHEDULER privilege. Window groups reside in the SYS schema. Window groups, like windows, are created with access to PUBLIC, therefore, no privileges are required to access window groups.

A window group cannot contain another window group.

DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an ANYDATA object. A job that references the program can override the default value.

Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   default_value           IN SYS.ANYDATA,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–25 DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique, so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedures.
argument_type	The data type of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
default_value	The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

- "DEFINE_PROGRAM_ARGUMENT Procedures" on page 114-63
- "SET_JOB_ANYDATA_VALUE Procedures" on page 114-113

DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event. Once started in a running chain, this step will not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step will replace the old one.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   event_schedule_name     IN VARCHAR2,
   timeout                 IN INTERVAL DAY TO SECOND DEFAULT NULL);

DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   timeout                 IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

Parameters

Table 114–26 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain that the step is in
step_name	The name of the step
event_schedule_name	The name of the event schedule that the step waits for
timeout	This parameter is reserved for future use
event_condition	See the CREATE_EVENT_SCHEDULE Procedure
queue_spec	See the CREATE_EVENT_SCHEDULE Procedure

Usage Notes

Defining a chain step requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

See Also: "DEFINE_CHAIN_STEP Procedure" on page 114-60

DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax, and indicates the prerequisites for the action to occur. The action specifies what is to be done as a result of the condition being met.

An actual rule object is created to store the rule in the schema in which the chain resides. If a rule name is given, this name will be used for the rule object. If a rule name is given and a rule already exists with this name in the chain's schema, the existing rule will be altered. (A schema different than the chain's schema cannot be specified). If no rule name is given, one will be generated of the form `SCHED_RULE${N}`.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
   chain_name              IN VARCHAR2,
   condition               IN VARCHAR2,
   action                  IN VARCHAR2,
   rule_name               IN VARCHAR2 DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–27 DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to alter
`condition`	A boolean expression expressed using either SQL or the Scheduler chain condition syntax. (Scheduler chain condition syntax is described below.) The expression must evaluate to `TRUE` for the action to be performed. If the condition is expressed with SQL, it must use the syntax of a `SELECT` statement `WHERE` clause. You can refer to chain step attributes by using the chain step name as a bind variable. The bind variable syntax is *`:step_name.attribute`*. (*`step_name`* refers to a typed object.) Possible attributes are: `completed`, `state`, `start_date`, `end_date`, `error_code`, and `duration`. Possible values for the `state` attribute include: `'NOT_STARTED'`, `'SCHEDULED'`, `'RUNNING'`, `'PAUSED'`, `'STALLED'`, `'SUCCEEDED'`, `'FAILED'`, and `'STOPPED'`. If a step is in the state `'SUCCEEDED'`, `'FAILED'`, or `'STOPPED'`, its `completed` attribute is set to `'TRUE'`, otherwise `completed` is `'FALSE'`. Every chain must have a rule that evaluates to `TRUE` to start the chain. For this purpose, you can use a rule that has `'TRUE'` as its condition if you are using Schedule chain condition syntax, or `'1=1'` as its condition if you are using SQL syntax.

Table 114–27 (Cont.) DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
action	The action to be performed when the rule evaluates to TRUE. The action must consist of at least a keyword with an optional value and an optional delay clause. Possible actions include: ■ [AFTER *delay_interval*] START *step_1*[,*step_2* ...] ■ STOP *step_1*[,*step_2* ...] ■ END [{*end_value*|*step_name.error_code*}] At the beginning of the START action, a delay clause can be given which specifies a delay interval to wait before performing the action. *delay_interval* is a formatted datetime interval of the form HH:MM:SS.
rule_name	The name of the rule that will be created. If no rule_name is given, one will be generated of the form SCHED_RULE$_{N}.
comments	An optional comment describing the rule. This will be stored in the rule object created.

Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain. The following are the available constructs, all of which are boolean expressions:

```
TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer
```

The following boolean operators are available to create more complex conditions:

```
expression AND expression
expression OR expression
NOT (expression)
```

integer can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the NOT operator.

Usage Notes

Defining a chain rule requires ALTER privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

```
'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7
```

Rule Conditions Using SQL Syntax

```
':step1.completed = ''TRUE'' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

':step1.duration > interval ''5'' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to
complete
```

Rule Actions

```
'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has
not completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
```

DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   program_name            IN VARCHAR2);
```

Parameters

Table 114–28 DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to alter.
`step_name`	The name of the step being defined. If a step already exists with this name, the new step will replace the old one.
`program_name`	The name of a program or chain to run during this step. The chain owner must have `EXECUTE` privileges on this program or chain.

Usage Notes

Defining a chain step requires `ALTER` privileges on the chain (either by being the owner, or by having `ALTER` privileges on the chain or by having the `CREATE ANY JOB` system privilege).

> **See Also:** "DEFINE_CHAIN_EVENT_STEP Procedure" on page 114-56

DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
  program_name            IN VARCHAR2,
  metadata_attribute      IN VARCHAR2,
  argument_position       IN PLS_INTEGER,
  argument_name           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–29 DEFINE_METADATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered
metadata_attribute	The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. Table Table 114–30 describes these attributes in detail.
argument_position	The position of the argument as it is passed to the executable. This cannot be greater than the number_of_arguments specified for the program. This must be unique, so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.

Table 114–30 Metadata Attributes

Metadata Attribute	Data Type	Description
job_name	VARCHAR2	Name of the currently running job
job_subname	VARCHAR2	Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.
job_owner	VARCHAR2	Owner of the currently running job
job_start	TIMESTAMP WITH TIME ZONE	When the currently running job started
window_start	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window opened
window_end	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window is scheduled to close
event_message	(See Description)	For an event-based job, the message content of the event that started the job. The data type of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table.

Usage Notes

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

All metadata attributes except `event_message` can also be used in PL/SQL blocks that you enter into the `job_action` or `program_action` attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

DEFINE_PROGRAM_ARGUMENT Procedures

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument(
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument(
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   default_value           IN VARCHAR2,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–31 DEFINE_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedures.
argument_type	The data type of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
default_value	The default value to be assigned to the argument if none is specified by the job.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have `ALTER` privileges on that program. You can also define a program argument if you have the `CREATE ANY JOB` privilege.

See Also:

- "DEFINE_ANYDATA_ARGUMENT Procedure" on page 114-55
- "SET_JOB_ARGUMENT_VALUE Procedures" on page 114-114

DISABLE Procedure

This procedure disables a program, job, chain, window, or window group.

Syntax

```
DBMS_SCHEDULER.DISABLE (
   name              IN VARCHAR2,
   force             IN BOOLEAN DEFAULT FALSE,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 114–32 DISABLE Procedure Parameters

Parameter	Description
name	The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a window group name is specified, then the window group will be disabled, but the windows that are members of the window group will not be disabled.
force	Whether to ignore dependencies. See the usage notes for more information.
commit_semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default. ■ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when force is set to TRUE. ■ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts disabling the rest of the jobs and commits all the disable operations that were successful. This type is only supported when disabling a job or a list of jobs.

Usage Notes

Disabling an object that is already disabled does not generate an error. Because the DISABLE procedure is used for several Scheduler objects, when disabling windows and window groups, they must be preceded by SYS.

The purpose of the force option is to point out dependencies. No dependent objects are altered.

To run DISABLE for a window or window group, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being disabled or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its state in the job queue is changed to disabled.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

Programs

When a program is disabled, the status is changed to disabled. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call, and are allowed to continue

Any argument that pertains to the program will not be affected when the program is disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error will occur.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is re-enabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a window group is disabled, jobs, other than a running job, that has the window group as its schedule will not run even if the member windows open. However, if the job had one of the window group members as its schedule, it would still run.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run.

If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime.

Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
   chain_name              IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–33 DROP_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of a chain to drop. Can also be a comma-delimited list of chains.
force	If force is set to FALSE, the chain must not be referenced by any job otherwise an error will occur. If force is set to TRUE, all jobs pointing to the chain are disabled before dropping the chain. Running jobs that point to this chain will be stopped before the chain is dropped.

Usage Notes

Dropping a chain requires alter privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user needs to have the privileges required to do this. See the DBMS_RULE_ADM.DROP_RULE_SET and DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT procedures for more information.

If force is FALSE, no jobs may be using this chain. If force is TRUE, any jobs that use this chain will be disabled before dropping the chain (and any of these jobs that are running will be stopped).

DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (
   chain_name              IN VARCHAR2,
   rule_name               IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–34 DROP_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
rule_name	The name of the rule to drop
force	If force is set to TRUE, the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If force is set to FALSE and the chain is running, an error is generated.

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so the user needs to have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–35 DROP_CHAIN_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step being dropped. Can be a comma-separated list.
force	If force is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If force is set to FALSE and this chain is currently running, an error is thrown.

Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

DROP_CREDENTIAL Procedure

This procedure drops a credential.

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (
   credential_name         IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–36 DROP_CREDENTIAL Procedure Parameters

Parameter	Description
`credential_name`	The name of the credential being dropped. This can optionally be prefixed with a schema. This cannot be set to `NULL`.
`force`	If set to `FALSE`, the credential must not be referenced by any job or an error will occur. If set to `TRUE`, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.

Usage Notes

Only the owner of a credential or a user with the `CREATE ANY JOB` system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

See Also: "CREATE_CREDENTIAL Procedure" on page 114-38

DROP_JOB Procedure

This procedure drops a job or all jobs in a job class. It results in the job being removed from the job queue, its metadata being removed, and no longer being visible in the *_SCHEDULER_JOBS views. Therefore, no more runs of the job will be executed. Dropping a job also drops all argument values set for that job.

Syntax

```
DBMS_SCHEDULER.DROP_JOB (
   job_name                IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE,
   commit_semantics        IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 114–37 DROP_JOB Procedure Parameters

Parameter	Description
job_name	The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.
force	If force is set to FALSE, and an instance of the job is running at the time of the call, the call results in an error. If force is set to TRUE, the Scheduler first attempts to stop the running job instance (by issuing the STOP_JOB call with the force flag set to false), and then drops the job.
commit_semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous drop operations that were successful are committed to disk. This is the default. ■ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. This type is not supported when force is set to TRUE. ■ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts dropping the rest of the jobs and commits all the drops that were successful.

Usage Notes

Dropping a job requires ALTER privileges on the job either by being the owner of the job, or by having the ALTER object privilege on the job or by having the CREATE ANY JOB system privilege.

DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
   job_class_name          IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–38 DROP_JOB_CLASS Procedure Parameters

Parameter	Description
job_class_name	The name of the job class. Can be a comma-delimited list.
force	If force is set to FALSE, a class must not be referenced by any jobs to be dropped otherwise an error will occur. If force is set to TRUE, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful will the class be dropped. Running jobs that belong to the job class are not affected.

Usage Notes

Dropping a job class requires the MANAGE SCHEDULER system privilege.

DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (
   program_name            IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–39 DROP_PROGRAM Procedure Parameters

Parameter	Description
program_name	The name of the program to be dropped. Can be a comma-delimited list.
force	If force is set to FALSE, the program must not be referenced by any job otherwise an error will occur. If force is set to TRUE, all jobs referencing the program are disabled before dropping the program. Running jobs that point to the program are not affected by the DROP_PROGRAM call, and are allowed to continue.

Usage Notes

Dropping a program requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program if you have the CREATE ANY JOB privilege.

DROP_PROGRAM_ARGUMENT Procedures

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_name           IN VARCHAR2);
```

Parameters

Table 114–40 DROP_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_name	The name of the argument being dropped
argument_position	The position of the argument to be dropped

Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program argument if you have the CREATE ANY JOB privilege.

DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (
   schedule_name    IN VARCHAR2,
   force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–41 DROP_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name of the schedule. Can be a comma-delimited list.
force	If force is set to FALSE, the schedule must not be referenced by any job or window otherwise an error will occur. If force is set to TRUE, any jobs or windows that use this schedule will be disabled before the schedule is dropped Running jobs and open windows that point to the schedule are not affected.

Usage Notes

You must be the owner of the schedule being dropped or have ALTER privileges for the schedule or the CREATE ANY JOB privilege.

DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. All references to the window are removed from window groups.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (
   window_name             IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–42 DROP_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window. Can be a comma-delimited list.
force	If force is set to FALSE, the window must be not be open or referenced by any job otherwise an error will occur. If force is set to TRUE, the window will be dropped and those jobs that have the window as their schedule will be disabled. However, jobs that have a window group of which the dropped window was a member as their schedule will not be disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply. Running jobs that have the window as their schedule will be allowed to continue, unless the stop_on_window_close flag was set to TRUE for the job. If this is the case, the job will be stopped when the window is dropped.

Usage Notes

Dropping a window requires the MANAGE SCHEDULER privilege.

DROP_WINDOW_GROUP Procedure

This procedure drops a window group but not the windows that are members of this window group.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW_GROUP (
   group_name              IN VARCHAR2
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–43 DROP_WINDOW_GROUP Procedure Parameters

Parameter	Description
group_name	The name of the window group
force	If force is set to FALSE, the window group must not be referenced by any job otherwise an error will occur. If force is set to TRUE, the window group will be dropped and those jobs that have the window group as their schedule will be disabled. Running jobs that have the window group as their schedule are allowed to continue, even if the stop_on_window_close flag was set to TRUE when for the job. If a member of the window group that is being dropped is open, the window group can still be dropped.

Usage Notes

If you want to drop all the windows that are members of this group but not the window group itself, you can use the DROP_WINDOW procedure and provide the name of the window group to the call.

To drop a window group, you must have the MANAGE SCHEDULER privilege.

ENABLE Procedure

This procedure enables a program, job, chain, window, or window group. When an object is enabled, the enabled flag is set to TRUE. By default, jobs, chains, and programs are created disabled and windows and window groups are created enabled.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (
   name              IN VARCHAR2,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 114–44 ENABLE Procedure Parameters

Parameter	Description
name	The name of the Scheduler object being enabled. Can be a comma-delimited list of names. If a job class name is specified, then all the jobs in the job class are enabled. If a window group name is specified, then the window group will be enabled, but the windows that are members of the window group, will not be enabled.
commit_ semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous enable operations that were successful are committed to disk. This is the default. ■ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs. ■ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts enabling the rest of the jobs and commits all the enable operations that were successful. This type is only supported when enabling a job or a list of jobs.

Usage Notes

Because the ENABLE procedure is used for several Scheduler objects, when enabling windows or window groups, they must be preceded by SYS.

To run ENABLE for a window or window group, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being enabled or have ALTER privileges on that object or have the CREATE ANY JOB privilege. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler's calendaring syntax. This procedure evaluates the calendar expression and tells you what the next execution date of a job or window will be. This is very useful for testing the correct definition of the calendar string without having to actually schedule the job or window.

This procedure can also be used to get multiple steps of the repeat interval by passing the `next_run_date` returned by one invocation as the `return_date_after` argument of the next invocation of this procedure.

Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
   calendar_string    IN  VARCHAR2,
   start_date         IN  TIMESTAMP WITH TIME ZONE,
   return_date_after  IN  TIMESTAMP WITH TIME ZONE,
   next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 114–45 EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
`calendar_string`	The calendar string to be evaluated. The string must be in the calendaring syntax described in "Operational Notes" on page 114-17.
`start_date`	The date after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be `NULL`.
`return_date_after`	With the `start_date` and the calendar string, the Scheduler has sufficient information to determine all valid execution dates. By setting this argument, the Scheduler knows which one of all possible matches to return. When a `NULL` value is passed for this argument, the Scheduler automatically fills in `systimestamp` as its value.
`next_run_date`	The first timestamp that matches the calendar string and start date that occurs after the value passed in for the `return_date_after` argument.

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
start_date        TIMESTAMP;
return_date_after TIMESTAMP;
next_run_date     TIMESTAMP;
BEGIN
start_date :=
  to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
return_date_after := start_date;
FOR i IN 1..5 LOOP
  DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(
```

```
    'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
    start_date, return_date_after, next_run_date);
DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM

PL/SQL procedure successfully completed.
```

Usage Notes

No specific Scheduler privileges are required.

EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (RUN_JOB can be used to start the job.)

If any of the steps of the chain are themselves running chains, another EVALUATE_RUNNING_CHAIN is performed on each of the nested running chains.

Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
   job_name              IN VARCHAR2);
```

Parameters

Table 114–46 EVALUATE_RUNNING_CHAIN Procedure Parameter

Parameter	Description
job_name	The name of the running job (pointing to a chain) to reevaluate the rules for

Usage Notes

Running EVALUATE_RUNNING_CHAIN on a job requires alter privileges on the job (either by being the owner, or by having ALTER privileges on the job or by having the CREATE ANY JOB system privilege).

Note: The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with one of the event steps of the chain

For most chains, this is sufficient. EVALUATE_RUNNING_CHAIN should be used only under the following circumstances:

- After manual intervention of a running chain with the ALTER_RUNNING_CHAIN procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, EVALUATE_RUNNING_CHAIN may not be needed if you set the evaluation_interval attribute when you created the chain.

GENERATE_JOB_NAME Function

This function returns a unique name for a job. The name will be of the form {prefix}N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOB$_1, JOB$_2, JOB$_3, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.

Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
   prefix        IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

Table 114–47 GENERATE_JOB_NAME Function Parameter

Parameter	Description
prefix	The prefix to use when generating the job name

Usage Notes

If the prefix is explicitly set to NULL, the name will be just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the DBMS_SCHEDULER calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the GENERATE_JOB_NAME function will never return the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to output values of the following types: VARCHAR2, TIMESTAMP WITH TIMEZONE, BOOLEAN, PLS_INTEGER, and INTERVAL DAY TO SECOND.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          OUT {VARCHAR2|TIMESTAMP WITH TIMEZONE|
                      PLS_INTEGER|BOOLEAN|INTERVAL DAY TO SECOND});

DBMS_SCHEDULER.GET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          OUT {VARCHAR2|TIMESTAMP WITH TIMEZONE|
                      PLS_INTEGER|BOOLEAN|INTERVAL DAY TO SECOND});
   value2         OUT VARCHAR2);
```

Parameters

Table 114–48 GET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being retrieved
value	The existing value of the attribute
value2	Most attributes have only one value associated with them, but some can have two. The value2 argument is for this optional second value.

Usage Notes

To run GET_ATTRIBUTE for a job class, you must have the MANAGE SCHEDULER privilege or have EXECUTE privileges on the class. For a schedule, window, or a window group, no privileges are necessary. Otherwise, you must be the owner of the object or have ALTER or EXECUTE privileges on that object or have the CREATE ANY JOB privilege.

GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

This procedures differs from the equivalent UTL_FILE procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle Database) installed.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
   source_file                  IN VARCHAR2,
   source_host                  IN VARCHAR2,
   credential_name              IN VARCHAR2,
   file_contents                OUT {BLOB|CLOB});
DBMS_SCHEDULER.GET_FILE (
   source_file                  IN VARCHAR2,
   source_host                  IN VARCHAR2,
   credential_name              IN VARCHAR2,
   destination_file_name        IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_permissions      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–49 GET_FILE Procedure Parameters

Parameter	Description
source_file	Fully qualified pathname of the file to retrieve from the operating system. The file name is case sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host. If the format of this parameter is *external_log_id*_stdout, then the stdout from the designated external job run is returned. If the format of this parameter is *external_log_id*_stderr, the error text from the designated external job run is returned. You obtain the value of *external_log_id* from the ADDITIONAL_INFO column of the *_SCHEDULER_JOB_RUN_DETAILS views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the external_log_id name/value pair, and then append either "_stdout" or "_stderr" to its value. The external job must have an associated credential. The credential_name parameter of GET_FILE must name the same credential that is used by the job, and the source_host parameter must be the same as the destination attribute of the job.
source_host	If the file is to be retrieved from a remote host, then the *host*:*port* of the Scheduler agent must be specified. If source_host is NULL or set to 'localhost', then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the schagent.conf file, which is located in the Scheduler agent home directory on the remote host.
credential_name	The name of the credential to use for accessing the file system.

Table 114–49 (Cont.) GET_FILE Procedure Parameters

Parameter	Description
file_contents	The contents of the file will be returned in this variable.
destination_ file_name	The contents of the file will be written into this file in the specified directory object.
destination_ directory_object	The contents of the file will be written into the directory specified by this directory object. The caller must have the necessary privileges on the directory object.
destination_ permissions	Reserved for future use

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
   attribute      IN VARCHAR2,
   value          OUT VARCHAR2);
```

Parameters

Table 114–50 GET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	The name of the attribute
value	The existing value of the attribute

Usage Notes

To run GET_SCHEDULER_ATTRIBUTE, you must have the MANAGE SCHEDULER privilege.

Table 114–51 lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see Table 114–75 on page 114-116 and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

Table 114–51 Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
default_timezone	Default time zone used by the Scheduler for repeat intervals and windows
log_history	Retention period in days for job and window logs
max_job_slave_processes	Maximum number of job slave processes that the Scheduler can start. May be NULL.
current_open_window	Name of the currently open window
event_expiry_time	Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.

OPEN_WINDOW Procedure

This procedure opens a window independent of its schedule. This window will open and the resource plan associated with it, will take effect immediately for the duration specified or for the normal duration of the window if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
   window_name             IN VARCHAR2,
   duration                IN INTERVAL DAY TO SECOND,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 114–52 OPEN_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window
duration	The duration of the window. It is of type interval day to second. If it is NULL, then the window will be opened for the regular duration as specified in the window metadata.
force	If force is set to FALSE, opening an already open window, will generate an error. If force is set to TRUE: You can open a window that is already open. The window stays open for the duration specified in the call, from the time the OPEN_WINDOW command was issued. Consider an example to illustrate this. window1 was created with a duration of four hours. It has how been open for two hours. If at this point you reopen window1 using the OPEN_WINDOW call and do not specify a duration, then window1 will be open for another four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes. The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.

Usage Notes

If there are jobs running when the window opens, the resources allocated to them might change due to the switch in resource plan.

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated, and will be as determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the ALTER SYSTEM statement with the force option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the MANAGE SCHEDULER privilege.

PURGE_LOG Procedure

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The PURGE_LOG procedure is used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
   log_history             IN PLS_INTEGER  DEFAULT 0,
   which_log               IN VARCHAR2     DEFAULT 'JOB_AND_WINDOW_LOG',
   job_name                IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 114–53 PURGE_LOG Procedure Parameters

Parameter	Description
log_history	This specifies how much history (in days) to keep. The valid range is 0 - 999. If set to 0, no history is kept.
which_log	This specifies which type of log. Valid values for which_log are job_log, window_log, and job_and_window_log.
job_name	This specifies which job-specific entries must be purged from the jog log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log.

Usage Notes

This procedure requires the MANAGE SCHEDULER privilege.

Examples

The following will completely purge all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following will purge all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following will purge all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in jobclass1 and that are older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer. It differs from the equivalent UTL_FILE procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```
DBMS_SCHEDULER.PUT_FILE (
   destination_file         IN VARCHAR2,
   destination_host         IN VARCHAR2,
   credential_name          IN VARCHAR2,
   file_contents            IN {BLOB|CLOB},
   destination_permissions  IN VARCHAR2 DEFAULT NULL);
DBMS_SCHEDULER.PUT_FILE (
   destination_file         IN VARCHAR2,
   destination_host         IN VARCHAR2,
   credential_name          IN VARCHAR2,
   source_file_name         IN VARCHAR2,
   source_directory_object  IN VARCHAR2,
   destination_permissions  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–54 PUT_FILE Procedure Parameters

Parameter	Description
destination_file	Fully qualified pathname of the file to save to the operating system file system. The file name is case sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.
destination_host	If NULL or set to 'localhost', the file is saved to the file system of the local computer. For saving to a remote host, must contain the *host*:*port* of the remote host, where *host* is the host name or IP address of the remote host, and *port* is the port on which the remote Scheduler agent listens. To determine the port number of a remote Scheduler agent, view the schagent.conf file, which is located in the Scheduler agent home directory on the remote host.
credential_name	The name of the credential to use for accessing the destination file system.
file_contents	The contents of the file will be read from this variable.
source_file_name	The contents of the file will be read from this file.
source_directory_object	The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE.

Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (
   subscriber_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–55 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Streams Advanced Queuing (AQ) agent for which to remove the subscription. If NULL, the user name of the calling user is used.

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

REMOVE_WINDOW_GROUP_MEMBER Procedure

This procedure removes one or more windows from an existing window group.

Syntax

```
DBMS_SCHEDULER.REMOVE_WINDOW_GROUP_MEMBER (
   group_name              IN VARCHAR2,
   window_list             IN VARCHAR2);
```

Parameters

Table 114–56 REMOVE_WINDOW_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the window group.
window_list	The name of the window or windows.

Usage Notes

If any of the windows specified is either invalid, does not exist, or is not a member of the given group, the call fails. Removing a window from a group requires the MANAGE SCHEDULER privilege.

Dropping an open window from a window group has no impact on running jobs that has the window as its schedule since the jobs would only be stopped when a window closes.

RESET_JOB_ARGUMENT_VALUE Procedures

This procedure resets (clears) the value previously set to an argument for a job.

RESET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_position       IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2);
```

Parameters

Table 114–57 RESET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job being altered
argument_position	The position of the program argument being reset
argument_name	The name of the program argument being reset

Usage Notes

If the corresponding program argument has no default value, the job will be disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RUN_CHAIN Procedures

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given. If no `job_name` is given, one will be generated of the form `RUN_CHAIN$_chainnameN`, where `chainname` is the first 8 characters of the chain name and *N* is an integer.

If a list of start steps is given, only those steps will be started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run). If `start_steps` is `NULL`, then the chain will start normally—that is, an initial evaluation will be done to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
   chain_name                IN VARCHAR2,
   start_steps               IN VARCHAR2,
   job_name                  IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
   chain_name               IN VARCHAR2,
   step_state_list          IN SYS.SCHEDULER$_STEP_TYPE_LIST,
   job_name                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–58 RUN_CHAIN Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to run
`job_name`	The name of the job to create to run the chain
`start_steps`	Comma-separated list of the steps to start when the chain starts running
`step_state_list`	List of chain steps with an initial state (`SUCCEEDED` or `FAILED`) to set for each. Set the attributes of `sys.scheduler$_step_type` as follows: `step_name` The name of the step `step_type` 'SUCCEEDED' or 'FAILED *error_number*' where *error_number* is a positive or negative integer.

Usage Notes

Running a chain requires `CREATE JOB` if the job is being created in the user's schema, or `CREATE ANY JOB` otherwise. In addition, the owner of the job being created needs execute privileges on the chain (by being the owner of the chain, by having the `EXECUTE` privilege on the chain, or by having the `EXECUTE ANY PROGRAM` system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```
declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/
```

RUN_JOB Procedure

This procedure runs a job immediately.

Syntax

```
DBMS_SCHEDULER.RUN_JOB (
   job_name                IN VARCHAR2,
   use_current_session     IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 114–59 RUN_JOB Procedure Parameters

Parameter	Description
job_name	The name of the job being run
use_current_session	This specifies whether the job run should occur in the same session as the one that the procedure was invoked from. When use_current_session is set to TRUE: ■ You can test a job and see any possible errors on the command line. ■ run_count, last_start_date, last_run_duration, and failure_count are not updated. ■ RUN_JOB can be run in parallel with a regularly scheduled job run. When use_current_session is set to FALSE: ■ You need to check the job log to find error information. ■ run_count, last_start_date, last_run_duration, and failure_count are updated. ■ RUN_JOB fails if a regularly scheduled job is running.

Usage Notes

The job does not have to be enabled. If the job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

The job can be run in two different modes. One is in the current user session. In this case, the call to RUN_JOB will block until it has completed the job. Any errors that occur during the execution of the job will be returned as errors to the RUN_JOB procedure. The other option is to run the job immediately like a regular job. In this case, RUN_JOB returns immediately and the job will be picked up by the coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use RUN_JOB in their sessions simultaneously when use_current_session is set to TRUE.

When using RUN_JOB with jobs that point to chains, use_current_session must be FALSE.

RUN_JOB requires that you be the owner of the job or have ALTER privileges on that job. You can also run a job if you have the CREATE ANY JOB privilege.

SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database. A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
   registration_password   IN VARCHAR2,
   expiration_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   max_uses                IN NUMBER DEFAULT NULL);
```

Parameters

Table 114–60 SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
registration_password	This is the password that remote agents must specify in order to successfully register with the database. If this is NULL, then no agents will be able to register with the database.
expiration_date	If this is set to a non-NULL value, then the registration_password will not be valid after this date. After this date, no agents will be able to register with the database. This cannot be set to a date in the past.
max_uses	This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents will be able to register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the MANAGE SCHEDULER system privilege.

By default, max_uses is set to NULL which means that there will be no limit on the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to NULL if no new agents are being registered.

SET_ATTRIBUTE Procedure

This procedure changes an attribute of an object. It is overloaded to accept values of the following types: VARCHAR2, TIMESTAMP WITH TIMEZONE, BOOLEAN, PLS_INTEGER, and INTERVAL DAY TO SECOND. To set an attribute to NULL, the SET_ATTRIBUTE_NULL procedure should be used. What attributes can be set depends on the object being altered. With the exception of the object name, all object attributes can be changed.

SET_ATTRIBUTE is overloaded.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          IN {VARCHAR2|TIMESTAMP WITH TIMEZONE|
                      PLS_INTEGER|BOOLEAN|INTERVAL DAY TO SECOND});

DBMS_SCHEDULER.SET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          IN {VARCHAR2|TIMESTAMP WITH TIMEZONE|
                      PLS_INTEGER|BOOLEAN|INTERVAL DAY TO SECOND});
   value2         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 114–61 SET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	See Table 114–62 through Table 114–70.
value	The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.
value2	Most attributes have only one value associated with them, but some can have two. The value2 argument is for this optional second value.

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler will first disable it, make the change and then re-enable it. If any errors are encountered during the enable process, the object is not re-enabled and an error is generated.

If an object is altered and it was in the disabled state, it will remain disabled after it is altered.

To run SET_ATTRIBUTE for a window, window group, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

Job

If there is a running instance of the job when the SET_ATTRIBUTE call is made, it is not affected by the call. The change is only seen in future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run will be scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes will take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`. This is also the case for job argument values that have been set.

Granting `ALTER` on a job will let a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and will not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

Program

If any currently running jobs use the program that is altered, they will continue to run with the program definition prior to the alter. The job will run with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change will not affect running jobs and open windows that use this schedule. The change will only be in effect the next time the jobs runs or the window opens.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan when a window opens that designates a resource plan, the Resource Manager activates with that plan.

Regular Job Attribute Values

Table 114–62 lists attribute values for regular jobs.

> **Note:** See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table. See also Table 114–63 for lightweight job attributes.

Table 114–62 Regular Job Attribute Values

Name	Description
logging_level	This attribute specifies how much information is logged. The three possible options are: DBMS_SCHEDULER.LOGGING_OFF No logging will be performed for any jobs in this class. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler will write detailed information to the job log for all runs of each job in this class. DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler will record all operations performed on all jobs in this class. In other words, every time a job is created, enabled, disabled, altered, and so on will be recorded in the log.
restartable	This attribute specifies whether a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it will be restarted from the beginning point of the job. In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The restart_on_recovery attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.) Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job. Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries. The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler will retry the job a maximum of six times. The first time, it will wait for one second and multiply this wait time with a factor of 10 each time thereafter. Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1. The Scheduler will stop retrying a job when: ■ One of the retries succeeds. ■ All of its six retries have failed. ■ The next retry would occur after the next regularly scheduled run of the job. The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.
max_failures	This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views. max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job will be started regardless of how many previous instances have failed.

Table 114–62 (Cont.) Regular Job Attribute Values

Name	Description
max_runs	This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED. max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it will repeat forever or until end_date or max_failures is reached.
max_run_duration	This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.
job_weight	This attribute is for expert users of parallel technology only. If your job will be using parallel technology, you can set the value of this attribute to the degree of parallelism of your SQL inside the job. job_weight has a range of 1-100, with 1 being the default
instance_stickiness	This attribute should only be used for a database running in an Oracle Real Application Clusters (RAC) environment. By default, it is set to TRUE. If you set instance_stickiness to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it will not start new jobs for a significant period of time, another instance will run the job. If the interval between runs is large, instance_stickiness will be ignored an the job will be handled as if it were a non-sticky job. If instance_stickiness is set to FALSE, each instance of the job runs on the first instance available. For non-RAC environments, this attribute is not useful because there is only one instance.
instance_id	Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.
database_role	This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby. Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.
stop_on_window_close	This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to TRUE implies that the job should be stopped once the associated window is closed. The job is stopped using the stop_job procedure with force set to FALSE. By default, stop_on_window_close is set to FALSE. Therefore, if you do not set this attribute, the job will be allowed to continue after the window closes. Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.

Table 114–62 (Cont.) Regular Job Attribute Values

Name	Description
job_priority	This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution. If no job priority is specified when creating a job, the default priority of 3 is assigned to it.
schedule_limit	In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m. If schedule_limit is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log will be made to reflect the skipped run.
program_name	The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.
job_action	The action that the job performs, depending on the job_type attribute. For example, if job_type is 'STORED_PROCEDURE', job_action contains the name of the stored procedure.
job_type	The type of this job. Can be any of: 'PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', and 'CHAIN'. If this is set, program_name must be NULL.
number_of_arguments	The number of arguments if the program is inlined. If this is set, program_name should be NULL.
schedule_name	The name of a schedule or window or window group to use as the schedule for this job. If this is set, end_date, start_date and repeat_interval should all be NULL.
repeat_interval	Either a PL/SQL function returning the next date on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "Calendaring Syntax" on page 114-17 for more information.
start_date	The original date on which this job started or will be scheduled to start. If this is set, schedule_name should be NULL.
end_date	The date after which the job will no longer run. It will be dropped if auto_drop is set or disabled with the state changed to COMPLETED if it is. If this is set, schedule_name should be NULL.
follow_default_timezone	If TRUE, the job start time is recomputed when the default timezone name changes. (Summer/winter transitions do not change the default timezone name.)
job_class	The class this job is associated with.
comments	An optional comment.
auto_drop	Whether the job should be dropped after having completed.

Table 114–62 (Cont.) Regular Job Attribute Values

Name	Description
event_spec	This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For details on what these arguments should contain, see the descriptions for the event_condition and queue_spec arguments in the CREATE_JOB procedure.
raise_ events	This attribute tells the Scheduler at what stages of the job's execution events should be raised. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it. ■ job_started CONSTANT PLS_INTEGER := 1 ■ job_succeeded CONSTANT PLS_INTEGER := 2 ■ job_failed CONSTANT PLS_INTEGER :=4 ■ job_broken CONSTANT PLS_INTEGER :=8 ■ job_completed CONSTANT PLS_INTEGER :=16 ■ job_stopped CONSTANT PLS_INTEGER :=32 ■ job_sch_lim_reached CONSTANT PLS_INTEGER :=64 ■ job_disabled CONSTANT PLS_INTEGER :=128 ■ job_chain_stalled CONSTANT PLS_INTEGER :=256 ■ job_all_events CONSTANT PLS_INTEGER := 511 ■ job_run_completed CONSTANT PLS_INTEGER := job_ succeeded + job_failed + job_stopped Table 114–64 describes these event types in detail.
single_ destination	This attribute specifies which of the destinations in the destination attribute a job will be run on. By default, the job will run on each of the destinations and this attribute is set to FALSE. Setting this to TRUE means that the job will be run on just one of the destinations. The Scheduler chooses the destination on which to run the job based on the load and number of jobs running on each of the listed destinations.
credential_ name	This attribute specifies the credential to use when running a remote job. If this attribute is NULL, then a preferred credential will be selected for each destination.
destination	This attribute specifies a host and port on which to run a remote external job. The attribute is of the form *host*:*port*, where *host* is the host name or IP address of the destination host, and *port* is the port number on which the Scheduler agent on that host listens. This attribute is set to NULL by default.
parallel_ instances	This is a Boolean attribute. If set to TRUE and an event is raised, then a run-once lightweight job will be created to handle the event; the job will be dropped once it has completed running. This lightweight job will not be visible in any of the *_SCHEDULER_JOBS views - it will be visible in the *_SCHEDULER_RUNNING_JOBS views. The name of this lightweight job will be the same as that of the parent job and a subname will be automatically generated to distinguish it from its parent and from its siblings.

Lightweight Job Attribute Values

Table 114–63 lists attribute values for persistent lightweight jobs.

> **Note:** See the CREATE_JOB procedure and the CREATE_JOBS procedure for more complete descriptions of the attributes in this table. See also Table 114–62 for regular job attributes.

Table 114–63 Lightweight Job Attribute Values

Name	Description
logging_level	This attribute specifies how much information is logged. The three possible options are: DBMS_SCHEDULER.LOGGING_OFF No logging will be performed for any jobs in this class. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler will write detailed information to the job log for all runs of each job in this class. DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler will record all operations performed on all jobs in this class. In other words, every time a job is created, enabled, disabled, altered, and so on will be recorded in the log.
restartable	This attribute specifies whether a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it will be restarted from the beginning point of the job. In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The restart_on_recovery attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.) Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job. Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries. The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler will retry the job a maximum of six times. The first time, it will wait for one second and multiply this wait time with a factor of 10 each time thereafter. Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1. The Scheduler will stop retrying a job when: ■ One of the retries succeeds. ■ All of its six retries have failed. ■ The next retry would occur after the next regularly scheduled run of the job. The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.
stop_on_window_close	This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to TRUE implies that the job should be stopped once the associated window is closed. The job is stopped using the stop_job procedure with force set to FALSE. By default, stop_on_window_close is set to FALSE. Therefore, if you do not set this attribute, the job will be allowed to continue after the window closes. Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.

Table 114–63 (Cont.) Lightweight Job Attribute Values

Name	Description
schedule_name	The name of a schedule or window or window group to use as the schedule for this job. If this is set, end_date, start_date and repeat_interval should all be NULL.
repeat_interval	Either a PL/SQL function returning the next date on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "Calendaring Syntax" on page 114-17 for more information.
start_date	The original date on which this job started or will be scheduled to start. If this is set, schedule_name should be NULL.
end_date	The date after which the job will no longer run. It will be dropped if auto_drop is set or disabled with the state changed to COMPLETED if it is. If this is set, schedule_name should be NULL.
job_class	The class this job is associated with.
instance_id	Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.
event_spec	This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For details on what these arguments should contain, see the descriptions for the event_condition and queue_spec arguments in the CREATE_JOB procedure.
raise_events	This attribute tells the Scheduler at what stages of the job's execution events should be raised. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it. ■ job_started CONSTANT PLS_INTEGER := 1 ■ job_succeeded CONSTANT PLS_INTEGER := 2 ■ job_failed CONSTANT PLS_INTEGER :=4 ■ job_broken CONSTANT PLS_INTEGER :=8 ■ job_completed CONSTANT PLS_INTEGER :=16 ■ job_stopped CONSTANT PLS_INTEGER :=32 ■ job_sch_lim_reached CONSTANT PLS_INTEGER :=64 ■ job_disabled CONSTANT PLS_INTEGER :=128 ■ job_chain_stalled CONSTANT PLS_INTEGER :=256 ■ job_all_events CONSTANT PLS_INTEGER := 511 ■ job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped Table Table 114–64 describes these event types in detail.

Table 114–64 Event Types Raised by the Scheduler

Event Type	Description
job_started	The job started
job_succeeded	The job completed successfully
job_failed	The job failed, either by throwing an error or by abnormally terminating
job_broken	The job has been disabled and has changed to the BROKEN state because it exceeded the number of failures defined by the max_failures job attribute

Table 114–64 (Cont.) Event Types Raised by the Scheduler

Event Type	Description
job_completed	The job completed because it reached its max_runs or end_date
job_stopped	The job was stopped by a call to STOP_JOB
job_sch_lim_reached	The job's schedule limit was reached. The job was not started because the delay in starting the job exceeded the value of the schedule_limit job attribute.
job_disabled	The job was disabled by the Scheduler or by a call to SET_ATTRIBUTE
job_chain_stalled	A job running a chain was put into the CHAIN_STALLED state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain evaluation_interval is set to NULL. No progress will be made in the chain unless there is manual intervention.
job_all_events	Not an event, but a constant that provides an easy way for you to enable all events
job_run_completed	A job run either failed, succeeded, or was stopped

Program Attribute Values

Table 114–65 lists program attribute values.

> **Note:** See the CREATE_PROGRAM procedure for more complete descriptions of the attributes in this table.

Table 114–65 Program Attribute Values

Name	Description
program_action	The action that the program performs, depending on the program_type attribute. For example, if program_type is 'STORED_PROCEDURE', program_action contains the name of the stored procedure.
program_type	The type of program. This must be one of the following supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.
number_of_arguments	The number of arguments required by the stored procedure or other executable that the program invokes
max_failures	This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views. max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job will be started regardless of how many previous instances have failed.
max_runs	This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED. max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it will repeat forever or until end_date or max_failures is reached.

Table 114–65 (Cont.) Program Attribute Values

Name	Description
max_run_duration	This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.
job_weight	This attribute is for expert users of parallel technology only. If your job will be using parallel technology, you can set the value of this attribute to the degree of parallelism of your SQL inside the job. job_weight has a range of 1-100, with 1 being the default
job_priority	This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution. If no job priority is specified when creating a job, the default priority of 3 is assigned to it.
schedule_limit	In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m. If schedule_limit is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log will be made to reflect the skipped run.
comments	An optional comment. This can describe what the program does, or give usage details.

Job Class Attribute Values

Table 114–66 lists job class attribute values.

> **Note:** See the CREATE_JOB_CLASS procedure for more complete descriptions of the attributes in this table.

Table 114–66 Job Class Attribute Values

Name	Description
resource_ consumer_group	The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See *Oracle Database Administrator's Guide* for a description of resource consumer groups and the Database Resource Manager.
service	The database service that the jobs in the job class have affinity to. If both the resource_consumer_group and service attributes are set for a job class, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.

Table 114–66 (Cont.) Job Class Attribute Values

Name	Description
logging_level	This attribute specifies how much information is logged. The three possible options are: ■ DBMS_SCHEDULER.LOGGING_OFF No logging will be performed for any jobs in this class. ■ DBMS_SCHEDULER.LOGGING_RUNS The Scheduler will write detailed information to the job log for all runs of each job in this class. ■ DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler will record all operations performed on all jobs in this class. In other words, every time a job is created, enabled, disabled, altered, and so on will be recorded in the log.
log_history	This enables you to control the amount of logging the Scheduler performs. To prevent the job log and the window log from growing indiscriminately, the Scheduler has an attribute that specifies how much history (in days) to keep. Once a day, the Scheduler will automatically purge all log entries from both the job log as well as the window log that are older than the specified history. The default is 30 days. You can change the default by using the SET_SCHEDULER_ATTRIBUTE procedure. For example, to change it to 90 days, issue the following statement: `DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE ('log_history','90');` The range of valid values is 1 through 999.
comments	An optional comment about the class.

Window Attribute Values

Table 114–67 lists window attribute values.

> **Note:** See the CREATE_WINDOW procedure for more complete descriptions of the attributes in this table.

Table 114–67 Window Attribute Values

Name	Description
resource_plan	The resource plan to be associated with a window. When the window opens, the system will switch to this resource plan. When the window closes, the original resource plan will be restored. If a resource plan has been made active with the force option, no resource plan switch will occur. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.
window_priority	The priority of the window. Must be one of 'LOW' (default) or 'HIGH'.
duration	The duration of the window.
schedule_name	The name of a schedule to use with this window. If this is set, start_date, end_date, and repeat_interval must all be NULL.

Table 114–67 (Cont.) Window Attribute Values

Name	Description
repeat_interval	A string using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, schedule_name must be NULL. See "Calendaring Syntax" on page 114-17 for more information.
start_date	The next date on which this window is scheduled to open. If this is set, schedule_name must be NULL.
end_date	The date after which the window will no longer open. If this is set, schedule_name must be NULL.
comments	An optional comment about the window.

Window Group Attribute Values

Table 114–68 lists window group attribute values.

Table 114–68 Window Group Attribute Values

Name	Description
comments	An optional comment about the window group.

Schedule Attribute Values

Table 114–69 lists schedule attribute values.

> **Note:** See the CREATE_SCHEDULE and CREATE_CALENDAR_SCHEDULE procedures for more complete descriptions of the attributes in this table.

Table 114–69 Schedule Attribute Values

Name	Description
repeat_interval	An expression using the calendaring syntax. See "Calendaring Syntax" on page 114-17 for more information.
comments	An optional comment.
end_date	The cutoff date after which the schedule will not specify any dates.
start_date	The start or reference date used by the calendaring syntax.
event_spec	This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For details on what these arguments should contain, see the descriptions for the event_condition and queue_spec arguments to the CREATE_JOB procedure.
source	The host name that the database is running on. This is used by remote agents to know where to send the job run details.

Chain Attribute Values

Table 114–70 lists chain attribute values.

> **Note:** See the CREATE_CHAIN procedure for more complete descriptions of the attributes in this table.

Table 114–70 Chain Attribute Values

Name	Description
`evaluation_interval`	If this is not `NULL`, evaluation of the chain occurs not only at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives), but also periodically at this interval. For most chains, the normal evaluation times are sufficient. Because evaluation of a large chain is CPU intensive, this attribute should be used only when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.
`comments`	An optional comment describing the purpose of the chain.

SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to NULL. What attributes can be set depends on the object being altered. If the object is enabled, it will be disabled before being altered and be reenabled afterward. If the object cannot be reenabled, an error is generated and the object will be left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
   name              IN VARCHAR2,
   attribute         IN VARCHAR2);
```

Parameters

Table 114–71 SET_ATTRIBUTE_NULL Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being changed

Usage Notes

To run SET_ATTRIBUTE_NULL for a window, window group, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE Procedures

This procedure sets the value for an argument of the associated program for a job, encapsulated in an AnyData object. It overrides any default value set for the program argument. NULL is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the DEFINE_ANYDATA_ARGUMENT Procedure

No type checking of the argument is done at any time by the Scheduler.

SET_JOB_ANYDATA_VALUE is overloaded.

Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
   job_name                IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_value          IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2,
   argument_value          IN SYS.ANYDATA);
```

Parameters

Table 114–72 SET_JOB_ANYDATA_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_ position	The position of the program argument being set
argument_value	The new value to be assigned to the program argument, encapsulated in an AnyData object

Usage Notes

SET_JOB_ANYDATA_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE does not apply to lightweight jobs because lightweight jobs cannot take AnyData arguments.

See Also:

- "SET_JOB_ARGUMENT_VALUE Procedures" on page 114-114
- "DEFINE_ANYDATA_ARGUMENT Procedure" on page 114-55

SET_JOB_ARGUMENT_VALUE Procedures

This procedure sets the value of an argument of the associated program for a job. It overrides any default value set for the program argument. NULL is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the DEFINE_PROGRAM_ARGUMENT Procedures or the DEFINE_METADATA_ARGUMENT Procedure

No type checking of the argument is done at any time by the Scheduler.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_value          IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2,
   argument_value          IN VARCHAR2);
```

Parameters

Table 114–73 SET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_ARGUMENT_VALUE procedure.

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- "SET_JOB_ANYDATA_VALUE Procedures" on page 114-113
- "DEFINE_PROGRAM_ARGUMENT Procedures" on page 114-63

SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
   jobattr_array     IN JOBATTR_ARRAY,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 114–74 SET_JOB_ATTRIBUTES Procedure Parameters

Parameter	Description
jobattr_array	The array of job attribute changes.
commit_semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous attribute changes that were successful are committed to disk. This is the default. ■ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. ■ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts the rest of the job attribute changes on the list and commits all the changes that were successful.

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and re-enables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.

SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately. The attributes you can set are `default_timezone`, `max_job_slave_processes`, and `log_history`.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (
   attribute      IN VARCHAR2,
   value          IN VARCHAR2);
```

Parameters

Table 114–75 SET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
`attribute`	The name of the Scheduler attribute. Possible values are: ■ `default_timezone`: It is very important that this attribute is set. Whenever a `repeat_interval` is specified without setting the `start_date`, the Scheduler needs to know which time zone it must apply to the repeat interval syntax. For example, if the repeat interval is specified as `"FREQ=DAILY;BYHOUR=22"` the job will repeat every day at 10pm, but 10pm in which time zone? If no `start_date` is specified the Scheduler will pick up the time zone from this `default_timezone` attribute. If you want your job or window to follow daylight savings adjustments, you must set this attribute to the proper region name. For instance, if your database resides in Paris, you would set this to `'Europe/Warsaw'`. Daylight saving adjustments will not be followed if you specify an absolute offset. For example, '-8:00' would be correct for only half of the year in San Francisco. If no value is specified for this attribute, the Scheduler uses the time zone of `systimestamp` when the job or window is enabled. This is always an absolute offset and will not follow daylight savings adjustments. ■ `log_history`: This enables you to control the amount of logging the Scheduler performs. ■ `max_job_slave_processes`: This enables you to set a maximum number of slave processes for a particular system configuration and load. The default value is `NULL`, and the valid range is 1-999. Even though the Scheduler automatically determines what the optimum number of slave processes is for a given system configuration and load, you still might want to set a fixed limit on the Scheduler. If this is the case, you can set this attribute. Although the number set by `max_job_slave_processes` is a real maximum, it does not mean the Scheduler will start the specified number of slaves. For example, even though this attribute is set to 10, the Scheduler might still determine that is should not start more than 3 slave processes. However, if it wants to start 15, but it is set to 10, it will not start more than 10. ■ `event_expiry_time`: The time in seconds before an event generated by the Scheduler (in other words, a message enqueued by the Scheduler into the Scheduler event queue) expires (in other words, is automatically purged from the queue). If `NULL`, Scheduler-generated events expire after 24 hours.
`value`	The new value of the attribute

Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the MANAGE SCHEDULER privilege.

STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class. Any instance of the job will be stopped. After stopping the job, the state of a one-time job will be set to STOPPED whereas the state of a repeating job will be set to SCHEDULED or COMPLETED depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all steps of the running chain that are running will be stopped.

For external jobs, STOP_JOB stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

Syntax

```
DBMS_SCHEDULER.STOP_JOB (
   job_name         IN VARCHAR2
   force            IN BOOLEAN DEFAULT FALSE
   commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 114–76 STOP_JOB Procedure Parameters

Parameter	Description
job_name	The name of the job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are stopped. The job class is not affected by this call.
force	If force is set to FALSE, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned. If force is set to TRUE, the Scheduler will immediately terminate the job slave. Oracle recommends that STOP_JOB with force set to TRUE be used only after a STOP_JOB with force set to FALSE has failed. Use of the force option requires the MANAGE SCHEDULER system privilege.
commit_semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous stop operations that were successful are committed to disk. This is the default. ■ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts stopping the rest of the jobs and commits all the stop operations that were successful.

Usage Notes

STOP_JOB without the force option requires that you be the owner of the job or have ALTER privileges on that job. You can also stop a job if you have the CREATE ANY JOB or MANAGE SCHEDULER privilege.

STOP_JOB with the force option requires that you have the MANAGE SCHEDULER privilege.

115

DBMS_SERVER_ALERT

The DBMS_SERVER_ALERT package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- Using DBMS_SERVER_ALERT
- Summary of DBMS_SERVER_ALERT Subprograms

Using DBMS_SERVER_ALERT

This section contains topics which relate to using the `DBMS_SERVER_ALERT` package. The following topics define constants used in package procedures.

- Object Types
- Relational Operators
- Supported Metrics

Object Types

You qualify the metric by an individual object for the following object types.

Table 115–1 Object Types Defined as Constants

Constant	Description
OBJECT_TYPE_SYSTEM	Metrics collected on the system level for each instance.
OBJECT_TYPE_FILE	Metrics collected on the file level. These are used for AVERAGE_FILE_READ_TIME and AVERAGE_FILE_WRITE_TIME metrics.
OBJECT_TYPE_SERVICE	Metrics collected on the service level. Currently ELAPSED_TIME_PER_CALL and CPU_TIME_PER_CALL are collected.
OBJECT_TYPE_TABLESPACE	Metrics collected on the tablespace level.
OBJECT_TYPE_EVENT_CLASS	Metrics collected on wait event class level. Currently supported metrics are AVG_USERS_WAITING and DB_TIME_WAITING.
OBJECT_TYPE_SESSION	Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.

Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 115–2 Relational Operators Defined as Constants

Constant	Description
OPERATOR_CONTAINS	A metric value matching an entry in a list of threshold values is considered a violation.
OPERATOR_DO_NOT_CHECK	The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.
OPERATOR_EQ	A metric value equal to the threshold value is considered a violation.
OPERATOR_GE	A metric value greater than or equal to the threshold value is considered a violation.
OPERATOR_GT	A metric value greater than the threshold value is considered a violation.
OPERATOR_LE	A metric value less than or equal to the threshold value is considered a violation.
OPERATOR_LT	A metric value less than the threshold value is considered a violation.
OPERATOR_NE	A metric value not equal to the threshold value is considered a violation.

Supported Metrics

The following metrics are supported. All internal metric names are supplied as package constants.

Table 115–3 List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
SQL_SRV_RESPONSE_TIME	Service Response (for each execution)	Seconds
BUFFER_CACHE_HIT	Buffer Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_HIT	Library Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_MISS	Library Cache Miss (%)	% of cache accesses
MEMORY_SORTS_PCT	Sorts in Memory (%)	% of sorts
REDO_ALLOCATION_HIT	Redo Log Allocation Hit	% of redo allocations
TRANSACTION_RATE	Number of Transactions (for each second)	Transactions for each Second
PHYSICAL_READS_SEC	Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_TXN	Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_SEC	Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_TXN	Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_DIR_SEC	Direct Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_DIR_TXN	Direct Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_DIR_SEC	Direct Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_DIR_TXN	Direct Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_LOB_SEC	Direct LOB Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_LOB_TXN	Direct LOB Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_LOB_SEC	Direct LOB Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_LOB_TXN	Direct LOB Physical Writes (for each transaction)	Writes for each Transaction
REDO_GENERATED_SEC	Redo Generated (for each second)	Redo Bytes for each Second
REDO_GENERATED_TXN	Redo Generated (for each transaction)	Redo Bytes for each Transaction
DATABASE_WAIT_TIME	Database Wait Time (%)	% of all database time
DATABASE_CPU_TIME	Database CPU Time (%)	% of all database time
LOGONS_SEC	Cumulative Logons (for each second)	Logons for each Second

Table 115–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
LOGONS_TXN	Cumulative Logons (for each transaction)	Logons for each Transaction
LOGONS_CURRENT	Current Number of Logons	Number of Logons
OPEN_CURSORS_SEC	Cumulative Open Cursors (for each second)	Cursors for each Second
OPEN_CURSORS_TXN	Cumulative Open Cursors (for each transaction)	Cursors for each Transaction
OPEN_CURSORS_CURRENT	Current Number of Cursors	Number of Cursors
USER_COMMITS_SEC	User Commits (for each second)	Commits for each Second
USER_COMMITS_TXN	User Commits (for each transaction)	Commits for each Transaction
USER_ROLLBACKS_SEC	User Rollbacks (for each second)	Rollbacks for each Second
USER_ROLLBACKS_TXN	User Rollbacks (for each transaction)	Rollbacks for each Transaction
USER_CALLS_SEC	User Calls (for each second)	Calls for each Second
USER_CALLS_TXN	User Calls (for each transaction)	Calls for each Transaction
RECURSIVE_CALLS_SEC	Recursive Calls (for each second)	Calls for each Second
RECURSIVE_CALLS_TXN	Recursive Calls (for each transaction)	Calls for each Transaction
SESS_LOGICAL_READS_SEC	Session Logical Reads (for each second)	Reads for each Second
SESS_LOGICAL_READS_TXN	Session Logical Reads (for each transaction)	Reads for each Transaction
DBWR_CKPT_SEC	DBWR Checkpoints (for each second)	Checkpoints for each Second
LOG_SWITCH_SEC	Background Checkpoints (for each second)	Checkpoints for each Second
REDO_WRITES_SEC	Redo Writes (for each second)	Writes for each Second
REDO_WRITES_TXN	Redo Writes (for each transaction)	Writes for each Transaction
LONG_TABLE_SCANS_SEC	Scans on Long Tables (for each second)	Scans for each Second
LONG_TABLE_SCANS_TXN	Scans on Long Tables (for each transaction)	Scans for each Transaction
TOTAL_TABLE_SCANS_SEC	Total Table Scans (for each second)	Scans for each Second
TOTAL_TABLE_SCANS_TXN	Total Table Scans (for each transaction)	Scans for each Transaction
FULL_INDEX_SCANS_SEC	Fast Full Index Scans (for each second)	Scans for each Second
FULL_INDEX_SCANS_TXN	Fast Full Index Scans (for each transaction)	Scans for each Transaction
TOTAL_INDEX_SCANS_SEC	Total Index Scans (for each second)	Scans for each Second
TOTAL_INDEX_SCANS_TXN	Total Index Scans (for each transaction)	Scans for each Transaction
TOTAL_PARSES_SEC	Total Parses (for each second)	Parses for each Second

Table 115–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
TOTAL_PARSES_TXN	Total Parses (for each transaction)	Parses for each Transaction
HARD_PARSES_SEC	Hard Parses (for each second)	Parses for each Second
HARD_PARSES_TXN	Hard Parses (for each transaction)	Parses for each Transaction
PARSE_FAILURES_SEC	Parse Failures (for each second)	Parses for each Second
PARSE_FAILURES_TXN	Parse Failures (for each transaction)	Parses for each Transaction
DISK_SORT_SEC	Sorts to Disk (for each second)	Sorts for each Second
DISK_SORT_TXN	Sorts to Disk (for each transaction)	Sorts for each Transaction
ROWS_PER_SORT	Rows Processed for each Sort	Rows for each Sort
EXECUTE_WITHOUT_PARSE	Executes Performed Without Parsing	% of all executes
SOFT_PARSE_PCT	Soft Parse (%)	% of all parses
CURSOR_CACHE_HIT	Cursor Cache Hit (%)	% of soft parses
USER_CALLS_PCT	User Calls (%)	% of all calls
TXN_COMMITTED_PCT	Transactions Committed (%)	% of all transactions
NETWORK_BYTES_SEC	Network Bytes, for each second	Bytes for each Second
RESPONSE_TXN	Response (for each transaction)	Seconds for each Transaction
DATA_DICT_HIT	Data Dictionary Hit (%)	% of dictionary accesses
DATA_DICT_MISS	Data Dictionary Miss (%)	% of dictionary accesses
SHARED_POOL_FREE_PCT	Shared Pool Free(%)	% of shared pool
AVERAGE_FILE_READ_TIME	Average File Read Time	Microseconds
AVERAGE_FILE_WRITE_TIME	Average File Write Time	Microseconds
DISK_IO	Disk I/O	Milliseconds
PROCESS_LIMIT_PCT	Process Limit Usage (%)	% of maximum value
SESSION_LIMIT_PCT	Session Limit Usage (%)	% of maximum value
USER_LIMIT_PCT	User Limit Usage (%)	% of maximum value
AVG_USERS_WAITING	Average Number of Users Waiting on a Class of Wait Events	Count of sessions
DB_TIME_WAITING	Percent of Database Time Spent Waiting on a Class of Wait Events	% of Database Time
APPL_DESGN_WAIT_SCT	Application Design Wait (by session count)	Count of sessions
APPL_DESGN_WAIT_TIME	Application Design Wait (by time)	Microseconds
PHYS_DESGN_WAIT_SCT	Physical Design Wait (by session count)	Count of sessions
PHYS_DESGN_WAIT_TIME	Physical Design Wait (by time)	Microseconds
CONTENTION_WAIT_SCT	Internal Contention Wait (by session count)	Count of sessions
CONTENTION_WAIT_TIME	Internal Contention Wait (by time)	Microseconds
PSERVICE_WAIT_SCT	Process Service Wait (by session count)	Count of sessions

Table 115–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PSERVICE_WAIT_TIME	Process Service Wait (by time)	Microseconds
NETWORK_MSG_WAIT_SCT	Network Message Wait (by session count)	Count of sessions
NETWORK_MSG_WAIT_TIME	Network Message Wait (by time)	Microseconds
DISK_IO_WAIT_SCT	Disk I/O Wait (by session count)	Count of sessions
OS_SERVICE_WAIT_SCT	Operating System Service Wait (by session count)	Count of sessions
OS_SERVICE_WAIT_TIME	Operating System Service Wait (by time)	Microseconds
DBR_IO_LIMIT_WAIT_SCT	Resource Mgr I/O Limit Wait (by session count)	Count of sessions
DBR_IO_LIMIT_WAIT_TIME	Resource Mgr I/O Limit Wait (by time)	Microseconds
DBR_CPU_LIMIT_WAIT_SCT	Resource Mgr CPU Limit Wait (by session count)	Count of sessions
DBR_CPU_LIMIT_WAIT_TIME	Resource Mgr CPU Limit Wait (by time)	Microseconds
DBR_USR_LIMIT_WAIT_SCT	Resource Mgr User Limit Wait (by session count)	Count of sessions
DBR_USR_LIMIT_WAIT_TIME	Resource Mgr User Limit Wait (by time)	Microseconds
OS_SCHED_CPU_WAIT_SCT	Operating System Scheduler CPU Wait (by session count)	Count of sessions
OS_SCHED_CPU__WAIT_TIME	Operating System Scheduler CPU Wait (by time)	Microseconds
CLUSTER_MSG_WAIT_SCT	Cluster Messaging Wait (by session count)	Count of sessions
CLUSTER_MSG_WAIT_TIME	Cluster Messaging Wait (by time)	Microseconds
OTHER_WAIT_SCT	Other Waits (by session count)	Count of sessions
OTHER_WAIT_TIME	Other Waits (by time)	Microseconds
ENQUEUE_TIMEOUTS_SEC	Enqueue Timeouts (for each second)	Timeouts for each Second
ENQUEUE_TIMEOUTS_TXN	Enqueue Timeouts (for each transaction)	Timeouts for each Transaction
ENQUEUE_WAITS_SEC	Enqueue Waits (for each second)	Waits for each Second
ENQUEUE_WAITS_TXN	Enqueue Waits (for each transaction)	Waits for each Transaction
ENQUEUE_DEADLOCKS_SEC	Enqueue Deadlocks (for each second)	Deadlocks for each Second
ENQUEUE_DEADLOCKS_TXN	Enqueue Deadlocks (for each transaction)	Deadlocks for each Transaction
ENQUEUE_REQUESTS_SEC	Enqueue Requests (for each second)	Requests for each Second
ENQUEUE_REQUESTS_TXN	Enqueue Requests (for each transaction)	Requests for each Transaction

Table 115–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
DB_BLKGETS_SEC	DB Block Gets (for each second)	Gets for each Second
DB_BLKGETS_TXN	DB Block Gets (for each transaction)	Gets for each Transaction
CONSISTENT_GETS_SEC	Consistent Gets (for each second)	Gets for each Second
CONSISTENT_GETS_TXN	Consistent Gets (for each transaction)	Gets for each Transaction
DB_BLKCHANGES_SEC	DB Block Changes (for each second)	Changes for each Second
DB_BLKCHANGES_TXN	DB Block Changes (for each transaction)	Changes for each Transaction
CONSISTENT_CHANGES_SEC	Consistent Changes (for each second)	Changes for each Second
CONSISTENT_CHANGES_TXN	Consistent Changes (for each transaction)	Changes for each Transaction
SESSION_CPU_SEC	Database CPU (for each second)	Microseconds for each Second
SESSION_CPU_TXN	Database CPU (for each transaction)	Microseconds for each Transaction
CR_BLOCKS_CREATED_SEC	CR Blocks Created (for each second)	Blocks for each Second
CR_BLOCKS_CREATED_TXN	CR Blocks Created (for each transaction)	Blocks for each Transaction
CR_RECORDS_APPLIED_SEC	CR Undo Records Applied (for each second)	Records for each Second
CR_RECORDS_APPLIED_TXN	CR Undo Records Applied (for each transaction)	Records for each Transaction
RB_RECORDS_APPLIED_SEC	Rollback Undo Records Applied (for each second)	Records for each Second
RB_RECORDS_APPLIED_TXN	Rollback Undo Records Applied (for each transaction)	Records for each Transaction
LEAF_NODE_SPLITS_SEC	Leaf Node Splits (for each second)	Splits for each Second
LEAF_NODE_SPLITS_TXN	Leaf Node Splits (for each transaction)	Splits for each Transaction
BRANCH_NODE_SPLITS_SEC	Branch Node Splits (for each second)	Splits for each Second
BRANCH_NODE_SPLITS_TXN	Branch Node Splits (for each transaction)	Splits for each Transaction
GC_BLOCKS_CORRUPT	Global Cache Blocks Corrupt	Blocks
GC_BLOCKS_LOST	Global Cache Blocks Lost	Blocks
GC_AVG_CR_GET_TIME	Global Cache CR Request	Milliseconds
GC_AVG_CUR_GET_TIME	Global Cache Current Request	Milliseconds
PX_DOWNGRADED_SEC	Downgraded Parallel Operations (for each second)	Operations for each Second
PX_DOWNGRADED_25_SEC	Downgraded to 25% and more (for each second)	Operations for each Second
PX_DOWNGRADED_50_SEC	Downgraded to 50% and more (for each second)	Operations for each Second
PX_DOWNGRADED_75_SEC	Downgraded to 75% and more (for each second)	Operations for each Second

Table 115–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PX_DOWNGRADED_SER_SEC	Downgraded to serial (for each second)	Operations for each Second
BLOCKED_USERS	Number of Users blocked by some Session	Number of Users
PGA_CACHE_HIT	PGA Cache Hit (%)	% bytes processed in PGA
ELAPSED_TIME_PER_CALL	Elapsed time for each user call for each service	Microseconds for each call
CPU_TIME_PER_CALL	CPU time for each user call for each service	Microseconds for each call
TABLESPACE_PCT_FULL	Tablespace space usage	% full
TABLESPACE_BYT_FREE	Tablespace bytes space usage	Kilobytes free

Summary of DBMS_SERVER_ALERT Subprograms

Table 115–4 DBMS_SERVER_ALERT Package Subprograms

Subprogram	Description
EXPAND_MESSAGE Function on page 115-12	Expands alert messages
GET_THRESHOLD Procedure on page 115-13	Gets the current threshold settings for a specified metric
SET_THRESHOLD Procedure on page 115-14	Sets the warning and critical thresholds for a specified metric

EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE(
   user_language            IN   VARCHAR2,
   message_id               IN   NUMBER,
   argument_1               IN   VARCHAR2,
   argument_2               IN   VARCHAR2,
   argument_3               IN   VARCHAR2,
   argument_4               IN   VARCHAR2,
   argument_5               IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 115–5 EXPAND_MESSAGE Procedure Parameters

Parameter	Description
`user_language`	The language of the current session.
`message_id`	Id of the alert message
`argument_1`	The first argument in the alert message.
`argument_2`	The second argument in the alert message.
`argument_3`	The third argument in the alert message.
`argument_4`	The fourth argument in the alert message.
`argument_5`	The fifth argument in the alert message.

GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD(
   metrics_id               IN   BINARY_INTEGER,
   warning_operator         OUT  BINARY_INTEGER,
   warning_value            OUT  VARCHAR2,
   critical_operator        OUT  BINARY_INTEGER,
   critical_value           OUT  VARCHAR2,
   observation_period       OUT  BINARY_INTEGER,
   consecutive_occurrences  OUT  BINARY_INTEGER,
   instance_name            IN   VARCHAR2,
   object_type              IN   BINARY_INTEGER,
   object_name              IN   VARCHAR2);
```

Parameters

Table 115–6 GET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See "Supported Metrics" on page 115-5.
warning_operator	The operator for the compa3ring the actual value with the warning threshold.
warning_value	The warning threshold value.
critical_operator	The operator for the comparing the actual value with the critical threshold.
critical_value	The critical threshold value.
observation_period	The period at which the metric values are computed and verified against the threshold setting.
consecutive_ occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV$INSTANCE View.
object_type	Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.
object_name	The name of the object.

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid.

SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```
DBMS_SERVER_ALERT.SET_THRESHOLD(
   metrics_id               IN   BINARY_INTEGER,
   warning_operator         IN   BINARY_INTEGER,
   warning_value            IN   VARCHAR2,
   critical_operator        IN   BINARY_INTEGER,
   critical_value           IN   VARCHAR2,
   observation_period       IN   BINARY_INTEGER,
   consecutive_occurrences  IN   BINARY_INTEGER,
   instance_name            IN   VARCHAR2,
   object_type              IN   BINARY_INTEGER,
   object_name              IN   VARCHAR2);
```

Parameters

Table 115–7 SET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See "Supported Metrics" on page 115-5.
warning_operator	The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See "Relational Operators" on page 115-4.
warning_value	The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.
critical_operator	The operator for the comparing the actual value with the critical threshold. See "Relational Operators" on page 115-4.
critical_value	The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.
observation_period	The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.
consecutive_ occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts.
object_type	See "Object Types" on page 115-3.
object_name	The name of the object. This is NULL for SYSTEM.

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the DBA_THRESHOLDS view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.

116

DBMS_SERVICE

The DBMS_SERVICE package lets you create, delete, activate and deactivate services for a single instance.

The chapter contains the following topics:

- Using DBMS_SERVICE
  - Overview
  - Security Model
  - Constants
  - Exceptions
- Summary of DBMS_SERVICE Subprograms

> **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide* for administering services in Oracle Real Application Clusters.

Using DBMS_SERVICE

This section contains topics which relate to using the `DBMS_SERVICE` package.

- Overview
- Security Model
- Constants
- Exceptions

Overview

DBMS_SERVICE supports the management of services in the RDBMS for the purposes of workload measurement, management, prioritization, and XA/and distributed transaction management.

Oracle Real Application Clusters (RAC) has a functionality to manage service names across instances. This package allows the creation, deletion, starting and stopping of services in both RAC and a single instance. Additionally it provides the ability to disconnect all sessions which connect to the instance with a service name when RAC removes that service name from the instance.

> **See Also:** For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

Security Model

Privileges

The client using this package should have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

Schemas

This package should be installed under `SYS` schema.

Roles

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

Constants

The DBMS_SERVICE package uses the constants shown in following tables

- Constants used in calling arguments are described in Table 116–1, " Constants used in Calling Arguments"
- Constants used in connection balancing goal arguments are described inTable 116–2, " Constants used in Connection Balancing Goal Arguments"
- Constants used TAF failover attribute arguments are described inTable 116–3, " Constants used in TAF Failover Attribute Arguments"

Table 116–1 Constants used in Calling Arguments

Name	Type	Value	Description
GOAL_NONE	NUMBER	0	Disables Load Balancing Advisory
GOAL_SERVICE_TIME	NUMBER	1	Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service
GOAL_THROUGHPUT	NUMBER	2	Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service

Table 116–2 Constants used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_SHORT	NUMBER	1	Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either goal_service_time or goal_throughput). When GOAL=NONE (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.
CLB_GOAL_LONG	NUMBER	2	Balances the number of connections per instance using session count per service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.

Table 116–3 Constants used in TAF Failover Attribute Arguments

Name	Type	Value	Description
FAILOVER_METHOD_NONE	VARCHAR2	0	Server side TAF is not enabled for this service
FAILOVER_METHOD_BASIC	VARCHAR2	1	Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time. It is not possible to pre-establish a backup connection. (which is to say, PRECONNECT is not supported)

Table 116–3 (Cont.) Constants used in TAF Failover Attribute Arguments

Name	Type	Value	Description
FAILOVER_TYPE_NONE	NUMBER		Server side TAF type is NONE
FAILOVER_TYPE_SESSION	NUMBER		Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF will re-connect to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.
FAILOVER_TYPE_SELECT	NUMBER		Server side TAF failover type is SELECT
FAILOVER_RETRIES	NUMBER		Number of retries to use during a failover. Specifies the number of times that TAF should attempt the re-connect and re-authenticate pair. The value must be integral and greater than 0. The maximum value is UB4MAXVAL
FAILOVER_DELAY	NUMBER		Number of seconds delay before trying to failover. Specifies the delay (in seconds) that TAF will incur if the re-connect / re-authentication fails. The value must be integral and greater than 0. The maximum value is UB4MAXVAL.

Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF will continue to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay should be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method will default to BASIC. Delay and retries are optional and may be specified independently.

Exceptions

The following table lists the exceptions raised by DBMS_SERVICE package.

Table 116–4 DBMS_SERVICE Exceptions

Exception	Error Code	Description
NULL_SERVICE_NAME	44301	The service name argument was found to be NULL
NULL_NETWORK_NAME	44302	The network name argument was found to be NULL
SERVICE_EXISTS	44303	This service name was already in existence
SERVICE_DOES_NOT_EXIST	44304	The specified service was not in existence
SERVICE_IN_USE	44305	The specified service was running
SERVICE_NAME_TOO_LONG	44306	The service name was too long
NETWORK_PREFIX_TOO_LONG	44307	The network name, excluding the domain, was too long
NOT_INITIALIZED	44308	The services layer was not yet initialized
GENERAL_FAILURE	44309	There was an unknown failure
MAX_SERVICES_EXCEEDED	44310	The maximum number of services has been reached
SERVICE_NOT_RUNNING	44311	The specified service was not running
DATABASE_CLOSED	44312	The database was closed
INVALID_INSTANCE	44313	The instance name argument was not valid
NETWORK_EXISTS	44314	The network name was already in existence
NULL_ATTRIBUTES	44315	All attributes specified were NULL
INVALID_ARGUMENT	44316	Invalid argument supplied
DATABASE_READONLY	44317	The database is open read-only
MAX_SN_LENGTH	44318	The total length of all running service network names exceeded the maximum allowable length

Summary of DBMS_SERVICE Subprograms

Table 116–5 DBMS_SERVICE Package Subprograms

Subprogram	Description
CREATE_SERVICE Procedure on page 116-9	Creates service
DELETE_SERVICE Procedure on page 116-10	Deletes service
DISCONNECT_SESSION Procedure on page 116-11	Disconnects service
MODIFY_SERVICE Procedure on page 116-12	Modifies service
START_SERVICE Procedure on page 116-13	Activates service
STOP_SERVICE Procedure on page 116-14	Stops service

CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
   service_name        IN VARCHAR2,
   network_name        IN VARCHAR2,
   goal                IN NUMBER DEFAULT NULL,
   dtp                 IN BOOLEAN DEFAULT NULL,
   aq_ha_notifications IN BOOLEAN DEFAULT NULL,
   failover_method     IN VARCHAR2 DEFAULT NULL,
   failover_type       IN VARCHAR2 DEFAULT NULL,
   failover_retries    IN NUMBER DEFAULT NULL,
   failover_delay      IN NUMBER DEFAULT NULL,
   clb_goal            IN NUMBER DEFAULT NULL);
```

Parameters

Table 116–6 CREATE_SERVICE Procedure Parameters

Parameter	Description
`service_name`	The name of the service limited to 64 characters in the Data Dictionary
`network_name`	The network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET `service_names` character set (see *Oracle Database Net Services Reference*).
`goal`	The workload management goal directive for the service. Valid values: ■ `DBMS_SERVICE.GOAL_SERVICE_TIME` ■ `DBMS_SERVICE.GOAL_THROUGHPUT` ■ `DBMS_SERVICE.GOAL_NONE`
`dtp`	Declares the service to be for DTP or distributed transactions including XA transactions
`aq_ha_notifications`	Determines whether HA events are sent via AQ for this service
`failover_method`	The TAF failover method for the service
`failover_type`	The TAF failover type for the service
`failover_retries`	The TAF failover retries for the service
`failover_delay`	The TAF failover delay for the service
`clb_goal`	Method used for Connection Load Balancing (see Table 116–2, " Constants used in Connection Balancing Goal Arguments")

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.us.oracle.com','ernie.us.oracle.com');
```

DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

Syntax

```
DBMS_SERVICE.DELETE_SERVICE(
   service_name   IN VARCHAR2);
```

Parameters

Table 116–7 DELETE_SERVICE Procedure Parameters

Parameter	Description
`service_name`	The name of the service limited to 64 characters in the Data Dictionary

Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.us.oracle.com');
```

DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(
   service_name   IN VARCHAR2);
```

Parameters

Table 116–8 DISCONNECT_SESSION Procedure Parameters

Parameter	Description
service_name	The name of the service limited to 64 characters in the Data Dictionary

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the DBMS_JOB package or put the SQL session in background if the caller does not want to wait for all corresponding sessions disconnected.

Examples

This disconnects sessions with service_name 'ernie.us.oracle.com'.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.us.oracle.com');
```

MODIFY_SERVICE Procedure

This procedure modifies an existing service.

Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(
   service_name        IN VARCHAR2,
   goal                IN NUMBER DEFAULT NULL,
   dtp                 IN BOOLEAN DEFAULT NULL,
   aq_ha_notifications IN BOOLEAN DEFAULT NULL,
   failover_method     IN VARCHAR2 DEFAULT NULL,
   failover_type       IN VARCHAR2 DEFAULT NULL,
   failover_retries    IN NUMBER DEFAULT NULL,
   failover_delay      IN NUMBER DEFAULT NULL,
   clb_goal            IN NUMBER DEFAULT NULL);
```

Parameters

Table 116–9 MODIFY_SERVICE Procedure Parameters

Parameter	Description
service_name	The name of the service limited to 64 characters in the Data Dictionary
goal	The workload management goal directive for the service. Valid values: ■ DBMS_SERVICE.GOAL_SERVICE_TIME ■ DBMS_SERVICE.GOAL_THROUGHPUT ■ DBMS_SERVICE.GOAL_NONE
dtp	Declares the service to be for DTP or distributed transactions including XA transactions
aq_ha_notifications	Determines whether HA events are sent via AQ for this service
failover_method	The TAF failover method for the service
failover_type	The TAF failover type for the service
failover_retries	The TAF failover retries for the service
failover_delay	The TAF failover delay for the service
clb_goal	Method used for Connection Load Balancing (see Table 116–2, " Constants used in Connection Balancing Goal Arguments")

START_SERVICE Procedure

This procedure starts a service. This procedure alters the service_name IOP to contain this service_name. In RAC, implementing this option will act on the instance specified.

Syntax

```
DBMS_SERVICE.START_SERVICE(
   service_name  IN VARCHAR2,
   instance_name IN VARCHAR2);
```

Parameters

Table 116–10 START_SERVICE Procedure Parameters

Parameter	Description
service_name	The name of the service limited to 64 characters in the Data Dictionary
instance_name	The name of the instance where the service should be activated (optional). The instance on which to start the service. NULL results in starting of the service on the local instance. In single instance this can only be the current instance or NULL. Specify DBMS_SERVICE.ALL_INSTANCES to start the service on all configured instances.

Examples

```
DBMS_SERVICE.START_SERVICE('ernie.us.oracle.com');
```

STOP_SERVICE Procedure

This procedure stops a service, altering the `service_name` IOP to remove this `service_name`. In RAC this will call out to CRS to stop the service optionally on the instance specified.

Syntax

```
DBMS_SERVICE.STOP_SERVICE(
   service_name   IN VARCHAR2,
   instance_name  IN VARCHAR2);
```

Parameters

Table 116–11 STOP_SERVICE Procedure Parameters

Parameter	Description
`service_name`	The name of the service limited to 64 characters in the Data Dictionary
`instance_name`	The name of the instance where the service should be stopped (optional). The instance on which to stop the service. `NULL` results in stopping of the service locally. n single instance this can only be the current instance or `NULL`. The default in RAC and exclusive case is `NULL`. Specify `DBMS_SERVICE.ALL_INSTANCES` to stop the service on all configured instances.

Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.us.oracle.com');
```

117

DBMS_SESSION

This package provides access to SQL `ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- Using DBMS_SESSION
  - Security Model
  - Operational Notes
- Summary of DBMS_SESSION Subprograms

Using DBMS_SESSION

- Security Model
- Operational NotesOperational Notes

Security Model

This package runs with the privileges of the calling user, rather than the package owner SYS.

Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

Summary of DBMS_SESSION Subprograms

Table 117–1 DBMS_SESSION Package Subprograms

Subprogram	Description
CLEAR_ALL_CONTEXT Procedure on page 117-6	Clears all context information
CLEAR_CONTEXT Procedure on page 117-7	Clears the context
CLEAR_IDENTIFIER Procedure on page 117-8	Clears the identifier
CLOSE_DATABASE_LINK Procedure on page 117-9	Closes database link
FREE_UNUSED_USER_MEMORY Procedure on page 117-10	Lets you reclaim unused memory after performing operations requiring large amounts of memory
IS_ROLE_ENABLED Function on page 117-12	Determines if the named role is enabled for the session.
IS_SESSION_ALIVE Function on page 117-13	Determines if the specified session is active
LIST_CONTEXT Procedures on page 117-14	Returns a list of active namespace and context for the current session
SESSION _TRACE_DISABLE Procedure on page 117-19	Resets the session-level SQL trace for the session from which it was called.
SESSION _TRACE_ENABLE Procedure on page 117-20	Enables session-level SQL trace for the invoking session
RESET_PACKAGE Procedure on page 117-21	De-instantiates all packages in the session
SET_CONTEXT Procedure on page 117-23	Sets or resets the value of a context attribute
SET_IDENTIFIER on page 117-25	Sets the identifier
SET_NLS Procedure on page 117-26	Sets Globalization Support (NLS)
SET_ROLE Procedure on page 117-27	Sets role
SET_SQL_TRACE Procedure on page 117-28	Turns tracing on or off
SWITCH_CURRENT_ CONSUMER_GROUP Procedure on page 117-29	Facilitates changing the current resource consumer group of a user's current session
UNIQUE_SESSION_ID Function on page 117-31	Returns an identifier that is unique for all sessions currently connected to this database

CLEAR_ALL_CONTEXT Procedure

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
   namespace          VARCHAR2);
```

Parameters

Table 117–2 CLEAR_ALL_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace where the application context information is to be cleared. Required.

Usage Notes

This procedure must be invoked directly or indirectly by the trusted package.

CLEAR_CONTEXT Procedure

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
   namespace         VARCHAR2,
   client_identifier VARCHAR2
   attribute         VARCHAR2);
```

Parameters

Table 117–3 CLEAR_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace in which the application context is to be cleared. Required. For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context. For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT.
client_ identifier	Applies to a global context and is optional for other types of contexts; 64-byte maximum.
attribute	The specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_ identifier arguments is cleared.

Usage Notes

This procedure must be invoked directly or indirectly by the trusted package.

CLEAR_IDENTIFIER Procedure

This procedure removes the `set_client_id` in the session.

Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

Usage Notes

This procedure is executable by public.

CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:

```
ALTER SESSION CLOSE DATABASE LINK <name>
```

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (
   dblink VARCHAR2);
```

Parameters

Table 117–4 CLOSE_DATABASE_LINK Procedure Parameters

Parameter	Description
dblink	Name of the database link to close.

FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

> **Note:** This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server**: This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server**: This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA

memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared.After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure `FREE_UNUSED_USER_MEMORY`.

```
CREATE PACKAGE foobar
   type number_idx_tbl is table of number indexed by binary_integer;

   store1_table  number_idx_tbl;     --  PL/SQL indexed table
   store2_table  number_idx_tbl;     --  PL/SQL indexed table
   store3_table  number_idx_tbl;     --  PL/SQL indexed table
   ...
END;            --  end of foobar

DECLARE
   ...
   empty_table   number_idx_tbl;     --  uninitialized ("empty") version
BEGIN
   FOR i in 1..1000000 loop
     store1_table(i) := i;           --  load data
   END LOOP;
   ...
   store1_table := empty_table;      --  "truncate" the indexed table
   ...
   -
   dbms_session.free_unused_user_memory;  -- give memory back to system

   store1_table(1) := 100;           --  index tables still declared;
   store2_table(2) := 200;           --  but truncated.
   ...
END;
```

IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (
   rolename    VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 117–5 IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.

Return Values

Table 117–6 IS_ROLE_ENABLED Function Return Values

Return	Description
is_role_enabled	TRUE or FALSE, depending on whether the role is enabled.

IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (
   uniqueid VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 117–7 IS_SESSION_ALIVE Function Parameters

Parameter	Description
`uniqueid`	Unique ID of the session: This is the same one as returned by `UNIQUE_SESSION_ID`.

Return Values

Table 117–8 IS_SESSION_ALIVE Function Return Values

Return	Description
`is_session_alive`	`TRUE` or `FALSE`, depending on whether the session is active.

LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
   namespace VARCHAR2(30),
   attribute VARCHAR2(30),
   value     VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
   list OUT AppCtxTabTyp,
   size OUT NUMBER);
```

Parameters

Table 117–9 LIST_CONTEXT Procedure Parameters

Parameter	Description
`list`	Buffer to store a list of application context set in the current session.

Return Values

Table 117–10 LIST_CONTEXT Procedure Return Values

Return	Description
`list`	A list of (namespace, attribute, values) set in current session.
`size`	Returns the number of entries in the buffer returned.

Usage Notes

The context information in the list appears as a series of `<namespace>` `<attribute>` `<value>`. Because `list` is a table type variable, its size is dynamically adjusted to the size of returned list.

MODIFY_PACKAGE_STATE Procedure

This procedure can be used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running. The procedure uses the `DBMS_SESSION` constants listed in Table 117–12.

Syntax

```
DBMS_SESSION.MODIFY_PACKAGE_STATE(
   action_flags IN PLS_INTEGER);
```

Parameters

Table 117–11 MODIFY_PACKAGE_STATE Procedure Parameters

Parameter	Description
`action_flags`	Bit flags that determine the action taken on PL/SQL program units: `DBMS_SESSION.FREE_ALL_RESOURCES` (or `1`)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking `MODIFY_PACKAGE_STATE` with the `DBMS_SESSION.FREE_ALL_RESOURCES` parameter provides functionality identical to the `DBMS_SESSION.RESET_PACKAGE()` interface. `DBMS_SESSION.REINITIALIZE` (or `2`)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the `DBMS_SESSION.REINITIALIZE` flag is similar to the `DBMS_SESSION.FREE_ALL_RESOURCES` flag in that both have the effect of reinitializing all packages. However, `DBMS_SESSION.REINITIALIZE` should exhibit better performance than the `DBMS_SESSION.FREE_ALL_RESOURCES` option because: ▪ Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused. ▪ Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use. ▪ The session memory for PL/SQL modules without global state (such as types, stored-procedures) will not be freed and recreated.

Usage Notes

See the parameter descriptions in Table 117–13 for the differences between the flags and why DBMS_SESSION.REINITIALIZE exhibits better performance than DBMS_SESSION.FREE_ALL_RESOURCES.

Table 117–12 Action_flags Constants for MODIFY_PACKAGE_STATE

Constant	Description
FREE_ALL_RESOURCES	PLS_INTEGER:= 1
REINITIALIZE	PLS_INTEGER:= 2

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v   varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ....
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/
```

For the package P, reinitialization involves:

- Setting P.n to NULL
- Invoking function P2.foo and setting P.m to the value returned from P2.foo
- Setting P.d to the return value of SYSDATE built-in
- Closing cursor P.c if it was previously opened
- Setting P.v to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.

- When using FREE_ALL_RESOURCES or REINITIALIZE, make sure that resetting package variable values does not affect the application.
- Because DBMS_SESSION.REINITIALIZE does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the FREE_ALL_RESOURCES flag or the RESET_PACKAGE procedure had been used. For instance, after performing DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE), if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages will remain until the end of the session (or until DBMS_SESSION.RESET_PACKAGE is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS_SESSION.REINITIALIZE.

  Instead, use DBMS_SESSION.MODIFY_PACKAGE_STATE(2) on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of DBMS_SESSION.MODIFY_PACKAGE_STATE. Consider a package P with some global state (a cursor c and a number cnt). When the package is first initialized, the package variable cnt is 0 and the cursor c is CLOSED. Then, in the session, change the value of cnt to 111 and also execute an OPEN operation on the cursor. If you call print_status to display the state of the package, you see that cnt is 111 and that the cursor is OPEN. Next, call DBMS_SESSION.MODIFY_PACKAGE_STATE. If you print the status of the package P again using print_status, you see that cnt is 0 again and the cursor is CLOSED. If the call to DBMS_SESSION.MODIFY_PACKAGE_STATE had not been made, then the second print_status would have printed 111 and OPEN.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2   P.cnt := 111;
  3   open p.c;
```

```
  4   P.print_status;
  5  end;
  6  /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
  2   dbms_session.modify_package_state(dbms_session.reinitialize);
  3  end;
  4  /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL>
SQL> begin
  2   P.print_status;
  3  end;
  4  /
P.cnt = 0
P.c is CLOSED

PL/SQL procedure successfully completed.
```

SESSION _TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE();
```

SESSION _TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(
   waits     IN   BOOLEAN DEFAULT TRUE,
   binds     IN   BOOLEAN DEFAULT FALSE,
   plan_stat IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 117–13 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
`waits`	Specifies if wait information is to be traced
`binds`	Specifies if bind information is to be traced
`plan_stat`	Frequency at which we dump row source statistics. Value should be '`NEVER`', '`FIRST_EXECUTION`' (equivalent to `NULL`) or '`ALL_EXECUTIONS`'.

RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

> **Note:** See "SESSION _TRACE_ENABLE Procedure" on page 117-20. The MODIFY_PACKAGE_STATE interface, introduced in Oracle9i, provides an equivalent of the RESET_PACKAGE capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values will not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

> **Note:** `RESET_PACKAGE` only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure `P1` calls PL/SQL procedure `P2`, and `P2` calls `RESET_PACKAGE`. The `RESET_PACKAGE` effects do not occur until procedure `P1` finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```
DBMS_SESSION.SET_CONTEXT (
   namespace VARCHAR2,
   attribute VARCHAR2,
   value     VARCHAR2,
   username  VARCHAR2,
   client_id VARCHAR2 );
```

Parameters

Table 117–14 SET_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace of the application context to be set, limited to 30 bytes.
attribute	The attribute of the application context to be set, limited to 30 bytes.
value	The value of the application context to be set, limited to 4 kilobytes.
username	The database username attribute of the application context. Default: NULL
client_id	The application-specific client_id attribute of the application context (64-byte maximum). Default: NULL

Usage Notes

Note the following:

- For 8i compatibility, only the first three parameters are used.
- The first three parameters are required for all types of context.
- The username parameter must be a valid SQL identifier
- The client_id parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for set_identifier.
- If the namespace parameter is a global context namespace, then the username parameter is matched against the current database user name in the session, and the client_id parameter will be matched against the current client_id in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package
- The caller of SET_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.

- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.

  See Also: *Oracle Database Security Guide* for more information about

  - "Setting the username and client ID"
  - "Example: Creating a Global Application Context that Uses a Client Session ID"

SET_IDENTIFIER

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (
   client_id VARCHAR2);
```

Parameters

Table 117–15 SET_IDENTIFIER Procedure Parameters

Parameter	Description
client_id	The application-specific identifier of the current database session.

Usage Notes

Note the following:

- SET_IDENTIFIER initializes the current session with a client identifier to identify the associated global application context
- client_id is case sensitive; it must match the client_id parameter in the set_context
- This procedure is executable by public

SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the following SQL statement:

```
ALTER SESSION SET <nls_parameter> = <value>
```

Syntax

```
DBMS_SESSION.SET_NLS (
   param VARCHAR2,
   value VARCHAR2);
```

Parameters

Table 117–16 SET_NLS Procedure Parameters

Parameter	Description
`param`	Globalization Support parameter. The parameter name must begin with 'NLS'.
`value`	Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, "`set_nls ('nls_date_format','"DD-MON-YY"')`".

SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the `SET ROLE` SQL statement.

Syntax

```
DBMS_SESSION.SET_ROLE (
   role_cmd VARCHAR2);
```

Parameters

Table 117–17 SET_ROLE Procedure Parameters

Parameter	Description
`role_cmd`	This text is appended to "set role" and then run as SQL.

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the following SQL statement:

```
ALTER SESSION SET SQL_TRACE ...
```

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (
   sql_trace boolean);
```

Parameters

Table 117–18 SET_SQL_TRACE Procedure Parameters

Parameter	Description
sql_trace	TRUE turns tracing on, FALSE turns tracing off.

SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (
   new_consumer_group     IN  VARCHAR2,
   old_consumer_group     OUT VARCHAR2,
   initial_group_on_error IN  BOOLEAN);
```

Parameters

Table 117–19 SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

Parameter	Description
new_consumer_group	Name of consumer group to which you want to switch.
old_consumer_group	Name of the consumer group from which you just switched out.
initial_group_on_error	If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error.

Return Values

This procedure outputs the old consumer group of the user in the parameter old_consumer_group.

Note: You can switch back to the old consumer group later using the value returned in old_consumer_group.

Exceptions

Table 117–20 SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions

Exception	Description
29368	Non-existent consumer group.
1031	Insufficient privileges.
29396	Cannot switch to OTHER_GROUPS consumer group.

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (old_consumer_group) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting initial_group_on_error to TRUE, SWITCH_CURRENT_CONSUMER_GROUP puts the current session into the default group, if it can't put it into the group designated by new_consumer_group. The error associated with the attempt to move

a session into new_consumer_group is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
   old_group varchar2(30);
   prev_group varchar2(30);
   curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error will be thrown, but the consumer group will not change
  -- because 'initial_group_on_error' is set to FALSE

  dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)

  BEGIN
    -- perform some operations while under privileged group

  EXCEPTION
    WHEN OTHERS THEN
     -- It is possible that the procedure owner does not have privileges
     -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
     -- that the user is moved out of the privileged group in such a
     -- situation

     dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
     RAISE;
    END;

  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/
```

UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```
DBMS_SESSION.UNIQUE_SESSION_ID
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

Return Values

Table 117–21 UNIQUE_SESSION_ID Function Return Values

Return	Description
`unique_session_id`	Returns up to 24 bytes.

118

DBMS_SHARED_POOL

The DBMS_SHARED_POOL package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. DBMS_SHARED_POOL enables you to display the sizes of objects in the shared pool, and mark them for keeping or unkeeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- Using DBMS_SHARED_POOL
  - Overview
  - Operational Notes
- Summary of DBMS_SHARED_POOL Subprograms

Using DBMS_SHARED_POOL

- Overview
- Operational Notes

Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

DBMS_SHARED_POOL is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, DBMS_SHARED_POOL supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. DBMS_SHARED_POOL is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

Operational Notes

To create DBMS_SHARED_POOL, run the DBMSPOOL.SQL script. The PRVTPOOL.PLB script is automatically executed after DBMSPOOL.SQL runs. These scripts are *not* run by CATPROC.SQL.

Summary of DBMS_SHARED_POOL Subprograms

Table 118–1 DBMS_SHARED_POOL Package Subprograms

Subprogram	Description
ABORTED_REQUEST_ THRESHOLD Procedure on page 118-6	Sets the aborted request threshold for the shared pool
KEEP Procedure on page 118-7	Keeps an object in the shared pool
PURGE Procedure on page 118-8	Purges the named object or specified heap(s) of the object
SIZES Procedure on page 118-9	Shows objects in the shared pool that are larger than the specified size
UNKEEP Procedure on page 118-10	Unkeeps the named object

ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (
   threshold_size NUMBER);
```

Parameters

Table 118–2 ABORTED_REQUEST_THRESHOLD Procedure Parameters

Parameter	Description
`threshold_size`	Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of `threshold_size` is 5000 to ~2 GB inclusive.

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an '`ALTER SYSTEM FLUSH SHARED_POOL`'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than `thresh_hold` size. This user gets the 'out of memory' error without attempting to search the LRU list.

KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```
DBMS_SHARED_POOL.KEEP (
   name VARCHAR2,
   flag CHAR      DEFAULT 'P');
```

Parameters

Table 118–3 KEEP Procedure Parameters

Parameter	Description
name	Name of the object to keep. The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be kept.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.

Exceptions

An exception is raised if the named object cannot be found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, and types which are specified by name
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by DBMS_SHARED_POOL.KEEP('0034CDFF, 20348871'). The complete hexadecimal address must be in the first 8 characters.

PURGE Procedure

This procedure purges the named object or specified heap(s) of the object.

Syntax

```
DBMS_SHARED_POOL.KEEP (
   name    VARCHAR2,
   flag    CHAR DEFAULT 'P',
   heaps   NUMBER DEFAULT 1)
```

Parameters

Table 118–4 KEEP Procedure Parameters

Parameter	Description
name	Name of the object to keep. The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be kept.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.
heaps	Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1<<0 | 1<<6 => hex 0x41 => decimal 65, so specify heaps =>65. Default is 1, that is, heap 0 which means the whole object would be purged

Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the KEEP Procedure are supported for PURGE.

SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (
   minsize NUMBER);
```

Parameters

Table 118–5 SIZES Procedure Parameters

Parameter	Description
`minsize`	Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.

Usage Notes

Issue the SQLDBA or SQLPLUS `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (
   name VARCHAR2,
   flag CHAR     DEFAULT 'P');
```

Caution: This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 118–6 UNKEEP Procedure Parameters

Parameter	Description
`name`	Name of the object to unkeep. See description of the `name` object for the `KEEP` procedure.
`flag`	See description of the flag parameter for the `KEEP` procedure.

Exceptions

An exception is raised if the named object cannot be found.

119

DBMS_SPACE

The DBMS_SPACE package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- Using DBMS_SPACE
  - Security Model
- Summary of DBMS_SPACE Subprograms

Using DBMS_SPACE

- Security Model

Security Model

This package runs with SYS privileges. The execution privilege is granted to PUBLIC. Subprograms in this package run under the caller security. The user must have ANALYZE privilege on the object.

Data Structures

The DBMS_SPACE package defines a RECORD type and a TABLE type.

RECORD Types

ASA_RECO_ROW Record Type

TABLE Types

ASA_RECO_ROW_TB Table Type

ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

```
TYPE asa_reco_row IS RECORD (
   tablespace_name       VARCHAR2(30),
   segment_owner         VARCHAR2(30),
   segment_name          VARCHAR2(30),
   segment_type          VARCHAR2(18),
   partition_name        VARCHAR2(30),
   allocated_space       NUMBER,
   used_space            NUMBER,
   reclaimable_space     NUMBER,
   chain_rowexcess       NUMBER,
   recommendations       VARCHAR2(1000),
   c1                    VARCHAR2(1000),
   c2                    VARCHAR2(1000),
   c3                    VARCHAR2(1000),
   task_id               NUMBER,
   mesg_id               NUMBER);
```

Attributes

Table 119–1 ASA_RECO_ROW Attributes

Field	Description
tablespace_name	Name of the tablespace containing the object
segment_owner	Name of the schema
segment_name	Name of the object
segment_type	Type of the segment 'TABLE','INDEX' and so on
partition_name	Name of the partition
allocated_space	Space allocated to the segment
used_space	Space actually used by the segment
reclaimable_space	Reclaimable free space in the segment
chain_rowexcess	Percentage of excess chain row pieces that can be eliminated
recommendations	Recommendation or finding for this segment
c1	Command associated with the recommendation
c2	Command associated with the recommendation
c3	Command associated with the recommendation
task_id	Advisor Task that processed this segment
mesg_id	Message ID corresponding to the recommendation

ASA_RECO_ROW_TB Table Type

Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

Summary of DBMS_SPACE Subprograms

Table 119–2 DBMS_SPACE Package Subprograms

Subprogram	Description
ASA_RECOMMENDATIONS Function on page 119-8	Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user
CREATE_INDEX_COST Procedure on page 119-9	Determines the cost of creating an index on an existing table
CREATE_TABLE_COST Procedures on page 119-10	Determines the size of the table given various attributes
FREE_BLOCKS Procedure on page 119-12	Returns information about free blocks in an object (table, index, or cluster)
OBJECT_DEPENDENT_ SEGMENTS Function on page 119-14	Returns the list of segments that are associated with the object
OBJECT_GROWTH_TREND Function on page 119-16	A table function where each row describes the space usage of the object at a specific point in time
SPACE_USAGE Procedures on page 119-18	Returns information about free blocks in an auto segment space managed segment
UNUSED_SPACE Procedure on page 119-21	Returns information about unused space in an object (table, index, or cluster)

ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (
   all_runs        IN    VARCHAR2 DEFAULT := TRUE,
   show_manual     IN    VARCHAR2 DEFAULT := TRUE,
   show_findings   IN    VARCHAR2 DEFAULT := FALSE)
 RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

Table 119–3 CREATE_INDEX_COST Procedure Parameters

Parameter	Description
`all_runs`	If `TRUE`, returns recommendations/findings for all runs of auto segment advisor. If `FALSE`, returns the results of the `LATEST` run only. `LATEST` does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.
`show_manual`	If `TRUE`, we show the results of manual invocations only. The auto advisor results are excluded. If `FALSE`, results of manual invocation of segment advisor are not returned.
`show_findings`	Show only the findings instead of the recommendations

CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
   ddl             IN    VARCHAR2,
   used_bytes      OUT   NUMBER,
   alloc_bytes     OUT   NUMBER,
   plan_table      IN    VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

Parameters

Table 119–4 CREATE_INDEX_COST Procedure Parameters

Parameter	Description
ddl	The create index DDL statement
used_bytes	The number of bytes representing the actual index data
alloc_bytes	Size of the index when created in the tablespace
plan_table	Which plan table to use, default NULL

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
   tablespace_name    IN VARCHAR2,
   avg_row_size       IN NUMBER,
   row_count          IN NUMBER,
   pct_free           IN NUMBER,
   used_bytes         OUT NUMBER,
   alloc_bytes        OUT NUMBER);

DBMS_SPACE.CREATE_TABLE_COST (
   tablespace_name    IN VARCHAR2,
   colinfos           IN CREATE_TABLE_COST_COLUMNS,
   row_count          IN NUMBER,
   pct_free           IN NUMBER,
   used_bytes         OUT NUMBER,
   alloc_bytes        OUT NUMBER);

CREATE TYPE create_table_cost_colinfo IS OBJECT (
   COL_TYPE   VARCHAR(200),
   COL_SIZE   NUMBER);
```

Parameters

Table 119–5 CREATE_TABLE_COST Procedure Parameters

Parameter	Description
tablespace_name	The tablespace in which the object will be created. The default is SYSTEM tablespace.
avg_row_size	The anticipated average row size in the table
colinfos	The description of the columns
row_count	The anticipated number of rows in the table
pct_free	The percentage of free space in each block for future expansion of existing rows due to updates
used_bytes	The space used by user data
alloc_bytes	The size of the object taking into account the tablespace extent characteristics

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
 ub NUMBER;
 ab NUMBER;
 cl sys.create_table_cost_columns;
BEGIN
  cl := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
        sys.create_table_cost_colinfo('VARCHAR2',30),
        sys.create_table_cost_colinfo('VARCHAR2',30),
        sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',cl,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```

FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster). See SPACE_USAGE Procedures for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (
   segment_owner     IN  VARCHAR2,
   segment_name      IN  VARCHAR2,
   segment_type      IN  VARCHAR2,
   freelist_group_id IN  NUMBER,
   free_blks         OUT NUMBER,
   scan_limit        IN  NUMBER DEFAULT NULL,
   partition_name    IN  VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 119–6 FREE_BLOCKS Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): ■ TABLE ■ TABLE PARTITION ■ TABLE SUBPARTITION ■ INDEX ■ INDEX PARTITION ■ INDEX SUBPARTITION ■ CLUSTER ■ LOB ■ LOB PARTITION ■ LOB SUBPARTITION
freelist_group_id	Freelist group (instance) whose free list size is to be computed
free_blks	Returns count of free blocks for the specified group
scan_limit	Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is composite.

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

Note: An error is raised if scan_limit is not a positive number.

OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS(
   objowner     IN     VARCHAR2,
   objname      IN     VARCHAR2,
   partname     IN     VARCHAR2,
   objtype      IN     NUMBER)
  RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 119–7 OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objowner	The schema containing the object
objname	The name of the object
partname	The name of the partition
objtype	Type of the object: ■ OBJECT_TYPE_TABLE constant positive := 1; ■ OBJECT_TYPE_NESTED_TABLE constant positive := 2; ■ OBJECT_TYPE_INDEX constant positive := 3; ■ OBJECT_TYPE_CLUSTER constant positive := 4; ■ OBJECT_TYPE_TABLE_PARTITION constant positive := 7; ■ OBJECT_TYPE_INDEX_PARTITION constant positive := 8; ■ OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9; ■ OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10; ■ OBJECT_TYPE_MV constant positive := 13; ■ OBJECT_TYPE_MVLOG constant positive := 14;

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD (
   segment_owner      VARCHAR2(100),
   segment_name       VARCHAR2(100),
   segment_type       VARCHAR2(100),
   tablespace_name    VARCHAR2(100),
   partition_name     VARCHAR2(100),
```

```
  lob_column_name    VARCHAR2(100));
```

Table 119–8 OBJECT_DEPENDENT_SEGMENT Type Parameters

Parameter	Description
segment_owner	The schema containing the segment
segment_name	The name of the segment
segmemnt_type	The type of the segment, such as table, index or LOB
tablespace_name	The name of the tablespace
partition_name	The name of the partition, if any
lob_column_name	The name of the LOB column, if any

OBJECT_GROWTH_TREND Function

This is a table function. The output will be in the form of one or more rows where each row describes the space usage of the object at a specific point in time. Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
   object_owner           IN    VARCHAR2,
   object_name            IN    VARCHAR2,
   object_type            IN    VARCHAR2,
   partition_name         IN    VARCHAR2 DEFAULT NULL,
   start_time             IN    TIMESTAMP DEFAULT NULL,
   end_time               IN    TIMESTAMP DEFAULT NULL,
   interval               IN    DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
   skip_interpolated      IN    VARCHAR2 DEFAULT 'FALSE',
   timeout_seconds        IN    NUMBER DEFAULT NULL,
   single_datapoint_flag  IN    VARCHAR2 DEFAULT 'TRUE')
 RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 119–9 OBJECT_GROWTH_TREND Function Parameters

Parameter	Description
`object_owner`	The schema containing the object
`object_name`	The name of the object
`object_type`	The type of the object
`partition_name`	The name of the partition
`start_time`	Statistics generated after this time will be used in generating the growth trend
`end_time`	Statistics generated until this time will be used in generating the growth trend
`interval`	The interval at which to sample
`skip_interpolated`	Whether interpolation of missing values should be skipped
`timeout_seconds`	The time-out value for the function in seconds
`single_data_point_flag`	Whether in the absence of statistics the segment should be sampled

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
   timepoint      TIMESTAMP,
   space_usage    NUMBER,
   space_alloc    NUMBER,
   quality        VARCHAR(20));
```

Table 119–10 OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
`timepoint`	The time at which the statistic was recorded
`space_usage`	The space used by data
`space_alloc`	The size of the segment including overhead and unused space
`quality`	The quality of result: "`GOOD`", "`INTERPOLATED`", "`PROJECTION`"

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

SPACE_USAGE Procedures

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBs, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management.The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBs in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired.

Syntax

```
DBMS_SPACE.SPACE_USAGE(
   segment_owner           IN  VARCHAR2,
   segment_name            IN  VARCHAR2,
   segment_type            IN  VARCHAR2,
   unformatted_blocks      OUT NUMBER,
   unformatted_bytes       OUT NUMBER,
   fs1_blocks              OUT NUMBER,
   fs1_bytes               OUT NUMBER,
   fs2_blocks              OUT NUMBER,
   fs2_bytes               OUT NUMBER,
   fs3_blocks              OUT NUMBER,
   fs3_bytes               OUT NUMBER,
   fs4_blocks              OUT NUMBER,
   fs4_bytes               OUT NUMBER,
   full_blocks             OUT NUMBER,
   full_bytes              OUT NUMBER,
   partition_name          IN  VARCHAR2 DEFAULT NULL);

DBMS_SPACE.SPACE_USAGE(
   segment_owner           IN    VARCHAR2,
   segment_name            IN    VARCHAR2,
   segment_type            IN    VARCHAR2,
   segment_size_blocks     OUT   NUMBER,
   segment_size_bytes      OUT   NUMBER,
   used_blocks             OUT   NUMBER,
   used_bytes              OUT   NUMBER,
   expired_blocks          OUT   NUMBER,
   expired_bytes           OUT   NUMBER,
   unexpired_blocks        OUT   NUMBER,
   unexpired_bytes         OUT   NUMBER,
   partition_name          IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 119–11 SPACE_USAGE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Name of the segment to be analyzed
partition_name	Partition name of the segment to be analyzed

Table 119–11 (Cont.) SPACE_USAGE Procedure Parameters

Parameter	Description
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): ■ TABLE ■ TABLE PARTITION ■ TABLE SUBPARTITION ■ INDEX ■ INDEX PARTITION ■ INDEX SUBPARTITION ■ CLUSTER ■ LOB ■ LOB PARTITION ■ LOB SUBPARTITION
unformatted_blocks	Total number of blocks unformatted
unformatted bytes	Total number of bytes unformatted
fs1_blocks	Number of blocks having at least 0 to 25% free space
fs1_bytes	Number of bytes having at least 0 to 25% free space
fs2_blocks	Number of blocks having at least 25 to 50% free space
fs2_bytes	Number of bytes having at least 25 to 50% free space
fs3_blocks	Number of blocks having at least 50 to 75% free space
fs3_bytes	Number of bytes having at least 50 to 75% free space
fs4_blocks	Number of blocks having at least 75 to 100% free space
fs4_bytes	Number of bytes having at least 75 to 100% free space
ful1_blocks	Total number of blocks full in the segment
full_bytes	Total number of bytes full in the segment
segment_size_blocks	Number of blocks allocated to the segment
segment_size_bytes	Number of bytes allocated to the segment
used_blocks	Number blocks allocated to the LOB that contains active data
used_bytes	Number bytes allocated to the LOB that contains active data
expired_blocks	Number of expired blocks used by the LOB to keep version data
expired_bytes	Number of expired bytes used by the LOB to keep version data
unexpired_blocks	Number of unexpired blocks used by the LOB to keep version data
unexpired_bytes	Number of unexpired bytes used by the LOB to keep version data
partition_name	Name of the partition (NULL if not a partition)

Examples

```
variable unf number;
variable unfb number;
variable fs1 number;
```

```
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                       'TABLE',
                       :unf, :unfb,
                       :fs1, :fs1b,
                       :fs2, :fs2b,
                       :fs3, :fs3b,
                       :fs4, :fs4b,
                       :full, :fullb);
end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
```

UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```
DBMS_SPACE.UNUSED_SPACE (
   segment_owner              IN  VARCHAR2,
   segment_name               IN  VARCHAR2,
   segment_type               IN  VARCHAR2,
   total_blocks               OUT NUMBER,
   total_bytes                OUT NUMBER,
   unused_blocks              OUT NUMBER,
   unused_bytes               OUT NUMBER,
   last_used_extent_file_id   OUT NUMBER,
   last_used_extent_block_id  OUT NUMBER,
   last_used_block            OUT NUMBER,
   partition_name             IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 119–12 UNUSED_SPACE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): ■ TABLE ■ TABLE PARTITION ■ TABLE SUBPARTITION ■ INDEX ■ INDEX PARTITION ■ INDEX SUBPARTITION ■ CLUSTER ■ LOB ■ LOB PARTITION ■ LOB SUBPARTITION
total_blocks	Returns total number of blocks in the segment
total_bytes	Returns total number of blocks in the segment, in bytes
unused_blocks	Returns number of blocks which are not used
unused_bytes	Returns, in bytes, number of blocks which are not used
last_used_extent_file_id	Returns the file ID of the last extent which contains data
last_used_extent_block_id	Returns the starting block ID of the last extent which contains data
last_used_block	Returns the last block within this extent which contains data

Table 119–12 (Cont.) UNUSED_SPACE Procedure Parameters

Parameter	Description
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.

Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,
   :total_bytes,:unused_blocks, :unused_bytes, :lastextf,
   :last_extb, :lastusedblock);
```

120

DBMS_SPACE_ADMIN

The DBMS_SPACE_ADMIN package provides functionality for locally managed tablespaces.

> **See Also:** *Oracle Database Administrator's Guide* for an example and description of using DBMS_SPACE_ADMIN.

This chapter contains the following topics:

- Using DBMS_SPACE_ADMIN
  - Security Model
  - Constants
  - Operational Notes
- Summary of DBMS_SPACE_ADMIN Subprograms

Using DBMS_SPACE_ADMIN

This section contains topics which relate to using the `DBMS_SPACE_ADMIN` package.

- Security Model
- Constants
- Operational Notes

Security Model

This package runs with SYS privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

Constants

Table 120–1 DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENT_VERIFY_EXTENTS	POSITIVE	1	Verifies that the space owned by segment is appropriately reflected in the bitmap as used
SEGMENT_VERIFY_EXTENTS_GLOBAL	POSITIVE	2	Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it
SEGMENT_MARK_CORRUPT	POSITIVE	3	Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation).
SEGMENT_MARK_VALID	POSITIVE	4	Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.
SEGMENT_DUMP_EXTENT_MAP	POSITIVE	5	Dumps the extent map for a given segment
TABLESPACE_VERIFY_BITMAP	POSITIVE	6	Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent
TABLESPACE_EXTENT_MAKE_FREE	POSITIVE	7	Marks the DBA range (extent) as free in the bitmaps
TABLESPACE_EXTENT_MAKE_USED	POSITIVE	8	Marks the DBA range (extent) as used in the bitmaps
SEGMENT_VERIFY_BASIC	POSITIVE	9	Performs the basic metadata checks
SEGMENT_VERIFY_DEEP	POSITIVE	10	Performs deep verification
SEGMENT_VERIFY_SPECIFIC	POSITIVE	11	Performs a specific check for the segment
HWM_CHECK	POSITIVE	12	Checks HWM
BMB_CHECK	POSITIVE	13	Checks integrity among L1, L2 and L3 BMBs
SEG_DICT_CHECK	POSITIVE	14	Checks consistency of segment header with corresponding SEG entry
EXTENT_TS_BITMAP_CHECK	POSITIVE	15	Checks whether the tablespace bitmaps corresponding to the extent map are marked used
DB_BACKPOINTER_CHECK	POSITIVE	16	Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment
EXTENT_SEGMENT_BITMAP_CHECK	POSITIVE	17	Checks whether the bitmap blocks are consistent with the extent map

Table 120–1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
BITMAPS_CHECK	POSITIVE	18	Checks from the datablocks that the bitmap states representing the blocks are consistent
TS_VERIFY_BITMAPS	POSITIVE	19	Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace
TS_VERIFY_DEEP	POSITIVE	20	Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option
TS_VERIFY_SEGMENTS	POSITIVE	21	Performs ASSM_SEGMENT_ VERIFY on all segments in the tablespace. will take either the basic or the deep option
SEGMENTS_DUMP_ BITMAP_SUMMARY	POSITIVE	27	Dumps only bitmap block summaries

Operational Notes

Before migrating the SYSTEM tablespace, the following conditions must be met. These conditions are enforced by the TABLESPACE_MIGRATE_TO_LOCAL procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not SYSTEM.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

Summary of DBMS_SPACE_ADMIN Subprograms

Table 120–2 DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
ASSM_SEGMENT_VERIFY Procedure on page 120-8	Verifies segments created in ASSM tablespaces
ASSM_TABLESPACE_VERIFY Procedure on page 120-10	Verifies ASSM tablespaces
SEGMENT_CORRUPT Procedure on page 120-11	Marks the segment corrupt or valid so that appropriate error recovery can be done
SEGMENT_DROP_CORRUPT Procedure on page 120-12	Drops a segment currently marked corrupt (without reclaiming space)
SEGMENT_DUMP Procedure on page 120-13	Dumps the segment header and extent maps of a given segment
SEGMENT_VERIFY Procedure on page 120-14	Verifies the consistency of the extent map of the segment
TABLESPACE_FIX_BITMAPS Procedure on page 120-15	Marks the appropriate DBA range (extent) as free or used in bitmap
TABLESPACE_FIX_SEGMENT_STATES Procedure on page 120-16	Fixes the state of the segments in a tablespace in which migration was aborted
TABLESPACE_MIGRATE_FROM_LOCAL Procedure on page 120-17	Migrates a locally-managed tablespace to dictionary-managed tablespace
TABLESPACE_MIGRATE_TO_LOCAL Procedure on page 120-18	Migrates a tablespace from dictionary managed format to locally managed format
TABLESPACE_REBUILD_BITMAPS Procedure on page 120-19	Rebuilds the appropriate bitmaps
TABLESPACE_REBUILD_QUOTAS Procedure on page 120-20	Rebuilds quotas for given tablespace
TABLESPACE_RELOCATE_BITMAPS Procedure on page 120-21	Relocates the bitmaps to the destination specified
TABLESPACE_VERIFY Procedure on page 120-22	Verifies that the bitmaps and extent maps for the segments in the tablespace are in sync

ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in ASSM (Automatic Segment Space Management) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
   segment_owner   IN VARCHAR2,
   segment_name    IN VARCHAR2,
   segment_type    IN VARCHAR2,
   partition_name  IN VARCHAR2,
   verify_option   IN POSITIVE  DEFAULT SEGMENT_VERIFY_BASIC,
   attrib          IN POSITIVE  DEFAULT NULL);
```

Parameters

Table 120–3 ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
segment_owner	The schema that owns the segment
segment_name	The name of the segment to be verified
segment_type	The segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER
partition_name	Name of the partition or subpartition
verify_option	■ SEGMENT_VERIFY_DEEP := 9. Performs deep verification ■ SEGMENT_VERIFY_BASIC:= 10. Performs the basic metadata checks (Default)

Table 120–3 (Cont.) ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
attrib	When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following: ■ HWM_CHECK - CONSTANT POSITIVE := 12; checks whether high water mark information is accurate. ■ BMB_CHECK - CONSTANT POSITIVE := 13; checks whether space bitmap blocks have correct backpointers to the segment header. ■ SEG_DICT_CHECK - CONSTANT POSITIVE := 14; checks whether dictionary information for segment is accurate. ■ EXTENT_TS_BITMAP_CHECK - CONSTANT POSITIVE := 15; checks whether extent maps are consistent with file level bitmaps. ■ DB_BACKPOINTER_CHECK - CONSTANT POSITIVE := 16; checks whether datablocks have correct backpointers to the space metadata blocks. ■ EXTENT_SEGMENT_BITMAP_CHECK - CONSTANT POSITIVE := 17; checks whether extent map in the segment match with the bitnaps in the segment. ■ BITMAPS_CHECK - CONSTANT POSITIVE := 18; checks whether space bitmap blocks are accurate.

Usage Notes

- Using this procedure requires SYSDBA privileges to execute.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_*process_ID*.trc to the location specified in the USER_DUMP_DEST initialization parameter.

ASSM_TABLESPACE_VERIFY Procedure

This procedures verifies all the segments created in an ASSM tablespace. The verification per segment is either basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
   tablespace_name   IN VARCHAR2,
   ts_option         IN POSITIVE,
   segment_option    IN POSITIVE DEFAULT NULL);
```

Parameters

Table 120–4 ASSM_TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of the tablespace to verify, tablespace should be ASSM
ts_option	■ TS_VERIFY_BITMAPS - CONSTANT POSITIVE := 19; The bitmaps are verified against the extents. This will detect bits that are marked used or free wrongly and will also detect multiple allocation of extents. The file metadata will be validated against file$ and control file. This is the default option (1). ■ TS_VERIFY_DEEP - CONSTANT POSITIVE := 20; This option is used to verify the file bitmaps as well perform checks on all the segments (2). ■ TS_SEGMENTS - CONSTANT POSITIVE := 21; This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally the user can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY (3).
segment_option	When the TABLESPACE_VERIFY_SEGMENTS or TABLESPACE_VERIFY_DEEP is selected, the SEGMENT_OPTION can be specified optionally. When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following: ■ SEGMENT_VERIFY_BASIC - CONSTANT POSITIVE := 9; ■ SEGMENT_VERIFY_DEEP - CONSTANT POSITIVE := 10; The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BASIC is specified.

Usage Notes

Using this procedure requires SYSDBA privileges to execute.

This procedure outputs a dump file named sid_ora_*process_ID*.trc to the location specified in the USER_DUMP_DEST initialization parameter.

SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be done. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    POSITIVE,
   corrupt_option          IN    POSITIVE  DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

Table 120–5 SEGMENT_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
corrupt_option	SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, 3);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, 4);
```

SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space). For this to work, the segment should have been marked *temporary*. To mark a corrupt segment as temporary, issue a `DROP` command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    POSITIVE);
```

Parameters

Table 120–6 SEGMENT_DROP_CORRUPT Procedure Parameters

Parameter	Description
`tablespace_name`	Name of tablespace in which segment resides
`header_relative_file`	Relative file number of segment header
`header_block`	Block number of segment header

Usage Notes

The procedure cannot be used on the `SYSTEM` tablespace.

The space for the segment is not released, and it must be fixed by using the TABLESPACE_FIX_BITMAPS Procedure or the TABLESPACE_REBUILD_BITMAPS Procedure.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    POSITIVE,
   dump_option             IN    POSITIVE  DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

Table 120–7 SEGMENT_DUMP Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
dump_option	SEGMENT_DUMP_EXTENT_MAP SEGMENT_DUMP_BITMAP_SUMMARY.

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass SEGMENT_DUMP_BITMAP_SUMMARY as the dump_option parameter.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    POSITIVE,
   verify_option           IN    POSITIVE  DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

Table 120–8 SEGMENT_VERIFY Procedure Parameters

Parameters	Description
`tablespace_name`	Name of tablespace in which segment resides
`header_relative_file`	Relative file number of segment header
`header_block`	Block number of segment header
`verify_option`	What kind of check to do: `SEGMENT_VERIFY_EXTENTS` or `SEGMENT_VERIFY_EXTENTS_GLOBAL`

Usage Notes

Anomalies are output as dba-range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all dba-ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps in sync.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33, 1);
```

> **Note:** All `DBMS_SPACE_ADMIN` package examples use the tablespace `USERS` which contains `SCOTT.EMP`.

TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate DBA range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
   tablespace_name         IN    VARCHAR2,
   dbarange_relative_file  IN    POSITIVE,
   dbarange_begin_block    IN    POSITIVE,
   dbarange_end_block      IN    POSITIVE,
   fix_option              IN    POSITIVE);
```

Parameters

Table 120–9 TABLESPACE_FIX_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
dbarange_relative_file	Relative file number of DBA range (extent)
dbarange_begin_block	Block number of beginning of extent
dbarange_end_block	Block number (inclusive) of end of extent
fix_option	TABLESPACE_EXTENT_MAKE_FREE or TABLESPACE_EXTENT_MAKE_USED

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as USED in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83, 7);
```

Alternately, specifying an option of 8 marks the bits FREE in bitmaps. The BEGIN and END blocks should be in extent boundary and should be extent multiple. Otherwise, an error is raised.

TABLESPACE_FIX_SEGMENT_STATES Procedure

Use this procedure to fix the state of the segments in a tablespace in which migration was aborted. During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, the segment states are corrected by SMON when event 10906 is set. Database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (
   tablespace_name     IN    VARCHAR);
```

Parameters

Table 120–10 TABLESPACE_FIX_SEGMENT_STATES Procedure Parameters

Parameter Name	Purpose
tablespace_name	Name of the tablespace whose segments need to be fixed

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```

TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally-managed tablespace to a dictionary-managed tablespace. You cannot use this procedure for SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (
   tablespace_name         IN    VARCHAR2);
```

Parameter

Table 120–11 TABLESPACE_MIGRATE_FROM_LOCAL Procedure Parameter

Parameter	Description
tablespace_name	Name of tablespace

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

TABLESPACE_MIGRATE_TO_LOCAL Procedure

Use this procedure to migrate the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
   tablespace_name     IN     VARCHAR,
   unit_size           IN     POSITIVE DEFAULT NULL,
   rfno                IN     INTGER DEFAULT NULL);
```

Parameters

Table 120–12 TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Purpose
`tablespace_name`	Name of the tablespace to be migrated
`unit_size`	Unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace
`rfno`	Relative File Number of the file where the bitmap blocks should be placed (optional)

Usage Notes

Before you migrate the `SYSTEM` tablespace, you should migrate any dictionary-managed tablespaces that you may want to use in read/write mode to locally managed. After the `SYSTEM` tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

See Also: *Oracle Database Administrator's Guide*

The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.

Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the `MINIMUM EXTENT` for the tablespace (5 if `MINIMUM EXTENT`T is not specified). Thus, the calculated value will not be larger than the `MINIMUM EXTENT` for the tablespace. The last free extent in every file will be ignored for GCD calculation. If you specify the unit size, it has to be a factor of the UNIT size calculated by the system, otherwise an error message is returned.

The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, an error is issued. The data file specified should be part of the tablespace being migrated. If the dataflow is not specified then the system will choose a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, an error will be raised.

Examples

To migrate a tablespace 'TS1' with minimum extent size 1m, use

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps will be placed in file with relative file number 2.

TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block DBA is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
   tablespace_name         IN    VARCHAR2,
   bitmap_relative_file    IN    POSITIVE   DEFAULT NULL,
   bitmap_block            IN    POSITIVE   DEFAULT NULL);
```

Parameters

Table 120–13 TABLESPACE_REBUILD_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
bitmap_relative_file	Relative file number of bitmap block to rebuild
bitmap_block	Block number of bitmap block to rebuild

Usage Notes

Note: Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (
   tablespace_name         IN    VARCHAR2);
```

Parameters

Table 120–14 TABLESPACE_REBUILD_QUOTAS Procedure Parameters

Parameter	Description
`tablespace_name`	Name of tablespace

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

TABLESPACE_RELOCATE_BITMAPS Procedure

Use this procedure to relocate the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (
   tablespace_name    IN      VARCHAR2,
   filno              IN      POSITIVE,
   blkno              IN      POSITIVE);
```

Parameters

Table 120–15 TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

Parameter Name	Purpose
tablespace_name	Name of Tablespace
filno	Relative File Number of the destination file
blkno	Block Number of the destination DBA

Usage Notes

Migration of a tablespace from dictionary managed to locally managed format could result in the creation of SPACE HEADER segment that contains the bitmap blocks. The SPACE HEADER segment is treated as user data. If the user wishes to explicitly resize a file at or below the space header segment, an error is issued. Use the TABLESPACE_RELOCATE_BITMAPS command to move the control information to a different destination and then resize the file.

This procedure cannot be used on the SYSTEM tablespace.

The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE  DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

Note: The source and the destination addresses should not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location an error is raised.

TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are in sync.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (
   tablespace_name         IN    VARCHAR2,
   verify_option           IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

Table 120–16 TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
verify_option	TABLESPACE_VERIFY_BITMAP

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

121

DBMS_SPM

The DBMS_SPM package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

> **See Also:** For more information about "Using SQL Plan Management" in the *Oracle Database Performance Tuning Guide*

This chapter contains the following topics:

- Using DBMS_SPM
  - Security Model
- Summary of DBMS_SPM Subprograms

Using DBMS_SPM

- Security Model

Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS_SPM package.

Summary of DBMS_SPM Subprograms

This table list the package subprograms in alphabetical order.

Table 121–1 DBMS_SPM Package Subprograms

Subprogram	Description
ALTER_SQL_PLAN_BASELINE Function on page 121-5	Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format
CONFIGURE Procedure on page 121-7	Sets configuration options for SQL management base, in parameter/value format
CREATE_STGTAB_BASELINE Procedure on page 121-8	Creates a staging table that will be used for the purpose of transporting SQL plan baselines from one system to another
DROP_SQL_PLAN_BASELINE Function on page 121-9	drops a single plan, or all plans associated with a SQL statement
EVOLVE_SQL_PLAN_BASELINE Function on page 121-10	Evolves SQL plan baselines associated with one or more SQL statements
LOAD_PLANS_FROM_CURSOR_CACHE Functions on page 121-12	Loads one or more plans present in the cursor cache for a SQL statement
LOAD_PLANS_FROM_SQLSET Function on page 121-14	Loads plans stored in a SQL tuning set (STS) into SQL plan baselines
PACK_STGTAB_BASELINE Function on page 121-15	Packs (exports) SQL plan baselines from SQL management base into a staging table
UNPACK_STGTAB_BASELINE Function on page 121-16	Unpacks (imports) SQL plan baselines from a staging table into SQL management base

ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
   sql_handle        IN VARCHAR2 := NULL,
   plan_name         IN VARCHAR2 := NULL,
   attribute_name    IN VARCHAR2,
   attribute_value   IN VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 121–2 ALTER_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.
attribute_name	Name of plan attribute to set (see table below).
attribute_value	Value of plan attribute to use (see table below)

Table 121–3 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

Name	Description	Possible Values
enabled	'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.	'YES' or 'NO'
fixed	'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.	'YES' or 'NO'
autopurge	'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.	'YES' or 'NO'
plan_name	Name of the plan	String of up to 30-characters
description	Plan description.	String of up to 500-characters

Return Values

The number of plans altered.

Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

CONFIGURE Procedure

This procedure sets configuration options for SQL management base, in parameter/value format. This function can be called numerous times, each time setting a different configuration option.

Syntax

```
DBMS_SPM.CONFIGURE (
   parameter_name    IN VARCHAR2,
   parameter_value   IN NUMBER);
```

Parameters

Table 121–4 CONFIGURE Procedure Parameters

Parameter	Description
parameter_name	Name of parameter to set (see table below)
parameter_value	Value of parameter to use (see table below)

Table 121–5 Names & Values for CONFIGURE Procedure Parameters

Name	Description	Possible Values	Default Value
space_budget_percent	Maximum percent of SYSAUX space that can be used for SQL management base	1,2, …, 50	10
plan_retention_weeks	Number of weeks to retain unused plans before they are purged	5,6, …, 523	53

Usage Notes

- The default space budget for SQL management base is no more than ten percent of the size of SYSAUX tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table that will be used for the purpose of transporting SQL plan baselines from one system to another.

Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
   table_name        IN VARCHAR2,
   table_owner       IN VARCHAR2 := NULL,
   tablespace_name   IN VARCHAR2 := NULL);
```

Parameters

Table 121–6 CREATE_STGTAB_BASELINE Procedure Parameters

Parameter	Description
`table_name`	Name of staging table to create for the purpose of packing and unpacking SQL plan baselines
`table_owner`	Name of owner of the staging table. Default `NULL` means current schema is the table owner.
`tablespace_name`	Name of tablespace. Default NULL means create staging table in the default tablespace.

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
   sql_handle     IN VARCHAR2 := NULL,
   plan_name      IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 121–7 DROP_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
`sql_handle`	SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If `NULL` then `plan_name` must be specified.
`plan_name`	Plan name. It identifies a specific plan. Default `NULL` means to drop all plans associated with the SQL statement identified by `sql_handle`.

Return Values

The number of plans dropped

EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans. If interrogated by the user (parameter `verify` = 'YES'), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit` = 'YES').

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
   sql_handle   IN VARCHAR2 := NULL,
   plan_name    IN VARCHAR2 := NULL,
   time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
   verify       IN VARCHAR2 := 'YES',
   commit       IN VARCHAR2 := 'YES')
  RETURN CLOB;

DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
   plan_list    IN DBMS_SPM.NAME_LIST,
   time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
   verify       IN VARCHAR2 := 'YES',
   commit       IN VARCHAR2 := 'YES')
  RETURN CLOB;
```

Parameters

Table 121–8 EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
`sql_handle`	SQL statement identifier. Unless `plan_name` is specified, `NULL` means to consider all statements with non-accepted plans in their SQL plan baselines.
`plan_name`	Plan identifier. Default `NULL` means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if `sql_handle` is `NULL`.
`plan_list`	A list of plan names. Each plan in the list can belong to same or different SQL statement.
`time_limit`	Time limit in number of minutes. This applies only if `verify` = 'YES'. The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. ■ `DBMS_SPM.AUTO_LIMIT` (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done. ■ `DBMS_SPM.NO_LIMIT` means there is no time limit. ■ A positive integer value represents a user specified time limit.

Table 121–8 (Cont.) EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
verify	Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan. ■ 'YES' (Default) will verify that a non-accepted plan gives better performance before changing it to an accepted plan. ■ 'NO' means not to execute plans but only to change non-accepted plans into accepted plans.
commit	Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'. ■ 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when verify = 'YES'. ■ 'NO' - generate a report without any updates. Note that commit = 'NO' together with verify = 'NO' represents a no-op.

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if verify = 'YES' the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute_name and attribute_value pair.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   sql_text          IN  CLOB,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   sql_handle        IN  VARCHAR2,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   attribute_name   IN VARCHAR2,
   attribute_value  IN VARCHAR2,
   fixed            IN VARCHAR2 := 'NO',
   enabled          IN VARCHAR2 := 'YES')
  RETURN PLS_INTEGER;
```

Parameters

Table 121–9 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
`sql_id`	SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and it is used to identify the SQL plan baseline into which the plan(s) will be loaded. If the SQL plan baseline doesn't exist it is created.
`plan_hash_value`	Plan identifier. Default `NULL` means capture all plans present in the cursor cache for the SQL statement identified by `SQL_ID`.
`sql_text`	SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.

Table 121–9 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_handle	SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
fixed	Default 'NO' means the loaded plans will be used as 'non-fixed' plans. Value 'YES' means the loaded plans will be used as 'fixed' plans and the SQL plan baseline will not be evolved over time.
attribute_name	One of possible attribute names: ■ SQL_TEXT" ■ 'PARSING_SCHEMA_NAME' ■ 'MODULE' ■ 'ACTION'
attribute_value	Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name => 'SQL_TEXT', and attribute_value => '% HR-123 %' means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name => 'MODULE', and attribute_value => 'HR' means applying MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This procedure can be used to seed SQL management base with new SQL plan baselines.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sqlset_owner     IN  VARCHAR2 := NULL,
   basic_filter     IN  VARCHAR2 := NULL,
   fixed            IN  VARCHAR2 := 'NO',
   enabled          IN  VARCHAR2 := 'YES'
   commit_rows      IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 121–10 LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the STS from where the plans are loaded into SQL plan baselines
sqlset_owner	Owner of STS. NULL means current schema is the owner.
basic_filter	A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can specified against the view DBA_SQLSET_STATEMENTS. For example basic_filter => 'sql_text like ''select /*LOAD_STS*/%''' or basic_filter => 'sql_id="b62q7nc33gzwx"'.
fixed	Default 'NO' means the loaded plans will be used as 'non-fixed' plans. Value 'YES' means the loaded plans will be used as 'fixed' plans and the SQL plan baseline will not be evolved over time.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this procedure.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
   table_name       IN VARCHAR2,
   table_owner      IN VARCHAR2 := NULL,
   sql_handle       IN VARCHAR2 := NULL,
   plan_name        IN VARCHAR2 := NULL,
   sql_text         IN CLOB     := NULL,
   creator          IN VARCHAR2 := NULL,
   origin           IN VARCHAR2 := NULL,
   enabled          IN VARCHAR2 := NULL,
   accepted         IN VARCHAR2 := NULL,
   fixed            IN VARCHAR2 := NULL,
   module           IN VARCHAR2 := NULL,
   action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 121–11 PACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table into which SQL plan baselines will be packed (case insensitive unless double quoted)
table_owner	Name of staging table owner.Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of SQL plan baselines packed

UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
   table_name       IN VARCHAR2,
   table_owner      IN VARCHAR2 := NULL,
   sql_handle       IN VARCHAR2 := NULL,
   plan_name        IN VARCHAR2 := NULL,
   sql_text         IN CLOB     := NULL,
   creator          IN VARCHAR2 := NULL,
   origin           IN VARCHAR2 := NULL,
   enabled          IN VARCHAR2 := NULL,
   accepted         IN VARCHAR2 := NULL,
   fixed            IN VARCHAR2 := NULL,
   module           IN VARCHAR2 := NULL,
   action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 121–12 UNPACK_STGTAB_BASELINE Function Parameters

Parameter	Description
`table_name`	Name of staging table from which SQL plan baselines will be unpacked (case insensitive unless double quoted)
`table_owner`	Name of staging table owner.Default NULL means current schema is the table owner
`sql_handle`	SQL handle (case sensitive)
`plan_name`	Plan name (case sensitive, % wildcards accepted)
`sql_text`	SQL text string (case sensitive, % wildcards accepted)
`creator`	Creator of SQL plan baseline (case insensitive unless double quoted)
`origin`	Origin of SQL plan baseline, should be `'MANUAL-LOAD'`, `'AUTO-CAPTURE','MANUAL_SQLTUNE'` or `'AUTO-SQLTUNE'` (case insensitive)
`enabled`	Must be '`YES`' or '`NO`' (case insensitive)
`accepted`	Must be '`YES`' or '`NO`' (case insensitive)
`fixed`	Must be '`YES`' or '`NO`' (case insensitive)
`module`	Module (case sensitive)
`action`	Action (case sensitive)

Return Values

Number of plans unpacked

122

DBMS_SQL

The DBMS_SQL package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL. For example, you can enter a DROP TABLE statement from within a stored procedure by using the PARSE procedure supplied with the DBMS_SQL package.

> **See Also:** For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference.*

This chapter contains the following topics:

- Using DBMS_SQL

  - RECORD TYPES
  - TABLE TYPES
- Summary of DBMS_SQL Subprograms

Using DBMS_SQL

- Overview
- Security Model
- Constants
- Exceptions
- Operational Notes
- Examples

Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to `DBMS_SQL` that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than `DBMS_SQL`. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)

Also, there are some tasks that can only be performed using `DBMS_SQL`.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

See Also: *Oracle Call Interface Programmer's Guide*

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI uses bind by address, while the `DBMS_SQL` package uses bind by value.
- With `DBMS_SQL` you must call `VARIABLE_VALUE` to retrieve the value of an `OUT` parameter for an anonymous block, and you must call `COLUMN_VALUE` after fetching rows to actually retrieve the values of the columns in the rows into your program.
- The current release of the `DBMS_SQL` package does not provide `CANCEL` cursor procedures.
- Indicator variables are not required, because `NULL`s are fully supported as values of a PL/SQL variable.

A sample usage of the `DBMS_SQL` package follows. For users of the Oracle Call Interface, this code should seem fairly straightforward.

Security Model

DBMS_SQL is a SYS-owned package compiled with AUTHID CURRENT_USER. Any DBMS_SQL subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

> **See Also:** *Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

In Oracle Database 11g, Release 1 (11.1), Oracle introduces a number of enhancements to DBMS_SQL to improve the security of the package.

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, ORA-29471, is raised when any DBMS_SQL subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and DBMS_SQL becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the IS_OPEN Function denotes a cursor currently open in the session, the return value is TRUE. If the actual value is NULL, then the return value is FALSE. Otherwise, this raises an ORA-29471 error.

Note that the OPEN_CURSOR Function is the only DBMS_SQL subprogram that has no formal parameter for the cursor number; rather, it returns a cursor number. Therefore it is not within the scope of these rules.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single DBMS_SQL subprogram call. The check is:

- The current_user is the same on calling the subprogram as it was on calling the most recent parse.
- The enabled roles on calling the subprogram must be a superset of the enabled roles on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, and ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the OPEN_CURSOR subprogram which takes a formal parameter, security_level, with allowed values NULL, 1 and 2.

- When security_level = 1 (or is NULL), the checks are made only when binding and executing.
- When security_level = 2, the checks are always made.

Upgrade Considerations

This security regime is stricter than those in Oracle Database 10g, Release 2 (10.2) and previous releases. As a consequence, users of DBMS_SQL may encounter runtime errors on upgrade. While these security enhancements make for more secure applications, users may wish to relax the security checks temporarily as they migrate to Oracle Database 11g, Release 1 (11.1). If so, please consult with Oracle Support on steps to relax the above security restrictions.

Constants

The constants described in Table 122–1 are used with the `language_flag` parameter of the PARSE Procedures.

Table 122–1 DBMS_SQL Constants

Name	Type	Value	Description
`V6`	`INTEGER`	`0`	Specifies Oracle database version 6 behavior
`NATIVE`	`INTEGER`	`1`	Specifies normal behavior for the database to which the program is connected
`V7`	`INTEGER`	`2`	Specifies Oracle database version 7 behavior

Exceptions

```
inconsistent_type EXCEPTION;
  pragma exception_init(inconsistent_type, -6562);
```

This exception is raised by the COLUMN_VALUE Procedure or the VARIABLE_VALUE Procedures when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.

Operational Notes

- Execution Flow
- Processing Queries
- Processing Updates, Inserts, and Deletes
- Locating Errors

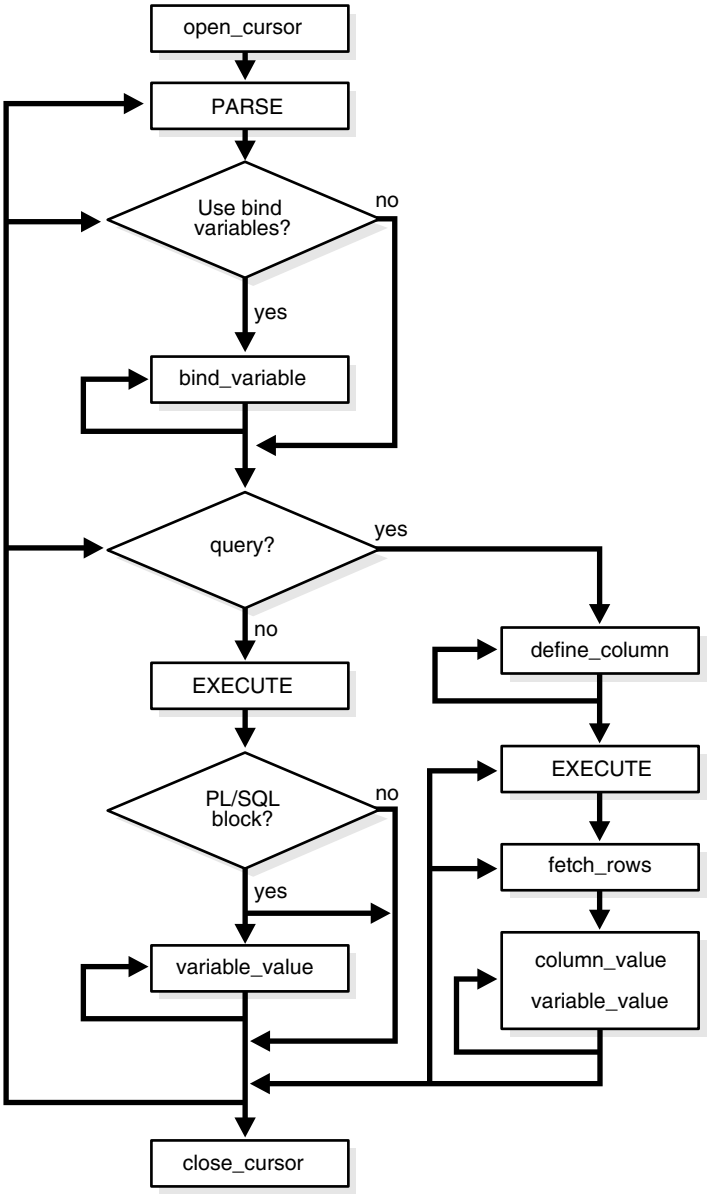
Execution Flow

1. OPEN_CURSOR
2. PARSE
3. BIND_VARIABLE or BIND_ARRAY
4. DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY
5. EXECUTE
6. FETCH_ROWS or EXECUTE_AND_FETCH
7. VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG
8. CLOSE_CURSOR

OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the OPEN_CURSOR Function function, you receive a cursor `ID` number for the data structure representing a valid cursor maintained by Oracle. These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the `DBMS_SQL` package.

PARSE



Every SQL statement must be parsed by calling the PARSE Procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

> **Note:** When parsing a DDL statement to drop a package or a procedure, a deadlock can occur if you're still using a procedure in the package. After a call to a procedure, that procedure is considered to be in use until execution has returned to the user side. Any such deadlock times out after five minutes.

The execution flow of `DBMS_SQL` is shown in Figure 122–1.

Figure 122–1 DBMS_SQL Execution Flow

BIND_VARIABLE or BIND_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the bind procedures, the BIND_ARRAY Procedures on page 122-52 or the BIND_VARIABLE Procedures on page 122-55, to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind, variables.

`DBMS_SQL` can run a DML statement multiple times — each time with a different bind variable. The `BIND_ARRAY` procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each `EXECUTE`. This is similar to the array interface supported by the OCI.

DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The columns of the row being selected in a SELECT statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures (DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY) to specify the variables that are to receive the SELECT values, much the way an INTO clause does for a static query.

Use the DEFINE_COLUMN_LONG procedure to define LONG columns, in the same way that DEFINE_COLUMN is used to define non-LONG columns. You must call DEFINE_COLUMN_LONG before using the COLUMN_VALUE_LONG procedure to fetch from the LONG column.

Use the DEFINE_ARRAY procedure to define a PL/SQL collection into which you want to fetch rows in a single SELECT statement. DEFINE_ARRAY provides an interface to fetch multiple rows at one fetch. You must call DEFINE_ARRAY before using the COLUMN_VALUE procedure to fetch the rows.

EXECUTE

Call the EXECUTE function to run your SQL statement.

FETCH_ROWS or EXECUTE_AND_FETCH

The FETCH_ROWS function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve anymore rows. Instead of calling EXECUTE and then FETCH_ROWS, you may find it more efficient to call EXECUTE_AND_FETCH if you are calling EXECUTE for a single execution.

VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG

For queries, call COLUMN_VALUE to determine the value of a column retrieved by the FETCH_ROWS call. For anonymous blocks containing calls to PL/SQL procedures or DML statements with returning clause, call VARIABLE_VALUE to retrieve the values assigned to the output variables when statements were run.

To fetch just part of a LONG database column (which can be up to two gigabytes in size), use the COLUMN_VALUE_LONG procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling CLOSE_CURSOR. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

If you neglect to close a cursor, then the memory used by that cursor remains allocated even though it is no longer needed.

Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the SELECT statement by calling the DEFINE_COLUMN Procedure, the DEFINE_COLUMN_LONG Procedure, or the DEFINE_ARRAY Procedure.
2. Run your SELECT statement by calling the EXECUTE Function.
3. Call the FETCH_ROWS Function (or EXECUTE_AND_FETCH) to retrieve the rows that satisfied your query.

4. Call COLUMN_VALUE Procedure or COLUMN_VALUE_LONG Procedure to determine the value of a column retrieved by the FETCH_ROWS Function for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. You must first run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the EXECUTE Function.
2. If statements have the `returning` clause, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables.

Locating Errors

There are additional functions in the DBMS_SQL package for obtaining information about the last referenced cursor in the session. The values returned by these functions are only meaningful immediately after a SQL statement is run. In addition, some error-locating functions are only meaningful after certain DBMS_SQL calls. For example, you call the LAST_ERROR_POSITION Function immediately after a PARSE.

Examples

This section provides example procedures that make use of the DBMS_SQL package.

Example 1

This example does not require the use of dynamic SQL because the text of the statement is known at compile time, but it illustrate the basic concept underlying the package.

The DEMO procedure deletes all of the employees from the EMP table whose salaries are greater than the salary that you specify when you run DEMO.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
    cursor_name INTEGER;
    rows_processed INTEGER;
BEGIN
    cursor_name := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
                   DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(STRING IN varchar2) AS
    cursor_name INTEGER;
    ret INTEGER;
BEGIN
   cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
   DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
   ret := DBMS_SQL.EXECUTE(cursor_name);
   DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@hq.com('CREATE TABLE acct(c1 INTEGER)');
```

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id        of type NUMBER
name      of type VARCHAR2(30)
birthdate of type DATE
```

This procedure does not specifically require the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
     source      IN VARCHAR2,
     destination IN VARCHAR2) IS
     id_var             NUMBER;
     name_var           VARCHAR2(30);
     birthdate_var      DATE;
     source_cursor      INTEGER;
     destination_cursor INTEGER;
     ignore             INTEGER;
  BEGIN

  -- Prepare a cursor to select from the source table:
     source_cursor := dbms_sql.open_cursor;
     DBMS_SQL.PARSE(source_cursor,
         'SELECT id, name, birthdate FROM ' || source,
          DBMS_SQL.NATIVE);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
     ignore := DBMS_SQL.EXECUTE(source_cursor);

  -- Prepare a cursor to insert into the destination table:
     destination_cursor := DBMS_SQL.OPEN_CURSOR;
     DBMS_SQL.PARSE(destination_cursor,
                 'INSERT INTO ' || destination ||
                 ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
                  DBMS_SQL.NATIVE);

  -- Fetch a row from the source table and insert it into the destination table:
     LOOP
       IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
         -- get column values of the row
         DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
         DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
         DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

  -- Bind the row into the cursor that inserts into the destination table. You
  -- could alter this example to require the use of dynamic SQL by inserting an
  -- if condition before the bind.
        DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
        DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
        DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
birthdate_var);
         ignore := DBMS_SQL.EXECUTE(destination_cursor);
      ELSE

  -- No more rows to copy:
```

```
      EXIT;
    END IF;
  END LOOP;

  -- Commit and close all cursors:
    COMMIT;
    DBMS_SQL.CLOSE_CURSOR(source_cursor);
    DBMS_SQL.CLOSE_CURSOR(destination_cursor);
  EXCEPTION
    WHEN OTHERS THEN
      IF DBMS_SQL.IS_OPEN(source_cursor) THEN
        DBMS_SQL.CLOSE_CURSOR(source_cursor);
      END IF;
      IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
        DBMS_SQL.CLOSE_CURSOR(destination_cursor);
      END IF;
      RAISE;
  END;
/
```

Examples 3, 4, and 5: Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array      DBMS_SQL.NUMBER_TABLE;
  empname_array    DBMS_SQL.VARCHAR2_TABLE;
  jobs_array       DBMS_SQL.VARCHAR2_TABLE;
  mgr_array        DBMS_SQL.NUMBER_TABLE;
  hiredate_array   DBMS_SQL.VARCHAR2_TABLE;
  sal_array        DBMS_SQL.NUMBER_TABLE;
  comm_array       DBMS_SQL.NUMBER_TABLE;
  deptno_array     DBMS_SQL.NUMBER_TABLE;
  c                NUMBER;
  dummy            NUMBER;
BEGIN
  empno_array(1):= 9001;
  empno_array(2):= 9002;
  empno_array(3):= 9003;
  empno_array(4):= 9004;
  empno_array(5):= 9005;
  empno_array(6):= 9006;
  empno_array(7):= 9007;

  empname_array(1) := 'Dopey';
  empname_array(2) := 'Grumpy';
  empname_array(3) := 'Doc';
  empname_array(4) := 'Happy';
  empname_array(5) := 'Bashful';
  empname_array(6) := 'Sneezy';
  empname_array(7) := 'Sleepy';

  jobs_array(1) := 'Miner';
  jobs_array(2) := 'Miner';
  jobs_array(3) := 'Miner';
  jobs_array(4) := 'Miner';
```

```
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1):= 1000;
sal_array(2):= 1000;
sal_array(3):= 1000;
sal_array(4):= 1000;
sal_array(5):= 1000;
sal_array(6):= 1000;
sal_array(7):= 1000;

comm_array(1):= 0;
comm_array(2):= 0;
comm_array(3):= 0;
comm_array(4):= 0;
comm_array(5):= 0;
comm_array(6):= 0;
comm_array(7):= 0;

deptno_array(1):= 11;
deptno_array(2):= 11;
deptno_array(3):= 11;
deptno_array(4):= 11;
deptno_array(5):= 11;
deptno_array(6):= 11;
deptno_array(7):= 11;

stmt := 'INSERT INTO emp VALUES(
   :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
   :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
```

```
  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;
```

Here is an example of a bulk `UPDATE` statement that demonstrates updating salaries for four existing employees in the `emp` table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array     DBMS_SQL.NUMBER_TABLE;
  salary_array    DBMS_SQL.NUMBER_TABLE;
  c               NUMBER;
  dummy           NUMBER;
BEGIN

  empno_array(1):= 7369;
  empno_array(2):= 7876;
  empno_array(3):= 7900;
  empno_array(4):= 7934;

  salary_array(1) := 10000;
  salary_array(2) := 10000;
  salary_array(3) := 10000;
  salary_array(4) := 10000;

  stmt := 'update emp set sal = :salary_array
    WHERE empno = :num_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
  DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

In a `DELETE` statement, for example, you could bind in an array in the `WHERE` clause and have the statement be run for each element in the array:

```
DECLARE
  stmt VARCHAR2(200);
  dept_no_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
begin
  dept_no_array(1) := 10; dept_no_array(2) := 20;
  dept_no_array(3) := 30; dept_no_array(4) := 40;
  dept_no_array(5) := 30; dept_no_array(6) := 40;
  stmt := 'delete from emp where deptno = :dept_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
```

```
  DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

In the preceding example, only elements 1 through 4 are used as specified by the BIND_ARRAY call. Each element of the array potentially deletes a large number of employees from the database.

Examples 6 and 7: Defining an Array

The following examples show how to use the DEFINE_ARRAY procedure:

```
declare
  c       NUMBER;
  d       NUMBER;
  n_tab   DBMS_SQL.NUMBER_TABLE;
  indx    NUMBER := -10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  dBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

    EXIT WHEN d != 10;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

Each time the preceding example does a FETCH_ROWS Function call, it fetches 10 rows that are kept in DBMS_SQL buffers. When the COLUMN_VALUE Procedure call is run, those rows move into the PL/SQL table specified (in this case n_tab), at positions -10 to -1, as specified in the DEFINE statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at EXECUTE and keeps getting updated every time a COLUMN_VALUE call is made. If you re-execute at any point, then the current index for each DEFINE is re-initialized to "indx".

In this way the entire result of the query is fetched into the table. When FETCH_ROWS cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the DEFINE_ARRAY procedure:

Consider a table MULTI_TAB defined as:

```
CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```
declare
  c       NUMBER;
  d       NUMBER;
  n_tab  DBMS_SQL.NUMBER_TABLE;
  d_tab1 DBMS_SQL.DATE_TABLE;
  v_tab  DBMS_SQL.VARCHAR2_TABLE;
  d_tab2 DBMS_SQL.DATE_TABLE;
  indx NUMBER := 10;
BEGIN

  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab,  5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab,  5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

  d := DBMS_SQL.EXECUTE(c);

  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);

    EXIT WHEN d != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

/*
```

The four tables can be used for anything. One usage might be to use BIND_ARRAY to move the rows to another table by using a statement such as 'INSERT into SOME_T values (:a, :b, :c, :d);

```
*/

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
```

```
END;
/
```

Example 8: Describe Columns

This can be used as a substitute to the SQL*Plus `DESCRIBE` call by using a `SELECT *` query on the table that you want to describe.

```
DECLARE
  c           NUMBER;
  d           NUMBER;
  col_cnt     INTEGER;
  f           BOOLEAN;
  rec_tab     DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
  PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
  BEGIN
    DBMS_OUTPUT.NEW_LINE;
    DBMS_OUTPUT.PUT_LINE('col_type            =    '
                         || rec.col_type);
    DBMS_OUTPUT.PUT_LINE('col_maxlen          =    '
                         || rec.col_max_len);
    DBMS_OUTPUT.PUT_LINE('col_name            =    '
                         || rec.col_name);
    DBMS_OUTPUT.PUT_LINE('col_name_len        =    '
                         || rec.col_name_len);
    DBMS_OUTPUT.PUT_LINE('col_schema_name     =    '
                         || rec.col_schema_name);
    DBMS_OUTPUT.PUT_LINE('col_schema_name_len =    '
                         || rec.col_schema_name_len);
    DBMS_OUTPUT.PUT_LINE('col_precision       =    '
                         || rec.col_precision);
    DBMS_OUTPUT.PUT_LINE('col_scale           =    '
                         || rec.col_scale);
    DBMS_OUTPUT.PUT('col_null_ok         =    ');
    IF (rec.col_null_ok) THEN
      DBMS_OUTPUT.PUT_LINE('true');
    ELSE
      DBMS_OUTPUT.PUT_LINE('false');
    END IF;
  END;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;

  DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

  d := DBMS_SQL.EXECUTE(c);

  DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
 * Following loop could simply be for j in 1..col_cnt loop.
 * Here we are simply illustrating some of the PL/SQL table
 * features.
 */
  col_num := rec_tab.first;
  IF (col_num IS NOT NULL) THEN
    LOOP
      print_rec(rec_tab(col_num));
      col_num := rec_tab.next(col_num);
      EXIT WHEN (col_num IS NULL);
```

```
    END LOOP;
  END IF;

  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

Example 9: RETURNING clause

The RETURNING clause was added to DML statements in an earlier Oracle database release. With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions. These values are returned in bind variables.

DBMS_SQL.BIND_VARIABLE is used to bind these outbinds if a single row is inserted, updated, or deleted. If multiple rows are inserted, updated, or deleted, then DBMS_SQL.BIND_ARRAY is used. DBMS_SQL.VARIABLE_VALUE must be called to get the values in these bind variables.

> **Note:** This is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an out-bind inside DBMS_SQL.

i) Single row insert

```
CREATE OR REPLACE PROCEDURE single_Row_insert
     (c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
c NUMBER;
n NUMBER;
begin
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

ii) Single row update

```
CREATE OR REPLACE PROCEDURE single_Row_update
     (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
                    'WHERE rownum < 2' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
```

```
/
```

iii) Single row delete

```
CREATE OR REPLACE PROCEDURE single_Row_Delete
     (c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
c NUMBER;
n number;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'delete from tab ' ||
                    'where rownum < 2 ' ||
                   'returning c1*c2 into :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

iv) Multiple row insert

```
CREATE OR REPLACE PROCEDURE multi_Row_insert
     (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
      r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

v) Multiple row Update.

```
CREATE OR REPLACE PROCEDURE multi_Row_update
     (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

Note: bnd1 and bnd2 can be arrays as well. The value of the expression for all the rows updated will be in bnd3. There is no way of differentiating which rows were updated of each value of bnd1 and bnd2.

vi) Multiple row delete

```
CREATE OR REPLACE PROCEDURE multi_row_delete
     (c1 DBMS_SQL.NUMBER_TABLE,
      r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
                    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

vii) Out-bind in bulk PL/SQL

```
CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
   (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/
```

Note: `DBMS_SQL.BIND_ARRAY` of `number_Table` internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 10: Binds and Defines of User-defined Types in DBMS_SQL

```
CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/

INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
```

```
/
INSERT INTO depts
     VALUES('Asia', dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
   some_dnames dnames_var;
   c      NUMBER;
   r      NUMBER;
   sql_stmt VARCHAR2(32767) :=
    'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
INTO :b3';

BEGIN

   c := DBMS_SQL.OPEN_CURSOR;

   DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

   DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
   DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
   DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

   r := DBMS_SQL.EXECUTE(c);

   -- Get value of outbind variable
   DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

   DBMS_SQL.CLOSE_CURSOR(c);

   -- select dept_names
   sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

   c := DBMS_SQL.OPEN_CURSOR;
   DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

   DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
   DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

   r := DBMS_SQL.EXECUTE_AND_FETCH(c);

   DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

   DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through some_dnames collections
    FOR i IN some_dnames.FIRST .. some_dnames.LAST  LOOP
        DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
    END LOOP;
END;
/

DECLARE
  new_dnames dnames_var;
BEGIN
  new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                           'Executive', 'Marketing');
  update_depts(new_dnames, 'Asia');
END;
```

/

Data Structures

The DBMS_SQL package defines the following RECORD types and TABLE types.

RECORD Types

- DESC_REC Record Type
- DESC_REC2 Record Type
- DESC_REC3 Record Type

TABLE Types

- BFILE_TABLE Table Type
- BINARY_DOUBLE_TABLE Table Type
- BINARY_FLOAT_TABLE Table Type
- BLOB_TABLE Table Type
- CLOB_TABLE Table Type
- DATE_TABLE Table Type
- DESC_TAB Table Type
- DESC_TAB2 Table Type
- DESC_TAB3 Table Type
- INTERVAL_DAY_TO_SECOND_TABLE
- INTERVAL_YEAR_TO_MONTH_TABLE Table Type
- NUMBER_TABLE Table Type
- TIME_TABLE Table Type
- TIME_WITH_TIME_ZONE_TABLE Table Type
- TIMESTAMP_TABLE Table Type
- TIMESTAMP_WITH_LTZ_TABLE Table Type
- TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type
- UROWID_TABLE Table Type
- VARCHAR2_TABLE Table Type
- VARCHAR2A Table Type
- VARCHAR2S Table Type

DESC_REC Record Type

> **Note:** This type has been deprecated in favor of the DESC_REC2 Record Type.

This record type holds the describe information for a single column in a dynamic query. It is the element type of the DESC_TAB table type and the DESCRIBE_COLUMNS Procedure.

Syntax

```
TYPE desc_rec IS RECORD (
      col_type            BINARY_INTEGER := 0,
      col_max_len         BINARY_INTEGER := 0,
      col_name            VARCHAR2(32)   := '',
      col_name_len        BINARY_INTEGER := 0,
      col_schema_name     VARCHAR2(32)   := '',
      col_schema_name_len BINARY_INTEGER := 0,
      col_precision       BINARY_INTEGER := 0,
      col_scale           BINARY_INTEGER := 0,
      col_charsetid       BINARY_INTEGER := 0,
      col_charsetform     BINARY_INTEGER := 0,
      col_null_ok         BOOLEAN        := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Fields

Table 122–2 DESC_REC Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```
TYPE desc_rec2 IS RECORD (
   col_type            binary_integer := 0,
   col_max_len         binary_integer := 0,
   col_name            varchar2(32767) := '',
   col_name_len        binary_integer := 0,
   col_schema_name     varchar2(32)   := '',
   col_schema_name_len binary_integer := 0,
   col_precision       binary_integer := 0,
   col_scale           binary_integer := 0,
   col_charsetid       binary_integer := 0,
   col_charsetform     binary_integer := 0,
   col_null_ok         boolean        := TRUE);
```

Fields

Table 122–3 DESC_REC2 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```
TYPE desc_rec3 IS RECORD (
   col_type              binary_integer := 0,
   col_max_len           binary_integer := 0,
   col_name              varchar2(32767) := '',
   col_name_len          binary_integer := 0,
   col_schema_name       varchar2(32) := '',
   col_schema_name_len   binary_integer := 0,
   col_precision         binary_integer := 0,
   col_scale             binary_integer := 0,
   col_charsetid         binary_integer := 0,
   col_charsetform       binary_integer := 0,
   col_null_ok           boolean := TRUE,
   col_type_name         varchar2(32767)   := '',
   col_type_name_len     binary_integer := 0);
```

Fields

Table 122–4 DESC_REC3 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set ID
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible
col_type_name	User-define type column type name, this field is valid when col_type is 109
col_type_name_len	Length of user-define type column type name, this field is valid when col_type is 109

BFILE_TABLE Table Type

This is a table of `BFILE`.

Syntax

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

BINARY_DOUBLE_TABLE Table Type

This is a table of `BINARY_DOUBLE`.

Syntax

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

BINARY_FLOAT_TABLE Table Type

This is a table of `BINARY_FLOAT`.

Syntax

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

BLOB_TABLE Table Type

This is a table of BLOB.

Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

CLOB_TABLE Table Type

This is a table of `CLOB`.

Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

DATE_TABLE Table Type

This is a table of DATE.

Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

DESC_TAB Table Type

This is a table of DESC_REC Record Type.

Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

DESC_TAB2 Table Type

This is a table of DESC_REC2 Record Type.

Syntax

```
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```

DESC_TAB3 Table Type

This is a table of DESC_REC3 Record Type.

Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```

INTERVAL_DAY_TO_SECOND_TABLE

This is a table of DSINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF
   DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of `YMINTERVAL_UNCONSTRAINED`.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED
   INDEX BY BINARY_INTEGER;
```

NUMBER_TABLE Table Type

This is a table of NUMBER.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

TIME_TABLE Table Type

This is a table of `TIME_UNCONSTRAINED`.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIME_TZ_UNCONSTRAINED`.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED
   INDEX BY BINARY_INTEGER;;
```

TIMESTAMP_TABLE Table Type

This is a table of `TIMESTAMP_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of `TIMESTAMP_LTZ_UNCONSTRAINED`

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF
    TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF
    TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

UROWID_TABLE Table Type

This is a table of `UROWID`.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

VARCHAR2_TABLE Table Type

This is table of `VARCHAR2(2000)`.

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

VARCHAR2A Table Type

This is table of `VARCHAR2(32767)`.

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

VARCHAR2S Table Type

This is table of `VARCHAR2(256)`.

> **Note:** This type has been superseded by the VARCHAR2A Table Type. Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_SQL Subprograms

Table 122–5 DBMS_SQL Package Subprograms

Subprogram	Description
BIND_ARRAY Procedures on page 122-52	Binds a given value to a given collection
BIND_VARIABLE Procedures on page 122-55	Binds a given value to a given variable
CLOSE_CURSOR Procedure on page 122-57	Closes given cursor and frees memory
COLUMN_VALUE Procedure on page 122-58	Returns value of the cursor element for a given position in a cursor
COLUMN_VALUE_LONG Procedure on page 122-61	Returns a selected part of a `LONG` column, that has been defined using `DEFINE_COLUMN_LONG`
DEFINE_ARRAY Procedure on page 122-62	Defines a collection to be selected from the given cursor, used only with `SELECT` statements
DEFINE_COLUMN Procedure on page 122-65	Defines a column to be selected from the given cursor, used only with `SELECT` statements
DEFINE_COLUMN_LONG Procedure on page 122-67	Defines a `LONG` column to be selected from the given cursor, used only with `SELECT` statements
DESCRIBE_COLUMNS Procedure on page 122-68	Describes the columns for a cursor opened and parsed through `DBMS_SQL`
DESCRIBE_COLUMNS2 Procedure on page 122-69	Describes describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure
DESCRIBE_COLUMNS3 Procedure on page 122-70	Describes describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure
EXECUTE Function on page 122-72	Executes a given cursor
EXECUTE_AND_FETCH Function on page 122-73	Executes a given cursor and fetch rows
FETCH_ROWS Function on page 122-74	Fetches a row from a given cursor
IS_OPEN Function on page 122-75	Returns `TRUE` if given cursor is open
LAST_ERROR_POSITION Function on page 122-76	Returns byte offset in the SQL statement text where the error occurred
LAST_ROW_COUNT Function on page 122-77	Returns cumulative count of the number of rows fetched
LAST_ROW_ID Function on page 122-78	Returns `ROWID` of last row processed
LAST_SQL_FUNCTION_CODE Function on page 122-79	Returns SQL function code for statement
OPEN_CURSOR Function on page 122-80	Returns cursor ID number of new cursor
PARSE Procedures on page 122-81	Parses given statement
TO_CURSOR_NUMBER Function on page 122-81	Takes an `OPEN`ed strongly or weakly-typed ref cursor and transforms it into a `DBMS_SQL` cursor number

Table 122–5 (Cont.) DBMS_SQL Package Subprograms

Subprogram	Description
TO_REFCURSOR Function on page 122-85	Takes an `OPEN`ed, `PARSE`d, and `EXECUTE`d cursor and transforms/migrates it into a PL/SQL manageable `REF CURSOR` (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL
VARIABLE_VALUE Procedures on page 122-87	Returns value of named variable for given cursor

BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_ARRAY (
   c                   IN INTEGER,
   name                IN VARCHAR2,
   <table_variable>    IN <datatype>
 [,index1              IN INTEGER,
   index2              IN INTEGER)] );
```

Where the <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>     Clob_Table
<bflt_tab>     Binary_Float_Table
<bdbl_tab>     Binary_Double_Table
<blob_tab>     Blob_Table
<bfile_tab>    Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
```

Notice that the BIND_ARRAY procedure is overloaded to accept different datatypes.

Parameters

Table 122–6 BIND_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the collection in the statement.
table_variable	Local variable that has been declared as <datatype>.
index1	Index for the table element that marks the lower bound of the range.
index2	Index for the table element that marks the upper bound of the range.

Usage Notes

The length of the bind variable name should be <=30 bytes.

For binding a range, the table must contain the elements that specify the range — tab(index1) and tab(index2) — but the range does not have to be dense. Index1 must be less than or equal to index2. All elements between tab(index1) and tab(index2) are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

> **See Also:** "Examples 3, 4, and 5: Bulk DML" on page 122-14 for examples of how to bind collections.

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The DBMS_SQL package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local DBMS_SQL buffers (the same as for all scalar types) and then the table is manipulated from the local DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```
TYPE binary_double_table
                    IS TABLE OF BINARY_DOUBLE  INDEX BY BINARY_INTEGER;
TYPE binary_float_table
                    IS TABLE OF BINARY_FLOAT   INDEX BY BINARY_INTEGER;
TYPE bfile_table    IS TABLE OF BFILE          INDEX BY BINARY_INTEGER;
TYPE blob_table     IS TABLE OF BLOB           INDEX BY BINARY_INTEGER;
TYPE clob_table     IS TABLE OF CLOB           INDEX BY BINARY_INTEGER;
TYPE date_table     IS TABLE OF DATE           INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
                    IS TABLE OF dsinterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
                    IS TABLE OF yminterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE number_table   IS TABLE OF NUMBER         INDEX BY BINARY_INTEGER;
TYPE time_table     IS TABLE OF time_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
                    IS TABLE OF time_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_table
                    IS TABLE OF timestamp_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
```

```
                  IS TABLE OF timestamp_ltz_unconstrained
                                                INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                  IS TABLE OF timestamp_tz_unconstrained
                                                INDEX BY BINARY_INTEGER;
TYPE urowid_table   IS TABLE OF UROWID         INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab>   Time_Table
<ttz_tab>  Time_With_Time_Zone_Table
<tms_tab>  Timestamp_Table
<tstz_tab> Timestamp_With_ltz_Table;
<tstz_tab> Timestamp_With_Time_Zone_Table
<ids_tab>  Interval_Day_To_Second_Table
<iym_tab>  Interval_Year_To_Month_Table
```

BIND_VARIABLE Procedures

This procedures binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_VARIABLE (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN <datatype>)
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

Notice that `BIND_VARIABLE` is overloaded to accept different datatypes.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets [] indicate an optional parameter for the `BIND_VARIABLE` function.

```
DBMS_SQL.BIND_VARIABLE (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);

DBMS_SQL.BIND_VARIABLE_RAW (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN RAW [,out_value_size IN INTEGER]);

DBMS_SQL.BIND_VARIABLE_ROWID (
   c              IN INTEGER,
```

```
   name            IN VARCHAR2,
   value           IN ROWID);
```

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

Table 122–7 BIND_VARIABLE Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the variable in the statement.
value	Value that you want to bind to the variable in the cursor. For IN and IN/OUT variables, the value has the same type as the type of the value being passed in for this parameter.
out_value_size	Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);

or

BIND_VARIABLE (cursor_name, 'X', 3500);
```

The length of the bind variable name should be <=30 bytes.

See Also: "Examples 3, 4, and 5: Bulk DML" on page 122-14 for examples of how to bind collections.

CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```
DBMS_SQL.CLOSE_CURSOR (
   c    IN OUT INTEGER);
```

Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

Parameters

Table 122–8 CLOSE_CURSOR Procedure Parameters

Parameter	Mode	Description
c	IN	ID number of the cursor that you want to close.
c	OUT	Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.

COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling FETCH_ROWS.

Syntax

```
DBMS_SQL.COLUMN_VALUE (
   c                IN  INTEGER,
   position         IN  INTEGER,
   value            OUT <datatype>
 [,column_error     OUT NUMBER]
 [,actual_length    OUT INTEGER]);
```

Where square brackets [ ] indicate optional parameters and <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT CHAR CHARACTER SET ANY_CS
 [,column_error    OUT NUMBER]
 [,actual_length   OUT INTEGER]);

DBMS_SQL.COLUMN_VALUE_RAW (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT RAW
 [,column_error    OUT NUMBER]
 [,actual_length   OUT INTEGER]);

DBMS_SQL.COLUMN_VALUE_ROWID (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT ROWID
 [,column_error    OUT NUMBER]
```

```
 [,actual_length   OUT INTEGER]);
```

The following syntax enables the COLUMN_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.COLUMN_VALUE(
   c                IN             INTEGER,
   position         IN             INTEGER,
   <param_name>     IN OUT NOCOPY  <table_type>);
```

Where the <param_name> and its corresponding <table_type> can be any one of these matching pairs:

```
bdbl_tab     Binary_Double_Table
bflt_tab     Binary_Float_Table
bf_tab       Bfile_Table
bl_tab       Blob_Table
cl_tab       Clob_Table
d_tab        Date_Table
ids_tab      Interval_Day_To_Second_Table
iym_tab      Interval_Year_To_Month_Table
n_tab        Number_Table
tm_tab       Time_Table
ttz_tab      Time_With_Time_Zone_Table
tms_tab      Timestamp_Table
tstz_tab     Timestamp_With_ltz_Table;
tstz_tab     Timestamp_With_Time_Zone_Table
ur_tab       Urowid_Table
c_tab        Varchar2_Table
```

Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

Parameters

Table 122–9 COLUMN_VALUE Procedure Parameters (Single Row)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
value	Returns the value at the specified column. Oracle raises exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to DEFINE_COLUMN.
column_error	Returns any error code for the specified column value.
actual_length	The actual length, before any truncation, of the value in the specified column.

Table 122–10 COLUMN_VALUE Procedure Parameters (Bulk)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
<param_name>	Local variable that has been declared <table_type>. <param_name> is an IN OUT NOCOPY parameter for bulk operations. For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the DEFINE_ARRAY Procedure a batch size (the cnt parameter) of 10 rows was specified and a start index (lower_bound) of 1 was specified, then the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate elements 11..20, and so on.

Exceptions

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure DEFINE_COLUMN.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (
   c            IN  INTEGER,
   position     IN  INTEGER,
   length       IN  INTEGER,
   offset       IN  INTEGER,
   value        OUT VARCHAR2,
   value_length OUT INTEGER);
```

Pragmas

```
pragma restrict_references(column_value_long,RNDS,WNDS);
```

Parameters

Table 122–11 COLUMN_VALUE_LONG Procedure Parameters

Parameter	Description
c	Cursor ID number of the cursor from which to get the value.
position	Position of the column of which to get the value.
length	Number of bytes of the long value to fetch.
offset	Offset into the long field for start of fetch.
value	Value of the column as a VARCHAR2.
value_length	Number of bytes actually returned in value.

DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a FETCH_ROWS call). This procedure lets you do batch fetching of rows from a single SELECT statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into DBMS_SQL buffers until you run a COLUMN_VALUE call, at which time the rows are copied into the table that was passed as an argument to the COLUMN_VALUE call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using DBMS_SQL. (These are the same types as you can specify for the BIND_ARRAY procedure.)

```
TYPE binary_double_table
                    IS TABLE OF BINARY_DOUBLE  INDEX BY BINARY_INTEGER;
TYPE binary_float_table
                    IS TABLE OF BINARY_FLOAT   INDEX BY BINARY_INTEGER;
TYPE bfile_table    IS TABLE OF BFILE          INDEX BY BINARY_INTEGER;
TYPE blob_table     IS TABLE OF BLOB           INDEX BY BINARY_INTEGER;
TYPE clob_table     IS TABLE OF CLOB           INDEX BY BINARY_INTEGER;
TYPE date_table     IS TABLE OF DATE           INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
                    IS TABLE OF dsinterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
                    IS TABLE OF yminterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE number_table   IS TABLE OF NUMBER         INDEX BY BINARY_INTEGER;
TYPE time_table     IS TABLE OF time_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
                    IS TABLE OF time_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_table
                    IS TABLE OF timestamp_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
                    IS TABLE OF timestamp_ltz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                    IS TABLE OF timestamp_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE urowid_table   IS TABLE OF UROWID         INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab>   Time_Table
<ttz_tab>  Time_With_Time_Zone_Table
<tms_tab>  Timestamp_Table
<tstz_tab> Timestamp_With_ltz_Table;
<tstz_tab> Timestamp_With_Time_Zone_Table
<ids_tab>  Interval_Day_To_Second_Table
<iym_tab>  Interval_Year_To_Month_Table
```

Syntax

```
DBMS_SQL.DEFINE_ARRAY (
   c           IN INTEGER,
   position    IN INTEGER,
   <table_variable>    IN <datatype>
   cnt         IN INTEGER,
   lower_bnd   IN INTEGER);
```

Where <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>     Clob_Table
<bflt_tab>     Binary_Float_Table
<bdbl_tab>     Binary_Double_Table
<blob_tab>     Blob_Table
<bfile_tab>    Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
```

Note that DEFINE_ARRAY is overloaded to accept different datatypes.

Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent FETCH_ROWS call fetch "count" rows. When the COLUMN_VALUE call is made, these rows are placed in positions indx, indx+1, indx+2, and so on. While there are still rows coming, the user keeps issuing FETCH_ROWS/COLUMN_VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN_VALUE call.

Parameters

Table 122–12 DEFINE_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind an array.
position	Relative position of the column in the array being defined. The first column in a statement has position 1.
table_variable	Local variable that has been declared as <datatype>.
cnt	Number of rows that must be fetched.
lower_bnd	Results are copied into the collection, starting at this lower bound index.

Usage Notes

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The indx can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
```

```
    TYPE namelist IS TABLE OF employees.last_name%TYPE;
    TYPE sallist IS TABLE OF employees.salary%TYPE;
    names    namelist;
    sals     sallist;
    c        NUMBER;
    r        NUMBER;
    sql_stmt VARCHAR2(32767) :=
        'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

    DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
    DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

    r := DBMS_SQL.EXECUTE(c);

    LOOP
      r := DBMS_SQL.FETCH_ROWS(c);
      DBMS_SQL.COLUMN_VALUE(c, 1, names);
      DBMS_SQL.COLUMN_VALUE(c, 2, sals);
      EXIT WHEN r != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST  LOOP
      DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/
```

See Also: "Examples 6 and 7: Defining an Array" on page 122-17 for examples of how to define collections.

DEFINE_COLUMN Procedure

This procedure defines a column to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

Syntax

```
DBMS_SQL.DEFINE_COLUMN (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN <datatype>)
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

Note that DEFINE_COLUMN is overloaded to accept different datatypes.

The following syntax is also supported for the DEFINE_COLUMN procedure:

```
DBMS_SQL.DEFINE_COLUMN (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN VARCHAR2 CHARACTER SET ANY_CS,
   column_size    IN INTEGER),
   urowid         IN INTEGER;
```

To define columns with CHAR, RAW, and ROWID data, you can use the following variations on the procedure syntax:

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN CHAR CHARACTER SET ANY_CS,
   column_size    IN INTEGER);

DBMS_SQL.DEFINE_COLUMN_RAW (
   c              IN INTEGER,
```

```
   position       IN INTEGER,
   column         IN RAW,
   column_size    IN INTEGER);

DBMS_SQL.DEFINE_COLUMN_ROWID (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN ROWID);
```

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 122–13 DEFINE_COLUMN Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value, in bytes, for columns of type VARCHAR2, CHAR, and RAW.

DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (
   c              IN INTEGER,
   position       IN INTEGER);
```

Parameters

Table 122–14 DEFINE_COLUMN_LONG Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (
   c              IN  INTEGER,
   col_cnt        OUT INTEGER,
   desc_t         OUT DESC_TAB);
```

Parameters

Table 122–15 DESCRIBE_COLUMNS Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described
col_cnt	Number of columns in the select list of the query
desc_t	Describe table to fill in with the description of each of the columns of the query

See Also: "Example 8: Describe Columns" on page 122-19 illustrates how to use DESCRIBE_COLUMNS.

DESCRIBE_COLUMNS2 Procedure

This function describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS2 (
   c              IN  INTEGER,
   col_cnt        OUT INTEGER,
   desc_t         OUT DESC_TAB2);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);
```

Parameters

Table 122–16 DESCRIBE_COLUMNS2 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

DESCRIBE_COLUMNS3 Procedure

This function describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
   c              IN  INTEGER,
   col_cnt        OUT INTEGER,
   desc_t         OUT DESC_TAB3);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters

Table 122–17 DESCRIBE_COLUMNS3 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Usage Notes

The cursor passed in by the cursor ID has to be OPENed and PARSEd, otherwise an "invalid cursor id" error is raised.

Examples

```
CREATE TYPE PROJECT_T AS OBJECT
      ( projname          VARCHAR2(20),
        mgr               VARCHAR2(20))
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
  curid      NUMBER;
  desctab    DBMS_SQL.DESC_TAB3;
  colcnt     NUMBER;
  sql_stmt   VARCHAR2(200) := 'select * from projecttab';
BEGIN

    curid := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

    DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

    FOR i IN 1 .. colcnt LOOP
      IF desctab(i).col_type = 109 THEN
```

```
        DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
        DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                             desctab(i).col_type_name);
      END IF;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

Output:

PROJECT is user-defined type: HR.PROJECT_T
```

EXECUTE Function

This function executes a given cursor. This function accepts the `ID` number of the cursor and returns the number of rows processed. The return value is only valid for `INSERT`, `UPDATE`, and `DELETE` statements; for other types of statements, including DDL, the return value is undefined and should be ignored.

Syntax

```
DBMS_SQL.EXECUTE (
   c   IN INTEGER)
  RETURN INTEGER;
```

Parameters

Table 122–18 EXECUTE Function Parameters

Parameter	Description
`c`	Cursor ID number of the cursor to execute.

EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows. This function provides the same functionality as calling EXECUTE and then calling FETCH_ROWS. Calling EXECUTE_AND_FETCH instead, however, may reduce the number of network round-trips when used against a remote database.

The EXECUTE_AND_FETCH function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (
   c              IN INTEGER,
   exact          IN BOOLEAN DEFAULT FALSE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(execute_and_fetch,WNDS);
```

Parameters

Table 122–19 EXECUTE_AND_FETCH Function Parameters

Parameter	Description
c	ID number of the cursor to execute and fetch.
exact	Set to TRUE to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch TRUE option with LONG columns. Even if an exception is raised, the rows are still fetched and available.

FETCH_ROWS Function

This function fetches a row from a given cursor. You can call FETCH_ROWS repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling COLUMN_VALUE, for each column, after each call to FETCH_ROWS.

The FETCH_ROWS function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (
   c              IN INTEGER)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

Table 122–20 FETCH_ROWS Function Parameters

Parameter	Description
c	ID number.

IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```
DBMS_SQL.IS_OPEN (
   c               IN INTEGER)
  RETURN BOOLEAN;
```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

Table 122–21 IS_OPEN Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to check.

Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the CLOSE_CURSOR Procedure Procedure `NULL`s out the cursor variable passed to it.

Exceptions

`ORA-29471 DBMS_SQL access denied:` This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent DBMS_SQL call in the same session will raise this error, meaning that DBMS_SQL is non-operational for this session.

LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Usage Notes

Call this function after a `PARSE` call, before any other `DBMS_SQL` procedures or functions are called.

LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call. If called after an EXECUTE call, then the value returned is zero.

LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID
   RETURN ROWID;
```

Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call.

LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement. These codes are listed in the *Oracle Call Interface Programmer's Guide.*

Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Usage Notes

You should call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

OPEN_CURSOR Function

This procedure opens a new cursor. The second overload takes a `security_level` parameter to apply fine-grained control to the security of the opened cursor.

When you no longer need this cursor, you must close it explicitly by calling the CLOSE_CURSOR Procedure.

Syntax

```
DBMS_SQL.OPEN_CURSOR
  RETURN INTEGER;

DBMS_SQL.OPEN_CURSOR (
   security_level   IN   INTEGER)
  RETURN INTEGER;
```

Parameters

Table 122–22 OPEN_CURSOR Function Parameters

Parameter	Description
`security_level`	Specifies the level of security protection to enforce on the opened cursor. Valid security level values are `0`, `1`, and `2`. When a `NULL` argument value is provided to this overload, as well as for cursors opened using the overload of open_cursor without the security_level parameter, the default security level value `1` will be enforced on the opened cursor. ▪ `Level 0` - allows all `DBMS_SQL` operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default. ▪ `Level 1` - requires that the effective userid and roles of the caller to `DBMS_SQL` for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. ▪ `Level 2` - requires that the effective userid and roles of the caller to `DBMS_SQL` for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.

Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

This function returns the cursor ID number of the new cursor.

Usage Notes

You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are three versions of the PARSE procedure:

- Taking a VARCHAR2 statement as an argument
- Taking VARCHAR2a, table of VARCHAR2(32767), as an argument. The VARCHAR2A overload version of the procedure concatenates elements of a PL/SQL table statement and parses the resulting string. You can use this procedure to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.
- Taking a CLOB statement as an argument. You can use the CLOB overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

```
DBMS_SQL.PARSE (
   c                 IN   INTEGER,
   statement         IN   VARCHAR2,
   language_flag     IN   INTEGER);

DBMS_SQL.PARSE (
   c                 IN   INTEGER,
   statement         IN   CLOB,
   language_flag     IN   INTEGER);

DBMS_SQL.PARSE (
   c                 IN   INTEGER,
   statement         IN   VARCHAR2A,
   lb                IN   INTEGER,
   ub                IN   INTEGER,
   lfflg             IN   BOOLEAN,
   language_flag     IN   INTEGER);
```

Parameters

Table 122–23 PARSE Procedure Parameters

Parameter	Description
c	ID number of the cursor in which to parse the statement.
statement	SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs. Unlike PL/SQL statements, your SQL statement should not include a final semicolon. For example: DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2); DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);
lb	Lower bound for elements in the statement.
ub	Upper bound for elements in the statement.

Table 122–23 (Cont.) PARSE Procedure Parameters

Parameter	Description
lfflg	If TRUE, then insert a linefeed after each element on concatenation.
language_flag	Determines how Oracle handles the SQL statement. The following options are recognized: ■ V6 (or 0) specifies version 6 behavior. ■ NATIVE (or 1) specifies normal behavior for the database to which the program is connected. ■ V7 (or 2) specifies Oracle database version 7 behavior.

Usage Notes

- Using DBMS_SQL to dynamically run DDL statements can result in the program hanging. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, results in a hang.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

  For example, the following code does *not* compile on the client:

  ```
  DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
  DBMS_SQL.NATIVE
  ```

  The following code works on the client, because the argument is explicitly provided:

  ```
  DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
  ```
- The VARCHAR2S type is currently supported for backward compatibility of legacy code. However, you are advised to use VARCHAR2A both for its superior capability and because VARCHAR2S will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new CLOB overload version of the PARSE procedure can be used instead of the VARCHAR2A overload

Exceptions

If you create a type/procedure/function/package using DBMS_SQL that has compilation warnings, an ORA-24344 exception is raised, and the procedure is still created.

TO_CURSOR_NUMBER Function

This function takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER(
   rc IN OUT SYS_REFCURSOR)
  RETURN INTEGER;
```

Parameters

Table 122–24 TO_CURSOR_NUMBER Function Parameters

Parameter	Description
rc	REF CURSOR to be transformed into a cursor number

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR

Usage Notes

- The REF CURSOR passed in has to be OPENed, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- Toggle between REF CURSOR and DBMS_SQL cursor number after started to fetch is not allowed, and an error is raised.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  desctab         DBMS_SQL.DESC_TAB;
  colcnt          NUMBER;
  namevar         VARCHAR2(50);
  numvar          NUMBER;
  datevar         DATE;
  empno           NUMBER := 100;
BEGIN

    -- sql_stmt := 'select ..... from employees where employee_id = :b1';
    OPEN src_cur FOR sql_stmt USING empno;

    -- Switch from native dynamic SQL to DBMS_SQL
    curid := DBMS_SQL.TO_CURSORID(src_cur);

    DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

    -- Define columns
    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 2 THEN
           DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
```

```
        ELSIF desctab(i).col_type = 12 THEN
            DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
.......
         ELSE
            DBMS_SQL.DEFINE_COLUMN(curid, i, namevar);
         END IF;
    END LOOP;

  -- Fetch Rows
    WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
        FOR i IN 1 .. colcnt LOOP
          IF (desctab(i).col_type = 1) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
         ELSIF (desctab(i).col_type = 2) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
          ELSIF (desctab(i).col_type = 12) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
....
          END IF;
        END LOOP;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/
```

TO_REFCURSOR Function

This function takes an OPENed, PARSEd, and EXECUTEd cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQLswitched to use native dynamic SQL. This subprogram is only used with SELECT cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR(
   cursor_number IN  INTEGER)
  RETURN SYS_REFCURSOR;
```

Parameters

Table 122–25 TO_REFCURSOR Function Parameters

Parameter	Description
cursor_number	Cursor number of the cursor to be transformed into REF CURSOR

Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS_SQL cursor number.

Usage Notes

- The cursor passed in by the cursor_number has to be OPENed, PARSEd, and EXECUTEd; otherwise an error is raised.
- Once the cursor_number is transformed into a REF CURSOR, the cursor_number is no longer accessible by any DBMS_SQL operations.
- After a cursor_number is transformed into a REF CURSOR, using DBMS_SQL.IS_OPEN to check to see if the cursor_number is still open results in an error.
- Toggle between REF CURSOR and DBMS_SQL cursor number after started to fetch is not allowed, and an error is raised.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  sql_stmt        VARCHAR2(200);
  ret             INTEGER;
  empnos          DBMS_SQL.Number_Table;
  depts           DBMS_SQL.Number_Table;
BEGIN

  -- DBMS_SQL.OPEN_CURSOR
  curid := DBMS_SQL.OPEN_CURSOR;

  sql_stmt :=
    'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID = :b1';

  DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
```

```
  ret := DBMS_SQL.EXECUTE(curid);

  -- Switch from DBMS_SQL to native dynamic SQL
  src_cur := DBMS_SQL.TO_REFCURSOR(curid);

  -- Fetch with native dynamic SQL
  FETCH src_cur BULK COLLECT INTO empnos, depts;

  IF empnos.COUNT > 0 THEN
    DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
    DBMS_OUTPUT.PUT_LINE('----- ------');
    -- Loop through the empnos and depts collections
    FOR i IN 1 .. empnos.COUNT LOOP
      DBMS_OUTPUT.PUT_LINE(empnos(i) || '   ' || depts(i));
    END LOOP;
  END IF;

  -- Close cursor
  CLOSE src_cur;
END;
/
```

VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

Syntax

```
DBMS_SQL.VARIABLE_VALUE (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT NOCOPY <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.VARIABLE_VALUE_CHAR (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT CHAR CHARACTER SET ANY_CS);

DBMS_SQL.VARIABLE_VALUE_RAW (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT RAW);

DBMS_SQL.VARIABLE_VALUE_ROWID (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT ROWID);
```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.VARIABLE_VALUE (
   c                IN   INTEGER,
   name             IN   VARCHAR2,
   value            OUT NOCOPY <table_type>);
```

For bulk operations, <table_type> can be:

```
Binary_Double_Table
Binary_Float_Table
Bfile_Table
Blob_Table
Clob_Table
Date_Table
Interval_Day_To_Second_Table
Interval_Year_To_Month_Table
Number_Table
Time_Table
Time_With_Time_Zone_Table
Timestamp_Table
Timestamp_With_ltz_Table;
Timestamp_With_Time_Zone_Table
Urowid_Table
Varchar2_Table
```

Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

Parameters

Table 122–26 VARIABLE_VALUE Procedure Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	■ Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE. ■ Array option: Local variable that has been declared <table_type>. For bulk operations, value is an OUT NOCOPY parameter.

123

DBMS_SQLDIAG

The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

> **See Also:** *Oracle Database Administrator's Guide* for more information about "Managing Diagnostic Data"

This chapter contains the following topics:

- Using DBMS_SQLDIAG
  - Overview
  - Constants
  - Examples
- Summary of DBMS_SQLDIAG Subprograms

Using DBMS_SQLDIAG

- Overview
- Constants
- Examples

Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement.

This section covers the following topics:

- About the SQL Repair Advisor
- Running the SQL Repair Advisor
- Removing a SQL Patch

About the SQL Repair Advisor

You run the SQL Repair Advisor after a SQL statement fails with a critical error. The advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

Running the SQL Repair Advisor

You run the SQL Repair Advisor by creating and executing a diagnostic task using the `CREATE_DIAGNOSIS_TASK` and `EXECUTE_DIAGNOSIS_TASK` respectively. The SQL Repair Advisor first reproduces the critical error and then tries to produce a workaround in the form of SQL patch.

1. **Identify the problem SQL statement**

   Consider the SQL statement that gives a critical error:

   ```
   DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT MAX(ROWID) FROM t t2
   WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)
   ```

   You use the SQL Repair advisor to repair this critical error.

2. **Create a diagnosis task**

   Invoke `DBMS_SQLDIAG. CREATE_DIAGNOSIS_TASK`. You can specify an optional task name, an optional time limit for the advisor task, and problem type. In the example below, we specify the SQL text, the task name as '`error_task`' and a problem type as '`DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR`'.

   ```
   DECLARE
       rep_out         CLOB;
       t_id            VARCHAR2(50);
     BEGIN
       t_id := DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK(
         sql_text => 'DELETE FROM t t1 WHERE t1.a = ''a'' AND ROWID <> (SELECT
   MAX(ROWID) FROM t t2 WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)',
         task_name => 'error_task',
         problem_type =>DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR);
   ```

3. **Execute the diagnosis task**

   To execute the workaround generation and analysis phase of the SQL Repair Advisor, you call `DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK` with the task ID returned by the `CREATE_DIAGNOSIS_TASK`. After a short delay, the SQL Repair Advisor returns. As part of its execution, the SQL Repair Advisor keeps a record of its findings which can be accessed through the reporting facilities of SQL Repair Advisor.

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (t_id);
```

4. **Report the diagnosis task**

   The analysis of the diagnosis task is accessed through dbms_sqldiag.report_diagnosis_task. If the SQL Repair Advisor was able to find a workaround, it recommends a SQL Patch. A SQL Patch is similar to a SQL profile but unlike the SQL Profile, it is used to workaround compilation or execution errors.

```
rep_out := DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (t_id, DBMS_SQLDIAG.TYPE_TEXT);

  DBMS_OUTPUT.PUT_LINE ('Report : ' ||  rep_out);

  END;
  /
```

5. **Applying the patch**

   If a patch recommendation is present in the report, you can run the `ACCEPT_SQL_PATCH` command to accept the patch by invoking `DBMS_SQLDIAG.ACCEPT_SQL_PATCH`. This procedure takes the `task_name` as an argument.

```
EXECUTE DBMS_SQLDIAG.ACCEPT_SQL_PATCH(task_name => 'error_task', task_owner =>
'SYS', replace => TRUE);
```

6. **Test the patch**

   Now that you have accepted the patch, you can rerun the SQL statement. This time, it will not give you the critical error. If you run 'explain plan' for this statement, you will see that a SQL patch was used to generate the plan.

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (select max(rowid) FROM t t2
WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d);
```

Removing a SQL Patch

In a situation where you obtained an official patch from Oracle to fix an error, or upgraded to the next patchset or release of Oracle which included the fix for the error, you call `DBMS_SQLDIAG.DROP_SQL_PATCH` with the patch name to drop the SQL patch. The patch name can be obtained from the explain plan section or by querying the view `DBA_SQL_PATCHES`.

Constants

The DBMS_SQLDIAG package uses the constants shown in the following tables:

- Table 123–1, " DBMS_SQLDIAG Constants - SQLDIAG Advisor Name" describes the name of SQL repair advisor as seen by the advisor framework
- Table 123–2, " DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values" describes SQLDIAG advisor task scope parameter values
- Table 123–3, " DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants" describes SQLDIAG advisor `time_limit` constants
- Table 123–4, " DBMS_SQLDIAG Constants - Report Type (possible values) Constants" describes possible formats for a report
- Table 123–5, " DBMS_SQLDIAG Constants - Report Level (possible values) Constants" describes possible levels of detail in the report
- Table 123–6, " DBMS_SQLDIAG Constants - Report Section (possible values) Constants" describes possible report sections (comma delimited)
- Table 123–7, " DBMS_SQLDIAG Constants - Problem Type Constants" describes possible values for the `problem_type` parameter of the CREATE_DIAGNOSIS_TASK Functions
- Table 123–8, " DBMS_SQLDIAG Constants - Findings Filter Constants" describes possible values for the `_sql_findings_mode` parameter

Table 123–1 DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

Constant	Type	Value	Description
`ADV_SQL_DIAG_NAME`	`VARCHAR2`(18)	'SQL Repair Advisor'	Name of SQL repair advisor as seen by the advisor framework

Table 123–2 DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values

Constant	Type	Value	Description
`SCOPE_COMPREHENSIVE`	`VARCHAR2`(13)	`'COMPREHENSIVE'`	Detailed analysis of the problem which may take more time to execute
`SCOPE_LIMITED`	`VARCHAR2`(7)	`'LIMITED'`	Brief analysis of the problem

Table 123–3 DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants

Constant	Type	Value	Description
`TIME_LIMIT_DEFAULT`	`NUMBER`	1800	Default time limit for analysis of the problem

Table 123–4 DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Report from the REPORT_DIAGNOSIS_TASK Function in HTML form
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Report from the REPORT_DIAGNOSIS_TASK Function in text form
TYPE_XML	VARCHAR2(3)	'XML'	Report from the REPORT_DIAGNOSIS_TASK Function in XML form

Table 123–5 DBMS_SQLDIAG Constants - Report Level (possible values) Constants

Constant	Type	Value	Description
LEVEL_ALL	VARCHAR2(3)	'ALL'	Complete report including annotations about statements skipped over
LEVEL_BASIC	VARCHAR2(5)	'BASIC'	Shows information about every statement analyzed, including recommendations not implemented
LEVEL_TYPICAL	VARCHAR2(7)	'TYPICAL'	Simple report shows only information about the actions taken by the advisor.

Table 123–6 DBMS_SQLDIAG Constants - Report Section (possible values) Constants

Constant	Type	Value	Description
SECTION_ALL	VARCHAR2(3)	'ALL'	All statements
SECTION_ERRORS	VARCHAR2(6)	'ERRORS'	Statements with errors
SECTION_FINDINGS	VARCHAR2(8)	'FINDINGS'	Tuning findings
SECTION_INFORMATION	VARCHAR2(11)	'INFORMATION'	General information
SECTION_PLANS	VARCHAR2(5)	'PLANS'	Explain plans
SECTION_SUMMARY	VARCHAR2(7)	'SUMMARY'	Summary information

Table 123–7 DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_PERFORMANCE	NUMBER	1	User suspects this is a performance problem

Table 123–7 (Cont.) DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_WRONG_RESULTS	NUMBER	2	User suspects the query is giving inconsistent results
PROBLEM_TYPE_COMPILATION_ERROR	NUMBER	3	User sees a crash in compilation
PROBLEM_TYPE_EXECUTION_ERROR	NUMBER	4	User sees a crash in execution

Table 123–8 DBMS_SQLDIAG Constants - Findings Filter Constants

Constant	Type	Value	Description
SQLDIAG_FINDINGS_ALL	NUMBER	1	Show all possible findings
SQLDIAG_FINDINGS_VALIDATION	NUMBER	2	Show status of validation rules over structures
SQLDIAG_FINDINGS_FEATURES	NUMBER	3	Show only features used by the query
SQLDIAG_FINDINGS_FILTER_PLANS	NUMBER	4	Show the alternative plans generated by the advisor

Examples

Patch Pack / Unpack

Patches can be exported out of one system and imported into another by means of a staging table, provided by subprograms in this package. Like with SQL diagnosis sets, the operation of inserting into the staging table is called a "pack", and the operation of creating patches from staging table data is termed the "unpack".

DBAs should perform a pack/unpack as follows:

1. Create a staging table owned by user 'SH' through a call to CREATE_STGTAB_SQLPATCH:

```
EXEC DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH(
    table_name          =>  'STAGING_TABLE',
    schema_name         =>  'SH');
```

2. Call PACK_STGTAB_SQLPATCH one or more times to write SQL patch data into the staging table. In this case, copy data for all SQL patches in the DEFAULT category into a staging table owned by the current schema owner:

```
EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
    staging_table_name  =>  'STAGING_TABLE');
```

3. In this case, only a single SQL patch SP_FIND_EMPLOYEE is copied into a staging table owned by the current schema owner:

```
EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
    patch_name          =>  'SP_FIND_EMPLOYEE',
    staging_table_name  =>  'STAGING_TABLE');
```

   The staging table can then be moved to another system using either datapump, import/export commands or via a databaselink.

4. Call UNPACK_STGTAB_SQLPATCH to create SQL patches on the new system from the patch data in the staging table. In this case, change the name in the data for the SP_FIND_EMPLOYEE patch stored in the staging table to 'SP_FIND_EMP_PROD':

```
exec dbms_sqldiag.remap_stgtab_sqlpatch(
   old_patch_name      =>  'SP_FIND_EMPLOYEE',
   new_patch_name      =>  'SP_FIND_EMP_PROD',
```

Summary of DBMS_SQLDIAG Subprograms

Table 123–9 DBMS_SQLDIAG Package Subprograms

Subprogram	Description
ACCEPT_SQL_PATCH Function & Procedure on page 123-11	Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task
ALTER_SQL_PATCH Procedure on page 123-13	Alters specific attributes of an existing SQL patch object
CANCEL_DIAGNOSIS_TASK Procedure on page 123-14	Cancels a diagnostic task
CREATE_STGTAB_ SQLPATCH Procedure on page 123-17	Creates the staging table used for transporting SQL patches from one system to another
DROP_DIAGNOSIS_TASK Procedure on page 123-18	Drops a diagnostic task
DROP_SQL_PATCH Procedure on page 123-19	Drops the named SQL patch from the database
EXECUTE_DIAGNOSIS_TASK Procedure on page 123-20	Executes a diagnostic task
EXPLAIN_SQL_TESTCASE Function on page 123-21	Explains a SQL test case
EXPORT_SQL_TESTCASE Procedures on page 123-22	Exports a SQL test case to a directory
EXPORT_SQL_TESTCASE_ DIR_BY_INC Function on page 123-24	Generates a SQL Test Case corresponding to the incident ID passed as an argument.
EXPORT_SQL_TESTCASE_ DIR_BY_TXT Function on page 123-25	Generates a SQL Test Case corresponding to the SQL passed as an argument
GET_SQL Function on page 123-26	Imports a SQL test case
INCIDENTID_2_SQL Procedure on page 123-27	Initializes a `sql_setrow` from an incident ID
INTERRUPT_DIAGNOSIS_ TASK Procedure on page 123-28	Interrupts a diagnostic task
PACK_STGTAB_SQLPATCH Procedure on page 123-29	SQL patches into the staging table created by the CREATE_ STGTAB_SQLPATCH Procedure
REPORT_DIAGNOSIS_TASK Function on page 123-30	Reports on a diagnostic task
RESET_DIAGNOSIS_TASK Procedure on page 123-31	Resets a diagnostic task
RESUME_DIAGNOSIS_TASK Procedure on page 123-32	Resumes a diagnostic task
SET_DIAGNOSIS_TASK_ PARAMETER Procedure on page 123-33	Sets a diagnosis task parameter

Table 123–9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
UNPACK_STGTAB_SQLPATCH Procedure on page 123-34	Unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure, using the patch data stored in the staging table to create patches on this system

ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
   task_name      IN  VARCHAR2,
   object_id      IN  NUMBER := NULL,
   name           IN  VARCHAR2 := NULL,
   description    IN  VARCHAR2 := NULL,
   category       IN  VARCHAR2 := NULL,
   task_owner     IN  VARCHAR2 := NULL,
   replace        IN  BOOLEAN := FALSE,
   force_match    IN  BOOLEAN := FALSE)
 RETURN VARCHAR2;

DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
   task_name      IN  VARCHAR2,
   object_id      IN  NUMBER := NULL,
   name           IN  VARCHAR2 := NULL,
   description    IN  VARCHAR2 := NULL,
   category       IN  VARCHAR2 := NULL,
   task_owner     IN  VARCHAR2 := NULL,
   replace        IN  BOOLEAN := FALSE,
   force_match    IN  BOOLEAN := FALSE);
```

Parameters

Table 123–10 ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
taskname	Name of the SQL diagnosis task
object_id	Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task
name	Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.
description	User specified string describing the purpose of this SQL patch. Maximum size of description is 500.
category	Category name which must match the value of the SQLDIAGNOSE_CATEGORY parameter in a session for the session to use this patch. It defaults to the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.
task_owner	Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.

Table 123–10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
`replace`	If the patch already exists, it will be replaced if this argument is `TRUE`. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to `TRUE`.
`force_match`	If `TRUE` this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the `FORCE` option of the `CURSOR_SHARING` parameter. If `FALSE`, literals are not transformed. This is analogous to the matching algorithm used by the `EXACT` option of the `CURSOR_SHARING` parameter.

Return Values

Name of the SQL patch

Usage Notes

Requires `CREATE ANY SQL PATCH` privilege

ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
   name            IN  VARCHAR2,
   attribute_name  IN  VARCHAR2,
   value           IN  VARCHAR2);
```

Parameters

Table 123–11 ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
`name`	Name of SQL patch to alter.
`attribute_name`	Name of SQL patch to alter. Possible values: ■ `STATUS` -> can be set to `ENABLED` or `DISABLED` ■ `NAME` -> can be reset to a valid name (must be a valid Oracle identifier and must be unique). ■ `DESCRIPTION` -> can be set to any string of size no more than 500 ■ `CATEGORY` -> can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text) This parameter is mandatory and is case sensitive.
`value`	New value of the attribute. See `attribute_name` for valid attribute values. This parameter is mandatory.

Usage Notes

Requires `ALTER ANY SQL PATCH` privilege

CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 123–12 CANCEL_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text           IN   CLOB,
    bind_list          IN   sql_binds := NULL,
    user_name          IN   VARCHAR2  := NULL,
    scope              IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit         IN   NUMBER    := TIME_LIMIT_DEFAULT,
    task_name          IN   VARCHAR2  := NULL,
    description        IN   VARCHAR2  := NULL,
    problem_type       IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
  RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id             IN   VARCHAR2,
    plan_hash_value    IN   NUMBER    := NULL,
    scope              IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit         IN   NUMBER    := TIME_LIMIT_DEFAULT,
    task_name          IN   VARCHAR2  := NULL,
    description        IN   VARCHAR2  := NULL,
    problem_type       IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
  RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sqlset_name       IN VARCHAR2,
    basic_filter      IN VARCHAR2 :=  NULL,
    object_filter     IN VARCHAR2 :=  NULL,
    rank1             IN VARCHAR2 :=  NULL,
    rank2             IN VARCHAR2 :=  NULL,
    rank3             IN VARCHAR2 :=  NULL,
    result_percentage IN NUMBER   :=  NULL,
    result_limit      IN NUMBER   :=  NULL,
    scope             IN VARCHAR2 :=  SCOPE_COMPREHENSIVE,
    time_limit        IN NUMBER   :=  TIME_LIMIT_DEFAULT,
    task_name         IN VARCHAR2 :=  NULL,
    description       IN VARCHAR2 :=  NULL,
    plan_filter       IN VARCHAR2 :=  'MAX_ELAPSED_TIME',
    sqlset_owner      IN VARCHAR2 :=  NULL,
    problem_type      IN NUMBER   := PROBLEM_TYPE_PERFORMANCE)
  RETURN VARCHAR2;
```

Parameters

Table 123–13 CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement

Table 123–13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
bind_list	Set of bind values
user_name	Username for who the statement/sqlset will be diagnosed
scope	Diagnosis scope (limited/comprehensive)
time_limit	Maximum duration in seconds for the diagnosis session
task_name	Optional diagnosis task name
description	Maximum of 256 SQL diagnosis session description
problem_type	Determines the goal of the task. Possible values are: ■ PROBLEM_TYPE_WRONG_RESULTS ■ PROBLEM_TYPE_COMPILATION_ERROR ■ PROBLEM_TYPE_EXECUTION_ERROR
sql_id	Identifier of the statement
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	Sqlset name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set (STS)
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from (filtered/ranked) SQL
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: ■ LAST_GENERATED: plan with most recent timestamp ■ FIRST_GENERATED: opposite to LAST_GENERATED ■ LAST_LOADED: plan with most recent first_load_time stat info ■ FIRST_LOADED: opposite to LAST_LOADED ■ MAX_ELAPSED_TIME: plan with maximum elapsed time ■ MAX_BUFFER_GETS: plan with maximum buffer gets ■ MAX_DISK_READS: plan with maximum disk reads ■ MAX_DIRECT_WRITES: plan with maximum direct writes ■ MAX_OPTIMIZER_COST: plan with maximum optimum cost
sqlset_owner	Owner of the sqlset, or null for current schema owner

CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
   table_name       IN  VARCHAR2,
   schema_name      IN  VARCHAR2 := NULL,
   tablespace_name  IN  VARCHAR2 := NULL);
```

Parameters

Table 123–14 CREATE_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
table_name	(Mandatory) Name of the table to create (case-sensitive)
schema_name	Schema to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)

DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 123–15 DROP_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (
   name     IN  VARCHAR2,
   ignore   IN  BOOLEAN := FALSE);
```

Parameters

Table 123–16 DROP_SQL_PATCH Function & Procedure Parameters

Parameter	Description
name	Name of patch to be dropped. The name is case sensitive.
ignore	Ignore errors due to object not existing.

Usage Notes

Requires DROP ANY SQL PATCH privilege

EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 123–17 EXECUTE_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase        IN   CLOB)
  RETURN CLOB;
```

Parameters

Table 123–18 EXPLAIN_SQL_TESTCASE Procedure Parameters

Parameter	Description
sqlTestCase	XML document describing the SQL test case

EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN   VARCHAR2,
    sql_text           IN   CLOB,
    user_name          IN   VARCHAR2  := 'SYS',
    bind_list          IN   sql_binds :=  NULL,
    exportEnvironment  IN   BOOLEAN   :=  TRUE,
    exportMetadata     IN   BOOLEAN   :=  TRUE,
    exportData         IN   BOOLEAN   :=  TRUE,
    samplingPercent    IN   NUMBER    :=  100,
    ctrlOptions        IN   VARCHAR2  :=  NULL,
    timeLimit          IN   NUMBER    :=  0,
    testcase_name      IN   VARCHAR2  :=  NULL,
    testcase           IN OUT NOCOPY CLOB);
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN   VARCHAR2,
    incident_id        IN   VARCHAR2,
    exportEnvironment  IN   BOOLEAN   :=  TRUE,
    exportMetadata     IN   BOOLEAN   :=  TRUE,
    exportData         IN   BOOLEAN   :=  TRUE,
    samplingPercent    IN   NUMBER    :=  100,
    ctrlOptions        IN   VARCHAR2  :=  NULL,
    timeLimit          IN   NUMBER    :=  0,
    testcase_name      IN   VARCHAR2  :=  NULL,
    testcase           IN OUT NOCOPY CLOB);
```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use `V$SQL` to get the SQL identifier and the SQL hash value.

```
DBMS_SQLDIAG.BUILD_SQL_TESTCASE (
    directory          IN   VARCHAR2,
    sql_id             IN   VARCHAR2,
    plan_hash_value    IN   NUMBER    := NULL,
    exportEnvironment  IN   BOOLEAN   :=  TRUE,
    exportMetadata     IN   BOOLEAN   :=  TRUE,
    exportData         IN   BOOLEAN   :=  TRUE,
    samplingPercent    IN   NUMBER    :=  100,
    ctrlOptions        IN   VARCHAR2  :=  NULL,
    timeLimit          IN   NUMBER    :=  0,
    testcase_name      IN   VARCHAR2  :=  NULL,
    testcase           IN OUT NOCOPY CLOB);
```

Parameters

Table 123–19 EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
`directory`	Directory to store the various generated files

Table 123–19 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
sql_text	Text of the SQL statement to export
username	Name of the user schema to use to parse the SQL, defaults to SYS
bind_list	List of bind values associated to the statement
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters
timeLimit	How much time should we spend exporting the SQL test case
testcaseName	An optional name for the SQL test case. This is used to prefix all the generated scripts
testcaseMetadata	Resulting test case
incident_id	Incident ID containing the offending SQL
sql_id	Identifier of the statement in the cursor cache

EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL Test Case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 123–20 EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
`incident_id`	Incident ID containing the offending SQL
`directory`	Directory to store the various generated files
`exportEnvironment`	`TRUE` if the compilation environment should be exported
`exportMetadata`	`TRUE` if the definition of the objects referenced in the SQL should be exported
`exportData`	`TRUE` if the data of the objects referenced in the SQL should be exported
`samplingPercent`	If is `TRUE`, specify the sampling percentage to use to create the dump file
`ctrlOptions`	Opaque control parameters

EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    sql_text           IN   CLOB,
    user_name          IN   VARCHAR2 := 'SYS',
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL)
  RETURN BOOLEAN;
```

Parameters

Table 123–21 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to explain
username	Name of the user schema to use to parse the SQL, defaults to SYS
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters

GET_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

Syntax

```
DBMS_SQLDIAG.GET_SQL (
    incident_id  IN     VARCHAR2)
  RETURN SQLSET_ROW;
```

Parameters

Table 123–22 GET_SQL Function Parameters

Parameter	Description
`incident_id`	Identifier of the incident

INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
    incident_id   IN     VARCHAR2,
    sql_stmt      OUT    SQLSET_ROW,
    problem_type  OUT    NUMBER,
    err_code      OUT    BINARY_INTEGER,
    err_mesg      OUT    VARCHAR2);
```

Parameters

Table 123–23 INCIDENTID_2_SQL Procedure Parameters

Parameter	Description
`incident_id`	Identifier of the incident
`sql_stmt`	Resulting SQL
`problem_type`	Tentative type of SQL problem (currently among `PROBLEM_TYPE_COMPILATION_ERROR` and `PROBLEM_TYPE_EXECUTION_ERROR`)
`err_code`	Error code if any otherwise it is set to `NULL`
`err_msg`	Error message if any otherwise it is set to `NULL`

INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 123–24 INTERRUPT_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
   patch_name            IN  VARCHAR2 := '%',
   patch_category        IN  VARCHAR2 := 'DEFAULT',
   staging_table_name    IN  VARCHAR2,
   staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 123–25 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
`patch_name`	Name of patch to pack (% wildcards acceptable, case-sensitive)
`patch_category`	Category to which to pack patches (% wildcards acceptable, case-insensitive)
`staging_table_name`	(Mandatory) Name of the table to use (case-sensitive)
`staging_schema_owner`	Schema where the table resides, or `NULL` for current schema (case-sensitive)

Usage Notes

- Requires: `ADMINISTER SQL PLAN MANAGEMENT OBJECT` privilege and `INSERT` privilege on the staging table
- By default, we move all SQL patches in category `DEFAULT`. See the Examples on page 123-8 for details. Note that the subprogram issues a `COMMIT` after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
    taskname           IN   VARCHAR2,
    type               IN   VARCHAR2  := TYPE_TEXT,
    level              IN   VARCHAR2  := LEVEL_TYPICAL,
    section            IN   VARCHAR2  := SECTION_ALL,
    object_id          IN   NUMBER    := NULL,
    result_limit       IN   NUMBER    := NULL,
    owner_name         IN   VARCHAR2  := NULL)
  RETURN CLOB;
```

Parameters

Table 123–26 REPORT_DIAGNOSIS_TASK Function Parameters

Parameter	Description
taskname	Name of task to report
type	Type of the report. Possible values are: TEXT, HTML, XML (see Table 123–4, " DBMS_SQLDIAG Constants - Report Type (possible values) Constants").
level	Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 123–5, " DBMS_SQLDIAG Constants - Report Level (possible values) Constants").
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 123–6, " DBMS_SQLDIAG Constants - Report Section (possible values) Constants").
object_id	Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).
result_limit	Number of statements in a STS for which the report is generated
owner_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 123–27 RESET_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 123–28 RESUME_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2. The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- MODE : diag scope (comprehensive, limited)
- _SQLDIAG_FINDING_MODE : findings in the report (see " DBMS_SQLDIAG Constants - Findings Filter Constants" on page 123-7 for possible values)

Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
    taskname           IN   VARCHAR2,
    parameter          IN   VARCHAR2,
    value              IN   NUMBER);
```

Parameters

Table 123–29 SET_DIAGNOSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
taskname	Identifier of the task to execute
parameter	Name of the parameter to set
value	New value of the specified parameter

UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT_SQL_PATCH Function & Procedure).

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
   patch_name            IN  VARCHAR2 := '%',
   patch_category        IN  VARCHAR2 := '%',
   replace               IN  BOOLEAN,
   staging_table_name    IN  VARCHAR2,
   staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 123–30 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
`patch_name`	Name of patch to unpack (% wildcards acceptable, case-sensitive)
`patch_category`	Category from which to unpack patches (% wildcards acceptable, case-insensitive)
`replace`	Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.
`staging_table_name`	(Mandatory) Name of the table to use (case-sensitive)
`staging_schema_owner`	Schema where the table resides, or `NULL` for current schema (case-sensitive)

Usage Notes

- Requires: `ADMINISTER SQL MANAGEMENT OBJECT` privilege and `SELECT` privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

124

DBMS_SQLPA

The DBMS_SQLPA package provides the interface SQL Performance Analyzer.

The chapter contains the following topics:

- Using DBMS_SQLPA
  - Overview
  - Security Model
- Summary of DBMS_SQLPA Subprograms

Using DBMS_SQLPA

- Overview
- Security Model

Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the CREATE_ANALYSIS_TASK Functions to create an analysis task for a single statement or a group of SQL statements.s
2. The EXECUTE_ANALYSIS_TASK Function & Procedure executes a previously created analysis task.
3. The REPORT_ANALYSIS_TASK Function displays the results of an analysis task.

Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.

Summary of DBMS_SQLPA Subprograms

Table 124–1 DBMS_SQLPA Package Subprograms

Subprogram	Description
CANCEL_ANALYSIS_TASK Procedure on page 124-6	Cancels the currently executing task analysis of one or more SQL statements
CREATE_ANALYSIS_TASK Functions on page 124-7	Creates an advisor task to process and analyze one or more SQL statements
DROP_ANALYSIS_TASK Procedure on page 124-10	Drops a SQL analysis task
EXECUTE_ANALYSIS_TASK Function & Procedure on page 124-11	Executes a previously created analysis task
INTERRUPT_ANALYSIS_TASK Procedure on page 124-13	Interrupts the currently executing analysis task
REPORT_ANALYSIS_TASK Function on page 124-14	Displays the results of an analysis task
RESET_ANALYSIS_TASK Procedure on page 124-16	Resets the currently executing analysis task to its initial state
RESUME_ANALYSIS_TASK Procedure on page 124-17	Resumes a previously interrupted analysis task that was created to process a SQL tuning set.
SET_ANALYSIS_TASK_PARAMETER Procedures on page 124-18	Sets the SQL analysis task parameter value
SET_ANALYSIS_DEFAULT_ PARAMETER Procedures on page 124-20	Sets the SQL analysis task parameter default value

CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 124–2 CANCEL_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Name of the task to cancel

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements. You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  parsing_schema    IN VARCHAR2  := NULL,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_id            IN VARCHAR2,
  plan_hash_value   IN NUMBER    := NULL,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  sql_id            IN VARCHAR2,
  plan_hash_value   IN NUMBER    := NULL,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name        IN VARCHAR2,
  basic_filter       IN VARCHAR2 :=  NULL,
  order_by           IN VARCHAR2 :=  NULL,
  top_sql            IN VARCHAR2 :=  NULL,
  task_name          IN VARCHAR2 :=  NULL,
```

```
  description       IN VARCHAR2 :=  NULL
  sqlset_owner      IN VARCHAR2 :=  NULL)
RETURN VARCHAR2;
```

Parameters

Table 124–3 CREATE_ANALYSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	A set of bind values
parsing_schema	Name of the schema where the statement can be compiled
task_name	Optional analysis task name
description	Description of the SQL analysis task to a maximum of 256 characters
sql_id	Identifier of a SQL statement
plan_hash_value	Hash value of the SQL execution plan
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
order_by	Order-by clause on the selected SQL
top_sql	Top N SQL after filtering and ranking
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
     sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id       => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap  => 1,
    end_snap    => 2,
    sql_id      => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
```

```
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
  sqlset_name    =>   'my_workload', -
  order_by       =>   'BUFFER_GETS', -
  description    =>   'process workload ordered by buffer gets');
```

DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task.The task and all its result data are deleted.

Syntax

```
DBMS_SQLPA.DROP_ANALYSIS_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 124–4 DROP_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	The name of the analysis task to drop

EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2               := 'test execute',
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL)
 RETURN VARCHAR2;

DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2               := 'test execute',
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL);
```

Parameters

Table 124–5 EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
execution_type	Type of the action to perform by the function. If NULL it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. Possible values are: ■ [TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default. ■ EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. ■ COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the task
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set via the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).
execution_desc	A 256-length string describing the execution

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

Examples

1. Create a task with a purpose of change impact analysis

```
EXEC :tname := dbms_sqltune.create_tuning_task(
    sqlset_name     => 'my_sts');
```

2. Make baseline or the before change execution

```
EXEC dbms_sqltune.execute_tuning_task(
    task_name       => :tname,
    execution_type  => 'test execute',
    execution_name  => 'before_change');
```

3. Make change

```
...
```

4. Make the after change version of the workload performance

```
EXEC dbms_sqltune.execute_tuning_task(
   task_name          => :tname, -
   execution_type     => 'test execute ',
   execution_name     => 'after_change')
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER(
   :tname,'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(
   task_name         => :tname, -
   execution_type    => 'test execute', -
   execution_name    => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(
   task_name        => :tname, -
   execution_type   => 'compare performance',
   execution_params => dbms_advisor.arglist(
      'execution_name1',
      'before_change',
      'execution_name2',
      'after_change',
      'comparion_metric',
      'buffer_gets'));
```

INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
   task_name         IN VARCHAR2);
```

Parameters

Table 124–6 INTERRUPT_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to interrupt

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
   task_name       IN   VARCHAR2,
   type            IN   VARCHAR2   := 'text',
   level           IN   VARCHAR2   := 'typical',
   section         IN   VARCHAR2   := 'summary',
   object_id       IN   NUMBER     := NULL,
   top_sql         IN   NUMBER     := 100,
   task_owner      IN    VARCHAR2  := NULL,
   execution_name  IN  VARCHAR2    := NULL))
RETURN CLOB;
```

Parameters

Table 124–7 REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
task_name	Name of the task to report
type	Type of the report to produce. Possible values are TEXT (default), HTML and XML.
level	Level of detail in the report: ■ BASIC - currently the same as typical ■ TYPICAL (default) - show information about every statement analyzed, including changing and errors ■ ALL - details of all SQL ■ IMPROVED - only improved SQL ■ REGRESSED - only regressed SQL ■ CHANGED - only SQL with changed performance ■ UNCHANGED - only SQL with unchanged performance ■ CHANGED_PLANS - only SQL with plan changes ■ UNCHANGED_PLANS - only SQL with unchanged plans ■ ERRORS - SQL with errors only
section	Optionally limit the report to a single section (ALL for all sections): ■ SUMMARY (default) - workload summary only ■ SECTION_ALL - summary and details on SQL
object_id	Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)
top_sql	Number of SQL statements in a STS for which the report is generated
task_owner	Owner of the relevant analysis task. Defaults to the current schema owner.
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

Return Values

A CLOB containing the desired report.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS',
5) from dual;
```

RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution. All intermediate result data will be deleted.

Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
 task_name         IN VARCHAR2);
```

Parameters

Table 124–8 RESET_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or `FAILED` (with a fatal error) task execution.

Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
 task_name         IN VARCHAR2,
 basic_filter      IN VARCHAR2 := NULL);
```

Parameters

Table 124–9 RESUME_ANALYSIS_TASK Procedure Parameters

Parameter	Description
`task_name`	Identifier of the analysis task to resume
`basic_filter`	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter `basic_filter`) that was specified when calling the CREATE_ANALYSIS_TASK Functions.

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide.  For this example we will just resume.

EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name         IN VARCHAR2,
  parameter         IN VARCHAR2,
  value             IN VARCHAR2);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name         IN VARCHAR2,
  parameter         IN VARCHAR2,
  value             IN NUMBER);
```

Parameters

Table 124–10 SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute

Table 124–10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: ■ APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). ■ COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10) ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task) ■ EXECUTION_NAME1: name of the first task execution to analyze ■ EXECUTION_NAME2: name of the second task execution to analyze ■ LOCAL_TIME_LIMIT: per-statement time out (seconds) ■ BASIC_FILTER: basic filter for SQL tuning set ■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. ■ SQL_LIMIT: maximum number of SQL statements to tune ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements ■ TIME_LIMIT: global time out (seconds) ■ WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.
value	New value of the specified parameter

SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 124–11 SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: ■ APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). ■ COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10) ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task) ■ EXECUTION_NAME1: name of the first task execution to analyze ■ EXECUTION_NAME2: name of the second task execution to analyze ■ LOCAL_TIME_LIMIT: per-statement time out (seconds) ■ BASIC_FILTER: basic filter for SQL tuning set ■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. ■ SQL_LIMIT: maximum number of SQL statements to tune ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements ■ TIME_LIMIT: global time out (seconds) ■ WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.
value	New value of the specified parameter

DBMS_SQLTUNE

The DBMS_SQLTUNE package provides the interface to tune SQL statements.

The chapter contains the following topics:

- Using DBMS_SQLTUNE
  - Overview
  - Security Model
- Data Structures
- Subprogram Groups
  - SQL Tuning Advisor Subprograms
  - SQL Profile Subprograms
  - SQL Tuning Set Subprograms
  - Real-time SQL Monitoring Subprograms
- Summary of DBMS_SQLTUNE Subprograms

Using DBMS_SQLTUNE

- Overview
- Security Model

Overview

The DBMS_SQLTUNE package provides a number interrelated areas of functionality:

- SQL Tuning Advisor Subprograms
- SQL Profile Subprograms
- SQL Tuning Set Subprograms
- Real-time SQL Monitoring Subprograms

SQL Tuning Advisor

The SQL Tuning Advisor is one of a suite of Advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, the SQL Tuning Advisor automates the tuning process of problematic SQL statements. That is, it takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advice is provided is in the form of precise SQL actions for tuning the SQL along with their expected performance benefit.

The group of SQL Tuning Advisor Subprograms provide a task-oriented interface that lets you access the Advisor. You can call the following subprograms in the order given to use some of the SQL Tuning Advisor's features:

1. You use the CREATE_TUNING_TASK Functions to create a tuning task for tuning a single statement or a group of SQL statements.
2. The EXECUTE_TUNING_TASK Function & Procedure executes a previously created tuning task.
3. The REPORT_TUNING_TASK Function displays the results of a tuning task.
4. You use the SCRIPT_TUNING_TASK Function to create a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations

SQL Profile Subprograms

The SQL Tuning Advisor may recommend the creation of a SQL Profile to improve the performance of a statement. SQL Profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL Profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of SQL Profile Subprograms provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the ACCEPT_SQL_PROFILE Procedure and Function to accept a SQL Profile recommended by the SQL Tuning Advisor.
- You can alter the STATUS, NAME, DESCRIPTION, and CATEGORY attributes of an existing SQL Profile with the ALTER_SQL_PROFILE Procedure.
- You can drop a SQL Profile with the DROP_SQL_PROFILE Procedure.

SQL Tuning Sets

The SQL Tuning Advisor input can be a single SQL statement or a set of statements. When tuning multiple statements in one advisor task, you give the input in the form of a SQL Tuning Set (STS). A SQL Tuning Set is a database object that stores SQL

statements along with their execution context in a system-provided schema. SQL Tuning Sets provide an infrastructure for dealing with SQL workloads and simplify tuning of a large number of SQL statements.

SQL Tuning Sets store SQL statements along with

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans - which are the sequence of operations Oracle performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

SQL Tuning Sets can be created by filtering or ranking SQL statements from several sources:

- The cursor cache using the SELECT_CURSOR_CACHE Function
- Top SQL statements from the Automatic Workload Repository using the SELECT_WORKLOAD_REPOSITORY Functions
- Other SQL Tuning Sets using the SELECT_SQLSET Function
- A user-defined workload

The complete group of SQL Tuning Set Subprograms facilitates this functionality. As examples:

- You use the CREATE_SQLSET Procedure and Function to creates a SQL tuning set object in the database
- The LOAD_SQLSET Procedure populates the SQL tuning set with a set of selected SQL
- The CAPTURE_CURSOR_CACHE_SQLSET Procedure collects SQL statements from the cursor cache over a specified time interval, attempting to build a realistic picture of system workload.

Import/Export SQL Tuning Sets and SQL Profiles

You use `DBMS_SQLTUNE` subprograms to move SQL Profiles and SQL Tuning Sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source system and populate that staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as datapump, import/export, or database link), where it is used to reconstitute the objects in their original form. These steps are implemented by means of subprograms included in this package:

1. Call the CREATE_STGTAB_SQLPROF Procedure or the CREATE_STGTAB_SQLSET Procedure to create the staging table on the source system.
2. Call the PACK_STGTAB_SQLPROF Procedure or PACK_STGTAB_SQLSET Procedure to populate the staging table with information from the source system.
3. Once you have moved the staging table to the destination system, you call the UNPACK_STGTAB_SQLPROF Procedure or the UNPACK_STGTAB_SQLSET Procedure to recreate the object on the new system.

> **See Also:** Oracle Database Performance Tuning Guide for more information about programmatic flow.

Automatic Tuning Task Functions

There is a reserved system task "SYS_AUTO_SQL_TUNING_TASK" that performs SQL Tuning in the maintenance window, within the Autotask framework. It automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor upon them. It performs the same comprehensive analysis of any other SQL Tuning Task. In addition, it tests any SQL Profiles it finds by executing both the old and new query plan and implements the ones with a large benefit. SQL Profiles are implemented immediately at the time of tuning so the system can automatically benefit from the new plan. In each maintenance window, the task stores its results as a new execution, so that all results over the lifetime of the task are available, connected to each other through the task name but kept distinct by their execution names. You can use the DBA_ADVISOR_EXECUTIONS views to see information about the task's executions.

The automatic task is created by the system as part of the catalog scripts. It has its own special interface for displaying the report (the REPORT_AUTO_TUNING_TASK Function), and it shares the other interface with the standard tuning tasks. The task has its own report interface for viewing reports that span multiple executions.

To set parameters of the automatic task, use the SET_TUNING_TASK_PARAMETER Procedures. To execute the task immediately, use the function version of the EXECUTE_TUNING_TASK Function & Procedure. Disabling the task is done by means of the DBMS_AUTO_TASK_ADMIN package.

Real-time SQL Monitoring

Real-time SQL Monitoring allows DBAs or performance analysts to monitor the execution of long running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated close to real-time during statement execution. These statistics are exposed by two new fixed views, V$SQL_MONITOR and V$SQL_PLAN_MONITOR. In addition, DBMS_SQLTUNE provides a subprogram REPORT_SQL_MONITOR() to report on monitoring information.

Security Model

This package is available to PUBLIC and performs its own security checking:

- As the SQL Tuning advisor relies on the advisor framework, all tuning task interfaces (XXX_TUNING_TASK) require privilege ADVISOR.
- SQL Tuning Set subprograms (XXX_SQLSET) require either the ADMINISTER SQL TUNING SET or the ADMINISTER ANY SQL TUNING SET privilege. Users having the ADMINISTER SQL TUNING SET privilege can only create and modify a SQL tuning set they own, while the ADMINISTER ANY SQL TUNING SET privilege allows them to operate upon all SQL tuning sets, even those owned by other users. For example, using the CREATE_SQLSET Procedure and Function you can create a SQL tuning set to be owned by another user. In this case, the user need not necessarily have the ADMINISTER SQL TUNING SET privilege to operate upon her tuning set.
- Previously, three different privileges were needed to invoke subprograms concerned with SQL Profiles:
  - CREATE ANY SQL PROFILE
  - ALTER ANY SQL PROFILE
  - DROP ANY SQL PROFILE

  These have now been deprecated in favor of ADMINISTER SQL MANAGEMENT OBJECT

Data Structures

The DBMS_SQLTUNE package defines the following OBJECT type

Object Types

- SQLSET_ROW Object Type

SQLSET_ROW Object Type

The SQLSET_ROW object models the content of a SQL Tuning Set for the user. Logically, a SQL Tuning Set is a collection of SQLSET_ROWs where each SQLSET_ROW contains a single SQL statement along with its execution context, statistics, binds and plan. The SELECT_XXX subprograms each model a data source as a collection of SQLSET_ROWs, unique by (sql_id, plan_hash_value). Similarly, the LOAD_SQLSET procedure takes as input a cursor whose row type is SQLSET_ROW, treating each SQLSET_ROW in isolation according to the policies requested by the user.

Several subprograms in the DBMS_SQLTUNE package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the SQLSET_ROW as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                   VARCHAR(13),
  force_matching_signature NUMBER,
  sql_text                 CLOB,
  object_list              sql_objects,
  bind_data                RAW(2000),
  parsing_schema_name      VARCHAR2(30),
  module                   VARCHAR2(48),
  action                   VARCHAR2(32),
  elapsed_time             NUMBER,
  cpu_time                 NUMBER,
  buffer_gets              NUMBER,
  disk_reads               NUMBER,
  direct_writes            NUMBER,
  rows_processed           NUMBER,
  fetches                  NUMBER,
  executions               NUMBER,
  end_of_fetch_count       NUMBER,
  optimizer_cost           NUMBER,
  optimizer_env            RAW(2000),
  priority                 NUMBER,
  command_type             NUMBER,
  first_load_time          VARCHAR2(19),
  stat_period              NUMBER,
  active_stat_period       NUMBER,
  other                    CLOB,
  plan_hash_value          NUMBER,
  sql_plan                 sql_plan_table_type,
  bind_list                sql_binds)
```

Attributes

Table 125–1 SQLSET_ROW Attributes

Attribute	Description
sql_id	Unique SQL ID
forcing_matching_signature	Signature with literals, case, and whitespace removed
sql_text	Full text for the statement
object_list	Currently not implemented

Table 125–1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive.
parsing_schema	Schema where the SQL is parsed
module	Last application module for the SQL
action	Last application action for the SQL
elapsed_time	Sum total elapsed time for this SQL statement
cpu_time	Sum total CPU time for this SQL statement
buffer_gets	Sum total number of buffer gets
disk_reads	Sum total number of disk reads
direct_writes	Sum total number of direct writes
rows_processed	Sum total number of rows processed by this SQL
fetches	Sum total number of fetches
executions	Total executions of this SQL
end_of_fetch_count	Number of times the statement was fully executed with all of its rows fetched
optimizer_cost	Optimizer cost for this SQL
optimizer_env	Optimizer environment for this SQL statement
priority	User-defined priority (1,2,3)
command_type	Statement type, such as INSERT or SELECT.
first_load_time	Load time of parent cursor
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active
other	Other column for user defined attributes
plan_hash_value	Plan hash value of the plan
sql_plan	Explain plan
bind_list	List of user specified binds for SQL This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data - they are mutually exclusive.

Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function:

- SQL Tuning Advisor Subprograms
- SQL Profile Subprograms
- SQL Tuning Set Subprograms
- Real-time SQL Monitoring Subprograms

SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 125–2 SQL Tuning Task Subprograms

Subprogram	Description
CANCEL_TUNING_TASK Procedure on page 125-24	Cancels the currently executing tuning task
CREATE_TUNING_TASK Functions on page 125-30	Creates a tuning of a single statement or SQL tuning set for either the SQL Tuning Advisor
DROP_TUNING_TASK Procedure on page 125-37	Drops a SQL tuning task
EXECUTE_TUNING_TASK Function & Procedure on page 125-38	Executes a previously created tuning task
IMPLEMENT_TUNING_TASK Function on page 125-39	Implements a set of SQL Profile recommendations made by the SQL Tuning Advisor
INTERRUPT_TUNING_TASK Procedure on page 125-40	Interrupts the currently executing tuning task
REPORT_AUTO_TUNING_TASK Function on page 125-51	Displays a report from the automatic tuning task, reporting on a range of executions
REPORT_TUNING_TASK Function on page 125-56	Displays the results of a tuning task
RESET_TUNING_TASK Procedure on page 125-58	Resets the currently executing tuning task to its initial state
RESUME_TUNING_TASK Procedure on page 125-59	Resumes a previously interrupted task that was created to process a SQL tuning set.
SCRIPT_TUNING_TASK Function on page 125-60	Creates a SQL*PLUS script which can then be executed to implement a set of SQL Tuning Advisor recommendations
SET_TUNING_TASK_PARAMETER Procedures on page 125-70	Updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

The Summary of DBMS_SQLTUNE Subprograms contains a complete listing of all subprograms in the package.

SQL Profile Subprograms

This subprogram group provides an interface to manage SQL Profiles.

Table 125–3 SQL Profile Subprograms

Subprogram	Description
ACCEPT_SQL_PROFILE Procedure and Function on page 125-18	Creates a SQL Profile for the specified tuning task
ALTER_SQL_PROFILE Procedure on page 125-22	Alters specific attributes of an existing SQL Profile object
CREATE_STGTAB_SQLPROF Procedure on page 125-28	Creates the staging table used for copying SQL profiles from one system to another.
DROP_SQL_PROFILE Procedure on page 125-35	Drops the named SQL Profile from the database
PACK_STGTAB_SQLPROF Procedure on page 125-45	Moves profile data out of the `SYS` schema into the staging table
REMAP_STGTAB_SQLPROF Procedure on page 125-48	Changes the profile data values kept in the staging table prior to performing an unpack operation
SQLTEXT_TO_SIGNATURE Function on page 125-72	Returns a SQL text's signature
UNPACK_STGTAB_SQLPROF Procedure on page 125-73	Uses the profile data stored in the staging table to create profiles on this system

The Summary of DBMS_SQLTUNE Subprograms contains a complete listing of all subprograms in the package.

SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

Table 125–4 SQL Tuning Set Subprograms

Subprogram	Description
ADD_SQLSET_REFERENCE Function on page 125-21	Adds a new reference to an existing SQL tuning set to indicate its use by a client
CAPTURE_CURSOR_CACHE_SQLSET Procedure on page 125-25	Over a specified time interval incrementally captures a workload from the cursor cache into a SQL tuning set
CREATE_SQLSET Procedure and Function on page 125-27	Creates a SQL tuning set object in the database
CREATE_STGTAB_SQLSET Procedure on page 125-29	Creates a staging table through which SQL Tuning Sets are imported and exported
DELETE_SQLSET Procedure on page 125-34	Deletes a set of SQL statements from a SQL tuning set
DROP_SQLSET Procedure on page 125-36	Drops a SQL tuning set if it is not active
LOAD_SQLSET Procedure on page 125-41	Populates the SQL tuning set with a set of selected SQL
PACK_STGTAB_SQLSET Procedure on page 125-46	Copies tuning sets out of the `SYS` schema into the staging table
REMOVE_SQLSET_REFERENCE Procedure on page 125-50	Deactivates a SQL tuning set to indicate it is no longer used by the client
SELECT_CURSOR_CACHE Function on page 125-62	Collects SQL statements from the cursor cache
SELECT_SQLSET Function on page 125-66	Collects SQL statements from an existing SQL tuning set
SELECT_WORKLOAD_REPOSITORY Functions on page 125-68	Collects SQL statements from the workload repository
UNPACK_STGTAB_SQLSET Procedure on page 125-74	Copies one or more SQL tuning sets from the staging table
UPDATE_SQLSET Procedures on page 125-76	Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set

The Summary of DBMS_SQLTUNE Subprograms contains a complete listing of all subprograms in the package.

Real-time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`.

Table 125–5 SQL Tuning Set Subprograms

Subprogram	Description
REPORT_SQL_MONITOR Function on page 125-53	Reports on real-time SQL Monitoring

Summary of DBMS_SQLTUNE Subprograms

Table 125–6 DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
ACCEPT_SQL_PROFILE Procedure and Function on page 125-18	Create a SQL Profile for the specified tuning task	SQL Profile Subprograms on page 125-12
ADD_SQLSET_REFERENCE Function on page 125-21	Adds a new reference to an existing SQL tuning set to indicate its use by a client	SQL Tuning Set Subprograms on page 125-13
ALTER_SQL_PROFILE Procedure on page 125-22	Alters specific attributes of an existing SQL Profile object	SQL Profile Subprograms on page 125-12
CANCEL_TUNING_TASK Procedure on page 125-24	Cancels the currently executing tuning task	SQL Tuning Advisor Subprograms on page 125-11
CAPTURE_CURSOR_CACHE_SQLSET Procedure on page 125-25	Over a specified time interval incrementally captures a workload from the cursor cache into a SQL tuning set	SQL Tuning Set Subprograms on page 125-13
CREATE_SQLSET Procedure and Function on page 125-27	Creates a SQL tuning set object in the database	SQL Tuning Set Subprograms on page 125-13
CREATE_STGTAB_SQLPROF Procedure on page 125-28	Creates the staging table used for copying SQL profiles from one system to another.	SQL Profile Subprograms on page 125-12
CREATE_STGTAB_SQLSET Procedure on page 125-29	Creates a staging table through which SQL Tuning Sets are imported and exported	SQL Tuning Set Subprograms on page 125-13
CREATE_TUNING_TASK Functions on page 125-30	Creates a tuning of a single statement or SQL tuning set for either the SQL Tuning Advisor	SQL Tuning Advisor Subprograms on page 125-11
DELETE_SQLSET Procedure on page 125-34	Deletes a set of SQL statements from a SQL tuning set	SQL Tuning Set Subprograms on page 125-13
DROP_SQL_PROFILE Procedure on page 125-35	Drops the named SQL Profile from the database	SQL Profile Subprograms on page 125-12
DROP_SQLSET Procedure on page 125-36	Drops a SQL tuning set if it is not active	SQL Tuning Set Subprograms on page 125-13
DROP_TUNING_TASK Procedure on page 125-37	Drops a SQL tuning task	SQL Tuning Advisor Subprograms on page 125-11
EXECUTE_TUNING_TASK Function & Procedure on page 125-38	Executes a previously created tuning task	SQL Tuning Advisor Subprograms on page 125-11

Table 125–6 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
IMPLEMENT_TUNING_TASK Function on page 125-39	implements a set of SQL Profile recommendations made by the SQL Tuning Advisor	SQL Tuning Advisor Subprograms on page 125-11
INTERRUPT_TUNING_TASK Procedure on page 125-40	Interrupts the currently executing tuning task	SQL Tuning Advisor Subprograms on page 125-11
LOAD_SQLSET Procedure on page 125-41	Populates the SQL tuning set with a set of selected SQL	SQL Tuning Set Subprograms on page 125-13
PACK_STGTAB_SQLPROF Procedure on page 125-45	Moves profile data out of the `SYS` schema into the staging table	SQL Profile Subprograms on page 125-12
PACK_STGTAB_SQLSET Procedure on page 125-46	Moves tuning sets out of the `SYS` schema into the staging table	SQL Tuning Set Subprograms on page 125-13
REMAP_STGTAB_SQLPROF Procedure on page 125-48	Changes the profile data values kept in the staging table prior to performing an unpack operation	SQL Profile Subprograms on page 125-12
REMAP_STGTAB_SQLSET Procedure on page 125-49	Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system	SQL Tuning Set Subprograms on page 125-13
REMOVE_SQLSET_ REFERENCE Procedure on page 125-50	Deactivates a SQL tuning set to indicate it is no longer used by the client	SQL Tuning Set Subprograms on page 125-13
REPORT_AUTO_TUNING_ TASK Function on page 125-51	Displays a report from the automatic tuning task, reporting on a range of subtasks	SQL Tuning Set Subprograms on page 125-13
REPORT_SQL_MONITOR Function on page 125-53	Displays a report on real-time SQL monitoring	Real-time SQL Monitoring Subprograms on page 125-14
REPORT_TUNING_TASK Function on page 125-56	Displays the results of a tuning task	SQL Tuning Set Subprograms on page 125-13
RESET_TUNING_TASK Procedure on page 125-58	Resets the currently executing tuning task to its initial state	SQL Tuning Advisor Subprograms on page 125-11
RESUME_TUNING_TASK Procedure on page 125-59	Resumes a previously interrupted task that was created to process a SQL tuning set.	SQL Tuning Advisor Subprograms on page 125-11
SCRIPT_TUNING_TASK Function on page 125-60	Creates a SQL*PLUS script which can then be executed to implement a set of SQL Tuning Advisor recommendations	SQL Tuning Advisor Subprograms on page 125-11
SELECT_CURSOR_CACHE Function on page 125-62	Collects SQL statements from the cursor cache	SQL Tuning Set Subprograms on page 125-13

Table 125–6 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
SELECT_SQLSET Function on page 125-66	Collects SQL statements from an existing SQL tuning set	SQL Tuning Set Subprograms on page 125-13
SELECT_WORKLOAD_ REPOSITORY Functions on page 125-68	Collects SQL statements from the workload repository	SQL Tuning Set Subprograms on page 125-13
SET_TUNING_TASK_ PARAMETER Procedures on page 125-70	Updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.	SQL Tuning Set Subprograms on page 125-13
SQLTEXT_TO_SIGNATURE Function on page 125-72	Returns a SQL text's signature	SQL Profile Subprograms on page 125-12
UNPACK_STGTAB_SQLPROF Procedure on page 125-73	Uses the profile data stored in the staging table to create profiles on this system	SQL Profile Subprograms on page 125-12
UNPACK_STGTAB_SQLSET Procedure on page 125-74	Moves one or more SQL tuning sets from the staging table	SQL Tuning Set Subprograms on page 125-13
UPDATE_SQLSET Procedures on page 125-76	Updates selected fields for a SQL statement in a SQL tuning set	SQL Tuning Set Subprograms on page 125-13

ACCEPT_SQL_PROFILE Procedure and Function

This procedure creates a SQL Profile recommended by the SQL Tuning Advisor. The SQL text is normalized for matching purposes though it is stored in the data dictionary in de-normalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement doesn't exist, an error is reported.

> **See Also:** SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name    IN  VARCHAR2,
   object_id    IN  NUMBER   := NULL,
   name         IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   category     IN  VARCHAR2 := NULL);
   task_owner   IN VARCHAR2  := NULL,
   replace      IN BOOLEAN   := FALSE,
   force_match  IN BOOLEAN   := FALSE);

DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name    IN  VARCHAR2,
   object_id    IN  NUMBER   := NULL,
   name         IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   category     IN  VARCHAR2 := NULL;
   task_owner   IN VARCHAR2  := NULL,
   replace      IN BOOLEAN   := FALSE,
   force_match  IN BOOLEAN   := FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 125–7 ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
object_id	The identifier of the advisor framework object representing the SQL statement associated with the tuning task
name	The name of the SQL Profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL Profile.
description	A user specified string describing the purpose of the SQL Profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.
category	This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL Profile. It defaults to the value "DEFAULT". This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL Profile. An ACCEPT_SQL_PROFILE will fail if this combination is duplicated.

Table 125–7 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
task_owner	Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL Profile associated to a tuning task owned by another user. The current user is the default value.
replace	If the profile already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.
force_match	If TRUE this causes SQL Profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.

Return Values

The name of the SQL profile.

Usage Notes

The CREATE ANY SQL PROFILE privilege is required.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement form the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
   begin_snap  => 1, -
   end_snap    => 2, -
   sql_id      => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, object_id) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, TEST), so that it will not be used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name  =>  :stmt_task, -
   category   =>  'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name   =>  :stmt_task, -
                                      force_match =>  TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to '5'. Please notice that you must pass an object id to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object id is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
  sqlset_name   => 'my_workload',  -
  rank1         => 'ELAPSED_TIME', -
  time_limit    => 3600,           -
  description   => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

 -- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name  =>  :sts_task, -
   object_id  =>  5);
```

ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
   sqlset_name  IN  VARCHAR2,
   description  IN  VARCHAR2 := NULL)
 RETURN NUMBER;
```

Parameters

Table 125–8 ADD_SQLSET_REFERENCE Function Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
description	The description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only.

The function returns a reference ID that is used to remove it later. You use the REMOVE_SQLSET_REFERENCE Procedure to delete references to a SQL tuning set.

```
variable rid number;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
                                sqlset_name => 'my_workload', -
                                description => 'my sts reference');
```

You can use the views USER/DBA_SQLSET_REFERENCES to find all references on a given SQL tuning set.

ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL Profile object. The following attributes can be altered (using these attribute names):

- "STATUS" can be set to "ENABLED" or "DISABLED"
- "NAME" can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- "DESCRIPTION" can be set to any string of size no more than 500 characters
- "CATEGORY" can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text)

See Also: SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
   name                 IN  VARCHAR2,
   attribute_name       IN  VARCHAR2,
   value                IN  VARCHAR2);
```

Parameters

Table 125–9 ALTER_SQL_PROFILE Procedure Parameters

Parameter	Description
name	The (mandatory) name of the existing SQL Profile to alter
attribute_name	The (mandatory) attribute name to alter (case insensitive) using valid attribute names
value	The (mandatory) new value of the attribute using valid attribute values

Usage Notes

Requires the "ALTER ANY SQL PROFILE" privilege.

Examples

```
-- Disable a profile, so it will be not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (name             =>  :pname,   -
                                     attribute_name   =>  'STATUS', -
                                     value            =>  'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>   :pname,   -
                                      attribute_name  =>   'STATUS', -
                                      value           =>   'ENABLED');

-- Change the category of the profile so it will be used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>  :pname,   -
                                      attribute_name  =>  'CATEGORY', -
                                      value           =>  'TEST');
```

```
-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>  :pname,   -
                                      attribute_name  =>  'CATEGORY', -
                                      value           =>  'DEFAULT');
```

CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 125–10 CANCEL_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task to cancel

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

CAPTURE_CURSOR_CACHE_SQLSET Procedure

Over a specified time interval this procedure incrementally captures a workload from the cursor cache into a SQL tuning set. The procedure captures a workload from the cursor cache into a SQL tuning set, polling the cache multiple times over a time period and updating the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
    sqlset_name         IN VARCHAR2,
    time_limit          IN POSITIVE := 1800,
    repeat_interval     IN POSITIVE := 300,
    capture_option      IN VARCHAR2 := 'MERGE',
    capture_mode        IN NUMBER   := MODE_REPLACE_OLD_STATS,
    basic_filter        IN VARCHAR2 := NULL,
    sqlset_owner        IN VARCHAR2 := NULL);
```

Parameters

Table 125–11 CAPTURE_CURSOR_CACHE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
time_limit	The total amount of time, in seconds, to execute
repeat_interval	The amount of time, in seconds, to pause between sampling
capture_option	During capture, either insert new statements, update existing ones, or both. 'INSERT', 'UPDATE', or 'MERGE' just like load_option in load_sqlset
capture_mode	capture mode (UPDATE and MERGE capture options).Possible values: ■ MODE_REPLACE_OLD_STATS - Replace statistics when the number of executions seen is greater than that stored in the SQL tuning set ■ MODE_ACCUMULATE_STATS - Add new values to current values for SQL we already store. Note that this mode detects if a statement has been aged out, so the final value for a statistics will be the sum of the statistics of all cursors that statement existed under.
basic_filter	Filter to apply to cursor cache on each sampling (see select_xxx subprograms)
sqlset_owner	The owner of the SQL tuning set or NULL for current schema owner

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This will capture all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and cursor cache turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                      sqlset_name     => 'my_workload', -
                                      time_limit      =>  30, -
                                      repeat_interval =>  5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                        sqlset_name     => 'my_workload', -
                        time_limit      => 30, -
                        repeat_interval => 5, -
                        capture_mode    => dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                    sqlset_name     => 'my_workload', -
                                    time_limit      => 30, -
                                    repeat_interval => 5, -
                                    capture_option  => 'INSERT');
```

CREATE_SQLSET Procedure and Function

The procedure creates a SQL tuning set object in the database.

The function causes the system t o generate a name for the SQL Tuning Set.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
   sqlset_name  IN  VARCHAR2,
   description  IN  VARCHAR2 := NULL
   sqlset_owner IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.CREATE_SQLSET (
   sqlset_name  IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   sqlset_owner IN  VARCHAR2 := NULL)
 RETURN VARCHAR2;
```

Parameters

Table 125–12 CREATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
description	The description of the SQL tuning set
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

> **See Also:** SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
   table_name            IN VARCHAR2,
   schema_name           IN VARCHAR2 := NULL,
   tablespace_name       IN VARCHAR2 := NULL);
```

Parameters

Table 125–13 CREATE_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
`table_name`	The name of the table to create (case-insensitive unless double quoted). Required.
`schema_name`	The schema to create the table in, or `NULL` for current schema (case-insensitive unless double quoted)
`tablespace_name`	The tablespace to store the staging table within, or `NULL` for current user's default tablespace (case-insensitive unless double quoted)

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLPROF Procedure.
- This procedure can be called multiple times if you would like to have different SQL profiles in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name  => 'PROFILE_STGTAB');
```

CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL Tuning Sets are imported and exported

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
   table_name           IN VARCHAR2,
   schema_name          IN VARCHAR2 := NULL,
   tablespace_name      IN VARCHAR2 := NULL);
```

Parameters

Table 125–14 CREATE_STGTAB_SQLSET Procedure Parameters

Parameter	Description
table_name	The name of the table to create (case-sensitive)
schema_name	The schema in which to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	The tablespace in which to store the staging table, or NULL for current user's default tablespace (case-sensitive)

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLSET Procedure.
- This procedure can be called multiple times if you would like to have different tuning sets in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.
- Users issuing the call must have permission to CREATE TABLE in the schema provided and the relevant tablespace.
- Please note that the staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

CREATE_TUNING_TASK Functions

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the Cursor Cache given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.

In all cases, the function mainly creates an advisor task and sets its parameters.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

SQL text format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  user_name         IN VARCHAR2  := NULL,
  scope             IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sql_id            IN VARCHAR2,
  plan_hash_value   IN NUMBER    := NULL,
  scope             IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  sql_id            IN VARCHAR2,
  plan_hash_value   IN NUMBER    := NULL,
  scope             IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQLSET format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sqlset_name        IN VARCHAR2,
  basic_filter       IN VARCHAR2 :=  NULL,
```

```
  object_filter     IN VARCHAR2 :=  NULL,
  rank1             IN VARCHAR2 :=  NULL,
  rank2             IN VARCHAR2 :=  NULL,
  rank3             IN VARCHAR2 :=  NULL,
  result_percentage IN NUMBER   :=  NULL,
  result_limit      IN NUMBER   :=  NULL,
  scope             IN VARCHAR2 :=  SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER   :=  TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2 :=  NULL,
  description       IN VARCHAR2 :=  NULL
  plan_filter       IN VARCHAR2 :=  'MAX_ELAPSED_TIME',
  sqlset_owner      IN VARCHAR2 :=  NULL)
RETURN VARCHAR2;
```

Parameters

Table 125–15 CREATE_TUNING_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sql_id	Identifier of a SQL statement
bind_list	An ordered list of bind values in ANYDATA type
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from the (filtered/ranked) SQL
user_name	Username for whom the statement is to be tuned
scope	Tuning scope (limited/comprehensive)
time_limit	The maximum duration in seconds for the tuning session
task_name	Optional tuning task name
description	Description of the SQL tuning session to a maximum of 256 characters

Table 125–15 (Cont.) CREATE_TUNING_TASK Function Parameters

Parameter	Description
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value) associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are: ■ LAST_GENERATED: plan with the most recent timestamp ■ FIRST_GENERATED: plan with the earliest timestamp, the opposite to LAST_GENERATED ■ LAST_LOADED: plan with the most recent first_load_time statistics information ■ FIRST_LOADED: plan with the earliest first_load_time statistics information, the opposite to LAST_LOADED ■ MAX_ELAPSED_TIME: plan with the maximum elapsed time ■ MAX_BUFFER_GETS: plan with the maximum buffer gets ■ MAX_DISK_READS: plan with the maximum disk reads ■ MAX_DIRECT_WRITES: plan with the maximum direct writes ■ MAX_OPTIMIZER_COST: plan with the maximum optimizer cost
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

Usage Notes

With regard to the form of this subprogram that takes a SQL Tuning Set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
  sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24');

-- tune in limited scope
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', -
   scope => 'LIMITED');

-- only give 10 minutes for tuning statement
```

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', -
   time_limit => 600);

-- Workload repository format
exec :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
   end_snap => 2, sql_id => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then tune it)

-- Tune our statements in order by buffer gets, time limit of one hour
-- the default ranking measure is elapsed time.
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
  sqlset_name  => 'my_workload', -
  rank1        => 'BUFFER_GETS', -
  time_limit   => 3600, -
  description  => 'tune my workload ordered by buffer gets');
```

DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
   sqlset_name   IN  VARCHAR2,
   basic_filter  IN  VARCHAR2 := NULL,
   sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 125–16 DELETE_SQLSET Procedure Parameters

Parameter	Description
`sqlset_name`	The SQL tuning set name
`basic_filter`	SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the Tuning Set.
`sqlset_owner`	The owner of the SQL tuning set, or `NULL` for current schema owner

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload', -
                                basic_filter  => 'elapsed_time < 1000000');
```

DROP_SQL_PROFILE Procedure

This procedure drops the named SQL Profile from the database.

> **See Also:** SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (
   name          IN  VARCHAR2,
   ignore        IN  BOOLEAN  := FALSE);
```

Parameters

Table 125–17 DROP_SQL_PROFILE Procedure Parameters

Parameter	Description
`name`	The (mandatory) name of SQL Profile to be dropped. The name is case sensitive.
`ignore`	Ignores errors due to object not existing

Usage Notes

Requires the "`DROP ANY SQL PROFILE`" privilege.

Examples

```
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (
   sqlset_name   IN  VARCHAR2,
   sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 125–18 DROP_SQLSET Procedure Parameters

Parameter	Description
`sqlset_name`	The SQL tuning set name
`sqlset_owner`	The owner of the SQL tuning set, or `NULL` for current schema owner

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task.The task and all its result data are deleted.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 125–19 DROP_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to drop

EXECUTE_TUNING_TASK Function & Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK(
   task_name         IN VARCHAR2,
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL)
 RETURN VARCHAR2;

DBMS_SQLTUNE.EXECUTE_TUNING_TASK(
   task_name         IN VARCHAR2,
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL);
```

Parameters

Table 125–20 EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
`task_name`	Name of the tuning task to execute
`execution_name`	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
`execution_params`	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set via the SET_TUNING_TASK_PARAMETER Procedures).
`execution_desc`	A 256-length string describing the execution

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

IMPLEMENT_TUNING_TASK Function

This function implements a set of SQL Profile recommendations made by the SQL Tuning Advisor. Call this subprogram is equivalent to calling the SCRIPT_TUNING_TASK Function and then running the script.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name      IN VARCHAR2,
    rec_type       IN VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name     IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL);
```

Parameters

Table 125–21 IMPLEMENT_TUNING_TASK Function Parameters

Parameter	Description
`task_name`	Name of the tuning task for which to implement recommendations
`rec_type`	Filter the types of recommendations to implement. Only '`PROFILES`' is supported.
`owner_name`	Owner of the relevant tuning task or `NULL` for the current user.
`execution_name`	name of the task execution to use. If `NULL`, recommendations from the last task execution will be implemented.

INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task will end its operations as it would at normal exit so that the user will be able access the intermediate results.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 125–22 INTERRUPT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to interrupt

Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (
   sqlset_name       IN  VARCHAR2,
   populate_cursor   IN  sqlset_cursor,
   load_option       IN VARCHAR2 := 'INSERT',
   update_option     IN VARCHAR2 := 'REPLACE',
   update_condition  IN VARCHAR2 :=  NULL,
   update_attributes IN VARCHAR2 :=  NULL,
   ignore_null       IN BOOLEAN  :=  TRUE,
   commit_rows       IN POSITIVE :=  NULL,
   sqlset_owner      IN VARCHAR2 := NULL);
```

Parameters

Table 125–23 LOAD_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name to populate
populate_cursor	The cursor reference from which to populate
load_option	Specifies how the statements will be loaded into the SQL tuning set. The possible values are: ■ INSERT (default) - add only new statements ■ UPDATE - update existing the SQL statements and ignores any new statements ■ MERGE - this is a combination of the two other options. This option inserts new statements and updates the information of the existing ones.
update_option	Specifies how the existing statements will be updated. This parameter is considered only if load_option is specified with 'UPDATE'/'MERGE' as an option. The possible values are: ■ REPLACE (default) - update the statement using the new statistics, bind list, object list, and so on. ■ ACCUMULATE - when possible combine attributes (for example, statistics like elapsed_time, and so on) otherwise just replace the old values (for example, module, action, and so on) by the new provided ones. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.

Table 125–23 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
update_condition	Specifies a where clause to execute the update operation. The update is performed only if the specified condition is true. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: ■ OLD - to refer to statement attributes from the SQL tuning set (destination) ■ NEW - to refer to statements attributes from the input statements (source)
update_attributes	Specifies the list of a SQL statement attributes to update during a merge or update operation.The possible values are: ■ NULL (default) - the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution context like module, action, and so on. ■ BASIC - statistics and binds only ■ TYPICAL - BASIC + SQL plans (without row source statistics) and without object reference list ■ ALL - all attributes including the execution context attributes like module, action, and so on. ■ List of comma separated attribute names to update - EXECUTION_CONTEXT, EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)
ignore_null	If TRUE do not update an attribute if the new value is NULL. That is, do not override with NULL values unless intentional.
commit_rows	If a value is provided, the load will commit after each set of that many statements is inserted. If NULL is provided, the load will commit only once, at the end of the operation.
sqlset_owner	The owner of the SQL tuning set, or the current schema owner or NULL for current owner

Exceptions

- This procedure returns an error when sqlset_name is invalid, or a corresponding SQL tuning set does not exist, or the populate_cursor is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in sqlset_row), or because they violate the user's privileges.

Usage Notes

Rows in the input populate_cursor must be of type SQLSET_ROW.

Examples

In this example, you create and populate a SQL tuning set with all cursor cache statements with an elapsed time of 5 seconds or more excluding statements that belong to SYS schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which will only load new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the cursor cache
DECLARE
 cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
 OPEN cur FOR
   SELECT VALUE(P)
     FROM table(
       DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
         'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
         'ALL')) P;

DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                         populate_cursor => cur);

END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with `'ACCUMULATE'` as your `update_option` because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the `SYS`-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
                                                'parsing_schema_name <> ''SYS''',
                                                NULL, NULL,NULL,NULL,
                                                1,
                                                NULL,
                                                'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                           populate_cursor => cur,
                           Using DBMS_SQLTUNE
                           load_option => 'MERGE',
                           update_option => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that `'INSERT'` is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
```

```
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
populate_cursor => cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                           populate_cursor => cur,
                           load_option => 'UPDATE');
END;
/
```

PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the SYS. schema into the staging table.

> **See Also:** SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
   profile_name          IN VARCHAR2 := '%',
   profile_category      IN VARCHAR2 := 'DEFAULT',
   staging_table_name    IN VARCHAR2,
   staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 125–24 PACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to pack (% wildcards acceptable, case-sensitive)
profile_category	The category to pack profiles from (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Usage Notes

- This procedures requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.
- Note that this function issues a COMMIT after packing each SQL profile, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles that will be used by default on this system.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name => 'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this will even move profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
                                       staging_table_name => 'PROFILE_STGTAB');
```

PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET Procedure.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
   sqlset_name          IN VARCHAR2,
   sqlset_owner         IN VARCHAR2 := NULL,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 125–25 PACK_STGTAB_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The name of the SQL Tuning Set to pack (% wildcards acceptable, case-sensitive)
sqlset_owner	The category from which to pack SQL Tuning Sets (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-sensitive)
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- This procedure can be called several times to move more than one SQL tuning set. Users can then move the populated staging table to another system using any method, such as database link or datapump. Users can then call the UNPACK_STGTAB_SQLSET Procedure create the SQL tuning set on the other system.
- Note that this function issues a COMMIT after packing each SQL tuning set, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the system in the staging table (to create a staging table, see the CREATE_STGTAB_SQLSET Procedure).

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name        => '%', -
                                     sqlset_owner       => '%', -
                                     staging_table_name => 'STGTAB_SQLSET');
```

Put only those SQL tuning sets owned by the current user in the staging table.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name        => '%', -
                                     staging_table_name => 'STGTAB_SQLSET');
```

Pack a specific SQL tuning set.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name        => 'my_workload', -
                                     staging_table_name => 'STGTAB_SQLSET');
```

Pack a second SQL tuning set.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name        => 'workload_subset', -
                                     staging_table_name => 'STGTAB_SQLSET');
```

REMAP_STGTAB_SQLPROF Procedure

This procedure allows DBAs to change the profile data values kept in the staging table prior to performing an unpack operation. The procedure can be used to change the category of a profile.It can be used to change the name of a profile if one already exists on the system with the same name.

See Also: SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 125–26 REMAP_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
`old_profile_name`	The name of the profile to target for a remap operation (case-sensitive)
`new_profile_name`	The new name of the profile, or `NULL` to remain the same (case-sensitive)
`new_profile_category`	The new category for the profile, or `NULL` to remain the same (case-sensitive)
`staging_table_name`	The name of the table on which to perform the remap operation (case-sensitive). Required.
`staging_schema_owner`	The schema where the table resides, or `NULL` for current schema (case-sensitive)

Usage Notes

Using this procedure requires the `UPDATE` privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name    => :pname,          -
                                       new_profile_name    => 'IMP' || :pname, -
                                       staging_table_name  => 'PROFILE_STGTAB');
```

Change the SQL profile in the staging table to be `'TEST'` category before we import it. This way users can test the profile on the new system before it is active.

```
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name     => :pname,       -
                                       new_profile_category => 'TEST',       -
                                       staging_table_name   => 'PROFILE_STGTAB');
```

REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system.

> **See Also:** SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
   old_sqlset_name        IN VARCHAR2,
   old_sqlset_owner       IN VARCHAR2 := NULL,
   new_sqlset_name        IN VARCHAR2 := NULL,
   new_sqlset_owner       IN VARCHAR2 := NULL,
   staging_table_name     IN VARCHAR2,
   taging_schema_owner   IN VARCHAR2 := NULL);
```

Parameters

Table 125–27 REMAP_STGTAB_SQLSET Procedure Parameters

Parameter	Description
`old_sqlset_name`	The name of the tuning set to target for a remap operation. Wildcards are not supported.
`old_sqlset_owner`	The new name of the tuning set owner to target for a remap operation. `NULL` for current schema owner
`new_sqlset_name`	The new name for the tuning set, or `NULL` to keep the same tuning set name.
`new_sqlset_owner`	The new owner for the tuning set, or `NULL` to remain the same owner name.
`staging_table_name`	The name of the table on which to perform the remap operation (case-sensitive)
`staging_schema_owner`	The name of staging table owner, or `NULL` for current schema owner (case-sensitive)

Usage Notes

You can call this procedure multiple times to remap more than one tuning set name or owner. Note that this procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name    => 'my_workload', -
                                      old_sqlset_owner   => 'SH', -
                                      new_sqlset_name    => 'imp_workload', -
                                      staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name    => 'imp_workload', -
                                      old_sqlset_owner   => 'SH', -
                                      new_sqlset_owner   => 'SYS', -
                                      staging_table_name => 'STGTAB_SQLSET');
```

REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate it is no longer used by the client.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
   sqlset_name   IN  VARCHAR2,
   reference_id  IN  NUMBER);
```

Parameters

Table 125–28 REMOVE_SQLSET_REFERENCE Procedure Parameters

Parameter	Description
`sqlset_name`	The SQL tuning set name
`reference_id`	The identifier of the reference to remove

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again.

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
                                sqlset_name   => 'my_workload', -
                                reference_id  => :rid);
```

Use views `USER/DBA_SQLSET_REFERENCES` to find all references on a given SQL tuning set.

REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task. This differs from theREPORT_AUTO_TUNING_TASK Function in that it reports on a range of subtasks.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec      IN VARCHAR2  := NULL,
    end_exec        IN VARCHAR2  := NULL,
    type            IN VARCHAR2  := TYPE_TEXT,
    level           IN VARCHAR2  := LEVEL_TYPICAL,
    section         IN VARCHAR2  := SECTION_ALL,
    object_id       IN NUMBER    := NULL,
    result_limit    IN NUMBER    := NULL,
    segment_scheme IN VARCHAR2  := SEGMENT_NONE)
  RETURN CLOB;
```

Parameters

Table 125–29 REPORT_AUTO_TUNING_TASK Function Parameters

Parameter	Description
begin_exec	Name of execution from which to begin the report. NULL retrieves a report on the most recent run
end_exec	Name of execution at which to end the report. NULL retrieves a report on the most recent run.
type	Type of the report to produce. Possible values are TYPE_TEXT which produces a text report
level	Level of detail in the report: ■ LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor. ■ LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented. ■ LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Optionally limit the report to a single section (ALL for all sections): ■ SECTION_SUMMARY - summary information ■ SECTION_FINDINGS - tuning findings ■ SECTION_PLAN - explain plans ■ SECTION_INFORMATION - general information ■ SECTION_ERROR - statements with errors ■ SECTION_ALL - all statements
object_id	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report
segment_scheme	Currently non-operational

Return Values

A CLOB containing the desired report.

REPORT_SQL_MONITOR Function

This function builds a report (in Text, HTML or XML) to present the monitoring information collected with regard to the execution of a SQL statement. Note that this function is provided for ease of use and the structure or content of this report could change in future releases.

> **See Also:** Real-time SQL Monitoring Subprograms on page 125-14 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITORK(
   sql_id                 IN VARCHAR2  := NULL,
   session_id             IN NUMBER    := NULL,
   session_serial         IN NUMBER    := NULL,
   sql_exec_start         IN DATE      := NULL,
   sql_exec_id            IN NUMBER    := NULL,
   inst_id                IN NUMBER    := -1,
   start_time_filter      IN DATE      := NULL,
   end_time_filter        IN DATE      := NULL,
   instance_id_filter     IN NUMBER    := NULL,
   parallel_filter        IN VARCHAR2  := NULL,
   event_detail           IN VARCHAR2  := 'YES',
   report_level           IN VARCHAR2  := 'TYPICAL',
   type                   IN VARCHAR2  := 'TEXT')
 RETURN CLOB;
```

Parameters

Table 125–30 REPORT_SQL_MONITOR Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
session_id	If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
sql_exec_start	This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
sql_exec_id	This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.

Table 125–30 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
inst_id	Only considers statements started on the specified instance. Use -1 (the default) to target the login instance. NULL will target all instances.
start_time_filter	If not NULL, the report will only consider the activity (from GV$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity will start when the execution of the targeted SQL statement has started.
end_time_filter	If not NULL, the report will show only the activity (from GV$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity will end when the targeted SQL statement execution has ended or is the current time if the statement is still executing.
instance_id_filter	Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.
parallel_filter	Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be: ■ NULL to target all processes ■ [qc][servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]: 'qc' stands for query coordinator and servers() stipulate which PX servers to consider. The following examples show how to target a subset of the parallel processes: ■ qc: targets only the query coordinator ■ servers(1): targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel. ■ servers(,2): targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers) ■ servers(1,1): consider only group 1, set 1 ■ servers(1,2,4): consider only group 1, set 2, server number 4. This reports for a single parallel server process ■ qc servers(1,2,4): same as above by also including the query coordinator
event_detail	When value is 'YES' (the default), reported activity from GV$ACTIVE_SESSION_HISTORY is aggregated by (wait_class, event_name). Use 'NO' to only aggregate by wait_class.
report_level	Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Individual report sections can also be enabled/disabled by using a +/-<section_name>. Several sections are defined: 'PLAN', 'PARALLEL', 'SESSIONS', 'INSTANCE', and 'SQL_TEXT'. For example, use 'BASIC +PARALLEL' to show the basic report with an additional section reporting parallel information. Or use 'ALL -PLAN -INSTANCE' for a complete report excluding plan detail and instance information.

Table 125–30 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML' or 'XML'.

Return Values

A CLOB containing the desired report.

Usage Notes

- The target SQL statement for this report can be:
  - The last SQL monitored by Oracle (this is the default behavior, so there is no need to specify any parameter)
  - The last SQL executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally it serial number. For example, use session_id=>USERENV('SID') for the current session or session_id=>20, session_serial=>103 for session ID 20, serial number 103.
  - The last execution of a specific statement identified by its sql_id.
  - A specific execution of a SQL statement identified by its execution key (sql_id, sql_exec_start and sql_exec_id).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the SELECT_CATALOG role).
  - GV$SQL_MONITOR
  - GV$SQL_PLAN_MONITOR
  - GV$SQL_PLAN
  - GV$ACTIVE_SESSION_HISTORY
  - GV$SESSION_LONGOPS
  - GV$SQL

  See Also: *Oracle Database Performance Tuning Guide* for more information about SQL real-time monitoring.

REPORT_TUNING_TASK Function

This procedure displays the results of a tuning task.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK(
   task_name       IN   VARCHAR2,
   type            IN   VARCHAR2   := TYPE_TEXT,
   level           IN   VARCHAR2   := LEVEL_TYPICAL,
   section         IN   VARCHAR2   := SECTION_ALL,
   object_id       IN   NUMBER     := NULL,
   result_limit    IN   NUMBER     := NULL,
   owner_name      IN    VARCHAR2  := NULL,
   execution_name  IN  VARCHAR2    := NULL))
RETURN CLOB;
```

Parameters

Table 125–31 REPORT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task to report
type	Type of the report to produce. Possible values are TYPE TEXT which produces a text report.
level	Level of detail in the report: ■ LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor. ■ LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented. ■ LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Optionally limit the report to a single section (ALL for all sections): ■ SECTION_SUMMARY - summary information ■ SECTION_FINDINGS - tuning findings ■ SECTION_PLAN - explain plans ■ SECTION_INFORMATION - general information ■ SECTION_ERROR - statements with errors ■ SECTION_ALL - all statements
object_id	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

Return Values

A CLOB containing the desired report.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS',
5) from dual;
```

RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 125–32 RESET_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
 task_name         IN VARCHAR2,
 basic_filter      IN VARCHAR2 := NULL);
```

Parameters

Table 125–33 RESUME_TUNING_TASK Procedure Parameters

Parameter	Description
`task_name`	The name of the tuning task to resume
`basic_filter`	A SQL predicate to filter the SQL from the SQL Tuning Set. Note that this filter will be applied in conjunction with the basic filter (i.e., parameter `basic_filter`) when calling CREATE_TUNING_TASK Functions.

Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide.  For this example we will just resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

SCRIPT_TUNING_TASK Function

This function creates a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations.

> **See Also:** SQL Tuning Advisor Subprograms on page 125-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name          IN VARCHAR2,
  rec_type           IN VARCHAR2  := REC_TYPE_ALL,
  object_id          IN NUMBER    := NULL,
  result_limit       IN NUMNBER   := NULL,
  owner_name         IN VARCHAR2  := NULL,
  execution_name     IN VARCHAR2  := NULL)
 RETURN CLOB;
```

Parameters

Table 125–34 SCRIPT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task for which to apply a script
rec_type	Filter the script by types of recommendations to include. Any subset of the following separated by commas: or 'ALL: ''PROFILES''STATISTICS''INDEXES'. For example, a script with profiles and statistics: 'PROFILES,STATISTICS'
object_id	Optionally filters by a single object ID
result_limit	Optionally shows commands for only top N SQL (ordered by object_id and ignored if an object_id is also specified)
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner
excution_name	Name of the task execution to use. If NULL, the script will be generated for the last task execution.

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- Once the script is returned, it should then by checked by the DBA and executed.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of just the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;
```

```
-- get a script of just stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about just one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

SELECT_CURSOR_CACHE Function

This function collects SQL statements from the SQL Cursor Cache.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter        IN   VARCHAR2 := NULL,
  object_filter       IN   VARCHAR2 := NULL,
  ranking_measure1    IN   VARCHAR2 := NULL,
  ranking_measure2    IN   VARCHAR2 := NULL,
  ranking_measure3    IN   VARCHAR2 := NULL,
  result_percentage   IN   NUMBER   := 1,
  result_limit        IN   NUMBER   := NULL,
  attribute_list      IN   VARCHAR2 := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 125–35 SELECT_CURSOR_CACHE Procedure Parameters

Parameter	Description
`sqlset_name`	The SQL tuning set name
`basic_filter`	The SQL predicate to filter the SQL from the cursor cache defined on attributes of the `SQLSET_ROW`
`object_filter`	Specifies the objects that should exist in the object list of selected SQL from the cursor cache
`ranking_measure(n)`	An order-by clause on the selected SQL
`result_percentage`	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
`result_limit`	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
`attribute_list`	List of SQL statement attributes to return in the result. The possible values are: ▪ `BASIC` (default) -all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ▪ `TYPICAL` - `BASIC` + SQL plan (without row source statistics) and without object reference list ▪ `ALL` - return all attributes ▪ Comma separated list of attribute names this allows to return only a subset of SQL attributes: `EXECUTION_STATISTICS`, `BIND_LIST`, `OBJECT_LIST`, SQL_PLAN,`SQL_PLAN_STATISTICS`: similar to `SQL_PLAN` + row source statistics

Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the cursor cache views.

Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j'''));

-- Notice that some statements can have multiple plans.  The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value).  This is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset will be called after opening a cursor, along the
-- lines given below

-- Select all statements in the cursor cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(P)
    FROM table(
     DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
end;
/

-- All statements from a particular module/action.
```

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
         'module = ''MY_APPLICATION'' and action = ''MY_ACTION''')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/

-- all statements that ran for at least five seconds
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'buffer_gets > 100 and parsing_schema_name = ''APPS'''))P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(dbms_sqltune.select_cursor_cache(
      'elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
```

```
      'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/

-- Select the top 100 statements in the cursor cache ordering by elapsed_time.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'ELAPSED_TIME', NULL, NULL,
                                                1,
                                                100)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the cursor cache.  This means that the buffer gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'BUFFER_GETS', NULL, NULL,
                                                .9)) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

SELECT_SQLSET Function

This function reads SQLSET contents.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name         IN   VARCHAR2,
  basic_filter        IN   VARCHAR2 := NULL,
  object_filter       IN   VARCHAR2 := NULL,
  ranking_measure1    IN   VARCHAR2 := NULL,
  ranking_measure2    IN   VARCHAR2 := NULL,
  ranking_measure3    IN   VARCHAR2 := NULL,
  result_percentage   IN   NUMBER   := 1,
  result_limit        IN   NUMBER   := NULL)
  attribute_list      IN   VARCHAR2 := NULL,
  plan_filter         IN   VARCHAR2 := NULL,
  sqlset_owner        IN   VARCHAR2 := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 125–36 SELECT_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	The SQL predicate to filter the SQL from the SQL Tuning Set defined on attributes of the SQLSET_ROW
object_filter	Specifies the objects that should exist in the object list of selected SQL from the cursor cache
ranking_measure(n)	An order-by clause on the selected SQL
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: ■ BASIC (default) -all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list ■ ALL - return all attributes ■ Comma separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN,SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)
plan_filter	The plan filter

Table 125–36 (Cont.) SELECT_SQLSET Procedure Parameters

Parameter	Description
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

SELECT_WORKLOAD_REPOSITORY Functions

This function collects SQL statements from the workload repository. The overloaded forms let you:

- Collect SQL statements from all snapshots between `begin_snap` and `end_snap`.
- Collect SQL statements from a workload repository baseline.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLAOD_REPOSITORY (
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL
  attribute_list    IN VARCHAR2 := NULL)
 RETURN sys.sqlset PIPELINED;

DBMS_SQLTUNE.SELECT_WORKLAOD REPOSITORY (
  baseline_name     IN VARCHAR2,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL)
  attribute_list    IN VARCHAR2 := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 125–37 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
`begin_snap`	Begin snapshot (non-inclusive)
`end_snap`	End snapshot (inclusive)
`baseline_name`	The name of the baseline period
`basic_filter`	The SQL predicate to filter the SQL from the workload repository defined on attributes of the `SQLSET_ROW`
`object_filter`	Specifies the objects that should exist in the object list of selected SQL from the SWRF
`ranking_measure(n)`	An order-by clause on the selected SQL
`result_percentage`	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.

Table 125–37 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: ■ BASIC (default) -all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list ■ ALL - return all attributes ■ Comma separated list of attribute names allowing return of only a subset of SQL attributes: EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN,SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

The task must be set to its initial state before calling this procedure.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.set_tuning_task_parameter(
   task_name    IN  VARCHAR2,
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);

DBMS_SQLTUNE.set_tuning_task_parameter(
   task_name    IN  VARCHAR2,
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 125–38 SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
`task_name`	Identifier of the task to execute

Table 125–38 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2: ■ MODE: tuning scope (comprehensive, limited) ■ USERNAME: username under which the statement will be parsed ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task) ■ DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function & Procedure. ■ TIME_LIMIT: global time out (seconds) ■ LOCAL_TIME_LIMIT: per-statement time out (seconds) ■ TEST_EXECUTE: FULL/AUTO/OFF. * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute ■ BASIC_FILTER: basic filter for SQL tuning set ■ OBJECT_FILTER: object filter for SQL tuning set ■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_LIMIT: maximum number of SQL statements to tune ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements
parameter (cont.)	The following parameters are supported for the automatic tuning task only: ■ ACCEPT_SQL_PROFILES: TRUE/FALSE: whether the task should accept SQL Profiles automatically ■ MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum ■ MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.
value	New value of the specified parameter

SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in `dba_sql_profiles`.

> **See Also:** SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
  sql_text    IN CLOB,
  force_match IN BOOLEAN  := FALSE)
 RETURN NUMBER;
```

Parameters

Table 125–39 SQLTEXT_TO_SIGNATURE Function Parameters

Parameter	Description
`sql_text`	SQL text whose signature is required. Required.
`force_match`	If `TRUE`, this returns a signature that supports SQL matching with literal values transformed into bind variables. If `FALSE`, returns the signature based on the text with literals not transformed

Return Values

This function returns the signature of the specified SQL text.

UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

> **See Also:** SQL Profile Subprograms on page 125-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
   profile_name          IN VARCHAR2 := '%',
   profile_category      IN VARCHAR2 := 'DEFAULT',
   replace               IN BOOLEAN,
   staging_table_name    IN VARCHAR2,
   staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 125–40 UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
`profile_name`	The name of the profile to unpack (% wildcards acceptable, case-sensitive)
`profile_category`	The category from which to unpack profiles (% wildcards acceptable, case-sensitive)
`replace`	The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If `FALSE`, this function raises errors if you try to create a profile that already exists
`staging_table_name`	The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.
`staging_schema_owner`	The schema where the table resides, or `NULL` for current schema (case-insensitive unless double quoted)

Usage Notes

Using this procedure requires the `CREATE ANY SQL PROFILE` privilege and the `SELECT` privilege on staging table.

Examples

```
-- Unpack all profiles stored in a staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace            => FALSE, -
                                        staging_table_name => 'PROFILE_STGTAB');

-- If there is a failure during the unpack operation, users can find the profile
-- we failed on and perform a remap_stgtab_sqlprof operation targeting it.  Then
-- they can resume the unpack operation by setting replace to TRUE so that
-- the profiles that were already created will just be replaced
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace            => TRUE, -
                                        staging_table_name => 'PROFILE_STGTAB');
```

UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
   sqlset_name          IN VARCHAR2 := '%',
   sqlset_owner         IN VARCHAR2 := NULL,
   replace              IN BOOLEAN,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 125–41 UNPACK_STGTAB_SQLSET Procedure Parameters

Parameter	Description
`sqlset_name`	The name of the tuning set to unpack (not NULL). Wildcard characters ('%') are supported to unpack multiple tuning sets in a single call. For example, just specify '%' to unpack all tuning sets from the staging table.
`sqlset_owner`	The name of tuning set owner, or `NULL` for current schema owner. Wildcards supported.
`replace`	Replaces tuning set if they already exist.If `FALSE`, raises errors if you try to create a tuning set that already exists
`staging_table_name`	The name of the staging table, moved after a call to the PACK_STGTAB_SQLSET Procedure (case-sensitive)
`staging_schema_owner`	The name of staging table owner, or `NULL` for current schema owner (case-sensitive)

Usage Notes

- Users can drop the staging table after this procedure completes successfully.
- The unpack procedure commits after successfully loading each SQL tuning set. If it fails with one tuning set, no part of that tuning set will have been unpacked, but those which the subprogram had already apprehended will continue to exist.
- When failures occur due to SQL tuning set name or owner conflicts, users should use the REMAP_STGTAB_SQLSET Procedure to patch the staging table, and then call this procedure again to unpack those tuning sets that remain.

Examples

```
 -- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name         => '%', -
                                       sqlset_owner        => '%', -
                                       replace             => FALSE, -
                                       staging_table_name  => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system.  In this case, users should call
```

```
-- remap_stgtab_sqlset to patch the staging table and with which to call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name         => '%', -
                                       sqlset_owner        => '%', -
                                       replace             => TRUE, -
                                       staging_table_name  => 'STGTAB_SQLSET');
```

UPDATE_SQLSET Procedures

This procedure updates selected fields for SQL statement in a SQL tuning set.

> **See Also:** SQL Tuning Set Subprograms on page 125-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   attribute_name   IN  VARCHAR2,
   attribute_value IN NUMBER := NULL);
```

Parameters

Table 125–42 UPDATE_SQLSET Function Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
sql_id	The identifier of the statement to update
attribute_name	The name of the attribute to modify
attribute_value	The new value of the attribute

126

DBMS_STAT_FUNCS

The DBMS_STAT_FUNCS package provides statistical functions.

This chapter contains the following topic:

- Summary of DBMS_STAT_FUNCS Subprograms

Summary of DBMS_STAT_FUNCS Subprograms

Table 126–1 DBMS_STAT_FUNCS Package Subprograms

Subprogram	Description
EXPONENTIAL_DIST_FIT Procedure on page 126-3	Tests how well a sample of values fits an exponential distribution
NORMAL_DIST_FIT Procedure on page 126-4	Tests how well a sample of values fits a normal distribution
POISSON_DIST_FIT Procedure on page 126-5	Tests how well a sample of values fits a Poisson distribution
SUMMARY Procedure on page 126-6	Summarizes a numerical column of a table
UNIFORM_DIST_FIT Procedure on page 126-7	Tests how well a sample of values fits a uniform distribution
WEIBULL_DIST_FIT Procedure on page 126-8	Tests how well a sample of values fits a Weibull distribution

EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   lambda       IN    NUMBER,
   mu           IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 126–2 EXPONENTIAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED','KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The scale parameter.
mu	The location parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.

NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
   mean         IN    NUMBER,
   stdev        IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 126–3 NORMAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.
mean	The mean of the distribution against which to compare.
stdev	The standard deviation of the distribution against which to compare.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.

POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   lambda       IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 126–4 POISSON_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The lambda parameter is the shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.

SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`. The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   sigma_value  IN    NUMBER DEFAULT 3,
   s           OUT    SummaryType);
```

Parameters

Table 126–5 SUMMARY Procedure Parameters

Parameter	Description
`ownername`	The schema where the table resides.
`tablename`	The table where the column resides.
`columnname`	The column of the table to be summarized.
`sigma_value`	The number of sigmas for the set of extreme values, defaults to 3.
`s`	The Record containing summary information about given column.

Definition of SummaryType

```
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
   count             NUMBER,
   min               NUMBER,
   max               NUMBER,
   range             NUMBER,
   mean              NUMBER,
   cmode             num_table,
   variance          NUMBER,
   stddev            NUMBER,
   quantile_5        NUMBER,
   quantile_25       NUMBER,
   median            NUMBER,
   quantile_75       NUMBER,
   quantile_95       NUMBER,
   plus_x_sigma      NUMBER,
   minus_x_sigma     NUMBER,
   extreme_values    num_table,
   top_5_values      n_arr,
   bottom_5_values   n_arr);
```

UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   var_type     IN    VARCHAR2 DEFAULT 'CONTINUOUS',
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   paramA       IN    NUMBER,
   paramB       IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 126–6 UNIFORM_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
var_type	The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'
test_type	The type of test to use: 'CHI_SQUARED','KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
paramA	Parameter A estimated from the sample (the location parameter).
paramB	Parameter B estimated from the sample (the scale parameter).
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.

WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   alpha        IN    NUMBER,
   mu           IN    NUMBER,
   beta         IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 126–7 WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
alpha	The scale parameter.
mu	The location parameter.
beta	The slope/shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.

127

DBMS_STATS

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

> **See Also:** *Oracle Database Performance Tuning Guide*

This chapter contains the following topics:

- Using DBMS_STATS
  - Overview
  - Types
  - Constants
  - Operational Notes
  - Deprecated Subprograms
  - Examples
- Summary of DBMS_STATS Subprograms

Using DBMS_STATS

This section contains topics which relate to using the `DBMS_STATS` package.

- Overview
- Types
- Constants

Overview

The Oracle RDBMS allows you to collect statistics of many different kinds as an aid to improving performance. This package is concerned with optimizer statistics only. Given that Oracle sets automatic statistics collection of this kind on by default, this package is intended for only specialized cases.

The statistics of interest to be viewed or modified can reside in the dictionary or in a table created in the user's schema for this purpose. You can also collect and manage user-defined statistics for tables and domain indexes using this package.

For example, if the `DELETE_COLUMN_STATS` procedure is invoked on a column for which an association is defined, user-defined statistics for that column are deleted in addition to deletion of the standard statistics.

Only statistics stored in the dictionary have an impact on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about "Managing Optimizer Statistics".

Types

Types for the minimum and maximum values and histogram endpoints include:

```
TYPE numarray  IS VARRAY(256) OF NUMBER;
TYPE datearray IS VARRAY(256) OF DATE;
TYPE chararray IS VARRAY(256) OF VARCHAR2(4000);
TYPE rawarray  IS VARRAY(256) OF RAW(2000);
TYPE fltarray IS VARRAY(256) OF BINARY_FLOAT;
TYPE dblarray IS VARRAY(256) OF BINARY_DOUBLE;

TYPE StatRec IS RECORD (
  epc    NUMBER,
  minval RAW(2000),
  maxval RAW(2000),
  bkvals NUMARRAY,
  novals NUMARRAY);
```

Types for listing stale tables include:

```
TYPE ObjectElem IS RECORD (
  ownname     VARCHAR2(30),     -- owner
  objtype     VARCHAR2(6),      -- 'TABLE' or 'INDEX'
  objname     VARCHAR2(30),     -- table/index
  partname    VARCHAR2(30),     -- partition
  subpartname VARCHAR2(30));    -- subpartition
type ObjectTab is TABLE of ObjectElem;
```

Type for displaying statistics difference report:

```
TYPE DiffRepElem IS RECORD (
 report     CLOB,              -- stats difference report
 maxdiffpct number);           -- max stats difference (percentage)
type DiffRepTab is table of DiffRepElem;
```

Constants

The DBMS_STATS package uses the constants shown in Table 127–1:

Table 127–1 DBMS_AUTO_TASK_ADMIN Constants

Name	Type	Value	Description
AUTO_CASCADE	BOOLEAN	NULL	Lets Oracle decide whether to collect statistics for indexes or not
AUTO_DEGREE	NUMBER	32768	Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters
AUTO_INVALIDATE	BOOLEAN	NULL	Lets Oracle decide when to invalidate dependent cursors
AUTO_SAMPLE_SIZE	NUMBER	0	Indicates that auto-sample size algorithms should be used

Operational Notes

The DBMS_STATS subprograms perform the following general operations:

- Gathering Optimizer Statistics
- Setting or Getting Statistics
- Deleting Statistics
- Transferring Statistics
- Locking or Unlocking Statistics
- Restoring and Purging Statistics History
- User-Defined Statistics
- Pending Statistics
- Comparing Statistics
- Extended Statistics

Most of the DBMS_STATS procedures include the three parameters statown, stattab, and statid. These parameters allow you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with *sets* of statistics.

The stattab parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the statown parameter is specified). You can create multiple tables with different stattab identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single stattab by using the statid parameter, which avoids cluttering the user's schema.

For the SET and GET procedures, if stattab is not provided (that is, NULL), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if stattab is not NULL, then the SET or GET operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of DBMS_STATS procedures using the SET_PARAM Procedure.

Most of the procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a parameter, force which allows you to override any lock on statistics.

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the ANALYZE command:

GATHER_DATABASE_STATS Procedures
GATHER_DICTIONARY_STATS Procedure
GATHER_FIXED_OBJECTS_STATS Procedure
GATHER_INDEX_STATS Procedure

GATHER_SCHEMA_STATS Procedures
GATHER_SYSTEM_STATS Procedure
GATHER_TABLE_STATS Procedure

The GATHER_* procedures also collect user-defined statistics for columns and domain indexes.

The statown, stattab, and statid parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

GENERATE_STATS Procedure

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

PREPARE_COLUMN_VALUES Procedures
PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure

SET_COLUMN_STATS Procedures
SET_INDEX_STATS Procedures
SET_SYSTEM_STATS Procedure
SET_TABLE_STATS Procedure

GET_COLUMN_STATS Procedures
GET_INDEX_STATS Procedures
GET_SYSTEM_STATS Procedure
GET_TABLE_STATS Procedure

In the special versions of the SET_*_STATS procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or external statistics table:

- User-defined statistics (extstats)
- The statistics type schema name (statsschema)
- The statistics type name (statsname)

The user-defined statistics and the corresponding statistics type are inserted into the USTATS$ dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the GET_*_STATS procedures return user-defined statistics and the statistics type owner and name as OUT arguments corresponding to the schema object specified. If user-defined statistics are not collected, NULL values are returned.

Deleting Statistics

The DELETE_* procedures delete both user-defined statistics and the standard statistics for the given schema object.

DELETE_COLUMN_STATS Procedure
DELETE_DATABASE_STATS Procedure
DELETE_DICTIONARY_STATS Procedure

DELETE_FIXED_OBJECTS_STATS Procedure
DELETE_INDEX_STATS Procedure
DELETE_SCHEMA_STATS Procedure
DELETE_SYSTEM_STATS Procedure
DELETE_TABLE_STATS Procedure

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

CREATE_STAT_TABLE Procedure
DROP_STAT_TABLE Procedure

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table (`EXPORT_*`)
- from a user statistics table to the dictionary (`IMPORT_*`)

EXPORT_COLUMN_STATS Procedure
EXPORT_DATABASE_STATS Procedure
EXPORT_DICTIONARY_STATS Procedure
EXPORT_FIXED_OBJECTS_STATS Procedure
EXPORT_INDEX_STATS Procedure
EXPORT_SCHEMA_STATS Procedure
EXPORT_SYSTEM_STATS Procedure
EXPORT_TABLE_STATS Procedure

IMPORT_COLUMN_STATS Procedure
IMPORT_DATABASE_STATS Procedure
IMPORT_DICTIONARY_STATS Procedure
IMPORT_FIXED_OBJECTS_STATS Procedure
IMPORT_INDEX_STATS Procedure
IMPORT_SCHEMA_STATS Procedure
IMPORT_SYSTEM_STATS Procedure
IMPORT_TABLE_STATS Procedure

Note: Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

LOCK_SCHEMA_STATS Procedure
LOCK_TABLE_STATS Procedure

UNLOCK_SCHEMA_STATS Procedure
UNLOCK_TABLE_STATS Procedure

The `LOCK_*` procedures either freeze the current set of the statistics or to keep the statistics empty (uncollected).When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

RESET_GLOBAL_PREFS_DEFAULTS Procedure
RESTORE_DICTIONARY_STATS Procedure
RESTORE_FIXED_OBJECTS_STATS Procedure
RESTORE_SCHEMA_STATS Procedure
RESTORE_SYSTEM_STATS Procedure
RESTORE_TABLE_STATS Procedure

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the ALTER_STATS_HISTORY_RETENTION Procedure.

The other `DBMS_STATS` procedures related to restoring statistics are:

- PURGE_STATS Procedure: This procedure lets you manually purge old versions beyond a time stamp.
- GET_STATS_HISTORY_RETENTION Function: This function gets the current statistics history retention value.
- GET_STATS_HISTORY_AVAILABILITY Function: This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

`RESTORE_*` operations are not supported for user defined statistics.

User-Defined Statistics

The `DBMS_STATS` package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the GET_INDEX_STATS Procedures invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

`SET_*` and `GET_*` operations for user-defined statistics are also supported using a special version of the `SET` and `GET` interfaces for columns and indexes.

`EXPORT_*`, `IMPORT_*` and `RESTORE_*` operations are not supported for user defined statistics.

Pending Statistics

The package gather statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the `PUBLISH` option to `FALSE` using the `SET*PREFS` procedures. The default value for `PUBLISH` is `TRUE`.The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_private_statistics` is set to `TRUE`. The default value of this parameter is `FALSE` and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the EXPORT_PENDING_STATS Procedure) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

Once the performance or query plans have been verified, the pending statistics can be published (run the PUBLISH_PENDING_STATS Procedure) if the performance is acceptable or delete (run the DELETE_PENDING_STATS Procedure) if not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- DELETE_PENDING_STATS Procedure
- EXPORT_PENDING_STATS Procedure
- PUBLISH_PENDING_STATS Procedure

Comparing Statistics

The `DIFF_TABLE_STATS_*` statistics can be used to compare statistics for a table from two different sources. The statistics can be from:

- two different user statistics tables
- a single user statistics table containing two sets of statistics that can be identified using statids
- a user statistics table and dictionary history
- pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function, with a default of 10%. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the differential percentage.

Extended Statistics

This package allows you to collect statistics for column groups and expressions (known as "statistics extensions"). The statistics collected for column groups and expressions are called "extended statistics".

Statistics on Column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates c1=1 and c2=1 and if there are statistics on (c1, c2), the optimizer will use this statistics for estimating the combined selectivity of the predicates.The expression statistics are used by optimizer for estimating selectivity of predicates on those expressions. The extended statistics are similar to column statistics and the procedures that take columns names will accept extension names in place of column names.

Related subprograms:

- CREATE_EXTENDED_STATS Function
- DROP_EXTENDED_STATS Procedure

- SHOW_EXTENDED_STATS_NAME Function

Deprecated Subprograms

The following subprograms are obsolete with Release 11*g*:

- GET_PARAM Function

  Instead, use GET_PREFS Function
- SET_PARAM Procedure

  Instead, use SET_GLOBAL_PREFS Procedure
- RESET_GLOBAL_PREFS_DEFAULTS Procedure

  Instead use RESET_GLOBAL_PREF_DEFAULTS Procedure

Examples

- Using Pending Statistics
- Gathering Daytime System Statistics

Using Pending Statistics

Assume many modifications have been made to the `employees` table since the last time statistics were gathered. To ensure that the cost-based optimizer is still picking the best plan, statistics should be gathered once again; however, the user is concerned that new statistics will cause the optimizer to choose bad plans when the current ones are acceptable. The user can do the following:

```
EXEC DBMS_STATS.SET_TABLE_PREFS('hr', 'employees', 'PUBLISH', 'false');
```

By setting the employees tables publish preference to `FALSE`, any statistics gather from now on will not be automatically published. The newly gathered statistics will be marked as pending.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS ('hr', 'employees');
```

To test the newly gathered statistics, set `optimizer_pending_statistics` to `TRUE` in a session and run sample queries.

```
ALTER SESSION SET optimizer_use_pending_statistics = TRUE;
```

If the pending statistics generate sound execution plans, they can be published:

```
EXEC DBMS_STATS.PUBLISH_PENDING_STATS('hr', 'employees');
EXEC DBMS_STATS.SET_TABLE_PREF('hr', 'employees', 'PUBLISH', 'true');
```

Gathering Daytime System Statistics

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the `MYSTATS` table.

```
BEGIN
   DBMS_STATS.GATHER_SYSTEM_STATS (
      interval => 720,
      stattab  => 'mystats',
      statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the `MYSTATS` table.

```
BEGIN
   DBMS_STATS.GATHER_SYSTEM_STATS (
      interval => 720,
      stattab  => 'mystats',
      statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE   jobno   number;
BEGIN
   DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
```

```
   (''mystats'','''OLTP''');'
   sysdate, 'sysdate + 1');
   COMMIT;
END;

BEGIN
   DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
   (''mystats'','''OLAP''');'
   sysdate + 0.5, 'sysdate + 1');
   COMMIT;
END;
```

Summary of DBMS_STATS Subprograms

Table 127–2 DBMS_STATS Package Subprograms

Subprogram	Description
ALTER_STATS_HISTORY_RETENTION Procedure on page 127-20	Changes the statistics history retention value
CONVERT_RAW_VALUE Procedures on page 127-21	Convert the internal representation of a minimum or maximum value into a datatype-specific value
CONVERT_RAW_VALUE_NVARCHAR Procedure on page 127-22	Convert the internal representation of a minimum or maximum value into a datatype-specific value
CONVERT_RAW_VALUE_ROWID Procedure on page 127-23	Convert the internal representation of a minimum or maximum value into a datatype-specific value
COPY_TABLE_STATS Procedure on page 127-24	Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling
CREATE_EXTENDED_STATS Function on page 127-25	Creates a virtual column for a user specified column group or an expression in a table
CREATE_STAT_TABLE Procedure on page 127-27	Creates a table with name `stattab` in ownname's schema which is capable of holding statistics
DELETE_COLUMN_STATS Procedure on page 127-28	Deletes column-related statistics
DELETE_DATABASE_PREFS Procedure on page 127-30	Deletes the statistics preferences of all the tables, excluding the tables owned by Oracle.
DELETE_DATABASE_STATS Procedure on page 127-33	Deletes statistics for the entire database
DELETE_DICTIONARY_STATS Procedure on page 127-34	Deletes statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas)
DELETE_FIXED_OBJECTS_STATS Procedure on page 127-33	Deletes statistics of all fixed tables
DELETE_INDEX_STATS Procedure on page 127-36	Deletes index-related statistics
DELETE_PENDING_STATS Procedure on page 127-37	Deletes the private statistics that have been collected but have not been published
DELETE_SCHEMA_PREFS Procedure on page 127-38	Deletes the statistics preferences of all the tables owned by the specified owner name
DELETE_SCHEMA_STATS Procedure on page 127-41	Deletes schema-related statistics
DELETE_SYSTEM_STATS Procedure on page 127-42	Deletes system statistics
DELETE_TABLE_PREFS Procedure on page 127-43	Deletes statistics preferences of the specified table in the specified schema
DELETE_TABLE_STATS Procedure on page 127-46	Deletes table-related statistics
DIFF_TABLE_STATS_IN_HISTORY Function on page 127-48	Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps

Table 127–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
DIFF_TABLE_STATS_IN_PENDING Function on page 127-49	Compares pending statistics and statistics as of a timestamp or statistics from dictionary.
DIFF_TABLE_STATS_IN_STATTAB Function on page 127-50	Compares statistics for a table from two different sources
DROP_EXTENDED_STATS Procedure on page 127-51	Drops the statistics entry that is created for the user specified extension
DROP_STAT_TABLE Procedure on page 127-52	Drops a user statistics table created by `CREATE_STAT_TABLE`
EXPORT_COLUMN_STATS Procedure on page 127-53	Retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`
EXPORT_DATABASE_PREFS Procedure on page 127-54	Exports the statistics preferences of all the tables, excluding the tables owned by Oracle.
EXPORT_DATABASE_STATS Procedure on page 127-55	Retrieves statistics for all objects in the database and stores them in the user statistics table identified by `statown.stattab`
EXPORT_DICTIONARY_STATS Procedure on page 127-56	Retrieves statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`
EXPORT_FIXED_OBJECTS_STATS Procedure on page 127-57	Retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`
EXPORT_INDEX_STATS Procedure on page 127-58	Retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`
EXPORT_PENDING_STATS Procedure on page 127-59	Exports the statistics gathered and stored as pending
EXPORT_SCHEMA_PREFS Procedure on page 127-60	Exports the statistics preferences of all the tables owned by the specified owner name
EXPORT_SCHEMA_STATS Procedure on page 127-61	Retrieves statistics for all objects in the schema identified by ownname and stores them in the user statistics table identified by `stattab`
EXPORT_SYSTEM_STATS Procedure on page 127-62	Retrieves system statistics and stores them in the user statistics table
EXPORT_TABLE_PREFS Procedure on page 127-63	Exports statistics preferences of the specified table in the specified schema into the specified statistics table
EXPORT_TABLE_STATS Procedure on page 127-64	Retrieves statistics for a particular table and stores them in the user statistics table
FLUSH_DATABASE_MONITORING_INFO Procedure on page 127-65	Flushes in-memory monitoring information for all the tables to the dictionary
GATHER_DATABASE_STATS Procedures on page 127-66	Gathers statistics for all objects in the database
GATHER_DICTIONARY_STATS Procedure on page 127-66	Gathers statistics for dictionary schemas '`SYS`', '`SYSTEM`' and schemas of RDBMS components
GATHER_FIXED_OBJECTS_STATS Procedure on page 127-74	Gathers statistics of fixed objects

Table 127–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
GATHER_INDEX_STATS Procedure on page 127-75	Gathers index statistics
GATHER_SCHEMA_STATS Procedures on page 127-77	Gathers statistics for all objects in a schema
GATHER_SYSTEM_STATS Procedure on page 127-81	Gathers system statistics
GATHER_TABLE_STATS Procedure on page 127-83	Gathers table and column (and index) statistics
GENERATE_STATS Procedure on page 127-86	Generates object statistics from previously collected statistics of related objects
GET_COLUMN_STATS Procedures on page 127-87	Gets all column-related information
GET_INDEX_STATS Procedures on page 127-89	Gets all index-related information
GET_PARAM Function on page 127-92	Gets the default value of parameters of `DBMS_STATS` procedures [see Deprecated Subprograms on page 127-12]
GET_STATS_HISTORY_AVAILABILITY Function on page 127-96	Gets the oldest timestamp where statistics history is available
GET_STATS_HISTORY_RETENTION Function on page 127-97	Returns the current retention value
GET_SYSTEM_STATS Procedure on page 127-98	Gets system statistics from stattab, or from the dictionary if stattab is `NULL`
GET_TABLE_STATS Procedure on page 127-100	Gets all table-related information
IMPORT_COLUMN_STATS Procedure on page 127-102	Retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_DATABASE_PREFS Procedure on page 127-103	Imports the statistics preferences of all the tables, excluding the tables owned by Oracle.
IMPORT_DATABASE_STATS Procedure on page 127-104	Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary
IMPORT_DICTIONARY_STATS Procedure on page 127-105	Retrieves statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas) from the user statistics table and stores them in the dictionary
IMPORT_FIXED_OBJECTS_STATS Procedure on page 127-106	Retrieves statistics for fixed tables from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_INDEX_STATS Procedure on page 127-107	Retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_SCHEMA_PREFS Procedure on page 127-108	Imports the statistics preferences of all the tables owned by the specified owner name
IMPORT_SCHEMA_STATS Procedure on page 127-109	Retrieves statistics for all objects in the schema identified by `ownname` from the user statistics table and stores them in the dictionary

Table 127–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
IMPORT_SYSTEM_STATS Procedure on page 127-110	Retrieves system statistics from the user statistics table and stores them in the dictionary
IMPORT_TABLE_PREFS Procedure on page 127-111	Sets the statistics preferences of the specified table in the specified schema.
IMPORT_TABLE_STATS Procedure on page 127-112	Retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary
LOCK_PARTITION_STATS Procedure on page 127-113	Locks statistics for a partition
LOCK_SCHEMA_STATS Procedure on page 127-114	Locks the statistics of all tables of a schema
LOCK_TABLE_STATS Procedure on page 127-115	Locks the statistics on the table
PREPARE_COLUMN_VALUES Procedures on page 127-116	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PREPARE_COLUMN_VALUES_ NVARCHAR2 Procedure on page 127-118	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PREPARE_COLUMN_VALUES_ ROWID Procedure on page 127-120	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PUBLISH_PENDING_STATS Procedure on page 127-122	Publishes the statistics gathered and stored as pending
PURGE_STATS Procedure on page 127-123	Purges old versions of statistics saved in the dictionary
RESET_GLOBAL_PREFS_ DEFAULTS Procedure on page 127-124	Resets the default values of all parameters to Oracle recommended values
RESET_PARAM_DEFAULTS Procedure on page 127-125	Resets global preferences to default values
RESTORE_DICTIONARY_STATS Procedure on page 127-127	Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp
RESTORE_FIXED_OBJECTS_ STATS Procedure on page 127-128	Restores statistics of all fixed tables as of a specified timestamp
RESTORE_SCHEMA_STATS Procedure on page 127-129	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_SYSTEM_STATS Procedure on page 127-130	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_TABLE_STATS Procedure on page 127-131	Restores statistics of a table as of a specified timestamp (as_of_timestamp), as well as statistics of associated indexes and columns
SET_COLUMN_STATS Procedures on page 127-132	Sets column-related information

Table 127–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
SET_DATABASE_PREFS Procedure on page 127-134	Sets the statistics preferences of all the tables, excluding the tables owned by Oracle
SET_GLOBAL_PREFS Procedure on page 127-132	Sets the global statistics preferences
SET_INDEX_STATS Procedures on page 127-140	Sets index-related information
SET_PARAM Procedure on page 127-143	Sets default values for parameters of `DBMS_STATS` procedures [see Deprecated Subprograms on page 127-12]
SET_SCHEMA_PREFS Procedure on page 127-145	Sets the statistics preferences of all the tables owned by the specified owner name
SET_SYSTEM_STATS Procedure on page 127-146	Sets system statistics
SET_TABLE_PREFS Procedure on page 127-148	Sets the statistics preferences of the specified table in the specified schema
SET_TABLE_STATS Procedure on page 127-151	Sets table-related information
SHOW_EXTENDED_STATS_NAME Function on page 127-153	Returns the name of the virtual column that is created for the user-specified extension
UNLOCK_PARTITION_STATS Procedure on page 127-154	Unlocks the statistics for a partition
UNLOCK_SCHEMA_STATS Procedure on page 127-155	Unlocks the statistics on all the table in a schema
UNLOCK_TABLE_STATS Procedure on page 127-156	Unlocks the statistics on the table
UPGRADE_STAT_TABLE Procedure on page 127-157	Upgrades user statistics on an older table

ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value. Statistics history retention is used by both the automatic purge and PURGE_STATS Procedure.

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
   retention       IN     NUMBER);
```

Parameters

Table 127–3 ALTER_STATS_HISTORY_RETENTION Procedure Parameters

Parameter	Description
retention	The retention time in days. The statistics history will be retained for at least these many number of days.The valid range is [1,365000]. Also you can use the following values for special purposes: ■ 0 - old statistics are never saved. The automatic purge will delete all statistics history ■ 1 - statistics history is never purged by automatic purge. ■ NULL - change statistics history retention to default value

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges.

CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT BINARY_FLOAT);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT BINARY_DOUBLE);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT DATE);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT NUMBER);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT VARCHAR2);
```

Pragmas

```
pragma restrict_references(convert_raw_value, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 127–4 CONVERT_RAW_VALUE Procedure Parameters

Parameter	Description
`rawval`	The raw representation of a column minimum or maximum datatype-specific output parameters
`resval`	The converted, type-specific value

CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
   rawval     RAW,
   resval OUT NVARCHAR2);
```

Pragmas

```
pragma restrict_references(convert_raw_value_nvarchar, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 127–5 CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters

Parameter	Description
`rawval`	The raw representation of a column minimum or maximum datatype-specific output parameters
`resval`	The converted, type-specific value

CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
   rawval     RAW,
   resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 127–6 CONVERT_RAW_VALUE_ROWID Procedure Parameters

Parameter	Description
`rawval`	The raw representation of a column minimum or maximum datatype-specific output parameters
`resval`	The converted, type-specific value

COPY_TABLE_STATS Procedure

This procedure copies the statistics of the source [sub] partition to the destination [sub] partition after scaling (the number of blks, number of rows). It sets the high bound partitioning value as the maximum value of the first partitioning column and high bound partitioning value of the previous partition as the minimum value of the first partitioning column for a range partitioned table. It finds the maximum and minimum from the list of values for the list partitioned table. It also sets the normalized maximum and minimum values. If the destination partition is the first partition then minimum values are equal to maximum values. If the statistics for source are not available then nothing is copied.

Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   srcpartname      VARCHAR2,
   dstpartname      VARCHAR2,
   scale_factor     VARCHAR2 DEFAULT 1,
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–7 COPY_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of index to analyze
tabname	Table name of source and destination [sub] partitions
srcpartname	Source [sub] partition
dtspartname	Destination [sub] partition
scale_factor	Scale factor to scale nblks, nrows etc. in dstpartname
force	When value of this argument is TRUE, copy statistics even if locked

Exceptions

ORA-20000: Invalid partition name

ORA-20001: Bad input value

CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user specified column group or an expression in a table. Statistics for this extension will be gathered when user or auto statistics gathering job gathers statistics for the table. We call statistics for such an extension, "extended statistics". This function returns the name of this newly created entry for the extension.

Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 127–8 CREATE_EXTENDED_STATS Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

Usage Notes

There are nine restrictions on the extension:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by SYS.
- Extensions cannot be created on cluster tables or index organized tables.
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column can not appear more than once in a column group.
- A column group can not contain expressions.

- An expression must contain at least one column.
- An expression can not contain a subquery.

CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
   ownname  VARCHAR2,
   stattab  VARCHAR2,
   tblspace VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–9 CREATE_STAT_TABLE Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`stattab`	Name of the table to create. This value should be passed as the `stattab` parameter to other procedures when the user does not want to modify the dictionary statistics directly.
`tblspace`	Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.

Exceptions

`ORA-20000`: Table already exists or insufficient privileges.

`ORA-20001`: Tablespace does not exist.

DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
   ownname         VARCHAR2,
   tabname         VARCHAR2,
   colname         VARCHAR2,
   partname        VARCHAR2 DEFAULT NULL,
   stattab         VARCHAR2 DEFAULT NULL,
   statid          VARCHAR2 DEFAULT NULL,
   cascade_parts   BOOLEAN  DEFAULT TRUE,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                      get_param('NO_INVALIDATE')),
   force           BOOLEAN  DEFAULT FALSE,
   col_stat_type   VARCHAR2 DEFAULT 'ALL');
```

Parameters

Table 127–10 DELETE_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	When value of this argument is TRUE, deletes column statistics even if locked
col_stat_type	Type of column statistics to be deleted.This argument takes the following values: ■ HISTOGRAM - delete column histogram only ■ ALL - delete base column statistics and histogram

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20005: Object statistics are locked.

DELETE_DATABASE_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–11 DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE – The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE – The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT – The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 127–11 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column|attribute [size_clause] [,column|attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–11 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL – This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.
.	STALE_PERCENT – This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT',TRUE);
```

DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 127–12 DELETE_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 127–13 DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force          BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 127–14 DELETE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.
statid	The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	Ignores the statistics lock on objects and deletes the statistics if set to TRUE

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–15 DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
cascade_parts	If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	When value of this argument is TRUE, deletes index statistics even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20005: Object statistics are locked.

DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2);
```

Parameters

Table 127–16 DELETE_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL then delete applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
    ownname    IN   VARCHAR2,
    pname      IN   VARCHAR2);
```

Parameters

Table 127–17 DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE – The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE – The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT – The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 127–17 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column|attribute [size_clause] [,column|attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–17 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL – This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.
.	STALE_PERCENT – This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
   ownname          VARCHAR2,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–18 DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	When value of this argument is TRUE, deletes statistics of tables in a schema even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option) if stattab is not specified. If stattab is specified, the subprogram deletes all system statistics with the associated statid from the stattab.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–19 DELETE_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.

DELETE_TABLE_PREFS Procedure

This procedure is used to delete the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2);
```

Parameters

Table 127–20 DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE – The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE – The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT – The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 127–20 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_ clause] ■ FOR COLUMNS [size clause] column|attribute [size_clause] [,column|attribute [size_ clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_ INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–20 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL – This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.
.	STALE_PERCENT – This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted ANALYZE privilege on the table, or ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
   cascade_columns  BOOLEAN  DEFAULT TRUE,
   cascade_indexes  BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–21 DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this table for all underlying partitions as well
cascade_columns	Indicates that DELETE_COLUMN_STATS should be called for all underlying columns (passing the cascade_parts parameter)
cascade_indexes	Indicates that DELETE_INDEX_STATS should be called for all underlying indexes (passing the cascade_parts parameter)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	When value of this argument is TRUE, deletes table statistics even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

DIFF_TABLE_STATS_IN_HISTORY Function

This function can be used to compare statistics for a table from two timestamps in past and compare the statistics as of that timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
      ownname        IN  VARCHAR2,
      tabname        IN  VARCHAR2,
      time1          IN  TIMESTAMP WITH TIME ZONE,
      time2          IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
      pctthreshold   IN  NUMBER  DEFAULT 10)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 127–22 DIFF_TABLE_STATS_IN_HISTORY Procedure Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
time1	First timestamp 1
time2	Second timestamp 2
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics and statistics as of a timestamp or statistics from dictionary.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
      ownname        IN  VARCHAR2,
      tabname        IN  VARCHAR2,
      timestamp      IN  TIMESTAMP WITH TIME ZONE,
      pctthreshold   IN  NUMBER  DEFAULT 10)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 127–23 DIFF_TABLE_STATS_IN_PENDING Function Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
timestamp	Time stamp to get statistics from the history
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

DIFF_TABLE_STATS_IN_STATTAB Function

This function can be used to compare statistics for a table from two different sources. The statistics can be drawn from

- two different user statistics tables
- a single user statistics table containing 2 sets of statistics that can be identified using `statids`
- a user statistics table and dictionary

The function also compares the statistics of the dependent objects (indexes, columns, partitions) as well. It displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the difference percentage.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
      ownname        IN  VARCHAR2,
      tabname        IN  VARCHAR2,
      stattab1       IN  VARCHAR2,
      stattab2       IN  VARCHAR2 DEFAULT NULL,
      pctthreshold   IN  NUMBER  DEFAULT 10,
      statid1        IN  VARCHAR2 DEFAULT NULL,
      statid2        IN  VARCHAR2 DEFAULT NULL,
      stattab1own    IN  VARCHAR2 DEFAULT NULL,
      stattab2own    IN  VARCHAR2 DEFAULT NULL)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 127–24 DIFF_TABLE_STATS_IN_STATTAB Procedure Parameters

Parameter	Description
`ownname`	Owner of the table. Specify `NULL` for current schema.
`tabname`	Table for which statistics are to be compared
`stattab1`	User statistics table 1
`stattab2`	User statistics table 2. If `NULL`, statistics in `stattab1` is compared with current statistics in dictionary. This is the default. Specify same table as `stattab1` to compare two sets within the statistics table (see `statid` below).
`pctthreshold`	The function reports difference in statistics only if it exceeds this limit. The default value is 10.
`stadid1`	(optional) Identifies statistics set within `stattab1`.
`stadid2`	(optional) Identifies statistics set within `stattab2`
`stattab1own`	Schema containing `stattab1` (if other than `ownname`)
`stattab2own`	Schema containing `stattab2` (if other than `ownname`)

DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension. This cancels the effects of the CREATE_EXTENDED_STATS Function.

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2);
```

Parameters

Table 127–25 DROP_EXTENDED_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Usage Notes

If no extended statistics set is created for the extension, this function throws an error.

Exceptions

- ORA-20000: Insufficient privileges or extension does not exist.
- ORA-20001: Error when processing extension

DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```
DBMS_STATS.DROP_STAT_TABLE (
   ownname VARCHAR2,
   stattab VARCHAR2);
```

Parameters

Table 127–26 DROP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

EXPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
   ownname  VARCHAR2,
   tabname  VARCHAR2,
   colname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–27 EXPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`tabname`	Name of the table to which this column belongs
`colname`	Name of the column or extension
`partname`	Name of the table partition. If the table is partitioned and if `partname` is `NULL`, then global and partition column statistics are exported.
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–28 EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name to where statistics should be exported
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

EXPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
   stattab VARCHAR2,
   statid  VARCHAR2 DEFAULT NULL,
   statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–29 EXPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
   stattab VARCHAR2,
   statid  VARCHAR2 DEFAULT NULL,
   statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–30 EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)

Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–31 EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20002`: Bad user statistics table, may need to upgrade it.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
   ownname  VARCHAR2,
   indname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–32 EXPORT_INDEX_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`indname`	Name of the index
`partname`	Name of the index partition. If the index is partitioned and if `partname` is `NULL`, then global and partition index statistics are exported.
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT USER);
```

Parameters

Table 127–33 EXPORT_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- If the parameter tabname is NULL then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–34 EXPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

EXPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by `ownname` and stores them in the user statistics tables identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
   ownname VARCHAR2,
   stattab VARCHAR2,
   statid  VARCHAR2 DEFAULT NULL,
   statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–35 EXPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–36 EXPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
`stattab`	Identifier of the user statistics table that describes where the statistics will be stored.
`statid`	Optional identifier associated with the statistics stored from the `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20002`: Bad user statistics table; may need to be upgraded.

`ORA-20003`: Unable to export system statistics.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–37 EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name where to export the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

EXPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user statistics table. Cascade results in all index statistics associated with the specified table being exported as well.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
   ownname  VARCHAR2,
   tabname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   cascade  BOOLEAN  DEFAULT TRUE,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–38 EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
cascade	If true, then column and index statistics for this table are also exported
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure flushes in-memory monitoring information for all tables in the dictionary. Corresponding entries in the *_TAB_MODIFICATIONS, *_TAB_STATISTICS and *_IND_STATISTICS views are updated immediately, without waiting for the Oracle database to flush them periodically. This procedure is useful when you need up-to-date information in those views. Because the GATHER_*_STATS procedures internally flush monitoring information, it is not necessary to run this procedure before gathering the statistics.

Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

The ANALYZE_ANY system privilege is required to run this procedure.

GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   objlist          OUT      ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   gather_sys       BOOLEAN  DEFAULT TRUE,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DATABASE_STATS (
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   statown          VARCHAR2 DEFAULT NULL,
   gather_sys       BOOLEAN  DEFAULT TRUE,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);
```

Parameters

Table 127–39 GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_PARAM Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 127–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
method_opt	Accepts: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_PARAM Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.
cascade	Gather statistics on the indexes as well. Index statistics gathering is not parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure.

Table 127–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to save the current statistics. The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.
statid	Identifier (optional) to associate with these statistics within stattab.
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns a list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
gather_sys	Gathers statistics on the objects owned by the 'SYS' user
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
obj_filter_list	A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

Statistics for external tables are not collected by this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Bad input value.

GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
   comp_id          VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER AUTO',
   objlist    OUT   ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
   comp_id           VARCHAR2 DEFAULT NULL,
   estimate_percent  NUMBER DEFAULT
                        to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
   block_sample      BOOLEAN DEFAULT FALSE,
   method_opt        VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
   degree            NUMBER DEFAULT to_degree_type(GET_PARAM('DEGREE')),
   granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade           BOOLEAN DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
   stattab           VARCHAR2 DEFAULT NULL,
   statid            VARCHAR2 DEFAULT NULL,
   options           VARCHAR2 DEFAULT 'GATHER AUTO',
   statown           VARCHAR2 DEFAULT NULL,
   no_invalidate     BOOLEAN DEFAULT
                             to_no_invalidate_type(get_param('NO_INVALIDATE')),
   obj_filter_list   ObjectTab DEFAULT NULL);
```

Parameters

Table 127–40 GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
comp_id	The component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components).Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_PARAM Procedure .

Table 127–40 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	Accepts: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_PARAM Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure. NULL means use of table default value that was specified by the DEGREE clause in the CREATE or ALTER INDEX statement. Use the constant DBMS_STATS.DEFAULT_DEGREE for the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–40 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
cascade	Gathers statistics on indexes also.Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default.The default value can be changed using the SET_PARAM Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	The (optional) identifier to associate with these statistics within stattab
options	Further specification of objects for which to gather statistics: ■ 'GATHER' - gathers statistics on all objects in the schema ■ 'GATHER AUTO' - gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed. ■ 'GATHER STALE' - gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale. ■ 'GATHER EMPTY' - gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. ■ 'LIST AUTO' - returns list of objects to be processed with 'GATHER AUTO' ■ 'LIST STALE' - returns list of stale objects as determined by looking at the *_tab_modifications views ■ 'LIST EMPTY' - returns list of objects which currently have no statistics
objlist	The list of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
obj_filter_list	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges.

ORA-20001: Bad input value.

ORA-20002: Bad user statistics table, may need to upgrade it.

GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

Parameters

Table 127–41 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	The user statistics table identifier describing where to save the current statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Bad input value.

ORA-20002: Bad user statistics table, may need to upgrade it.

GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible. Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (GET_PARAM('ESTIMATE_PERCENT')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                                        (GET_PARAM('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–42 GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
`ownname`	Schema of index to analyze
`indname`	Name of index
`partname`	Name of partition
`estimate_percent`	Percentage of rows to estimate (`NULL` means compute). The valid range is `[0.000001,100]`. Use the constant `DBMS_STATS.AUTO_SAMPLE_SIZE` to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_PARAM Procedure.
`stattab`	User statistics table identifier describing where to save the current statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)
`degree`	Degree of parallelism. The default for `degree` is `NULL`. The default value can be changed using the SET_PARAM Procedure. `NULL` means use of table default value that was specified by the `DEGREE` clause in the `CREATE/ALTER INDEX` statement. Use the constant `DBMS_STATS.DEFAULT_DEGREE` for the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or `DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.`

Table 127–42 (Cont.) GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	Gather statistics on object even if it is locked

Exceptions

ORA-20000: Index does not exist or insufficient privileges.

ORA-20001: Bad input value.

GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
   ownname          VARCHAR2,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   objlist          OUT      ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
  force             BOOLEAN DEFAULT FALSE,
  obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_SCHEMA_STATS (
   ownname          VARCHAR2,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE'),
   force            BOOLEAN DEFAULT FALSE,
   obj_filter_list  ObjectTab DEFAULT NULL);
```

Parameters

Table 127–43 GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_PARAM Procedure.

Table 127–43 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_PARAM Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters.The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–43 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
cascade	Gather statistics on the indexes as well.Index statistics gathering is not parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

When you use a specific value for the sampling percentage, DBMS_STATS honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Statistics for external tables are not collected by this procedure.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges.

ORA-20001: Bad input value.

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the SAMPLE schema and any table in the SYS schema, if stale, will have statistics gathered upon it.

```
DECLARE
  filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'SYS';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                 options => 'gather_stale');
END;
```

GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
   gathering_mode   VARCHAR2 DEFAULT 'NOWORKLOAD',
   interval         INTEGER  DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–44 GATHER_SYSTEM_STATS Procedure Parameters

Parameter	Description
gathering_mode	Mode values are: NOWORKLOAD: Will capture characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period Oracle will estimate the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. Oracle recommends to run GATHER_SYSTEM_STATS ('noworkload') after creation of the database and tablespaces. To fine tune system statistics for the workload use 'START' and 'STOP' or 'INTERVAL' options. If you gather both 'NOWORKLOAD' and workload specific (statistics collected using 'INTERVAL' or 'START' and 'STOP'), the workload statistics will be used by optimizer. Collected components: cpuspeednw, ioseektim, iotfrspeed. INTERVAL: Captures system activity during a specified interval. This works in combination with the interval parameter. You should provide an interval value in minutes, after which system statistics are created or updated in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=>'STOP') to stop gathering earlier than scheduled. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc. START | STOP: Captures system activity during specified start and stop times and refreshes the dictionary or stattab with statistics for the elapsed period. Interval value is ignored. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc.
interval	Time, in minutes, to gather statistics. This parameter applies only when gathering_mode='INTERVAL'
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to gather system statistics.

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0.

GATHER_TABLE_STATS Procedure

This procedure gathers table and column (and index) statistics. It attempts to parallelize as much of the work as possible, but there are some restrictions as described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT  to_no_invalidate_type (
                                 get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–45 GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of table to analyze
tabname	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_PARAM Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 127–45 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
method_opt	Accepts either of the following options, or both in combination: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ▪ FOR COLUMNS [size clause] column|attribute [size_clause] [,column|attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. – column_name : name of a column – extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_PARAM Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION '- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–45 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
cascade	Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	Gather statistics of table even if it is locked

Usage Notes

Index statistics collection can be parellelized except for cluster, domain and join indexes.

Exceptions

ORA-20000: Table does not exist or insufficient privileges.

ORA-20001: Bad input value.

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

GENERATE_STATS Procedure

This procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

Syntax

```
DBMS_STATS.GENERATE_STATS (
   ownname    VARCHAR2,
   objname    VARCHAR2,
   organized  NUMBER DEFAULT 7,
   force      BOOLEAN default FALSE);
```

Parameters

Table 127–46 GENERATE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of object
objname	Name of object
organized	Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.
force	If TRUE, generates statistics for the target object even if it is locked

Usage Notes

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist.

ORA-20001: Invalid option or invalid statistics.

GET_COLUMN_STATS Procedures

These procedures gets all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
   ownname     VARCHAR2,
   tabname     VARCHAR2,
   colname     VARCHAR2,
   partname    VARCHAR2 DEFAULT NULL,
   stattab     VARCHAR2 DEFAULT NULL,
   statid      VARCHAR2 DEFAULT NULL,
   distcnt OUT NUMBER,
   density OUT NUMBER,
   nullcnt OUT NUMBER,
   srec    OUT StatRec,
   avgclen OUT NUMBER,
   statown     VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   colname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   ext_stats   OUT  RAW,
   stattypown  OUT  VARCHAR2 DEFAULT NULL,
   stattypname OUT  VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–47 GET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type

Table 127–47 (Cont.) GET_COLUMN_STATS Procedure Parameters

Parameter	Description
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density
nullcnt	Number of NULLs
srec	Structure holding internal representation of column minimum, maximum, and histogram values
avgclen	Average length of the column (in bytes)
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object.

GET_INDEX_STATS Procedures

These procedures get all index-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows    OUT NUMBER,
   numlblks   OUT NUMBER,
   numdist    OUT NUMBER,
   avglblk    OUT NUMBER,
   avgdblk    OUT NUMBER,
   clstfct    OUT NUMBER,
   indlevel   OUT NUMBER,
   statown        VARCHAR2 DEFAULT NULL,
   cachedblk  OUT NUMBER,
   cachehit   OUT NUMBER);

DBMS_STATS.GET_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows    OUT NUMBER,
   numlblks   OUT NUMBER,
   numdist    OUT NUMBER,
   avglblk    OUT NUMBER,
   avgdblk    OUT NUMBER,
   clstfct    OUT NUMBER,
   indlevel   OUT NUMBER,
   statown        VARCHAR2 DEFAULT NULL,
   guessq     OUT NUMBER,
   cachedblk  OUT NUMBER,
   cachehit   OUT NUMBER);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   ext_stats   OUT  RAW,
   stattypown  OUT  VARCHAR2 DEFAULT NULL,
   stattypname OUT  VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   cachedblk        OUT NUMBER,
   cachehit         OUT NUMBER);
```

Parameters

Table 127–48 GET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to get the statistics. If the index is partitioned and if partname is NULL, then the statistics are retrieved for the global index level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition)
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)
clstfct	Clustering factor for the index (partition)
indlevel	Height of the index (partition)
statown	Schema containing stattab (if different than ownname)
guessq	Guess quality for the index (partition)
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges or no statistics have been stored for requested object.

GET_PARAM Function

> **Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the GET_PREFS Function.
>
> See also Deprecated Subprograms on page 127-12.

This function returns the default value of parameters of `DBMS_STATS` procedures.

Syntax

```
DBMS_STATS.GET_PARAM (
   pname      IN   VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 127–49 GET_PARAM Function Parameters

Parameter	Description
`pname`	The parameter name

Exceptions

`ORA-20001`: Invalid input values

GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (
   pname     IN   VARCHAR2,
   ownname   IN   VARCHAR2 DEFAULT NULL,
   tabname   IN   VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 127–50 GET_PREFS Function Parameters

Parameter	Description
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE – The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE – The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT – The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 127–50 (Cont.) GET_PREFS Function Parameters

Parameter	Description
.	METHOD_OPT – The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ▪ FOR COLUMNS [size clause] column|attribute [size_clause] [,column|attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. – column_name : name of a column – extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_PARAM Procedure.
.	NO_INVALIDATE – The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY – The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–50 (Cont.) GET_PREFS Function Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL – This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.
.	STALE_PERCENT – This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
ownname	Owner name
tabname	Table name

Exceptions

ORA-20001: Invalid input values

Usage Notes

If the ownname and tabname are provided and a preference has been entered for the table, the function returns the preference as specified for the table. In all other cases it returns the global preference if it has been specified, otherwise the default value is returned.

GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available.Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
 RETURN TIMESTAMP WITH TIMEZONE;
```

GET_STATS_HISTORY_RETENTION Function

This function returns the current retention value.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION
 RETURN NUMBER;
```

GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (
   status    OUT  VARCHAR2,
   dstart    OUT  DATE,
   dstop     OUT  DATE,
   pname          VARCHAR2,
   pvalue    OUT  NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–51 GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
`status`	Output is one of the following: ■ `COMPLETED:` ■ `AUTOGATHERING:` ■ `MANUALGATHERING:` ■ `BADSTATS:`
`dstart`	Date when statistics gathering started. If `status` = `MANUALGATHERING`, the start date is returned.
`dstop`	Date when statistics gathering stopped. ■ If `status` = `COMPLETE`, the finish date is returned. ■ If `status` = `AUTOGATHERING`, the future finish date is returned. ■ If `status` = `BADSTATS`, the must-finished-by date is returned.

Table 127–51 (Cont.) GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: ■ iotfrspeed - I/O transfer speed in bytes for each millisecond ■ ioseektim - seek time + latency time + operating system overhead time, in milliseconds ■ sreadtim - average time to read single block (random read), in milliseconds ■ mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds ■ cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) ■ cpuspeednw - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option. ■ mbrc - average multiblock read count for sequential read, in blocks ■ maxthr - maximum I/O system throughput, in bytes/second ■ slavethr - average slave I/O throughput, in bytes/second
pvalue	The parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to gather system statistics.

ORA-20004: Parameter does not exist.

GET_TABLE_STATS Procedure

This procedure gets all table-related information.

Syntax

```
DBMS_STATS.GET_TABLE_STATS (
   ownname         VARCHAR2,
   tabname         VARCHAR2,
   partname        VARCHAR2 DEFAULT NULL,
   stattab         VARCHAR2 DEFAULT NULL,
   statid          VARCHAR2 DEFAULT NULL,
   numrows     OUT NUMBER,
   numblks     OUT NUMBER,
   avgrlen     OUT NUMBER,
   statown         VARCHAR2 DEFAULT NULL,
   cachedblk   OUT NUMBER,
   cachehit    OUT NUMBER);
```

Parameters

Table 127–52 GET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
numrows	Number of rows in the table (partition).
numblks	Number of blocks the table (partition) occupies.
avgrlen	Average row length for the table (partition).
statown	Schema containing stattab (if different than ownname).
cachedblk	
cachehit	

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_ [TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the

user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–53 IMPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
`ownname`	The name of the schema
`tabname`	The name of the table to which this column belongs
`colname`	Name of the column or extension
`partname`	The name of the table partition. If the table is partitioned and if `partname` is `NULL`, then global and partition column statistics are imported.
`stattab`	The user statistics table identifier describing from where to retrieve the statistics
`statid`	The (optional) identifier to associate with these statistics within `stattab`
`statown`	The schema containing `stattab` (if different than `ownname`)
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
`force`	If set to `TRUE`, imports statistics even if statistics are locked

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values in the user statistics table.

`ORA-20005`: Object statistics are locked.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–54 IMPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name where to import the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

IMPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–55 IMPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing from where to retrieve the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different from current schema)
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
`force`	Overrides statistics locked at the object (table) level: ▪ `TRUE` - Ignores the statistics lock and imports the statistics. ▪ `FALSE` - The statistics will be imported only if they are not locked.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–56 IMPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	Overrides statistics lock at the object (table) level: ■ TRUE - Ignores the statistics lock and imports the statistics. ■ FALSE - The statistics will be imported only if there is no lock.

Usage Notes

- You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

ORA-20002: Bad user statistics table, may need to upgrade it.

IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–57 IMPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing from where to retrieve the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different from current schema)
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
`force`	Overrides statistics lock: ▪ `TRUE` - Ignores the statistics lock and imports the statistics ▪ `FALSE` - The statistics will be imported only if there is no lock

Usage Notes

- You must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values in the user statistics table.

`ORA-20002`: Bad user statistics table, may need to upgrade it.

IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–58 IMPORT_INDEX_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`indname`	Name of the index
`partname`	Name of the index partition. If the index is partitioned and if `partname` is `NULL`, then global and partition index statistics are imported.
`stattab`	User statistics table identifier describing from where to retrieve the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`.
`statown`	Schema containing `stattab` (if different than `ownname`)
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
`force`	Imports statistics even if index statistics are locked

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid or inconsistent values in the user statistics table

`ORA-20005`: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–59 IMPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

IMPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
   ownname       VARCHAR2,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULTto_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–60 IMPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	Overrides statistics locked at the object (table) level: ■ TRUE - Ignores the statistics lock and imports the statistics. ■ FALSE - The statistics will be imported only if there is no lock.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_SYSTEM_STATS Procedure

http://usunnab06.us.oracle.com:80/servers/MifChecker/Out/Y10312_01.htm retrieves system statistics from the user statistics table, identified by stattab, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–61 IMPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
`stattab`	Identifier of the user statistics table where the statistics will be retrieved
`statid`	Optional identifier associated with the statistics retrieved from the stattab
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values in the user statistics table.

`ORA-20002`: Bad user statistics table; may need to be upgraded.

`ORA-20003`: Unable to import system statistics.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–62 IMPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

IMPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary. Cascade results in all index statistics associated with the specified table being imported as well.

Syntax

```
DBMS_STATS.IMPORT_TABLE_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   cascade       BOOLEAN  DEFAULT TRUE,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–63 IMPORT_TABLE_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`tabname`	Name of the table
`partname`	Name of the table partition. If the table is partitioned and if `partname` is `NULL`, then global and partition table statistics are imported.
`stattab`	User statistics table identifier describing from where to retrieve the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`cascade`	If true, then column and index statistics for this table are also imported
`statown`	Schema containing `stattab` (if different than `ownname`)
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
`force`	Imports statistics even if table statistics are locked

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```
DBMS_STATS.LOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

Table 127–64 LOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock
tabname	Name of the table
partname	Partition name

LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (
   ownname     VARCHAR2);
```

Parameters

Table 127–65 LOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema to lock

Usage Notes

See "Usage Notes" for LOCK_TABLE_STATS Procedure.

LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2);
```

Parameters

Table 127–66 LOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema
tabname	The name of the table

Usage Notes

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use Dynamic Sampling.
- The locked or unlocked state is not exported along with the table statistics when using EXPORT_*_STATS procedures.

PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   charvals        CHARARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec      IN OUT StatRec,
   datevals         DATEARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   dblvals         DBLARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   fltvals         FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   numvals         NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   rawvals         RAWARRAY);
```

Pragmas

```
pragma restrict_references(prepare_column_values, WNDS, RNDS, WNPS, RNPS);
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS,
RNPS);
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 127–67 PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.

Table 127–67 (Cont.) PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in Table 127–68.

Table 127–68 Datatype-Specific Input Parameters

Type	Description
charvals	The array of values when the column type is character-based. Up to the first 32 bytes of each string should be provided. Arrays must have between 2 and 256 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
datevals	The array of values when the column type is date-based
dblvals	The array of values when the column type is double-based
fltvals	The array of values when the column type is float-based
numvals	The array of values when the column type is numeric-based
rawvals	The array of values when the column type is RAW. Up to the first 32 bytes of each strings should be provided.
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
rwmin, rwmax	The minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 127–69 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values.

PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR2 (
   srec     IN OUT StatRec,
   nvmin           NVARCHAR2,
   nvmax           NVARCHAR2);
```

Pragmas

```
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS,
RNPS);
```

Parameters

Table 127–70 PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in Table 127–68.

Table 127–71 Datatype-Specific Input Parameters

Type	Description
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.

Output Parameters

Table 127–72 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS.
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values.

PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
   srec  IN OUT StatRec,
   rwmin        ROWID,
   rwmax        ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 127–73 PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in Table 127–68.

Table 127–74 Datatype-Specific Input Parameters

Type	Description
rwmin, rwmax	The minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 127–75 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.

Table 127–75 (Cont.) PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS.
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS.

Exceptions

ORA-20001: Invalid or inconsistent input values.

PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
    ownname          IN  VARCHAR2 DEFAULT USER,
    tabname          IN  VARCHAR2,
    no_invalidate    BOOLEAN DEFAULT
       to_no_invalidate_type(get_param('NO_INVALIDATE')),
    force       IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–76 PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
no_invalidate	Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	If TRUE, will override the lock

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary. To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS(
    before_timestamp       TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 127–77 PURGE_STATS Procedure Parameters

Parameter	Description
before_timestamp	Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure.The default is 31 days.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

RESET_GLOBAL_PREFS_DEFAULTS Procedure

This procedurere sets global preference, such as `CASCADE`, `ESTIMATE_PERCENT` and `GRANULARITY`, to default values. This reverses the global preferences set by the SET_GLOBAL_PREFS Procedure.

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREFS_DEFAULTS;
```

RESET_PARAM_DEFAULTS Procedure

This procedure resets the default values of all parameters to Oracle recommended values.

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_DATABSE_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 127–78 RESTORE_DATABASE_STATS Procedure Parameters

Parameter	Description
`as_of_timestamp`	The timestamp to which to restore statistics
`force`	Restores statistics even if their statistics are locked
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values.

`ORA-20006`: Unable to restore statistics, statistics history not available.

RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 127–79 RESTORE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 127–80 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
`as_of_timestamp`	The timestamp to which to restore statistics
`force`	Restores statistics even if their statistics are locked
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.

Usage Notes

To run this procedure, you must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values.

`ORA-20006`: Unable to restore statistics, statistics history not available.

RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   ownname                VARCHAR2,
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 127–81 RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	The schema of the tables for which the statistics are to be restored
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 127–82 RESTORE_SYSTEM_STATS Procedure Parameters

Parameter	Description
`as_of_timestamp`	The timestamp to which to restore statistics

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values.

`ORA-20006`: Unable to restore statistics, statistics history not available.

RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). The procedure will restore statistics of associated indexes and columns as well. If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
   ownname                  VARCHAR2,
   tabname                  VARCHAR2,
   as_of_timestamp          TIMESTAMP WITH TIME ZONE,
   restore_cluster_index    BOOLEAN DEFAULT FALSE,
   force                    BOOLEAN DEFAULT FALSE,
   no_invalidate            BOOLEAN DEFAULT to_no_invalidate_type
                                          (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 127–83 RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The schema of the table for which the statistics are to be restored
tabname	The table name
as_of_timestamp	The timestamp to which to restore statistics
restore_cluster_index	If the table is part of a cluster, restore statistics of the cluster index if set to TRUE
force	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

SET_COLUMN_STATS Procedures

This procedure sets column-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   distcnt       NUMBER DEFAULT NULL,
   density       NUMBER DEFAULT NULL,
   nullcnt       NUMBER DEFAULT NULL,
   srec          StatRec DEFAULT NULL,
   avgclen       NUMBER DEFAULT NULL,
   flags         NUMBER DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–84 SET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.

Table 127–84 (Cont.) SET_COLUMN_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.
nullcnt	Number of NULLs
srec	StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS
avgclen	Average length for the column (in bytes)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
force	Sets the values even if statistics of the column are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent input values.

ORA-20005: Object statistics are locked.

SET_DATABASE_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    pvalue           IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 127–85 SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE – The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE – The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT – The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 127–85 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column|attribute [size_clause] [,column|attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–85 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL – This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.
.	STALE_PERCENT – This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Invalid or illegal input values.

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE','99');
```

SET_GLOBAL_PREFS Procedure

This procedure is used to set the global statistics preferences.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
    pname     IN   VARCHAR2,
    pvalue    IN   VARCHAR2);
```

Parameters

Table 127–86 SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE – The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE – The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT – The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 127–86 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column|attribute [size_clause] [,column|attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–86 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL – This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.
.	STALE_PERCENT – This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only of there is no preference specified for the table to be analyzed.
- To run this procedure, you need to have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_GLOBAL_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_GLOBAL_PREFS('DEGREE','99');
```

SET_INDEX_STATS Procedures

These procedures set index-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   numrows       NUMBER    DEFAULT NULL,
   numlblks      NUMBER    DEFAULT NULL,
   numdist       NUMBER    DEFAULT NULL,
   avglblk       NUMBER    DEFAULT NULL,
   avgdblk       NUMBER    DEFAULT NULL,
   clstfct       NUMBER    DEFAULT NULL,
   indlevel      NUMBER    DEFAULT NULL,
   flags         NUMBER    DEFAULT NULL,
   statown       VARCHAR2  DEFAULT NULL,
   no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   guessq        NUMBER    DEFAULT NULL,
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 127–87 SET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index

Table 127–87 (Cont.) SET_INDEX_STATS Procedure Parameters

Parameter	Description
partname	Name of the index partition in which to store the statistics. If the index is partitioned and if partname is NULL, then the statistics are stored at the global index level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from numlblks and numdist.
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from clstfct and numdist.
clstfct	See clustering_factor column of the all_indexes view for a description
indlevel	Height of the index (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
guessq	Guess quality. See the pct_direct_access column of the all_indexes view for a description.
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)
force	Sets the values even if statistics of the index are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only

when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20005: Object statistics are locked.

SET_PARAM Procedure

> **Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the SET_GLOBAL_PREFS Procedure.
>
> See also Deprecated Subprograms on page 127-12.

This procedure sets default values for parameters of DBMS_STATS procedures. You can use the GET_PARAM Function to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
   pname      IN    VARCHAR2,
   pval       IN    VARCHAR2);
```

Parameters

Table 127–88 SET_PARAM Procedure Parameters

Parameter	Description
pname	The parameter name The default value for following parameters can be set. ■ CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures. ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)
pval	The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values: ■ 'ALL' - Statistics are collected for all objects in the system ■ 'ORACLE' - Statistics are collected for all Oracle owned objects ■ 'AUTO' - Oracle decides for which objects to collect statistics

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':

- When NULL is unquoted, this sets the parameter to the value Oracle recommends.
- In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or illegal input value.

Examples

```
DBMS_STATS.SET_PARAM('CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT','5');
DBMS_STATS.SET_PARAM('DEGREE','NULL');
```

SET_SCHEMA_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname   IN   VARCHAR2,
    pname     IN   VARCHAR2,
    pvalue    IN   VARCHAR2);
```

Parameters

Table 127–89 SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or illegal input value.

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH' 'ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'DEGREE','99');
```

SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
   pname          VARCHAR2,
   pvalue         NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127–90 SET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: ■ iotfrspeed—I/O transfer speed in bytes for each millisecond ■ ioseektim - seek time + latency time + operating system overhead time, in milliseconds ■ sreadtim - average time to read single block (random read), in milliseconds ■ mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds ■ cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) ■ cpuspeednw - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option. ■ mbrc - average multiblock read count for sequential read, in blocks ■ maxthr - maximum I/O system throughput, in bytes/second ■ slavethr - average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid input value.

`ORA-20002`: Bad user statistics table; may need to be upgraded.

`ORA-20003`: Unable to set system statistics.

`ORA-20004`: Parameter does not exist.

SET_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2,
    pvalue     IN  VARCHAR2);
```

Parameters

Table 127–91 SET_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE – The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE – The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT – The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 127–91 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column|attribute [size_clause] [,column|attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 127–91 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL – This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.
.	STALE_PERCENT – This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table or should have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE','99');
```

SET_TABLE_STATS Procedure

This procedure sets table-related information.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   numrows       NUMBER   DEFAULT NULL,
   numblks       NUMBER   DEFAULT NULL,
   avgrlen       NUMBER   DEFAULT NULL,
   flags         NUMBER   DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 127–92 SET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
numrows	Number of rows in the table (partition)
numblks	Number of blocks the table (partition) occupies
avgrlen	Average row length for the table (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Table 127–92 (Cont.) SET_TABLE_STATS Procedure Parameters

Parameter	Description
force	Sets the values even if statistics of the table are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_ [TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20005: Object statistics are locked.

SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 127–93 SHOW_EXTENDED_STATS_NAME Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

Table 127–94 UNLOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to unlock
tabname	Name of the table
partname	Partition name

UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (
   ownname    VARCHAR2);
```

Parameters

Table 127–95 UNLOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema

Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2);
```

Parameters

Table 127–96 UNLOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema
tabname	The name of the table

Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
   ownname    VARCHAR2,
   stattab    VARCHAR2);
```

Parameters

Table 127–97 UPGRADE_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	Name of the table

Exceptions

ORA-20000: Unable to upgrade table.

128

DBMS_STORAGE_MAP

With the DBMS_STORAGE_MAP package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- Using DBMS_STORAGE_MAP
  - Overview
  - Operational Notes
- Summary of DBMS_STORAGE_MAP Subprograms

Using DBMS_STORAGE_MAP

- Overview
- Operational Notes

Overview

The following terminology and descriptions will help you understand the DBMS_STORAGE_MAP API:

- Mapping libraries

  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in filemap.ora.

- Mapping files

  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

See Also:

- *Oracle Database Administrator's Guide* for more information
- *Oracle Database Reference* for V$MAP views, including V$MAP_FILE, V$MAP_ELEMENT, V$MAP_SUBELEMENT, V$MAP_FILE_EXTENT

Operational Notes

For `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL`: Invoking these functions when mapping information already exists will refresh the mapping if configuration IDs are supported. If configuration IDs are not supported, then invoking these functions again will rebuild the mapping.

> **See Also:** *Oracle Database Administrator's Guide* for a discussion of the configuration ID, an attribute of the element or file that is changed.

Summary of DBMS_STORAGE_MAP Subprograms

Table 128–1 DBMS_STORAGE_MAP Package Subprograms

Subprogram	Description
DROP_ALL Function on page 128-6	Drops all mapping information in the shared memory of the instance
DROP_ELEMENT Function on page 128-7	Drops the mapping information for the element defined by `elemname`
DROP_FILE Function on page 128-8	Drops the file mapping information defined by `filename`
LOCK_MAP Procedure on page 128-9	Locks the mapping information in the shared memory of the instance
MAP_ALL Function on page 128-10	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
MAP_ELEMENT Function on page 128-11	Builds mapping information for the element identified by `elemname`
MAP_FILE Function on page 128-12	Builds mapping information for the file identified by `filename`
MAP_OBJECT Function on page 128-13	Builds the mapping information for the Oracle object identified by the object name, owner, and type
RESTORE Function on page 128-14	Loads the entire mapping information from the data dictionary into the shared memory of the instance
SAVE Function on page 128-15	Saves information needed to regenerate the entire mapping into the data dictionary
UNLOCK_MAP Procedure on page 128-16	Unlocks the mapping information in the shared memory of the instance.

DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
      dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 128–2 DROP_ALL Function Parameters

Parameter	Description
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 128–3 DROP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is dropped.
`cascade`	If `TRUE`, then `DROP_ELEMENT` is invoked recursively on all elements of the DAG defined by `elemname`, if possible.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
   filename          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 128–4 DROP_FILE Function Parameters

Parameter	Description
`filename`	The file for which file mapping information is dropped.
`cascade`	If `TRUE`, then the mapping DAGs for the elements where the file resides are also dropped, if possible.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance. This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, `V$MAP_ELEMENT` and `V$MAP_SUBELEMENT`, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
   max_num_fileext   IN NUMBER DEFAULT 100,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 128–5 MAP_ALL Function Parameters

Parameter	Description
`max_num_fileext`	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is `100`; `max_num_fileextent` is an overloaded argument.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

Usage Notes

You must explicitly call `MAP_ALL` in a cold startup scenario.

MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 128–6 MAP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is built.
`cascade`	If `TRUE`, all elements within the elemname I/O stack DAG are mapped.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
   filename           IN VARCHAR2,
   filetype           IN VARCHAR2,
   cascade            IN BOOLEAN,
   max_num_fileextent IN NUMBER DEFAULT 100,
   dictionary_update  IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 128–7 MAP_FILE Function Parameters

Parameter	Description
`filename`	The file for which mapping information is built.
`filetype`	Defines the type of the file to be mapped. It can be "`DATAFILE`", "`SPFILE`", "`TEMPFILE`", "`CONTROLFILE`", "`LOGFILE`", or "`ARCHIVEFILE`".
`cascade`	Should be `TRUE` only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an `ALTER SYSTEM` command or DML operations on extended files), `cascade` can be set to `FALSE` because the mapping changes are limited to the file extents only. If `TRUE`, mapping DAGs are also built for the elements where the file resides.
`max_num_fileextent`	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is `100`; `max_num_fileextent` is an overloaded argument.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
   objname  IN  VARCHAR2,
   owner    IN  VARCHAR2,
   objtype  IN  VARCHAR2);
```

Parameters

Table 128–8 MAP_OBJECT Function Parameters

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance. You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

129

DBMS_STREAMS

The DBMS_STREAMS package, one of a set of Oracle Streams packages, provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

This chapter contains the following topics:

- Using DBMS_STREAMS
  - Security Model
- Summary of DBMS_STREAMS Subprograms

Using DBMS_STREAMS

This section contains topics which relate to using the `DBMS_STREAMS` package.

- Security Model

Security Model

User group PUBLIC is granted EXECUTE privilege on this package.

See Also: *Oracle Database Security Guide* for more information about user group PUBLIC

Summary of DBMS_STREAMS Subprograms

Table 129–1 DBMS_STREAMS Package Subprograms

Subprogram	Description
COMPATIBLE_11_1 Function on page 129-5	Returns the `DBMS_STREAMS.COMPATIBLE_11_1` constant
COMPATIBLE_10_2 Function on page 129-6	Returns the `DBMS_STREAMS.COMPATIBLE_10_2` constant
COMPATIBLE_10_1 Function on page 129-7	Returns the `DBMS_STREAMS.COMPATIBLE_10_1` constant
COMPATIBLE_9_2 Function on page 129-8	Returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant
CONVERT_ANYDATA_TO_LCR_DDL Function on page 129-9	Converts a `ANYDATA` object to a `SYS.LCR$_DDL_RECORD` object
CONVERT_ANYDATA_TO_LCR_ROW Function on page 129-10	Converts a `ANYDATA` object to a `SYS.LCR$_ROW_RECORD` object
CONVERT_LCR_TO_XML Function on page 129-11	Converts a logical change record (LCR) encapsulated in a `ANYDATA` object into an XML object that conforms to the XML schema for LCRs
CONVERT_XML_TO_LCR Function on page 129-12	Converts an XML object that conforms to the XML schema for LCRs into a logical change record (LCR) encapsulated in a `ANYDATA` object
GET_INFORMATION Function on page 129-13	Returns information about various Oracle Streams attributes
GET_STREAMS_NAME Function on page 129-14	Returns the name of the invoker
GET_STREAMS_TYPE Function on page 129-15	Returns the type of the invoker
GET_TAG Function on page 129-16	Gets the binary tag for all redo entries generated by the current session
SET_TAG Procedure on page 129-17	Sets the binary tag for all redo entries subsequently generated by the current session

Note: The subprograms in this package do not commit.

COMPATIBLE_11_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_11_1 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_11_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 229-29
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_10_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_2 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_10_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 229-29
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_10_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_1 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_10_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 229-29
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_9_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_9_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 229-29
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

CONVERT_ANYDATA_TO_LCR_DDL Function

This function converts a ANYDATA object into a SYS.LCR$_DDL_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
   source  IN  ANYDATA)
RETURN SYS.LCR$_DDL_RECORD;
```

Parameters

Table 129–2 CONVERT_ANYDATA_TO_LCR_DDL Function Parameters

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a DDL logical change record (DDL LCR), then the function raises an exception.

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a ANYDATA queue to a SYS.LCR$_DDL_RECORD typed queue.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about this function

CONVERT_ANYDATA_TO_LCR_ROW Function

This function converts a ANYDATA object into a SYS.LCR$_ROW_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
   source  IN  ANYDATA)
RETURN SYS.LCR$_ROW_RECORD;
```

Parameters

Table 129–3 CONVERT_ANYDATA_TO_LCR_ROW Function Parameters

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a row logical change record (row LCR), then the function raises an exception.

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of row LCRs from a ANYDATA queue to a SYS.LCR$_ROW_RECORD typed queue.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about this function

CONVERT_LCR_TO_XML Function

This function converts a logical change record (LCR) encapsulated in a ANYDATA object into an XML object that conforms to the XML schema for LCRs. The LCR can be a row LCR or a DDL LCR.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_LCR_TO_XML(
   anylcr  IN  ANYDATA)
RETURN SYS.XMLTYPE;
```

Parameters

Table 129–4 CONVERT_LCR_TO_XML Function Parameters

Parameter	Description
anylcr	The ANYDATA encapsulated LCR to be converted. If this object is not a ANYDATA encapsulated LCR, then the function raises an exception.

CONVERT_XML_TO_LCR Function

This function converts an XML object that conforms to the XML schema for logical change records (LCRs) into an LCR encapsulated in a `ANYDATA` object. The LCR can be a row or DDL LCR.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_XML_TO_LCR(
   xmldat  IN  SYS.XMLTYPE)
RETURN ANYDATA;
```

Parameters

Table 129–5 CONVERT_XML_TO_LCR Function Parameters

Parameter	Description
`xmldat`	The XML LCR object to be converted. If this object does not conform to XML schema for LCRs, then the function raises an exception.

GET_INFORMATION Function

This function returns information about various Oracle Streams attributes.

Syntax

```
DBMS_STREAMS.GET_INFORMATION(
   name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 129–6 GET_INFORMATION Function Parameters

Parameter	Description
name	The type of information you want to retrieve. Currently, the following names are available: ■ SENDER: Returns the name of the sender for the current logical change record (LCR) from its AQ message properties. This function is called inside an apply handler. An apply handler is a DML handler, a DDL handler, an error handler, or a message handler. Returns NULL if called outside of an apply handler. The return value is to be interpreted as a VARCHAR2. ■ CONSTRAINT_NAME: Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a DML handler or error handler for an apply process. Returns NULL if called outside of a DML handler or error handler. The return value is to be interpreted as a VARCHAR2.

GET_STREAMS_NAME Function

This function gets the Oracle Streams name of the invoker if the invoker is one of the following Oracle Streams types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_NAME
RETURN VARCHAR2;
```

Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the GET_STREAMS_NAME function to determine the name of the apply process that raised the error.

GET_STREAMS_TYPE Function

This function gets the Oracle Streams type of the invoker and returns one of the following types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_TYPE
RETURN VARCHAR2;
```

Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the GET_STREAMS_TYPE function to instruct a DML handler to operate differently if it is processing messages from the error queue (ERROR_EXECUTION type) instead of the apply process queue (APPLY type).

GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_STREAMS.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```
SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
```

SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS.SET_TAG(
   tag  IN RAW  DEFAULT NULL);
```

Parameters

Table 129–7 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

> **See Also:** BUILD Procedure on page 28-15

DBMS_STREAMS_ADM

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring Oracle Streams replication environments. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level.

See Also:

- *Oracle Streams Concepts and Administration*, *Oracle Streams Replication Administrator's Guide*, and *Oracle Database 2 Day + Data Replication and Integration Guide* for more information about this package and Oracle Streams
- Chapter 112, "DBMS_RULE"

This chapter contains the following topics:

- Using DBMS_STREAMS_ADM
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Operational Notes
- Summary of DBMS_STREAMS_ADM Subprograms

Using DBMS_STREAMS_ADM

This section contains topics which relate to using the `DBMS_STREAMS_ADM` package.

- Overview
- Deprecated Subprograms
- Security Model
- Operational Notes

Overview

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring an Oracle Streams replication environment. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues, and for managing Oracle Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then refer to Chapter 112, "DBMS_RULE" package.

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10*g* Release 2 and later:

- `MAINTAIN_SIMPLE_TABLESPACE`

  This procedure is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

  See Also: MAINTAIN_SIMPLE_TTS Procedure on page 130-97

- `MAINTAIN_TABLESPACES`

  This procedure is replaced by the `MAINTAIN_TTS` procedure.

  See Also: MAINTAIN_TTS Procedure on page 130-112

Security Model

A user is associated with each Oracle Streams client. The following sections describe these users:

- Capture User
- Propagation User
- Apply User
- Messaging Client User

Capture User

The following procedures can create a capture process:

- ADD_GLOBAL_RULES Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

The following procedures can create a synchronous capture:

- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates a capture process or a synchronous capture, then it configures the current user as the capture user. The capture user is the user in whose security domain a capture process or synchronous capture captures changes that satisfy its rule set(s) and runs custom rule-based transformations configured for these rules. This user must have the necessary privileges to capture changes. The procedure grants the capture user `ENQUEUE` privilege on the queue used by the capture process or synchronous capture and configures the user as a secure queue user of the queue.

> **See Also:** CREATE_CAPTURE Procedure on page 28-16 and CREATE_SYNC_CAPTURE Procedure on page 28-22 for information about the privileges required to capture changes (refer to the `capture_user` parameter)

Propagation User

The following procedures can create a propagation:

- ADD_GLOBAL_PROPAGATION_RULES Procedure
- ADD_MESSAGE_PROPAGATION_RULE Procedure
- ADD_SCHEMA_PROPAGATION_RULES Procedure
- ADD_SUBSET_PROPAGATION_RULES Procedure
- ADD_TABLE_PROPAGATION_RULES Procedure

When a propagation is created, a propagation job also might be created. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

Note:

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users might or might not be the same.
- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate messages.

See Also:

- CREATE_PROPAGATION Procedure on page 93-5 for more information about the required privileges
- "Propagation Rules for LCRs" on page 130-10 for information about when a propagation job is created

Apply User

The following procedures can create an apply process:

- ADD_GLOBAL_RULES Procedure
- ADD_MESSAGE_RULE Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates an apply process, then it configures the current user as the apply user. The apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

See Also: CREATE_APPLY Procedure on page 20-11 for information about the privileges required to apply changes (refer to the `apply_user` parameter)

Messaging Client User

The following procedures can create a messaging client:

- ADD_GLOBAL_RULES Procedure
- ADD_MESSAGE_RULE Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging

client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.

Operational Notes

Several procedures in this package create rules for Oracle Streams clients, and several procedures configure an Oracle Streams replication environment. The following sections provide information about using these procedures:

- Procedures That Create Rules and Oracle Streams Clients
- Procedures That Configure an Oracle Streams Replication Environment

Procedures That Create Rules and Oracle Streams Clients

Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. Some of the procedures in the `DBMS_STREAMS_ADM` package add rules to the rule sets of Oracle Streams clients. The rules can pertain to changes in the redo log, to data manipulation language (DML) changes made to a table, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a DML change or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs can either represent changes that were captured by a capture process or a synchronous capture, or they can represent changes created by a user or application. A user message is a custom message that is based on a user-defined type and created by users or applications.

A capture process, propagation, apply process, or messaging client can have both positive and negative rule sets. A synchronous capture can have only a positive rule set.

For all of the procedures except the ones that create subset rules, and for all Oracle Streams clients except for synchronous captures, you use the `inclusion_rule` parameter to specify the type of rule set (either positive or negative) for the created rules. If the Oracle Streams client does not have a rule set of the specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the Oracle Streams client are not affected. Additional rules can be added to a rule set using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If an Oracle Streams client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

The following sections describe each type of rule in detail:

- Capture Process Rules for Changes in the Redo Log
- Synchronous Capture Rules for DML Changes to Tables
- Propagation Rules for LCRs
- Propagation Rules for User Messages
- Apply Process Rules for LCRs
- Apply Process Rules for User Messages
- Messaging Client Rules for LCRs
- Messaging Client Rules for User Messages

> **See Also:** *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Capture Process Rules for Changes in the Redo Log

The following procedures add rules to a rule set of a capture process when you specify `capture` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all changes made to a source database. See ADD_GLOBAL_RULES Procedure on page 130-34.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified schema. See ADD_SCHEMA_RULES Procedure on page 130-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 130-59.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified table. See ADD_TABLE_RULES Procedure on page 130-68.

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute the procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

- `ADD_GLOBAL_RULES` invokes the `PREPARE_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SCHEMA_RULES` invokes the `PREPARE_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SUBSET_RULES` and `ADD_TABLE_RULES` invoke the `PREPARE_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

These procedures also enable supplemental logging for the primary key, unique key, foreign key, and bitmap index columns in the tables prepared for instantiation. The primary key columns are unconditionally logged. The unique key, foreign key, and bitmap index columns are conditionally logged.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for instantiation and specify the necessary supplemental logging manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the `source_database` parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the `CREATE_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

> **See Also:** Chapter , "Summary of DBMS_CAPTURE_ADM Subprograms" on page 28-2 for more information about the CREATE_CAPTURE procedure and the procedures that prepare database objects for instantiation

Synchronous Capture Rules for DML Changes to Tables

The following procedures add rules to the rule set of a synchronous capture when you specify sync_capture for the streams_type parameter:

- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 130-59.
- The ADD_TABLE_RULES procedure adds a rule whose rule condition evaluates to TRUE for DML changes made to a specified table. See ADD_TABLE_RULES Procedure on page 130-68.

If one of these procedures adds rules to the positive rule set for a synchronous capture, then the synchronous capture captures row changes resulting from DML changes to the table at the source database and enqueues these changes into the specified queue. A synchronous capture cannot have a negative rule set.

A synchronous capture captures changes locally at the database where it is configured. This database is the source database for changes captured by the synchronous capture. Therefore, for synchronous capture rules, you should execute the procedure at the source database.

These procedures automatically prepare the appropriate tables for instantiation by invoking the PREPARE_SYNC_INSTANTIATION function in the DBMS_CAPTURE_ADM package at the source database.

Note:

- A synchronous capture ignores rules in its rule set that were created by a procedure other than ADD_SUBSET_RULES or ADD_TABLE_RULES.
- When the ADD_TABLE_RULES or the ADD_SUBSET_RULES procedure adds rules to a synchronous capture rule set, the procedure must obtain an exclusive lock on the specified table. If there are outstanding transactions on the specified table, then the procedure waits until it can obtain a lock.

Propagation Rules for LCRs

The following procedures add propagation rules for LCRs to a rule set of a propagation:

- The ADD_GLOBAL_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in a source queue. See ADD_GLOBAL_PROPAGATION_RULES Procedure on page 130-30.
- The ADD_SCHEMA_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in a source queue containing changes made to a specified schema. See ADD_SCHEMA_PROPAGATION_RULES Procedure on page 130-46.
- The ADD_SUBSET_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in a source queue containing the results

of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_PROPAGATION_RULES Procedure" on page 130-55.

- The ADD_TABLE_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in a source queue containing changes made to a specified table. See "ADD_TABLE_PROPAGATION_RULES Procedure" on page 130-64.

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the source_databse parameter, then the rules include conditions for the specified source database.

Propagation Rules for User Messages

The ADD_MESSAGE_PROPAGATION_RULE procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user messages of a specific message type that evaluate to TRUE for the rule condition from a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user messages in a source queue of a specific message type that evaluate to TRUE for the rule condition. This procedure generates a rule name for the rule.

> **See Also:** "ADD_MESSAGE_PROPAGATION_RULE Procedure" on page 130-39

Apply Process Rules for LCRs

The following procedures add rules to a rule set of an apply process when you specify apply for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the apply process queue. See "ADD_GLOBAL_RULES Procedure" on page 130-34.
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 130-50.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the apply process queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 130-59.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 130-68.

If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the apply process using the source_database parameter. If the source_database

parameter is NULL, and one of these procedures creates an apply process, then the source database name of the first LCR received by the apply process is used for the source database.

The rules in the apply process rule sets determine which messages are dequeued by the apply process. When you create rules with one of these procedures, and you specify a value for the source_databse parameter, then the rules include conditions for the specified source database. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. In addition, when adding rules to an existing apply process, the database specified in the source_database parameter cannot be different than the source database for the apply process. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.

Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to alter the tag value after the apply process is created, if necessary.

An apply process created by one of these procedures can apply messages only at the local database and can apply only captured messages. To create an apply process that applies messages at a remote database or an apply process that applies user messages, use the CREATE_APPLY procedure in the DBMS_APPLY_ADM package.

You can also use the DBMS_APPLY_ADM.CREATE_APPLY procedure to specify nondefault values for the apply_captured, apply_user, apply_database_link, and apply_tag parameters when you run that procedure. You can use one of the procedures in the DBMS_STREAMS_ADM package to add rules to a rule set used by the apply process after you create it.

> **See Also:** "ALTER_APPLY Procedure" on page 20-4 and "CREATE_APPLY Procedure" on page 20-11

Apply Process Rules for User Messages

The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of an apply process when you specify apply for the streams_type parameter. For an apply process rule, you should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the apply process dequeues user messages of a specific message type that satisfy the apply process rule and sends these messages to its message handler. If no message handler is specified for the apply process, then use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to set the message handler. If this procedure adds a rule to the negative rule set for an apply process, then the apply process discards user messages of a specific message type that satisfy the apply process rule.

> **See Also:**
>
> - ADD_MESSAGE_RULE Procedure on page 130-43
> - ALTER_APPLY Procedure on page 20-4

Messaging Client Rules for LCRs

The following procedures add rules to a rule set of a messaging client when you specify dequeue for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the messaging client queue. See "ADD_GLOBAL_RULES Procedure" on page 130-34.

- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the messaging client queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 130-50.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the messaging client queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 130-59.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the messaging client queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 130-68.

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the source_database parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the source_database parameter. You should execute these procedures at the database where you want to dequeue the messages with the messaging client.

Messaging Client Rules for User Messages

The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of a messaging client when you specify dequeue for the streams_type parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user messages of a specific message type that satisfy the message rule.

See Also: "ADD_MESSAGE_RULE Procedure" on page 130-43

Procedures That Configure an Oracle Streams Replication Environment

The following procedures in this package configure a replication environment that is maintained by Oracle Streams:

- MAINTAIN_GLOBAL Procedure
- MAINTAIN_SCHEMAS Procedure
- MAINTAIN_SIMPLE_TTS Procedure
- MAINTAIN_TABLES Procedure
- MAINTAIN_TTS Procedure
- PRE_INSTANTIATION_SETUP Procedure and POST_INSTANTIATION_SETUP Procedure

The PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures must be used together to complete the Oracle Streams replication configuration.

The following sections contain information about using these procedures:

- Local Capture or Downstream Capture for the Source Database
- Single Source and Bi-Directional Configurations
- Oracle Streams Clients and Queues Configured By These Procedures

- Change Cycling and Tags
- Automatic Platform Conversion
- Actions Performed by These Procedures
- Configuration Progress and Recoverability
- Requirements for Running These Procedures
- Common Parameters for the Configuration Procedures

Local Capture or Downstream Capture for the Source Database

Local capture means that a capture process runs on the source database. Downstream capture means that a capture process runs on a database other than the source database. These procedures can either configure local capture or downstream capture for the database specified in the `source_database` parameter.

The database that captures changes made to the source database is called the capture database. These procedures can configure one of the following databases as the capture database:

- Source database (local capture)
- Destination database (downstream capture)
- A third database (downstream capture)

The database on which the procedure is run is configured as the capture database for the source database. Therefore, to configure local capture at the source database, run the procedure at the source database. To configure downstream capture at the destination database or a third database, run the procedure at the destination database or third database.

Note:

- When these procedures configure downstream capture, they always configure archived-log downstream capture. These procedures do not configure real-time downstream capture. However, you can configure redo transport services for real-time downstream capture before running a procedure, and then set the `downstream_real_time_mine` capture process parameter to `Y` after the procedure completes. You can also generate scrips with the procedures and modify the scripts to configure real-time downstream capture.
- If these procedures configure bi-directional replication, then the capture process for the destination database always is a local capture process. That is, these procedures always configure the capture process for changes made to the destination database to run on the destination database.
- When the RMAN `DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation with one of these procedures, the destination database cannot be the capture database.

See Also:

- *Oracle Streams Concepts and Administration* for information about local capture and downstream capture
- *Oracle Database 2 Day + Data Replication and Integration Guide* for an example that uses the `MAINTAIN_SCHEMAS` procedure to configure a Streams replication environment that uses a real-time downstream capture process
- "Single Source and Bi-Directional Configurations" on page 130-15

Single Source and Bi-Directional Configurations

These procedures either set up a single source Oracle Streams configuration with the database specified in the `source_database` parameter acting as the only source database, or these procedures set up a bi-directional Oracle Streams configuration with both databases acting as source and destination databases. The `bi_directional` parameter controls whether the Oracle Streams configuration is single source or bi-directional:

- If `bi_directional` is `FALSE`, then a capture process captures changes made to the source database and an apply process at the destination database applies these changes. If the destination database is not the capture database, then a propagation propagates the captured changes to the destination database. The default value for this parameter is `FALSE`.
- If `bi_directional` is `TRUE`, then a separate capture process captures changes made to each database, propagations propagate these changes to the other database, and each database applies changes from the other database.

If `bi_directional` is set to `FALSE`, then these procedures do not configure bi-directional replication. Therefore, changes made to the shared database objects at the destination database are not replicated to the source database, and the shared database objects are not kept synchronized at the two databases, unless no changes are made to the shared database objects at the destination database. However, if `bi_directional` is set to `TRUE`, then Oracle Streams is configured to keep the shared database objects synchronized at the two databases, even if both databases allow changes to the database objects.

Note: You might need to configure conflict resolution if bi-directional replication is configured.

See Also:

- SET_UPDATE_CONFLICT_HANDLER Procedure on page 20-50
- "Local Capture or Downstream Capture for the Source Database" on page 130-14
- *Oracle Streams Replication Administrator's Guide* for more information about conflict resolution

Oracle Streams Clients and Queues Configured By These Procedures

These procedures configure the following Oracle Streams clients:

- These procedures configure a capture process that captures changes to the source database. If bi-directional replication is configured, then these procedures also configure a capture process that captures changes to the destination database.
- If the capture database and the destination database are different databases, then these procedures configure a propagation that propagates changes from the capture database to the destination database.
- If the capture database and the destination database are the same database, then the queue names determine whether a propagation is created:
  - If the `capture_queue_name` and `apply_queue_name` parameters specify different queue names, then a propagation is created between the two queues within the destination database.
  - If the `capture_queue_name` and `apply_queue_name` parameters specify the same queue name, then a propagation is not created, and the downstream capture process and the apply process use the same queue. This configuration is possible only if the `bi_directional` parameter is set to `FALSE` to configure a single source replication environment.
- If bi-directional replication is configured, then these procedures configure a propagation that propagates changes from the destination database to the source database.
- These procedures configure an apply process that applies changes at the destination database. These changes originated at the source database. If bi-directional replication is configured, then these procedures also configure an apply process that applies changes to the source database. These changes originated at the destination database.

By default, the `capture_queue_name` and `apply_queue_name` parameters are set to `NULL`. When these parameters are set to `NULL`, these procedures configure a separate queue for each capture process and apply process. The Oracle Streams replication environment might operate more efficiently if each Oracle Streams client has its own separate queue.

However, two Oracle Streams clients share a queue in the following configurations:

- The configuration described previously in this section in which the downstream capture process and the apply process at the destination database share a queue.
- A configuration in which all of the following conditions are met:
  - The capture database is the source database or a third database.
  - The `bi_directional` parameter is set to `TRUE`.
  - The same queue name is specified for the `capture_queue_name` and `apply_queue_name` parameters.

  In this case, the local capture process and the apply process at the destination database share the same queue. If the source database is the capture database, then the local capture process and the apply process at the source database also share the same queue.

The `capture_name` and `capture_queue_name` parameters must be set to `NULL` when both of the following conditions are met:

- The destination database is the capture database.
- The `bi_directional` parameter is set to `TRUE`.

When both of these conditions are met, these procedure configure two capture processes at the destination database, and these capture processes must have different names. When the `capture_name` and `capture_queue_name` parameters are set to `NULL`, the system generates a different name for the capture processes and queues. These procedures raise an error if both conditions are met and either the `capture_name` parameter or the `capture_queue_name` parameter is set to a non-`NULL` value.

See Also:

- "Single Source and Bi-Directional Configurations" on page 130-15
- "Local Capture or Downstream Capture for the Source Database" on page 130-14

Change Cycling and Tags

Change cycling happens when a change is sent back to the database where it originated. Typically, change cycling should be avoided because it can result in each change going through endless loops back to the database where it originated. Such loops can result in unintended data in the database and tax the networking and computer resources of an environment.

If the `bi_directional` parameter is set to `TRUE`, then these procedures configure bi-directional replication. To prevent change cycling in a bi-directional Oracle Streams replication environment, these procedures configure the environment in the following way:

- The apply process at each database applies each change with an apply tag that is unique to the environment. An apply tag is an Oracle Streams tag that is part of each redo record created by the apply process. For example, if a procedure configures databases `sfdb.net` and `nydb.net` for bi-directional replication, then the apply tag for the apply process at `sfdb.net` might be the hexidecimal equivalent of `'1'`, and the apply tag for the apply process at `nydb.net` might be the hexidecimal equivalent of `'2'`.
- The capture process at each database captures all changes to the shared database objects, regardless of tags in the redo records for the changes to these database objects.
- Each propagation propagates all changes made to the shared database objects to the other database in the bi-directional replication environment, except for changes that originated at the other database. Continuing the example, the propagation at `sfdb.net` propagates all changes to `nydb.net`, except for changes with a tag value that is the hexidecimal equivalent of `'1'`, because these changes originated at `nydb.net`. Similarly, the propagation at `nydb.net` propagates all changes to `sfdb.net`, except for changes with a tag value that is the hexidecimal equivalent of `'2'`. A change that is not propagated because of its tag value is discarded.

These procedures cannot be used to configure multi-directional replication where changes can be cycled back to a source database by a third database in the environment. For example, these procedures cannot be used to configure an Oracle Streams replication environment with three databases where each database shares changes with the other two databases in the environment. Such an environment is sometimes called an "n-way" replication environment. If these procedures were used to configure a three way replication environment such as this, then changes made at a source database would be cycled back to the same source database. In a valid three way replication environment, a particular change is made only once at each database.

These procedures can be used to configure an Oracle Streams replication environment that includes more than two databases, as long as changes made at a source database cannot cycle back to the same source database. For example, a procedure can be run multiple times to configure an environment in which a primary database shares changes with multiple secondary databases. Such an environment is sometimes called a "hub-and-spoke" replication environment.

You can configure the Oracle Streams environment manually to replicate changes in a multiple source environment where each source database shares changes with the other source databases, or you can modify generated scripts to achieve this.

See Also:

- "Single Source and Bi-Directional Configurations" on page 130-15
- *Oracle Streams Replication Administrator's Guide* for more information about tags, for information about configuring a hub-and-spoke replication environment, and for information about configuring an n-way replication environment
- *Oracle Database 2 Day + Data Replication and Integration Guide* or examples that configure hub-and-spoke replication environments

Automatic Platform Conversion

If the source and destination databases are running on different platforms, then these procedures, or the scripts generated by these procedures, convert transferred datafiles to the appropriate platform automatically.

Actions Performed by These Procedures

To view all of the actions performed by one of these procedures in detail, use the procedure to generate a script, and view the script in a text editor.

Configuration Progress and Recoverability

When one of these procedures is run with the `perform_actions` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When one of these procedures is run with the `perform_actions` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by one of these procedures is run.

See Also: "RECOVER_OPERATION Procedure" on page 130-129

Requirements for Running These Procedures

Meet the following requirements when you use one of these procedures:

- Run the procedure at the capture database.

- If the bi_directional parameter is set to TRUE, or if the source database is not the capture database, then the source_database parameter must specify a database that contains the database objects to be shared. The database specified in the destination_database parameter might or might not contain these database objects. If the destination database does not contain the shared database objects, then these procedures will instantiate the database objects at the destination database (excluding the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures).
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs one of these procedures should be granted DBA role. This user must have the necessary privileges to complete the following actions:
  - Create ANYDATA queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
  - Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
- If the bi_directional parameter is set to TRUE or if a network instantiation will be performed, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- If these procedures configure downstream capture, then the corresponding user at the capture database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- If these procedures configure downstream capture, then the corresponding user at the capture database must be able to use a database link to access the destination database. This database link should have the same name as the global name of the destination database.
- Each specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes one of these procedures must have READ and WRITE privilege on each one.
- These procedures, or the scripts generated by these procedures, must be run at an Oracle Database 10*g* Release 2 or later database.
- If the perform_actions parameter is set to TRUE in one of these procedures to configure the Oracle Streams replication environment directly, then all of the databases configured by the procedure must be Oracle Database 10*g* Release 2 or later databases.
- If the perform_actions parameter is set to FALSE in one of these procedures, and the replication environment is configured with a generated script, then the databases configured by the script must be Oracle Database 10*g* Release 1 or later databases. If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.

To ensure that the user who runs these procedures has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.

> **See Also:** *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator

Common Parameters for the Configuration Procedures

Table 130–1 describes the common parameters for the procedures in this package that configure an Oracle Streams replication environment.

Table 130–1 Common Parameters for Configuration Procedures

Parameter	Description
`source_database`	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If `NULL`, then the procedure uses the global name of the local database.
`destination_database`	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If `NULL`, then the procedure raises an error.
`perform_actions`	If `TRUE`, then the procedure performs the necessary actions to configure the replication environment directly. If `FALSE`, then the procedure does not perform the necessary actions to configure the replication environment directly. Specify `FALSE` when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify `FALSE` and either of the following parameters is `NULL`: ▪ `script_name` ▪ `script_directory_object`

Table 130–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the replication environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the replication environment directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the replication environment directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error.
capture_name	The name of each capture process configured to capture changes. Do not specify an owner. If the bi_directional parameter is set to TRUE, then each capture process created by this procedure has the specified name. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If NULL, then the system generates a name for each capture process it creates. **Note:** The capture process name cannot be altered after the capture process is created.
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.

Table 130–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
capture_queue_name	The name of each queue used by a capture process, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the system generates a name for each queue used by a capture process.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
propagation_name	The name of each propagation configured to propagate changes. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set. If NULL, then the system generates a name for each propagation it creates. **Note:** The propagation name cannot be altered after the propagation is created.
apply_name	The name of each apply process configured to apply changes. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for each apply process it creates. When to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter. **Note:** The apply process name cannot be altered after the apply process is created.
apply_queue_table	The name of the queue table for each queue used by an apply process, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by an apply process, and the current user is the owner of each queue table.

Table 130–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
apply_queue_name	The name of each queue used by an apply process, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the system generates a name for each queue used by an apply process.
apply_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
bi_directional	Specify TRUE to configure bi-directional replication between the database specified in source_database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured to capture changes to both databases, and propagations are configured to propagate these changes. If TRUE, then a database link from the destination database to the source database with the same global name as the source database must exist. Specify FALSE to configure one way replication from the database specified in source_database and the database specified in destination_database. A capture process is configured at the current database and an apply process is configured at the destination database. A propagation is configured if necessary. **See Also:** "Oracle Streams Clients and Queues Configured By These Procedures" on page 130-15 for information about when propagations are configured
include_ddl	Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes. Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, are not replicated.

Summary of DBMS_STREAMS_ADM Subprograms

Table 130–2 DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
ADD_COLUMN Procedure on page 130-27	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
ADD_GLOBAL_PROPAGATION_RULES Procedure on page 130-30	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_GLOBAL_RULES Procedure on page 130-34	Adds global rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
ADD_MESSAGE_PROPAGATION_RULE Procedure on page 130-39	Either adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_MESSAGE_RULE Procedure on page 130-43	Adds a message rule to either the positive or negative rule set of an apply process or messaging client, and creates the specified apply process or messaging client if it does not exist
ADD_SCHEMA_PROPAGATION_RULES Procedure on page 130-46	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SCHEMA_RULES Procedure on page 130-50	Adds schema rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
ADD_SUBSET_PROPAGATION_RULES Procedure on page 130-55	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SUBSET_RULES Procedure on page 130-59	Adds subset rules to the positive rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist
ADD_TABLE_PROPAGATION_RULES Procedure on page 130-64	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_TABLE_RULES Procedure on page 130-68	Adds table rules to the rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist

Table 130–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
CLEANUP_INSTANTIATION_SETUP Procedure on page 130-74	Removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package
DELETE_COLUMN Procedure on page 130-78	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
GET_MESSAGE_TRACKING Function on page 130-80	Returns the tracking label for the current session
GET_SCN_MAPPING Procedure on page 130-81	Gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment
MAINTAIN_GLOBAL Procedure on page 130-83	Configures an Oracle Streams environment that replicates changes at the database level between two databases
MAINTAIN_SCHEMAS Procedure on page 130-87	Configures an Oracle Streams environment that replicates changes to specified schemas between two databases
MAINTAIN_SIMPLE_TABLESPACE Procedure on page 130-92	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure is deprecated.
MAINTAIN_SIMPLE_TTS Procedure on page 130-97	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases
MAINTAIN_TABLES Procedure on page 130-100	Configures an Oracle Streams environment that replicates changes to specified tables between two databases
MAINTAIN_TABLESPACES Procedure on page 130-105	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure is deprecated.
MAINTAIN_TTS Procedure on page 130-112	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases
MERGE_STREAMS Procedure on page 130-115	Merges a stream flowing from one capture process with a stream flowing from another capture process
MERGE_STREAMS_JOB Procedure on page 130-118	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the MERGE_STREAMS procedure to merge the two streams
POST_INSTANTIATION_SETUP Procedure on page 130-120	Performs the actions required after instantiation to configure an Oracle Streams replication environment
PRE_INSTANTIATION_SETUP Procedure on page 130-124	Performs the actions required before instantiation to configure an Oracle Streams replication environment

Table 130–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
PURGE_SOURCE_CATALOG Procedure on page 130-128	Removes all Oracle Streams data dictionary information at the local database for the specified object
RECOVER_OPERATION Procedure on page 130-129	Provides options for an Oracle Streams replication configuration operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
REMOVE_QUEUE Procedure on page 130-131	Removes the specified `ANYDATA` queue
REMOVE_RULE Procedure on page 130-132	Removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, propagation, apply process, or messaging client.
REMOVE_STREAMS_CONFIGURATION Procedure on page 130-134	Removes the Oracle Streams configuration at the local database
RENAME_COLUMN Procedure on page 130-136	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
RENAME_SCHEMA Procedure on page 130-139	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
RENAME_TABLE Procedure on page 130-141	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
SET_MESSAGE_NOTIFICATION Procedure on page 130-143	Sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue
SET_MESSAGE_TRACKING Procedure on page 130-148	Sets the tracking label for logical change records (LCRs) produced by the current session
SET_RULE_TRANSFORM_FUNCTION Procedure on page 130-149	Sets or removes the transformation function name for a rule-based transformation
SET_UP_QUEUE Procedure on page 130-153	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of Oracle Streams
SPLIT_STREAMS Procedure on page 130-156	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process

Note: All subprograms commit unless specified otherwise.

ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

Note:

- `ADD_COLUMN` transformations cannot add columns of the following datatypes: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REF`s, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.ADD_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA,
   value_type    IN  VARCHAR2     DEFAULT 'NEW',
   step_number   IN  NUMBER       DEFAULT 0,
   operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_STREAMS_ADM.ADD_COLUMN(
   rule_name        IN  VARCHAR2,
   table_name       IN  VARCHAR2,
   column_name      IN  VARCHAR2,
   column_function  IN  VARCHAR2,
   value_type       IN  VARCHAR2     DEFAULT 'NEW',
   step_number      IN  NUMBER       DEFAULT 0,
   operation        IN  VARCHAR2     DEFAULT 'ADD');
```

Parameters

Table 130–3 ADD_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table to which the column is added in the row LCR, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. The column type is determined by the type specified in the ANYDATA object. This parameter cannot be specified if the column_function parameter is specified.
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified.
value_type	Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all add column transformations with the specified step_number for the specified rule.

table_name	column_name	step_number	Result
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule.

ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 130–4 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 130–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 130–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 229, "Logical Change Record TYPEs"

Table 130–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ▪ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ▪ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ▪ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

See Also:

- "Operational Notes" on page 130-8 and "Propagation Rules for LCRs" on page 130-10 for more information about the rules created by this procedure
- "Propagation User" on page 130-5

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_GLOBAL_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- Capture process rules for capturing changes to an entire database when the `streams_type` parameter is set to `capture`. See "Capture Process Rules for Changes in the Redo Log" on page 130-9 for more information about these rules.
- Apply process rules for applying all logical change records (LCRs) in a queue when the `streams_type` parameter is set to `apply`. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 130-11 for more information about these rules.
- Messaging client rules for dequeuing all persistent LCRs from a queue when the `streams_type` parameter is set to `dequeue`. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 130-12 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2  DEFAULT NULL,
   queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN   DEFAULT TRUE,
   include_ddl         IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
   source_database     IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name       OUT  VARCHAR2,
   ddl_rule_name       OUT  VARCHAR2,
   inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
   and_condition       IN   VARCHAR2  DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2  DEFAULT NULL,
   queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN   DEFAULT TRUE,
```

```
  include_ddl          IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
  source_database      IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130–5 ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, then the procedure creates it automatically. If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. An apply process and a messaging client cannot have the same name.
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

Table 130–5 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Table 130–5 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 229, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process, apply process, or messaging client uses the rules created for filtering.

- "Operational Notes" on page 130-8
- "Security Model" on page 130-5

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_MESSAGE_PROPAGATION_RULE Procedure

This procedure adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
   message_type             IN   VARCHAR2,
   rule_condition           IN   VARCHAR2,
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   inclusion_rule           IN   BOOLEAN   DEFAULT TRUE,
   rule_name                OUT  VARCHAR2,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
   message_type             IN   VARCHAR2,
   rule_condition           IN   VARCHAR2,
   streams_name             IN   VARCHAR2  DEFAULT NULL,
   source_queue_name        IN   VARCHAR2,
   destination_queue_name   IN   VARCHAR2,
   inclusion_rule           IN   BOOLEAN   DEFAULT TRUE,
   queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 130–6 ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
`message_type`	The type of the message. The type can be an Oracle built-in type, such as `VARCHAR2` or `NUMBER`, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as `[`*`schema_name`*`.]`*`type_name`*. If the schema is not specified, then the current user is the default. For example, to specify `VARCHAR2`, enter `VARCHAR2(`*`n`*`)`, where *n* is the size specification. To specify a type named `usr_msg` in the `strmadmin` schema, enter `strmadmin.usr_msg` for this parameter. The following datatypes require a size specification: `VARCHAR2`, `NVARCHAR2`, and `RAW`. **See Also:** *Oracle Database SQL Language Reference* for more information about datatypes
`rule_condition`	The rule condition for this message type. The rule variable name specified in the rule condition must be the following: `:msg` **See Also:** "Examples" on page 130-41

Table 130–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
rule_name	Contains the rule name

Table 130–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ▪ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ▪ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ▪ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- "Operational Notes" on page 130-8 and "Propagation Rules for User Messages" on page 130-11 for more information about the rules created by this procedure
- "Propagation User" on page 130-5

Examples

Suppose the message type is VARCHAR2(128). Given this type, the following rule condition can be specified:

```
':msg = ''HQ'''
```

This rule condition evaluates to TRUE if a user message of type VARCHAR2(128) has HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes: source_dbname, owner, name, and message. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND  ' ||
```

```
':msg.name = ''EMPLOYEES'''
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

Note: The quotation marks in the preceding examples are all single quotation marks.

ADD_MESSAGE_RULE Procedure

This procedure adds a message rule to a rule set of one of the following types of Oracle Streams clients:

- Apply process rule for dequeuing user messages of a specific message type from a queue when the `streams_type` parameter is set to `apply`. See "Apply Process Rules for User Messages" on page 130-12 for more information about such rules.
- Messaging client rule dequeuing user messages of a specific message type from a queue when the `streams_type` parameter is set to `dequeue`. See "Messaging Client Rules for User Messages" on page 130-13 for more information about such rules.

This procedure also creates the specified Oracle Streams client if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

> **Note:** Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
   message_type    IN   VARCHAR2,
   rule_condition  IN   VARCHAR2,
   streams_type    IN   VARCHAR2,
   streams_name    IN   VARCHAR2  DEFAULT NULL,
   queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
   inclusion_rule  IN   BOOLEAN   DEFAULT TRUE,
   rule_name       OUT  VARCHAR2);

DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
   message_type    IN   VARCHAR2,
   rule_condition  IN   VARCHAR2,
   streams_type    IN   VARCHAR2,
   streams_name    IN   VARCHAR2  DEFAULT NULL,
   queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
   inclusion_rule  IN   BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 130–7 ADD_MESSAGE_RULE Procedure Parameters

Parameter	Description
message_type	The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as [*schema_name*.]*type_name*. If the schema is not specified, then the current user is the default. For example, to specify VARCHAR2, enter VARCHAR2(*n*), where *n* is the size specification. To specify a type named usr_msg in the strmadmin schema, enter strmadmin.usr_msg for this parameter. The following datatypes require a size specification: VARCHAR2, NVARCHAR2, and RAW. **See Also:** *Oracle Database SQL Language Reference* for more information about datatypes
rule_condition	The rule condition for this message type. The rule variable name specified in the rule condition must be the following: :msg **See Also:** "Examples" on page 130-45
streams_type	The type of message consumer, either apply for apply process or dequeue for messaging client
streams_name	The name of the Oracle Streams apply process or messaging client. If the specified streams_type is apply, then specify the name of the apply process. Do not specify an owner. If the specified apply process does not exist, then the procedure creates it automatically with a system-generated name. If the specified streams_type is dequeue, then specify the messaging client. For example, if the user strmadmin is the messaging client, then specify strmadmin. If NULL and a relevant apply process or messaging client for the queue exists, then the procedure uses the relevant apply process or messaging client. If NULL and multiple relevant apply processes or messaging clients for the queue exist, then the procedure raises an error. If NULL and no Oracle Streams client of the specified streams_type exists for the queue, then the procedure creates an apply process or messaging client automatically with a system-generated name. An apply process and a messaging client cannot have the same name.
queue_name	The name of the local queue from which messages will be dequeued, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the apply process or messaging client. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the apply process or messaging client. In either case, the system creates the rule set if it does not exist.
rule_name	Contains the rule name

Usage Notes

If an apply process rule is added, then this procedure creates the apply process if it does not exist. An apply process created by this procedure can apply only user messages, and dequeued messages are sent to the message handler for the apply process. If a messaging client rule is added, then this procedure creates a messaging client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- "Operational Notes" on page 130-8
- "Security Model" on page 130-5
- ALTER_APPLY Procedure on page 20-4 for more information about setting a message handler for an apply process

Examples

Suppose the message type is `VARCHAR2(128)`. Given this type, the following rule condition can be specified:

```
':msg = ''HQ'''
```

This rule condition evaluates to `TRUE` if a user message of type `VARCHAR2(128)` has `HQ` for its value.

Suppose the message type is `usr_msg`, and that this type has the following attributes: `source_dbname`, `owner`, `name`, and `message`. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND  ' ||
':msg.name = ''EMPLOYEES'''
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

Note: The quotation marks in the preceding examples are all single quotation marks.

ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 130–8 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema. For example, `hr`.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 130–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 130–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 229, "Logical Change Record TYPEs"

Table 130–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ▪ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ▪ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ▪ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules created for filtering.

See Also:

- "Operational Notes" on page 130-8 and "Propagation Rules for LCRs" on page 130-10 for more information about the rules created by this procedure
- "Propagation User" on page 130-5

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SCHEMA_RULES Procedure

This procedures adds rules to a rule set of one of the following types of Oracle Streams clients:

- Capture process rules for capturing changes to a specified schema when the `streams_type` parameter is set to `capture`. See "Capture Process Rules for Changes in the Redo Log" on page 130-9 for more information about these rules.
- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema when the `streams_type` parameter is set to `apply`. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 130-11 for more information about these rules.
- Messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified schema when the `streams_type` parameter is set to `dequeue`. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 130-12 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
   schema_name          IN   VARCHAR2,
   streams_type         IN   VARCHAR2,
   streams_name         IN   VARCHAR2  DEFAULT NULL,
   queue_name           IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml          IN   BOOLEAN   DEFAULT TRUE,
   include_ddl          IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
   source_database      IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name        OUT  VARCHAR2,
   ddl_rule_name        OUT  VARCHAR2,
   inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
   and_condition        IN   VARCHAR2  DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
   schema_name          IN   VARCHAR2,
```

```
  streams_type        IN   VARCHAR2,
  streams_name        IN   VARCHAR2  DEFAULT NULL,
  queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN   DEFAULT TRUE,
  include_ddl         IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
  source_database     IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
  and_condition       IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130–9 ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, then the procedure creates it automatically. If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. An apply process and a messaging client cannot have the same name.

Table 130–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 130–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. In either case, the system creates the rule set if it does not exist.

Table 130–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 229, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process, apply process, or messaging client uses the rules created for filtering.

See Also:

- "Operational Notes" on page 130-8
- "Security Model" on page 130-5

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SUBSET_PROPAGATION_RULES Procedure

This procedures adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   insert_rule_name          OUT  VARCHAR2,
   update_rule_name          OUT  VARCHAR2,
   delete_rule_name          OUT  VARCHAR2,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 130–10 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, `LONG`, or `LONG RAW` columns currently or in the future.
`dml_condition`	The subset condition. Specify this condition similar to the way you specify conditions in a `WHERE` clause in SQL. For example, to specify rows in the `hr.employees` table where the `salary` is greater than `4000` and the `job_id` is `SA_MAN`, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` **Note:** The quotation marks in the preceding example are all single quotation marks.

Table 130–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_tagged_lcr	If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database. If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.

Table 130–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes, as well as updates that must be converted into deletes
queue_to_queue	If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules created for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:

- "Operational Notes" on page 130-8 and "Propagation Rules for LCRs" on page 130-10 for more information about the rules created by this procedure
- "Propagation User" on page 130-5

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

ADD_SUBSET_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- Capture process rules for capturing changes to a subset of rows in a specified table when the `streams_type` parameter is set to `capture`. See "Capture Process Rules for Changes in the Redo Log" on page 130-9 for more information about these rules.
- Synchronous capture rules for capturing changes to a subset of rows in a specified table when the `streams_type` parameter is set to `sync_capture`. See "Synchronous Capture Rules for DML Changes to Tables" on page 130-10 for more information about these rules.
- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table when the `streams_type` parameter is set to `apply`. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 130-11 for more information about these rules.
- Messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a subset of rows in a specified table when the `streams_type` parameter is set to `dequeue`. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 130-12 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

> **Note:** Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
   table_name          IN   VARCHAR2,
   dml_condition       IN   VARCHAR2,
   streams_type        IN   VARCHAR2 DEFAULT 'apply',
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL,
   insert_rule_name    OUT  VARCHAR2,
   update_rule_name    OUT  VARCHAR2,
   delete_rule_name    OUT  VARCHAR2);

DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
   table_name          IN   VARCHAR2,
   dml_condition       IN   VARCHAR2,
   streams_type        IN   VARCHAR2 DEFAULT 'apply',
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 130–11 ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process, synchronous capture, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` **Note:** The quotation marks in the preceding example are all single quotation marks.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify sync_capture for a synchronous capture. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, then the procedure creates it automatically. If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. An apply process and a messaging client cannot have the same name.

Table 130–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
include_tagged_lcr	If TRUE, then the Oracle Streams client performs its action regardless of the tag: ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag. ■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag. If FALSE, then an Oracle Streams client performs its action only when the tag is NULL: ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag. ■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 130–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For synchronous capture rules, specify the name of the local database. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes, as well as updates that must be converted into deletes

Usage Notes

Running this procedure generates three rules for the specified capture process, synchronous capture, apply process, or messaging client: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured, applied, or dequeued. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, synchronous capture, apply process, or messaging client uses the rules created for filtering. If the Oracle Streams client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:

- "Operational Notes" on page 130-8
- "Security Model" on page 130-5

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

ADD_TABLE_PROPAGATION_RULES Procedure

This procedures adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 130–12 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 130–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 130–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 229, "Logical Change Record TYPEs"

Table 130–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules created for filtering.

- "Operational Notes" on page 130-8 and "Propagation Rules for LCRs" on page 130-10 for more information about the rules created by this procedure
- "Security Model" on page 130-5

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- Capture process rules for capturing changes to a specified table when the `streams_type` parameter is set to `capture`. See "Capture Process Rules for Changes in the Redo Log" on page 130-9 for more information about these rules.
- Synchronous capture rules for capturing changes to a specified table when the `streams_type` parameter is set to `sync_capture`. See "Synchronous Capture Rules for DML Changes to Tables" on page 130-10 for more information about these rules.
- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table when the `streams_type` parameter is set to `apply`. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 130-11 for more information about these rules.
- Messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified table when the `streams_type` parameter is set to `dequeue`. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 130-12 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
   table_name          IN   VARCHAR2,
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN  DEFAULT TRUE,
   include_ddl         IN   BOOLEAN  DEFAULT FALSE,
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL,
   dml_rule_name       OUT  VARCHAR2,
   ddl_rule_name       OUT  VARCHAR2,
   inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
   and_condition       IN   VARCHAR2  DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_TABLE_RULES(
   table_name          IN   VARCHAR2,
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN  DEFAULT TRUE,
   include_ddl         IN   BOOLEAN  DEFAULT FALSE,
```

```
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL,
   inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
   and_condition       IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130–13 ADD_TABLE_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify sync_capture for a synchronous capture. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, then the procedure creates it automatically. If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. An apply process and a messaging client cannot have the same name.

Table 130–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.

Table 130–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the Oracle Streams client, then the Oracle Streams client performs its action regardless of the tag: ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag. ■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the Oracle Streams client, then whether a database change is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for an Oracle Streams client, then the Oracle Streams client performs its action only when the tag is NULL: ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag. ■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the Oracle Streams client, then a database change can be discarded only if it has a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 130–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For synchronous capture rules, specify the name of the local database. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. A synchronous capture cannot have a negative rule set. Specifying FALSE for a synchronous capture raises an error. In either case, the system creates the rule set if it does not exist.

Table 130–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 229, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process, synchronous capture, apply process, or messaging client uses the rules created for filtering.

See Also:

- "Operational Notes" on page 130-8
- "Security Model" on page 130-5

Examples

The following is an example of a table rule condition created for DML changes:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

CLEANUP_INSTANTIATION_SETUP Procedure

This procedure removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package. This procedure either remove the configuration directly, or it can generate a script that removes the configuration.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Attention: When the CLEANUP_INSTANTIATION_SETUP procedure is run, the parameter values must match the parameter values specified when the corresponding PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures were run, except for the values of the following parameters: perform_actions, script_name, and script_directory_object.

See Also:

- "PRE_INSTANTIATION_SETUP Procedure" on page 130-124
- "POST_INSTANTIATION_SETUP Procedure" on page 130-120
- "Procedures That Configure an Oracle Streams Replication Environment" on page 130-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.CLEANUP_INSTANTIATION_SETUP(
   maintain_mode           IN VARCHAR2,
   tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_database         IN VARCHAR2,
   destination_database    IN VARCHAR2,
   perform_actions         IN BOOLEAN   DEFAULT TRUE,
   script_name             IN VARCHAR2  DEFAULT NULL,
   script_directory_object IN VARCHAR2  DEFAULT NULL,
   capture_name            IN VARCHAR2  DEFAULT NULL,
   capture_queue_table     IN VARCHAR2  DEFAULT NULL,
   capture_queue_name      IN VARCHAR2  DEFAULT NULL,
   capture_queue_user      IN VARCHAR2  DEFAULT NULL,
   propagation_name        IN VARCHAR2  DEFAULT NULL,
   apply_name              IN VARCHAR2  DEFAULT NULL,
   apply_queue_table       IN VARCHAR2  DEFAULT NULL,
   apply_queue_name        IN VARCHAR2  DEFAULT NULL,
   apply_queue_user        IN VARCHAR2  DEFAULT NULL,
   bi_directional          IN BOOLEAN   DEFAULT FALSE,
   change_global_name      IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 130–14 CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ▪ GLOBAL to clean up the Oracle Streams configuration that maintained the entire database in both the source and destination databases ▪ TRANSPORTABLE TABLESPACES to cleanup the Oracle Streams configuration that maintained a set of tablespaces at both the source and destination database
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 134-8
source_database	The global name of the source database. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. A database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
perform_actions	If TRUE, then this procedure performs the necessary actions to clean up the Oracle Streams configuration directly. If FALSE, then the procedure does not perform the necessary actions to clean up the Oracle Streams configuration directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ▪ script_name ▪ script_directory_object

Table 130–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to clean up the Oracle Streams configuration. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the statements are appended to the existing file. If non-NULL and the perform_actions parameter is TRUE, then this procedure generates the specified script and performs the actions to clean up the Oracle Streams configuration directly. If NULL and the perform_actions parameter is TRUE, then this procedure directly performs the actions to clean up the Oracle Streams configuration without generating a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then this parameter is ignored, and this procedure does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error.
capture_name	The name of the capture processes configured to capture changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the capture processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure automatically identifies the capture queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_name	The name of each queue used by a capture process, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the procedure automatically identifies the capture queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_user	The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the source database. This user is a secure queue user of the queue.

Table 130–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
propagation_name	The name of the propagations configured to propagate changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the propagations with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_name	The name of the apply processes configured to apply changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the apply processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_table	The name of the queue table for each queue used by an apply process, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure automatically identifies the apply queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_name	The name of each queue used by an apply process, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the procedure automatically identifies the apply queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_user	The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user is a secure queue user of the queue.
bi_directional	Specify TRUE if the Oracle Streams replication configuration is bi-directional between the database specified in source_database and the database specified in destination_database. Specify FALSE if the Oracle Streams replication configuration is one way replication from the current database to the database specified in destination_database.
change_global_name	If TRUE, then the procedure changes the global name of the database specified in destination_database to match the global name of the current database. If FALSE, then the procedure does not change the global name of the database specified in destination_database.

DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

- The `DELETE_COLUMN` procedure supports the same datatypes supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the datatypes supported by Oracle Streams capture processes

Syntax

```
DBMS_STREAMS_ADM.DELETE_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   value_type    IN  VARCHAR2   DEFAULT '*',
   step_number   IN  NUMBER     DEFAULT 0,
   operation     IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 130–15 DELETE_COLUMN Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`table_name`	The name of the table from which the column is deleted in the row LCR, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`column_name`	The name of the column deleted from each row LCR that satisfies the rule.

Table 130–15 (Cont.) DELETE_COLUMN Procedure Parameters

Parameter	Description
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.

GET_MESSAGE_TRACKING Function

Returns the tracking label for the current session.

See Also: SET_MESSAGE_TRACKING Procedure on page 130-148

Syntax

```
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

GET_SCN_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment. This information can be used for the following purposes:

- To recover transactions after point-in-time recovery is performed on a source database in a multiple source Oracle Streams environment
- To run flashback queries for the corresponding SCN at a source database and destination database in an Oracle Streams single source replication environment

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about point-in-time recovery and flashback queries in an Oracle Streams replication environment

Syntax

```
DBMS_STREAMS_ADM.GET_SCN_MAPPING(
   apply_name             IN  VARCHAR2,
   src_pit_scn            IN  NUMBER,
   dest_instantiation_scn OUT NUMBER,
   dest_start_scn         OUT NUMBER,
   dest_skip_txn_ids      OUT DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 130–16 GET_SCN_MAPPING Procedure Parameters

Parameter	Description
apply_name	Name of the apply process which applies logical change records (LCRs) from the source database. The procedure raises an error if the specified apply process does not exist.
src_pit_scn	The SCN at the source database. For point-in-time recovery, specify the point-in-time recovery SCN at the source database. If the specified SCN is greater than the source commit SCN of the last applied transaction, then NULL is returned for both dest_start_scn and dest_instantiation_scn. In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.
dest_instantiation_scn	The SCN at the destination database that corresponds to the specified src_pit_scn at the source database. For point-in-time recovery, use this value for the instantiation SCNs at the source database during recovery.
dest_start_scn	For point in time recovery, the SCN to use for the start_scn parameter for the recovery capture process.

Table 130–16 (Cont.) GET_SCN_MAPPING Procedure Parameters

Parameter	Description
`dest_skip_txn_ids`	Transaction IDs of transactions that were skipped at the `dest_instantiation_scn` because the apply process was applying nondependent transactions out of order. For point in time recovery, these transaction IDs should be ignored by the recovery apply process. This parameter is relevant only if the `commit_serialization` for the apply process that applied these transactions was set to `none`, and the transactions were applied out of order.

MAINTAIN_GLOBAL Procedure

This procedure configures an Oracle Streams environment that replicates changes at the database level between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the destination database while the `MAINTAIN_GLOBAL` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

See Also: "Procedures That Configure an Oracle Streams Replication Environment" on page 130-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_GLOBAL(
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   dump_file_name               IN VARCHAR2  DEFAULT NULL,
   capture_name                 IN VARCHAR2  DEFAULT NULL,
   capture_queue_table          IN VARCHAR2  DEFAULT NULL,
   capture_queue_name           IN VARCHAR2  DEFAULT NULL,
   capture_queue_user           IN VARCHAR2  DEFAULT NULL,
   propagation_name             IN VARCHAR2  DEFAULT NULL,
   apply_name                   IN VARCHAR2  DEFAULT NULL,
   apply_queue_table            IN VARCHAR2  DEFAULT NULL,
   apply_queue_name             IN VARCHAR2  DEFAULT NULL,
   apply_queue_user             IN VARCHAR2  DEFAULT NULL,
   log_file                     IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE,
   include_ddl                  IN BOOLEAN   DEFAULT FALSE,
```

```
   instantiation               IN INTEGER   DEFAULT
                                            DBMS_STREAMS_ADM.INSTANTIATION_FULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 130-20 for descriptions of the procedure parameters

Table 130–17 MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the procedure raises an error.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In these cases, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is incremented to produce an export dump file with a unique name in the source directory.

Table 130–17 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 130–17 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_FULL performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If you use the RMAN DUPLICATE or CONVERT DATABASE command for database instantiation, then the destination database cannot be the capture database. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL or DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK, then the database objects being instantiated must exist at the source database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.

MAINTAIN_SCHEMAS Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `schema_names` parameter is type `VARCHAR2` and the other `schema_name` parameters is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of schemas in different ways and are mutually exclusive.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the schemas from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_SCHEMAS` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

See Also: "Procedures That Configure an Oracle Streams Replication Environment" on page 130-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SCHEMAS(
   schema_names                 IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,

   include_ddl                  IN BOOLEAN   DEFAULT FALSE,
   instantiation                IN INTEGER   DEFAULT
                                             DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 130-20 for descriptions of the procedure parameters that are not in Table 130–18

Table 130–18 MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
schema_names	The schemas to be configured for replication and maintained by Oracle Streams after configuration. The schemas can be specified in the following ways: ▪ Comma-delimited list of type VARCHAR2 ▪ A PL/SQL index-by table of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. The first schema should be in position 1. The last position must be NULL. If a specified schema does not exist at the source database, then the procedure raises an error. If this parameter is set to NULL, then the procedure raises an error.

Table 130–18 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the procedure raises an error.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is incremented to produce an export dump file with a unique name in the source directory.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.

Table 130–18 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 130–18 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA or DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK, then the database objects being instantiated must exist at the source database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.

MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

See Also:

- "Deprecated Subprograms" on page 130-4
- MAINTAIN_SIMPLE_TTS Procedure on page 130-97

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE(
   tablespace_name              IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_database         IN VARCHAR2,
   setup_streams                IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 130–19 MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
`tablespace_name`	The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams. The tablespace must exist at the source database, but it must not exist at the destination database. A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have `READ` privilege on this directory object. If `NULL`, then the procedure raises an error.
`source_directory_object`	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If `NULL`, then the procedure raises an error.
`destination_directory_object`	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred. If `NULL`, then the procedure raises an error.

Table 130–19 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist. If NULL, then the procedure raises an error.
setup_streams	If TRUE, then the procedure performs the necessary actions to maintain the tablespace directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespace directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ▪ script_name ▪ script_directory_object
script_name	If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error.

Table 130–19 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
bi_directional	Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Documentation for this Procedure

The documentation in the following sections applies to the MAINTAIN_SIMPLE_TABLESPACE procedure:

- Single Source and Bi-Directional Configurations on page 130-15
- Change Cycling and Tags on page 130-17
- Automatic Platform Conversion on page 130-18

Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN_SIMPLE_TABLESPACE procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted DBA role. This user must have the necessary privileges to complete the following actions:

  - Create ANYDATA queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
  - Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
  - The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 134-17 for the list of required privileges.
  - The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 134-10 for the list of required privileges.

  To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.

- If the bi_directional parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes this procedure must have READ and WRITE privilege on each one.
- The databases configured by this procedure must be Oracle Database 10*g* Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The setup_streams parameter is set to TRUE to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10*g* Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The setup_streams parameter is set to FALSE in this procedure, and the replication environment is configured with a generated script.

  If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.
- If the procedure is run at an Oracle Database 10*g* Release 1 database, then the databases configured by the procedure must be Oracle Database 10*g* Release 1 or later databases.

See Also: *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure uses the default values for the parameters in the `MAINTAIN_TABLESPACES` procedure that do not exist in the `MAINTAIN_SIMPLE_TABLESPACE` procedure. For example, this procedure creates a capture process at the source database named `capture`, because that is the default value for the `capture_name` parameter in the `MAINTAIN_TABLESPACES` procedure.

> **See Also:** MAINTAIN_TABLESPACES Procedure on page 130-105

Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

> **See Also:** "RECOVER_OPERATION Procedure" on page 130-129

MAINTAIN_SIMPLE_TTS Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespace from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_SIMPLE_TABLESPACE` procedure.

See Also: "Procedures That Configure an Oracle Streams Replication Environment" on page 130-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TTS(
   tablespace_name              IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 130-20 for descriptions of the procedure parameters that are not in Table 130–20

Table 130–20 MAINTAIN_SIMPLE_TTS Procedure Parameters

Parameter	Description
`tablespace_name`	The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams. The tablespace must exist at the source database, but it must not exist at the destination database. A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have `READ` privilege on this directory object. If `NULL`, then the procedure raises an error.
`source_directory_object`	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If `NULL`, then the procedure raises an error.
`destination_directory_object`	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred. If `NULL`, then the procedure raises an error.

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate `ALTER TABLESPACE` statements on the tablespace, nor is it configured to replicate `ALTER TABLE` statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Privileges Required by the MAINTAIN_SIMPLE_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 130-18, the user who runs the `MAINTAIN_SIMPLE_TTS` procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package
- The necessary privileges to run the `CLONE_SIMPLE_TABLESPACE` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 134-17 for the list of required privileges.

- The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 134-10 for the list of required privileges.

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TTS Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TTS procedure that do not exist in the MAINTAIN_SIMPLE_TTS procedure. For example, this procedure automatically generates the capture process name, because NULL is the default value for the capture_name parameter in the MAINTAIN_TTS procedure, and the procedure generates the capture process name when NULL is specified for capture_name.

See Also: MAINTAIN_TTS Procedure on page 130-112

MAINTAIN_TABLES Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_name` parameters is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables in different ways and are mutually exclusive.

Note: If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_TABLES` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

See Also: "Procedures That Configure an Oracle Streams Replication Environment" on page 130-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TABLES(
   table_names                    IN VARCHAR2,
   source_directory_object        IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database                IN VARCHAR2,
   destination_database           IN VARCHAR2,
   perform_actions                IN BOOLEAN   DEFAULT TRUE,
   script_name                    IN VARCHAR2  DEFAULT NULL,
   script_directory_object        IN VARCHAR2  DEFAULT NULL,
   dump_file_name                 IN VARCHAR2  DEFAULT NULL,
   capture_name                   IN VARCHAR2  DEFAULT NULL,
   capture_queue_table            IN VARCHAR2  DEFAULT NULL,
   capture_queue_name             IN VARCHAR2  DEFAULT NULL,
   capture_queue_user             IN VARCHAR2  DEFAULT NULL,

instantiation                IN INTEGER   DEFAULT
                                          DBMS_STREAMS_ADM.INSTANTIATION_TABLE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 130-20 for descriptions of the procedure parameters that are not in Table 130–21

Table 130–21 MAINTAIN_TABLES Procedure Parameters

Parameter	Description
table_names	The tables to be configured for replication and maintained by Oracle Streams after configuration. The tables can be specified in the following ways: ■ Comma-delimited list of type VARCHAR2 ■ A PL/SQL index-by table of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. The first table should be in position 1. The last position must be NULL. Each table should be specified as [*schema_name*.]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. If a specified table does not exist at the source database, then the procedure raises an error. If this parameter is set to NULL, then the procedure raises an error.

Table 130–21 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remain in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the procedure raises an error.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is incremented to produce an export dump file with a unique name in the source directory.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.

Table 130–21 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 130–21 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_TABLE performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE or DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK, then the tables being instantiated must exist at the source database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported. Also, if an instantiated table does not exist at the destination database, then this procedure sets the instantiation SCN for the table. However, if an instantiated table already exist at the destination database before instantiation, then this procedure does not set the instantiation SCN for the table. In this case, you must set the instantiation SCN for the table manually after the procedure completes.

MAINTAIN_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the `MAINTAIN_TTS` procedure.

See Also:

- "Deprecated Subprograms" on page 130-4
- MAINTAIN_TTS Procedure on page 130-112

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TABLESPACES(
   tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_database         IN VARCHAR2,
   setup_streams                IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   dump_file_name               IN VARCHAR2  DEFAULT NULL,
   source_queue_table           IN VARCHAR2  DEFAULT 'streams_queue_table',
   source_queue_name            IN VARCHAR2  DEFAULT 'streams_queue',
   source_queue_user            IN VARCHAR2  DEFAULT NULL,
   destination_queue_table      IN VARCHAR2  DEFAULT 'streams_queue_table',
   destination_queue_name       IN VARCHAR2  DEFAULT 'streams_queue',
   destination_queue_user       IN VARCHAR2  DEFAULT NULL,
   capture_name                 IN VARCHAR2  DEFAULT 'capture',
   propagation_name             IN VARCHAR2  DEFAULT NULL,
   apply_name                   IN VARCHAR2  DEFAULT NULL,
   log_file                     IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE,
   include_ddl                  IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 130–22 MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_names	The local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If NULL, then the procedure raises an error. **See Also:** TABLESPACE_SET Table Type on page 134-8
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred. If NULL, then the procedure raises an error.
destination_database	The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
setup_streams	If TRUE, then the procedure performs the necessary actions to maintain the tablespaces directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespaces directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object

Table 130–22 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
script_name	If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace set directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is incremented to produce an export dump file with a unique name in the source directory.
source_queue_table	The name of the queue table for the queue at the source database, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.
source_queue_name	The name of the queue at the source database that will function as the ANYDATA queue, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.

Table 130–22 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
source_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
destination_queue_table	The name of the queue table for the queue at the destination database, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue at the destination database that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.
destination_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
capture_name	The name of each capture process configured to capture changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database objects in the tablespace set to the positive capture process rule set. **Note:** The capture process name cannot be altered after the capture process is created.
propagation_name	The name of each propagation configured to propagate changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the database objects in the tablespace set to the positive propagation rule set. If NULL, then the system generates a name for each propagation it creates. **Note:** The propagation name cannot be altered after the propagation is created.

Table 130–22 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
apply_name	The name of each apply process configured to apply changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the database objects in the tablespace set to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for each apply process it creates. **Note:** The apply process name cannot be altered after the apply process is created.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.
bi_directional	Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.
include_ddl	Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes. Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, will not be replicated.

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Additional Documentation for this Procedure

The documentation in the following sections applies to the MAINTAIN_TABLESPACES procedure:

- Single Source and Bi-Directional Configurations on page 130-15
- Change Cycling and Tags on page 130-17
- Automatic Platform Conversion on page 130-18

Requirements for Running this Procedure

Meet the following requirements when run the `MAINTAIN_TABLESPACES` procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted `DBA` role. This user must have the necessary privileges to complete the following actions:
  - Create `ANYDATA` queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
  - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package
  - The necessary privileges to run the `CLONE_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See CLONE_TABLESPACES Procedure on page 134-19 for the list of required privileges.
  - The necessary privileges to run the `ATTACH_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See ATTACH_TABLESPACES Procedure on page 134-12 for the list of required privileges.

  To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.
- If the `bi_directional` parameter is set to `TRUE`, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.
- The databases configured by this procedure must be Oracle Database 10*g* Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.

- The databases configured by this procedure must be Oracle Database 10*g* Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

  If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.
- If the procedure is run at an Oracle Database 10*g* Release 1 database, then the databases configured by the procedure must be Oracle Database 10*g* Release 1 or later databases.

See Also: *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator

Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

See Also: "RECOVER_OPERATION Procedure" on page 130-129

MAINTAIN_TTS Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespaces from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_TABLESPACES` procedure.

See Also: "Procedures That Configure an Oracle Streams Replication Environment" on page 130-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TTS(
   tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   dump_file_name               IN VARCHAR2  DEFAULT NULL,
   capture_name                 IN VARCHAR2  DEFAULT NULL,
   capture_queue_table          IN VARCHAR2  DEFAULT NULL,
   capture_queue_name           IN VARCHAR2  DEFAULT NULL,
   capture_queue_user           IN VARCHAR2  DEFAULT NULL,
   propagation_name             IN VARCHAR2  DEFAULT NULL,
   apply_name                   IN VARCHAR2  DEFAULT NULL,
   apply_queue_table            IN VARCHAR2  DEFAULT NULL,
   apply_queue_name             IN VARCHAR2  DEFAULT NULL,
   apply_queue_user             IN VARCHAR2  DEFAULT NULL,
   log_file                     IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE,
   include_ddl                  IN BOOLEAN   DEFAULT FALSE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 130-20 for descriptions of the procedure parameters that are not in Table 130–23

Table 130–23 MAINTAIN_TTS Procedure Parameters

Parameter	Description
tablespace_names	The local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If NULL, then the procedure raises an error. **See Also:** TABLESPACE_SET Table Type on page 134-8
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is incremented to produce an export dump file with a unique name in the source directory.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside

of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Additional Privileges Required by the MAINTAIN_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 130-18, the user who runs the `MAINTAIN_TTS` procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package
- The necessary privileges to run the `CLONE_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See CLONE_TABLESPACES Procedure on page 134-19 for the list of required privileges.
- The necessary privileges to run the `ATTACH_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See ATTACH_TABLESPACES Procedure on page 134-12 for the list of required privileges.

MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The CAPTURE_MESSAGE_CREATE_TIME in the GV$STREAMS_CAPTURE view of the cloned capture process has caught up to, or nearly caught up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The MERGE_STREAMS procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

   When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:

- MERGE_STREAMS_JOB Procedure on page 130-118
- SPLIT_STREAMS Procedure on page 130-156

Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS(
   cloned_propagation_name  IN  VARCHAR2,
   propagation_name         IN  VARCHAR2  DEFAULT NULL,
   queue_name               IN  VARCHAR2  DEFAULT NULL,
   perform_actions          IN  BOOLEAN   DEFAULT TRUE,
   script_name              IN  VARCHAR2  DEFAULT NULL,
   script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130–24 MERGE_STREAMS Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you want to use a name that is different than the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See "Usage Notes" on page 130-117 for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions: ■ The queue specified in the queue_name parameter does not exist. ■ The queue specified in the queue_name parameter exists but is not used by a capture process.

Table 130–24 (Cont.) MERGE_STREAMS Procedure Parameters

Parameter	Description
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See "Usage Notes" on page 130-117 for more information.
perform_actions	If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ▪ script_name ▪ script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error.

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original capture process.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned capture process.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:

- MERGE_STREAMS Procedure on page 130-115
- SPLIT_STREAMS Procedure on page 130-156
- *Oracle Streams Replication Administrator's Guide* for instructions on using the MERGE_STREAMS_JOB procedure

Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS_JOB(
   capture_name          IN  VARCHAR2,
   cloned_capture_name   IN  VARCHAR2,
   merge_threshold       IN  NUMBER,
   schedule_name         IN  VARCHAR2  DEFAULT NULL,
   merge_job_name        IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130–25 MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
capture_name	The name of the original capture process. Do not specify an owner.
cloned_capture_name	The name of the cloned capture process. Do not specify an owner.

Table 130–25 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
merge_threshold	The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines whether or not the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.
schedule_name	The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.
merge_job_name	The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.

Usage Notes

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

POST_INSTANTIATION_SETUP Procedure

This procedure performs the actions required after instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the source database.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

Attention: When the `POST_INSTANTIATION_SETUP` procedure is run, the parameter values must match the parameter values specified when the corresponding `PRE_INSTANTIATION_SETUP` procedure was run, except for the values of the following parameters: `perform_actions`, `script_name`, `script_directory_object`, and `start_processes`.

Note: A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

- *Oracle Streams Replication Administrator's Guide* for information about setting up an Oracle Streams replication environment
- *Oracle Streams Concepts and Administration* for information about completing database maintenance operations

Syntax

```
DBMS_STREAMS_ADM.POST_INSTANTIATION_SETUP(
```

```
maintain_mode           IN VARCHAR2,
tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
source_database         IN VARCHAR2,
destination_database    IN VARCHAR2,
perform_actions         IN BOOLEAN          DEFAULT TRUE,
script_name             IN VARCHAR2         DEFAULT NULL,
script_directory_object IN VARCHAR2         DEFAULT NULL,
capture_name            IN VARCHAR2         DEFAULT NULL,
capture_queue_table     IN VARCHAR2         DEFAULT NULL,
capture_queue_name      IN VARCHAR2         DEFAULT NULL,
capture_queue_user      IN VARCHAR2         DEFAULT NULL,
propagation_name        IN VARCHAR2         DEFAULT NULL,
apply_name              IN VARCHAR2         DEFAULT NULL,
apply_queue_table       IN VARCHAR2         DEFAULT NULL,
apply_queue_name        IN VARCHAR2         DEFAULT NULL,
apply_queue_user        IN VARCHAR2         DEFAULT NULL,
bi_directional          IN BOOLEAN          DEFAULT FALSE,
include_ddl             IN BOOLEAN          DEFAULT FALSE,
start_processes         IN BOOLEAN          DEFAULT FALSE,
instantiation_scn       IN NUMBER           DEFAULT NULL,
exclude_schemas         IN VARCHAR2         DEFAULT NULL,
exclude_flags           IN BINARY_INTEGER   DEFAULT NULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 130-20 for descriptions of the procedure parameters that are not in Table 130–26

Table 130–26 POST_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ▪ GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter ▪ TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 134-8

Table 130–26 (Cont.) POST_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
start_processes	If TRUE, then the procedure starts each capture process and apply process. Any disabled capture or apply process created by the PRE_INSTANTITAION_SETUP procedure also is started. If FALSE, then the procedure does not start any capture processes or apply processes.
instantiation_scn	Specify the instantiation SCN for the database objects at the destination database if the instantiation SCN was not set during instantiation. The instantiation SCN is not set automatically during RMAN instantiations, but the correct instantiation SCN value should be determined during an RMAN instantiation. See the *Oracle Streams Replication Administrator's Guide* for more information. Specify NULL if the instantiation SCN was set for the database objects at the destination database during instantiation. The instantiation SCN can be set during export/import instantiations.
exclude_schemas	A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database. This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.
exclude_flags	Specify what is excluded from the replication configuration in the schemas specified by the exclude_schemas parameter. This parameter works the same way in the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures. See "Usage Notes" on page 130-126 for the PRE_INSTANTIATION_SETUP procedure for more information.

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Destination Database Renamed During RMAN Database Instantiation

If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. If the RMAN

DUPLICATE or RMAN CONVERT DATABASE command is used for database instantiation, then the global name of the destination database can be renamed to the global name of the source database during instantiation. In this case, before you run the POST_INSTANTIATION_SETUP procedure, complete the following steps:

1. Rename the global name of the destination database back to the name specified in the destination_database parameter.
2. At the destination database, drop and recreate any loopback database links that existed on the source and were cloned on the destination database. For example, suppose the source database dbs1.net has a database link that refers to itself. Suppose the destination database is dbs2.net. At the destination database, drop and recreate this database link as a loopback database link that refers to itself (dbs2.net).
3. At the destination database, drop any database links that were cloned from the source database and are from the source database to the destination database. For example, if the source database is dbs1.net and the destination database is dbs2.net, then drop any database links on the destination database that are from dbs1.net to dbs2.net.
4. Create a database link from the destination database to the source database with the same name as the global name of the source database. The database link must be accessible to the Oracle Streams administrator at the destination database.

   This database link is required because the POST_INSTANTIATION_SETUP procedure runs the SET_GLOBAL_INSTANTIATION_SCN procedure in the DBMS_APPLY_ADM package at the destination database, and the SET_GLOBAL_INSTANTIATION_SCN procedure requires the database link. The instantiation SCN is set to the value specified in the instantiation_scn parameter of the POST_INSTANTIATION_SETUP procedure.

Note: When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

Oracle Streams Components Removed From the Destination Database

If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. During database instantiation, Oracle Streams components created by the PRE_INSTANTIATION_SETUP procedure, such as Oracle Streams clients and queues, can be copied from the source database to the destination database. The POST_INSTANTIATION_SETUP procedure removes the Stream components created by the PRE_INSTANTIATION_SETUP procedure from the destination database.

In some cases, rule sets and rules created by the PRE_INSTANTIATION_SETUP procedure might not be removed from the destination database. The POST_INSTANTIATION_SETUP procedure does not associate these rule sets and rules with any Stream clients in the destination database. Optionally, you can remove these rule sets and rules from the destination database after the POST_INSTANTIATION_SETUP procedure, or the script generated by the procedure, completes.

Note: The POST_INSTANTIATION_SETUP procedure only removes Oracle Streams components that were created by the PRE_INSTANTIATION_SETUP procedure. It does not remove Oracle Streams components that were created in a different way.

PRE_INSTANTIATION_SETUP Procedure

This procedure performs the actions required before instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the database that will be the source database in the Stream replication environment.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

Note:

- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.
- When the RMAN `DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation, the destination database cannot be the capture database.

- *Oracle Streams Replication Administrator's Guide* for information about setting up an Oracle Streams replication environment
- *Oracle Streams Concepts and Administration* for information about completing database maintenance operations

Syntax

```
DBMS_STREAMS_ADM.PRE_INSTANTIATION_SETUP(
   maintain_mode           IN VARCHAR2,
   tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_database         IN VARCHAR2,
```

```
destination_database    IN VARCHAR2,
perform_actions         IN BOOLEAN         DEFAULT TRUE,
script_name             IN VARCHAR2        DEFAULT NULL,
script_directory_object IN VARCHAR2        DEFAULT NULL,
capture_name            IN VARCHAR2        DEFAULT NULL,
capture_queue_table     IN VARCHAR2        DEFAULT NULL,
capture_queue_name      IN VARCHAR2        DEFAULT NULL,
capture_queue_user      IN VARCHAR2        DEFAULT NULL,
propagation_name        IN VARCHAR2        DEFAULT NULL,
apply_name              IN VARCHAR2        DEFAULT NULL,
apply_queue_table       IN VARCHAR2        DEFAULT NULL,
apply_queue_name        IN VARCHAR2        DEFAULT NULL,
apply_queue_user        IN VARCHAR2        DEFAULT NULL,
bi_directional          IN BOOLEAN         DEFAULT FALSE,
include_ddl             IN BOOLEAN         DEFAULT FALSE,
start_processes         IN BOOLEAN         DEFAULT FALSE,
exclude_schemas         IN VARCHAR2        DEFAULT NULL,
exclude_flags           IN BINARY_INTEGER  DEFAULT NULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 130-20 for descriptions of the procedure parameters that are not in Table 130–27

Table 130–27 PRE_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ▪ GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter ▪ TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 134-8

Table 130–27 (Cont.) PRE_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.
start_processes	If TRUE, then the procedure starts each capture process and apply process. If FALSE, then the procedure does not start any capture processes or apply processes.
exclude_schemas	A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database. This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.
exclude_flags	Specify what to exclude from the replication configuration in the schemas specified by the exclude_schemas parameter. See "Usage Notes" on page 130-126 for more information.

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

The exclude_flags Parameter

Specify one of the following values:

- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL to exclude changes to the schemas and all of the database objects in the schemas
- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED to exclude changes to the database objects that are not supported by Oracle Streams in the schemas

If both of these values are specified, then the procedure raises an error.

In addition to DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL or DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED, specify one or both of the following values:

- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML to exclude data manipulation language (DML) changes made to the excluded database objects
- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL to exclude data definition language (DDL) changes made to the excluded database objects

Use the plus sign (+) to specify more than one of these values. For example, to maintain DML changes to the tables in a schemas specified by the exclude_schemas parameter but exclude DDL changes to these schemas and the database objects in these schemas, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

To exclude DML and DDL changes made to unsupported database objects in the schemas specified by the exclude_schemas parameter, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

Rules for the excluded database objects are added to the negative rule set of each capture process. Therefore, changes to the excluded database objects will not be captured and replicated.

This parameter is valid only if the maintain_mode parameter is set to GLOBAL and the exclude_schemas parameter is set to a non-NULL value. If the maintain_mode parameter is set to GLOBAL and the exclude_schemas parameter is set to a NULL, then the procedure ignores this parameter. If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then this the procedure ignores this parameter and excludes any database objects in the specified tablespace set that are not supported by Oracle Streams from the Oracle Streams configuration automatically.

Also, if schemas are specified in the exclude_schemas parameter, but the exclude_flags parameter is set to NULL, then the procedure does not add any rules to the negative rule set of any capture process, and the procedure includes the schemas specified in the exclude_schemas parameter in the replication environment.

PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG(
   source_database     IN  VARCHAR2,
   source_object_name  IN  VARCHAR2,
   source_object_type  IN  VARCHAR2);
```

Parameters

Table 130–28 PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
source_database	The global name of the source database containing the object. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
source_object_name	The name of the object specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
source_object_type	Type of the object. Currently, TABLE is the only possible object type.

Usage Notes

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for this table while running the PURGE_SOURCE_CATALOG procedure at the dbs2.net database removes data dictionary information about the table at dbs2.net.

Do not run this procedure at a database if either of the following conditions are true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

> **Note:** These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

RECOVER_OPERATION Procedure

This procedure provides options for an Oracle Streams replication configuration operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.

This procedure only can perform these actions for replication configuration operations being done by one of the following procedures:

- MAINTAIN_GLOBAL Procedure
- MAINTAIN_SCHEMAS Procedure
- MAINTAIN_SIMPLE_TABLESPACE Procedure
- MAINTAIN_SIMPLE_TTS Procedure
- MAINTAIN_TABLES Procedure
- MAINTAIN_TABLESPACES Procedure
- MAINTAIN_TTS Procedure
- PRE_INSTANTIATION_SETUP Procedure
- POST_INSTANTIATION_SETUP Procedure

When these procedures configure the replication environment directly (not by generating a script), information about the configuration actions is stored in the following data dictionary views when the procedure is running:

- DBA_RECOVERABLE_SCRIPT
- DBA_RECOVERABLE_SCRIPT_PARAMS
- DBA_RECOVERABLE_SCRIPT_BLOCKS
- DBA_RECOVERABLE_SCRIPT_ERRORS

The data dictionary views are populated at the database where the replication configuration procedure is run. When one of these procedures completes successfully, metadata about the configuration operation is purged from these views. However, when one of these procedures encounters an error and stop, metadata about the configuration operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the RECOVER_OPERATION procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in DBA_RECOVERABLE_SCRIPT_ERRORS before proceeding.

Run the RECOVER_OPERATION procedure at the database where the replication configuration procedure was run.

> **Note:** To run the RECOVER_OPERATION procedure, both databases must be Oracle Database 10*g* Release 2 or later databases.

Syntax

```
DBMS_STREAMS_ADM.RECOVER_OPERATION(
   script_id       IN  RAW,
   operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```

Parameters

Table 130–29 RECOVER_OPERATION Procedure Parameters

Parameter	Description
`script_id`	The operation id of the procedure invocation that is being rolled forward, rolled back, or purged. Query the `SCRIPT_ID` column of the `DBA_RECOVERABLE_SCRIPT` data dictionary view to determine the operation id.
`operation_mode`	If `FORWARD`, then the procedure rolls forward the operation. Specify `FORWARD` to try to complete the operation. If `ROLLBACK`, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then the procedure purges all of the metadata about the operation. If `PURGE`, then the procedure purges all of the metadata about the operation without rolling the operation back.

REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the Oracle Streams clients that are using the queue.

> **Note:** The specified queue must be a ANYDATA queue.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_QUEUE(
   queue_name               IN  VARCHAR2,
   cascade                  IN  BOOLEAN  DEFAULT FALSE,
   drop_unused_queue_table  IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 130–30 REMOVE_QUEUE Procedure Parameters

Parameter	Description
queue_name	The name of the queue to remove, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.
cascade	If TRUE, then the procedure drops any Oracle Streams clients that use the queue. If FALSE, then the procedure raises an error if there are any Oracle Streams clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no Oracle Streams clients are using the queue currently.
drop_unused_queue_table	If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.

REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the procedure drops the messaging client automatically.

> **Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_RULE(
   rule_name         IN  VARCHAR2,
   streams_type      IN  VARCHAR2,
   streams_name      IN  VARCHAR2,
   drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
   inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 130–31 REMOVE_RULE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule to remove, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure removes all rules from the specified capture process, synchronous capture, apply process, propagation, or messaging client rule set. For example, to specify a rule in the `hr` schema named `prop_rule1`, enter `hr.prop_rule1`. If the schema is not specified, then the current user is the default.
`streams_type`	The type of Oracle Streams client: ■ Specify `capture` for a capture process. ■ Specify `sync_capture` for a synchronous capture. ■ Specify `propagation` for a propagation. ■ Specify `apply` for an apply process. ■ Specify `dequeue` for a messaging client.
`streams_name`	The name of the Oracle Streams client, which can be a capture process, synchronous capture, propagation, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified Oracle Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.

Table 130–31 (Cont.) REMOVE_RULE Procedure Parameters

Parameter	Description
drop_unused_rule	If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database. If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database. If FALSE, then the procedure does not drop the rule from the database.
inclusion_rule	If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the Oracle Streams client.

REMOVE_STREAMS_CONFIGURATION Procedure

This procedure removes the Oracle Streams configuration at the local database.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;
```

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_STREAMS_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_STREAMS_ADM` package
- Removes specifications for DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rules that were created using the `DBMS_STREAMS_ADM` package. Does not drop rules that were created using the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

Attention: Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Oracle Streams configuration at a database.

Note:

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

- STOP_APPLY Procedure on page 20-55 in the `DBMS_APPLY_ADM` package
- REMOVE_RULE Procedure on page 130-132 in the `DBMS_STREAMS_ADM` package

RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

- The RENAME_COLUMN procedure supports the same datatypes supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the datatypes supported by Oracle Streams capture processes

Syntax

```
DBMS_STREAMS_ADM.RENAME_COLUMN(
   rule_name         IN  VARCHAR2,
   table_name        IN  VARCHAR2,
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*',
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 130–32 RENAME_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table in which the column is renamed in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
from_column_name	The name of the column to be renamed in each row LCR that satisfies the rule.
to_column_name	The new name of the column in each row LCR that satisfies the rule.

Table 130–32 (Cont.) RENAME_COLUMN Procedure Parameters

Parameter	Description
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified step_number for the specified rule.
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified to_column_name and step_number for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name and step_number for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified column_name for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name and column_name for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified table_name for the specified rule.

table_name	from_column_name	to_column_name	step_number	Result
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.

RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

> **Note:** Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.RENAME_SCHEMA(
   rule_name         IN  VARCHAR2,
   from_schema_name  IN  VARCHAR2,
   to_schema_name    IN  VARCHAR2,
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 130–33 RENAME_SCHEMA Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_schema_name`	The name of the schema to be renamed in each row LCR that satisfies the rule.
`to_schema_name`	The new name of the schema in each row LCR that satisfies the rule.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
`operation`	Specify `'ADD'` to add the transformation to the rule. Specify `'REMOVE'` to remove the transformation from the rule.

Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table

lists the behavior of the RENAME_SCHEMA procedure when one or more of these parameters is NULL:

from_schema_name	to_schema_name	step_number	Result
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified to_schema_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified from_schema_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.

RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

> **Note:** Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.RENAME_TABLE(
   rule_name        IN  VARCHAR2,
   from_table_name  IN  VARCHAR2,
   to_table_name    IN  VARCHAR2,
   step_number      IN  NUMBER    DEFAULT 0,
   operation        IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 130–34 RENAME_TABLE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_table_name`	The name of the table to be renamed in each row LCR that satisfies the rule, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`to_table_name`	The new name of the table in each row LCR that satisfies the rule, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `humres.staff`. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering

Table 130–34 (Cont.) RENAME_TABLE Procedure Parameters

Parameter	Description
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from_table_name, to_table_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is NULL:

from_table_name	to_table_name	step_number	Result
NULL	NULL	NULL	Remove all rename table transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename table transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename table transformations with the specified to_table_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename table transformations with the specified from_table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.

SET_MESSAGE_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue. A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

Note:

- Currently, messaging clients cannot dequeue buffered messages.
- The DBMS_AQ package can also configure notifications. The DBMS_AQ package provides some notification features that are not available in DBMS_STREAMS_ADM package, such as buffered message notifications and notification grouping by time.

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
   streams_name          IN  VARCHAR2,
   notification_action   IN  VARCHAR2,
   notification_type     IN  VARCHAR2     DEFAULT 'PROCEDURE',
   notification_context  IN  ANYDATA      DEFAULT NULL,
   include_notification  IN  BOOLEAN      DEFAULT TRUE,
   queue_name            IN  VARCHAR2     DEFAULT 'streams_queue');
```

Parameters

Table 130–35 SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
streams_name	The name of the Oracle Streams messaging client. Do not specify an owner. For example, if the user strmadmin is the messaging client, then specify strmadmin.

Table 130–35 (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
notification_action	The action to be performed on message notification. Specify one of the following: ■ For URL notifications, specify a URL without the prefix http://. For example, to specify the URL http://www.company.com:8080, enter the following: www.company.com:8080 ■ For email notifications, specify an email address. For example, to specify an the email address xyz@company.com, enter the following: xyz@company.com ■ For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form [*schema_name*.]*procedure_name*. If the *schema_name* is not specified, then the user who invokes the SET_MESSAGE_NOTIFICATION procedure is the default. The procedure must be a PLSQLCALLBACK data structure. For example, to specify a procedure named notify_orders in the oe schema, enter the following: oe.notify_orders **See Also:** Examples on page 130-146 for more information about message notification procedures
notification_type	The type of notification. Specify one of the following: ■ HTTP if you specified a URL for notification_action ■ MAIL if you specified an email address for notification_action ■ PROCEDURE if you specified a user-defined procedure for notification_action The type must match the specification for the notification_action parameter.
notification_context	The context of the notification. The context must be specified using RAW datatype information. For example, to specify the hexidecimal equivalent of 'FF', enter the following: ANYDATA.ConvertRaw(HEXTORAW('FF')) The notification context is passed the PL/SQL procedure in procedure notifications and is not relevant for mail or HTTP notifications.
include_notification	If TRUE, then the procedure adds this notification for the specified streams_name and queue_name. That is, specifying TRUE turns on the notification for the streams_name and queue_name. If FALSE, then the procedure removes this notification for the specified streams_name and queue_name. That is, specifying FALSE turns off the notification for the streams_name and queue_name. If you specify FALSE, then this procedure ignores any specified values for the notification_action or notification_context parameters.

Table 130–35 (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
queue_name	The name of a local ANYDATA queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue. The specified queue must be a ANYDATA queue. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.

Usage Notes

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.
- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure can dequeue the message.
- An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the DBMS_AQELM package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you might want to use the DBMS_AQELM package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an AQXmlNotification, which includes of the following:

- notification_options, which includes the following:
  - destination - The destination queue from which the message was dequeued
  - consumer_name - The name of the messaging client that dequeued the message
- message_set - The set of message properties

See Also:

- The documentation for the DBMS_AQELM package for more information on email notifications and HTTP notifications
- *Oracle Database 2 Day + Data Replication and Integration Guide* for an example that configures message notification to automatically dequeue of messages of interest
- *Oracle Streams Concepts and Administration* for an example that configures e-mail notifications
- *Oracle Streams Advanced Queuing User's Guide* and *Oracle XML DB Developer's Guide* for more information about message notifications and XML
- *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Examples

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:

```
PROCEDURE procedure_name(
  context  IN  ANYDATA,
  reginfo  IN  SYS.AQ$_REG_INFO,
  descr    IN  SYS.AQ$_DESCRIPTOR);
```

Here, *procedure_name* stands for the name of the procedure. The procedure is a PLSQLCALLBACK data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type oe.user_msg using the message identifier and consumer name sent by the notification. To complete the example, first create the type:

```
CREATE TYPE oe.user_msg AS OBJECT(
  object_name    VARCHAR2(30),
  object_owner   VARCHAR2(30),
  message        VARCHAR2(50));
/
```

Next, create the procedure:

```
CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
  context  ANYDATA,
  reginfo  SYS.AQ$_REG_INFO,
  descr    SYS.AQ$_DESCRIPTOR)
AS
  dequeue_options     DBMS_AQ.DEQUEUE_OPTIONS_T;
  message_properties  DBMS_AQ.MESSAGE_PROPERTIES_T;
  message_handle      RAW(16);
  message             ANYDATA;
  oe_message          oe.user_msg;
  rc                  PLS_INTEGER;
BEGIN
  -- Get the message identifier and consumer name from the descriptor
  dequeue_options.msgid := descr.msg_id;
  dequeue_options.consumer_name := descr.consumer_name;
  -- Dequeue the message
  DBMS_AQ.DEQUEUE(
```

```
    queue_name         => descr.queue_name,
    dequeue_options    => dequeue_options,
    message_properties => message_properties,
    payload            => message,
    msgid              => message_handle);
  rc := message.getobject(oe_message);
  COMMIT;
END;
/
```

See Also: *Oracle Database PL/SQL Packages and Types Reference* for more information about `PLSQLCALLBACK` data structures

SET_MESSAGE_TRACKING Procedure

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

Note: The tracking label set by this procedure does not track non-LCR messages.

See Also: GET_MESSAGE_TRACKING Function on page 130-80

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_TRACKING(
   tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
   actions        IN NUMBER    DEFAULT DBMS_STREAMS_ADM.ACTION_MEMORY);
```

Parameters

Table 130–36 SET_MESSAGE_TRACKING Procedure Parameters

Parameter	Description
`tracking_label`	The label used to track the LCRs produced by the session. Set this parameter to `NULL` to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
`actions`	If `DBMS_STREAMS_ADM.ACTION_MEMORY` is specified, then the LCRs are tracked in memory, and the `V$STREAMS_MESSAGE_TRACKING` dynamic performance view is populated with information about the LCRs. If `DBMS_STREAMS_ADM.ACTION_TRACE` is specified, then the LCRs are tracked in the trace files of each database that processes the LCRs. The values specified for this parameter are enumerated constants. Enumerated constants must be prefixed with the package name.

SET_RULE_TRANSFORM_FUNCTION Procedure

This procedure sets or removes the transformation function name for a custom rule-based transformation.

Syntax

```
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
   rule_name           IN  VARCHAR2,
   transform_function  IN  VARCHAR2);
```

Parameters

Table 130–37 SET_RULE_TRANSFORM_FUNCTION Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule whose rule-based transformation function you are setting or removing, specified as `[`*`schema_name`*`.]`*`rule_name`*. For example, to specify a rule in the `hr` schema named `prop_rule1`, enter `hr.prop_rule1`. If the schema is not specified, then the current user is the default.
`transform_function`	Either the name of the transformation function to be used in the rule-based transformation for the rule or `NULL`. If you specify a transformation function name, then specify an existing function in one of the following forms: ▪ `[`*`schema_name`*`.]`*`function_name`* ▪ `[`*`schema_name`*`.]`*`package_name.function_name`* If the function is in a package, then you must specify the *`package_name`*. For example, to specify a function in the `transform_pkg` package in the `hr` schema named `executive_to_management`, enter `hr.transform_pkg.executive_to_management`. An error is returned if the specified procedure does not exist. If the *`schema_name`* is not specified, then the user who invokes the rule-based transformation function is the default. If you specify `NULL`, then the `SET_RULE_TRANSFORM_FUNCTION` procedure removes the current custom rule-based transformation from the rule.

Usage Notes

The following sections contain usage notes for this procedure:

- Transformation Function Signature
- Rule Action Context
- User Who Calls the Transformation Function
- Function Verification

Transformation Function Signature

A custom rule-based transformation function always operates on one message, but it can return one message or many messages. A custom rule-based transformation function that returns one message is a one-to-one transformation function. A one-to-one transformation function must have the following signature:

```
FUNCTION user_function (
   parameter_name   IN  ANYDATA)
RETURN ANYDATA;
```

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an ANYDATA encapsulation of a message.

A custom rule-based transformation function that can return more than one message is a one-to-many transformation function. A one-to-many transformation function must have the following signature:

```
FUNCTION user_function (
   parameter_name  IN  ANYDATA)
RETURN STREAMS$_ANYDATA_ARRAY;
```

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an array that contains zero or more ANYDATA encapsulations of a message. If the array contains zero ANYDATA encapsulations of a message, then the original message is discarded.

The STREAMS$_ANYDATA_ARRAY type is an Oracle-supplied type that has the following definition:

```
CREATE OR REPLACE TYPE SYS.STREAMS$_ANYDATA_ARRAY
   AS VARRAY(2147483647) of ANYDATA
/
```

The following restrictions apply to custom rule-based transformations that use one-to-many functions:

- Rules that are associated with one-to-many functions are supported for Oracle Streams capture processes only. These rules must not be added to rule sets used by other Oracle Streams clients, including propagations, apply processes, and messaging clients.
- One-to-many functions only can operate on row logical change records (row LCRs). They cannot operate on DDL LCRs.
- Row LCRs returned by a one-to-many function cannot contain piecewise LOB, LONG, or LONG RAW operations.
- The one-to-many function must return row LCRs in the correct order. The order of row LCRs in the array (starting from index 1) is the order that the row LCRs will be executed in the transaction.

When an apply process dequeues row LCRs that are the result of a transformation by a one-to-many function, the apply process uses the instantiation SCN of the LCR passed to the one-to-many function for all of row LCRs.

Note:

- An error is raised if a one-to-one or one-to-many transformation function returns NULL.
- Only one custom rule-based transformation can be specified for a particular rule. You cannot specify both a one-to-one and a one-to-many transformation function for the same rule.
- For any LCR constructed and returned by a custom rule-based transformation, the source_database_name, transaction_id, and scn parameter values must match the values in the original LCR. Oracle automatically specifies the values in the original LCR for these parameters, even if an attempt is made to construct LCRs with different values.

Rule Action Context

This procedure modifies the specified rule's action context to specify the transformation. A rule's action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Oracle Streams. The Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A custom rule-based transformation in Oracle Streams always consists of the following name-value pair in an action context:

- If the function is a one-to-one transformation function, then the name is STREAMS$_TRANSFORM_FUNCTION. If the function is a one-to-many transformation function, then the name is STREAMS$_ARRAY_TRANS_FUNCTION.
- The value is a ANYDATA instance containing a PL/SQL function name specified as a VARCHAR2. This function performs the transformation.

User Who Calls the Transformation Function

The user that calls the transformation function must have EXECUTE privilege on the function. The following list describes which user calls the transformation function:

- If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
- If a transformation is specified for a rule used by a synchronous capture, then the user who calls the transformation function is the capture user for the synchronous capture.
- If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.
- If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.
- If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.

Function Verification

This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when an Oracle Streams client tries to invoke the transformation function.

SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_STREAMS_ADM.SET_UP_QUEUE(
   queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
   storage_clause  IN  VARCHAR2  DEFAULT NULL,
   queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
   queue_user      IN  VARCHAR2  DEFAULT NULL,
   comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 130–38 SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_table	The name of the queue table specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.
storage_clause	The storage clause for queue table The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause. If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause. If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created. **See Also:** *Oracle Database SQL Language Reference* for more information about storage clauses
queue_name	The name of the queue that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue. If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default. Queue names can be a maximum of 24 bytes.

Table 130–38 (Cont.) SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
comment	The comment for the queue

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10*g* release 2 or later, the sort_list setting in CREATE_QUEUE_TABLE is set to commit_time. If the database is a release prior to Oracle Database 10*g* release 2, the sort_list setting in CREATE_QUEUE_TABLE is set to enq_time.
- If the specified queue table already exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the CREATE_QUEUE procedure in the DBMS_AQADM package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not already exist. If an agent with this name already exists and is associated with the queue user only, then it is used. SET_UP_QUEUE then runs the ENABLE_DB_ACCESS procedure in the DBMS_AQADM package, specifying the agent and the user.

Note:

- To enqueue messages into and dequeue messages from a queue, a queue user must have EXECUTE privilege on the DBMS_STREAMS_MESSAGING package or the DBMS_AQ package. The SET_UP_QUEUE procedure does not grant this privilege.
- If the agent that SET_UP_QUEUE tries to create already exists and is associated with a user other than the user specified by queue_user, then the procedure raises an error. In this case, rename or remove the existing agent, and retry SET_UP_QUEUE.

See Also: *Oracle Streams Concepts and Administration* for more information about secure queue users

SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process queue. The queue can grow and begin to spill messages to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates messages from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

Note: If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:

- "MERGE_STREAMS Procedure" on page 130-115
- "MERGE_STREAMS_JOB Procedure" on page 130-118
- *Oracle Streams Replication Administrator's Guide* for instructions on using the SPLIT_STREAMS procedure

Syntax

```
DBMS_STREAMS_ADM.SPLIT_STREAMS(
   propagation_name          IN      VARCHAR2,
   cloned_propagation_name   IN      VARCHAR2  DEFAULT NULL,
   cloned_queue_name         IN      VARCHAR2  DEFAULT NULL,
   cloned_capture_name       IN      VARCHAR2  DEFAULT NULL,
   perform_actions           IN      BOOLEAN   DEFAULT TRUE,
   script_name               IN      VARCHAR2  DEFAULT NULL,
   script_directory_object   IN      VARCHAR2  DEFAULT NULL,
   auto_merge_threshold      IN      NUMBER    DEFAULT NULL,
   schedule_name             IN OUT  VARCHAR2,
   merge_job_name            IN OUT  VARCHAR2);
```

Parameters

Table 130–39 SPLIT_STREAMS Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation that cannot send messages to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
cloned_propagation_name	The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.
cloned_queue_name	The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.
cloned_capture_name	The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.
perform_actions	If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object

Table 130–39 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error.
auto_merge_threshold	If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream. If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.

Table 130–39 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
schedule_name	The Oracle Scheduler schedule name, specified as [*schema_name*.]*schedule_name*. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name if you want to adhere to naming conventions or if you want to track the schedule more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run. If an existing schedule name is specified, an error is raised.
merge_job_name	The Oracle Scheduler job name, specified as [*schema_name*.]*merge_job_name*. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If an existing job name is specified, an error is raised.

DBMS_STREAMS_ADVISOR_ADM

The DBMS_STREAMS_ADVISOR_ADM package, one of a set of Oracle Streams packages, provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered. This package is part of the Oracle Streams Performance Advisor.

This chapter contains the following topics:

- Using DBMS_STREAMS_ADVISOR_ADM
  - Overview
  - Constants
  - Views
- Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

> **See Also:** *Oracle Streams Concepts and Administration* for instructions about using this package

Using DBMS_STREAMS_ADVISOR_ADM

This section contains topics which relate to using the `DBMS_STREAMS_ADVISOR_ADM` package.

- Overview
- Constants
- Views

Overview

The DBMS_STREAMS_ADVISOR_ADM package enables you to gather and analyze information about an Oracle Streams environment. You can use this information in the following ways:

- To populate data dictionary views with an Oracle Streams topology that contains information about the Oracle Streams components at one or more databases
- To examine the Oracle Streams components at one or more databases in your environment and the ways in which information flows through streams that include these components
- To analyze the performance of the Oracle Streams components in your environment
- To detect performance problems with Oracle Streams components and correct these problems

Constants

The DBMS_STREAMS_ADVISOR_ADM package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_DBMS_ADVISOR_ADM.CAPTURE_TYPE.

Table 131–1 DBMS_STREAMS_ADVISOR_ADM Parameters With Enumerated Constants

Parameter	Option	Type	Description
component_type	■ CAPTURE_TYPE ■ PROPAGATION_SENDER_TYPE ■ PROPAGATION_RECEIVER_TYPE ■ APPLY_TYPE ■ QUEUE_TYPE	NUMBER	CAPTURE_TYPE indicates that the Oracle Streams component is a capture process. The constant number for this option is 1. PROPAGATION_SENDER_TYPE indicates that the Oracle Streams component is a propagation sender. The constant number for this option is 2. PROPAGATION_RECEIVER_TYPE indicates that the Oracle Streams component is a propagation receiver. The constant number for this option is 3. APPLY_TYPE indicates that the Oracle Streams component is an apply process. The constant number for this option is 4. QUEUE_TYPE indicates that the Oracle Streams component is a queue. The constant number for this option is 5.

Views

The DBMS_STREAMS_ADVISOR_ADM package uses the following views:

- DBA_STREAMS_TP_COMPONENT contains information about each Oracle Streams component at each database.
- DBA_STREAMS_TP_COMPONENT_LINK contains information about how messages flow between Oracle Streams components.
- DBA_STREAMS_TP_COMPONENT_STAT contains temporary performance statistics about each Oracle Streams component.
- DBA_STREAMS_TP_DATABASE contains information about each database that contains Oracle Streams components.
- DBA_STREAMS_TP_PATH_BOTTLENECK contains temporary information about Oracle Streams components that might be slowing down the flow of a stream.
- DBA_STREAMS_TP_PATH_STAT contains temporary performance statistics about each stream path that exists in the Oracle Streams topology.

The topology information is stored permanently in the following data dictionary views: DBA_STREAMS_TP_DATABASE, DBA_STREAMS_TP_COMPONENT, and DBA_STREAMS_TP_COMPONENT_LINK.

However, the following views contain temporary information: DBA_STREAMS_TP_COMPONENT_STAT, DBA_STREAMS_TP_PATH_BOTTLENECK, and DBA_STREAMS_TP_PATH_STAT. Some of the data in these views is retained only for the user session that runs the ANALYZE_CURRENT_PERFORMANCE procedure. When this user session ends, this temporary information is purged.

- *Oracle Database Reference*
- *Oracle Streams Concepts and Administration* for sample queries that use these views

Operational Notes

This section contains the following operational notes for the DBMS_STREAMS_ADVISOR_ADM package:

- Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package
- General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package

The DBMS_STREAMS_ADVISOR_ADM analyzes the following Oracle Streams components at the specified databases:

- Capture processes
- Propagations
- Apply processes
- Queues

The DBMS_STREAMS_ADVISOR_ADM package does not analyze the following Oracle Streams components:

- Synchronous captures
- Messaging clients

General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

To use the DBMS_STREAMS_ADVISOR_ADM package, complete the following general steps:

1. Identify the database that you will use to gather the information.

   An administrative user at this database must meet the following requirements:

   - The user must have access to a database link to each database that contains Oracle Streams components.
   - The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.

   Typically, in an Oracle Streams environment, the Oracle Streams administrator uses this package.

   If no database in your environment meets these requirements, then choose a database, configure the necessary database links, and grant the necessary privileges to the users before proceeding.
2. Connect as the administrative user to the database you identified in Step 1, and remain connected to the session while you complete the remaining steps.
3. Run the ANALYZE_CURRENT_PERFORMACE procedure.
4. Optionally, allow messages to flow in the environment for some time.
5. Optionally, rerun the ANALYZE_CURRENT_PERFORMACE procedure one or more times.

6. Query the data dictionary views listed in "Views" on page 131-5 to analyze the Oracle Streams environment.
7. If you want to update the information in the data dictionary views or if you add new Oracle Streams components to any database in the environment, repeat Steps 2-6.

Note: When you exit the user session, the rate, bandwidth, event, and flow control statistics are purged from the data dictionary views.

Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

Table 131–2 DBMS_STREAMS_ADVISOR_ADM Package Subprograms

Subprogram	Description
ANALYZE_CURRENT_PERFORMANCE Procedure on page 131-9	Gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered

ANALYZE_CURRENT_PERFORMANCE Procedure

This procedure gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.

The performance analyses includes:

- Calculating bottleneck components for each separate stream
- Calculating the throughput of each Oracle Streams component
- Calculating the latency of each Oracle Streams component
- Calculating the top wait event of each Oracle Streams component
- Calculating the message rate of each stream
- Calculating the transaction rate of each stream

The procedure places the gathered information in data dictionary views.

Note: The parameters in this procedure must all be either non-`NULL` or `NULL`.

See Also:

- *Oracle Streams Concepts and Administration* for instructions on using this procedure
- "Views" on page 131-5

Syntax

```
DBMS_STREAMS_ADVISOR_ADM.ANALYZE_CURRENT_PERFORMANCE(
   component_name  IN  VARCHAR2  DEFAULT NULL,
   component_db    IN  VARCHAR2  DEFAULT NULL,
   component_type  IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 131–3 ANALYZE_CURRENT_PERFORMANCE Procedure Parameters

Parameter	Description
`component_name`	The name of the Oracle Streams component to analyze. For example, to analyze a capture process named `capture01`, then specify `capture01`. If `NULL`, then all of the Oracle Streams components are analyzed, and the other two parameters must also be `NULL`.
`component_db`	The global name of the database that contains the component specified in the `component_name` parameter. For example, if the `db.net` database contains the component, then specify `db.net`. If `NULL`, then all of the Oracle Streams components are analyzed, and the other two parameters must also be `NULL`.

Table 131–3 (Cont.) ANALYZE_CURRENT_PERFORMANCE Procedure Parameters

Parameter	Description
component_type	The type of the component specified in the component_name parameter. If the component_name parameter is non-NULL, then specify one of the following: ■ DBMS_STREAMS_ADVISOR_ADM.CAPTURE_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_SENDER_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_RECEIVER_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.APPLY_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.QUEUE_TYPE See "Constants" on page 131-4 for information about these constants. If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.

132

DBMS_STREAMS_AUTH

The DBMS_STREAMS_AUTH package, one of a set of Oracle Streams packages, provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about this package and Oracle Streams administrators

This chapter contains the following topic:

- Summary of DBMS_STREAMS_AUTH Subprograms

Summary of DBMS_STREAMS_AUTH Subprograms

Table 132–1 DBMS_STREAMS_AUTH Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure on page 132-3	Either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that can be used to grant these privileges
GRANT_REMOTE_ADMIN_ACCESS Procedure on page 132-6	Enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link
REVOKE_ADMIN_PRIVILEGE Procedure on page 132-7	Either revokes Oracle Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges
REVOKE_REMOTE_ADMIN_ACCESS Procedure on page 132-9	Disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link

Note: All subprograms commit unless specified otherwise.

GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that can be used to grant these privileges.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE(
   grantee           IN  VARCHAR2,
   grant_privileges  IN  BOOLEAN   DEFAULT TRUE,
   file_name         IN  VARCHAR2  DEFAULT NULL,
   directory_name    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 132–2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted
grant_privileges	If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fail, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.
file_name	The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege

- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_STREAMS_ADM
  - DBMS_STREAMS_MESSAGING
  - DBMS_TRANSFORM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

  In addition, the grantee has the ability to grant these privileges to other users.
- SELECT_CATALOG_ROLE
- SELECT privilege on data dictionary views related to Oracle Streams
- The ability to allow a remote Oracle Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure does not grant any roles to the grantee.
- This procedure grants only the privileges necessary to configure and administer an Oracle Streams environment. You can grant more privileges to the grantee if necessary.

See Also:

- "GRANT_REMOTE_ADMIN_ACCESS Procedure" on page 132-6
- *Oracle Streams Concepts and Administration* for more information about configuring an Oracle Streams administrator

GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 132–3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Oracle Streams administrator at a downstream capture database administers the source database using this connection. You can also run the procedure at a database running an apply process so that a remote Oracle Streams administrator can set instantiation SCNs at the local database.

Note: The GRANT_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: "GRANT_ADMIN_PRIVILEGE Procedure" on page 132-3

REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes Oracle Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges.

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE(
   grantee            IN  VARCHAR2,
   revoke_privileges  IN  BOOLEAN   DEFAULT TRUE,
   file_name          IN  VARCHAR2  DEFAULT NULL,
   directory_name     IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 132–4 REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user from whom privileges are revoked
revoke_privileges	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fail, then the procedure raises an error. A revoke statement will fail if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

Note: To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also: "GRANT_ADMIN_PRIVILEGE Procedure" on page 132-3

REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.

Note: The REVOKE_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: "REVOKE_ADMIN_PRIVILEGE Procedure" on page 132-7

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 132–5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user for whom access from a remote Oracle Streams administrator is disabled. If a row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.

133

DBMS_STREAMS_MESSAGING

The DBMS_STREAMS_MESSAGING package, one of a set of Oracle Streams packages, provides interfaces to enqueue messages into and dequeue messages from a ANYDATA queue.

Note: Currently, messaging clients cannot dequeue buffered messages. In addition, the DBMS_STREAMS_MESSAGING package cannot be used to enqueue messages into or dequeue messages from a buffered queue. However, the DBMS_AQ package can be used to enqueue and dequeue buffered messages.

See Also:

- *Oracle Streams Concepts and Administration* for more information about Oracle Streams and for an example that uses the procedures in this package
- *Oracle Streams Advanced Queuing User's Guide* for more information about queues, messaging, and the DBMS_AQ package

This chapter contains the following topic:

- Summary of DBMS_STREAMS_MESSAGING Subprograms

Summary of DBMS_STREAMS_MESSAGING Subprograms

Table 133–1 DBMS_STREAMS_MESSAGING Package Subprograms

Subprogram	Description
DEQUEUE Procedure on page 133-3	Uses the specified Oracle Streams messaging client to dequeue a message from the specified queue
ENQUEUE Procedure on page 133-5	The current user enqueues a message into the specified queue

Note: The subprograms in this package do not commit.

DEQUEUE Procedure

This procedure uses the specified Oracle Streams messaging client to dequeue a message from the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.DEQUEUE(
   queue_name    IN   VARCHAR2,
   streams_name  IN   VARCHAR2,
   payload       OUT  ANYDATA,
   dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
   navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
   wait          IN   BINARY_INTEGER  DEFAULT FOREVER,
   msgid         OUT  RAW);

DBMS_STREAMS_MESSAGING.DEQUEUE(
   queue_name    IN   VARCHAR2,
   streams_name  IN   VARCHAR2,
   payload       OUT  ANYDATA,
   dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
   navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
   wait          IN   BINARY_INTEGER  DEFAULT FOREVER);
```

Parameters

Table 133–2 DEQUEUE Procedure Parameters

Parameter	Description
`queue_name`	The name of the local queue from which messages will be dequeued, specified as `[`*`schema_name`*`.]`*`queue_name`*. The current database must contain the queue, and the queue must be a secure queue of `ANYDATA` type. For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.
`streams_name`	The name of the Oracle Streams messaging client. For example, if the user `strmadmin` is the messaging client, then specify `strmadmin`. If `NULL` and a relevant messaging client for the queue exists, then the procedure uses the relevant messaging client. If `NULL` and multiple relevant messaging clients for the queue exist, then the procedure raises an error.
`payload`	The payload that is dequeued
`dequeue_mode`	Specify one of the following settings: `REMOVE`: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. `LOCKED`: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. `BROWSE`: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.

Table 133–2 (Cont.) DEQUEUE Procedure Parameters

Parameter	Description
navigation	Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Specify one of the following settings: NEXT MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then retrieve the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT TRANSACTION: Skip the remainder of the current message group (if any) and retrieve the first message of the next message group. This setting can only be used if message grouping is enabled for the current queue. FIRST MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. **Note:** Each message group contains the messages in a single transaction. **See Also:** *Oracle Streams Advanced Queuing User's Guide* for more information about dequeue options
wait	Either FOREVER or NO_WAIT If FOREVER, then the dequeue call is blocked without a time out until a message is available in the queue. If NO_WAIT, then a wait time of zero seconds is used. In this case, the dequeue will return immediately even if there are no messages in the queue.
msgid	Specifies the message identifier of the message that is dequeued

Exceptions

Table 133–3 DEQUEUE Procedure Exceptions

Exception	Description
ENDOFCURTRANS	Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way: SYS.DBMS_STREAMS_MESSAGING.ENDOFCURTRANS Every dequeue procedure should include an exception handler that handles this exception.
NOMOREMSGS	There are no more messages in the queue for the dequeue operation. Specify this exception in the following way: SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS A dequeue procedure that specifies NO_WAIT for the wait parameter should include an exception handler that handles this exception.

ENQUEUE Procedure

This procedure enables the current user to enqueue a message into the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.ENQUEUE(
   queue_name  IN   VARCHAR2,
   payload     IN   ANYDATA,
   msgid       OUT  RAW);

DBMS_STREAMS_MESSAGING.ENQUEUE(
   queue_name  IN   VARCHAR2,
   payload     IN   ANYDATA);
```

Parameters

Table 133–4 ENQUEUE Procedure Parameters

Parameter	Description
`queue_name`	The name of the local queue into which messages will be enqueued, specified as `[`*`schema_name`*`.]`*`queue_name`*. The current database must contain the queue, and the queue must be a secure queue of `ANYDATA` type. For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.
`payload`	The payload that is enqueued
`msgid`	Specifies the message identifier of the message that is enqueued

Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the `DBMS_STREAMS_ADM.SET_UP_QUEUE` procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run `SET_UP_QUEUE` and specify a queue user.

See Also: SET_UP_QUEUE Procedure on page 130-153

134

DBMS_STREAMS_TABLESPACE_ADM

The DBMS_STREAMS_TABLESPACE_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another. This package uses transportable tablespaces, Data Pump, the DBMS_FILE_TRANSFER package, and the DBMS_FILE_GROUP package.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

This chapter contains the following topics:

- Using DBMS_STREAMS_TABLESPACE_ADM
  - Overview
- Data Structures
- Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

Using DBMS_STREAMS_TABLESPACE_ADM

This section contains topics which relate to using the `DBMS_STREAMS_TABLESPACE_ADM` package.

- Overview

Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A **self-contained tablespace** has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A **simple tablespace** is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- ATTACH_SIMPLE_TABLESPACE Procedure
- CLONE_SIMPLE_TABLESPACE Procedure
- DETACH_SIMPLE_TABLESPACE Procedure
- PULL_SIMPLE_TABLESPACE Procedure

A **self-contained tablespace set** has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- ATTACH_TABLESPACES Procedure
- CLONE_TABLESPACES Procedure
- DETACH_TABLESPACES Procedure
- PULL_TABLESPACES Procedure

To determine whether a set of tablespaces is self-contained, use the `TRANSPORT_SET_CHECK` procedure in the Oracle supplied package `DBMS_TTS`.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespaces and tablespace sets

Data Structures

The DBMS_STREAMS_TABLESPACE_ADM package defines RECORD types and TABLE types.

RECORD Types

- FILE Record Type

TABLE Types

- DIRECTORY_OBJECT_SET Table Type
- FILE_SET Table Type
- TABLESPACE_SET Table Type

DIRECTORY_OBJECT_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement `CREATE DIRECTORY`.

Syntax

```
TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)
  INDEX BY BINARY_INTEGER;
```

FILE Record Type

Contains the directory object associated with a directory and the name of the file in the directory.

Syntax

```
TYPE FILE IS RECORD(
   directory_object VARCHAR2(32),
   file_name        VARCHAR2(4000));
```

Fields

Table 134–1 FILE Fields

Field	Description
`directory_object`	The name of a directory object. You must specify the name of a directory object created using the SQL statement `CREATE DIRECTORY`.
`file_name`	The name of the file in the corresponding directory associated with the directory object

FILE_SET Table Type

Contains one or more files.

Syntax

```
TYPE FILE_SET IS TABLE OF FILE
   INDEX BY BINARY_INTEGER;
```

TABLESPACE_SET Table Type

Contains the names of one or more tablespaces.

Syntax

```
TYPE TABLESPACE_SET IS TABLE OF VARCHAR2(32)
   INDEX BY BINARY_INTEGER;
```

Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

Table 134–2 DBMS_STREAMS_TABLESPACE_ADM Package Subprograms

Subprogram	Description
ATTACH_SIMPLE_TABLESPACE Procedure on page 134-10	Uses Data Pump to import a simple tablespace previously exported using the `DBMS_STREAMS_TABLESPACE_ADM` package or Data Pump export
ATTACH_TABLESPACES Procedure on page 134-12	Uses Data Pump to import a self-contained tablespace set previously exported using the `DBMS_STREAMS_TABLESPACE_ADM` package, Data Pump export, or the Recovery Manager (RMAN) `TRANSPORT TABLESPACE` command
CLONE_SIMPLE_TABLESPACE Procedure on page 134-17	Clones a simple tablespace. The tablespace can later be attached to a database.
CLONE_TABLESPACES Procedure on page 134-19	Clones a set of self-contained tablespaces. The tablespaces can later be attached to a database.
DETACH_SIMPLE_TABLESPACE Procedure on page 134-23	Detaches a simple tablespace. The tablespace can later be attached to a database.
DETACH_TABLESPACES Procedure on page 134-25	Detaches a set of self-contained tablespaces. The tablespaces can later be attached to a database.
PULL_SIMPLE_TABLESPACE Procedure on page 134-29	Copies a simple tablespace from a remote database and attaches it to the current database
PULL_TABLESPACES Procedure on page 134-31	Copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database

Note: All subprograms commit unless specified otherwise.

ATTACH_SIMPLE_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE(
   directory_object      IN  VARCHAR2,
   tablespace_file_name  IN  VARCHAR2,
   converted_file_name   IN  VARCHAR2  DEFAULT NULL,
   datafile_platform     IN  VARCHAR2  DEFAULT NULL,
   tablespace_name       OUT VARCHAR2);
```

Parameters

Table 134–3 ATTACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
directory_object	The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.
	The name of the Data Pump export dump file must be the same as the datafile name for the tablespace, except with a .dmp extension. If the converted_file_name is non-NULL, specify the dump file produced by the export database, not the file name after conversion.
	The Data Pump import log file is written to this directory. The name of the log file is the same as the datafile name for the tablespace, except with an .alg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
	If NULL, then the procedure raises an error.
tablespace_file_name	The name of the datafile for the tablespace being imported.
	If NULL, then the procedure raises an error.
converted_file_name	If the datafile_platform parameter is non-NULL and is not the same as the platform of the local import database, then specify a file name for the converted datafile. The datafile is converted to the platform of the local import database and copied to the new file name. The existing datafile is not modified nor deleted.
	If non-NULL and the datafile_platform parameter is NULL, then the procedure ignores this parameter.
	If non-NULL and the datafile_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter.
	If NULL and the datafile_platform parameter is non-NULL, then the procedure raises an error.

Table 134–3 (Cont.) ATTACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
datafile_platform	Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
tablespace_name	Contains the name of the attached tablespace. The attached tablespace is read-only. Use an ALTER TABLESPACE statement to make the tablespace read/write if necessary.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
- Have READ and WRITE privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: Overview on page 134-3

ATTACH_TABLESPACES Procedure

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the datapump_job_name parameter. This job performs the Data Pump import to complete the attach operation. In addition, if the platform at the export database is different than the local database platform, then this procedure optionally can create datafiles for the tablespace set that can be used with the local platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump import is performed. This version of the procedure uses the files in a file group version and can copy the export dump file, export log file, and the datafiles that comprise the tablespace set into the specified directories. The file group and version are specified using the file_group_name and version_name parameters, respectively. This version of the procedure does not require a datafiles platform specification if the platform at the export database is different than the local database platform. Instead, the tablespace set is migrated automatically to the correct platform when it is attached.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
   datapump_job_name          IN OUT VARCHAR2,
   dump_file                  IN     FILE,
   tablespace_files           IN     FILE_SET,
   converted_files            IN     FILE_SET,
   datafiles_platform         IN     VARCHAR2  DEFAULT NULL,
   log_file                   IN     FILE      DEFAULT NULL,
   tablespace_names           OUT    TABLESPACE_SET);

DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
   file_group_name            IN   VARCHAR2,
   version_name               IN   VARCHAR2  DEFAULT NULL,
   datafiles_directory_object IN   VARCHAR2  DEFAULT NULL,
   logfile_directory_object   IN   VARCHAR2  DEFAULT NULL,
   repository_db_link         IN   VARCHAR2  DEFAULT NULL,
   tablespace_names           OUT  TABLESPACE_SET);
```

Parameters

Table 134–4 ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.

Table 134–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
dump_file	The file name of the Data Pump dump file to import. If NULL or if a file attribute is NULL, then the procedure raises an error.
tablespace_files	The file set that contains the datafiles for the tablespace set being imported. If NULL, then the procedure raises an error.
converted_files	If the datafiles_platform parameter is non-NULL and is not the same as the platform for the local import database, then specify a file set with the names of the converted datafiles. The datafiles are converted to the platform of the local import database and copied to the new file names. In this case, the number of files in the specified file set must match the number of files in the file set specified for the tablespace_files parameter. The existing datafiles are not modified nor deleted. If non-NULL and the datafiles_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafiles_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafiles_platform parameter is non-NULL, then the procedure raises an error.
datafiles_platform	Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
log_file	Specify the log file name for the Data Pump import. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.
version_name	The name of the file group version to attach. If NULL, then the procedure uses the version with the latest creation time for the file group.

Table 134–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
datafiles_directory_object	The directory object into which the datafiles and Data Pump export dump file are copied. The files are copied from the tablespace repository directories to this directory. If non-NULL, the attached tablespaces use the files in specified directory. However, the file group version specified in the version_name parameter consists of the files in the original directory, not in the directory specified by this datafiles_directory_object parameter. If NULL, then the procedure does not copy the datafiles and dump file.
logfile_directory_object	The directory object into which the Data Pump import log file is placed. The system generates a log file name with the extension .alg. If NULL, then the procedure places the import log file in the same directory as the dump file.
repository_db_link	If the file group is in a different database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then meet the following requirements: ■ Each directory object that contains files in the version being attached must exist on both databases. ■ The corresponding directory objects must have the same names on both databases. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.
tablespace_names	Contains the names of the attached tablespaces. The attached tablespaces are read-only. Use ALTER TABLESPACE statements to make the tablespaces read/write if necessary.

Usage Notes

The following sections contain usage notes for this procedure:

- User Requirements
- Procedures Used to Clone or Detach a Tablespace Set
- When the Attach Database Is Different Than the Clone or Detach Database
- Automatic Storage Management Directories

See Also:

- Overview on page 134-3
- *Oracle Streams Concepts and Administration*

User Requirements

To run either version of this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role

- Have READ and WRITE privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the dump_file and tablespace_files parameters, or by the datafiles_directory_object parameter
- Have WRITE privilege on the directory object that will hold the Data Pump import log file, specified by the log_file parameter or logfile_directory_object parameter if it is non-NULL

If the Data Pump job version of the procedure is run, then the user must have WRITE privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the converted_files parameter if it is non-NULL.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Procedures Used to Clone or Detach a Tablespace Set

After a tablespace set is cloned or detached using the CLONE_TABLESPACES or DETACH_TABLEPSACES procedure, respectively, the tablespace set can be attached to a database using the ATTACH_TABLESPACES procedure. If the Data Pump job version of the CLONE_TABLESPACES or DETACH_TABLEPSACES procedure was used, then use the Data Pump job version of the ATTACH_TABLESPACES procedure. If the file group version of the CLONE_TABLESPACES or DETACH_TABLEPSACES procedure was used, then use the file group version of the ATTACH_TABLESPACES procedure.

See Also:

- CLONE_TABLESPACES Procedure on page 134-19
- DETACH_TABLESPACES Procedure on page 134-25

When the Attach Database Is Different Than the Clone or Detach Database

You can attach a tablespace set to a different database than the database from which the tablespace set was cloned or detached. The two databases might or might not share a file system. If the two databases do not share a file system, then you must transfer the dump file and datafiles to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method. You can attach the tablespace set in one of the following ways depending on the version of the ATTACH_TABLESPACES procedure you use:

- If you use the Data Pump job version of the procedure, then specify the relevant files on the file system. The directory object names can be different in the databases.
- If you use the file group version of the procedure, then you can use the repository_db_link parameter to specify the database where tablespace repository resides. The directory objects for the files must exist and must match in the databases.

See Also:

- CLONE_TABLESPACES Procedure on page 134-19
- DETACH_TABLESPACES Procedure on page 134-25
- Chapter 55, "DBMS_FILE_GROUP" for more information about file groups

Automatic Storage Management Directories

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

> **See Also:** *Oracle Database Utilities* for information about specifying ASM directories for directory objects

CLONE_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE(
   tablespace_name      IN  VARCHAR2,
   directory_object     IN  VARCHAR2,
   destination_platform IN  VARCHAR2  DEFAULT NULL,
   tablespace_file_name OUT VARCHAR2);
```

Parameters

Table 134–5 CLONE_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
tablespace_name	The tablespace to be cloned. If NULL, then the procedure raises an error.
directory_object	The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The name of the Data Pump export dump file is the same as the datafile name for the tablespace, except with a .dmp extension. If a file already exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the datafile name for the tablespace, except with a .clg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.
destination_platform	Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.

Table 134–5 (Cont.) CLONE_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
`tablespace_file_name`	Contains the name of the cloned tablespace datafile. This datafile is placed in the directory specified by the parameter `directory_object`.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `directory_object` parameter
- If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also:

- Overview on page 134-3
- ATTACH_SIMPLE_TABLESPACE Procedure on page 134-10 and PULL_SIMPLE_TABLESPACE Procedure on page 134-29

CLONE_TABLESPACES Procedure

This procedure clones a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified directory
4. If this procedure made a tablespace read-only, then makes the tablespace read/write

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the specified directories, but the files are not added to a file group version. In addition, this version of the procedure optionally can create datafiles for the tablespace set that can be used with a platform that is different than the local database platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the appropriate file group version. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a destination platform specification if the destination platform is different. Instead, the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
   datapump_job_name            IN OUT VARCHAR2,
   tablespace_names             IN     TABLESPACE_SET,
   dump_file                    IN     FILE,
   tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
   destination_platform         IN     VARCHAR2  DEFAULT NULL,
   log_file                     IN     FILE      DEFAULT NULL,
   tablespace_files             OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
   tablespace_names             IN  TABLESPACE_SET,
   tablespace_directory_object  IN  VARCHAR2  DEFAULT NULL,
   log_file_directory_object    IN  VARCHAR2  DEFAULT NULL,
   file_group_name              IN  VARCHAR2,
   version_name                 IN  VARCHAR2  DEFAULT NULL,
   repository_db_link           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 134–6 CLONE_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.
tablespace_names	The tablespace set to be cloned. If NULL, then the procedure raises an error.
dump_file	The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file already exists, then the procedure raises an error.
tablespace_directory_objects	The set of directory objects into which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure copies datafiles for the tablespace set to the dump file directory.
destination_platform	Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .clg and places it in the dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.

Table 134–6 (Cont.) CLONE_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_directory_object	The directory object into which the datafiles are copied and Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then the procedure copies the datafiles to and places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.
log_file_directory_object	The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .clg. If NULL, then the procedure uses the directory object specified in tablespace_directory_object.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.
version_name	The name of the version into which the cloned tablespace set is placed. The specified version name cannot be a positive integer. If the specified version does not exist, then the procedure creates it. If the specified version exists, then the procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version. If NULL, then the procedure creates a new version, and the version number can be used to manage the version.
repository_db_link	If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then the directory object specified in tablespace_directory_object must exist on the local database and on the remote database. If tablespace_directory_object is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.
tablespace_files	Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter tablespace_directory_objects.

Usage Notes

To run either version of this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace_names parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the dump_file parameter or the tablespace_directory_object parameter
- Have WRITE privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the tablespace_directory_objects parameter if non-NULL or the tablespace_directory_object parameter
- Have WRITE privilege on the directory object that will contain the Data Pump export log file, specified by the log_file parameter if non-NULL or the log_file_directory_object parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After cloning a tablespace set using this procedure, you can attach the tablespaces to a different database using the ATTACH_TABLESPACES procedure.

See Also:

- Overview on page 134-3
- ATTACH_TABLESPACES Procedure on page 134-12
- Chapter 55, "DBMS_FILE_GROUP" for more information about file groups
- *Oracle Streams Concepts and Administration*

DETACH_SIMPLE_TABLESPACE Procedure

This procedure detaches a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_SIMPLE_TABLESPACE(
   tablespace_name       IN  VARCHAR2,
   directory_object      OUT VARCHAR2,
   tablespace_file_name  OUT VARCHAR2);
```

Parameters

Table 134–7 DETACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.
directory_object	Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement CREATE DIRECTORY exists for this directory. The name of the Data Pump export dump file is the same as the datafile name for the tablespace, except with a .dmp extension. If a file already exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the datafile name for the tablespace, except with a .dlg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
tablespace_file_name	Contains the name of the detached tablespace datafile.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only

- Have `READ` and `WRITE` privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method. You can use the two `OUT` parameters in this procedure to accomplish the attach or pull operation.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

Note: Do not use the `DETACH_SIMPLE_TABLESPACE` procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

See Also:

- Overview on page 134-3
- ATTACH_SIMPLE_TABLESPACE Procedure on page 134-10 and PULL_SIMPLE_TABLESPACE Procedure on page 134-29
- *Oracle Database Administrator's Guide* for more information about the Oracle-managed files feature

DETACH_TABLESPACES Procedure

This procedure detaches a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online and any table partitions must not span tablespaces in the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the database

This procedure does not move or copy the datafiles that comprise the specified tablespace set.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the detach operation by placing the export dump file and export log file in the specified directories, but the files are not added to a file group version.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the detach operation by placing the export dump file and export log file in the appropriate file group version. The datafiles that comprise the tablespace set are not moved or copied, but they are referenced in the version that is detached. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. Also, if the destination platform is different, then the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

> **Note:** Do not use the `DETACH_TABLESPACES` procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
   datapump_job_name         IN OUT VARCHAR2,
   tablespace_names          IN     TABLESPACE_SET,
   dump_file                 IN     FILE,
   log_file                  IN     FILE  DEFAULT NULL,
   tablespace_files          OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
   tablespace_names          IN TABLESPACE_SET,
   export_directory_object   IN VARCHAR2  DEFAULT NULL,
   log_file_directory_object IN VARCHAR2  DEFAULT NULL,
   file_group_name           IN VARCHAR2,
```

```
   version_name              IN VARCHAR2  DEFAULT NULL,
   repository_db_link        IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 134–8 DETACH_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.
tablespace_names	The tablespace set to be detached. If NULL, then the procedure raises an error.
dump_file	The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file already exists, then the procedure raises an error.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .dlg and places it in the dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
tablespace_files	Contains the names of the datafiles for the detached tablespace set.
export_directory_object	The directory object into which the Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then procedure places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.
log_file_directory_object	The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .dlg. If NULL, then the procedure places the export log file in the same directory as the export dump file.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.

Table 134–8 (Cont.) DETACH_TABLESPACES Procedure Parameters

Parameter	Description
version_name	The name of the version into which the detached tablespace set is placed. The specified version name cannot be a positive integer. If the specified version does not exist, then the procedure creates it. If the specified version exists, then procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version. If NULL, then the procedure creates a new version, and the version number can be used to manage the version.
repository_db_link	If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then the directory object specified in export_directory_object must exist on the local database and on the remote database. If export_directory_object is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.

Usage Notes

To run this either version of this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace_names parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the dump_file parameter or the export_directory_object parameter
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL or by the log_file_directory_object parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After detaching a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

See Also:

- Overview on page 134-3
- ATTACH_TABLESPACES Procedure on page 134-12
- Chapter 55, "DBMS_FILE_GROUP" for more information about file groups
- *Oracle Streams Concepts and Administration*
- *Oracle Database Administrator's Guide* for more information about the Oracle-managed files feature

PULL_SIMPLE_TABLESPACE Procedure

This procedure copies a simple tablespace from a remote database and attaches it to the current database. The specified tablespace at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the at the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE(
   tablespace_name          IN VARCHAR2,
   database_link            IN VARCHAR2,
   directory_object         IN VARCHAR2  DEFAULT NULL,
   conversion_extension     IN VARCHAR2  DEFAULT NULL,
   convert_directory_object IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 134–9 PULL_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
tablespace_name	The tablespace to be pulled. If NULL, then the procedure raises an error.
database_link	The name of the database link to the database that contains the tablespace to pull. The database link must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
directory_object	The directory object to which the datafile for the tablespace is copied on the local database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The Data Pump import log file is written to this directory. The name of the log file is the same as the datafile name for the tablespace, except with a .plg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.

Table 134–9 (Cont.) PULL_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
conversion_extension	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafile that is different than the extension for the tablespace datafile at the remote database. In this case, the procedure transfers the datafile to the import database and converts it to be compatible with the current import database platform automatically. After conversion is complete, the original datafile is deleted at the import database.
convert_directory_object	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the EXP_FULL_DATABASE role
- Have EXECUTE privilege on the DBMS_STREAMS_TABLESPACE_ADM package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE privilege on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles IMP_FULL_DATABASE and EXECUTE_CATALOG_ROLE
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL
- Have WRITE privilege on the directory object that will hold the datafile for the tablespace, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: Overview on page 134-3

PULL_TABLESPACES Procedure

This procedure copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database. All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES(
   datapump_job_name            IN OUT VARCHAR2,
   database_link                IN     VARCHAR2,
   tablespace_names             IN     TABLESPACE_SET,
   tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
   log_file                     IN     FILE,
   conversion_extension         IN     VARCHAR2  DEFAULT NULL,
   convert_directory_object     IN     VARCHAR2  DEFAULT NULL);
```

Parameters

Table 134–10 PULL_TABLESPACES Procedure Parameters

Parameter	Description
`data_pump_job_name`	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If `NULL`, then the system generates a Data Pump job name.
`database_link`	The name of the database link to the database that contains the tablespace set to pull. The database link must be accessible to the user who runs the procedure. If `NULL`, then the procedure raises an error.

Table 134–10 (Cont.) PULL_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_names	The tablespace set to be pulled. If NULL, then the procedure raises an error.
tablespace_directory_objects	The set of directory objects to which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure raises an error.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .plg and places it in one of the datafile directories. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
conversion_extension	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafiles that is different than the extension for the tablespace datafiles at the remote database. In this case, the procedure transfers the datafiles to the import database and converts them to be compatible with the current import database platform automatically. After conversion is complete, the original datafiles are deleted at the import database.
convert_directory_object	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the EXP_FULL_DATABASE role
- Have EXECUTE privilege on the DBMS_STREAMS_TABLESPACE_ADM package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE privilege on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the

`tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles `IMP_FULL_DATABASE` and `EXECUTE_CATALOG_ROLE`
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-`NULL`
- Have `WRITE` privilege on the directory objects that will hold the datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

135

DBMS_TDB

The DBMS_TDB package reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

> **See Also:** *Oracle Database Backup and Recovery User's Guide* regarding database transport using CONVERT DATABASE

This chapter contains the following topics:

- Using DBMS_TDB
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- Summary of DBMS_TDB Subprograms

Using DBMS_TDB

This section contains topics which relate to using `DBMS_TDB`.

- Overview
- Constants
- Views
- Operational Notes

Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

Security Model

Use of this package requires the `DBA` privilege.

Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in Table 135–1.

Table 135–1 DBMS_TDB Constants

Name	Type	Value	Description
SKIP_NONE	NUMBER	0	Check all files when checking whether a database is ready for transport.
SKIP_OFFLINE	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
SKIP_READONLY	NUMBER	3	Skip files in readonly tablespaces when checking whether a database is ready for transport.

Views

The DBMS_TDB package uses the following view listed in *Oracle Database Reference*:

- V$DB_TRANSPORTABLE_PLATFORM, which specifies which combinations of source and target platforms support database transport

Operational Notes

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

Summary of DBMS_TDB Subprograms

Table 135–2 DBMS_TDB Package Subprograms

Subprogram	Description
CHECK_DB Function on page 135-9	Checks whether a database can be transported to a target platform
CHECK_EXTERNAL Function on page 135-9	Checks whether a database has external tables, directory or BFILEs

CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2,
     skip_option            IN  NUMBER)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
   RETURN BOOLEAN;
```

Parameters

Table 135–3 CHECK_DB Procedure Parameters

Parameter	Description
target_platform_name	The name of the destination platform, as it appears in V$DB_TRANSPORTABLE_PLATFORM.
skip_option	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 135–1, " DBMS_TDB Constants" on page 135-5.

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns FALSE. If the database is ready for transport, returns TRUE.

Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see Table 135–4, " Reasons for CHECK_DB Function to Return FALSE" on page 135-9.

Table 135–4 Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Unrecognized target platform name.	Check V$DB_TRANSPORTABLE_PLATFORM for recognized platform names.

Table 135–4 (Cont.) Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the COMPATIBLE initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the COMPATIBLE initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

Examples

This example illustrates the use of CHECK_DB with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
       db_ready BOOLEAN;
     BEGIN
       db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
     END;
     /

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.
```

CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL
   RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return TRUE. Otherwise, return FALSE.

Usage Notes

- If SERVEROUTPUT is ON, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of CHECK_EXTERNAL with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
        external BOOLEAN;
     BEGIN
       external := DBMS_TDB.CHECK_EXTERNAL;
     END;
     /
The following external tables exist in the database:
SH.SALES_TRANSACTIONS_EXT
The following directories exist in the database:
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
The following BFILEs exist in the database:
PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
```

136

DBMS_TRACE

The DBMS_TRACE package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- Using DBMS_TRACE
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Operational Notes
- Summary of DBMS_TRACE Subprograms

Using DBMS_TRACE

- Overview
- Security Model
- Constants
- Restrictions
- Operational Notes

Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

- Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
- Running an application to be traced.
- Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).

Security Model

This package must be created under `SYS`.

Constants

The DBMS_TRACE package uses the constants shown in Table 136–1, " DBMS_TRACE Constants":

Table 136–1 DBMS_TRACE Constants

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses trancing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as ■ PL/SQL Trace Tool started ■ Trace flags changed ■ PL/SQL Virtual Machine started ■ PL/SQL Virtual Machine stopped
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Oracle recommends using the symbolic form for all these constants.

Restrictions

You cannot use PL/SQL tracing in a shared server environment.

Operational Notes

- Controlling Data Volume
- Creating Database Tables to Collect DBMS_TRACE Output
- Collecting Trace Data
- Collected Data
- Trace Control

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY]  <libunit-name> compile debug;
```

Note: You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the DBMS_TRACE package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.

- Level 2: Trace calls to enabled program units only. This corresponds to the constant TRACE_ENABLED_CALLS.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to TRACE_ALL_EXCEPTIONS.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to TRACE_ENABLED_EXCEPTIONS.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant TRACE_ALL_SQL.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant TRACE_ENABLED_SQL.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant TRACE_ALL_LINES.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant TRACE_ENABLED_LINES.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

Note: For both all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller's unit is enabled, the calling procedure name will also be output. If the callee's unit is enabled, the called procedure name will be output

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled.

All calls to DBMS_TRACE.SET_PLSQL_TRACE and DBMS_TRACE.CLEAR_PLSQL_TRACE place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated.

Summary of DBMS_TRACE Subprograms

Table 136–2 DBMS_TRACE Package Subprograms

Subprogram	Description
CLEAR_PLSQL_TRACE Procedure on page 136-11	Stops trace data dumping in session
GET_PLSQL_TRACE_LEVEL Function on page 136-12	Gets the trace level
PLSQL_TRACE_VERSION Procedure on page 136-13	Gets the version number of the trace package
SET_PLSQL_TRACE Procedure on page 136-14	Starts tracing in the current session

CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as a list of the enabled constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
  RETURN BINARY_INTEGER;
```

PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (
   major OUT BINARY_INTEGER,
   minor OUT BINARY_INTEGER);
```

Parameters

Table 136–3 PLSQL_TRACE_VERSION Procedure Parameters

Parameter	Description
major	Major version number of DBMS_TRACE.
minor	Minor version number of DBMS_TRACE.

SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (
   trace_level INTEGER);
```

Parameters

Table 136–4 SET_PLSQL_TRACE Procedure Parameters

Parameter	Description
`trace_level`	You must supply one or more of the constants as listed in Table 136–1, " DBMS_TRACE Constants". By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "`TRACE_PAUSE`", "`TRACE_RESUME`" and "`TRACE_STOP`" should not be used in combination with other constants Also see "Collecting Trace Data" on page 136-7 for more information.

137

DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

> **See Also:** *Oracle Database SQL Language Reference*

This chapter contains the following topics:

- Using DBMS_TRANSACTION
  - Security Model
- Summary of DBMS_TRANSACTION Subprograms

Using DBMS_TRANSACTION

- Security Model

Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

Summary of DBMS_TRANSACTION Subprograms

Table 137–1 DBMS_TRANSACTION Package Subprograms

Subprogram	Description
ADVISE_COMMIT Procedure on page 137-6	Equivalent to the SQL statement: `ALTER SESSION ADVISE COMMIT`
ADVISE_NOTHING Procedure on page 137-7	Equivalent to the SQL statement: `ALTER SESSION ADVISE NOTHING`
ADVISE_ROLLBACK Procedure on page 137-8	Equivalent to the SQL statement: `ALTER SESSION ADVISE ROLLBACK`
BEGIN_DISCRETE_TRANSACTION Procedure on page 137-9	Sets "discrete transaction mode" for this transaction
COMMIT Procedure on page 137-10	Equivalent to the SQL statement: `COMMIT`
COMMIT_COMMENT Procedure on page 137-11	Equivalent to the SQL statement: `COMMIT COMMENT <text>`
COMMIT_FORCE Procedure on page 137-12	Equivalent to the SQL statement: `COMMIT FORCE <text>, <number>"`
LOCAL_TRANSACTION_ID Function on page 137-13	Returns the local (to instance) unique identifier for the current transaction
PURGE_LOST_DB_ENTRY Procedure on page 137-14	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
PURGE_MIXED Procedure on page 137-16	Deletes information about a given mixed outcome transaction
READ_ONLY Procedure on page 137-17	Equivalent to the SQL statement: `SET TRANSACTION READ ONLY`
READ_WRITE Procedure on page 137-18	equivalent to the SQL statement: `SET TRANSACTION READ WRITE`
ROLLBACK Procedure on page 137-19	Equivalent to the SQL statement: `ROLLBACK`
ROLLBACK_FORCE Procedure on page 137-20	Equivalent to the SQL statement: `ROLLBACK FORCE <text>`
ROLLBACK_SAVEPOINT Procedure on page 137-21	Equivalent to the SQL statement: `ROLLBACK TO SAVEPOINT <savepoint_name>`
SAVEPOINT Procedure on page 137-22	Equivalent to the SQL statement: `SAVEPOINT <savepoint_name>`
STEP_ID Function on page 137-23	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction

Table 137–1 (Cont.) DBMS_TRANSACTION Package Subprograms

Subprogram	Description
USE_ROLLBACK_SEGMENT Procedure on page 137-24	Equivalent to the SQL statement: `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`

ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE COMMIT
```

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE NOTHING
```

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE ROLLBACK
```

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

BEGIN_DISCRETE_TRANSACTION Procedure

This procedure sets "discrete transaction mode" for this transaction.

Syntax

```
DBMS_TRANSACTION.BEGIN_DISCRETE_TRANSACTION;
```

Exceptions

Table 137–2 BEGIN_DISCRETE_TRANSACTION Procedure Exceptions

Exception	Description
ORA-08175	A transaction attempted an operation which cannot be performed as a discrete transaction. If this exception is encountered, then rollback and retry the transaction
ORA-08176	A transaction encountered data changed by an operation that does not generate rollback data: create index, direct load or discrete transaction. If this exception is encountered, then retry the operation that received the exception.

Examples

```
DISCRETE_TRANSACTION_FAILED exception;
    pragma exception_init(DISCRETE_TRANSACTION_FAILED, -8175);
CONSISTENT_READ_FAILURE exception;
    pragma exception_init(CONSISTENT_READ_FAILURE, -8176);
```

COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT COMMENT <text>
```

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (
   cmnt VARCHAR2);
```

Parameters

Table 137–3 COMMIT_COMMENT Procedure Parameters

Parameter	Description
cmnt	Comment to associate with this commit.

COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT FORCE <text>, <number>"
```

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (
   xid VARCHAR2,
   scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 137–4 COMMIT_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.
scn	System change number.

LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
   create_transaction BOOLEAN := FALSE)
  RETURN VARCHAR2;
```

Parameters

Table 137–5 LOCAL_TRANSACTION_ID Function Parameters

Parameter	Description
`create_transaction`	If true, then start a transaction if one is not currently active.

PURGE_LOST_DB_ENTRY Procedure

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in DBA_2PC_PENDING and associated tables are never removed, and recovery will periodically retry. Procedure PURGE_LOST_DB_ENTRY enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
   xid VARCHAR2);
```

Parameters

Table 137–6 PURGE_LOST_DB_ENTRY Procedure Parameters

Parameter	Description
xid	Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table.

Usage Notes

WARNING: PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 137–7 PURGE_LOST_DB_ENTRY Procedure States

State of Column	State of Global Transaction	State of Local Transaction	Normal DBA Action	Alternative DBA Action
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

NOTE 1: Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

NOTE 2: Examine and take any manual action to remove inconsistencies; then use the procedure PURGE_MIXED.

PURGE_MIXED Procedure

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome: Some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle; however, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
   xid VARCHAR2);
```

Parameters

Table 137–8 PURGE_MIXED Procedure Parameters

Parameter	Description
`xid`	Must be set to the value of the `LOCAL_TRAN_ID` column in the `DBA_2PC_PENDING` table.

READ_ONLY Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ ONLY
```

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK FORCE <text>
```

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (
   xid VARCHAR2);
```

Parameters

Table 137–9 ROLLBACK_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.

ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK TO SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 137–10 ROLLBACK_SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 137–11 SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID
   RETURN NUMBER;
```

USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>
```

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
   rb_name VARCHAR2);
```

Parameters

Table 137–12 USE_ROLLBACK_SEGMENT Procedure Parameters

Parameter	Description
rb_name	Name of rollback segment to use.

138

DBMS_TRANSFORM

The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide* for more on message format transformations.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms

Summary of DBMS_TRANSFORM Subprograms

Table 138–1 DBMS_TRANSFORM Package Subprograms

Subprograms	Description
CREATE_ TRANSFORMATION Procedure on page 138-3	Creates a transformation that maps an object of the source type to an object of the destination type
DROP_ TRANSFORMATION Procedure on page 138-5	Drops the given transformation
MODIFY_ TRANSFORMATION Procedure on page 138-6	Modifies an existing transformation

CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
    schema               VARCHAR2(30),
    name                 VARCHAR2(30),
    from_schema          VARCHAR2(30),
    from_type            VARCHAR2(30),
    to_schema            VARCHAR2(30),
    to_type              VARCHAR2(30),
    transformation       VARCHAR2(4000));
```

Parameters

Table 138–2 CREATE_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form *source.user_data*.

- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

DROP_TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORMATION (
  schema      VARCHAR2(30),
  name        VARCHAR2(30));
```

Parameters

Table 138–3 DROP_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
   schema             VARCHAR2(30),
   name               VARCHAR2(30),
   attribute_number   INTEGER,
   transformation     VARCHAR2(4000));
```

Parameters

Table 138–4 MODIFY_TRANSFORMATION Procedure Parameters

Parameter	Description
`schema`	Specifies the schema of the transformation.
`name`	Specifies the name of the transformation.
`attribute_number`	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
`transformation`	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an `attribute_number` of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

139

DBMS_TTS

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

This chapter contains the following topics:

- Using DBMS_TTS
  - Security Model
  - Exceptions
  - Operational Notes
- Summary of DBMS_TTS Subprograms

Using DBMS_TTS

- Security Model
- Exceptions
- Operational Notes

Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

Exceptions

```
ts_not_found  EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list  EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts     EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently:

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

Summary of DBMS_TTS Subprograms

These two procedures are designed to be called by database administrators.

Table 139–1 DBMS_TTS Package Subprograms

Subprogram	Description
DOWNGRADE Procedure on page 139-7	Downgrades transportable tablespace related data
TRANSPORT_SET_CHECK Procedure on page 139-8	Checks if a set of tablespaces (to be transported) is self-contained

DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
   ts_list          IN CLOB,
   incl_constraints IN BOOLEAN DEFAULT FALSE,
   full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 139–2 TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
ts_list	List of tablespace, separated by comma.
incl_constraints	TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)
full_check	Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to false. It will only consider OUT pointers as violations.

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

140

DBMS_TYPES

The DBMS_TYPES package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- Using DBMS_TYPES
  - Constants
  - Exceptions

Using DBMS_TYPES

- Constants
- Exceptions

Constants

The following table lists the constants in the DBMS_TYPES package.

Table 140–1 DBMS_TYPES Constants

Constant	Description
NO_DATA	Is only relevant if PieceWise is called, for a collection or anydataset. Denotes the end of collection/anydataset when all the elements have been accessed
SUCCESS	The operation succeeded
TYPECODE_BDOUBLE	A NUMBER type
TYPECODE_BFILE	A BFILE type
TYPECODE_BFLOAT	A NUMBER type
TYPECODE_BLOB	A BLOB type
TYPECODE_CFILE	A CFILE type
TYPECODE_CHAR	A CHAR type
TYPECODE_CLOB	A CLOB type
TYPECODE_DATE	A DATE type
TYPECODE_INTERVAL_DS	An INTERVAL_DS type
TYPECODE_INTERVAL_YM	A INTERVAL_YM type
TYPECODE_MLSLABEL	An MLSLABEL type
TYPECODE_NAMEDCOLLECTION	A named collection (VARRAY/nested table) type
TYPECODE_NCHAR	A NCHAR type
TYPECODE_NCLOB	A NCLOB type
TYPECODE_NUMBER	A NUMBER type
TYPECODE_NVARCHAR2	A NVARCHAR2 type
TYPECODE_OBJECT	An OBJECT type
TYPECODE_OPAQUE	An OPAQUE type
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

Exceptions

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

141

DBMS_UTILITY

The DBMS_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

- Using DBMS_UTILITY
  - Security Model
  - Constants
  - Types
  - Exceptions
- Summary of DBMS_UTILITY Subprograms

Using DBMS_UTILITY

- Security Model
- Constants
- Types
- Exceptions

Security Model

DBMS_UTILITY runs with the privileges of the calling user for the NAME_RESOLVE Procedure and the COMPILE_SCHEMA Procedure. This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.

Constants

The DBMS_UTILITY package uses the constants shown in Table 141–1, " DBMS_ UTILITY Constants".

Table 141–1 DBMS_UTILITY Constants

Name	Type	Value	Description
INV_ERROR_ON_ RESTRICTIONS	PLS_INTEGER	1	This constant is the only legal value for the p_option_flags parameter of the INVALIDATE subprogram

Types

- dblink_array
- index_table_type
- instance_record
- lname_array
- name_array
- number_array
- uncl_array

dblink_array

```
TYPE dblink_array IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

Lists of database links should be stored here.

index_table_type

```
TYPE index_table_type IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

The order in which objects should be generated is returned here.

instance_record

```
  TYPE instance_record IS RECORD (
       inst_number   NUMBER,
       inst_name     VARCHAR2(60));
  TYPE instance_table IS TABLE OF instance_record INDEX BY BINARY_INTEGER;
```

The list of active instance number and instance name.

The starting index of `instance_table` is 1; `instance_table` is dense.

lname_array

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) index by BINARY_INTEGER;
```

Lists of Long `NAME` should be stored here, it includes fully qualified attribute names.

name_array

```
TYPE name_array IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

Lists of `NAME` should be stored here.

number_array

```
TYPE number_array IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

The order in which objects should be generated is returned here for users.

uncl_array

```
TYPE uncl_array IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

Lists of `"USER"."NAME"."COLUMN"@LINK` should be stored here.

Exceptions

The following table lists the exceptions raised by DBMS_UTILITY.

Table 141–2 Exceptions Raised by DBMS_UTILITY

Exception	Error Code	Description
INV_NOT_EXIST_OR_NO_PRIV	-24237	Raised by the INVALIDATE subprogram when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	-24238	Raised by the INVALIDATE subprogram if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	-24239	Raised by the INVALIDATE subprogram when different combinations of conditions pertaining to the p_object_id parameter are contravened

Summary of DBMS_UTILITY Subprograms

Table 141–3 DBMS_UTILITY Package Subprograms

Subprogram	Description
ACTIVE_INSTANCES Procedure on page 141-9	Returns the active instance
ANALYZE_PART_OBJECT Procedure on page 141-10	Analyzes the given tables and indexes
CANONICALIZE Procedure on page 141-11	Canonicalizes a given string
COMMA_TO_TABLE Procedures on page 141-12	Converts a comma-delimited list of names into a PL/SQL table of names
COMPILE_SCHEMA Procedure on page 141-13	Compiles all procedures, functions, packages, views and triggers in the specified schema
CREATE_ALTER_TYPE_ERROR_TABLE Procedure on page 141-14	Creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement
CURRENT_INSTANCE Function on page 141-15	Returns the current connected instance number
DATA_BLOCK_ADDRESS_BLOCK Function on page 141-16	Gets the block number part of a data block address
DATA_BLOCK_ADDRESS_FILE Function on page 141-17	Gets the file number part of a data block address
DB_VERSION Procedure on page 141-18	Returns version information for the database
EXEC_DDL_STATEMENT Procedure on page 141-19	Executes the DDL statement in `parse_string`
FORMAT_CALL_STACK Function on page 141-20	Formats the current call stack
FORMAT_ERROR_BACKTRACE Function on page 141-21	Formats the backtrace from the point of the current error to the exception handler where the error has been caught
FORMAT_ERROR_STACK Function on page 141-24	Formats the current error stack
GET_CPU_TIME Function on page 141-25	Returns the current CPU time in 100th's of a second
GET_DEPENDENCY Procedure on page 141-26	Shows the dependencies on the object passed in.
GET_HASH_VALUE Function on page 141-27	Computes a hash value for the given string
GET_PARAMETER_VALUE Function on page 141-28	Gets the value of specified init.ora parameter
GET_TIME Function on page 141-30	Finds out the current time in 100th's of a second
INVALIDATE Procedure on page 141-31	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
IS_CLUSTER_DATABASE Function on page 141-34	Finds out if this database is running in cluster database mode

Table 141–3 (Cont.) DBMS_UTILITY Package Subprograms

Subprogram	Description
MAKE_DATA_BLOCK_ ADDRESS Function on page 141-35	Creates a data block address given a file number and a block number
NAME_RESOLVE Procedure on page 141-36	Resolves the given name
NAME_TOKENIZE Procedure on page 141-38	Calls the parser to parse the given name
PORT_STRING Function on page 141-39	Returns a string that uniquely identifies the version of Oracle and the operating system
TABLE_TO_COMMA Procedures on page 141-40	Converts a PL/SQL table of names into a comma-delimited list of names
VALIDATE Procedure on page 141-41	Makes invalid database objects valid

ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
   instance_table   OUT INSTANCE_TABLE,
   instance_count   OUT NUMBER);
```

Parameters

Table 141–4 ACTIVE_INSTANCES Procedure Parameters

Procedure	Description
`instance_table`	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
`instance_count`	Number of active instances.

ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL:

```
"ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>]
[<command_opt>] [<sample_clause>]
```

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
   schema        IN VARCHAR2 DEFAULT NULL,
   object_name   IN VARCHAR2 DEFAULT NULL,
   object_type   IN CHAR     DEFAULT 'T',
   command_type  IN CHAR     DEFAULT 'E',
   command_opt   IN VARCHAR2 DEFAULT NULL,
   sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

Table 141–5 ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
`schema`	Schema of the `object_name`.
`object_name`	Name of object to be analyzed, must be partitioned.
`object_type`	Type of object, must be `T` (table) or `I` (index).
`command_type`	Must be `V` (validate structure)
`command_opt`	Other options for the command type. For `C`, `E` it can be `FOR` table, `FOR` all `LOCAL` indexes, `FOR` all columns or combination of some of the 'for' options of analyze statistics (table). For `V`, it can be `CASCADE` when `object_type` is T.
`sample_clause`	The sample clause to use when `command_type` is '`E`'.

Usage Notes

For each partition of the object, run in parallel using job queues.

CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE(
   name           IN    VARCHAR2,
   canon_name     OUT   VARCHAR2,
   canon_len      IN    BINARY_INTEGER);
```

Parameters

Table 141–6 CANONICALIZE Procedure Parameters

Parameter	Description
name	The string to be canonicalized
canon_name	The canonicalized string
canon_len	The length of the string (in bytes) to canonicalize

Return Values

Returns the first canon_len bytes in canon_name.

Usage Notes

- If name is NULL, canon_name becomes NULL.
- If name is not a dotted name, and if name begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If name is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after a[.b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- a becomes A
- "a" becomes a
- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with",c.f" ignored.

COMMA_TO_TABLE Procedures

These procedures converts a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT uncl_array);

DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT lname_array);
```

Parameters

Table 141–7 COMMA_TO_TABLE Procedure Parameters

Parameter	Description

`list`	Comma separated list of list of 'names', where a name should have the following format for the first overloading:
	`a [. b [. c ]][ @ d ]`
	and the following format for the second overloading:
	`a [. b]*`
	where `a`, `b`, `c`, `d` are simple identifiers (quoted or unquoted).

`tablen`	Number of tables in the PL/SQL table.
`tab`	PL/SQL table which contains list of names.

Return Values

A PL/SQL table is returned, with values `1..n` and `n+1 is null`.

Usage Notes

The `list` must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.

Entries in the comma-delimited list cannot include multibyte characters.

The values in `tab` are copied from the original list, with no transformations.

COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
   schema          VARCHAR2,
   compile_all     BOOLEAN DEFAULT TRUE,
   reuse_settings  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 141–8 COMPILE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
compile_all	If TRUE, will compile everything within the schema regardless of whether it is VALID
	If FALSE, will compile only INVALID objects
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 141–9 COMPILE_SCHEMA Procedure Exceptions

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile SYS objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

Usage Notes

- Note that this subprogram is a wrapper for RECOMP_SERIAL Procedure included with the UTL_RECOMP package.
- After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.
- To see the errors associated with INVALID objects, you may use the Enterprise Manager command:

  ```
  SHOW ERRORS <type> <schema>.<name>
  ```

CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
   schema_name      IN     VARCHAR2,
   table_name       IN     VARCHAR2);
```

Parameters

Table 141–10 CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the table created.

Exceptions

An error is returned if the table already exists.

CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns `NULL` when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
   RETURN NUMBER;
```

DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 141–11 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

Parameter	Description
dba	Data block address.

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 141–12 DATA_BLOCK_ADDRESS_FILE Function Parameters

Parameter	Description
dba	Data block address.

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (
   version       OUT VARCHAR2,
   compatibility OUT VARCHAR2);
```

Parameters

Table 141–13 DB_VERSION Procedure Parameters

Parameter	Description
`version`	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
`compatibility`	The compatibility setting of the database determined by the "compatible" `init.ora` parameter. If the parameter is not specified in the `init.ora` file, then `NULL` is returned.

EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
   parse_string IN VARCHAR2);
```

Parameters

Table 141–14 EXEC_DDL_STATEMENT Procedure Parameters

Parameter	Description
`parse_string`	DDL statement to be executed.

FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

FORMAT_ERROR_BACKTRACE Function

This procedure displays the call stack at the point where an exception was raised, even if the procedure is called from an exception handler in an outer scope. The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
  RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos  integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
  BEGIN
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

    CASE g_end_pos > 0
      WHEN true THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
g_end_pos-g_start_pos ) );
        g_start_pos := g_end_pos+1;
        RETURN TRUE;

      WHEN FALSE THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
(Length(i_buff)-g_start_pos)+1 ) );
        RETURN FALSE;
    END CASE;
  END Output_One_Line;

BEGIN
  WHILE Output_One_Line() LOOP NULL;
  END LOOP;
END Log_Errors;

    or database administrator.
*/
```

FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
  RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

Return Values

See FORMAT_ERROR_BACKTRACE Function on page 141-21.

GET_CPU_TIME Function

This function returns the current CPU time in 100th's of a second. The returned CPU time is the number of 100th's of a second from some arbitrary epoch.

Syntax

```
DBMS_UTILITY.GET_CPU_TIME
 RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

This subprogram reports cycles (CPU time) used in performing work, and is unrelated to clock time or any other fixed reference. Since the base line is rubricator, and the relationship between work performed and the number generated is Operating System specific, the amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

GET_DEPENDENCY Procedure

This procedure shows the dependencies on the object passed in.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY
 type      IN     VARCHAR2,
 schema    IN     VARCHAR2,
 name      IN     VARCHAR2);
```

Parameters

Table 141–15 GET_DEPENDENCY Procedure Parameters

Parameter	Description
`type`	The type of the object, for example if the object is a table give the type as '`TABLE`'.
`schema`	The schema name of the object.
`name`	The name of the object.

Usage Notes

This procedure uses the DBMS_OUTPUTpackage to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
   name      VARCHAR2,
   base      NUMBER,
   hash_size NUMBER)
  RETURN NUMBER;
```

Parameters

Table 141–16 GET_HASH_VALUE Function Parameters

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value to start at.
hash_size	Desired size of the hash table.

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash_size value. Using a power of 2 for the hash_size parameter works best.

GET_PARAMETER_VALUE Function

This function gets the value of specified `init.ora` parameter.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
   parnam     IN        VARCHAR2,
   intval     IN OUT    BINARY_INTEGER,
   strval     IN OUT    VARCHAR2,
   listno     IN        BINARY_INTEGER DEFAULT 1)
  RETURN BINARY_INTEGER;
```

Parameters

Table 141–17 GET_PARAMETER_VALUE Function Parameters

Parameter	Description
`parnam`	Parameter name.
`intval`	Value of an integer parameter or the value length of a string parameter.
`strval`	Value of a string parameter.
`listno`	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

Return Values

Parameter type:

- 0 if parameter is an `INTEGER/BOOLEAN` parameter
- 1 if parameter is a string/file parameter

Usage Notes

When using `DBMS_UTILITY.GET_PARAMETER_VALUE`, only the first parameter setting of `/dir1` is returned when `init.ora` is set as follows:

```
utl_file_dir = /dir1
utl_file_dir = /dir2
```

However, the full comma-delimited string is returned if you are using:

```
utl_file_dir = /dir1, /dir2
```

Examples

```
DECLARE
  parnam VARCHAR2(256);
  intval BINARY_INTEGER;
  strval VARCHAR2(256);
  partyp BINARY_INTEGER;
BEGIN
  partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                             intval, strval);
  dbms_output.put('parameter value is: ');
  IF partyp = 1 THEN
    dbms_output.put_line(strval);
```

```
  ELSE
    dbms_output.put_line(intval);
  END IF;
  IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
  END IF;
  dbms_output.put('parameter type is: ');
  IF partyp = 1 THEN
    dbms_output.put_line('string');
  ELSE
    dbms_output.put_line('integer');
  END IF;
END;
```

GET_TIME Function

This function determines the current time in 100th's of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
  RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
   p_object_id              NUMBER,
   p_plsql_object_settings  VARCHAR2 DEFAULT NULL,
   p_option_flags           PLS_INTEGER DEFAULT 0);
```

Parameters

Table 141–18 INVALIDATE Procedure Parameters

Parameter	Description
p_object_id	ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.
p_plsql_object_ settings	This optional parameter is ignored if the object specified by p_ object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
p_option_flags	This parameter is optional and defaults to zero (no flags). Option flags supported by invalidate. ■ inv_error_on_restrictions (see Constants on page 141-4): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.

Exceptions

Table 141–19 INVALIDATE Exceptions

Exception	Description
INV_NOT_EXIST_OR_NO_PRIV	Raised when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	Raised if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	Raised when different combinations of conditions pertaining to the p_object_id parameter are contravened

Usage Notes

The object type (object_type column from ALL_OBJECTS) of the object specified by p_object_id must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is the package specification of STANDARD, DBMS_STANDARD, or specification or body of DBMS_UTILITY and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is an object type specification and there exist tables which depend on the type and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the object_id 1232 refers to the procedure remove_emp in the HR schema. Then the above call will mark the remove_emp procedure invalid and change it's PLSQL_OPTIMIZE_LEVEL compiler setting to 2. The values of other compiler settings will remain unchanged since REUSE SETTINGS is specified.

Objects that depend on hr.remove_emp will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the object_id 40775 refers to the type body leaf_category_typ in the OE schema. Then the above call will mark the type body invalid and change its PLSQL_CODE_TYPE compiler setting to NATIVE. The values of other compiler settings will be picked up from the current session environment since REUSE SETTINGS has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the `OE` schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
  RETURN BOOLEAN;
```

Return Values

This function returns `TRUE` if this instance was started in cluster database mode; `FALSE` otherwise.

MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number. A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
   file  NUMBER,
   block NUMBER)
  RETURN NUMBER;
```

Parameters

Table 141–20 MAKE_DATA_BLOCK_ADDRESS Function Parameters

Parameter	Description
`file`	File that contains the block.
`block`	Offset of the block within the file in terms of block increments.

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
   name          IN  VARCHAR2,
   context       IN  NUMBER,
   schema        OUT VARCHAR2,
   part1         OUT VARCHAR2,
   part2         OUT VARCHAR2,
   dblink        OUT VARCHAR2,
   part1_type    OUT NUMBER,
   object_number OUT NUMBER);
```

Parameters

Table 141–21 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	Name of the object. This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in. a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).
context	Must be an integer between 0 and 9. ■ 0 - table ■ 1 - PL/SQL (for 2 part names) ■ 2 - sequences ■ 3 - trigger ■ 4 - Java Source ■ 5 - Java resource ■ 6 - Java class ■ 7 - type ■ 8 - Java shared data ■ 9 - index
schema	Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.
part1	First part of the name. The type of this name is specified part1_type (synonym or package).
part2	If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.

Table 141–21 (Cont.) NAME_RESOLVE Procedure Parameters

Parameter	Description
dblink	If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.
part1_type	Type of part1 is: ■ 5 - synonym ■ 7 - procedure (top level) ■ 8 - function (top level) ■ 9 - package
object_number	Object identifier

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as "a [. b [. c]][@ dblink]". It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as `NULL`.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (
   name    IN  VARCHAR2,
   a       OUT VARCHAR2,
   b       OUT VARCHAR2,
   c       OUT VARCHAR2,
   dblink  OUT VARCHAR2,
   nextpos OUT BINARY_INTEGER);
```

Parameters

For each of `a`, `b`, `c`, `dblink`, tell where the following token starts in `anext`, `bnext`, `cnext`, `dnext` respectively.

PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

Syntax

```
DBMS_UTILITY.PORT_STRING
   RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

TABLE_TO_COMMA Procedures

These procedures converts a PL/SQL table of names into a comma-delimited list of names. This takes a PL/SQL table, `1..n`, terminated with `n+1 null`. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  UNCL_ARRAY,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);

DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  lname_array,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);
```

Parameters

Table 141–22 TABLE_TO_COMMA Procedure Parameters

Parameter	Description
`tab`	PL/SQL table which contains list of table names.
`tablen`	Number of tables in the PL/SQL table.
`list`	Comma separated list of tables.

Return Values

A comma-delimited list and the number of elements found in the table.

VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE(
    object_id       NUMBER);

DBMS_UTILITY.VALIDATE(
   owner          VARCHAR2,
   objname        VARCHAR2,
   namespace      NUMBER,
   edition_name   := SYS_CONTEXT ('USERENV', 'CURRENT_EDITION'));
```

Parameters

Table 141–23 VALIDATE Procedure Parameters

Parameter	Description
owner	Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj$. Equivalent numeric values are as follows: ■ 1 = TABLE/PROCEDURE/TYPE ■ 2 = BODY ■ 3 = TRIGGER ■ 4 = INDEX ■ 5 = CLUSTER ■ 8 = LOB ■ 9 = DIRECTORY ■ 10 = QUEUE ■ 11 = REPLICATION OBJECT GROUP ■ 12 = REPLICATION PROPAGATOR ■ 13 = JAVA SOURCE ■ 14 = JAVA RESOURCE ■ 58 = (Data Mining) MODEL
edition_name	[Note: Currently not operable. Reserved for future use]

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.

- The INVALIDATE Procedure invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its `object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

142

DBMS_WARNING

The DBMS_WARNING package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the PLSQL_WARNINGS initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- Using DBMS_WARNING
  - Security Model
- Summary of DBMS_WARNING Subprograms

Using DBMS_WARNING

- Security Model

Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

Summary of DBMS_WARNING Subprograms

Table 142–1 DBMS_WARNING Package Subprograms

Subprogram	Description
ADD_WARNING_SETTING_CAT Procedure on page 142-5	Modifies the current `session` or `system` warning settings of the `warning_category` previously supplied
ADD_WARNING_SETTING_NUM Procedure on page 142-6	Modifies the current `session` or `system` warning settings of the or `warning_number` previously supplied
GET_CATEGORY Function on page 142-7	Returns the category name, given the message number
GET_WARNING_SETTING_CAT Function on page 142-8	Returns the specific warning category in the session
GET_WARNING_SETTING_NUM Function on page 142-9	Returns the specific warning number in the session
GET_WARNING_SETTING_STRING Function on page 142-10	Returns the entire warning string for the current session
SET_WARNING_SETTING_STRING Procedure on page 142-11	Replaces previous settings with the new value

ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value. The effect of calling this function is same as adding the qualifier (`ENABLE/DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 142–2 ADD_WARNING_SETTING_CAT Procedure Parameters

Parameter	Description
`warning_category`	Name of the category. Allowed values are `ALL`, `INFORMATIONAL`, `SEVERE` and `PERFORMANCE`.
`warning_value`	Value for the category. Allowed values are `ENABLE`, `DISABLE`, and `ERROR`.
`scope`	Specifies if the changes are being performed in the session context or the system context. Allowed values are `SESSION` or `SYSTEM`.

ADD_WARNING_SETTING_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied. If the value was already set, you will override the existing value. The effect of calling this function is same as adding the qualifier (`ENABLE` / `DISABLE`/ `ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 142–3 ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
`warning_number`	The warning number. Allowed values are all valid warning numbers.
`warning_value`	Value for the category. Allowed values are `ENABLE`, `DISABLE`, and `ERROR`.
`scope`	Specifies if the changes are being performed in the session context or the system context. Allowed values are `SESSION` or `SYSTEM`.

GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```
DBMS_WARNING.GET_CATEGORY (
   warning_number  IN   pls_integer)
RETURN VARCHAR2;
```

Parameters

Table 142–4 GET_CATEGORY Function Parameters

Parameter	Description
warning_number	The warning message number.

GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2)
RETURN warning_value;
```

Parameters

Table 142–5 GET_WARNING_SETTING_CAT Function Parameters

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER)
RETURN warning_value;
```

Parameters

Table 142–6 GET_WARNING_SETTING_NUM Function Parameters

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING
 RETURN pls_integer;
```

Usage Notes

Use this function when you do not have `SELECT` privilege on `v$parameter` or `v$paramater2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

SET_WARNING_SETTING_STRING Procedure

This procedureS replaces previous settings with the new value. The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an `ALTER SESSION` or `SYSTEM SET PLSQL_WARNINGS` command. This will have same effect as `ALTER SESSION` OR `ALTER SYSTEM` command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (
   warning_value   IN   VARCHAR2,
   scope           IN   VARCHAR2);
```

Parameters

Table 142–7 SET_WARNING_SETTING_STRING Procedure Parameters

Parameter	Description
`warning_value`	The new string that will constitute the new value.
`scope`	This will specify if the changes are being done in the session context, or system context. Allowed values are `SESSION` or `SYSTEM`.

143

DBMS_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

- Documentation of DBMS_WM

Documentation of DBMS_WM

For a complete description of this package, see `DBMS_WM` in *Oracle Database Workspace Manager Developer's Guide.*

144

DBMS_WORKLOAD_CAPTURE

The DBMS_WORKLOAD_CAPTURE package configures the Workload Capture system and produce the workload capture data. Replay of this capture is implemented by way of the DBMS_WORKLOAD_REPLAYpackage.

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about "Database Replay"

This chapter contains the following topics:

- Using DBMS_WORKLOAD_CAPTURE
  - Overview
  - Security Model
- Summary of DBMS_WORKLOAD_CAPTURE Subprograms

Using DBMS_WORKLOAD_CAPTURE

- Overview
- Security Model

Overview

Since the capture infrastructure is instance wide (and RAC-wide) only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms

Security Model

Use of the package is restricted to users with `DBA` role or `EXECUTE_CATALOG_ROLE`.

Additionally, the user of the package must have access to a host directory that can also be accessed by the RDBMS to store/retrieve the workload capture data files.

Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table list the package subprograms in alphabetical order.

Table 144–1 DBMS_WORKLOAD_CAPTURE Package Subprograms

Subprogram	Description
ADD_FILTER Procedures on page 144-6	Adds a specified filter
DELETE_CAPTURE_INFO Procedure on page 144-7	Deletes the rows in the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views that corresponds to the given workload capture ID
DELETE_FILTER Procedure on page 144-8	Deletes a specified filter
EXPORT_AWR Procedure on page 144-9	Exports the AWR snapshots associated with a given capture ID
FINISH_CAPTURE Procedure on page 144-10	Depending on current state, it either finalizes the workload capture or unrestricts the database and puts it back in the "Normal" mode
GET_CAPTURE_INFO Function on page 144-11	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the `DBA_WORKLOAD_CAPTURES` and `DBA_WORKLOAD_FILTERS` views, and returns the appropriate `DBA_WORKLOAD_CAPTURES.ID`
IMPORT_AWR Function on page 144-12	Imports the AWR snapshots associated with a given capture ID
REPORT Function on page 144-13	Returns a report on the workload capture under consideration using one or more different sources
START_CAPTURE Procedure	Initiates the series of actions that are part of the capture process

ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue          IN   VARCHAR2 NOT NULL);

DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue         IN   NUMBER NOT NULL);
```

Parameters

Table 144–2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	A name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: ■ INSTANCE_NUMBER - type NUMBER ■ USER - type STRING ■ MODULE - type STRING ■ ACTION - type STRING ■ PROGRAM - type STRING ■ SERVICE - type STRING
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute will be parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory)

Usage Notes

- The workload capture filters work in either the DEFAULT INCLUSION or the DEFAULT EXCLUSION mode as determined by the default_action input to the START_CAPTURE Procedure.
- ADD_FILTER adds a new filter that will affect the next workload capture, and whether the filters will be considered as INCLUSION filters or EXCLUSION filters depends on the value of the default_action input to START_CAPTURE Procedure.
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the START_CAPTURE Procedure is executed.
- All the filters are listed in the DBA_WORKLOAD_FILTERS view.

DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
   capture_id     IN   NUMBER);
```

Parameters

Table 144–3 DELETE_CAPTURE_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to DBA_WORKLOAD_CAPTURES.ID. (Mandatory)

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
   filter_name           IN   VARCHAR2(40) NOT NULL);
```

Parameters

Table 144–4 DELETE_FILTER Procedure Parameters

Parameter	Description
filter_name	The filter to be deleted

EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
   capture_id     IN NUMBER);
```

Parameters

Table 144–5 EXPORT_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

Usage Notes

This procedure will work only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_CAPTURES was not created by calling the GET_CAPTURE_INFO Function) and the AWR snapshots that correspond to the original capture time period are still available.

FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and then stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
   timneout     IN   NUMBER  DEFAULT 30
   reason       IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 144–6 FINISH_CAPTURE Procedure Parameters

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush it's capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason will appear in the column ERROR_MESSAGE of the view DBA_WORKLOAD_CAPTURES.

Usage Notes

- By default, FINISH_CAPTURE will wait for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while FINISH_CAPTURE was waiting for acknowledgements, will flush their buffers and send back their acknowledgement to FINISH_CAPTURE.
- If a database session remains idle (waiting for the next user request) throughout the duration of FINISH_CAPTURE, the session might have unflushed capture buffers and will not send it's acknowledgement to FINISH_CAPTURE.

  To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking FINISH_CAPTURE. Either close the database session(s) before running FINISH_CAPTURE or send new database requests to those sessions during FINISH_CAPTURE.

GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
   dir      IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 144–7 GET_CAPTURE_INFO Function Parameters

Parameter	Description
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in DBA_WORKLOAD_CAPTURES, the GET_CAPTURE_INFO Function will simply return that row's DBA_WORKLOAD_CAPTURES.ID. If no existing row matches the capture present in the stipulated directory a new row will be inserted to DBA_WORKLOAD_CAPTURES and that row's ID will be returned.

IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the EXPORT_AWR Procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
   capture_id      IN  NUMBER,
   staging_schema  IN  VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 144–8 IMPORT_AWR Function Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema.The SYS schema is not a valid input. (Mandatory, Case sensitive).

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
   capture_id      IN   NUMBER,
   format          IN   VARCHAR2)
 RETURN CLOB;
```

Parameters

Table 144–9 REPORT Function Parameters

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

Return Values

The report body in the desired format returned as a CLOB

Table 144–10 Constants Used by Report Function

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Use this as input to the format argument to generate the text version of the report.

START_CAPTURE Procedure

This procedure initiates a database wide workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
   name              IN  VARCHAR2,
   dir               IN  VARCHAR2,
   duration          IN  NUMBER   DEFAULT NULL,
   default_action    IN  VARCHAR2 DEFAULT 'INCLUDE',
   auto_unrestrict   IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 144–11 START_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name will be preserved along with the captured workload actions. (Mandatory)
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files will be stored. Should contain enough space to hold all the workload capture files. (Mandatory)
duration	Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture will continue until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. ▪ If INCLUDE, by default all user requests to the database will be captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures will be treated as EXCLUSION filters, determining the workload that will not be captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) ▪ If EXCLUDE, by default no user request to the database will be captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures will be treated as INCLUSION filters, determining the workload that will be captured.
auto_unrestrict	Can be either TRUE or FALSE. ▪ If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT will be automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) ▪ If FALSE, no database instance will be automatically unrestricted.

Usage Notes

- All user requests sent to database after a successful invocation of `START_CAPTURE` will be recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture will last indefinitely until the FINISH_CAPTURE Procedure is executed.
- A workload capture once started will continue to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.
- One can use workload filters (as described with regard to the ADD_FILTER Procedures) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests will be captured.
- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the DBMS_SCHEDULER package) will not be captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` will be `UNRESTRICTED` upon a successful invocation of `START_CAPTURE` Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions will not be replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` will be replayed.

145

DBMS_WORKLOAD_REPLAY

The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture that was originally created by way of the DBMS_WORKLOAD_CAPTURE package. Typically, the DBMS_WORKLOAD_CAPTURE package will be used in the production system to capture a production workload, and the DBMS_WORKLOAD_REPLAY package will be subsequently used in a test system to replay the captured production workload for testing purposes.

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about "Database Replay"

This chapter contains the following topics:

- Using DBMS_WORKLOAD_REPLAY
  - Security Model
- Summary of DBMS_WORKLOAD_REPLAY Subprograms

Using DBMS_WORKLOAD_REPLAY

- Security Model

Security Model

Use of the package is restricted to users with `DBA` role or `EXECUTE_CATALOG_ROLE`.

Additionally, the user of the package must have access to the host directory that contains the workload capture files, and one or more hosts that has the Workload Replay Client installed and can be used to drive the captured workload during a database replay.

Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table list the package subprograms in alphabetical order.

Table 145–1 DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
CALIBRATE Function on page 145-5	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
CALIBRATE Function on page 145-5	Cancels the workload replay in progress
DELETE_REPLAY_INFO Procedure on page 145-7	Deletes the rows in `DBA_WORKLOAD_REPLAYS` that corresponds to the given workload replay ID
EXPORT_AWR Procedure on page 145-8	Exports the AWR snapshots associated with a given replay ID
GET_REPLAY_INFO Function on page 145-9	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
IMPORT_AWR Function on page 145-10	Imports the AWR snapshots associated with a given replay ID
INITIALIZE_REPLAY Procedure on page 145-11	Initializes replay, and loads specific data produced during processing into the database
PREPARE_REPLAY Procedure on page 145-12	Puts the RDBMS in a special "Prepare" mode
PROCESS_CAPTURE Procedure on page 145-15	Processes the workload capture found in `capture_dir` in place
REMAP_CONNECTION Procedure on page 145-16	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.
REPORT Function on page 145-17	Generates a report on the given workload replay
START_REPLAY Procedure on page 145-18	Starts the workload replay

CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
   capture_dir          IN VARCHAR2,
   process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
   threads_per_process  IN BINARY_INTEGER DEFAULT 50)
  RETURN CLOB;
```

Parameters

Table 145–2 CALIBRATE Function Parameters

Parameter	Description
capture_dir	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
process_per_cpu	Maximum number of process allowed per CPU (default is 4)
threads_per_process	Maximum number of threads allowed per process (default is 50)

Return Values

Returns a CLOB formatted as XML, that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

  $ wrc mode=calibrate replaydir=

CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
   error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 145–3 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which will be recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE. DEFAULT is NULL

Usage Notes

Prerequisite: A call to the INITIALIZE_REPLAY Procedure, or PREPARE_REPLAY Procedure, or START_REPLAY Procedure was already issued.

DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in DBA_WORKLOAD_REPLAYS that corresponds to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
   replay_id    IN  NUMBER);
```

Parameters

Table 145–4 DELETE_REPLAY_INFO Procedure Parameters

Parameter	Description
replay_id	ID of the workload replay that needs to be deleted. Corresponds To DBA_WORKLOAD_REPLAYS.ID (Mandatory)

EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
   replay_id    IN  NUMBER);
```

Parameters

Table 145–5 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	ID of the replay whose AWR snapshots should be exported. (Mandatory)

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic EXPORT_AWR invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_REPLAYS was not created by calling the GET_REPLAY_INFO Function) and the AWR snapshots that correspond to that replay time period are still available.

GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
   dir    IN VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 145–6 GET_REPLAY_INFO Function Parameters

Parameter	Description
dir	Name of the workload replay directory object (case sensitive). (Mandatory)

Return Values

The procedure returns the CAPTURE_ID which can be associated with both DBA_WORKLOAD_CAPTURE_ID and DBA_WORKLOAD_REPLAYS.CAPTURE.ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then, imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.
- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
   replay_id       IN   NUMBER,
   staging_schema  IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 145–7 IMPORT_AWR Function Parameters

Parameter	Description
replay_id	ID of the replay whose AWR snapshots should be exported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory)

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the EXPORT_AWR Procedure.
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the PREPARE_REPLAY Procedure).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
   replay_name     IN  VARCHAR2,
   replay_dir      IN  VARCHAR2);
```

Parameters

Table 145–8 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
replay_name	Name of the workload replay. Every replay of a processed workload capture can be given a name. (Mandatory)
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data

Usage Notes

- Prerequisites:
  - Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the PREPARE_REPLAY Procedure.

  For instance, during capture we may record the connection string each session used to connect to the server. The INITIALIZE_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

  Elaborating on the example described in the PROCESS_CAPTURE Procedure, one could invoke the following:

  ```
  DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
  ```

  This command will load up the connection map and by default will set all replay time connection strings to be equal to NULL. A NULL replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the REMAP_CONNECTION Procedure.

PREPARE_REPLAY Procedure

This procedure puts the database state in PREPARE FOR REPLAY mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN BOOLEAN  DEFAULT TRUE,
   connect_time_scale        IN NUMBER   DEFAULT 100,
   think_time_scale          IN NUMBER   DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 145–9 PREPARE_REPLAY Procedure Parameters

Parameter	Description
synchronization	Turns synchronization ON or OFF during workload replay. When synchronization is ON, the COMMIT order observed during the original workload capture will be preserved during replay. Every action that is replayed will be executed ONLY AFTER all of it's dependent COMMITs (all COMMITs that were issued before the given action in the original workload capture) have finished execution. DEFAULT is TRUE which preserves commit order.
connect_time_scale	Scales the time elapsed between the instant the workload capture was started and session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See Application of the connect_time_scale Parameter.
think_time_scale	Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See Application of the think_time_scale Parameter.
think_time_auto_correct	Auto corrects the think time between calls appropriately when user calls takes longer time to complete during replay than how long the same user call took to complete during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See Application of the think_time_auto_correct Parameter

Usage Notes

- Prerequisites:
  - The database has been initialized for replay using the INITIALIZE_REPLAY Procedure.
  - Any capture time connection strings that require remapping have been already done using the REMAP_CONNECTION Procedure.
- One or more external replay clients (WRC) can be started once the PREPARE_REPLAY procedure has been executed.

Examples

Application of the connect_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect  (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect  (42m after)
```

If the connect_time_scale is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect  ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect  (21m after)
```

If the connect_time_scale is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect  (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect  (84m after)
```

Application of the think_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
        previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
        call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min  (50% of 2m) after the completion of prev
        call
12:35 : Third user call completes in 9m (takes a minute longer)
```

Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
        call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
        call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in capture_dir in place.

Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
   capture_dir            IN   VARCHAR2);
```

Parameters

Table 145–10 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
catpure_dir	Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files will be added to this directory. (Mandatory)

Usage Notes

- This subprogram analyzes the workload capture found in the capture_dir and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the capture_dir can be used as input to the INITIALIZE_REPLAY Procedure in order to replay the captured workload present in capture_dir.
- Before a workload capture can be replayed in a particular database version, the capture needs to be "processed" using this PROCESS_CAPTURE procedure in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

  For example, suppose workload "foo" was captured in rec_dir in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload needs to be processed in version 11.1.0.1. The following procedure needs to be executed in a 11.1.0.1 database in order to process the capture directory rec_dir:

  ```
  DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
  ```

  Now, rec_dir contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many number of times as required.

REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
   connection_id         IN  NUMBER,
   replay_connection     IN  VARCHAR2);
```

Parameters

Table 145–11 REMAP_CONNECTION Procedure Parameters

Parameter	Description
`connection_id`	ID of the connection to be remapped.Corresponds to `DBA_WORKLOAD_CONNECTION_MAP.CONN_ID`
`replay_connection`	New connection string to be used during replay

Usage Notes

- By default, all instances of `replay_connection` will be equal to `NULL`. When `replay_connection` is `NULL` (default), replay sessions will connect to the default host as determined by the replay client's runtime environment. Consequently, if no capture time connect strings are remapped, then all the replay sessions will simply connect to the default host to replay the workload.
- A valid `replay_connection` should specify a connect identifier or a service point. Please refer to the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.
- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that will be used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
   replay_id          IN NUMBER,
   format             IN VARCHAR2 )
  RETURN CLOB;
```

Parameters

Table 145–12 REPORT Function Parameters

Parameter	Description
`replay_id`	Specifies the ID of the workload replay whose report is requested. (Mandatory)
`format`	Specifies the report format. Valid values are `XML`, `HTML`, or `TEXT`. (Mandatory)

Return Values

The report body in the desired format returned as a `CLOB`

Table 145–13 Constants Used by Report Function

Constant	Type	Value	Description
`TYPE_HTML`	`VARCHAR2`(4)	'HTML'	Generates the HTML version of the report
`TYPE_TEXT`	`VARCHAR2`(4)	'TEXT'	Use this as input to the `format` argument to generate the text version of the report.
`TYPE_XML`	`VARCHAR2`(3)	'XML'	Generates the XML version of the report

START_REPLAY Procedure

This procedure starts the workload replay. All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified and those replay clients (WRC) will begin issuing the captured workload.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
  - The call to the PREPARE_REPLAY Procedure was already issued.
  - Enough number of external replay clients (WRC) that can faithfully replay the captured workload have already been started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

  ```
  $ wrc mode=calibrate replaydir=.
  ```

146

DBMS_WORKLOAD_REPOSITORY

The `DBMS_WORKLOAD_REPOSITORY` package lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about the "Automatic Workload Repository"

The chapter contains the following topics:

- Using DBMS_WORKLOAD_REPOSITORY
  - Examples
- Data Structures
- Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

Using DBMS_WORKLOAD_REPOSITORY

This section contains topics which relate to using the DBMS_WORKLOAD_REPOSITORY package.

- Examples

Examples

This example shows how to generate an AWR text report with the DBMS_WORKLOAD_REPOSITORY package for database identifier 1557521192, instance id 1, snapshot ids 5390 and 5391 and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
   DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
     1557521192,  1, 5390, 5392) ) ;
```

You can call the DBMS_WORKLOAD_REPOSITORY packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (awrrpt.sql in this case) for the packaged function, which prompts the user for required information.

Data Structures

The DBMS_WORKLOAD_REPOSITORY package defines an object and associated table type.

OBJECT Types

- AWR_BASELINE_METRIC_TYPE Object Type

TABLE Types

- AWR_BASELINE_METRIC_TYPE_TABLE Table Type

AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE breakpoint_info AS OBJECT (
   baseline_name      VARCHAR2(64),
   dbid               NUMBER NOT NULL,
   instance_number    NUMBER NOT NULL,
   beg_time           DATE NOT NULL,
   end_time           DATE NOT NULL,
   metric_id          NUMBER NOT NULL,
   metric_name        VARCHAR2(64) NOT NULL,
   metric_unit        VARCHAR2(64) NOT NULL,
   num_interval       NUMBER NOT NULL,
   interval_size      NUMBER NOT NULL,
   average            NUMBER NOT NULL,
   minimum            NUMBER NOT NULL,
   maximum            NUMBER NOT NULL);
```

Fields

Table 146–1 RUNTIME_INFO Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRICS Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

Table 146–2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ASH_REPORT_HTML Function on page 146-9	Displays the ASH report in HTML
ASH_REPORT_TEXT Function on page 146-11	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function on page 146-13	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function on page 146-14	Displays the AWR Diff-Diff report in text
AWR_REPORT_HTML Function on page 146-15	Displays the AWR report in HTML
AWR_REPORT_TEXT Function on page 146-16	Displays the AWR report in text
AWR_SQL_REPORT_HTML Function on page 146-17	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function on page 146-18	Displays the AWR SQL Report in text format
CREATE_BASELINE Functions & Procedures on page 146-19	Creates a single baseline
CREATE_BASELINE_ TEMPLATE Procedures on page 146-19	Creates a baseline template
CREATE_SNAPSHOT Function and Procedure on page 146-23	Creates a manual snapshot immediately
DROP_BASELINE Procedure on page 146-24	Drops a range of snapshots
DROP_BASELINE_TEMPLATE Procedure on page 146-25	Removes a baseline template that is no longer needed
DROP_SNAPSHOT_RANGE Procedure on page 146-26	Activates service
MODIFY_SNAPSHOT_ SETTINGS Procedures on page 146-27	Modifies the snapshot settings
MODIFY_BASELINE_ WINDOW_SIZE Procedure on page 146-29	Modifies the window size for the Default Moving Window Baseline
RENAME_BASELINE Procedure on page 146-31	Renames a baseline
SELECT_BASELINE_METRICS Function on page 146-32	Shows the values of the metrics corresponding to a baseline

ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID. If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a `TOP SQL`). Capture occurs if the SQL is found in the cursor cache at snapshot time.

To uncolor the SQL, invoke the REMOVE_COLORED_SQL Procedure.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   sql_id          IN VARCHAR2,
   dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 146–3 ADD_COLORED_SQL Procedure Parameters

Parameter	Description
`sql_id`	13-character external SQL ID
`dbid`	Optional dbid, defaults to Local `DBID`

ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 146–4 ASH_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpt.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that `sql_id` value to the `l_sql_id` argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE` "PAYROLL" and `ACTION` "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

Table 146–5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
`l_sid`	Session ID (for example, `V$SESSION.SID`)	No
`l_sql_id`	SQL ID (for example, `V$SQL.SQL_ID`)	Yes
`l_wait_class`	Wait class name (for example, `V$EVENT_NAME.WAIT_CLASS`)	Yes
`l_service_hash`	Service name hash (for example, `V$ACTIVE_SERVICES.NAME_HASH`)	No
`l_module`	Module name (for example, `V$SESSION.MODULE`)	Yes
`l_action`	Action name (for example, `V$SESSION.ACTION`)	Yes
`l_client_id`	Client ID for end-to-end backtracing (for example, `V$SESSION.CLIENT_IDENTIFIER`)	Yes
`l_plsql_entry`	PL/SQL entry point (for example, "`SYS.DBMS_LOB.*`")	Yes

ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 146–6 ASH_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpt.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the `l_sql_id` argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, `AND` conditional logic is used to connect them. For example, to generate an ASH report on `MODULE` "PAYROLL" and `ACTION` "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

Table 146–7 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
`l_sid`	Session ID (for example, `V$SESSION.SID`)	No
`l_sql_id`	SQL ID (for example, `V$SQL.SQL_ID`)	Yes
`l_wait_class`	Wait class name (for example, `V$EVENT_NAME.WAIT_CLASS`)	Yes
`l_service_hash`	Service name hash (for example, `V$ACTIVE_SERVICES.NAME_HASH`)	No
`l_module`	Module name (for example, `V$SESSION.MODULE`)	Yes
`l_action`	Action name (for example, `V$SESSION.ACTION`)	Yes
`l_client_id`	Client ID for end-to-end backtracing (for example, `V$SESSION.CLIENT_IDENTIFIER`)	Yes
`l_plsql_entry`	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes

AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 146–8 AWR_DIFF_REPORT_HTML Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrddrpt.sql script which prompts users for the required information.

AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 146–9 AWR_DIFF_REPORT_TEXT Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrddrpt.sql script which prompts users for the required information.

AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 146–10 AWR_REPORT_HTML Parameters

Parameter	Description
`l_dbid`	Database identifier
`l_inst_num`	Instance number
`l_bid`	The `'Begin Snapshot' ID`
`l_eid`	The `'End Snapshot' ID`
`l_options`	A flag to specify to control the output of the report. Currently, Oracle supports one value: ▪ `l_options - 8`. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of `VARCHAR2(150)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 146–11 AWR_REPORT_TEXT Parameters

Parameter	Description
`l_dbid`	Database identifier
`l_insT_num`	Instance number
`l_bid`	The `'Begin Snapshot' ID`
`l_eid`	The `'End Snapshot' ID`
`l_options`	A flag to specify to control the output of the report. Currently, Oracle supports one value: ▪ `l_options - 8`. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of `VARCHAR2(80)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 146–12 AWR_SQL_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 146–13 AWR_SQL_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	Flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(120).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

CREATE_BASELINE Functions & Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL)
 RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);
 RETURN NUMBER;
```

Parameters

Table 146–14 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline'
end_snap_id	End snapshot sequence number for the baseline
start_time	Start time for the baseline'
end_time	End time for the baseline
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.

- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
end_snap_id => 107,
baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name           IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   day_of_week             IN VARCHAR2,
   hour_in_day             IN NUMBER,
   duration                IN NUMBER,
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name_prefix    IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER DEFAULT NULL);
```

Parameters

Table 146–15 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last

Table 146–15 (Cont.) CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
`baseline_name_prefix`	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

CREATE_SNAPSHOT Function and Procedure

This function and procedure create snapshots.In the case of the function, the snapshot ID is returned.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'TYPICAL');

DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'TYPICAL')
 RETURN NUMBER;
```

Parameters

Table 146–16 CREATE_SNAPSHOT Parameters

Parameter	Description
flush_level	Flush level for the snapshot is either 'TYPICAL' or 'ALL'

Examples

This example creates a manual snapshot at the TYPICAL level:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT();
```

If you query the DBA_HIST_SNAPSHOT view after the CREATE_SNAPSHOT action, you will see one more snapshot ID added to the Workload Repository.

DROP_BASELINE Procedure

This procedure drops a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
   baseline_name  IN  VARCHAR2,
   cascade        IN  BOOLEAN DEFAULT FALSE,
   dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

Table 146–17 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
       baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
   template_name           IN VARCHAR2,
   dbid                    IN NUMBER DEFAULT NULL);
```

Parameters

Table 146–18 DROP_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
template_name	Name of the template to remove
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.

DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
   low_snap_id    IN  NUMBER,
   high_snap_id   IN  NUMBER
   dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

Table 146–19 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (default to local DBID.

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the dba_hist_snapshot view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The INTERVAL setting affects how often snapshots are automatically captured.
- The RETENTION setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a NUMBER and the second takes a VARCHAR2 for the topnsql argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention   IN  NUMBER    DEFAULT NULL,
   interval    IN  NUMBER    DEFAULT NULL,
   topnsql     IN  NUMBER    DEFAULT NULL,
   dbid        IN  NUMBER    DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention   IN  NUMBER    DEFAULT NULL,
   interval    IN  NUMBER    DEFAULT NULL,
   topnsql     IN  VARCHAR2,
   dbid        IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 146–20 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
retention	New retention time (in minutes). The specified value must be in the range of MIN_RETENTION (1 day) to MAX_RETENTION (100 years). If ZERO is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting. If NULL is specified, the old value for retention is preserved. NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.
interval	New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year). If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting. If NULL is specified, the current value is preserved.

Table 146–20 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
topnsql	■ If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 100000000. Specifying NULL will keep the current setting. ■ If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.
dbid	Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.

Examples

This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
  interval  =>  60,
  retention =>  20160);
```

If you query the DBA_HIST_WR_CONTROL table after this procedure is executed, you will see the changes to these settings.

MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
   window_size     IN   NUMBER,
   dbid            IN   NUMBER DEFAULT NULL);
```

Parameters

Table 146–21 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (default to local DBID)

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the MODIFY_SNAPSHOT_SETTINGS Procedures can be used to adjust the retention setting.

REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the `TOP` list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   sql_id          IN VARCHAR2,
   dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 146–22 REMOVE_COLORED_SQL Procedure Parameters

Parameter	Description
`sql_id`	13-character external SQL ID
`dbid`	Optional dbid, defaults to Local `DBID`

RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
   old_baseline_name     IN   VARCHAR2,
   new_baseline_name     IN VARCHAR2,
   dbid                  IN NUMBER DEFAULT NULL);
```

Parameters

Table 146–23 RENAME_BASELINE Procedure Parameters

Parameter	Description
old_baseline_name	Old baseline name
new_baseline_name	New baseline name
dbid	Database ID (default to local DBID)

SELECT_BASELINE_METRICS Function

This table function shows the values of the metrics corresponding to a baseline. The table function will return an object of the AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRICS(
   baseline_name     IN VARCHAR2,
   dbid              IN NUMBER DEFAULT NULL,
   instance_num      IN NUMBER DEFAULT NULL)
 RETURN awr_baseline_metric_type_table PIPELINED;
```

Parameters

Table 146–24 SELECT_BASELINE_METRICS Procedure Parameters

Parameter	Description
baseline_name	Name of the baseline for which we would like to view metrics
dbid	Database Identifier for baseline. If NULL, then use the database identifier for the local database. Defaults to NULL.
instance_num	Instance for which number the user wants to see statistics. If NULL, show statistics for the local instance. Defaults to NULL.

147

DBMS_XA

The DBMS_XA package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

The chapter contains the following topics:

- Using DBMS_XA
  - Overview
  - Security Model
  - Constants
  - Operational Notes
- Data Structures
  - OBJECT Types
  - TABLE Types
- Summary of DBMS_XA Subprograms

Using DBMS_XA

- Overview
- Security Model
- Constants
- Operational Notes

Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

Security Model

This package is created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.

Any DBMS_XA subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_XA subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

SELECT privilege on SYS.DBA_PENDING_TRANSACTIONS is required for users who need to execute XA_RECOVER subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.

Constants

The DBMS_XA package uses the constants shown in Table 147–1 for use in the flag field of the XA_START Function and the XA_END Function.

Table 147–1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS_XA package uses the constants shown in Table 147–2 for Possible Return Values

Table 147–2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed

Table 147–2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVAL	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA_PREPARE/COMMIT/ ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA_END has been called so that there is not any transaction associated with the current session, the application may call XA_PREPARE/COMMIT/ ROLLBACK/FORGET.

XAER_PROTO error is returned from XA_PREPARE/COMMIT/ROLLBACK/FORGET if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

Data Structures

The DBMS_XA package uses the following OBJECT type and associated TABLE type.

OBJECT Types

- DBMS_XA_XID Object Type

TABLE Types

- DBMS_XA_XID_ARRAY Table Type

DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

> **See Also:** For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
       gtrid     IN   NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
       gtrid     IN   RAW,
       bqual     IN   RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
       formatid  IN   NUMBER,
       gtrid     IN   RAW,
       bqual     IN   RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
    RETURN SELF AS RESULT)
```

Attributes

Table 147–3 DBMS_XA_XID Object Type

Attribute	Description
`formatid`	Format identifier, a number identifying different transaction managers (TM)
`gtrid`	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
`bqual`	Branch qualifier, of which the maximum size is 64 bytes

DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

Summary of DBMS_XA Subprograms

Table 147–4 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure on page 147-12	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (RAC)
XA_COMMIT Function on page 147-13	Commits the global transaction specified by `xid`
XA_END Function on page 147-14	Disassociates the current session from the transaction branch specified by `xid`
XA_FORGET Function on page 147-15	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function on page 147-16	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function on page 147-17	Prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible
XA_RECOVER Function on page 147-18	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function on page 147-19	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function on page 147-20	Sets the transaction timeout in seconds for the current session
XA_START Function on page 147-21	Associates the current session with the transaction branch specified by `xid`

DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

XA_COMMIT Function

This function commits the global transaction specified by xid.

Syntax

```
DBMS_XA.XA_COMMIT (
   xid       IN  DBMS_XA_XID,
   onePhase  IN  BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 147–5 XA_COMMIT Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 147-9
onePhase	If TRUE, apply single phase commit

Return Values

See Table 147–2, " DBMS_XA Constants for Possible Return Values". Possible return values indicating error are: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO. Other possible return values include: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, and XA_HEURMIX.

Usage Notes

- An application must not call COMMIT, but instead must call XA_COMMIT to commit the global transaction specified by xid. If a user needs to commit a transaction branch that is created by other users, FORCE ANY TRANSACTION must be granted to the user.
- If onePhase is TRUE, the resource manager should use a one-phase commit protocol to commit the work done on behalf of xid. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding XA_PREPARE call has returned XA_OK, should XA_COMMIT be called.
- The application must make a separate XA_COMMIT call for each of the transaction branches of the global transaction for which XA_PREPARE has returned XA_OK.
- If the resource manager did not commit the transaction and the parameter onePhase is set to TRUE, the resource manager may return one of the XA_RB* code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

XA_END Function

This function disassociates the current session from the transaction branch specified by xid

A transaction manager calls XA_END when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When XA_END successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (
   xid   IN  DBMS_XA_XID,
   flag  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 147–6 XA_END Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 147-9
flag	See Table 147–1, " DBMS_XA Constants for Flag Field of XA_START & XA_END Functions".

Return Values

See Table 147–2, " DBMS_XA Constants for Possible Return Values". Possible return values in error are XAER_RMERR, XAER_RMFAILED, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB*.

Usage Notes

- TMSUCCESS or TMSUSPEND may be specified in flag, and the transaction branch is disassociated with the current session in detached state if the return value is XA_OK. TMFAIL is not supported. XA_END may be called with either TMSUCCESS or TMSUSPEND to disassociate the transaction branch identified by xid from the current session.
- XA_OK is returned if XA_END succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the application should proceed for other normal operations.
- Executing a ROLLBACK statement without calling XA_END first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until XA_END is called.
- Executing a COMMIT statement without calling XA_END first will result in ORA-02089: COMMIT is not allowed in a subordinate session.
- Executing a COMMIT or a ROLLBACK statement after XA_END has no effect on the transaction identified by xid, since this transaction is no longer associated with the current session. To commit the transaction ID or theXA_ROLLBACK Function to commit/rollback the transaction specified by the xid.

XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (
   xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 147–7 XA_FORGET Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 147-9

Return Values

See Table 147–2, " DBMS_XA Constants for Possible Return Values". Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER
 RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

XA_PREPARE Function

This function prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (
   xid   IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 147–8 XA_PREPARE Function Parameters

Parameter	Description
`xid`	See DBMS_XA_XID Object Type on page 147-9

Return Values

See Table 147–2, " DBMS_XA Constants for Possible Return Values". Possible return codes include: `XA_OK`, `XA_RDONLY`, `XA_RB*`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER
 RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See DBMS_XA_XID_ARRAY Table Type

Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
   xid       IN  DBMS_XA_XID)
 RETURN PLS_INTEGER;
```

Parameters

Table 147–9 XA_ROLLBACK Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 147-9

Return Values

See Table 147–2, " DBMS_XA Constants for Possible Return Values". Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.

XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (
   seconds  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 147–10 XA_SETTIMEOUT Function Parameters

Parameter	Description
`seconds`	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

Return Values

See Table 147–2, " DBMS_XA Constants for Possible Return Values". Possible return values are `XA_OK`, `XAER_RMERR`, `XAER_RMFAIL`, or `XAER_INVAL`.

Usage Notes

Only if return value is `XA_OK`, is the timeout value successfully set.

XA_START Function

This function associates the current session with a transaction branch specified by the xid.

Syntax

```
DBMS_XA.XA_START (
   xid   IN  DBMS_XA_XID,
   flag  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 147–11 XA_START Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 147-9
flag	See Table 147–1, " DBMS_XA Constants for Flag Field of XA_START & XA_END Functions".

Return Values

See Table 147–2, " DBMS_XA Constants for Possible Return Values"

Usage Notes

- If TMJOIN or TMRESUME is specified in flag, the start is for joining an existing transaction branch identified by the xid. TMJOIN flag should be used when the transaction is detached with TMSUCCESS flag. TMRESUME should be used when the transaction branch is detached with TMSUSPEND flag. XA_START may be called with either flag to join an existing transaction branch.
- If TMNOFLAGS is specified in flag, and neither TMJOIN nor TMRESUME is specified, a new transaction branch is to be started. If the transaction branch specified in xid already exists, XA_START returns an XAER_DUPID error code.
- Possible return values in error include: XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, and XAER_PROTO.
- XA_OK is returned if XA_START succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the PL/SQL application should proceed for other normal operations.
- Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. XAER_PROTO will be returned if XA_START is called with an active global transaction branch associated with the session. XAER_OUTSIDE will be returned if XA_START is called with a local transaction associated with the current session.

148

DBMS_XDB

The DBMS_XDB package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

See Also:

- *Oracle XML DB Developer's Guide*
- *Oracle Database New Features Guide*

This chapter contains the following topics:

- Using DBMS_XDB
  - Overview
  - Constants
- Summary of DBMS_XDB Subprograms

Using DBMS_XDB

This section contains topics which relate to using the `DBMS_XDB` package.

- Overview
- Constants

Overview

The DBMS_XDB package supports the following features:

- The Resource Management functionality providesLINK Procedures, EXISTSRESOURCE Function, LOCKRESOURCE Function, GETLOCKTOKEN Procedure, UNLOCKRESOURCE Function, CREATERESOURCE Functions, RENAMERESOURCE Procedure, DELETERESOURCE Procedure, GETRESOID Function, CREATEOIDPATH Function, REBUILDHIERARCHICALINDEX Procedure and CREATEFOLDER Function subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use CHECKPRIVILEGES Function, GETACLDOCUMENT Function, CHANGEPRIVILEGES Function and GETCHILDRESPATHS Function, LINK Procedures, LINK Procedures, LINK Procedures, LINK Procedures, LINK Procedures, LINK Procedures for Oracle Resources. ACLCHECKPRIVILEGES Function provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.
- Configuration Session Management is supported by CFG_REFRESH Procedure, CFG_GET Function and CFG_UPDATE Procedure. methods.
- The XDB username is created during XDB installation. This user owns a set of default tables and packages. GETXDB_TABLESPACE Function and MOVEXDB_TABLESPACE Procedure enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction

Constants

Table 148–1 Defined Constants for DBMS_XDB

Constant	Type	Value	Description
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid.
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.

Summary of DBMS_XDB Subprograms

Table 148–2 DBMS_XDB Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function on page 148-8	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
ADDMIMEMAPPING Procedure on page 148-9	Adds a mime mapping to the XDB configuration
ADDSCHEMALOCMAPPING Procedure on page 148-10	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure on page 148-11	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure on page 148-12	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure on page 148-13	Adds a security role `REF` to a specified servlet in the XDB configuration
ADDXMLEXTENSION Procedure on page 148-14	Adds adds an XML extension to the XDB configuration
APPENDPATH Procedure on page 148-15	Appends a childpath to a parentpath
APPENDPATH Procedure on page 148-15	Takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource
CFG_GET Function on page 148-17	Retrieves the session's configuration information
CFG_REFRESH Procedure on page 148-18	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure on page 148-19	Updates the configuration information
CHANGEOWNER Procedure on page 148-20	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function on page 148-21	Adds a specified ACE to a specified resource's ACL
COPYRESOURCE Procedure on page 148-23	Copies the resource at the source path to a new resource at the destination path
CHECKPRIVILEGES Function on page 148-22	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function on page 148-24	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function on page 148-25	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions on page 148-26	Creates a new resource
DELETEMIMEMAPPING Procedure on page 148-28	Deletes the mime mapping from the XDB configuration

Table 148–2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
DELETERESOURCE Procedure on page 148-29	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures on page 148-30	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
DELETESCHEMALOCMAPPING Procedure on page 148-31	Deletes the schema location mapping for the specified schema URL from the XDB configuration.
DELETESERVLET Procedure on page 148-32	Deletes a servlet from XDB configuration
DELETESERVLETMAPPING Procedure on page 148-33	Deletes the servlet mapping for the specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure on page 148-34	Deletes the specified role from a servlet in the XDB configuration
DELETEXMLEXTENSION Procedure on page 148-35	Deletes the specified XML extension from the XDB configuration
EXISTSRESOURCE Function on page 148-36	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function on page 148-37	Retrieves ACL document that protects resource given its path name
GETCHILDRESPATHS Function on page 148-38	Returns a cursor over the absolute paths of all the child resources
GETCONTENTBLOB Function on page 148-39	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function on page 148-40	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function on page 148-41	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function on page 148-42	Retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`
GETCONTENTXMLTYPE Function on page 148-43	Retrieves the contents of a resource returned as an `XMLTYPE`
GETFTPPORT Function on page 148-44	Gets the value of the current FTP port
GETHTTPPORT Function on page 148-45	Gets the value of the current HTTP port
GETLOCKTOKEN Procedure on page 148-47	Returns that resource's lock token for the current user given a path to a resource
GETLISTENERENDPOINT Procedure on page 148-46	Retrieves the parameters of a listener end point corresponding to the XML DB HTTP server
GETRESOID Function on page 148-49	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function on page 148-50	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function on page 148-51	Returns `TRUE` if the resource has BLOB content

Table 148–2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
HASCHARCONTENT Function on page 148-52	Returns `TRUE` if the resource has character content
HASXMLCONTENT Function on page 148-53	Returns `TRUE` if the resource has XML content
HASXMLREFERENCE Function on page 148-54	Returns `TRUE` if the resource has `REF` to XML content
ISFOLDER Function on page 148-55	Returns `TRUE` if the resource is a folder or container
LINK Procedures on page 148-56	Creates a link to an existing resource
LOCKRESOURCE Function on page 148-57	Gets a WebDAV-style lock on that resource given a path to that resource
MOVEXDB_TABLESPACE Procedure on page 148-58	Moves the XDB (user) to the specified tablespace
PROCESSLINKS Procedure on page 148-59	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure on page 148-60	Deletes all user metadata from a resource
REBUILDHIERARCHICALINDEX Procedure on page 148-61	Rebuilds the hierarchical index after import or export operations
RENAMERESOURCE Procedure on page 148-62	Renames the XDB resource
SETACL Procedure on page 148-63	Sets the ACL on a specified resource
SETCONTENT Procedures on page 148-64	Replaces the contents of a specified resource with specified datatype
SETFTPPORT Procedure on page 148-66	Sets the FTP port to a new value
SETHTTPPORT Procedure on page 148-67	Sets the HTP port to a new value
SETLISTENERENDPOINT Procedure on page 148-68	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure on page 148-69	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface or on both localhost and non-localhost interfaces
SPLITPATH Procedure on page 148-70	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure on page 148-71	Changes the modification time of the resource to the current time
UPDATERESOURCEMETADATA Procedures on page 148-72	Updates metadata for a resource
UNLOCKRESOURCE Function on page 148-74	Unlocks the resource given a lock token and resource path

ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
   acl_path  IN  VARCHAR2,
   owner     IN  VARCHAR2,
   privs     IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 148–3 ACLCHECKPRIVILEGES Function Parameters

Parameter	Description
acl_path	Absolute path in the Hierarchy for ACL document
owner	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
privs	An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.

ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB.ADDMIMEMAPPING(
     extension    IN   VARCHAR2,
     mimetype     IN   VARCHAR2);
```

Parameters

Table 148–4 ADDMIMEMAPPING Procedure Parameters

Parameter	Description
`extension`	Extension for which a mime type is being added
`mimetype`	Mime type

ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
     <namespace>namespace</namespace>
     <element>element</element>
      <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB.ADDSCHEMALOCMAPPING(
     namespace    IN   VARCHAR2,
     element      IN   VARCHAR2,
     schemaURL    IN   VARCHAR2);
```

Parameters

Table 148–5 ADDSCHEMALOCMAPPING Procedure Parameters

Parameter	Description
`namespace`	Namespace
`element`	Element
`schemaURL`	Schema URL

ADDSERVLET Procedure

This procedure adds the following servlet to XDB configuration:

```
<servlet>
     <servlet-name>name</servlet-name>
     <servlet-language>language</servlet-language>
     <display-name>dispname</display-name>
     <description>descript</description>
     <servlet-class>class</servlet-class>
     <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB.ADDSERVLET(
     name       IN   VARCHAR2,
    language    IN   VARCHAR2,
    dispname    IN   VARCHAR2,
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL);
```

Parameters

Table 148–6 ADDSERVLET Procedure Parameters

Parameter	Description
name	Servlet name
language	Must be one of "C", "Java", "PL/SQL"
dispname	Display name
icon	Icon
descript	Description
class	The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
jspfile	The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
plsql	The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
schema	Schema

ADDSERVLETMAPPING Procedure

This procedure adds the following servlet mapping to XDB configuration:

```
<servlet-mapping>
     <servlet-pattern>pattern</servlet-pattern>
     <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```
DBMS_XDB.ADDSERVLETMAPPING(
     pattern   IN   VARCHAR2,
     name      IN   VARCHAR2);
```

Parameters

Table 148–7 ADDSERVLETMAPPING Procedure Parameters

Parameter	Description
pattern	Sservlet pattern
name	Servlet name

ADDSERVLETSECROLE Procedure

This procedure adds the following security role `REF` to a specified servlet in XDB configuration:

```
<security-role-ref>
     <role-name>rolename</role-name>
     <role-link>rolelink</role-link>
     <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB.ADDSERVLETSECROLE(
     servname    IN   VARCHAR2,
     rolename    IN   VARCHAR2,
     rolelink    IN   VARCHAR2,
     descript    IN   VARCHAR2 := NULL);
```

Parameters

Table 148–8 ADDSERVLETSECROLE Procedure Parameters

Parameter	Description
`servname`	Sservlet name
`rolename`	Role name
`rolelink`	Role link
`descript`	Description

ADDXMLEXTENSION Procedure

This procedure adds the following XML extension to the XDB configuration under `<xml-extensions>`:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB.ADDXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 148–9 ADDXMLEXTENSION Procedure Parameters

Parameter	Description
`extension`	XML extension to be added

APPENDPATH Procedure

This procedure appends a childpath to a parentpath.

Syntax

```
DBMS_XDB.APPENDPATH (
     abspath       OUT   VARCHAR2,
     parentpath    IN    VARCHAR2,
    childpath      IN    VARCHAR2);
```

Parameters

Table 148–10 APPENDPATH Procedure

Parameter	Description
`abspath`	Absolute path of the resource
`parentpath`	Parentpath
`childpath`	Childpath

APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  XMLTYPE);

DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 148–11 APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata will be stored in its own table.

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that theREF passed in must be unique. In other words, there must not be aREF with the same value in the resource metadata, as this would violate uniqueness of properties. An error will be thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB.CFG_GET
 RETURN SYS.XMLType;
```

CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB.CFG_REFRESH;
```

CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB.CFG_UPDATE(
   xdbconfig   IN  SYS.XMLTYPE);
```

Parameters

Table 148–12 CFG_UPDATE Procedure Parameters

Parameter	Description
xdbconfig	The new configuration data

CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB.CHANGEOWNER(
     abspath    IN   VARCHAR2,
     owner      IN   VARCHAR2,
     recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 148–13 CHANGEOWNER Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`owner`	New owner for the resource
`recurse`	If `TRUE`, recursively change owner of all resources in the folder tree

CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
   res_path   IN    VARCHAR2,
   ace        IN    xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 148–14 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB.CHECKPRIVILEGES(
   res_path   IN  VARCHAR2,
   privs      IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 148–15 CHECKPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the Hierarchy for resource
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

COPYRESOURCE Procedure

The procedure copies the resource at a source path to a new resource at a destination path. If the `recurse` flag is `TRUE`, this produces a recursive (deep) copy.

Syntax

```
DBMS_XDB.COPYRESOURCE (
     srcpath    IN   VARCHAR2,
     dstpath    IN   VARCHAR2,
     recurse    IN   BOOLEAN := TRUE );
```

Parameters

Table 148–16 COPYRESOURCE Function Parameters

Parameter	Description
`srcpath`	Source abspath.
`dstpath`	Destination abspath
`recurse`	If `TRUE`, recursively copy subfolders

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB.CREATEFOLDER(
   path   IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 148–17 CREATEFOLDER Function Parameters

Parameter	Description
`path`	Path name for the new folder

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if `'/folder1/folder2'` is passed as the path parameter, then `'/folder1'` must already exist.

CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB.CREATEOIDPATH(
   oid    IN   RAW)
 RETURN VARCHAR2;
```

Parameters

Table 148–18 CREATEOIDPATH Function Parameters

Parameter	Description
oid	Object ID of the resource

CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  VARCHAR2,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a new resource with a specified `XMLType` data as its contents:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  SYS.XMLTYPE,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Given a `REF` to an existing `XMLType` row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     datarow        IN  REF SYS.XMLTYPE,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified `BLOB` as its contents, and specifies character set of the source `BLOB`:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  BLOB,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified `BFILE` as its contents, and specifies character set of the source `BFILE`:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  BFILE,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified `CLOB` as its contents:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  CLOB,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Parameters

Table 148–19 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.
data	The new resource's contents. The data will be parsed to check if it contains a schema-based XML document, and the contents will be stored as schema-based in the schema's default table. Otherwise, it will be saved as binary data.
datarow	REF to an XMLType row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If a zero CSID is specified then the data is defaulted to the database character set. Otherwise, the encoding of the data is determined as follows: ■ From the abspath extension, determine the resource's MIME type. ■ If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; otherwise, it is defaulted to the database character set.
createfolders	If TRUE, create the parent folders if they do not exist

Return Values

TRUE if operation successful; FALSE, otherwise.

DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETEMIMEMAPPING(
     extension    IN   VARCHAR2,);
```

Parameters

Table 148–20 DELETEMIMEMAPPING Procedure Parameters

Parameter	Description
extension	Extension for which a mime type is to be deleted

DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB.DELETERESOURCE(
   path          IN      VARCHAR2,
   delete_option IN      PLS_INTEGER);
```

Parameters

Table 148–21 DELETERESOURCE Procedure Parameters

Parameter	Description
`path`	Path name of the resource to delete
`delete_option`	The option that controls how a a resource is deleted; defined in Table 148–1 on page 148-4: ■ `DELETE_RESOURCE` ■ `DELETE_RECURSIVE` ■ `DELETE_FORCE` ■ `DELETE_RECURSIVE_FORCE`

DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It will also take an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only or schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN  VARCHAR2,
   metadata       IN  REF SYS.XMLTYPE,
   delete_option  IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN VARCHAR2,
   metadatans     IN VARCHAR2,
   metadataname   IN VARCHAR2,
   delete_option  IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 148–22 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	`REF` to the piece of metadata (schema based) to be deleted
`mettadatans`	Namespace of the metadata fragment to be removed
`mettadataname`	Local name of the metadata fragment to be removed
`delete_option`	Only applicable for schema-based metadata, this can be one of the following: ■ `DELETE_RES_METADATA_CASCADE` - deletes the corresponding row in the metadata table ■ `DELETE_RES_METADATA_NOCASCADE` - does not delete the row in the metadata table

DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESCHEMALOCMAPPING(
     schemaURL     IN   VARCHAR2);
```

Parameters

Table 148–23 DELETESCHEMALOCMAPPING Procedure Parameters

Parameter	Description
schemaURL	Schema URL

DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLET(
     name         IN    VARCHAR2);
```

Parameters

Table 148–24 DELETESERVLET Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLETMAPPING(
     name       IN    VARCHAR2);
```

Parameters

Table 148–25 DELETESERVLETMAPPING Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLETSECROLE(
     servname    IN   VARCHAR2,
     rolename    IN   VARCHAR2);
```

Parameters

Table 148–26 DELETESERVLETSECROLE Procedure Parameters

Parameter	Description
`servname`	Servlet name
`rolename`	Name of the role to be deleted

DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETEXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 148–27 DELETEXMLEXTENSION Procedure Parameters

Parameter	Description
extension	XML extension to be deleted

EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB.EXISTSRESOURCE(
   abspath    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 148–28 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB.GETACLDOCUMENT(
   abspath  IN  VARCHAR2)
  RETURN sys.xmltype;
```

Parameters

Table 148–29 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

GETCHILDRESPATHS Function

This function returns a cursor over the absolute paths of all the child resources.

Syntax

```
DBMS_XDB.GETCHILDRESPATHS(
     abspath    IN     VARCHAR2);
  RETURN SYS_REFCURSOR;
```

Parameters

Table 148–30 GETCHILDRESPATHS Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

A cursor over the absolute paths of all the child resources.

GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB.GETCONTENTBLOB(
     abspath    IN     VARCHAR2,
     csid       OUT    PLS_INTEGER,
     locksrc    IN     BOOLEAN := FALSE)
  RETURN BLOB;
```

Parameters

Table 148–31 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```
DBMS_XDB.GETCONTENTCLOB(
     abspath    IN     VARCHAR2,
  RETURN CLOB;
```

Parameters

Table 148–32 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(
     abspath    IN     VARCHAR2,
  RETURN BLOB;
```

Parameters

Table 148–33 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a a REF to an XMLTYPE.

Syntax

```
DBMS_XDB.GETCONTENTXMLREF(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 148–34 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a REF to an XMLTYPE.

GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 148–35 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB.GETFTPPORT
 RETURN NUMBER;
```

GETHTTPPORT Function

This procedure gets the value of the current HTTP port.

Syntax

```
DBMS_XDB.GETHTTPPORT
 RETURN NUMBER;
```

GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB.GETLISTENERENDPOINT (
   endpoint  IN   NUMBER,
   host      OUT  VARCHAR2,
   port      OUT  NUMBER,
   protocol  OUT  NUMBER);
```

Parameters

Table 148–36 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
`endpoint`	End point to be retrieved. Its value can be `XDB_ENDPOINT_HTTP` or `XDB_ENDPOINT_HTTP2`.
`host`	Interface on which the listener end point listens
`port`	Port on which the listener end point listens
`protocol`	Transport protocol accepted by the listener end point

GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB.GETLOCKTOKEN(
   path         IN      VARCHAR2,
   locktoken    OUT     VARCHAR2);
```

Parameters

Table 148–37 GETLOCKTOKEN Procedure Parameters

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

Usage Notes

The user must have READPROPERTIES privilege on the resource.

GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB.GETPRIVILEGES(
   res_path    IN     VARCHAR2)
 RETURN sys.xmltype;
```

Parameters

Table 148–38 GETPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the hierarchy of the resource

Return Values

An `XMLType` instance of `<privilege>` element, which contains the list of all leaf privileges granted on this resource to the current user.

GETRESOID Function

Returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB.GETRESOID(
   abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 148–39 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
 RETURN VARCHAR2;
```

HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASBLOBCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 148–40 HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has BOB content.

HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASCHARCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 148–41 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has character content.

HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASXMLCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 148–42 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASXMLREFERENCE
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 148–43 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```
DBMS_XDB.DBMS_XDB.ISFOLDER
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 148–44 DBMS_XDB.ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2);

DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2,
   linktype     IN   PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

Parameters

Table 148–45 LINK Procedure Parameters

Parameter	Description
`srcpath`	Path name of the resource to which a link is created
`linkfolder`	Folder in which the new link is placed
`linkname`	Name of the new link
`linktype`	Type of link to be created: ■ `DBMS_XDB.LINK_TYPE_HARD` (default) ■ `DBMS_XDB.LINK_TYPE_WEAK` ■ `DBMS_XDB.LINK_TYPE_SYMBOLIC`

LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB.LOCKRESOURCE(
   path      IN  VARCHAR2,
   depthzero IN  BOOLEAN,
   shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 148–46 LOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name of the resource to lock.
`depthzero`	Currently not supported
`shared`	Passing `TRUE` will obtain a shared write lock

Return Values

`TRUE` if successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB.MOVEXDB_TABLESPACE(
   new_tablespace   IN  VARCHAR2);
```

Parameters

Table 148–47 MOVEXDB_TABLESPACE Procedure Parameters

Parameter	Description
`new_tablespace`	Name of the tablespace where the XDB will be moved

Usage Notes

This operation waits for all concurrent XDB sessions to exit.

PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2,
 recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 148–48 PROCESSLINKS Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource. If the path is a folder, use the `recurse` flag.
`recurse`	Used only if `abspath` specifies a folder. If `TRUE`, process links of all resources in the folder hierarchy rooted at the specified resource. If `FALSE`, process links of all documents in this folder only.

PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(

 abspath  IN  VARCHAR2);
```

Parameters

Table 148–49 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB.REBUILDHIERARCHICALINDEX;
```

RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB.RENAMERESOURCE(
   srcpath    IN  VARCHAR2,
   destfolder IN  CARCHAR2,
   newname    IN  VARCHAR2);
```

Parameters

Table 148–50 RENAMERESOURCE Procedure Parameters

Parameter	Description
`srcpath`	Absolute path in the Hierarchy for the source resource destination folder
`destfolder`	Absolute path in the Hierarchy for the destination folder
`newname`	Name of the child in the destination folder

SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB.SETACL(
   res_path   IN  VARCHAR2,
   acl_path   IN  VARCHAR2);
```

Parameters

Table 148–51 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

SETCONTENT Procedures

This procedure replaces the contents of a resource with a specified datatype.

Syntax

Replaces the contents of the a resource with a specified CLOB:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   CLOB);
```

Replaces the contents of a resource with a specified BLOB:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   BLOB,
     csid    IN PLS_INTEGER);
```

Replaces the contents of a resource with a specified `XMLTYPE`:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   SYS.XMLTYPE);
```

Replaces the contents of a resource with a specified string:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   VARCHAR2);
```

Replaces the contents of a resource with a specified `REF` to an `XMLTYPE`

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   CLOB,
     sticky     IN   BOOLEAN := TRUE);
```

Replaces the contents of a resource with a specified BFILE:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   CLOB,
     csid       IN   PLS_INTEGER);
```

Parameters

Table 148–52 SETCONTENT Procedure Parameters

Parameter	Description
`abspath`	Absolute path in the Hierarchy for resource

Table 148–52 (Cont.) SETCONTENT Procedure Parameters

Parameter	Description
`data`	Input varying with overload: ■ CLOB data ■ BLOB data ■ `XMLTYPE` data ■ string data ■ `REF` to `XMLTYPE` data ■ a BFILE
`csid`	Character set id of the BLOB or BFILE
`sticky`	Whether or not the `REF` is sticky

SETFTPPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB.SETFTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 148–53 SETFTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the FTP port will be set

SETHTTPPORT Procedure

This procedure sets the HTP port to a new value.

Syntax

```
DBMS_XDB.SETHTTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 148–54 SETHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTP port will be set

SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB.SETLISTENERENDPOINT (
   endpoint  IN  NUMBER,
   host      IN  VARCHAR2,
   port      IN  NUMBER,
   protocol  IN  NUMBER);
```

Parameters

Table 148–55 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Syntax

```
DBMS_XDB.SETLISTENERLOCALACCESS (
   l_access   BOOLEAN);
```

Parameters

Table 148–56 SETLISTENERLOCALACCESS Procedure Parameters

Parameter	Description
`l_access`.	`TRUE` or `FALSE`.

SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB.SPLITPATH(
      abspath     IN  VARCHAR2,
      parentpath  OUT VARCHAR2,
     childpath    OUT VARCHAR2);
```

Parameters

Table 148–57 SPLITPATH Procedure Parameters

Parameter	Description
`abspath`	Absolute path to be split
`parentpath`	Parentpath
`childpath`	Childpath

TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB.DBMS_XDB.TOUCHRESOURCE
     abspath    IN     VARCHAR2);
```

Parameters

Table 148–58 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath  IN VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldns          IN   VARCHAR2,
   oldname IN VARCHAR,
   newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath       IN   VARCHAR2,
   oldns         IN   VARCHAR2,
   oldname       IN   VARCHAR,
   newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

Table 148–59 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REFs` is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
   path     IN  VARCHAR2,
   deltoken IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 148–60 UNLOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name to the resource
`deltoken`	Lock token to be removed

Return Values

`TRUE` if operation successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

149

DBMS_XDB_ADMIN

The `DBMS_XDB_ADMIN` package provides an interface to manage the XMLIndex on the XML DB repository.

> **See Also:** *Oracle XML DB Developer's Guide* for information about "Using XMLIndex on Oracle XML DB Repository"

This chapter contains the following topics:

- Summary of DBMS_XDB_ADMIN Subprograms

Summary of DBMS_XDB_ADMIN Subprograms

This table list the package subprograms in alphabetical order.

Table 149–1 DBMS_XDB_ADM Package Subprograms

Subprogram	Description
CREATEREPOSITORYXMLINDEX Procedure on page 149-3	Creates an XMLIndex on the XML DB repository
DROPREPOSITORYXMLINDEX Procedure on page 149-4	Drops the XMLIndex on the XML DB repository
XMLINDEXADDPATH Procedure on page 149-5	Takes a path in XML DB repository as an input and index all the resources under this given path
XMLINDEXREMOVEPATH Procedure on page 149-6	Removes the index for the given path

CREATEREPOSITORYXMLINDEX Procedure

This procedure creates an XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.CREATEREPOSITORYXMLINDEX;
```

DROPREPOSITORYXMLINDEX Procedure

This procedure drops the XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.DROPREPOSITORYXMLINDEX;
```

XMLINDEXADDPATH Procedure

This procedure adds to the repository xmlindex the resource identified by path (when `recurse` is `FALSE`) or adds to the repository xmlindex the sub-tree of resources rooted at path (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXADDPATH(
   path         IN  VARCHAR2,
   recurse      IN  BOOLEAN);
```

Parameters

Table 149–2 XMLINDEXADDPATH Procedure Parameters

Parameter	Description
`path`	Path to a resource
`recurse`	`TRUE` or `FALSE`

Examples

```
DECLARE
    ret BOOLEAN;
BEGIN
    ret := DBMS_XDB_ADMIN.XMLINDEXADDPATH('/PurchaseOrder', FALSE);
END;
```

XMLINDEXREMOVEPATH Procedure

This procedure removes from the repository xmlindex the resource identified by path (when `recurse` is `FALSE`) or removes from the repository xmlindex the sub-tree of resources rooted at path (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH(
   path              IN  VARCHAR2,
   isrecursive       IN  BOOLEAN)
 RETURN BOOLEAN;
```

Parameters

Table 149–3 XMLINDEXREMOVEPATH Procedure Parameters

Parameter	Description
`path`	Path to a resource
`recurse`	`TRUE` or `FALSE`

Examples

```
DECLARE

DBMS_XDBRESOURCE

The DBMS_XDBRESOURCE package provides the interface to operate on the resource's metadata and contents.

> **See Also:** Oracle XML DB Developer's Guide for examples of "Using DBMS_XDBRESOURCE"

This chapter contains the following topics:

- Using DBMS_XDBRESOURCE
  - Overview
- Summary of DBMS_XDBRESOURCE Subprograms

Using DBMS_XDBRESOURCE

- Overview

Overview

The DBMS_XDBRESOURCE package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in DBMS_XMLDOM package, an XDBResource instance could be converted to a DOMDocument type by using DBMS_XDBRESOURCE.MAKEDOCUMENT routine.

Summary of DBMS_XDBRESOURCE Subprograms

Table 150–1 DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
FREERESOURCE Procedure on page 150-7	Frees any memory associated with an XDBResource
GETACL Function on page 150-8	Given an XDBResource, returns its ACL as string
GETACLDOCFROMRES Function on page 150-9	Returns the ACL Document for the given resource as `XMLType`
GETAUTHOR Function on page 150-10	Given an XDBResource, returns its author
GETCHARACTERSET Function on page 150-11	Given an XDBResource, returns its character set
GETCOMMENT Function on page 150-12	Given an XDBResource, returns its comment
GETCONTENTBLOB Function on page 150-13	Returns the contents of the resource as a `BLOB`
GETCONTENTCLOB Function on page 150-14	Returns the contents of the resource as a `CLOB`
GETCONTENTREF Function on page 150-15	Returns the contents of the resource as an `XMLTypeRef`
GETCONTENTTYPE Function on page 150-16	Given an XDBResource, returns its content-type
GETCONTENTXML Function on page 150-17	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function on page 150-18	Returns the contents of the resource as a string
GETCREATIONDATE Function on page 150-19	Given an XDBResource, returns its creation date
GETCREATOR Function on page 150-20	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function on page 150-21	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function on page 150-22	Given an XDBResource, returns its display name
GETLANGUAGE Function on page 150-23	Given an XDBResource, returns its language
GETLASTMODIFIER Function on page 150-24	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function on page 150-25	Given an XDBResource, returns its modification date
GETOWNER Function on page 150-26	Given an XDBResource, returns its owner.
GETREFCOUNT Function on page 150-27	Given an XDBResource, returns its reference count
GETVERSIONID Function on page 150-28	Given an XDBResource, returns its version ID.
HASACLCHANGED Function on page 150-29	Returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise

Table 150–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
HASAUTHORCHANGED Function on page 150-30	Returns TRUE if the ACL of the given resource has changed FALSE otherwise
HASCHANGED Function on page 150-31	Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise
HASCHARACTERSETCHANGED Function on page 150-32	Returns TRUE if the character set of the given resource has changed, FALSE otherwise
HASCOMMENTCHANGED Function on page 150-33	Returns TRUE if the comment of the given resource has changed, FALSE otherwise
HASCONTENTCHANGED Function on page 150-34	Returns TRUE if the contents of the given resource has changed, FALSE otherwise
HASCONTENTTYPECHANGED Function on page 150-35	Returns TRUE if the content-type of the given resource has changed, FALSE otherwise
HASCREATIONDATECHANGED Function on page 150-36	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
HASCREATORCHANGED Function on page 150-37	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
HASCUSTOMMETADATACHANGED Function on page 150-38	Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise
HASDISPLAYNAMECHANGED Function on page 150-39	Returns TRUE if the display name of the given resource has changed, FALSE otherwise
HASLANGUAGECHANGED Function on page 150-40	Returns TRUE if the language of the given resource has changed, FALSE otherwise
HASLASTMODIFIERCHANGED Function on page 150-41	Returns TRUE if the last modifier of the given resource has changed, FALSE otherwise
HASMODIFICATIONDATECHANGED Function on page 150-42	Returns TRUE if the modification date of the given resource has changed, FALSE otherwise
HASOWNERCHANGED Function on page 150-43	Returns TRUE if the owner of the given resource has changed, FALSE otherwise
HASREFCOUNTCHANGED Function on page 150-44	Returns TRUE if the reference count of the given resource has changed, FALSE otherwise
HASVERSIONIDCHANGED Function on page 150-45	Returns TRUE if the version ID of the given resource has changed, FALSE otherwise
ISFOLDER Function on page 150-46	Returns TRUE if the given resource is a folder, FALSE otherwise
ISNULL Function on page 150-47	Returns TRUE if input resource is NULL, FALSE otherwise
MAKEDOCUMENT Function on page 150-48	Converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface
SAVE Procedure on page 150-49	Updates the resource with any modifications
SETACL Procedure on page 150-50	Sets the ACL of the given XDBResource to the path specified
SETAUTHOR Procedure on page 150-51	Sets the author of the given XDBResource to the specified string

Table 150–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
SETCHARACTERSET Procedure on page 150-52	Sets the character set of the given XDBResource to a specified character set
SETCOMMENT Procedure on page 150-53	Sets a comment associated with the given XDBResource
SETCONTENT Procedures on page 150-54	Replaces the contents of the given resource with the given `CLOB`
SETCONTENTTYPE Procedure on page 150-55	Sets the content-type of the given XDBResource
SETCUSTOMMETADATA Procedure on page 150-56	Sets the custom metadata specified by the XPath and namespace to new data
SETDISPLAYNAME Procedure on page 150-57	Sets the display name of the given XDBResource
SETLANGUAGE Procedure on page 150-58	Sets the language of the given XDBResource
SETOWNER Procedure on page 150-59	Sets the owner of the given XDBResource

FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.FREERESOURCE (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–2 FREERESOURCE Procedure Parameters

Parameter	Description
`res`	XDBResource to free

GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESEROUCE.GETACL (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–3 GETACL Function Parameters

Parameter	Description
res	XDBResource

GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as `XMLType`.

Syntax

```
DBMS_XDBRESEROUCE.GETACLDOCFROMRES (
   res    IN    XDBResource)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 150–4 GETACL Function Parameters

Parameter	Description
`res`	XDBResource

GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESEROUCE.GETAUTHOR (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–5 GETAUTHOR Function Parameters

Parameter	Description
`res`	XDBResource

GETCHARACTERSET Function

Given an XDBResource, this function returns its characterset.

Syntax

```
DBMS_XDBRESEROUCE.GETCHARACTERSET (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–6 GETCHARACTERSET Function Parameters

Parameter	Description
res	XDBResource

GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESEROUCE.GETCOMMENT (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–7 GETCOMMENT Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTBLOB Function

This function returns the contents of the resource as a `BLOB`.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTBLOB (
   res    IN    XDBResource)
 RETURN BLOB;
```

Parameters

Table 150–8 GETCONTENTBLOB Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTCLOB (
   res   IN    XDBResource)
 RETURN CLOB;
```

Parameters

Table 150–9 GETCONTENTCLOB Function Parameters

Parameter	Description
res	XDBResource

GETCONTENTREF Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTREF (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–10 GETCONTENTREF Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTTYPE (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–11 GETCONTENTTYPE Function Parameters

Parameter	Description
res	XDBResource

GETCONTENTXML Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTXML (
   res    IN    XDBResource)
 RETURN XMLType;
```

Parameters

Table 150–12 GETCONTENTXML Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTVARCHAR2 (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–13 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
res	XDBResource

GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATIONDATE (
   res    IN    XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 150–14 GETCREATIONDATE Function Parameters

Parameter	Description
res	XDBResource

GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATOR (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–15 GETCREATOR Function Parameters

Parameter	Description
res	XDBResource

GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESEROUCE.GETCUSTOMMETADATA (
   res        IN    XDBResource,
   xpath      IN    VARCHAR2,
   namespace  IN    VARCHAR2)
 RETURN XMLType;
```

Parameters

Table 150–16 GETCUSTOMMETADATA Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

Usage Notes

The first component of the XPath expression must be "Resource".

GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```
DBMS_XDBRESEROUCE.GETDISPLAYNAME (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–17 GETDISPLAYNAME Function Parameters

Parameter	Description
res	XDBResource

GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESEROUCE.GETLANGUAGE (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–18 GETLANGUAGE Function Parameters

Parameter	Description
res	XDBResource

GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESEROUCE.GETLASTMODIFIER (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–19 GETLASTMODIFIER Function Parameters

Parameter	Description
`res`	XDBResource

GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESEROUCE.GETMODIFICATIONDATE (
   res    IN    XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 150–20 GETMODIFICATIONDATE Function Parameters

Parameter	Description
res	XDBResource

GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESEROUCE.GETOWNER (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 150–21 GETOWNER Function Parameters

Parameter	Description
res	XDBResource

GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESEROUCE.GETREFCOUNT (
   res    IN    XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 150–22 GETREFCOUNT Function Parameters

Parameter	Description
res	XDBResource

GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESEROUCE.GETVERSIONID (
   res   IN    XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 150–23 GETVERSIONID Function Parameters

Parameter	Description
`res`	XDBResource

HASACLCHANGED Function

This function returns TRUE if the ACL of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASACLCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–24 GETACL Function Parameters

Parameter	Description
res	XDBResource

HASAUTHORCHANGED Function

This function returns `TRUE` if the author of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASAUTHORCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–25 HASAUTHORCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCHANGED (
   res         IN    XDBResource,
   xpath       IN    VARCHAR2,
   namespace   IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 150–26 HASCHANGED Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

HASCHARACTERSETCHANGED Function

This function returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCHARACTERSETCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–27 HASCHARACTERSETCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCOMMENTCHANGED Function

This function returns TRUE if the comment of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCOMMENTCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–28 HASCOMMENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCONTENTCHANGED Function

This function returns `TRUE` if the contents of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–29 HASCONTENTCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCONTENTTYPECHANGED Function

This function returns `TRUE` if the content-type of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTTYPECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–30 HASCONTENTTYPECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCREATIONDATECHANGED Function

This function returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCREATIONDATECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–31 HASCREATIONDATECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCREATORCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–32 HASCREATORCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCUSTOMMETADATACHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–33 HASCUSTOMMETADATACHANGED Function Parameters

Parameter	Description
res	XDBResource

HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASDISPLAYNAMECHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–34 HASDISPLAYNAMECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASLANGUAGECHANGED Function

This function returns TRUE if the language of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASLANGUAGECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–35 HASLANGUAGECHANGED Function Parameters

Parameter	Description
res	XDBResource

HASLASTMODIFIERCHANGED Function

This function returns `TRUE` if the last modifier of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASLASTMODIFIERCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–36 HASLASTMODIFIERCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASMODIFICATIONDATECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–37 HASMODIFICATIONDATECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASOWNERCHANGED Function

This function returns TRUE if the owner of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASOWNERCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–38 HASOWNERCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASREFCOUNTCHANGED Function

This function returns TRUE if the reference count of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASREFCOUNTCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–39 HASREFCOUNTCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASVERSIONIDCHANGED Function

This function returns TRUE if the version ID of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASVERSIONIDCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–40 HASVERSIONIDCHANGED Function Parameters

Parameter	Description
res	XDBResource

ISFOLDER Function

This function returns TRUE if the given resource is a folder, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.ISFOLDER (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–41 ISFOLDER Function Parameters

Parameter	Description
res	XDBResource

ISNULL Function

This function returns `TRUE` if input resource is `NULL`.

Syntax

```
DBMS_XDBRESEROUCE.ISNULL (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 150–42 ISNULL Function Parameters

Parameter	Description
`res`	Input resource

MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also: The DBMS_XMLDOM package

Syntax

```
DBMS_XDBRESEROUCE.MAKEDOCUMENT (
   res   IN    XDBResource)
 RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 150–43 MAKEDOCUMENT Function Parameters

Parameter	Description
res	XDBResource

SAVE Procedure

This procedures updates the resource with any modifications.

Syntax

```
DBMS_XDBRESEROUCE.SAVE (
   res    IN    XDBResource);
```

Parameters

Table 150–44 SAVE Procedure Parameters

Parameter	Description
res	XDBResource

SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESEROUCE.SETACL (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 150–45 SETACL Procedure Parameters

Parameter	Description
`res`	XDBResource
`ACLPath`	Absolute path of the new ACL

SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESEROUCE.SETAUTHOR (
   res     IN OUT  XDBResource,
   author  IN      VARCHAR2);
```

Parameters

Table 150–46 SETAUTHOR Procedure Parameters

Parameter	Description
res	XDBResource
author	Author

SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESEROUCE.SETCHARACTERSET (
   res      IN OUT  XDBResource,
   charSet  IN      VARCHAR2);
```

Parameters

Table 150–47 SETCHARACTERSET Procedure Parameters

Parameter	Description
`res`	XDBResource
`charset`	New character set

SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETCOMMENT (
   res      IN OUT  XDBResource,
   comment  IN      VARCHAR2);
```

Parameters

Table 150–48 SETCOMMENT Procedure Parameters

Parameter	Description
`res`	XDBResource
`comment`	New comment

SETCONTENT Procedures

This procedurereplaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BFILE,
   csid     IN      NUMBER);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BLOB,
   csid     IN      PLS_INTEGER);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      CLOB);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      REF SYS.XMLType,
   sticky   IN      BOOLEAN := TRUE);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      VARCHAR2);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      SYS.XMLType);
```

Parameters

Table 150–49 SETCONTENT Procedure Parameters

Parameter	Description
`res`	XDBResource
`data`	Data input as `BFILE`, `BLOB`, `CLOB`, string, `XMLType`
`csid`	Character set ID of the `BFILE`, `BLOB`
`sticky`	If `TRUE` creates a sticky `REF`, otherwise non-sticky

SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETCONTENTTYPE (
   res         IN OUT  XDBResource,
   conttype    IN      VARCHAR2);
```

Parameters

Table 150–50 SETCONTENTTYPE Procedure Parameters

Parameter	Description
`res`	XDBResource
`conttype`	New content-type

SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```
DBMS_XDBRESEROUCE.SETCUSTOMMETADATA (
   res          IN OUT  XDBResource,
   xpath        IN      VARCHAR2,
   namespace    IN      VARCHAR2,
   newMetadata  IN      XMLType);
```

Parameters

Table 150–51 SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

Usage Notes

The first component of the XPath expression must be "Resource".

SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETDISPLAYNAME (
   res      IN OUT  XDBResource,
   name     IN      VARCHAR2);
```

Parameters

Table 150–52 SETDISPLAYNAME Procedure Parameters

Parameter	Description
res	XDBResource
name	New display name

SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETLANGUAGE (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 150–53 SETLANGUAGE Procedure Parameters

Parameter	Description
`res`	XDBResource
`ACLPath`	New path

SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETOWNER (
   res      IN OUT  XDBResource,
   owner    IN      VARCHAR2);
```

Parameters

Table 150–54 SETOWNER Procedure Parameters

Parameter	Description
`res`	XDBResource
`owner`	New owner

151

DBMS_XDB_VERSION

Oracle XML DB versioning APIs are found in the `DBMS_XBD_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- Summary of DBMS_XDB_VERSION Subprograms

See Also: *Oracle XML DB Developer's Guide*

Summary of DBMS_XDB_VERSION Subprograms

Table 151–1 DBMS_XDB_VERSION Package Subprograms

Method	Description
CHECKIN Function on page 151-3	Checks in a checked-out VCR and returns the resource id of the newly-created version
CHECKOUT Procedure on page 151-4	Checks out a VCR before updating or deleting it
GETCONTENTSBLOBBYRESID Function on page 151-5	Obtain contents as a `BLOB`

GETPREDECESSORS Function on page 151-8	Retrieves the list of predecessors by path name
GETPREDSBYRESID Function on page 151-9	Retrieves the list of predecessors by resource id
GETRESOURCEBYRESID Function on page 151-10	Obtains the resource as an `XMLType`, given the resource object ID
GETSUCCESSORS Function on page 151-11	Retrieves the list of successors by path name
GETSUCCSBYRESID Function on page 151-12	Retrieves the list of successors by resource id
MAKEVERSIONED Function on page 151-13	Turns a regular resource whose path name is given into a version-controlled resource
UNCHECKOUT Function on page 151-14	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(
   pathname VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 151–2 CHECKIN Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.

CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout(
   pathname    VARCHAR2);
```

Parameters

Table 151–3 CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT Procedure the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT Procedure operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

GETCONTENTSBLOBBYRESID Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN BLOB;
```

Parameters

Table 151–4 GETCONTENTSBLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

GETCONTENTSCLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBYRESID(
   resid     DBMS_XDB.resid_type)
 RETURN CLOB;
```

Parameters

Table 151–5 GETCONTENTSCLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

GETCONTENTSXMLBYRESID Function

This function obtains contents as an `XMLType`.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN XMLType;
```

Parameters

Table 151–6 GETCONTENTSXMLBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

Return Values

If the contents are not valid XML, returns `NULL`.

GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
   pathname       VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 151–7 GETPREDECESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Return Values

An exception is raised if PATHNAME is illegal.

GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(
   resid      resid_type)
 RETURN resid_list_type;
```

Parameters

Table 151–8 GETPREDSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting predecessors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the RESID is illegal.

GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system will not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
   resid      resid_type)
 RETURN XMLType;
```

Parameters

Table 151–9 GETRESOURCEBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(
   pathname VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 151–10 GETSUCCESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Usage Notes

Getting successors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the PATHNAME is illegal.

GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(
   resid    resid_type)
  RETURN resid_list_type;
```

Parameters

Table 151–11 GETSUCCSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting successors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the PATHNAME is illegal.

MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
   pathname   VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 151–12 MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource will be created, and the given path name will be bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
   pathname     VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 151–13 UNCHECKOUT Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. UNCHECKOUT FunctionCHECKOUT Procedure doesn't have to take the same path name that was passed to operation. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn't exist.

152

DBMS_XDBT

The DBMS_XDBT package provides a convenient mechanism for administrators to set up a CONTEXT index on the Oracle XML DB hierarchy. The package contains procedures to create default preferences, create the index and set up automatic synchronization of the CONTEXT index

The DBMS_XDBT package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XDBT
  - Overview
  - Operational Notes
- Summary of DBMS_XDBT Subprograms

Using DBMS_XDBT

- Overview
- Operational Notes

Overview

The DBMS_XDBT package can be used in the following fashion:

- Customize the package to set up the appropriate configuration.
- DROPPREFERENCES ProcedureDrop any existing index preferences using the procedure.
- Create new index preferences using the CREATEPREFERENCES Procedure procedure.
- Create the CONTEXT index using the CREATEINDEX Procedure procedure.
- Set up automatic synchronization of the index using the CONFIGUREAUTOSYNC Procedureprocedure.

Operational Notes

The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views. This section describes the configuration settings, or package variables, available to customize the DBMS_XDBT package.

Table 152–1 General Indexing Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
IndexName	XDB$CI	The name of the CONTEXT index.
IndexTablespace	XDB$RESINFO	Tablespace used by tables and indexes comprising the CONTEXT index.
IndexMemory	128M	Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).
LogFile	'XdbCtxLog'	The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.

Table 152–2 Filtering Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SkipFilter_Types	image/%, audio/%, video/%, model/%	List of mime types that should not be indexed.
NullFilter_Types	text/plain, text/html, text/xml	List of mime types that do not need to use the INSO filter. Use this for text-based documents.
FilterPref	XDB$CI_FILTER	Name of the filter preference.

Table 152–3 Stoplist Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
StoplistPref	XDB$CI_STOPLIST	Name of the stoplist.
StopWords	0..9; 'a'..'z'; 'A'..'Z'	List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.

Table 152–4 Sectioning and Section Group Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SectionGroup	HTML_SECTION_GROUP	Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.
SectiongroupPref	XDB$CI_SECTIONGROUP	Name of the section group.

Table 152–5 Other Index Preference Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
DatastorePref	XDB$CI_DATASTORE	The name of the datastore preference.
StoragePref	XDB$CI_STORAGE	The name of the storage preference.
WordlistPref	XDB$CI_WORDLIST	The name of the wordlist preference.
DefaultLexerPref	XDB$CI_DEFAULT_LEXER	The name of the default lexer preference.

Table 152–6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
AutoSyncPolicy	SYNC_BY_PENDING_COUNT	Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.
MaxPendingCount	2	Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
CheckPendingCountInterval	10 minutes	How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
SyncInterval	60 minutes	Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME

Summary of DBMS_XDBT Subprograms

Table 152–7 DBMS_XDBT Package Subprograms

Subprogram	Description
CONFIGUREAUTOSYNC Procedure on page 152-7	Configures the CONTEXT index for automatic maintenance, SYNC
CREATEDATASTOREPREF Procedure on page 152-8	Creates a USER datastore preference for the CONTEXT index
CREATEFILTERPREF Procedure on page 152-9	Creates a filter preference for the CONTEXT index
CREATEINDEX Procedure on page 152-10	Creates the CONTEXT index on the XML DB hierarchy
CREATELEXERPREF Procedure on page 152-11	Creates a lexer preference for the CONTEXT index
CREATEPREFERENCES Procedure on page 152-12	Creates preferences required for the CONTEXT index on the XML DB hierarchy
CREATESECTIONGROUPPREF Procedure on page 152-13	Creates a storage preference for the CONTEXT index
CREATESTOPLISTPREF Procedure on page 152-14	Creates a section group for the CONTEXT index
CREATESTORAGEPREF Procedure on page 152-15	Creates a wordlist preference for the CONTEXT index
CREATEWORLDLISTPREF Procedure on page 152-16	Creates a stoplist for the CONTEXT index
DROPPREFERENCES Procedure on page 152-17	Drops any existing preferences

CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the USER_JOBS catalog views
- The configuration parameter AutoSyncPolicy can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

Sync Basis	Description
SYNC_BY_PENDING_COUNT	The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the MaxPendingCount configuration setting on page 152-5). The pending queue is polled at regular intervals (See the CheckPendingCountInterval configuration parameter on page 152-5) to determine if the number of documents exceeds the threshold.
SYNC_BY_TIME	The SYNC is triggered at regular intervals. (See the SyncInterval configuration parameter on page 152-5).
SYNC_BY_PENDING_COUNT_ AND_TIME	A combination of both of the preceding options.

CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEDATASTOREPREF;
```

Usage Notes

- The name of the datastore preference can be modified; see the DatastorePref configuration setting.
- The default USER datastore procedure also filters the incoming document. The DBMS_XDBT package provides a set of configuration settings that control the filtering process.
- The SkipFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
  - The NullFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
  - All other documents use the INSO filter through the IFILTER API.

CREATEFILTERPREF Procedure

This procedure creates a `NULL` filter preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEFILTERPREF;
```

Usage Notes

- The name of the filter preference can be modified; see `FilterPref` configuration setting.
- The `USER` datastore procedure filters the incoming document; see CREATEDATASTOREPREF Procedurefor more details.

CREATEINDEX Procedure

This procedure creates the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEINDEX;
```

Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.
- Set the `LogFile` configuration parameter to enable `ROWID` logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later SYNCs, will use.

CREATELEXERPREF Procedure

This procedure creates a BASIC `lexer` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

Usage Notes

- The name of the `lexer` preference can be modified; see `LexerPref` configuration setting. No other configuration settings are provided.
- `MultiLexer` preferences are not supported.
- Base letter translation is turned on by default.

CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```

CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

Usage Notes

- The name of the section group can be changed; see the SectiongroupPref configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the AUTO_SECTION_GROUP or the PATH_SECTION_GROUP; see the SectionGroup configuration setting.

CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```
