    error_on_overlap_time IN BOOLEAN := FALSE,
    error_on_nonexisting_time IN BOOLEAN := FALSE);
```

### Parameters

**Table 60–4 BEGIN\_UPGRADE Procedure Parameters**

Parameter	Description
new_version	New timezone version to which the database is to be upgraded
error_on_overlap_time	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE. For more information about boundary cases, see <i>Oracle Database SQL Language Reference</i> .
error_on_nonexisting_time	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE.

## CREATE\_AFFECTED\_TABLE Procedure

This procedure creates a table that has the schema shown in the comments for the [FIND\\_AFFECTED\\_TABLES Procedure](#).

### Syntax

```
DBMS_DST.CREATE_AFFECTED_TABLE (  
    table_name      IN VARCHAR2);
```

### Parameters

**Table 60–5** *CREATE\_AFFECTED\_TABLE Procedure Parameters*

Parameter	Description
table_name	Name of the table created

### Usage Notes

This procedure takes a `table_name` without schema qualification, creating a table within the current user schema.

## CREATE\_ERROR\_TABLE Procedure

This procedure creates a log error table which has the following schema:

```
CREATE TABLE dst$error_table(  
  table_owner    VARCHAR2(30),  
  table_name     VARCHAR2(30),  
  column_name    VARCHAR2(4000),  
  rid            ROWID,  
  error_number   NUMBER)
```

### Syntax

```
DBMS_DST.CREATE_ERROR_TABLE (  
  table_name     IN VARCHAR2);
```

### Parameters

**Table 60–6** CREATE\_ERROR\_TABLE Procedure Parameters

Parameter	Description
table_name	Name of the table created

### Usage Notes

- This procedure takes a table\_name without schema qualification, creating a table within the current user schema.
- The error number is found when upgrading time zone file and timestamp with time zone data. For more information about error handling when upgrading time zone file and timestamp with time zone data, see Oracle Database Globalization Support Guide

## CREATE\_TRIGGER\_TABLE Procedure

This procedure creates a table that has the following schema.

```
CREATE TABLE dst_trigger_table (  
  trigger_owner VARCHAR2(30),  
  trigger_name  VARCHAR2(30));
```

This table is used to record active triggers that are disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process.

### Syntax

```
DBMS_DST.CREATE_TRIGGER_TABLE (  
  table_name      IN  VARCHAR2);
```

### Parameters

**Table 60–7** CREATE\_TRIGGER\_TABLE Procedure Parameters

Parameter	Description
table_name	Name of table to be created

### Usage Notes

This procedure takes a table\_name without schema qualification, creating a table within the current user schema.

## END\_PREPARE Procedure

This procedure ends a prepare window.

### Syntax

```
DBMS_DST.BEGIN_PREPARE;
```

## END\_UPGRADE Procedure

This procedure ends an upgrade window. An upgraded window is ended if all the affected user tables have been upgraded. Otherwise, the OUT parameter `num_of_failures` indicates how many tables have not been converted.

### Syntax

```
DBMS_DST.END_UPGRADE (  
    num_of_failures    OUT  BINARY_INTEGER);
```

### Parameters

**Table 60–8** *END\_UPGRADE Procedure Parameters*

Parameter	Description
<code>num_of_failures</code>	Number of tables that fail to complete

## FIND\_AFFECTED\_TABLES Procedure

This procedure finds all the tables which have affected TSTZ data due to the new timezone version. This procedure can only be invoked during a prepare window. The tables which have affected TSTZ data are recorded into a table indicated by parameter `affected_tables`. If semantic errors must be logged, they are recorded into a table indicated by parameter `log_errors_table`.

### Syntax

```
DBMS_DST.FIND_AFFECTED_TABLES (
  affected_tables      IN  VARCHAR2 := 'sys.dst$affected_tables',
  log_errors           IN  BOOLEAN := FALSE,
  log_errors_table     IN  VARCHAR2 := 'sys.dst$error_table');
```

### Parameters

**Table 60–9 FIND\_AFFECTED\_TABLES Procedure Parameters**

Parameter	Description
<code>affected_tables</code>	<p>Name of table with the following schema:</p> <pre>CREATE TABLE dst\$affected_tables (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   row_count NUMBER,   error_count NUMBER)</pre> <p>The table can be created with the <a href="#">CREATE_AFFECTED_TABLE Procedure</a>.</p>
<code>log_errors</code>	<p>Boolean flag indicating whether to log errors during upgrade. If <code>FALSE</code>, no error is logged into the <code>log_errors_table</code> after aborting conversion of the current table. If <code>TRUE</code>, the error is logged to the <code>log_errors_table</code>.</p> <p>The default is <code>FALSE</code>.</p>
<code>log_errors_table</code>	<p>Table name with the following schema:</p> <pre>CREATE TABLE dst\$error_table (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   rid ROWID,   error_number NUMBER)</pre> <p>The table can be created with the <a href="#">CREATE_ERROR_TABLE Procedure</a>. The <code>rid</code> column records the rowids of the offending rows, and the <code>error_number</code> column records the corresponding error number.</p>

## UPGRADE\_DATABASE Procedure

This procedure upgrades all tables in the database, which have one or more columns defined on the TSTZ type or an ADT containing the TSTZ type. This procedure can only be invoked after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that, a base table and its materialized view log table are upgraded in an atomic transaction.

### Syntax

```
DBMS_DST.UPGRADE_DATABASE (
    num_of_failures      OUT BINARY_INTEGER,
    upgrade_data         IN  BOOLEAN := TRUE,
    parallel             IN  BOOLEAN := FALSE,
    continue_after_errors IN  BOOLEAN := TRUE,
    log_errors           IN  BOOLEAN := FALSE,
    log_errors_table     IN  VARCHAR2 := 'sys.dst$error_table' ,
    error_on_overlap_time IN  BOOLEAN := FALSE,
    error_on_nonexisting_time IN  BOOLEAN := FALSE,
    log_triggers_table  IN  VARCHAR2 := 'sys.dst$trigger_table');
```

### Parameters

**Table 60–10 UPGRADE\_DATABASE Procedure Parameters**

Parameter	Description
num_of_failures	Number of tables that fail to complete
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave it unconverted (FALSE).  The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML.  The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table.  The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, errors are logged to the log_errors_table.  The default is FALSE.
log_errors_table	Table name with the following schema:  <pre>CREATE TABLE dst\$error_table (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   rid ROWID,   error_number NUMBER)</pre> The table can be created with the <a href="#">CREATE_ERROR_TABLE Procedure</a> . The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number.

**Table 60–10 (Cont.) UPGRADE\_DATABASE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
error_on_overlap_time	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE.
error_on_nonexisting_time	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE.
log_triggers_table	Table to log triggers which are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade

## UPGRADE\_SCHEMA Procedure

This procedure upgrades tables in a specified list of schemas that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type. This procedure can be invoked only after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that a base table and its materialized view log table are upgraded in an atomic transaction.

### Syntax

```
DBMS_DST.UPGRADE_SCHEMA (
    num_of_failures          OUT BINARY_INTEGER,
    schema_list              IN VARCHAR2,
    upgrade_data             IN BOOLEAN := TRUE,
    parallel                 IN BOOLEAN := FALSE,
    continue_after_errors   IN BOOLEAN := TRUE,
    log_errors               IN BOOLEAN := FALSE,
    log_errors_table        IN VARCHAR2 := 'sys.dst$error_table' ,
    error_on_overlap_time    IN BOOLEAN := FALSE,
    error_on_nonexisting_time IN BOOLEAN := FALSE,
    log_triggers_table      IN VARCHAR2 := 'sys.dst$trigger_table');
```

### Parameters

**Table 60–11 UPGRADE\_SCHEMA Procedure Parameters**

Parameter	Description
num_of_failures	Number of tables that fail to complete
schema_list	Schema name list (comma separated strings)
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE) or to leave unconverted (FALSE). The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML. The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.

**Table 60–11 (Cont.) UPGRADE\_SCHEMA Procedure Parameters**

Parameter	Description
log_errors_table	<p>Table name with the following schema:</p> <pre>CREATE TABLE dst\$error_table (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   rid ROWID,   error_number NUMBER)</pre> <p>The table can be created with the <a href="#">CREATE_ERROR_TABLE Procedure</a>. The <code>rid</code> column records the rowids of the offending rows, and the <code>error_number</code> column records the corresponding error number.</p>
error_on_overlap_time	<p>Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error.</p> <p>The default is <code>TRUE</code>.</p>
error_on_nonexisting_time	<p>Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error.</p> <p>The default is <code>TRUE</code>.</p>
log_triggers_table	<p>Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade</p>

## UPGRADE\_TABLE Procedure

This procedure upgrades a specified list of tables that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

### Syntax

```
DBMS_DST.UPGRADE_TABLE (
    num_of_failures      OUT BINARY_INTEGER,
    table_list           IN VARCHAR2,
    upgrade_data         IN BOOLEAN := TRUE,
    parallel             IN BOOLEAN := FALSE,
    continue_after_errors IN BOOLEAN := TRUE,
    log_errors           IN BOOLEAN := FALSE,
    log_errors_table     IN VARCHAR2 := 'sys.dst$error_table' ,
    error_on_overlap_time IN BOOLEAN := FALSE,
    error_on_nonexisting_time IN BOOLEAN := FALSE,
    log_triggers_table  IN VARCHAR2 := 'sys.dst$trigger_table',
    atomic_upgrade      IN BOOLEAN := FALSE);
```

### Parameters

**Table 60–12 UPGRADE\_TABLE Procedure Parameters**

Parameter	Description
num_of_failures	Number of tables that fail to complete
table_list	Table name list (comma separated strings)
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave unconverted (FALSE). The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML), or Serial DML. The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.
log_errors_table	Table name with the following schema: <pre>CREATE TABLE dst\$error_table (   table_owner VARCHAR2(30),   table_name VARCHAR2(30),   column_name VARCHAR2(4000),   rid ROWID,   error_number NUMBER)</pre> The table can be created with the <a href="#">CREATE_ERROR_TABLE Procedure</a> . The rid parameter records the rowids of the offending rows and the corresponding error number.

**Table 60–12 (Cont.) UPGRADE\_TABLE Procedure Parameters**

Parameter	Description
<code>error_on_overlap_time</code>	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is <code>TRUE</code> .
<code>error_on_nonexisting_time</code>	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is <code>TRUE</code> .
<code>log_triggers_table</code>	Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade
<code>atomic_upgrade</code>	Boolean flag indicating whether to convert the listed tables atomically (in a single transaction). If <code>FALSE</code> , each table is converted in its own transaction. The default is <code>FALSE</code> .

### Usage Notes

This procedure can only be invoked after an upgrade window has been started. The table list has to satisfy the following partial ordering:

1. If a base table has a materialized view log table, the log table must be the next item in the list.
2. If the container table for a materialized view appears in the list, the materialized view's 'non-upgraded' base tables and log tables must appear in the table list and before the container table.

A base table and its materialized view log table need to be upgraded in an atomic transaction by specifying `atomic_upgrade` to `TRUE`.

---

## DBMS\_DISTRIBUTED\_TRUST\_ADMIN

DBMS\_DISTRIBUTED\_TRUST\_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- [Using DBMS\\_DISTRIBUTED\\_TRUST\\_ADMIN](#)
  - Overview
  - Security Model
  - Examples
- [Summary of DBMS\\_DISTRIBUTED\\_TRUST\\_ADMIN Subprograms](#)

---

## Using DBMS\_DISTRIBUTED\_TRUST\_ADMIN

- [Overview](#)
- [Security Model](#)
- [Examples](#)

## Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

## Security Model

To execute `DBMS_DISTRIBUTED_TRUST_ADMIN`, the `EXECUTE_CATALOG_ROLE` role must be granted to the DBA. To select from the view `TRUSTED_SERVERS`, the `SELECT_CATALOG_ROLE` role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the `ALLOW_SERVER` procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the `DENY_SERVER` procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures `DENY_ALL` and `ALLOW_ALL` delete all entries (in other words, server names) that are explicitly allowed or denied using the `ALLOW_SERVER` procedure or `DENY_SERVER` procedure respectively.

## Examples

If you have not yet used the package `DBMS_DISTRIBUTED_TRUST_ADMIN` to change the trust listing, by default you trust all databases in the same enterprise domain if that domain is listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Trusted    All
```

Because all servers are currently trusted, you can execute the [DENY\\_SERVER Procedure](#) and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Untrusted  SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the [DENY\\_ALL Procedure](#), you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

```
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;

TRUST      NAME
-----
Untrusted  All
```

The [ALLOW\\_SERVER Procedure](#) can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Trusted    SALES.US.AMERICAS.ACME_AUTO.COM
```

---

## Summary of DBMS\_DISTRIBUTED\_TRUST\_ADMIN Subprograms

**Table 61–1** *DBMS\_DISTRIBUTED\_TRUST\_ADMIN Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">ALLOW_ALL Procedure</a> on page 61-7	Empties the list and inserts a row indicating that all servers should be trusted
<a href="#">ALLOW_SERVER Procedure</a> on page 61-8	Enables a specific server to be allowed access even though deny all is indicated in the list
<a href="#">DENY_ALL Procedure</a> on page 61-9	Empties the list and inserts a row indicating that all servers should be untrusted
<a href="#">DENY_SERVER Procedure</a> on page 61-10	Enables a specific server to be denied access even though allow all is indicated in the list

## ALLOW\_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view `TRUSTED_SERVERS` will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

### Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

### Usage Notes

`ALLOW_ALL` only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

## ALLOW\_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "deny all").

### Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (  
    server IN VARCHAR2);
```

### Parameters

**Table 61–2** ALLOW\_SERVER Procedure Parameters

Parameter	Description
server	Unique, fully-qualified name of the server to be trusted.

### Usage Notes

If the Trusted Servers List contains the entry "deny all", then this procedure adds a specification indicating that a specific database (for example, DBx) is to be trusted.

If the Trusted Servers List contains the entry "allow all", and if there is no "deny DBx" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "allow all", and if there is a "deny DBx" entry in the list, then that entry is deleted.

## DENY\_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view `TRUSTED_SERVERS` will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

### Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

## DENY\_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified `allow all`).

### Syntax

```
DBMS_DISTRICTED_TRUST_ADMIN.DENY_SERVER (  
    server IN VARCHAR2);
```

### Parameters

**Table 61-3** *DENY\_SERVER Procedure Parameters*

Parameter	Description
<code>server</code>	Unique, fully-qualified name of the server to be untrusted.

### Usage Notes

If the Trusted Servers List contains the entry `allow all`, then this procedure adds an entry indicating that the specified database (for example, `DBx`) is not to be trusted.

If the Trusted Servers List contains the entry `"deny all"`, and if there is no `"allow DBx"` entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry `"deny all"`, and if there is an `"allow DBx"` entry, then this procedure causes that entry to be deleted.

---

## DBMS\_EDITIONS\_UTILITIES

The DBMS\_EDITIONS\_UTILITIES package implements the Edition API which provides helper functions for edition-related operations.

The chapter contains the following topics:

- [Using DBMS\\_EDITIONS\\_UTILITIES](#)
  - Overview
  - Security Model
  - Exceptions
- [Summary of DBMS\\_EDITIONS\\_UTILITIES Subprograms](#)

---

## Using DBMS\_EDITIONS\_UTILITIES

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)

## Overview

The `DBMS_EDITIONS_UTILITIES` package implements the Edition API which provides helper functions for edition-related operations.

## Security Model

This package is owned by `SYS` with execute access granted to `PUBLIC`. It runs with invokers rights, that is, with the security profile of the caller.

## Exceptions

**Table 62–1** *DBMS\_EDITIONS\_UTILITIES Error Messages*

<b>Error</b>	<b>Description</b>
ORA-38817	Insufficient privileges
ORA-942	Missing table

## Summary of DBMS\_EDITIONS\_UTILITIES Subprograms

**Table 62–2 DBMS\_EDITIONS\_UTILITIES Package Subprograms**

Subprogram	Description
<a href="#">SET_EDITIONING_VIEWS_READ_ONLY Procedure</a> on page 62-7	Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to READ ONLY or READ/WRITE

## SET\_EDITIONING\_VIEWS\_READ\_ONLY Procedure

Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to READ ONLY or READ/WRITE.

### Syntax

```
DBMS_EDITIONS_UTILITIES.SET_EDITIONING_VIEWS_READ_ONLY (
  table_name IN VARCHAR2,
  owner      IN VARCHAR2 DEFAULT NULL,
  read_only  IN BOOLEAN  DEFAULT TRUE);
```

### Parameters

**Table 62-3 SET\_EDITIONING\_VIEWS\_READ\_ONLY Procedure Parameters**

Parameter	Description
table_name	Base table of the editioning views
owner	Base table schema. The default (or NULL) is the current schema.
read_only	TRUE to set the views to read-only; FALSE (or NULL) sets the views to READ/WRITE. Default is TRUE.

### Usage Notes

The user must have the following privileges:

- Owner of the table, or have the ALTER ANY TABLE system privileges
- USE object privilege on all the editions for which the views are defined

The DBMS\_EPG package implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

- [Using DBMS\\_EPG](#)
  - Overview
  - Security Model
  - Exceptions
- [Data Structures](#)
  - [VARCHAR2\\_TABLE](#) Table Type
- [Subprogram Groups](#)
  - Configuration Subprograms
  - Authorization Subprograms
- [Summary of DBMS\\_EPG Subprograms](#)

## Using DBMS\_EPG

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)

## Overview

The DBMS\_EPG package is a platform on which PL/SQL users develop and deploy PL/SQL Web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of `mod_plsql` in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser by way of HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

## Security Model

The XDBADMIN role is required to invoke the configuration interface. It may be invoked by the database user "XDB".

The authorization interface can be invoked by any user.

## Exceptions

The following table lists the exceptions raised by the DBMS\_EPG package.

**Table 63–1** *DBMS\_EPG Exceptions*

<b>Exception</b>	<b>Error Code</b>	<b>Description</b>
DAD_NOT_FOUND	20000	Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.

## Data Structures

The DBMS\_EPG package defines a TABLE type.

### **VARCHAR2\_TABLE Table Type**

This type is used by the procedures GET\_ALL\_GLOBAL\_ATTRIBUTES, GET\_ALL\_DAD\_ATTRIBUTES, GET\_ALL\_DAD\_MAPPINGS, and GET\_DAD\_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

## Subprogram Groups

---

The DBMS\_EPG consists of two interfaces:

- [Configuration Subprograms](#)
- [Authorization Subprograms](#)

## Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

**Table 63–2 Configuration Subprogram Group**

Subprogram	Description
<a href="#">CREATE_DAD Procedure</a> on page 63-12	Creates a new DAD
<a href="#">DELETE_DAD_ATTRIBUTE Procedure</a> on page 63-14	Deletes a DAD attribute
<a href="#">DELETE_GLOBAL_ATTRIBUTE Procedure</a> on page 63-15	Deletes a global attribute
<a href="#">DROP_DAD Procedure</a> on page 63-16	Drops a DAD
<a href="#">GET_ALL_DAD_ATTRIBUTES Procedure</a> on page 63-17	Retrieves all the attributes of a DAD.
<a href="#">GET_ALL_DAD_MAPPINGS Procedure</a> on page 63-18	Retrieves all virtual paths to which the specified DAD is mapped.
<a href="#">GET_ALL_GLOBAL_ATTRIBUTES Procedure</a> on page 63-19	Retrieves all global attributes and values
<a href="#">GET_DAD_ATTRIBUTE Function</a> on page 63-20	Retrieves the value of a DAD attribute
<a href="#">GET_DAD_LIST Procedure</a> on page 63-21	Retrieves a list of all DADs for an Embedded Gateway instance.
<a href="#">GET_GLOBAL_ATTRIBUTE Function</a> on page 63-22	Retrieves the value of a global attribute
<a href="#">MAP_DAD Procedure</a> on page 63-23	Maps a DAD to the specified virtual path.
<a href="#">SET_DAD_ATTRIBUTE Procedure</a> on page 63-24	Sets the value for a DAD
<a href="#">SET_GLOBAL_ATTRIBUTE Procedure</a> on page 63-26	Sets the value of a global attribute
<a href="#">UNMAP_DAD Procedure</a> on page 63-27	Unmaps a DAD from the specified virtual path

## Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

**Table 63-3 Authorization Subprogram Group**

<b>Subprogram</b>	<b>Description</b>
<a href="#">AUTHORIZE_DAD Procedure</a> on page 63-11	Authorizes a DAD to invoke procedures and access document tables with a database user's privileges
<a href="#">DEAUTHORIZE_DAD Procedure</a> on page 63-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges

---

## Summary of DBMS\_EPG Subprograms

**Table 63–4 DBMS\_EPG Package Subprograms**

Subprogram	Description
<a href="#">AUTHORIZE_DAD Procedure</a> on page 63-11	authorizes a DAD to invoke procedures and access document tables with a database user's privileges
<a href="#">CREATE_DAD Procedure</a> on page 63-12	Creates a new DAD
<a href="#">DEAUTHORIZE_DAD Procedure</a> on page 63-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges
<a href="#">DELETE_DAD_ATTRIBUTE Procedure</a> on page 63-14	Deletes a DAD attribute
<a href="#">DELETE_GLOBAL_ATTRIBUTE Procedure</a> on page 63-15	Deletes a global attribute
<a href="#">DROP_DAD Procedure</a> on page 63-16	Drops a DAD
<a href="#">GET_ALL_DAD_ATTRIBUTES Procedure</a> on page 63-17	Retrieves all the attributes of a DAD.
<a href="#">GET_ALL_DAD_MAPPINGS Procedure</a> on page 63-18	Retrieves all virtual paths to which the specified DAD is mapped.
<a href="#">GET_ALL_GLOBAL_ATTRIBUTES Procedure</a> on page 63-19	Retrieves all global attributes and values
<a href="#">GET_DAD_ATTRIBUTE Function</a> on page 63-20	Retrieves the value of a DAD attribute
<a href="#">GET_DAD_LIST Procedure</a> on page 63-21	Retrieves a list of all DADs for an Embedded Gateway instance.
<a href="#">GET_GLOBAL_ATTRIBUTE Function</a> on page 63-22	Retrieves the value of a global attribute
<a href="#">MAP_DAD Procedure</a> on page 63-23	Maps a DAD to the specified virtual path.
<a href="#">SET_DAD_ATTRIBUTE Procedure</a> on page 63-24	Sets the value for a DAD
<a href="#">SET_GLOBAL_ATTRIBUTE Procedure</a> on page 63-26	Sets the value of a global attribute
<a href="#">UNMAP_DAD Procedure</a> on page 63-27	Unmaps a DAD from the specified virtual path

## AUTHORIZE\_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

**See Also:** [Authorization Subprograms](#) on page 63-9 for other subprograms in this group

### Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
  dad_name IN VARCHAR2,
  path     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 63-5** *AUTHORIZE\_DAD Procedure Parameters*

Parameter	Description
dad_name	The name of the DAD to create
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

### Usage Notes

- To authorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.
- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

### Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

### Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

## CREATE\_DAD Procedure

This procedure creates a new DAD.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.CREATE_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 63–6** CREATE\_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to create
path	The virtual path to which to map the DAD

## DEAUTHORIZE\_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

**See Also:** [Authorization Subprograms](#) on page 63-9 for other subprograms in this group

### Syntax

```
DBMS_EPG.DEAUTHORIZE_DAD (
  dad_name IN VARCHAR2,
  path     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 63–7 DEAUTHORIZE\_DAD Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD for which to deauthorize use
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

### Usage Notes

To deauthorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.

### Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

### Examples

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

## DELETE\_DAD\_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (  
    dad_name      IN  VARCHAR2,  
    attr_name     IN  VARCHAR2);
```

### Parameters

**Table 63–8** *DELETE\_DAD\_ATTRIBUTE Procedure Parameters*

Parameter	Description
dad_name	The name of the DAD for which to delete a DAD attribute
attr_name	The name of the DAD attribute to delete

### Exceptions

Raises an error if DAD does not exist

## DELETE\_GLOBAL\_ATTRIBUTE Procedure

This procedure deletes a global attribute.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (  
    attr_name      IN VARCHAR2);
```

### Parameters

**Table 63–9** *DELETE\_GLOBAL\_ATTRIBUTE Procedure Parameters*

Parameter	Description
attr_name	The global attribute to delete

## DROP\_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.DROP_DAD (  
    dadname IN VARCHAR2);
```

### Parameters

**Table 63–10** *DROP\_DAD Procedure Parameters*

Parameter	Description
dad_name	The DAD to drop

### Exceptions

Raises an error if the DAD does not exist.

## GET\_ALL\_DAD\_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
  dad_name      IN          VARCHAR2,
  attr_names    OUT NOCOPY VARCHAR2_TABLE,
  attr_values   OUT NOCOPY VARCHAR2_TABLE);
```

### Parameters

**Table 63–11** GET\_ALL\_DAD\_ATTRIBUTES Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
attr_names	The attribute names
attr_values	The attribute values

### Exceptions

Raises an error if DAD does not exist.

### Usage Notes

If the DAD has no attributes set, then `attr_names` and `attr_values` will be set to empty arrays.

## GET\_ALL\_DAD\_MAPPINGS Procedure

This procedure retrieves all virtual paths to which the specified DAD is mapped.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (  
    dad_name      IN          VARCHAR2,  
    paths         OUT NOCOPY VARCHAR2_TABLE);
```

### Parameters

**Table 63–12** GET\_ALL\_DAD\_MAPPINGS Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
paths	The virtual paths to which h the DAD is mapped

### Exceptions

Raises an error if DAD does not exist.

### Usage Notes

If the DAD is not mapped to any virtual path, `paths` will be set to empty arrays.

## GET\_ALL\_GLOBAL\_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
  attr_names      OUT  NOCOPY  VARCHAR2_TABLE,
  attr_values     OUT  NOCOPY  VARCHAR2_TABLE);
```

### Parameters

**Table 63–13** GET\_ALL\_GLOBAL\_ATTRIBUTES Procedure Parameters

Parameter	Description
attr_names	The global attribute names
attr_values	The values of the global attributes

### Usage Notes

If the gateway instance has no global attributes set, then attr\_names and attr\_values will be set to empty arrays.

## GET\_DAD\_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (  
    dad_name      IN  VARCHAR2,  
    attr_name     IN  VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 63–14** GET\_DAD\_ATTRIBUTE Function Parameters

Parameter	Description
dad_name	The name of the DAD for which to delete an attribute
attr_name	The name of the attribute to delete

### Return values

Returns the DAD attribute value. Returns NULL if attribute is unknown or has not been set.

### Exceptions

Raises an error if DAD does not exist.

## GET\_DAD\_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_DAD_LIST (  
    dad_names      OUT NOCOPY  VARCHAR2_TABLE);
```

### Parameters

**Table 63–15** *GET\_DAD\_LIST Procedure Parameters*

Parameter	Description
dad_names	The list of all DADs

### Usage Notes

If no DADs exist then dad\_names will be set to an empty array.

## GET\_GLOBAL\_ATTRIBUTE Function

This function retrieves the value of a global attribute.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (  
    attr_name IN VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 63–16** GET\_GLOBAL\_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to retrieve

### Return Values

Returns the global attribute value. Returns NULL if attribute has not been set or is not a valid attribute.

## MAP\_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.MAP_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2);
```

### Parameters

**Table 63–17** MAP\_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to map
path	The virtual path to map

### Exceptions

Raises an error if the DAD does not exist.

## SET\_DAD\_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
  dad_name     IN  VARCHAR2,
  attr_name    IN  VARCHAR2,
  attr_value   IN  VARCHAR2);
```

### Parameters

**Table 63–18 SET\_DAD\_ATTRIBUTE Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD for which to set the attribute
attr_name	The name of the attribute to set
attr_value	The attribute value to set

**Table 63–19 Mapping Between mod\_plsql and Embedded PL/SQL Gateway DAD Attributes**

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurrences	Legal Values
PlsqlAfterProcedure	after-procedure	No	String
PlsqlAlwaysDescribeProcedure	always-describe-procedure	No	Enumeration of On, Off
PlsqlAuthenticationMode	authentication-mode	No	Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa
PlsqlBeforeProcedure	before-procedure	No	String
PlsqlBindBucketLengths	bind-bucket-lengths	Yes	Unsigned integer
PlsqlBindBucketWidths	bind-bucket-widths	Yes	Unsigned integer
PlsqlCGIEnvironmentList	cgi-environment-list	Yes	String
PlsqlCompatibilityMode	compatibility-mode	No	Unsigned integer
PlsqlDatabaseUsername	database-username	No	String
PlsqlDefaultPage	default-page	No	String
PlsqlDocumentPath	document-path	No	String
PlsqlDocumentProcedure	document-procedure	No	String
PlsqlDocumentTablename	document-table-name	No	String

**Table 63–19 (Cont.) Mapping Between mod\_plsql and Embedded PL/SQL Gateway DAD Attributes**

<b>mod_plsql DAD Attribute</b>	<b>Embedded PL/SQL Gateway DAD Attribute</b>	<b>Allows Multiple Occurrences</b>	<b>Legal Values</b>
PlsqlErrorStyle	error-style	No	Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle
PlsqlExclusionList	exclusion-list	Yes	String
PlsqlFetchBufferSize	fetch-buffer-size	No	Unsigned integer
PlsqlInfoLogging	info-logging	No	Enumeration of InfoDebug
PlsqlOWADebugEnable	owa-debug-enable	No	Enumeration of On, Off
PlsqlMaxRequestsPerSession	max-requests-per-session	No	Unsigned integer
PlsqlNLSLanguage	nls-language	No	String
PlsqlPathAlias	path-alias	No	String
PlsqlPathAliasProcedure	path-alias-procedure	No	String
PlsqlRequestValidationFunction	request-validation-function	No	String
PlsqlSessionCookieName	session-cookie-name	No	String
PlsqlSessionStateManagement	session-state-management	No	Enumeration of StatelessWithResetPackageState, StatelessWithFastRestPackageState, StatelessWithPreservePackageState
PlsqlTransferMode	transfer-mode	No	Enumeration of Char, Raw
PlsqlUploadAsLongRaw	upload-as-long-raw	No	String

## Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

## Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. `mod_plsql` users should note the following
  - The `PlsqlDatabasePassword` attribute is not needed.
  - The `PlsqlDatabaseConnectString` attribute is not needed because the embedded gateway does not support logon to external databases.

## Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

## SET\_GLOBAL\_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
    attr_name    IN VARCHAR2,
    attr_value   IN VARCHAR2);
```

### Parameters

**Table 63–20** SET\_GLOBAL\_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to set
attr_value	The attribute value to set

**Table 63–21** Mapping Between mod\_plsql and Embedded PL/SQL Gateway Global Attributes

mod_plsql Global Attribute	Embedded PL/SQL Gateway Global Attribute	Allows Multiple Occurrences	Legal Values
PlsqlLogLevel	log-level	No	Unsigned integer
PlsqlMaxParameters	max-parameters	No	Unsigned integer

### Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If attr\_name attribute has been set before, then the old value will be overwritten with the new attr\_value argument.

### Exceptions

Raises an error if the attribute is unknown.

### Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

## UNMAP\_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

**See Also:** [Configuration Subprograms](#) on page 63-8 for other subprograms in this group

### Syntax

```
DBMS_EPG.UNMAP_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 63–22 UNMAP\_DAD Procedure Parameters**

Parameter	Description
dad_name	The name of the DAD to unmap
path	The virtual path to unmap

### Usage Notes

Raises an error if the DAD does not exist.

The DBMS\_ERRLOG package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

**See Also:** *Oracle Database Data Warehousing Guide* for more information regarding how to use DBMS\_ERRLOG and *Oracle Database SQL Language Reference* for `error_logging_clause` syntax

This chapter contains the following topics:

- [Using DBMS\\_ERRLOG](#)
  - Security Model
- [Summary of DBMS\\_ERRLOG Subprograms](#)

---

## Using DBMS\_ERRLOG

This section contains topics which relate to using the DBMS\_ERRLOG package.

- [Security Model](#)

## Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

---

## Summary of DBMS\_ERRLOG Subprograms

**Table 64–1** *DBMS\_ERRLOG Package Subprograms*

Subprogram	Description
<a href="#">CREATE_ERROR_LOG Procedure</a> on page 64-5	Creates the error logging table used in DML error logging

## CREATE\_ERROR\_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

LONG, CLOB, BLOB, BFILE, and ADT datatypes are not supported in the columns.

### Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
    dml_table_name          IN VARCHAR2,
    err_log_table_name      IN VARCHAR2 := NULL,
    err_log_table_owner     IN VARCHAR2 := NULL,
    err_log_table_space     IN VARCHAR2 := NULL,
    skip_unsupported       IN BOOLEAN := FALSE);
```

### Parameters

**Table 64–2 CREATE\_ERROR\_LOG Procedure Parameters**

Parameter	Description
dml_table_name	The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased.
err_log_table_name	The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR\$_'. Examples are the following: dml_table_name: 'EMP', err_log_table_name: 'ERR\$_EMP' dml_table_name: '"Emp2"', err_log_table_name: 'ERR\$_Emp2'
err_log_table_owner	The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.
err_log_table_space	The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.
skip_unsupported	When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.

### Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                               Null?      Type
-----
CHANNEL_ID                          NOT NULL   CHAR(1)
```

```

CHANNEL_DESC                NOT NULL    VARCHAR2 (20)
CHANNEL_CLASS                VARCHAR2 (20)

```

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```

SQL> DESC ERR$_CHANNELS
Name                               Null?    Type
-----
ORA_ERR_NUMBER$                    NUMBER
ORA_ERR_MSGS$                      VARCHAR2 (2000)
ORA_ERR_ROWID$                     ROWID
ORA_ERR_OPTYP$                     VARCHAR2 (2)
ORA_ERR_TAG$                       VARCHAR2 (2000)
CHANNEL_ID                         VARCHAR2 (4000)
CHANNEL_DESC                       VARCHAR2 (4000)
CHANNEL_CLASS                      VARCHAR2 (4000)

```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

---

---

**Note:** This functionality is deprecated with Oracle Database Release 11.2 and obsoleted with Release 12.1. For details regarding obsolescence, see My Oracle Support Note ID 1244535.1

---

---

The `DBMS_EXPFIL` package contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter.

**See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- [Using DBMS\\_EXPFIL](#)
- [Summary of Expression Filter Subprograms](#)

---

## Using DBMS\_EXPFIL

This section contains topics that relate to using the Rules Manager DBMS\_EXPFIL package.

- [Security Model](#)

## Security Model

The Oracle Database installation runs the `catexf.sql` script to load the `DBMS_EXPFIL` package and create the required Expression Filter schema objects in the `EXFSYS` schema.

`DBMS_EXPFIL` is an `EXFSYS`-owned package compiled with `AUTHID CURRENT_USER`. Any `DBMS_EXPFIL` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

Before you issue `COPY_ATTRIBUTE_SET` procedure, the user must have the `EXECUTE` privilege for the object type associated with the original attribute set.

A user requires `SELECT` privileges on a table storing expressions to evaluate them. The `SQL EVALUATE` operator evaluates expressions with the privileges of the owner of the table that stores the expressions. The privileges of the user issuing the query are not considered. The owner of the table can insert, update, and delete expressions. Other users must have `INSERT` and `UPDATE` privileges for the table and `INSERT EXPRESSION` and `UPDATE EXPRESSION` privilege for a specific Expression column in the table to be able to make modifications to it.

Using the `GRANT_PRIVILEGE` procedure, the owner of the table can grant `INSERT EXPRESSION` or `UPDATE EXPRESSION` privileges on one or more Expression columns to other users. Both privileges can be granted to a user by specifying `ALL` for the privilege type.

A user with `CREATE INDEX` privileges on a table cannot create an Expression Filter index unless the user is the owner of the table.

A user must have `EXECUTE` privilege on the `CTX_DDL` package for successful synchronization of the text indexes using the `DBMS_EXPFIL.SYNC_TEXT_INDEXES` procedure.

The `USER_EXPFIL_PRIVILEGES` view lists the privileges of the current user on expression sets belonging to other schemas and the privileges of other users on the expression sets owned by the current user.

## Summary of Expression Filter Subprograms

Table 65–1 describes the subprograms in the DBMS\_EXPFIL package.

All the values and names passed to the procedures defined in the DBMS\_EXPFIL package are not case sensitive, unless otherwise mentioned. To preserve the case, you use double quotation marks around the values.

**Table 65–1 DBMS\_EXPFIL Package Subprograms**

Subprogram	Description
<a href="#">ADD_ELEMENTARY_ATTRIBUTE Procedures</a>	Adds the specified attribute to the attribute set
<a href="#">ADD_FUNCTIONS Procedure</a>	Adds a function, type, or package to the approved list of functions with an attribute set
<a href="#">ASSIGN_ATTRIBUTE_SET Procedure</a>	Assigns an attribute set to a column storing expressions
<a href="#">BUILD_EXCEPTIONS_TABLE Procedure</a>	Creates an exception table to hold references to invalid expressions
<a href="#">CLEAR_EXPRSET_STATS Procedure</a>	Clears the predicate statistics for an expression set
<a href="#">COPY_ATTRIBUTE_SET Procedure</a>	Makes a copy of the attribute set
<a href="#">CREATE_ATTRIBUTE_SET Procedure</a>	Creates an attribute set
<a href="#">DEFAULT_INDEX_PARAMETERS Procedure</a>	Assigns default index parameters to an attribute set
<a href="#">DEFAULT_XINDEX_PARAMETERS Procedure</a>	Assigns default XPath index parameters to an attribute set
<a href="#">DEFRAG_INDEX Procedure</a>	Rebuilds the bitmap indexes online to reduce fragmentation
<a href="#">DROP_ATTRIBUTE_SET Procedure</a>	Drops an unused attribute set
<a href="#">GET_EXPRSET_STATS Procedure</a>	Collects predicate statistics for an expression set
<a href="#">GRANT_PRIVILEGE Procedure</a>	Grants an expression DML privilege to a user
<a href="#">INDEX_PARAMETERS Procedure</a>	Assigns index parameters to an expression set
<a href="#">MODIFY_OPERATOR_LIST Procedure</a>	Modifies the list of common operators used in predicates with a certain attribute
<a href="#">REVOKE_PRIVILEGE Procedure</a>	Revokes an expression DML privilege from a user
<a href="#">SYNC_TEXT_INDEXES Procedure</a>	Synchronizes the indexes defined to process the predicates involving the CONTAINS operator in stored expressions
<a href="#">UNASSIGN_ATTRIBUTE_SET Procedure</a>	Breaks the association between a column storing expressions and the attribute set
<a href="#">VALIDATE_EXPRESSIONS Procedure</a>	Validates expression metadata and the expressions stored in a column
<a href="#">XINDEX_PARAMETERS Procedure</a>	Assigns XPath index parameters to an expression set

## ADD\_ELEMENTARY\_ATTRIBUTE Procedures

This procedure adds the specified attribute to the attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  attr_type  IN   VARCHAR2,
  attr_defv1 IN   VARCHAR2 DEFAULT NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  tab_alias  IN   exf$table_alias);
```

Allows addition of text attributes to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  attr_type  IN   VARCHAR2,
  text_pref  IN   EXF$TEXT);
```

### Parameters

**Table 65–2 ADD\_ELEMENTARY\_ATTRIBUTE Procedure Parameters**

Parameter	Description
attr_set	Name of the attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
attr_defv1	Default value for the elementary attribute
tab_alias	Type that identifies the database table to which the attribute is aliased
text_pref	Text preferences such as LEXER and WORDLIST specification.

### Usage Notes

- If the attribute set receiving the elementary attribute was originally created from an existing object type, then additional attributes cannot be added.
- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more

information about table aliases, see *Oracle Database Rules Manager and Expression Filter Developer's Guide*.

- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- The default value specification for an attribute is similar to a default value specification for a table column. The resulting default values should agree with the datatype of the attribute. For example, valid default values for an attribute of DATE datatype are SYSDATE and `to_date('01-01-2004', 'DD-MM-YYYY')`.
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER\_EXPFIL\_ATTRIBUTE\_SETS and USER\_EXPFIL\_ATTRIBUTES.
- This procedure with a text preference bound to the `text_pref` argument creates a text attribute in the attribute set. The data type for such an attribute should be a VARCHAR2 or a CLOB. The preferences specified with this procedure are validated only when an Expression Filter index is created using this attribute set.
- These preferences are used in the creation of the CTXRULE index that processes the predicates involving CONTAINS operator. The valid preferences are those that are valid in the PARAMETERS clause of CTXRULE index creation. See *Oracle Text Application Developer's Guide* for the syntax.

## Examples

The following commands add two elementary attributes to an attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                                attr_set => 'HRAttrSet',
                                attr_name => 'HRREP',
                                attr_type => 'VARCHAR2(30)',
                                attr_defv1 => 'Betty Smith');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                                attr_set => 'HRAttrSet',
                                attr_name => 'DEPT',
                                tab_alias => exf$table_alias('DEPT'));
END;
/
```

The following commands define a CreationTime elementary attribute that takes the database time as the default value.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                                attr_set => 'PurchaseOrder',
                                attr_name => 'CreationTime',
                                attr_type => 'DATE',
                                attr_defv1 => 'SYSDATE');
END;
/
```

Alternately, the following commands initialize the CreationTime attribute to a specific value when it is not explicitly specified in the data item passed to the EVALUATE operator.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
```

```

                                attr_set => 'PurchaseOrder',
                                attr_name => 'CreationTime',
                                attr_type => 'DATE',
                                attr_defvl => 'to_date(''01-01-2004'', ''DD-MM-YYYY'')');
END;
/

```

The following commands create an attribute set with a Model attribute of VARCHAR2 data type and an InsReport attribute configured for text predicates.

```

BEGIN
  DBMS_EXPFIL.CREATE_EVENT_STRUT(event_struct => 'Car4Sale');
  // create scalar attributes
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Model',
    attr_type => 'VARCHAR2(30)');

  //create text attribute
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'InsReport',
    attr_type => 'CLOB',
    attr_type => exf$text(
      'LEXER insrpt_lexer
      WORDLIST insrpt_wordlist'));
END;
/

```

## ADD\_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the attribute set.

### Syntax

```
DBMS_EXPFIL.ADD_FUNCTIONS (
    attr_set IN VARCHAR2,
    funcs_name IN VARCHAR2);
```

### Parameters

**Table 65–3 ADD\_FUNCTIONS Procedure Parameters**

Parameter	Description
attr_set	Name of the attribute set to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

### Usage Notes

- By default, an attribute set implicitly allows references to all Oracle Database supplied SQL functions for use by the expression set. If the expression set refers to a user-defined function, the function must be explicitly added to the attribute set.
- The ADD\_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list. The function added to the attribute set, and thus used in the stored expressions, should not perform any DML or DDL (database state changing) operations. Oracle Database catches violations to this rule only at run-time while evaluating the expressions. Violations are not checked during the ADD\_FUNCTIONS procedure call.
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the expression set are considered valid. The expressions in a set can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding functions to an attribute set.
- Related views: USER\_EXPFIL\_ATTRIBUTE\_SETS and USER\_EXPFIL\_EXPRESSION\_SETS

### Examples

The following commands add two functions to the attribute set:

```
BEGIN
    DBMS_EXPFIL.ADD_FUNCTIONS (
        attr_set => 'Car4Sale',
        funcs_name => 'HorsePower');
    DBMS_EXPFIL.ADD_FUNCTIONS (
        attr_set => 'Car4Sale',
```

```
    funcs_name => 'Scott.CrashTestRating');  
END;  
/
```

## ASSIGN\_ATTRIBUTE\_SET Procedure

This procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column.

### Syntax

```
DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (
  attr_set   IN   VARCHAR2,
  expr_tab   IN   VARCHAR2,
  expr_col   IN   VARCHAR2,
  force      IN   VARCHAR2 DEFAULT 'FALSE');
```

### Parameters

**Table 65–4** *ASSIGN\_ATTRIBUTE\_SET Procedure Parameters*

Parameter	Description
attr_set	Name of the attribute set
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
force	Argument used to trust the existing expressions in a table (and skip validation)

### Usage Notes

- The ASSIGN\_ATTRIBUTE\_SET procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column. The attribute set contains the elementary attribute names and their data types and any functions used in the expressions. The Expression column, the column named by the expr\_col parameter to store the expression, uses the attribute set to validate changes and additions to the expression set.
- An attribute set can be assigned only to a table column in the same schema as the attribute set. An attribute set can be assigned to one or more table columns. Assigning an attribute set to a column storing expressions implicitly creates methods for the associated object type. For this operation to succeed, the object type cannot have any dependent objects before the attribute set is assigned.
- By default, the column should not have any expressions at the time of association. However, if the values in the column are known to be valid expressions, you can use a value of 'TRUE' for the force argument to assign the attribute set to a column containing expressions.
- See the information about defining Expression columns in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER\_EXPFIL\_ATTRIBUTE\_SETS and USER\_EXPFIL\_EXPRESSION\_SETS

### Examples

The following command assigns the attribute set to a column storing expressions. The expression set should be empty at the time of association.

```
BEGIN
```

```
DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (attr_set => 'Car4Sale',  
                                  expr_tab => 'consumer',  
                                  expr_col => 'interest');  
  
END;  
/
```

## BUILD\_EXCEPTIONS\_TABLE Procedure

This procedure creates the exception table, used in validation, in the current schema.

### Syntax

```
DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (  
    exception_tab IN VARCHAR2);
```

### Parameters

**Table 65–5** *BUILD\_EXCEPTIONS\_TABLE Procedure Parameter*

Parameter	Description
exception_tab	Name of the exception table

### Usage Notes

- During expression validation, you can optionally provide the name of the exception table in which the references to the invalid expressions are stored. The `BUILD_EXCEPTIONS_TABLE` procedure creates the exception table in the current schema.
- See the section on evaluation semantics in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and [VALIDATE\\_EXPRESSIONS Procedure](#) for more information.
- Related view: `USER_TABLES`

### Examples

The following command creates the exception table, `InterestExceptions`, in the current schema:

```
BEGIN  
    DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (exception_tab => 'InterestExceptions');  
END;  
/
```

## CLEAR\_EXPRSET\_STATS Procedure

This procedure clears the predicate statistics for the expression set stored in a table column.

### Syntax

```
DBMS_EXPFIL.CLEAR_EXPRSET_STATS (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2);
```

### Parameters

**Table 65–6** CLEAR\_EXPRSET\_STATS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

### Usage Notes

- See also [GET\\_EXPRSET\\_STATS Procedure](#) for information about gathering the statistics.
- Related views: USER\_EXPFIL\_EXPRESSION\_SETS and USER\_EXPFIL\_EXPRSET\_STATS

### Examples

The following command clears the predicate statistics for the expression set stored in interest column of the consumer table:

```
BEGIN
  DBMS_EXPFIL.CLEAR_EXPRSET_STATS (expr_tab => 'consumer',
                                   expr_col => 'interest');
END;
/
```

## COPY\_ATTRIBUTE\_SET Procedure

This procedure copies an attribute set along with its user-defined function list and default index parameters to another set.

### Syntax

```
DBMS_EXPFIL.COPY_ATTRIBUTE_SET (
  from_set  IN  VARCHAR2,
  to_set    IN  VARCHAR2);
```

### Parameters

**Table 65–7** *COPY\_ATTRIBUTE\_SET Procedure Parameters*

Parameter	Description
from_set	Name of an existing attribute set to be copied
to_set	Name of the new attribute set

### Usage Notes

- A schema-extended name can be used for the `from_set` argument to copy an attribute set across schemas. Before you issue this command, you must have the EXECUTE privilege for the object type associated with the original attribute set. Ensure that any references to schema objects (user-defined functions, tables, and embedded objects) are valid in the new schema.
- The default index parameters and the user-defined function list of the new set can be changed independent of the original set.
- Related views: ALL\_EXPFIL\_ATTRIBUTE\_SETS and ALL\_EXPFIL\_ATTRIBUTES.

### Examples

The following command makes a copy of the Car4Sale attribute set:

```
BEGIN
  DBMS_EXPFIL.COPY_ATTRIBUTE_SET (from_set => 'Car4Sale',
                                to_set    => 'Vehicle');
END;
/
```

## CREATE\_ATTRIBUTE\_SET Procedure

This procedure creates an empty attribute set or an attribute set with a complete set of elementary attributes derived from an object type with a matching name.

### Syntax

```
DBMS_EXPFIL.CREATE_ATTRIBUTE_SET (
  attr_set   IN   VARCHAR2,
  from_type  IN   VARCHAR2 DEFAULT 'NO');
```

### Parameters

**Table 65–8 CREATE\_ATTRIBUTE\_SET Procedure Parameters**

Parameter	Description
attr_set	Name of the attribute set to be created
from_type	YES, if the attributes for the attribute set should be derived from an existing object type

### Usage Notes

- The object type used for an attribute set cannot contain any user methods, and it should not be an evolved type (with the use of `ALTER TYPE` command). This object type should not have any dependent objects at the time of the attribute set creation. If the attribute set is not derived from an existing object type, this procedure creates an object type with a matching name.
- An attribute set with one or more table alias attributes cannot be derived from an object type. For this purpose, create an empty attribute set and add one elementary attribute at a time using the `DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE` procedure. (See *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.)
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and [ADD\\_ELEMENTARY\\_ATTRIBUTE Procedures](#) for more information.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ATTRIBUTES`.

### Examples

The following commands create an attribute set with all the required elementary attributes derived from the `Car4Sale` type:

```
CREATE OR REPLACE TYPE Car4Sale AS OBJECT
    (Model   VARCHAR2(20),
     Year    NUMBER,
     Price   NUMBER,
     Mileage NUMBER);
/

BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale',
                                  from_type => 'YES');
END;
/
```

Assuming that the `Car4Sale` type does not exist, the attribute set can be created from scratch as shown in the following example:

```
BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Model',
    attr_type => 'VARCHAR2(20)');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Year',
    attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Price',
    attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Mileage',
    attr_type => 'NUMBER');
END;
/
```

## DEFAULT\_INDEX\_PARAMETERS Procedure

This procedure assigns default index parameters to an attribute set. It also adds or drops a partial list of stored and indexed attributes to or from the default list associated with the attribute list.

### Syntax

```
DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
  attr_set   IN   VARCHAR2,
  attr_list  IN   EXF$ATTRIBUTE_LIST,
  operation  IN   VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 65–9** *DEFAULT\_INDEX\_PARAMETERS Procedure Parameters*

Parameter	Description
attr_set	Name of the attribute set
attr_list	An instance of EXF\$ATTRIBUTE_LIST with a partial list of (default) stored and indexed attributes for an Expression Filter index
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

### Usage Notes

- Existing Expression Filter indexes are not modified when the default parameters for the corresponding attribute set are changed. The new index defaults are used when a new Expression Filter index is created and when an existing index is rebuilt. (See the section on alter index rebuild in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about rebuilding indexes.)
- See the section on creating an index from default parameters in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about assigning default index parameters to an attribute set.
- Related views: USER\_EXPFIL\_ATTRIBUTE\_SETS and USER\_EXPFIL\_DEF\_INDEX\_PARAMS

### Examples

The following command adds the specified stored and indexed attributes to the attribute set's default index parameters list:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
    attr_set => 'Car4Sale',
    attr_list => exf$attribute_list (
      exf$attribute (attr_name => 'Model',
                    attr_oper => exf$indexoper('='),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'Price',
                    attr_oper => exf$indexoper('all'),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'HorsePower(Model, Year)',
                    attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
                    attr_indexed => 'FALSE'),
      exf$attribute (attr_name => 'CrashTestRating(Model, Year)',
```

```

                attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
                attr_indexed => 'FALSE')),
        operation => 'ADD');
END;
/

```

The following command drops the `CrashTestRating(Model, Year)` attribute (stored or indexed) from the previous list.

```

BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    attr_list => exf$attribute_list (
      exf$attribute (attr_name => 'CrashTestRating(Model, Year)'),
    operation => 'DROP');
END;
/

```

## DEFAULT\_XPINDEX\_PARAMETERS Procedure

This procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set.

### Syntax

```
DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS (
  attr_set   IN   VARCHAR2,
  xmlt_attr  IN   VARCHAR2,
  xptag_list IN   EXF$XP_PATH_TAGS,
  operation  IN   VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 65–10** DEFAULT\_XPINDEX\_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
xmlt_attr	Name of the attribute with the XMLType datatype
xptag_list	An instance of EXF\$XP_PATH_TAGS type with a partial list of XML elements and attributes to be configured for the Expression Filter index
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

### Usage Notes

- The attribute set used for an expression set may have one or more XML type attributes (defined with XMLType datatype) and the corresponding expressions may contain XPath predicates on these attributes. The Expression Filter index created for the expression set can be tuned to process these XPath predicates efficiently by using some XPath-specific index parameters (in addition to some non-XPath index parameters).
- The DEFAULT\_XPINDEX\_PARAMETERS procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set. The XPath parameters are assigned to a specific XMLType attribute in the attribute set and this information can be viewed using the USER\_EXPFIL\_DEF\_INDEX\_PARAMS view. The DEFAULT\_INDEX\_PARAMETERS procedure and the DEFAULT\_XPINDEX\_PARAMETERS procedure can be used independent of each other. They maintain a common list of default index parameters for the attribute set.
- See the section on index tuning for XPath predicates in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about XPath parameters to the default index parameters of an attribute set. See also [DEFAULT\\_INDEX\\_PARAMETERS Procedure](#) for more information about default index parameters.
- Related views: USER\_EXPFIL\_ATTRIBUTES and USER\_EXPFIL\_DEF\_INDEX\_PARAMS.

---

**Note:** The values assigned to the tag\_name argument of exf\$xmlt\_tag type are case sensitive.

---

## Examples

The following command adds the specified XML tags to the default index parameters list along with their preferences such as positional or value filter and indexed or stored predicate group:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    xmlt_attr => 'Details',
    xptag_list =>                                --- XPath tag list
    exf$xpath_tags(
      exf$xpath_tag(tag_name => 'stereo@make', --- XML attribute
                    tag_indexed => 'TRUE',
                    tag_type => 'VARCHAR(15)'), --- value filter
      exf$xpath_tag(tag_name => 'stereo', --- XML element
                    tag_indexed => 'FALSE',
                    tag_type => null), --- positional filter
      exf$xpath_tag(tag_name => 'memory', --- XML element
                    tag_indexed => 'TRUE',
                    tag_type => 'VARCHAR(10)'), --- value filter
      exf$xpath_tag(tag_name => 'GPS',
                    tag_indexed => 'TRUE',
                    tag_type => null)
    )
  );
END;
/
```

The following command drops the stereo@make tag from the default index parameters:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    xmlt_attr => 'Details',
    xptag_list =>                                --- XPath tag list
    exf$xpath_tags(
      exf$xpath_tag(tag_name => 'stereo@make')
    ),
    operation => 'DROP'
  );
END;
/
```

## DEFRAG\_INDEX Procedure

This procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.

### Syntax

```
DBMS_EXPFIL.DEFRAG_INDEX (
  idx_name IN VARCHAR2);
```

### Parameters

**Table 65–11** DEFRAG\_INDEX Procedure Parameter

Parameter	Description
idx_name	Name of the Expression Filter index

### Usage Notes

- The bitmap indexes defined for the indexed attributes of an Expression Filter index become fragmented as additions and updates are made to the expression set. This can affect performance. The DEFRAG\_INDEX procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.
- Indexes can be defragmented when the expression set is being modified. However, you should schedule defragmentation when the workload is relatively light, such as 2 a.m.
- See the section on index storage and maintenance in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about rebuilding indexes.
- Related views: USER\_EXPFIL\_INDEXES and USER\_INDEXES.

### Examples

The following command is issued to defragment the bitmap indexes associated with the Expression Filter index:

```
BEGIN
  DBMS_EXPFIL.DEFRAG_INDEX (idx_name => 'InterestIndex');
END;
/
```

## DROP\_ATTRIBUTE\_SET Procedure

This procedure drops an attribute set not being used for any expression set.

### Syntax

```
DBMS_EXPFIL.DROP_ATTRIBUTE_SET (  
    attr_set IN VARCHAR2);
```

### Parameters

**Table 65–12** *DROP\_ATTRIBUTE\_SET Procedure Parameter*

Parameter	Description
attr_set	Name of the attribute set to be dropped

### Usage Notes

- The `DROP_ATTRIBUTE_SET` procedure drops an attribute set not being used for any expression set. If the attribute set was initially created from an existing object type, the object type remains after dropping the attribute set. Otherwise, the object type is dropped with the attribute set.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_EXPRESSION_SETS`.

### Examples

Assuming that the attribute set is not used by an Expression column, the following command drops the attribute set:

```
BEGIN  
    DBMS_EXPFIL.DROP_ATTRIBUTE_SET(attr_set => 'Car4Sale');  
END;  
/
```

## GET\_EXPRSET\_STATS Procedure

This procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.

### Syntax

```
DBMS_EXPFIL.GET_EXPRSET_STATS (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2);
```

### Parameters

**Table 65–13** GET\_EXPRSET\_STATS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

### Usage Notes

- When a representative set of expressions are stored in a table column, you can use predicate statistics for those expressions to configure the corresponding Expression Filter index (using the TOP parameters clause). The GET\_EXPRSET\_STATS procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.
- See the section on creating an index from statistics in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about using predicate statistics.
- Related views: USER\_EXPFIL\_EXPRESSION\_SETS and USER\_EXPFIL\_EXPRSET\_STATS.

### Examples

The following command computes the predicate statistics for the expressions stored in the interest column of the consumer table:

```
BEGIN
  DBMS_EXPFIL.GET_EXPRSET_STATS (expr_tab => 'consumer',
                                expr_col => 'interest');
END;
/
```

## GRANT\_PRIVILEGE Procedure

This procedure grants privileges on one or more Expression columns to other users.

### Syntax

```
DBMS_EXPFIL.GRANT_PRIVILEGE (
    expr_tab   IN  VARCHAR2,
    expr_col   IN  VARCHAR2,
    priv_type  IN  VARCHAR2,
    to_user    IN  VARCHAR2);
```

### Parameters

**Table 65–14 GRANT\_PRIVILEGE Procedure Parameters**

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
priv_type	Type of the privilege to be granted. Valid values: INSERT EXPRESSION, UPDATE EXPRESSION, ALL.
to_user	User to whom the privilege is to be granted

### Usage Notes

- The SQL EVALUATE operator evaluates expressions with the privileges of the owner of the table that stores the expressions. The privileges of the user issuing the query are not considered. The owner of the table can insert, update, and delete expressions. Other users must have INSERT and UPDATE privileges for the table and INSERT EXPRESSION and UPDATE EXPRESSION privilege for a specific Expression column in the table.
- Using the GRANT\_PRIVILEGE procedure, the owner of the table can grant INSERT EXPRESSION or UPDATE EXPRESSION privileges on one or more Expression columns to other users. Both the privileges can be granted to a user by specifying ALL for the privilege type.
- See [REVOKE\\_PRIVILEGE Procedure](#) and the section on granting and revoking privileges in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about granting and revoking privileges.
- Related views: USER\_EXPFIL\_EXPRESSION\_SETS and USER\_EXPFIL\_PRIVILEGES.

### Examples

The owner of consumer table can grant INSERT EXPRESSION privileges to user SCOTT with the following command. User SCOTT should also have INSERT privileges on the table so that he can add new expressions to the set.

```
BEGIN
    DBMS_EXPFIL.GRANT_PRIVILEGE (expr_tab => 'consumer',
                                expr_col  => 'interest',
                                priv_type => 'INSERT EXPRESSION',
                                to_user   => 'SCOTT');
END;
```

## INDEX\_PARAMETERS Procedure

This procedure fine-tunes the index parameters for each expression set before index creation.

### Syntax

```
DBMS_EXPFIL.INDEX_PARAMETERS (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2,
  attr_list IN  EXF$ATTRIBUTE_LIST,
  operation IN  VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 65–15** INDEX\_PARAMETERS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions.
attr_list	An instance of EXF\$ATTRIBUTE_LIST with a partial list of stored and indexed attributes
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

### Usage Notes

- An attribute set can be used by multiple expression sets stored in different columns of user tables. By default, the index parameters associated with the attribute set are used to define an Expression Filter index on an expression set. If you need to fine-tune the index for each expression set, you can specify a small list of the index parameters in the PARAMETERS clause of the CREATE INDEX statement. However, when an Expression Filter index uses a large number of index parameters or if the index is configured for XPath predicates, fine-tuning the parameters with the CREATE INDEX statement is not possible.
- The INDEX\_PARAMETERS procedure fine-tunes the index parameters for each expression set before index creation. This procedure can be used to copy the defaults from the corresponding attribute set and selectively add (or drop) additional index parameters for the expression set. (You use the XPINDEX\_PARAMETERS procedure to add and drop XPath index parameters.) The Expression Filter index defined for an expression set with a non-empty list of index parameters always uses these parameters. The INDEX\_PARAMETERS procedure cannot be used when the Expression Filter index is already defined for the column storing expressions.
- The operations allowed with this procedure include:
  - Deriving the current list of default index parameters (including any XPath-specific parameters) from the corresponding attribute set and assigning them to the specified expression set (a value of DEFAULT for the operation argument).
  - Adding (or dropping) one or more attributes to (or from) the current list of parameters assigned to the expression set (values of ADD or DROP for the operation argument).

- Clearing the index parameters assigned to the expression set. This enables the user to start using default parameters or tune the parameters from scratch (a value of CLEAR for the operation argument).

---

**Note:** This procedure is useful only when an attribute set is shared across multiple expression sets. In all other cases, the defaults assigned to the attribute set can be tuned for the expression set using it.

---

- See the section on creating an index from exact parameters in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and [XPINDEX\\_PARAMETERS Procedure](#) for more information.
- Related views: USER\_EXPFIL\_EXPRESSION\_SETS, USER\_EXPFIL\_DEF\_INDEX\_PARAMS and USER\_EXPFIL\_INDEX\_PARAMS.

## Examples

The following command synchronizes the expression set's index parameters with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'consumer',
                              expr_col => 'interest',
                              attr_list => null,
                              operation => 'DEFAULT');

```

```
END;
/
```

The following command adds a stored attribute to the expression set's index parameters.

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'consumer',
                              expr_col => 'interest',
                              attr_list =>
                                exf$attribute_list (
                                  exf$attribute (
                                    attr_name => 'CrashTestRating(Model, Year)',
                                    attr_oper => exf$indexoper('all'),
                                    attr_indexed => 'FALSE')),
                              operation => 'ADD');

```

```
END;
/
```

The following command clears the index parameters associated with the expression set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'consumer',
                              expr_col => 'interest',
                              attr_list => null,
                              operation => 'CLEAR');

```

```
END;
/
```

A subsequent index creation will use the default index parameters assigned to the corresponding attribute set.

## MODIFY\_OPERATOR\_LIST Procedure

This procedure modifies the list of common operators associated with a certain attribute in the attribute set.

### Syntax

```
DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  attr_oper  IN   EXF$INDEXOPER);
```

### Parameters

**Table 65–16** *MODIFY\_OPERATOR\_LIST Procedure Parameters*

Parameter	Description
attr_set	Name of the attribute set
attr_name	Name of the stored or indexed attribute being modified
attr_oper	New list of operators that are frequently used in the predicates with the attribute

### Usage Notes

- The `MODIFY_OPERATOR_LIST` procedure modifies the operator list for the stored and indexed attributes defined in the default index parameters of the attribute set. Existing Expression Filter indexes are not affected when an attribute's operator list is modified. The updated index defaults are used when a new Expression Filter index is created or when an existing index is rebuilt.
- Related views: `USER_EXPFIL_DEF_INDEX_PARAMS`

### Examples

The following command modifies the operator list associated with the `HorsePower (Model, Year)` attribute defined in the `Car4Sale` attribute set.

```
BEGIN
  DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
    attr_set => 'Car4Sale',
    attr_name => 'HorsePower (Model, Year)',
    attr_oper => exf$indexoper('=', '<', '>', 'between'));
END;
/
```

## REVOKE\_PRIVILEGE Procedure

This procedure revokes an expression privilege previously granted by the owner.

### Syntax

```
DBMS_EXPFIL.REVOKE_PRIVILEGE (
    expr_tab  IN  VARCHAR2,
    expr_col  IN  VARCHAR2,
    priv_type IN  VARCHAR2,
    from_user IN  VARCHAR2);
```

### Parameters

**Table 65–17** REVOKE\_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
priv_type	Type of privilege to be revoked
from_user	User from whom the privilege is to be revoked

### Usage Notes

- See [GRANT\\_PRIVILEGE Procedure](#) and the section on granting and revoking privileges in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about granting and revoking privileges.
- Related views: USER\_EXPFIL\_EXPRESSION\_SETS and USER\_EXPFIL\_PRIVILEGES.

### Examples

The following command revokes the INSERT EXPRESSION privilege on the interest column of the consumer table from user SCOTT:

```
BEGIN
    DBMS_EXPFIL.REVOKE_PRIVILEGE (expr_tab => 'consumer',
                                  expr_col => 'interest',
                                  priv_type => 'INSERT EXPRESSION',
                                  from_user => 'SCOTT');
END;
/
```

## SYNC\_TEXT\_INDEXES Procedure

This procedure synchronizes the indexes defined to process the predicates involving the CONTAINS operator in stored expressions.

### Syntax

```
DBMS_EXPFIL.SYNC_TEXT_INDEXES (
    expr_tab IN VARCHAR2);
```

### Parameters

**Table 65–18 SYNC\_TEXT\_INDEXES Procedure Parameters**

Parameter	Description
expr_tab	Name of table with expression columns containing text predicates

### Usage Notes

- When an expression filter index is defined on a column storing expressions, any text predicates in the expressions are indexed using a CTXRULE index. Unlike the other types of indexes (bitmap for scalar and XML predicates or spatial for spatial predicates) used to process the predicates in the expression set, the CTXRULE index defined to process the text predicates is not transactional in nature. That is, when the text predicates are updated with DML operations on the table storing expressions, the new predicates are not automatically reflected in the corresponding CTXRULE index. This could result in inconsistent results until the CTXRULE index is synchronized. This procedure can be used to synchronize all the CTXRULE indexes associated with a table with one or more expression columns. This procedure identifies all the CTXRULE indexes and invokes the CTX\_DDL.SYNC\_INDEX procedure on each of these indexes.

You must have the EXECUTE privilege on the CTX\_DDL package for successful synchronization of the text indexes.

### Examples

The following command synchronizes the text indexes associated with the expression columns in the consumer table:

```
BEGIN
    DBMS_EXPFIL.SYNC_TEXT_INDEXES (expr_tab => 'consumer');
END;
/
```

## UNASSIGN\_ATTRIBUTE\_SET Procedure

This procedure unassigns an attribute set from a column storing expressions.

### Syntax

```
DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2);
```

### Parameters

**Table 65–19 UNASSIGN\_ATTRIBUTE\_SET Procedure Parameters**

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

### Usage Notes

- A column of an expression data type can be converted back to a VARCHAR2 type by unassigning the attribute set. You can unassign an attribute set from a column storing expressions if an Expression Filter index is not defined on the column.
- See [ASSIGN\\_ATTRIBUTE\\_SET Procedure](#) for information about assigning attribute sets.
- Related views: USER\_EXPFIL\_EXPRESSION\_SETS and USER\_EXPFIL\_INDEXES.

### Examples

The following command unassigns the attribute set previously assigned to the `interest` column of the `consumer` table. (See the section on bulk loading of expression data in *Oracle Database Rules Manager and Expression Filter Developer's Guide*.)

```
BEGIN
  DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (expr_tab => 'consumer',
                                     expr_col => 'interest');
END;
/
```

## VALIDATE\_EXPRESSIONS Procedure

This procedure validates all the expressions in a set.

### Syntax

```
DBMS_EXPFIL.VALIDATE_EXPRESSIONS (
  expr_tab      IN  VARCHAR2,
  expr_col      IN  VARCHAR2,
  exception_tab IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 65–20** VALIDATE\_EXPRESSIONS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
exception_tab	Name of the exception table. This table is created using the BUILD_EXCEPTIONS_TABLE procedure.

### Usage Notes

- The expressions stored in a table may have references to schema objects like user-defined functions and tables. When these schema objects are dropped or modified, the expressions could become invalid and the subsequent evaluation (query with EVALUATE operator) could fail.
- By default, the expression validation procedure fails on the first expression that is invalid. Optionally, the caller can pass an exception table to store references to all the invalid expressions. In addition to validating expressions in the set, this procedure validates the parameters (stored and indexed attributes) of the associated index and the approved list of user-defined functions. Any errors in the index parameters or the user-defined function list are immediately reported to the caller.
- See the section on evaluation semantics in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and [BUILD\\_EXCEPTIONS\\_TABLE Procedure](#) for more information.
- Related views: USER\_EXPFIL\_EXPRESSION\_SETS, USER\_EXPFIL\_ASET\_FUNCTIONS, and USER\_EXPFIL\_PREDTAB\_ATTRIBUTES.

### Examples

The following command validates the expressions stored in the interest column of the consumer table.

```
BEGIN
  DBMS_EXPFIL.VALIDATE_EXPRESSIONS (expr_tab => 'consumer',
                                     expr_col => 'interest');
END;
/
```

## XPINDEX\_PARAMETERS Procedure

This procedure is used in conjunction with the `INDEX_PARAMETERS` procedure to fine-tune the XPath-specific index parameters for each expression set.

### Syntax

```
DBMS_EXPFIL.XPINDEX_PARAMETERS (
    expr_tab    IN    VARCHAR2,
    expr_col    IN    VARCHAR2,
    xmlt_attr   IN    VARCHAR2,
    xptag_list  IN    EXF$XPATH_TAGS,
    operation   IN    VARCHAR2 DEFAULT 'ADD');
```

### Parameters

**Table 65–21** *XPINDEX\_PARAMETERS Procedure Parameters*

Parameter	Description
<code>exp_tab</code>	Name of table storing the expression set
<code>expr_col</code>	Name of column in the table that stores the expressions
<code>xmlt_attr</code>	Name of the attribute with the XMLType datatype
<code>xptag_list</code>	An instance of EXF\$XPATH_TAGS type with a partial list of XML elements and attributes
<code>operation</code>	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

### Usage Notes

- When an attribute set is shared by multiple expression sets, the `INDEX_PARAMETERS` procedure can be used to tune the simple (non-XPath) index parameters for each expression set. The `XPINDEX_PARAMETERS` procedure is used in conjunction with the `INDEX_PARAMETERS` procedure to fine-tune the XPath-specific index parameters for each expression set.
- See also [INDEX\\_PARAMETERS Procedure](#) and the section on index tuning for XPath predicates in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.
- Related views: `USER_EXPFIL_ATTRIBUTES`, `USER_EXPFIL_DEF_INDEX_PARAMS`, and `USER_EXPFIL_INDEX_PARAMS`.

---

**Note:** The values assigned to the `tag_name` argument of `exf$xpath_tag` type are case-sensitive.

---

### Examples

The following command synchronizes the index parameters of the expression set (XPath and non-XPath) with the defaults associated with the corresponding attribute set:

```
BEGIN
    DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'consumer',
                                expr_col => 'interest',
                                attr_list => null,
```

```
operation => 'DEFAULT');  
END;  
/
```

The following command adds an XPath-specific index parameter to the expression set:

```
BEGIN  
  DBMS_EXPFIL.XPINDEX_PARAMETERS(expr_tab => 'consumer',  
    expr_col => 'interest',  
    xslt_attr => 'details',  
    xptag_list =>  
      exf$xpath_tags(  
        exf$xpath_tag(tag_name => 'GPS',  
          tag_indexed => 'TRUE',  
          tag_type => NULL)),  
    operation => 'ADD');  
END;  
/
```

The DBMS\_FGA package provides fine-grained security functions.

This chapter contains the following topics:

- [Using DBMS\\_FGA](#)
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_FGA Subprograms](#)

## Using DBMS\_FGA

- [Security Model](#)
- [Operational Notes](#)

## Security Model

Execute privilege on DBMS\_FGA is needed for administering audit policies. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module will be executed with the module owner's privilege.

## Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering. For both the rule-based optimizer and the cost-based optimizer, you can refer to `DBA_FGA_AUDIT_TRAIL` to analyze the SQL text and corresponding bind variables that are issued.

---

## Summary of DBMS\_FGA Subprograms

**Table 66–1 DBMS\_FGA Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">ADD_POLICY Procedure</a> on page 66-6	Creates an audit policy using the supplied predicate as the audit condition
<a href="#">DISABLE_POLICY Procedure</a> on page 66-11	Disables an audit policy
<a href="#">DROP_POLICY Procedure</a> on page 66-12	Drops an audit policy
<a href="#">ENABLE_POLICY Procedure</a> on page 66-13	Enables an audit policy

## ADD\_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition. The maximum number of FGA policies on any table or view object is 256.

### Syntax

```
DBMS_FGA.ADD_POLICY (
    object_schema    VARCHAR2,
    object_name      VARCHAR2,
    policy_name      VARCHAR2,
    audit_condition  VARCHAR2,
    audit_column     VARCHAR2,
    handler_schema   VARCHAR2,
    handler_module   VARCHAR2,
    enable           BOOLEAN,
    statement_types  VARCHAR2,
    audit_trail      BINARY_INTEGER IN DEFAULT,
    audit_column_opts BINARY_INTEGER IN DEFAULT);
```

### Parameters

**Table 66–2 ADD\_POLICY Procedure Parameters**

Parameter	Description	Default Value
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)	NULL
object_name	The name of the object to be audited.	-
policy_name	The unique name of the policy.	-
audit_condition	A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.	NULL
audit_column	The columns to be checked for access. These can include OLS hidden columns or object type columns. The default, NULL, causes audit if any column is accessed or affected.	NULL
handler_schema	The schema that contains the event handler. The default, NULL, causes the current schema to be used.	NULL
handler_module	The function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.	NULL
enable	Enables the policy if TRUE, which is the default.	TRUE
statement_types	The SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only.	SELECT
audit_trail	Destination (DB or XML) of fine grained audit records. Also specifies whether to populate LSQLTEXT and LSQLBIND in fga_log\$.	DB+EXTENDED
audit_column_opts	Establishes whether a statement is audited when the query references <i>any</i> column specified in the audit_column parameter or only when <i>all</i> such columns are referenced.	ANY_COLUMNS

### Usage Notes

- If `object_schema` is not specified, the current log-on user schema is assumed.

- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's `audit_condition`. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)
- The `audit_condition` must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. The expression can also use functions, such as the `USER` or `SYS_CONTEXT` functions.

The expression must not combine conditions using operators such as `AND` and `OR`. `audit_condition` can be `NULL` (or omitted), which is interpreted as `TRUE`, but it cannot contain the following elements:

- Subqueries or sequences
- The following attributes of the `USERENV` namespace when accessed using the `SYS_CONTEXT` function:
  - \* `CURRENT_SQL`
  - \* `CURRENT_SQL_LENGTH`
  - \* `CURRENT_BIND`
- Any use of the pseudo columns `LEVEL`, `PRIOR`, or `ROWNUM`.

Specifying an audit condition of "1=1" to force auditing of all specified statements ("`statement_types`") affecting the specified column ("`audit_column`") is no longer needed to achieve this purpose. A `NULL` value for `audit_condition` causes audit to happen even if no rows are processed, so that all actions on a table with this policy are audited.

- The `audit_condition` is evaluated using the privileges of the user who creates the policy.
- The audit function (`handler_module`) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

```
PROCEDURE fname ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
VARCHAR2 ) AS ...
```

where `fname` is the name of the procedure, `object_schema` is the name of the schema of the table audited, `object_name` is the name of the table to be audited, and `policy_name` is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.

**See Also:** "Tutorial: Adding an E-Mail Alert to a Fine-Grained Audit Policy" in *Oracle Database Security Guide* for an example of creating an e-mail alert handler for a fine-grained audit policy

- The `audit_trail` parameter specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named `LSQLTEXT` and `LSQLBIND`):

- If `audit_trail` includes XML, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an `AUDIT_FILE_DEST` statement in SQL. (The default `AUDIT_FILE_DEST` is `$ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump` on Unix-based systems, and `$ORACLE_BASE\admin\ $DB_UNIQUE_NAME\adump` on Windows systems.)
- If `audit_trail` includes DB instead, then the audit records are written to the `SYS.FGA_LOG$` table in the database. However, for read-only databases, Oracle Database writes the fine-grained audit records to XML files, regardless of the `audit_trail` settings.
- If `audit_trail` includes EXTENDED, then the query's SQL Text and SQL Bind variable information are included in the audit trail.

Note that the SQL Text information could include sensitive data, such as credit card numbers, in the audit trail. See "Auditing Sensitive Information" in *Oracle Database Security Guide* for ways in which you can handle this.

- For example:
  - \* Setting `audit_trail` to `DBMS_FGA.DB` sends the audit trail to the `SYS.FGA_LOG$` table in the database and omits SQL Text and SQL Bind.
  - \* Setting `audit_trail` to `DBMS_FGA.DB + DBMS_FGA.EXTENDED` sends the audit trail to the `SYS.FGA_LOG$` table in the database and includes SQL Text and SQL Bind.
  - \* Setting `audit_trail` to `DBMS_FGA.XML` writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.
  - \* Setting `audit_trail` to `DBMS_FGA.XML + DBMS_FGA.EXTENDED` writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

The `audit_trail` parameter appears in the `ALL_AUDIT_POLICIES` view.

- You can change the operating system destination using the following command:
 

```
ALTER SYSTEM SET AUDIT_FILE_DEST = '<New Directory>' DEFERRED
```
- On many platforms, XML audit files are named `<process_name>_<processId>.xml`, for example, `ora_2111.xml`, or `s002_11.xml`. On Windows, the XML audit files are named `<process_name>_<ThreadId>.xml` (or `<process_name>_ProcessId.xml` if the process is not running as a thread).
- The `audit_column_opts` parameter establishes whether a statement is audited
  - when the query references *any* column specified in the `audit_column` parameter (`audit_column_opts = DBMS_FGA.ANY_COLUMNS`), or
  - only when *all* such columns are referenced (`audit_column_opts = DBMS_FGA.ALL_COLUMNS`).

The default is `DBMS_FGA.ANY_COLUMNS`.

The `ALL_AUDIT_POLICIES` view also shows `audit_column_opts`.

- When `audit_column_opts` is set to `DBMS_FGA.ALL_COLUMNS`, a SQL statement is audited only when all the columns mentioned in `audit_column` have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

Also, all these columns must refer to a single table/view or alias.

Thus, if a SQL statement selects the columns from different table aliases, the statement will not be audited.

### V\$XML\_AUDIT\_TRAIL View

The new values for the `audit_trail` parameter (`XML` and `XML+EXTENDED`) cause fine-grained auditing records to be written to operating system files in XML format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

A new dynamic view, `V$XML_AUDIT_TRAIL`, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an `.xml` extension) in the `AUDIT_FILE_DEST` directory to be parsed and presented in relational table format.

The `DBA_COMMON_AUDIT_TRAIL` view includes the contents of the `V$XML_AUDIT_TRAIL` dynamic view for standard and fine-grained audit records.

Since the audit XML files are stored in files with extension `.xml` on all platforms, the dynamic view presents audit information similarly on all platforms, using the following schema:

**Table 66–3 Elements in the V\$XML\_AUDIT\_TRAIL Dynamic View**

Element	Type
AUDIT_TYPE	VARCHAR2 (18)
SESSION_ID	NUMBER
PROXY_SESSIONID	NUMBER
STATEMENTID	NUMBER
ENTRYID	NUMBER
EXTENDED_TIMESTAMP	TIMESTAMP (6) WITH TIME ZONE
GLOBAL_UID	VARCHAR2 (32)
DB_USER	VARCHAR2 (30)
CLIENT_ID	VARCHAR2 (64)
EXT_NAME	VARCHAR2 (4000)
OS_USER	VARCHAR2 (255)
USERHOST	VARCHAR2 (128)
OS_PROCESS	VARCHAR2 (16)
TERMINAL	VARCHAR2 (255)
INSTANCE_NUMBER	NUMBER
OBJECT_SCHEMA	VARCHAR2 (30)
OBJECT_NAME	VARCHAR2 (128)
POLICY_NAME	VARCHAR2 (30)
STATEMENT_TYPE	VARCHAR2 (28)
TRANSACTIONID	RAW (8)
SCN	NUMBER

**Table 66–3 (Cont.) Elements in the V\$XML\_AUDIT\_TRAIL Dynamic View**

Element	Type
COMMENT_TEXT	VARCHAR2 (4000)
SQL_BIND	VARCHAR2 (4000)
SQL_TEXT	VARCHAR2 (4000)

## Usage Notes

- Every XML audit record contains the elements `AUDIT_TYPE` and `EXTENDED_TIMESTAMP`, with the latter printed in UTC zone (with no timezone information). Values retrieved using `V$XML_AUDIT_TRAIL` view are converted to session timezone and printed.
- For `SQL_TEXT` and `SQL_BIND` element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such `SQL_TEXT` and `SQL_BIND` values.
- For large numbers of XML audit files, querying `V$XML_AUDIT_TRAIL` is faster when they are loaded into a database table using `SQL*Loader` or a similar tool. XML audit files are larger than the equivalent written to OS files when `AUDIT_TRAIL=OS`.
- Error handling is the same as when `AUDIT_TRAIL=OS`. If any error occurs in writing an audit record to disk, including the directory identified by `AUDIT_FILE_DEST` being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.

## Examples

```
DBMS_FGA.ADD_POLICY (
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1',
  audit_condition => 'sal < 100',
  audit_column  => 'comm,sal',
  handler_schema => NULL,
  handler_module => NULL,
  enable        => TRUE,
  statement_types => 'INSERT, UPDATE',
  audit_trail   => DBMS_FGA.XML + DBMS_FGA.EXTENDED,
  audit_column_opts => DBMS_FGA.ANY_COLUMNS);
```

## DISABLE\_POLICY Procedure

This procedure disables an audit policy.

### Syntax

```
DBMS_FGA.DISABLE_POLICY (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_name    VARCHAR2 );
```

### Parameters

**Table 66–4** *DISABLE\_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

The default value for `object_schema` is NULL. (If NULL, the current log-on user schema is assumed.)

### Examples

```
DBMS_FGA.DISABLE_POLICY (
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1');
```

## DROP\_POLICY Procedure

This procedure drops an audit policy.

### Syntax

```
DBMS_FGA.DROP_POLICY (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_name    VARCHAR2 );
```

### Parameters

**Table 66–5** DROP\_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

### Usage Notes

The DBMS\_FGA procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the DBMS\_FGA procedures are part of the DDL transaction. The default value for object\_schema is NULL. (If NULL, the current log-on user schema is assumed.)

---

---

**Note:** Oracle Database automatically drops the audit policy if you remove the object specified in the object\_name parameter of the DBMS\_FGA.ADD\_POLICY procedure, or if you drop the user who created the audit policy.

---

---

### Examples

```
DBMS_FGA.DROP_POLICY (
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1');
```

## ENABLE\_POLICY Procedure

This procedure enables an audit policy.

### Syntax

```
DBMS_FGA.ENABLE_POLICY (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_name    VARCHAR2,
  enable         BOOLEAN);
```

### Parameters

**Table 66–6** *ENABLE\_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema of the object to be audited. (If <code>NULL</code> , the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.
enable	Defaults to <code>TRUE</code> to enable the policy.

### Examples

```
DBMS_FGA.ENABLE_POLICY (
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1',
  enable        => TRUE);
```

---

## DBMS\_FILE\_GROUP

The `DBMS_FILE_GROUP` package, one of a set of Oracle Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. You can use this package to create and manage file group repositories.

This chapter contains the following topics:

- [Using DBMS\\_FILE\\_GROUP](#)
  - Overview
  - Security Model
  - Constants
- [Summary of DBMS\\_FILE\\_GROUP Subprograms](#)

---

## Using DBMS\_FILE\_GROUP

This section contains topics which relate to using the DBMS\_FILE\_GROUP package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)

## Overview

The following terms pertain to the DBMS\_FILE\_GROUP package:

### File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is `expdat.dmp`.
- The directory object that contains the file is `db_files`.
- The file type is `DBMS_FILE_GROUP.EXPORT_DUMP_FILE`.

### Version

A **version** is a collection of related files. For example, a version might consist of a set of datafiles and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

### File Group

A **file group** is a collection of versions. A file group can logically group a set of versions. For example, a file group named `financial_quarters` can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as `Q1FY04`, `Q2FY04`, and so on.

**See Also:** *Oracle Streams Concepts and Administration*

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

## Constants

The DBMS\_FILE\_GROUP package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS\_FILE\_GROUP.EXPORT\_DUMP\_FILE.

Table 67-1 lists the parameters and enumerated constants.

**Table 67-1 DBMS\_FILE\_GROUP Parameters with Enumerated Constants**

Parameter	Option	Type	Description
file_type	<ul style="list-style-type: none"> <li>■ DATAFILE</li> </ul>	VARCHAR2 (30)	DATAFILE is a datafile for a database. This constant can be specified as 'DATAFILE'.
new_file_type	<ul style="list-style-type: none"> <li>■ EXPORT_DUMP_FILE</li> <li>■ DATAPUMP_LOG_FILE</li> </ul>		<p>EXPORT_DUMP_FILE is a Data Pump export dump file. This constant can be specified as 'DUMPSET'.</p> <p>DATAPUMP_LOG_FILE is a Data Pump export log file. This constant can be specified as 'DATAPUMPLOG'.</p>
max_versions	<ul style="list-style-type: none"> <li>■ INFINITE</li> </ul>	NUMBER	INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit.
retention_days			
privilege	<p>System privilege specified in the GRANT_SYSTEM_PRIVILEGE procedure:</p> <ul style="list-style-type: none"> <li>■ READ_ANY_FILE_GROUP</li> <li>■ MANAGE_ANY_FILE_GROUP</li> <li>■ MANAGE_FILE_GROUP</li> </ul> <p>Object privilege specified in the GRANT_OBJECT_PRIVILEGE procedure:</p> <ul style="list-style-type: none"> <li>■ READ_ON_FILE_GROUP</li> <li>■ MANAGE_ON_FILE_GROUP</li> </ul>	BINARY_INTEGER	<p>READ_ANY_FILE_GROUP grants the privilege to view information about any file group in any schema in the data dictionary.</p> <p>MANAGE_ANY_FILE_GROUP grants the privilege to create, manage, and drop any file group in any schema.</p> <p>MANAGE_FILE_GROUP grants the privilege to create, manage, and drop file groups in the user's schema.</p> <p>READ_ON_FILE_GROUP grants the privilege to view information about a specific file group in the data dictionary.</p> <p>MANAGE_ON_FILE_GROUP grants the privilege to manage a specific file group in a schema other than the user's schema.</p>

---

## Summary of DBMS\_FILE\_GROUP Subprograms

**Table 67–2 DBMS\_FILE\_GROUP Package Subprograms**

Subprogram	Description
<a href="#">ADD_FILE Procedure</a> on page 67-7	Adds a file to a version of a file group
<a href="#">ALTER_FILE Procedure</a> on page 67-9	Alters a file in a version of a file group
<a href="#">ALTER_FILE_GROUP Procedure</a> on page 67-11	Alters a file group
<a href="#">ALTER_VERSION Procedure</a> on page 67-13	Alters a version of a file group
<a href="#">CREATE_FILE_GROUP Procedure</a> on page 67-15	Creates a file group
<a href="#">CREATE_VERSION Procedure</a> on page 67-17	Creates a version of a file group
<a href="#">DROP_FILE_GROUP Procedure</a> on page 67-18	Drops a file group
<a href="#">DROP_VERSION Procedure</a> on page 67-19	Drops a version of a file group
<a href="#">GRANT_OBJECT_PRIVILEGE Procedure</a> on page 67-20	Grants object privileges on a file group to a user
<a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a> on page 67-21	Grants system privileges for file group operations to a user
<a href="#">PURGE_FILE_GROUP Procedure</a> on page 67-22	Purges a file group using the file group's retention policy
<a href="#">REMOVE_FILE Procedure</a> on page 67-23	Removes a file from a version of a file group
<a href="#">REVOKE_OBJECT_PRIVILEGE Procedure</a> on page 67-24	Revokes object privileges on a file group from a user
<a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a> on page 67-25	Revokes system privileges for file group operations from a user

---

**Note:** All subprograms commit unless specified otherwise.

---

## ADD\_FILE Procedure

This procedure adds a file to a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.ADD_FILE (
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  file_type       IN VARCHAR2 DEFAULT NULL,
  file_directory  IN VARCHAR2 DEFAULT NULL,
  version_name    IN VARCHAR2 DEFAULT NULL,
  comments        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 67-3 ADD\_FILE Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being added to the version. Each file name in a version must be unique.
file_type	The file type. The following are reserved file types: <ul style="list-style-type: none"> <li>■ If the file is a datafile, then enter the following: 'DATAFILE'</li> <li>■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' Data Pump metadata is populated when a Data Pump export dump file is imported.</li> <li>■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG'</li> </ul> <p>If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify <i>NULL</i> to omit a file type description.</p> <p>See "<a href="#">Constants</a>" on page 67-5 for more information about the reserved file types.</p>
file_directory	The name of the directory object that corresponds to the directory containing the file.  If <i>NULL</i> , then the procedure uses the default directory object for the version.  If <i>NULL</i> and no default directory object exists for the version, then the procedure uses the default directory object for the file group.  If <i>NULL</i> and no default directory object exists for the version or file group, then the procedure raises an error.

**Table 67–3 (Cont.) ADD\_FILE Procedure Parameters**

Parameter	Description
<code>version_name</code>	<p>The name of the version to which the file is added.</p> <p>If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group.</p> <p>If <code>NULL</code>, then the procedure uses the version with the latest creation time for the file group.</p>
<code>comments</code>	Comments about the file being added

## Usage Notes

To run this procedure with either `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have `READ` privilege on the directory object that contains the Data Pump export dump file

**See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

## ALTER\_FILE Procedure

This procedure alters a file in a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name    IN  VARCHAR2,
  file_name          IN  VARCHAR2,
  version_name       IN  VARCHAR2  DEFAULT NULL,
  new_file_name      IN  VARCHAR2  DEFAULT NULL,
  new_file_directory IN  VARCHAR2  DEFAULT NULL,
  new_file_type      IN  VARCHAR2  DEFAULT NULL,
  remove_file_type  IN  VARCHAR2  DEFAULT 'N',
  new_comments       IN  VARCHAR2  DEFAULT NULL,
  remove_comments   IN  VARCHAR2  DEFAULT 'N');
```

### Parameters

**Table 67-4 ALTER\_FILE Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being altered in the version
version_name	The name of the version that contains the file being altered.  If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered.  If NULL, then the procedure uses the version with the latest creation time for the file group.
new_file_name	The new name of the file if the file name is being changed. Each file name in a version must be unique.  If NULL, then the procedure does not change the file name.  <b>Note:</b> When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.
new_file_directory	The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed.  If NULL, then the procedure does not change the directory object name.  <b>Note:</b> When a non-NULL new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.

**Table 67–4 (Cont.) ALTER\_FILE Procedure Parameters**

Parameter	Description
<code>new_file_type</code>	<p>The file type. The following are reserved file types:</p> <ul style="list-style-type: none"> <li>■ If the file is a datafile, then enter the following: 'DATAFILE'</li> <li>■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET'</li> <li>■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG'</li> </ul> <p>If the file type is not one of the reserved file types, then enter a text description of the file type.</p> <p>If NULL, then the procedure does not change the file type.</p> <p><b>See Also:</b> "Constants" on page 67-5 for more information about the reserved file types.</p>
<code>remove_file_type</code>	<p>If Y, then the procedure removes the file type. If Y and the <code>new_file_type</code> parameter is non-NULL, then the procedure raises an error.</p> <p>If N, then the procedure does not remove the file type.</p>
<code>new_comments</code>	<p>New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments.</p> <p>If NULL, then the procedure does not change the existing comments.</p>
<code>remove_comments</code>	<p>If Y, then the procedure removes the comments for the file. If Y and the <code>new_comments</code> parameter is non-NULL, then the procedure raises an error.</p> <p>If N, then the procedure does not change the existing comments.</p>

## Usage Notes

If the file type is changed to `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `new_file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

**See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

## ALTER\_FILE\_GROUP Procedure

This procedure alters a file group.

### Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP (
  file_group_name      IN  VARCHAR2,
  keep_files           IN  VARCHAR2  DEFAULT NULL,
  min_versions         IN  NUMBER    DEFAULT NULL,
  max_versions         IN  NUMBER    DEFAULT NULL,
  retention_days       IN  NUMBER    DEFAULT NULL,
  new_default_directory IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory IN VARCHAR2  DEFAULT 'N',
  new_comments         IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

### Parameters

**Table 67-5 ALTER\_FILE\_GROUP Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group being altered, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	<p>If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged.</p> <p>If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged.</p> <p>If NULL, then this parameter is not changed.</p> <p><b>Note:</b> If the file group is dropped because of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.</p>
min_versions	<p>The minimum number of versions to retain. The specified value must be greater than or equal to 1.</p> <p>If NULL, then the procedure does not change the <i>min_versions</i> setting for the file group.</p>
max_versions	<p>The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <i>min_versions</i>. When the number of versions exceeds the specified <i>max_versions</i>, the oldest version is purged.</p> <p>Specify <i>DBMS_FILE_GROUP.INFINITE</i> for no limit to the number of versions.</p> <p>If NULL, then the procedure does not change the <i>max_versions</i> setting for the file group.</p>

**Table 67–5 (Cont.) ALTER\_FILE\_GROUP Procedure Parameters**

Parameter	Description
<code>retention_days</code>	<p>The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <code>retention_days</code> and there are more versions than the number specified in <code>min_versions</code>, the version is purged. The age of a version is calculated by subtracting the creation time from the current time.</p> <p>A decimal value can specify a fraction of a day. For example, 1.25 specifies one day and six hours.</p> <p>Specify <code>DBMS_FILE_GROUP.INFINITE</code> for no limit to the number of days a version can exist.</p> <p>If <code>NULL</code>, then the procedure does not change the <code>retention_days</code> setting for the file group.</p>
<code>new_default_directory</code>	<p>The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.</p> <p>If <code>NULL</code>, then the procedure does not change the default directory.</p>
<code>remove_default_directory</code>	<p>If <code>Y</code>, then the procedure removes the default directory for the file group. If <code>Y</code> and the <code>new_default_directory</code> parameter is set to a non-<code>NULL</code> value, then the procedure raises an error.</p> <p>If <code>N</code>, then the procedure does not remove the default directory for the file group.</p>
<code>new_comments</code>	<p>Comments about the file group. If non-<code>NULL</code>, then the new comments replace the existing comments for the file group.</p> <p>If <code>NULL</code>, then the procedure does not change the existing comments.</p>
<code>remove_comments</code>	<p>If <code>Y</code>, then the comments for the file group are removed. If <code>Y</code> and the <code>new_comments</code> parameter is set to a non-<code>NULL</code> value, then the procedure raises an error.</p> <p>If <code>N</code>, then the procedure does not change the comments for the file group.</p>

## Usage Notes

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

## ALTER\_VERSION Procedure

This procedure alters a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
  file_group_name      IN  VARCHAR2,
  version_name         IN  VARCHAR2  DEFAULT NULL,
  new_version_name     IN  VARCHAR2  DEFAULT NULL,
  remove_version_name  IN  VARCHAR2  DEFAULT 'N',
  new_default_directory IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory IN  VARCHAR2  DEFAULT 'N',
  new_comments         IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

### Parameters

**Table 67-6 ALTER\_VERSION Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
version_name	The name of the version being altered.  If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered.  If '*' is specified, then the procedure alters all versions, and the new_version_name parameter must be NULL.  If NULL, then the procedure uses the version with the latest creation time for the file group.
new_version_name	The new name of the version. Do not specify a schema.  The specified version name cannot be a positive integer or an asterisk ('*').  If NULL, then the procedure does not change the version name.
remove_version_name	If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the new_version_name parameter is set to a non-NULL value, then the procedure raises an error.  If N, then the procedure does not remove the version name.
new_default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added.  If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error.  If N, then the procedure does not remove the default directory.

**Table 67-6 (Cont.) ALTER\_VERSION Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>new_comments</code>	Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.
<code>remove_comments</code>	If Y, then the procedure removes the comments for the version. If Y and the <code>new_comments</code> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.

---

## CREATE\_FILE\_GROUP Procedure

This procedure creates a file group.

### Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP (
  file_group_name    IN  VARCHAR2,
  keep_files         IN  VARCHAR2  DEFAULT 'Y',
  min_versions       IN  NUMBER     DEFAULT 2,
  max_versions       IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days     IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory IN  VARCHAR2  DEFAULT NULL,
  comments           IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 67–7 CREATE\_FILE\_GROUP Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	If <i>Y</i> , then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged.  If <i>N</i> , then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged.  <b>Note:</b> If the file group is dropped because of a <i>DROP USER CASCADE</i> statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <i>min_versions</i> . When the number of versions exceeds the specified <i>max_versions</i> , the oldest version is purged.  Specify <i>DBMS_FILE_GROUP.INFINITE</i> for no limit to the number of versions.
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <i>retention_days</i> and there are more versions than the number specified in <i>min_versions</i> , the version is purged. The age of a version is calculated by subtracting the creation time from the current time.  A decimal value can specify a fraction of a day. For example, <i>1.25</i> specifies one day and six hours.  Specify <i>DBMS_FILE_GROUP.INFINITE</i> for no limit to the number of days a version can exist.
default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.
comments	Comments about the file group being created.

**Usage Notes**

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

## CREATE\_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the `PURGE_FILE_GROUP` procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the `OUT` parameter `version_out`, and the other does not.

**See Also:** [PURGE\\_FILE\\_GROUP Procedure](#) on page 67-22

### Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN  VARCHAR2 DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN  VARCHAR2 DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT NULL,
  version_out      OUT VARCHAR2);
```

### Parameters

**Table 67–8 CREATE\_VERSION Procedure Parameters**

Parameter	Description
<code>file_group_name</code>	The name of the file group to which the new version is added, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
<code>version_name</code>	The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk ( <code>'*' </code> ).
<code>default_directory</code>	The default directory object used when files are added to a version if no directory is specified when the files are added.
<code>comments</code>	Comments about the version being created
<code>version_out</code>	If the <code>version_name</code> parameter is set to a non-NULL value, then this parameter contains the specified version name. If the <code>version_name</code> parameter is set to NULL, then this parameter contains the generated version number.

## DROP\_FILE\_GROUP Procedure

This procedure drops a file group.

### Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP(  
    file_group_name IN VARCHAR2,  
    keep_files      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 67–9 DROP\_FILE\_GROUP Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group being dropped, specified as [ <i>schema_name</i> .] <i>file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	If <i>Y</i> , then the procedure retains the files in the file group on hard disk. If <i>N</i> , then the procedure deletes the files in the file group from hard disk. If <i>NULL</i> , then the procedure uses the default keep files property of the file group.

### Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

## DROP\_VERSION Procedure

This procedure drops a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_files      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 67–10 DROP\_VERSION Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
version_name	The name of the version being dropped.  If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is dropped.  If NULL, then the procedure uses the version with the oldest creation time for the file group.  If '*', then the procedure drops all versions.
keep_files	If Y, then the procedure retains the files in the version on hard disk.  If N, then the procedure deletes the files in the version from hard disk.  If NULL, then the procedure uses the default keep files property of the file group.

### Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

## GRANT\_OBJECT\_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

### Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name  IN  VARCHAR2,
  privilege    IN  BINARY_INTEGER,
  grantee      IN  VARCHAR2,
  grant_option IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 67–11 GRANT\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
object_name	The name of the file group on which the privilege is granted, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
privilege	The constant that specifies the privilege. See "Constants" on page 67-5 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If <code>TRUE</code> , then the specified user granted the specified privilege can grant this privilege to others.  If <code>FALSE</code> , then the specified user granted the specified privilege cannot grant this privilege to others.

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

## GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

---

**Note:** When you grant a privilege on "ANY" object (for example, ALTER\_ANY\_RULE), and the initialization parameter O7\_DICTIONARY\_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter O7\_DICTIONARY\_ACCESSIBILITY is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7\_DICTIONARY\_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object allows access to any schema, including SYS. Set the O7\_DICTIONARY\_ACCESSIBILITY initialization parameter with caution.

---

### Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege      IN  BINARY_INTEGER,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 67–12 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The constant that specifies the privilege. See " <a href="#">Constants</a> " on page 67-5 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

## PURGE\_FILE\_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group unless purging a version would cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

### Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
    file_group_name IN VARCHAR2);
```

### Parameter

**Table 67–13** *PURGE\_FILE\_GROUP Procedure Parameter*

Parameter	Description
<code>file_group_name</code>	The name of the file group, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.  If <code>NULL</code> and this procedure is run by <code>SYS</code> user, then the procedure purges all file groups.

### Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

## REMOVE\_FILE Procedure

This procedure removes a file from a version of a file group.

### Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_file       IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 67–14 REMOVE\_FILE Procedure Parameters**

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being removed from the version
version_name	The name of the version from which the file is removed.  If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is removed from version 1 of the file group.  If <code>NULL</code> , then the procedure uses the version with the latest creation time for the file group.  If '*', then the procedure removes the file from all versions.
keep_file	If <code>Y</code> , then the procedure retains the file on hard disk.  If <code>N</code> , then the procedure deletes the file from hard disk.  If <code>NULL</code> , then the procedure uses the default keep files property of the file group.

### Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

## REVOKE\_OBJECT\_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

### Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(  
  object_name IN VARCHAR2,  
  privilege   IN BINARY_INTEGER,  
  revokee    IN VARCHAR2);
```

### Parameters

**Table 67–15 REVOKE\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
<code>object_name</code>	The name of the file group on which the privilege is revoked, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
<code>privilege</code>	The constant that specifies the privilege. See " <a href="#">Constants</a> " on page 67-5 for valid privileges.
<code>revokee</code>	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

## REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

### Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(  
  privilege IN BINARY_INTEGER,  
  revokee   IN VARCHAR2);
```

### Parameters

**Table 67–16** *REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters*

Parameter	Description
privilege	The constant that specifies the privilege. See " <a href="#">Constants</a> " on page 67-5 for valid privileges.
revokee	The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.

## DBMS\_FILE\_TRANSFER

The `DBMS_FILE_TRANSFER` package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

**See Also:**

- *Oracle Database Administrator's Guide* for instructions about using file transfer
- *Oracle Streams Concepts and Administration* for applications of file transfer.

This chapter contains the following topic:

- [Using DBMS\\_FILE\\_TRANSFER](#)
  - Operating Notes
- [Summary of DBMS\\_FILE\\_TRANSFER Subprograms](#)

---

## Using DBMS\_FILE\_TRANSFER

- [Operating Notes](#)

## Operating Notes

---

---

**Caution:** DBMS\_FILE\_TRANSFER supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

If you want to use DBMS\_FILE\_TRANSFER for performing backups, note that you are implementing self-managed backups, and should therefore put the files in hot backup mode.

---

---

## Summary of DBMS\_FILE\_TRANSFER Subprograms

**Table 68–1 DBMS\_FILE\_TRANSFER Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">COPY_FILE Procedure</a> on page 68-5	Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.
<a href="#">GET_FILE Procedure</a> on page 68-7	Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM
<a href="#">PUT_FILE Procedure</a> on page 68-9	Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system

## COPY\_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

### Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE (
  source_directory_object    IN  VARCHAR2,
  source_file_name          IN  VARCHAR2,
  destination_directory_object IN VARCHAR2,
  destination_file_name     IN  VARCHAR2);
```

### Parameters

**Table 68–2 COPY\_FILE Procedure Parameters**

Parameter	Description
source_directory_object	The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the <code>CREATE DIRECTORY</code> command).
source_file_name	The name of the file to copy. This file must exist in the source directory.
destination_directory_object	The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, <code>+diskgroup1</code> ) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: <code>+diskgroup1/dbs/control</code> ).
destination_file_name	<p>The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM:</p> <ul style="list-style-type: none"> <li>■ The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type)</li> <li>■ The file type tag assigned to the file is <code>COPY_FILE</code></li> <li>■ The value of the <code>destination_file_name</code> argument becomes the file's alias name in the designated destination directory</li> </ul> <p>The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.</p>

## Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- READ privilege on the directory object specified in the `source_directory_object` parameter
- WRITE privilege on directory object specified in the `destination_directory_object` parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

**See Also:** *Oracle Automatic Storage Management Administrator's Guide* for instructions about using file transfer

## Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';
```

Directory created.

```
SQL> BEGIN
  2   DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR', 't_xdbtmp.f', 'DGROUP',
                                't_xdbtmp.f');
  3 END;
  4 /
```

PL/SQL procedure successfully completed.

```
SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

## GET\_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

### Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
  source_directory_object    IN VARCHAR2,
  source_file_name          IN VARCHAR2,
  source_database           IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  destination_file_name     IN VARCHAR2);
```

### Parameters

**Table 68–3** GET\_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.
source_database	The name of a database link to the remote database where the file is located.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.
destination_file_name	The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.

### Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The current user at the local database must have write privilege on the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V\$SESSION\_LONGOPS dynamic performance view.

## Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS '^t_work^';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- assumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
'a2back.dat' );

END ;
/
```

## PUT\_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

### Syntax

```
DBMS_FILE_TRANSFER.PUT_FILE(
  source_directory_object      IN  VARCHAR2,
  source_file_name            IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name       IN  VARCHAR2,
  destination_database        IN  VARCHAR2);
```

### Parameters

**Table 68–4** PUT\_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the local source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.
destination_file_name	The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.
destination_database	The name of a database link to the remote database to which the file is copied.

### Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The connected user at the destination database must have write privilege to the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V\$SESSION\_LONGOPS dynamic performance view.

## Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user;
Enter password: password

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
  DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                                'dbs2' ) ;
END ;
```

---

---

## DBMS\_FLASHBACK

Using DBMS\_FLASHBACK, you can flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).

**See Also:** For detailed information about DBMS\_FLASHBACK:

- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database SQL Language Reference*.

This chapter contains the following topics:

- [Using DBMS\\_FLASHBACK](#)
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Operational Notes
  - Examples
- [Summary of DBMS\\_FLASHBACK Subprograms](#)

## Using DBMS\_FLASHBACK

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

## Overview

DBMS\_FLASHBACK provides an interface for the user to view the database at a particular time in the past, with the additional capacity provided by transaction backout features that allow for selective removal of the effects of individual transactions. This should not be confused with a flashback database which actually moves the database back in time.

When DBMS\_FLASHBACK is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use DBMS\_FLASHBACK for the following reasons:

- Self-service repair: If you accidentally delete rows from a table, you can recover the deleted rows.
- Packaged applications such as e-mail and voicemail: You can use Flashback to restore deleted e-mail by re-inserting the deleted message into the current message box.
- Decision support system (DSS) and online analytical processing (OLAP) applications: You can perform data analysis or data modeling to track seasonal demand.

## Security Model

To use this package, a database administrator must grant `EXECUTE` privileges for `DBMS_FLASHBACK`.

## Types

The following types are used by DBMS\_FLASHBACK subprograms:

**Table 69-1 DBMS\_FLASHBACK**

Type	Description
TXNAME_ARRAY	Creates a VARRAY for holding Transaction Names or Identifiers (XIDs)

## Exceptions

**Table 69–2** *DBMS\_FLASHBACK Error Messages*

<b>Error</b>	<b>Description</b>
ORA-08180	Time specified is too old
ORA-08181	Invalid system change number specified
ORA-08182	User cannot begin read-only or serializable transactions in Flashback mode
ORA-08183	User cannot enable Flashback within an uncommitted transaction
ORA-08184	User cannot enable Flashback within another Flashback session
ORA-08185	SYS cannot enable Flashback mode

## Operational Notes

DBMS\_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need.

If you need to perform a Flashback over a 24-hour period, the DBA should set the `undo_retention` parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the `RETENTION GUARANTEE` clause for the undo tablespace to ensure that unexpired undo is not discarded. `UNDO_RETENTION` is not in itself a complete guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, `RETENTION GUARANTEE` prevents this. For more information, see the *Oracle Database Administrator's Guide*

In a Flashback-enabled session, `SYSDATE` is not affected; it continues to provide the current time.

DBMS\_FLASHBACK can be used within logon triggers to enable Flashback without changing the application code.

## Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```

DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
    employee_no    number(5) PRIMARY KEY,
    employee_name  varchar2(20),
    employee_mgr   number(5)
        CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
    salary         number,
    hiredate      date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20 seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
DECLARE
I NUMBER;
BEGIN
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly
DELETE FROM EMPLOYEE WHERE employee_name = 'Scott Tiger';
COMMIT;

```

```

REM -- notice that all of scott's employees are gone
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM EMPLOYEE
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Flashback to see Scott's organization
DECLARE
    restore_scn number;
BEGIN
    SELECT scn INTO restore_scn FROM keep_scn;
    DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (restore_scn);
END;
/

REM -- Show Scott's org.
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr

## Summary of DBMS\_FLASHBACK Subprograms

**Table 69–3 DBMS\_FLASHBACK Package Subprograms**

Subprogram	Description
<a href="#">DISABLE Procedure</a> on page 69-12	Disables the Flashback mode for the entire session
<a href="#">ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure</a> on page 69-13	Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN
<a href="#">ENABLE_AT_TIME Procedure</a> on page 69-14	Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in <code>query_time</code>
<a href="#">GET_SYSTEM_CHANGE_NUMBER Function</a> on page 69-15	Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots
<a href="#">TRANSACTION_BACKOUT Procedures</a> on page 69-16	Provides the mechanism to backout a transaction

## DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

### Syntax

```
DBMS_FLASHBACK.DISABLE;
```

### Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');  
SELECT salary FROM emp where name = 'Joe'  
EXECUTE dbms_flashback.disable;
```

## ENABLE\_AT\_SYSTEM\_CHANGE\_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number. In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

### Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (  
    query_scn IN NUMBER);
```

### Parameters

**Table 69–4** *ENABLE\_AT\_SYSTEM\_CHANGE\_NUMBER Procedure Parameters*

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

## ENABLE\_AT\_TIME Procedure

This procedure enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in `query_time`. It enables Flashback for the entire session.

### Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
    query_time    IN TIMESTAMP);
```

### Parameters

**Table 69–5** *ENABLE\_AT\_TIME Procedure Parameters*

Parameter	Description
<code>query_time</code>	<p>This is an input parameter of type <code>TIMESTAMP</code>. A time stamp can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>■ Using the <code>TIMESTAMP</code> constructor           <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME (TIMESTAMP '2001-01-09 12:31:00');</pre> <p>Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</p> </li> <li>■ Using the <code>TO_TIMESTAMP</code> function:           <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME (TO_ TIMESTAMP ('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS'))</pre> <p>You provide the format you want to use. This example shows the <code>TO_TIMESTAMP</code> function for February 12, 2001, 2:35 PM.</p> </li> <li>■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M.</li> <li>■ Note that if the query time contains a time zone, the time zone information is truncated.</li> </ul>

## GET\_SYSTEM\_CHANGE\_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

### Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER  
RETURN NUMBER;
```

## TRANSACTION\_BACKOUT Procedures

This procedure provides a mechanism to backout a set of transactions. The user can call these procedures with either transaction names or transaction identifiers (XIDS).

The procedure analyzes the transactional dependencies, perform DML's and generates an extensive report on the operation performed by the subprogram. This procedure does not commit the DML's performed as part of transaction backout. However it holds all the required locks on rows and tables in the right form, so that no other dependencies can enter the system. To make the changes permanent the user needs to explicitly commit the transaction.

A report is generated in the system tables DBA\_FLASHBACK\_TRANSACTION\_STATE and DBA\_FLASHBACK\_TRANSACTION\_REPORT.

### Syntax

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
  numtxns          NUMBER,
  xids              XID_ARRAY,
  options           NUMBER default NOCASCADE,
  timeHint         TIMESTAMP default MINTIME);
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
  numtxns          NUMBER,
  xids              XID_ARRAY,
  options           NUMBER default NOCASCADE,
  scnHint          TIMESTAMP default 0 );
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
  numtxns          NUMBER,
  txnnames         TXNAME_ARRAY,
  options           NUMBER default NOCASCADE,
  timehint         TIMESTAMP MINTIME );
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
  numtxns          NUMBER,
  txnNames         TXNAME_ARRAY,
  options           NUMBER default NOCASCADE,
  scnHint          NUMBER 0);
```

### Parameters

**Table 69–6 TRANSACTION\_BACKOUT Procedure Parameters**

Parameter	Description
numtxns	Number of transactions passed as input
xids	List of transaction IDs in the form of an array
txnnames	List of transaction names in the form of an array

**Table 69–6 (Cont.) TRANSACTION\_BACKOUT Procedure Parameters**

Parameter	Description
options	<p>Backout dependent transactions:</p> <ul style="list-style-type: none"> <li>■ NOCASCADE - The user expects no dependency. If a dependency is found, this raises an error, with the first dependent transaction provided in the report.</li> <li>■ NOCASCADE_FORCE - The user forcibly backs out the given transactions without considering the dependent transactions. The RDBMS executes the UNDO SQL for the given transactions in reverse order of their commit times. If no constraints break, and the result is satisfactory, the user can either COMMIT the changes or else ROLL BACK.</li> <li>■ NONCONFLICT_ONLY - This option lets the user backout the changes to the non-conflicting rows of the given transactions. Note that a transaction dependency happens due to a row conflict, whether either through WAW or primary/unique key constraints. If the user chooses to back out only the non-conflicting rows, this should not cause any problem with database consistency, although transaction atomicity is lost. As this is a recovery operation, the user can correct the data.</li> <li>■ CASCADE - This completely removes the given transactions including their dependents in a post order fashion (reverse order of commit times).</li> </ul>
timehint	Time hint on the start of the transaction
scnhint	SCN hint on the start of the transaction

## Usage Notes

---

**Note:** For information about restrictions in using TRANSACTION\_BACKOUT, see "Using Flashback Transaction" in the *Oracle Database Advanced Application Developer's Guide*.

---

- If transaction name is used, a time hint must be provided. The time hint should be a time before the start of all the given transactions to back out.
- If the SCN hint is provided, it must be before the start of the earliest transaction in the specified input set, or this raises an error and terminate. If it is not provided and the transaction has committed within undo retention, the database system is able to determine the start time.

---

---

## DBMS\_FLASHBACK\_ARCHIVE

The DBMS\_FLASHBACK\_ARCHIVE package contains two simple procedures for disassociation and reassociation of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.

**See Also:** Oracle Database Advanced Application Developer's Guide

This chapter contains the following topics:

---

## Using DBMS\_FLASHBACK\_ARCHIVE

- [Overview](#)
- [Security Model](#)
- [Examples](#)

## Overview

The Flashback Data Archive feature, which is available through the Total Recall option, provides strict protection on the internal history tables that it creates and maintains for users.

The read-only semantics provided prohibits users, including a DBA, from doing updates, deletes, and inserts on the Flashback Data Archive internal history tables. The feature also prohibits users from issuing any DDL statements on these tables. This strict security enforcement by Flashback Data Archive meets the requirements of regulatory-compliance type of applications. The feature supports a lot of common DDL statements, including some DDL statements that alter table definition or incur data movement, on user tables that are enabled for Flashback Data Archive. However, there are some DDL statements that are not supported on tables enabled for the feature. Since most applications schemas evolve as they release new versions of their software, the ability to perform DDL operations on the base table is a key customer requirement.

In order to support user applications' schema evolution during application upgrade and other table maintenance tasks beyond DDL statements supported by Flashback Data Archive, the `DBMS_FLASHBACK_ARCHIVE` package provides a set of simple-to-use PL/SQL procedures:

- To disassociate a Flashback Data Archive enabled base table from the underlying FDA.
- To reassociate a temporarily disassociated base table with its underlying FDA.

After a user has disassociated the base table from its FDA, it's possible to issue any DDL statements on the base table or the history tables in the FDA. Having finished with the schema changes, the user can then reassociate the base table with its FDA so that Flashback Data Archive protection is in operation and automatic tracking and archiving is resumed.

## Security Model

Users with the `FLASHBACK ARCHIVE ADMINISTER` system privilege can execute the disassociation and reassociation PL/SQL procedures. Once a table is disassociated, normal users can perform DDL and DML statements as long as they have the necessary privileges on the tables.

## Examples

Normally, users cannot perform any modification to the history table:

```
SQL> DELETE FROM scott.SYS_FBA_HIST_61527;
```

```
ERROR at line 1:
```

```
ORA-55622: DML, ALTER and CREATE UNIQUE INDEX operations are not allowed on table
"SCOTT"."SYS_FBA_HIST_61527"
```

Users also cannot issue DDL statements on history tables:

```
SQL> ALTER TABLE scott.SYS_FBA_HIST_61527 DROP COLUMN comm;
```

```
ERROR at line 1:
```

```
ORA-55622: DML, ALTER and CREATE UNIQUE INDEX operations are not allowed on table
"SCOTT"."SYS_FBA_HIST_61527"
```

Use the [DISASSOCIATE\\_FBA Procedure](#) to disassociate the `scott.emp_test` table:

```
SQL> EXEC DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA('scott','emp_test');
```

```
PL/SQL procedure successfully completed.
```

Now a user can perform table structural modifications (through DDL statements) to the user base table:

```
SQL> ALTER TABLE scott.emp_test RENAME COLUMN sal TO salary;
```

```
Table altered.
```

Users can also modify the contents in the history table that they couldn't modify previously.

```
SQL> DELETE FROM scott.SYS_FBA_HIST_61527 WHERE empno=3968;
```

```
2 rows deleted.
```

If a user tries to reassociate the history table with the base table, this will fail as the user has not performed corresponding structural modifications (through DDL statements) to the history table:

```
SQL> EXEC DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA('scott','emp_test');
BEGIN DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA('scott','emp_test');
END;
```

```
ERROR at line 1:
```

```
ORA-55636: Flashback Data Archive enabled table "SCOTT"."EMP_TEST" has different
definition from its history table
```

```
ORA-06512: at "SYS.DBMS_FLASHBACK_ARCHIVE", line 17
```

```
ORA-06512: at line 1
```

Disassociate the table and fix the table definition problem:

```
SQL> EXEC DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA('scott','emp_test');
```

```
PL/SQL procedure successfully completed.
```

Perform the same rename column DDL on the history table to make its definition conform to its base table `scott.emp_test`:

```
SQL> ALTER TABLE scott.SYS_FBA_HIST_61527 RENAME COLUMN sal TO salary;
```

Table altered.

**Finally, reassociate the base table with its history table successfully:**

```
SQL> EXEC DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA('scott','emp_test')
```

PL/SQL procedure successfully completed.

## Summary of DBMS\_FLASHBACK\_ARCHIVE Subprograms

**Table 70-1 DBMS\_FLASHBACK\_ARCHIVE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DISASSOCIATE_FBA Procedure</a> on page 70-8	Disassociates the given table from the flashback data archive
<a href="#">REASSOCIATE_FBA Procedure</a> on page 70-9	Reassociates the given table with the flashback data archive

## DISASSOCIATE\_FBA Procedure

This procedure disassociates the given table from the flashback data archive.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA (  
    owner_name    VARCHAR2,  
    table_name    VARCHAR2);
```

### Parameters

**Table 70–2 DISASSOCIATE\_FBA Procedure Parameters**

Parameter	Description
owner_name	Schema of the Flashback Data Archive enabled base table
table_name	Name of the Flashback Data Archive enabled base table

### Exceptions

**Table 70–3 DISASSOCIATE\_FBA Procedure Exceptions**

Parameter	Description
ORA-55602	User table is not enabled for Flashback Data Archive
ORA-55634	Cannot acquire the lock on the table for disassociation

## REASSOCIATE\_FBA Procedure

This procedure reassociates the given table with the flashback data archive.

### Syntax

```
DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA (
  owner_name      VARCHAR2,
  table_name      VARCHAR2);
```

### Parameters

**Table 70–4 REASSOCIATE\_FBA Procedure Parameters**

Parameter	Description
owner_name	Schema of the Flashback Data Archive enabled base table
table_name	Name of the Flashback Data Archive enabled base table

### Exceptions

**Table 70–5 REASSOCIATE\_FBA Procedure Exceptions**

Parameter	Description
ORA-55602	User table is not enabled for Flashback Data Archive
ORA-55636	table definition validation failed

### Usage Notes

- The procedure will signal an error if the base table and the history table do not have identical data definitions. For example when columns are added or table is split, the resulting base table and history table need to have the same schema.
- The FDA internal history table schema has some row versions metadata columns. The procedure will signal an error if any of the metadata columns is dropped by users.

---

---

## DBMS\_FREQUENT\_ITEMSET

The DBMS\_FREQUENT\_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- [Summary of DBMS\\_FREQUENT\\_ITEMSET Subprograms](#)

## Summary of DBMS\_FREQUENT\_ITEMSET Subprograms

**Table 71-1 DBMS\_FREQUENT\_ITEMSET Package Subprograms**

Subprogram	Description
<a href="#">FI_HORIZONTAL Function</a> on page 71-3	Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded
<a href="#">FI_TRANSACTIONAL Function</a> on page 71-5	Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded

## FI\_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

### Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL (
  tranx_cursor      IN      SYSREFCURSOR,
  support_threshold IN      NUMBER,
  itemset_length_min IN     NUMBER,
  itemset_length_max IN     NUMBER,
  including_items   IN      SYS_REFCURSOR DEFAULT NULL,
  excluding_items   IN      SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER);
```

### Parameters

**Table 71–2 FI\_HORIZONTAL Function Parameters**

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns. Each column of cursor represents an item. All columns of the cursor must be of the same data type. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned. The default is NULL.

## Return Values

**Table 71–3** *FI\_HORIZONTAL Return Values*

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER.

## Example

Suppose you have a table `horiz_table_in`.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in `horiz_table_in` looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
    CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
            FROM horiz_table_in),
    0.3,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                              ('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

## FI\_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

### Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
  tranx_cursor      IN   SYSREFCURSOR,
  support_threshold IN   NUMBER,
  itemset_length_min IN  NUMBER,
  itemset_length_max IN  NUMBER,
  including_items   IN   SYS_REFCURSOR DEFAULT NULL,
  excluding_items   IN   SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER);
```

### Parameters

**Table 71-4 FI\_TRANSACTIONAL Function Parameters**

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.

## Return Values

**Table 71–5** *FI\_TRANSACTIONAL Return Values*

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.

## Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

## Examples

Suppose that the input table `tranx_table_in` looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of `VARCHAR2(30)`, you must create a nested table of `VARCHAR2(30)`:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in),
        0.6,
        2,
        5,
        NULL,
        NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        CURSOR(SELECT tid, iid FROM tranx_table_in),
```

```

0.6,
2,
5,
CURSOR(SELECT * FROM table(FI_VARCHAR_NT
('apple', 'banana', 'orange'))),
CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));

```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```

SELECT
  bt.setid, nt.*
FROM
  (SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
   FROM table(
     DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
       CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
       NULL, NULL)) bt,
   table(bt.itemset) nt);

```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the NESTED\_TABLE\_FAST\_INSERT hint for performance:

```

CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */ INTO fq_nt
  SELECT cast(itemset as FI_VARCHAR_NT)
  FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
    NULL, NULL));

```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```

CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP

```

```
        FETCH freqC INTO coll_nt;
        EXIT WHEN freqC%NOTFOUND;
        num_rows := num_rows + 1;
        num_itms := num_itms + coll_nt.count;
    END LOOP;
    CLOSE freqC;
    DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
```

```
END;
/
```

This package contains constants and procedure declarations for health check management. Health Monitor provides facilities to run a check store and retrieve the reports through DBMS\_HM package

**See Also:** *Oracle Database Administrator's Guide* for more information about "Health Monitor"

This chapter contains the following topics:

## Using DBMS\_HM

---

- [Security Model](#)

## Security Model

Users must have EXECUTE privilege to run the procedures of DBMS\_HM package.

---

## Summary of DBMS\_HM Subprograms

**Table 72-1 DBMS\_HM Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET_RUN_REPORT Function</a> on page 72-5	Returns the report for the specified checker run
<a href="#">RUN_CHECK Procedure</a> on page 72-6	Runs the specified checker with the given arguments

## GET\_RUN\_REPORT Function

This function returns the report for the specified checker run.

### Syntax

```
DBMS_HM.GET_RUN_REPORT (  
    run_name      IN  VARCHAR2,  
    type          IN  VARCHAR2 := 'TEXT',  
    level         IN  VARCHAR2 := 'BASIC',)  
RETURN CLOB;
```

### Parameters

**Table 72–2** GET\_RUN\_REPORT Function Parameters

Parameter	Description
run_name	Name of the check's run
type	Report format type. Possible values are 'HTML', 'XML' and 'TEXT'. Default report type is 'TEXT'.
level	Details of report, possible value are 'BASIC' and 'DETAIL'. Caution: Currently only 'BASIC' level is supported.

## RUN\_CHECK Procedure

This procedure runs the specified checker with the given arguments. It lets user to specify a name for the run, inputs needed and maximum timeout for the run. The run's report will be maintained persistently in database.

### Syntax

```
DBMS_HM.RUN_CHECK (
    check_name      IN  VARCHAR2,
    run_name        IN  VARCHAR2 := NULL,
    timeout         IN  NUMBER := NULL,
    input_params    IN  VARCHAR2 := NULL);
```

### Parameters

**Table 72-3 RUN\_CHECK Procedure Parameters**

Parameter	Description
check_name	Name of the check to be invoked. Check names and their parameters can be accessed from the V\$HM_CHECK and V\$HM_CHECK_PARAM views. Users can run all checks which are not internal in nature: <code>SELECT name FROM V\$HM_CHECK WHERE INTERNAL_CHECK = 'N'</code> retrieves the list of checks that can be run manually by users.
run_name	Name with which external users can uniquely identify this check's run. If NULL value is passed, then HM creates a unique name and associates with this check's run.
timeout	Maximum amount of time (in units of seconds), this checker run is allowed to run. HM will interrupt the run, if it the specified time elapses for the run. If NULL value is passed, HM doesn't impose any timeout limits on the run.
input_params	<p>Input string: which consists of name, value pairs de-limited by a special character ';'.                      Example ('Data Block Integrity Check' invocation may take following type of input parameters.                      'BLC_DF_NUM=1;BLC_BL_NUM=23456'</p> <p>Input parameters BLC_DF_NUM and BLC_BL_NUM have values '1' and '23456' respectively.</p> <p>Every check will have well defined set of inputs associated with it. These Input parameters, their types, default values and descriptions can be obtained using V\$HM_CHECK_PARAM view.</p> <p>Example: The following query gets the list of parameters, their default values and descriptions for a 'Data Block Integrity Check'</p> <pre>SELECT a.* FROM v\$hm_check_param a, v\$hm_check b WHERE a.check_id = b.id AND b.name = 'Data Block Integrity Check';</pre>

The DBMS\_HPROF package provides an interface for profiling the execution of PL/SQL applications. It provides services for collecting the hierarchical profiler data, analyzing the raw profiler output and profiling information generation.

**See Also:** *Oracle Database Advanced Application Developer's Guide* for more information about the "PL/SQL Hierarchical Profiler"

This chapter contains the following topic:

- [Summary of DBMS\\_HPROF Subprograms](#)

## Summary of DBMS\_HPROF Subprograms

This table lists the package subprograms in alphabetical order.

**Table 73-1 DBMS\_HPROF Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">ANALYZE Function</a> on page 73-3	Analyzes the raw profiler output and produces hierarchical profiler information in database tables
<a href="#">START_PROFILING Procedure</a> on page 73-5	Starts hierarchical profiler data collection in the user's session
<a href="#">STOP_PROFILING Procedure</a> on page 73-6	Stops profiler data collection in the user's session.

## ANALYZE Function

This function analyzes the raw profiler output and produces hierarchical profiler information in database tables.

### Syntax

```
DBMS_HPROF.ANALYZE (
  location      VARCHAR2,
  filename      VARCHAR2,
  summary_mode  BOOLEAN      DEFAULT FALSE,
  trace         VARCHAR2    DEFAULT NULL,
  skip          PLS_INTEGER  DEFAULT 0,
  collect       PLS_INTEGER  DEFAULT NULL,
  run_comment   VARCHAR2    DEFAULT NULL)
RETURN NUMBER;
```

### Parameters

**Table 73–2 ANALYZE Function Parameters**

Parameter	Description
location	Name of a directory object. The raw profiler data file is read from the file system directory mapped to this directory object. Output files are also written to this directory.
filename	Name of the raw profiler data file to be analyzed. The file must exist in the directory specified by the <code>location</code> parameter.
summary_mode	By default (that is, when <code>summary_mode</code> is <code>FALSE</code> ), the detailed analysis is done. When <code>summary_mode</code> is <code>TRUE</code> , only top-level summary information is generated into the database table.
trace	Analyze only the subtrees rooted at the specified trace entry. By default (when <code>trace</code> is <code>NULL</code> ), the analysis/reporting is generated for the entire run. The trace entry must be specified in a special quoted qualified format (including the schema name, module name & function name) as in for example, <code>"SCOTT"."PKG"."FOO"</code> or <code>"".""."__plssql_vm"</code> . If multiple overloads exist for the specified name, all of them will be analyzed.
skip	Used only when <code>trace</code> is specified. Analyze only the subtrees rooted at the specified trace, but ignore the first <code>skip</code> invocations to trace. The default value for <code>skip</code> is 0.
collect	Used only when <code>trace</code> is specified. Analyze <code>collect</code> number of invocations of traces (starting from <code>skip+1</code> 'th invocation). By default only 1 invocation is collected.
run_comment	User-provided comment for this run

### Return Values

A unique run identifier for this run of the analyzer. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

## Usage Notes

- Use the `dbmshptab.sql` script located in the `rdbms/admin` directory to create the hierarchical profiler database tables and other data structures required for persistently storing the results of analyzing the raw profiler data.
- Running `dbmshptab.sql` drops the any previously created hierarchical profiler tables.

## Examples

The following snippet installs the hierarchical profiler tables in HR schema.

```
connect HR/HR;  
@?/rdbms/admin/dbmshptab.sql
```

## START\_PROFILING Procedure

This procedure starts hierarchical profiler data collection in the user's session.

### Syntax

```
DBMS_HPROF.START_PROFILING (
  location    VARCHAR2 DEFAULT NULL,
  filename    VARCHAR2 DEFAULT NULL,
  max_depth   PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 73-3 START\_PROFILING Procedure Parameters**

Parameter	Description
location	Name of a directory object. The file system directory mapped to this directory object is where the raw profiler output is generated.
filename	Output filename for the raw profiler data. The file is created in the directory specified by the location parameter.
max_depth	By default (that is, when max_depth value is NULL) profile information is gathered for all functions irrespective of their call depth. When a non-NULL value is specified for max_depth, the profiler collects data only for functions up to a call depth level of max_depth.

### Usage Notes

Even though the profiler does not individually track functions at depth greater than max\_depth, the time spent in such functions is charged to the ancestor function at depth max\_depth.

## **STOP\_PROFILING Procedure**

This procedure stops profiler data collection in the user's session. This subprogram also has the side effect of flushing data collected so far in the session, and it signals the end of a run.

### **Syntax**

```
DBMS_HPROF.STOP_PROFILING;
```

---

---

## DBMS\_HS\_PARALLEL

The DBMS\_HS\_PARALLEL PL/SQL package enables parallel processing for heterogeneous targets access. This package is designed to improve performance when retrieving data from a large foreign table.

This chapter discusses the following topics:

- [Using DBMS\\_HS\\_PARALLEL](#)
- [Summary of DBMS\\_HS\\_PARALLEL Subprograms](#)

---

## Using DBMS\_HS\_PARALLEL

DBMS\_HS\_PARALLEL is compiled with the authorization ID of CURRENT\_USER, which uses invoker's rights. In other words, all procedures in this package are executed with the privileges of the calling user.

---

## Summary of DBMS\_HS\_PARALLEL Subprograms

**Table 74–1 DBMS\_HS\_PARALLEL Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CREATE_OR_REPLACE_VIEW</a> on page 74-4	Creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.
<a href="#">CREATE_TABLE_TEMPLATE</a> on page 74-6	Writes out a CREATE TABLE template based on information gathered from the remote table. You can use the information to add any optimal Oracle CREATE TABLE clauses.
<a href="#">DROP_VIEW</a> on page 74-7	Drops the view and internal objects created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not already been created by the CREATE_OR_REPLACE_VIEW procedure, an error message is returned.
<a href="#">LOAD_TABLE</a> on page 74-8	Loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.

---

## CREATE\_OR\_REPLACE\_VIEW

This procedure creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.

### Syntax

```
CREATE_OR_REPLACE_VIEW (remote_table, database_link, oracle_view, parallel_degree)
```

### Parameters

**Table 74–2 CREATE\_OR\_REPLACE\_VIEW Parameter**

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_view	IN VARCHAR2	The name of the Oracle view. It is specified as [schema_name.]oracle_view_name. The default schema name is the current user. If the oracle_view parameter is not specified, the remote table name will be used as the view name.
parallel_degree	IN NUMBER	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.

### Usage Notes

- The specified Oracle view is created and future reference of this view utilizes internal database objects for parallel retrieval of remote non-Oracle table data. If the Oracle view already exists, the following Oracle error message is raised:
 

```
ORA-00955: name is already used by an existing object
```
- This view is created as a read-only view. If you attempt to insert and update the view, the following Oracle error message is raised:
 

```
ORA-01733: virtual column not allowed here
```
- If the remote table or the database link does not exist, one of the following Oracle error messages is raised:
 

```
ORA-00942: table or view does not exist
```

 or
 

```
ORA-02019: connection description for remote database not found
```
- You need the `CREATE VIEW`, `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `CREATE_OR_REPLACE_VIEW` procedure.

- If you encounter either of the following Oracle error messages, increase the `PROCESSES` and `SESSIONS` parameter in the Oracle initialization parameter file:  
`ORA-12801: error signaled in parallel query server P003`  
or  
`ORA-00018: maximum number of session exceeded`
- Because the `CREATE_OR_REPLACE_VIEW` procedure creates some internal objects, use the `DROP_VIEW` procedure to drop the view and the internal objects. The SQL `DROP VIEW` statement only drops the view and not the internal objects.

## CREATE\_TABLE\_TEMPLATE

This procedure writes out a CREATE TABLE template based on information gathered from the remote table. You can use the information to add any optimal Oracle CREATE TABLE clauses.

### Syntax

```
CREATE_TABLE_TEMPLATE (remote_table, database_link, oracle_table, create_table_
template_string)
```

### Parameters

**Table 74–3** CREATE\_TABLE\_TEMPLATE Parameter

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	IN VARCHAR2	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
create_table_template_string	OUT VARCHAR2	Contains the Oracle CREATE TABLE SQL template when the procedure is returned.

## DROP\_VIEW

This procedure drops the view and internal objects created by the CREATE\_OR\_REPLACE\_VIEW procedure. If the view has not already been created by the CREATE\_OR\_REPLACE\_VIEW procedure, an error message is returned.

### Syntax

```
DROP_VIEW (oracle_view)
```

### Parameters

**Table 74–4** DROP\_VIEW Parameter

Parameter	Value	Description
oracle_view	IN VARCHAR2 NOT NULL	The name of the Oracle view created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not been created by the CREATE_OR_REPLACE_VIEW procedure, an error is returned.

## LOAD\_TABLE

This procedure loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.

### Syntax

```
LOAD_TABLE (remote_table, database_link, oracle_table, truncate, parallel_degree,
row_count)
```

### Parameters

**Table 74–5 LOAD\_TABLE Parameters**

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	IN VARCHAR2	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
truncate	IN BOOLEAN	Determines whether the Oracle table is truncated before the data is loaded. The value is either TRUE or FALSE. The default value is TRUE which means the Oracle table is truncated first. When set to FALSE, the Oracle table will not be truncated before the data is loaded.
parallel_degree	IN NUMBER	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.
row_count	OUT NUMBER	Contains the number of rows just added with the load table operation.

### Usage Notes

- This procedure only loads the remote table data into Oracle local table. It does not create a key, index, constraints or any other dependencies such as triggers. It is recommended that you create these dependencies after the table data is loaded as performance will improve greatly. You will need to decide whether to create the dependencies before or after the data is loaded based on your knowledge of the remote table data and dependencies.

- If the local table does not exist, the `LOAD_TABLE` procedure creates a simple (non-partitioned) local table based on the exact column matching of the remote table after which the data is inserted into the local table.
- If the remote table or the database link does not exist, an error message is returned.
- If the local table is incompatible with the remote table, an error message is returned.
- You need the `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `LOAD_TABLE` procedure.
- If you encounter either of the following Oracle error messages, increase the `PROCESSES` and `SESSIONS` parameter in Oracle initialization parameter file:  

```
ORA-12801: error signaled in parallel query server P003  
or  
ORA-00018: maximum number of session exceeded
```
- One of the following is required for parallel processing:
  - The remote table is range partitioned.
  - Histogram information for a numeric column is available.
  - There is a numeric index or primary key.
- To drop the local table, use the `DROP TABLE SQL` statement.

---

---

## DBMS\_HS\_PASSTHROUGH

The DBMS\_HS\_PASSTHROUGH PL/SQL package allows you to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows operations in statements for which there is no equivalent in Oracle.

This chapter discusses the following topics:

- [Using DBMS\\_HS\\_PASSTHROUGH](#)
  - Overview
  - Operational Notes
- [Summary of DBMS\\_HS\\_PASSTHROUGH Subprograms](#)

**See Also:** *Oracle Database Heterogeneous Connectivity User's Guide* for more information about this package

---

## Using DBMS\_HS\_PASSTHROUGH

This section contains topics which relate to using the DBMS\_HS\_PASSTHROUGH package.

## Overview

You can execute passthrough SQL statements directly at the non-Oracle system using the PL/SQL package DBMS\_HS\_PASSTHROUGH. Any statement executed with this package is executed in the same transaction as standard SQL statements.

**See Also:** *Oracle Database Heterogeneous Connectivity User's Guide* for information about this package

## Operational Notes

The `DBMS_HS_PASSTHROUGH` package is a virtual package. It conceptually resides at the non-Oracle system. In reality, however, calls to this package are intercepted by Heterogeneous Services and mapped to one or more Heterogeneous Services calls. The driver, in turn, maps these Heterogeneous Services calls to the API of the non-Oracle system. The client application should invoke the procedures in the package through a database link in exactly the same way as it would invoke a non-Oracle system stored procedure. The special processing done by Heterogeneous Services is transparent to the user.

---

## Summary of DBMS\_HS\_PASSTHROUGH Subprograms

**Table 75–1 DBMS\_HS\_PASSTHROUGH Package Subprograms**

Subprogram	Description
<a href="#">BIND_INOUT_VARIABLE Procedure</a> on page 75-6	Binds IN OUT bind variables
<a href="#">BIND_INOUT_VARIABLE_RAW Procedure</a> on page 75-7	Binds IN OUT bind variables of data type RAW
<a href="#">BIND_OUT_VARIABLE Procedure</a> on page 75-8	Binds an OUT variable with a PL/SQL program variable
<a href="#">BIND_OUT_VARIABLE_RAW Procedure</a> on page 75-9	Binds an OUT variable of data type RAW with a PL/SQL program variable
<a href="#">BIND_VARIABLE Procedure</a> on page 75-10	Binds an IN variable positionally with a PL/SQL program variable
<a href="#">BIND_VARIABLE_RAW Procedure</a> on page 75-11	Binds IN variables of type RAW
<a href="#">CLOSE_CURSOR Procedure</a> on page 75-12	Closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system
<a href="#">EXECUTE_IMMEDIATE Procedure</a> on page 75-13	Runs a (non-SELECT) SQL statement immediately, without bind variables
<a href="#">EXECUTE_NON_QUERY Function</a> on page 75-14	Runs a (non-SELECT) SQL statement
<a href="#">FETCH_ROW Function</a> on page 75-15	Fetches rows from a query
<a href="#">GET_VALUE Procedure</a> on page 75-16	Retrieves column value from SELECT statement, or retrieves OUT bind parameters
<a href="#">GET_VALUE_RAW Procedure</a> on page 75-17	Similar to GET_VALUE, but for data type RAW
<a href="#">OPEN_CURSOR Function</a> on page 75-18	Opens a cursor for running a passthrough SQL statement at the non-Oracle system
<a href="#">PARSE Procedure</a> on page 75-19	Parses SQL statement at non-Oracle system

## BIND\_INOUT\_VARIABLE Procedure

This procedure binds IN OUT bind variables.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE (
  c      IN      BINARY_INTEGER NOT NULL,
  p      IN      BINARY_INTEGER NOT NULL,
  v      IN OUT  <dt>,
  n      IN      VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

**See Also:** For binding IN OUT variables of data type RAW see [BIND\\_INOUT\\_VARIABLE\\_RAW Procedure](#) on page 75-7.

### Parameters

**Table 75–2 BIND\_INOUT\_VARIABLE Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name of the bind variable.  For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 75–3 BIND\_INOUT\_VARIABLE Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### Pragmas

Purity level defined : WNDS, RNDS

## BIND\_INOUT\_VARIABLE\_RAW Procedure

This procedure binds IN OUT bind variables of data type RAW.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (
  c      IN      BINARY_INTEGER NOT NULL,
  p      IN      BINARY_INTEGER NOT NULL,
  v      IN OUT  RAW,
  n      IN      VARCHAR2);
```

### Parameters

**Table 75-4 BIND\_INOUT\_VARIABLE\_RAW Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name the bind variable.  For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 75-5 BIND\_INOUT\_VARIABLE\_RAW Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### Pragmas

Purity level defined : WNDS, RNDS

## BIND\_OUT\_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NULL,
  v      OUT <dt>,
  n      IN  VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

**See Also:** For binding OUT variables of data type RAW, see [BIND\\_OUT\\_VARIABLE\\_RAW Procedure](#) on page 75-9.

### Parameters

**Table 75–6 BIND\_OUT\_VARIABLE Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 75–7 BIND\_OUT\_VARIABLE Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### Pragmas

Purity level defined : WNDS, RNDS

## BIND\_OUT\_VARIABLE\_RAW Procedure

This procedure binds an OUT variable of data type RAW with a PL/SQL program variable.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NOT NULL,
  v      OUT RAW,
  n      IN  VARCHAR2);
```

### Parameters

**Table 75–8 BIND\_OUT\_VARIABLE\_RAW Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW.
n	(Optional) Name of the bind variable.  For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 75–9 BIND\_OUT\_VARIABLE\_RAW Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### Pragmas

Purity level defined : WNDS, RNDS

## BIND\_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      IN <dt>,
  n      IN VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

**See Also:** To bind RAW variables use [BIND\\_VARIABLE\\_RAW Procedure](#) on page 75-11.

### Parameters

**Table 75–10 BIND\_VARIABLE Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable name.
n	(Optional) Name of the bind variable.  For example, in <code>SELECT * FROM emp WHERE ename= :ename</code> , the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 75–11 BIND\_VARIABLE Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### Pragmas

Purity level defined: WNDS, RNDS

## BIND\_VARIABLE\_RAW Procedure

This procedure binds IN variables of type RAW.

### Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (
  c    IN BINARY_INTEGER NOT NULL,
  p    IN BINARY_INTEGER NOT NULL,
  v    IN RAW,
  n    IN VARCHAR2);
```

### Parameters

**Table 75–12 BIND\_VARIABLE\_RAW Procedure Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

### Exceptions

**Table 75–13 BIND\_VARIABLE\_RAW Procedure Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### Pragmas

Purity level defined : WNDS, RNDS

## CLOSE\_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

### Syntax

```
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (  
  c IN BINARY_INTEGER NOT NULL);
```

### Parameters

**Table 75–14** *CLOSE\_CURSOR Procedure Parameters*

Parameter	Description
c	Cursor to be released.

### Exceptions

**Table 75–15** *CLOSE\_CURSOR Procedure Exceptions*

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### Pragmas

Purity level defined : WNDS, RNDS

## EXECUTE\_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except SELECT can be run immediately. The statement must not contain any bind variables. The statement is passed in as a VARCHAR2 in the argument. Internally the SQL statement is run using the PASSTHROUGH SQL protocol sequence of OPEN\_CURSOR, PARSE, EXECUTE\_NON\_QUERY, CLOSE\_CURSOR.

### Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (
    s IN VARCHAR2 NOT NULL)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 75–16 EXECUTE\_IMMEDIATE Procedure Parameters**

Parameter	Description
s	VARCHAR2 variable with the statement to be executed immediately.

### Return Values

The number of rows affected by the execution of the SQL statement.

### Exceptions

**Table 75–17 EXECUTE\_IMMEDIATE Procedure Exceptions**

Exception	Description
ORA-28551	SQL statement is invalid.
ORA-28554	Max open cursors.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

## EXECUTE\_NON\_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a `SELECT` statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

### Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (  
    c IN BINARY_INTEGER NOT NULL)  
RETURN BINARY_INTEGER;
```

### Parameters

**Table 75–18 EXECUTE\_NON\_QUERY Function Parameters**

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.

### Return Values

The number of rows affected by the SQL statement in the non-Oracle system

### Exceptions

**Table 75–19 EXECUTE\_NON\_QUERY Function Exceptions**

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	<code>BIND_VARIABLE</code> procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

## FETCH\_ROW Function

This function fetches rows from a result set. The result set is defined with a SQL `SELECT` statement. When there are no more rows to be fetched, the exception `NO_DATA_FOUND` is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

### Syntax

```
DBMS_HS_PASSTHROUGH.FETCH_ROW (
  c   IN BINARY_INTEGER NOT NULL,
  f   IN BOOLEAN)
RETURN BINARY_INTEGER;
```

### Parameters

**Table 75–20** *FETCH\_ROW Function Parameters*

Parameter	Description
<code>c</code>	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
<code>first</code>	(Optional) Reexecutes <code>SELECT</code> statement. Possible values: <ul style="list-style-type: none"> <li>- <code>TRUE</code>: reexecute <code>SELECT</code> statement.</li> <li>- <code>FALSE</code>: fetch the next row, or if run for the first time, then execute and fetch rows (default).</li> </ul>

### Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

### Exceptions

**Table 75–21** *FETCH\_ROW Function Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

### Pragmas

Purity level defined : `WNDS`

## GET\_VALUE Procedure

This procedure has two purposes:

- It retrieves the select list items of `SELECT` statements, after a row has been fetched.
- It retrieves the `OUT` bind values, after the `SQL` statement has been run.

### Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NOT NULL,
  v      OUT <dt>);
```

<dt> is either `DATE`, `NUMBER`, or `VARCHAR2`.

**See Also:** For retrieving values of data type `RAW`, see [GET\\_VALUE\\_RAW Procedure](#) on page 75-17.

### Parameters

**Table 75–22** GET\_VALUE Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough <code>SQL</code> statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
p	Position of the bind variable or select list item in the <code>SQL</code> statement: Starts at 1.
v	Variable in which the <code>OUT</code> bind variable or select list item stores its value.

### Exceptions

**Table 75–23** GET\_VALUE Procedure Exceptions

Exception	Description
ORA-1403	Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the <code>SQL</code> statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

### Pragmas

Purity level defined : `WNDS`

## GET\_VALUE\_RAW Procedure

This procedure is similar to `GET_VALUE`, but for data type `RAW`.

### Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (
  c    IN BINARY_INTEGER NOT NULL,
  p    IN BINARY_INTEGER NOT NULL,
  v    OUT RAW);
```

### Parameters

**Table 75–24** *GET\_VALUE\_RAW Procedure Parameters*

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the <code>OUT</code> bind variable or select list item stores its value.

### Exceptions

**Table 75–25** *GET\_VALUE\_RAW Procedure Exceptions*

Exception	Description
ORA-1403	Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

### Pragmas

Purity level defined : `WNDS`

## OPEN\_CURSOR Function

This function opens a cursor for running a passthrough SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure CLOSE\_CURSOR.

### Syntax

```
DBMS_HS_PASSTHROUGH.OPEN_CURSOR  
RETURN BINARY_INTEGER;
```

### Return Values

The cursor to be used on subsequent procedure and function calls.

### Exceptions

**Table 75–26 OPEN\_CURSOR Function Exceptions**

Exception	Description
ORA-28554	Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' OPEN_CURSORS initialization parameter.

### Pragmas

Purity level defined : WNDS, RNDS

## PARSE Procedure

This procedure parses SQL statement at non-Oracle system.

### Syntax

```
DBMS_HS_PASSTHROUGH.PARSE (
  c          IN  BINARY_INTEGER NOT NULL,
  stmt      IN  VARCHAR2 NOT NULL);
```

### Parameters

**Table 75–27** *PARSE Procedure Parameters*

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened using function OPEN_CURSOR.
stmt	Statement to be parsed.

### Exceptions

**Table 75–28** *PARSE Procedure Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28551	SQL statement is illegal.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

### Pragmas

Purity level defined : WNDS, RNDS

The `DBMS_IOT` package creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command. `DBMS_IOT` can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the `enable_constraint` operation.

`DBMS_IOT` is not loaded during database installation. To install `DBMS_IOT`, run `dbmsiotc.sql`, available in the `ADMIN` directory.

This chapter contains the following topics:

- [Summary of DBMS\\_IOT Subprograms](#)

---

---

**Note:** With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

---

---

## Summary of DBMS\_IOT Subprograms

**Table 76–1** *DBMS\_IOT Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">BUILD_CHAIN_ROWS_TABLE Procedure</a> on page 76-3	Creates a table into which references to the chained rows for an index-organized table can be placed using the <code>ANALYZE</code> command
<a href="#">BUILD_EXCEPTIONS_TABLE Procedure</a> on page 76-4	Creates an exception table into which rows of an index-organized table that violate a constraint can be placed

## BUILD\_CHAIN\_ROWS\_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command.

### Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

### Parameters

**Table 76-2** BUILD\_CHAIN\_ROWS\_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
chainrow_table_name	Intended name for the chained-rows table.

### Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

### Examples

```
CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS', 'L', 'LC');
```

A chained-row table is created with the following columns:

Column Name	Null?	Type
OWNER_NAME		VARCHAR2(30)
TABLE_NAME		VARCHAR2(30)
CLUSTER_NAME		VARCHAR2(30)
PARTITION_NAME		VARCHAR2(30)
SUBPARTITION_NAME		VARCHAR2(30)
HEAD_ROWID		ROWID
TIMESTAMP		DATE
A		CHAR(16)
B		CHAR(16)
C		CHAR(16)

## BUILD\_EXCEPTIONS\_TABLE Procedure

This procedure creates an exception table into which rows of an index-organized table that violate a constraint can be placed during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

### Syntax

```
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

### Parameters

**Table 76-3** BUILD\_EXCEPTIONS\_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
exceptions_table_name	Intended name for exception-table.

### Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

### Examples

```
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS', 'L', 'LE');
```

An exception table for the preceding index-organized table with the following columns:

Column Name	Null?	Type
ROW_ID		VARCHAR2(30)
OWNER		VARCHAR2(30)
TABLE_NAME		VARCHAR2(30)
CONSTRAINT		VARCHAR2(30)
A		CHAR(16)
B		CHAR(16)
C		CHAR(16)

The DBMS\_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

- [Documentation of DBMS\\_JAVA](#)

---

## Documentation of DBMS\_JAVA

For a complete description of this package within the context of DBMS\_JAVA, see DBMS\_JAVA in the *Oracle Database Java Developer's Guide*.

The DBMS\_JOB package schedules and manages jobs in the job queue.

---

---

**Note:** The DBMS\_JOB package has been superseded by the DBMS\_SCHEDULER package. In particular, if you are administering jobs to manage system load, you should consider disabling DBMS\_JOB by revoking the package execution privilege for users.

For more information, see [Chapter 128, "DBMS\\_SCHEDULER"](#) and "Moving from DBMS\_JOB to DBMS\_SCHEDULER" in *Oracle Database Administrator's Guide*.

---

---

This chapter contains the following topics:

- [Using DBMS\\_JOB](#)
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_JOB Subprograms](#)

## Using DBMS\_JOB

---

- [Security Model](#)
- [Operational Notes](#)

## Security Model

No specific system privileges are required to use DBMS\_JOB. No system privileges are available to manage DBMS\_JOB. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted EXECUTE. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

## Operational Notes

- [Working with Oracle Real Application Clusters](#)
- [Stopping a Job](#)

### Working with Oracle Real Application Clusters

DBMS\_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the [DBMS\\_SCHEDULER](#) package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

#### DBMS\_JOB.SUBMIT

To submit a job to the job queue, use the following syntax:

```
DBMS_JOB.SUBMIT(  
  job      OUT      BINARY_INTEGER,  
  what     IN       VARCHAR2, NEXT_DATE IN DATE DEFAULTSYSDATE,  
  interval IN       VARCHAR2 DEFAULT 'NULL',  
  no_parse IN       BOOLEAN DEFAULT FALSE,  
  instance IN       BINARY_INTEGER DEFAULT ANY_INSTANCE,  
  force    IN       BOOLEAN DEFAULT FALSE);
```

Use the parameters `instance` and `force` to control job and instance affinity. The default value of `instance` is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the `instance` value. Oracle displays error ORA-23319 if the `instance` value is a negative number or NULL.

The `force` parameter defaults to `false`. If `force` is TRUE, any positive integer is acceptable as the job instance. If `force` is FALSE, the specified instance must be running, or Oracle displays error number ORA-23428.

#### DBMS\_JOB.INSTANCE

To assign a particular instance to execute a job, use the following syntax:

```
DBMS_JOB.INSTANCE( JOB IN BINARY_INTEGER,  
  instance          IN BINARY_INTEGER,  
  force             IN BOOLEAN DEFAULT FALSE);
```

The `FORCE` parameter in this example defaults to `FALSE`. If the `instance` value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of `force`. If the `INSTANCE` value is positive and the `FORCE` parameter is `FALSE`, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the `force` parameter is `TRUE`, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the `instance` value is negative or NULL.

#### DBMS\_JOB.CHANGE

To alter user-definable parameters associated with a job, use the following syntax:

```
DBMS_JOB.CHANGE( JOB IN BINARY_INTEGER,
```

```
        what                IN VARCHAR2 DEFAULT NULL,  
next_date          IN DATE DEFAULT NULL,  
interval           IN VARCHAR2 DEFAULT NULL,  
instance           IN BINARY_INTEGER DEFAULT NULL,  
force              IN BOOLEAN DEFAULT FALSE );
```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is `null` indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the instance number is negative.

### **DBMS\_JOB.RUN**

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If `force` is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if `force` is `FALSE` and the connected instance is the incorrect instance.

```
DBMS_JOB.RUN(  
    job      IN BINARY_INTEGER,  
    force    IN BOOLEAN DEFAULT FALSE);
```

## **Stopping a Job**

Note that, once a job is started and running, there is no easy way to stop the job.

## Summary of DBMS\_JOB Subprograms

**Table 78–1** *DBMS\_JOB Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">BROKEN Procedure</a> on page 78-7	Disables job execution
<a href="#">CHANGE Procedure</a> on page 78-8	Alters any of the user-definable parameters associated with a job
<a href="#">INSTANCE Procedure</a> on page 78-9	Assigns a job to be run by a instance
<a href="#">INTERVAL Procedure</a> on page 78-10	Alters the interval between executions for a specified job
<a href="#">NEXT_DATE Procedure</a> on page 78-11	Alters the next execution time for a specified job
<a href="#">REMOVE Procedure</a> on page 78-12	Removes specified job from the job queue
<a href="#">RUN Procedure</a> on page 78-13	Forces a specified job to run
<a href="#">SUBMIT Procedure</a> on page 78-14	Submits a new job to the job queue
<a href="#">USER_EXPORT Procedures</a> on page 78-16	Re-creates a given job for export, or re-creates a given job for export with instance affinity
<a href="#">WHAT Procedure</a> on page 78-17	Alters the job description for a specified job

## BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

### Syntax

```
DBMS_JOB.BROKEN (  
  job      IN  BINARY_INTEGER,  
  broken   IN  BOOLEAN,  
  next_date IN DATE DEFAULT SYSDATE);
```

### Parameters

**Table 78–2** *BROKEN Procedure Parameters*

Parameter	Description
job	Number of the job being run.
broken	Job broken: IN value is FALSE.
next_date	Date of the next refresh.

---

---

**Note:** If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

---

---

### Usage Notes

You must issue a COMMIT statement immediately after the statement.

## CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

### Syntax

```
DBMS_JOB.CHANGE (
  job      IN  BINARY_INTEGER,
  what     IN  VARCHAR2,
  next_date IN DATE,
  interval IN  VARCHAR2,
  instance IN  BINARY_INTEGER DEFAULT NULL,
  force    IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 78–3** *CHANGE Procedure Parameters*

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.
next_date	Date of the next refresh.
interval	Date function; evaluated immediately before the job starts running.
instance	When a job is submitted, specifies which instance can run the job. This defaults to <code>NULL</code> , which indicates that instance affinity is not changed.
force	If this is <code>FALSE</code> , then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception.  If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance.

### Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
- If the parameters `what`, `next_date`, or `interval` are `NULL`, then leave that value as it is.

### Example

```
BEGIN
  DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
  COMMIT;
END;
```

## INSTANCE Procedure

This procedure changes job instance affinity.

### Syntax

```
DBMS_JOB.INSTANCE (
  job          IN BINARY_INTEGER,
  instance     IN BINARY_INTEGER,
  force        IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 78–4** *INSTANCE Procedure Parameters*

Parameter	Description
job	Number of the job being run.
instance	When a job is submitted, a user can specify which instance can run the job.
force	If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance. If this is <code>FALSE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception.

### Usage Notes

You must issue a `COMMIT` statement immediately after the statement.

## INTERVAL Procedure

This procedure changes how often a job runs.

### Syntax

```
DBMS_JOB.INTERVAL (
  job      IN  BINARY_INTEGER,
  interval IN  VARCHAR2);
```

### Parameters

**Table 78–5** *INTERVAL Procedure Parameters*

Parameter	Description
job	Number of the job being run.
interval	Date function, evaluated immediately before the job starts running.

### Usage Notes

- If the job completes successfully, then this new date is placed in `next_date`. `interval` is evaluated by plugging it into the statement `select interval into next_date from dual`;
- The `interval` parameter must evaluate to a time in the future. Legal intervals include:

Interval	Description
'sysdate + 7'	Run once a week.
'next_day(sysdate, ''TUESDAY'')'	Run once every Tuesday.
'null'	Run only once.

- If `interval` evaluates to `NULL` and if a job completes successfully, then the job is automatically deleted from the queue.
- You must issue a `COMMIT` statement immediately after the statement.

## NEXT\_DATE Procedure

This procedure changes when an existing job next runs.

### Syntax

```
DBMS_JOB.NEXT_DATE (  
    job          IN BINARY_INTEGER,  
    next_date IN DATE);
```

### Parameters

**Table 78–6** NEXT\_DATE Procedure Parameters

Parameter	Description
job	Number of the job being run.
next_date	Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.

### Usage Notes

You must issue a COMMIT statement immediately after the statement.

## REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

### Syntax

```
DBMS_JOB.REMOVE (  
    job          IN BINARY_INTEGER );
```

### Parameters

**Table 78–7 REMOVE Procedure Parameters**

Parameter	Description
job	Number of the job being run.

### Usage Notes

You must issue a COMMIT statement immediately after the statement.

### Example

```
BEGIN  
    DBMS_JOB.REMOVE(14144);  
    COMMIT;  
END;
```

## RUN Procedure

This procedure runs job `JOB` now. It runs it even if it is broken.

Running the job recomputes `next_date`. See view `user_jobs`.

### Syntax

```
DBMS_JOB.RUN (
  job      IN  BINARY_INTEGER,
  force    IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 78–8** *RUN Procedure Parameters*

Parameter	Description
<code>job</code>	Number of the job being run.
<code>force</code>	If this is <code>TRUE</code> , then instance affinity is irrelevant for running jobs in the foreground process. If this is <code>FALSE</code> , then the job can be run in the foreground only in the specified instance.

### Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

---

**Caution:** This re-initializes the current session's packages.

---

### Exceptions

An exception is raised if `force` is `FALSE`, and if the connected instance is the wrong one.

## SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

### Syntax

```
DBMS_JOB.SUBMIT (
  job      OUT BINARY_INTEGER,
  what     IN  VARCHAR2,
  next_date IN  DATE DEFAULT sysdate,
  interval IN  VARCHAR2 DEFAULT 'null',
  no_parse IN  BOOLEAN DEFAULT FALSE,
  instance IN  BINARY_INTEGER DEFAULT any_instance,
  force    IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 78–9 SUBMIT Procedure Parameters**

Parameter	Description
<code>job</code>	Number of the job being run.
<code>what</code>	PL/SQL procedure to run.
<code>next_date</code>	Next date when the job will be run.
<code>interval</code>	Date function that calculates the next time to run the job. The default is <code>NULL</code> . This must evaluate to either a future point in time or <code>NULL</code> .
<code>no_parse</code>	A flag. The default is <code>FALSE</code> . If this is set to <code>FALSE</code> , then Oracle parses the procedure associated with the job. If this is set to <code>TRUE</code> , then Oracle parses the procedure associated with the job the first time that the job is run.  For example, if you want to submit a job before you have created the tables associated with the job, then set this to <code>TRUE</code> .
<code>instance</code>	When a job is submitted, specifies which instance can run the job.
<code>force</code>	If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance. If this is <code>FALSE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception.

### Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

### Example

This submits a new job to the job queue. The job calls the procedure `DBMS_DDL.ANALYZE_OBJECT` to generate optimizer statistics for the table `DQUON.ACCOUNTS`. The statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```
VARIABLE jobno number;
BEGIN
```

```
DBMS_JOB.SUBMIT(:jobno,  
  'dbms_ddl.analyze_object(''TABLE'',  
  'DQUON', 'ACCOUNTS',  
  'ESTIMATE', NULL, 50);'  
  SYSDATE, 'SYSDATE + 1');  
COMMIT;  
END;  
/  
Statement processed.  
print jobno  
JOBNO  
-----  
14144
```

## USER\_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (*8i* and after) and preserves the compatibility.

### Syntax

```
DBMS_JOB.USER_EXPORT (  
  job      IN      BINARY_INTEGER,  
  mycall  IN OUT  VARCHAR2);  
  
DBMS_JOB.USER_EXPORT (  
  job      IN      BINARY_INTEGER,  
  mycall  IN OUT  VARCHAR2,  
  myinst  IN OUT  VARCHAR2);
```

### Parameters

**Table 78–10** *USER\_EXPORT Procedure Parameter*

Parameter	Description
job	Number of the job being run.
mycall	Text of a call to re-create the given job.
myinst	Text of a call to alter instance affinity.

## WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

### Syntax

```
DBMS_JOB.WHAT (  
  job      IN  BINARY_INTEGER,  
  what     IN  VARCHAR2);
```

### Parameters

**Table 78–11** WHAT Procedure Parameters

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.

### Usage Notes

- You must issue a COMMIT statement immediately after the statement.
- Some legal values of what (assuming the routines exist) are:
  - 'myproc(''10-JAN-82'', next\_date, broken);'
  - 'scott.emppackage.give\_raise(''JENKINS'', 30000.00);'
  - 'dbms\_job.remove(job);'

The DBMS\_LDAP package lets you access data from LDAP servers.

## DBMS\_LIBCACHE

The `DBMS_LIBCACHE` package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

  - Overview
  - Security Model
- [Summary of DBMS\\_LIBCACHE Subprograms](#)

---

## Using DBMS\_LIBCACHE

- [Overview](#)
- [Security Model](#)

## Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package `DBMS_LIBCACHE` for `SELECT` statements. The open and parse functions are executed in advance for `PL/SQL` and `DML`. For `PL/SQL`, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

## Security Model

To execute `DBMS_LIBCACHE` you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, `DBMS_LIBCACHE` should be called for each.

Alternatively, `DBMS_LIBCACHE` may be called with the generic user `PARSER`. However, this user cannot parse the SQL that uses objects with access granted through roles. This is a standard PL/SQL security limitation.

## Summary of DBMS\_LIBCACHE Subprograms

**Table 81-1 DBMS\_LIBCACHE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">COMPILE_FROM_REMOTE Procedure</a> on page 81-6	Extracts SQL in batch from the source instance and compiles the SQL at the target instance

## COMPILE\_FROM\_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

### Syntax

```
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
  p_db_link          IN      dbms_libcache$def.db_link%type,
  p_username         IN      VARCHAR2 default null,
  p_threshold_executions IN  NATURAL default 3,
  p_threshold_sharable_mem IN NATURAL default 1000,
  p_parallel_degree  IN      NATURAL default 1);
```

### Parameters

**Table 81–2** *COMPILE\_FROM\_REMOTE Procedure Parameters*

Parameter	Description
p_db_link	Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role <code>SELECT_ON_CATALOG</code> at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with <code>dbms_libcache\$def.ACCESS_METHOD = DB_LINK_METHOD</code>
p_instance_name	(Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive.
p_username	Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single <code>user_id</code> , for example <code>APPS</code> , <code>APPS</code> is the parsing <code>user_id</code> that is recorded in the shared pool. To select only SQL statements parsed by <code>APPS</code> , enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example <code>GL</code> . If the username is supplied, it must be valid. The name is not case sensitive.
p_threshold_executions	The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.

**Table 81-2 (Cont.) COMPILE\_FROM\_REMOTE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>p_threshold_sharable_mem</code>	The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.
<code>p_parallel_degree</code>	The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.

The DBMS\_LOB package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use DBMS\_LOB to access and manipulation specific parts of a LOB or complete LOBs.

## Using DBMS\_LOB

---

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Datatypes](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)

## Overview

DBMS\_LOB can read and modify BLOBs, CLOBs, and NLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

## Security Model

This package must be created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.

Any DBMS\_LOB subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS\_LOB subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the AUTHID to indicate whether they want definer's rights or invoker's rights. For example:

```
CREATE PROCEDURE proc1 AUTHID DEFINER ...
```

or

```
CREATE PROCEDURE proc1 AUTHID CURRENT_USER ...
```

**See Also:** For more information on AUTHID and privileges, see *Oracle Database PL/SQL Language Reference*

You can provide secure access to BFILES using the DIRECTORY feature discussed in BFILENAME function in the *Oracle Database SecureFiles and Large Objects Developer's Guide* and the *Oracle Database SQL Language Reference*.

For information about the security model pertaining to temporary LOBs, see [Operational Notes](#).

## Constants

The DBMS\_LOB package uses the constants shown in following tables:

- [Table 82–1, "DBMS\\_LOB Constants - Basic"](#)
- [Table 82–2, "DBMS\\_LOB Constants - Option Types"](#)
- [Table 82–3, "DBMS\\_LOB Constants - Option Values"](#)
- [Table 82–4, "DBMS\\_LOB Constants - DBFS State Value Types"](#)
- [Table 82–5, "DBMS\\_LOB Constants - DBFS Cache Flags"](#)
- [Table 82–6, "DBMS\\_LOB Constants - Maximum 1-Byte ASCII Characters for Contenttype"](#)

**Table 82–1 DBMS\_LOB Constants - Basic**

Constant	Type	Value	Description
CALL	PLS_INTEGER	12	Create the TEMP LOB with call duration
FILE_READONLY	BINARY_INTEGER	0	Open the specified BFILE read-only
LOB_READONLY	BINARY_INTEGER	0	Open the specified LOB read-only
LOB_READWRITE	BINARY_INTEGER	1	Open the specified LOB read-write
LOBMAXSIZE	INTEGER	18446744073709551615	Maximum size of a LOB in bytes
SESSION	PLS_INTEGER	10	Create the TEMP LOB with session duration

**Table 82–2 DBMS\_LOB Constants - Option Types**

Constant	Definition	Value	Description
OPT_COMPRESS	BINARY_INTEGER	1	Set/Get the SECUREFILE compress option value
OPT_DEDUPLICATE	BINARY_INTEGER	4	Set/Get the SECUREFILE Deduplicate option value
OPT_ENCRYPT	BINARY_INTEGER	2	Get the SECUREFILE encrypt option value

**Table 82–3 DBMS\_LOB Constants - Option Values**

Constant	Definition	Value	Description
COMPRESS_OFF	BINARY_INTEGER	0	For <a href="#">SETOPTIONS Procedures</a> , set compress off; for <a href="#">GETOPTIONS Functions</a> , compress is off
COMPRESS_ON	BINARY_INTEGER	1	For <a href="#">SETOPTIONS Procedures</a> , set compress on; for <a href="#">GETOPTIONS Functions</a> , compress is on
DEDUPLICATE_OFF	BINARY_INTEGER	0	For <a href="#">SETOPTIONS Procedures</a> , set deduplicate is off; for <a href="#">GETOPTIONS Functions</a> , deduplicate is off

**Table 82–3 (Cont.) DBMS\_LOB Constants - Option Values**

Constant	Definition	Value	Description
DEDUPLICATE_ON	BINARY_INTEGER	4	For <a href="#">SETOPTIONS Procedures</a> , set deduplicate is on; for <a href="#">GETOPTIONS Functions</a> , deduplicate is on
ENCRYPT_OFF	BINARY_INTEGER	0	For <a href="#">GETOPTIONS Functions</a> , encrypt is off
ENCRYPT_ON	BINARY_INTEGER	2	For <a href="#">GETOPTIONS Functions</a> , encrypt is on

**Table 82–4 DBMS\_LOB Constants - DBFS State Value Types**

Constant	Definition	Value	Description
DBFS_LINK_NEVER	PLS_INTEGER	0	LOB has never been archived
DBFS_LINK_NO	PLS_INTEGER	2	LOB was archived, but as been read back in to the RDBMS
DBFS_LINK_YES	PLS_INTEGER	1	LOB is currently archived

**Table 82–5 DBMS\_LOB Constants - DBFS Cache Flags**

Constant	Definition	Value	Description
DBFS_LINK_CACHE	PLS_INTEGER	1	Put the LOB data to the archive, but keep the data in the RDBMS as a cached version
DBFS_LINK_NOCACHE	PLS_INTEGER	0	Put the LOB data to the archive, and remove the data from the RDBMS.

**Table 82–6 DBMS\_LOB Constants - Maximum 1-Byte ASCII Characters for Contenttype**

Constant	Definition	Value	Description
CONTENTTYPE_MAX_SIZE	PLS_INTEGER	128	Maximum number of bytes allowed in the content type string

## Datatypes

The DBMS\_LOB package uses the datatypes shown in [Table 82–7](#).

**Table 82–7 Datatypes Used by DBMS\_LOB**

Type	Description
BLOB	Source or destination binary LOB.
RAW	Source or destination RAW buffer (used with BLOB).
CLOB	Source or destination character LOB (including NCLOB).
VARCHAR2	Source or destination character buffer (used with CLOB and NCLOB).
INTEGER	Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access.
BFILE	Large, binary object stored outside the database.

The DBMS\_LOB package defines no special types.

An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets.

The clause ANY\_CS in the specification of DBMS\_LOB subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

## Operational Notes

All `DBMS_LOB` subprograms work based on `LOB` locators. For the successful completion of `DBMS_LOB` subprograms, you must provide an input locator that represents a `LOB` that already exists in the database tablespaces or external file system. See also Chapter 1 of *Oracle Database SecureFiles and Large Objects Developer's Guide*.

To use `LOBs` in your database, you must first use SQL data definition language (DDL) to define the tables that contain `LOB` columns.

- [Internal `LOBs`](#)
- [External `LOBs`](#)
- [Temporary `LOBs`](#)

### Internal `LOBs`

To populate your table with internal `LOBs` after `LOB` columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the `LOB` columns.

### External `LOBs`

For an external `LOB` (`BFILE`) to be represented by a `LOB` locator, you must:

- Ensure that a `DIRECTORY` object representing a valid, existing physical directory has been defined, and that physical files (the `LOBs` you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the `DIRECTORY` object and the filename of the external `LOB` you are adding to the `BFILENAME` function to create a `LOB` locator for your external `LOB`.

Once you have completed these tasks, you can insert or update a row containing a `LOB` column using the specified `LOB` locator.

After the `LOBs` are defined and created, you can then `SELECT` from a `LOB` locator into a local PL/SQL `LOB` variable and use this variable as an input parameter to `DBMS_LOB` for access to the `LOB` value.

For details on the different ways to do this, you must refer to the section of the *Oracle Database SecureFiles and Large Objects Developer's Guide* that describes "Accessing External `LOBs` (`BFILES`)."

### Temporary `LOBs`

The database supports the definition, creation, deletion, access, and update of temporary `LOBs`. Your temporary tablespace stores the temporary `LOB` data. Temporary `LOBs` are not permanently stored in the database. Their purpose is mainly to perform transformations on `LOB` data.

For temporary `LOBs`, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary `LOBs` can be either `BLOBs`, `CLOBs`, or `NCLOBs`.

A temporary `LOB` is empty when it is created. By default, all temporary `LOBs` are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary `LOBs` are deleted, and the space for temporary `LOBs` is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as `CACHE/ NOCACHE`. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and rollbacks are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL `DBMS_LOB` package, `PRO*C/C++`, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the `EMPTY_BLOB` or `EMPTY_CLOB` functions that are supported for permanent LOBs. The `EMPTY_BLOB` function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the `DBMS_LOB` package by using the appropriate `FREETEMPORARY` or `OCIDurationEnd` statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and `DBMS_LOB` statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or `DBMS_LOB COPY` command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a `v$` view called `V$TEMPORARY_LOBS`, which contains information about how many temporary LOBs exist for each session. `v$` views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using `V$TEMPORARY_LOBS` in conjunction with `DBA_SEGMENTS`, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in `DBMS_LOB` return `NULL` if any of the input parameters are `NULL`. All procedures in `DBMS_LOB` raise an exception if the `LOB` locator is input as `NULL`.
2. Operations based on `CLOBs` do not verify if the character set IDs of the parameters (`CLOB` parameters, `VARCHAR2` buffers and patterns, and so on) match. It is the user's responsibility to ensure this.
3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.

**See Also:** *Oracle Database PL/SQL Language Reference* for more information on `NOCOPY` syntax

## Rules and Limits

- [General Rules and Limits](#)
- [Rules and Limits Specific to External Files \(BFILEs\)](#)
- [Maximum LOB Size](#)
- [Maximum Buffer Size](#)

### General Rules and Limits

- Oracle Database does not support constraints on columns or attributes whose type is a LOB, with the following exception: NOT NULL constraints are supported for a LOB column or attribute.
- The following rules apply in the specification of subprograms in this package:
  - length, offset, and amount parameters for subprograms operating on BLOBs and BFILEs must be specified in terms of *bytes*.
  - length, offset, and amount parameters for subprograms operating on CLOBs must be specified in terms of *characters*.

In multi-byte character sets, it is not possible to interpret these offsets correctly. As a result, SUBSTR raises the following error: ORA-22998: CLOB or NCLOB in multibyte character set not supported.

- A subprogram raises an INVALID\_ARGVAL exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
  1. Only positive, absolute offsets from the beginning of LOB data are permitted: Negative offsets from the tail of the LOB are not permitted.
  2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as amount, offset, newlen, nth, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
  3. The value of offset, amount, newlen, nth must not exceed the value lobmaxsize 18446744073709551615 ( $2^{64}$ ) in any DBMS\_LOB subprogram.
  4. For CLOBs consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed  $(lobmaxsize/character\_width\_in\_bytes)$  characters.

For example, if the CLOB consists of 2-byte characters, such as:

```
JA16SJISFIXED
```

Then, the maximum amount value should not exceed:

```
18446744073709551615/2 = 9223372036854775807
```

- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for RAW and VARCHAR2 parameters used in DBMS\_LOB subprograms. For example, if you declare a variable to be:

```
charbuf VARCHAR2(3000)
```

Then, charbuf can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for DBMS\_LOB subprograms for CLOBs and NCLOBs.

- The `%CHARSET` clause indicates that the form of the parameter with `%CHARSET` must match the form of the `ANY_CS` parameter to which it refers.

For example, in `DBMS_LOB` subprograms that take a `VARCHAR2` buffer parameter, the form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. If the input `LOB` parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input `LOB` parameter is of type `CLOB`, then the buffer must contain `CHAR` data.

For `DBMS_LOB` subprograms that take two `CLOB` parameters, both `CLOB` parameters must have the same form; that is, they must both be `NCLOBs`, or they must both be `CLOBs`.

- If the value of `amount` plus the `offset` exceeds the maximum `LOB` size allowed by the database, then access exceptions are raised.

Under these input conditions, read subprograms, such as `READ`, `COMPARE`, `INSTR`, and `SUBSTR`, read until `End of Lob/File` is reached. For example, for a `READ` operation on a `BLOB` or `BFILE`, if the user specifies `offset` value of 3 GB and an `amount` value of 2 GB on a `LOB` that is 4GB in size, then `READ` returns only 1GB (4GB-3GB) bytes.

- Functions with `NULL` or invalid input values for parameters return a `NULL`. Procedures with `NULL` values for destination `LOB` parameters raise exceptions.
- Operations involving patterns as parameters, such as `COMPARE`, `INSTR`, and `SUBSTR` do not support regular expressions or special matching characters (such as `%` in the `LIKE` operator in SQL) in the `pattern` parameter or substrings.
- The `End of LOB` condition is indicated by the `READ` procedure using a `NO_DATA_FOUND` exception. This exception is raised only upon an attempt by the user to read beyond the end of the `LOB`. The `READ` buffer for the last read contains 0 bytes.
- For consistent `LOB` updates, you must lock the row containing the destination `LOB` before making a call to any of the procedures (mutators) that modify `LOB` data.
- Unless otherwise stated, the default value for an `offset` parameter is 1, which indicates the first byte in the `BLOB` or `BFILE` data, and the first character in the `CLOB` or `NCLOB` value. No default values are specified for the `amount` parameter — you must input the values explicitly.
- You must lock the row containing the destination internal `LOB` before calling any subprograms that modify the `LOB`, such as `APPEND`, `COPY`, `ERASE`, `TRIM`, or `WRITE`. These subprograms do not implicitly lock the row containing the `LOB`.

### Rules and Limits Specific to External Files (BFILES)

- The subprograms `COMPARE`, `INSTR`, `READ`, `SUBSTR`, `FILECLOSE`, `FILECLOSEALL` and `LOADFROMFILE` operate only on an *opened* `BFILE` locator; that is, a successful `FILEOPEN` call must precede a call to any of these subprograms.
- For the functions `FILEEXISTS`, `FILEGETNAME` and `GETLENGTH`, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the `DIRECTORY` object and the file.
- `DBMS_LOB` does not support any concurrency control mechanism for `BFILE` operations.
- In the event of several open files in the session whose closure has not been handled properly, you can use the `FILECLOSEALL` subprogram to close all files opened in the session and resume file operations from the beginning.

- If you are the creator of a DIRECTORY, or if you have system privileges, then use the CREATE OR REPLACE, DROP, and REVOKE statements in SQL with extreme caution.

If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to invoke a program or anonymous block that calls FILECLOSEALL, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after *both* normal and abnormal termination of operations on the BFILE.

In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than SESSION\_MAX\_OPEN\_FILES.

In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the BFILE variable in its most current state.

After the exception transfers program control outside the PL/SQL program block, all references to the open BFILES are lost. The result is a larger open file count which may or may not exceed the SESSION\_MAX\_OPEN\_FILES value.

For example, consider a READ operation past the end of the BFILE value, which generates a NO\_DATA\_FOUND exception:

```
-- This assumes a directory 'DDD' whose path is already known
DECLARE
    fil BFILE:= bfilename('DDD', 'filename.foo');
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: ' ||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
END;
```

```
ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10
```

After the exception has occurred, the BFILE locator variable file goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```
DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
```

```
SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
dbms_lob.open(fil, dbms_lob.lob_readonly);
amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
dbms_lob.read(fil, amt, pos, buf);
dbms_output.put_line('Read F1 past EOF: '||
    utl_raw.cast_to_varchar2(buf));
dbms_lob.close(fil);
exception
WHEN no_data_found
THEN
    BEGIN
        dbms_output.put_line('End of File reached. Closing file');
        dbms_lob.fileclose(fil);
        -- or dbms_lob.filecloseall if appropriate
    END;
END;
```

```
Statement processed.
End of File reached. Closing file
```

In general, you should ensure that files opened in a PL/SQL block using `DBMS_LOB` are closed before normal or abnormal termination of the block.

### Maximum LOB Size

The maximum size for LOBs supported by the database is equal to the value of the blocksize of the tablespace the LOB column resides in times the value  $2^{32}-1$  (4294967295). This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

### Maximum Buffer Size

The maximum buffer size, 32767 bytes, is represented by `maxbufsize`.

## Exceptions

**Table 82–8 DBMS\_LOB Exceptions**

Exception	Code	Description
ACCESS_ERROR	22925	You are trying to write too much data to the LOB: LOB size is limited to 4 gigabytes.
BUFFERING_ENABLED	22279	Cannot perform operation with LOB buffering enabled
CONTENTTYPE_TOOLONG	43859	The length of the <code>contenttype</code> string exceeds the defined maximum. Modify the length of the <code>contenttype</code> string and retry the operation.
CONTENTTYPEBUF_WRONG	43862	The length of the <code>contenttype</code> buffer is less than defined constant. Modify the length of the <code>contenttype</code> buffer and retry the operation.
INVALID_ARGVAL	21560	The argument is expecting a non-NULL, valid value but the argument value passed in is NULL, invalid, or out of range.
INVALID_DIRECTORY	22287	The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access.
NO_DATA_FOUND	1403	ENDOFLOB indicator for looping read operations. This is not a hard error.
NOEXIST_DIRECTORY	22285	The directory leading to the file does not exist.
NOPRIV_DIRECTORY	22286	The user does not have the necessary access privileges on the directory or the file for the operation.
OPEN_TOOMANY	22290	The number of open files has reached the maximum limit.
OPERATION_FAILED	22288	The operation attempted on the file failed.
QUERY_WRITE	14553	Cannot perform a LOB write inside a query or PDML slave
SECUREFILE_BADLOB	43856	A non-SECUREFILE LOB type was used in a SECUREFILE only call
SECUREFILE_BADPARAM	43857	An invalid argument was passed to a SECUREFILE subprogram
SECUREFILE_MARKERASED	43861	The mark provided to a FRAGMENT_* operation has been deleted
SECUREFILE_OUTOFBOUNDS	43883	Attempted to perform a FRAGMENT_* operation past the LOB end
UNOPENED_FILE	22289	The file is not open for the required operation to be performed.
VALUE_ERROR	6502	PL/SQL error for invalid values to subprogram's parameters.

---

## Summary of DBMS\_LOB Subprograms

**Table 82–9 DBMS\_LOB Package Subprograms**

Subprogram	Description
<a href="#">APPEND Procedures</a> on page 82-19	Appends the contents of the source LOB to the destination LOB
<a href="#">CLOSE Procedure</a> on page 82-20	Closes a previously opened internal or external LOB
<a href="#">COMPARE Functions</a> on page 82-21	Compares two entire LOBs or parts of two LOBs
<a href="#">CONVERTTOBLOB Procedure</a> on page 82-23	Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets
<a href="#">CONVERTTOCLOB Procedure</a> on page 82-26	Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets
<a href="#">COPY Procedures</a> on page 82-29	Copies all, or part, of the source LOB to the destination LOB
<a href="#">COPY_DBFS_LINK Procedures</a> on page 82-31	Copies the DBFS link in the source LOB to the destination LOB
<a href="#">COPY_FROM_DBFS_LINK</a> on page 82-32	Retrieves the data for the LOB from the DBFS store
<a href="#">CREATETEMPORARY Procedures</a> on page 82-33	Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace
<a href="#">DBFS_LINK_GENERATE_PATH Functions</a> on page 82-34	Returns a unique file path name for use in creating a DBFS Link
<a href="#">ERASE Procedures</a> on page 82-35	Erases all or part of a LOB
<a href="#">FILECLOSE Procedure</a> on page 82-37	Closes the file
<a href="#">FILECLOSEALL Procedure</a> on page 82-38	Closes all previously opened files
<a href="#">FILEEXISTS Function</a> on page 82-39	Checks if the file exists on the server
<a href="#">FILEGETNAME Procedure</a> on page 82-40	Gets the directory object name and file name
<a href="#">FILEISOPEN Function</a> on page 82-41	Checks if the file was opened using the input BFILE locators
<a href="#">FILEOPEN Procedure</a> on page 82-42	Opens a file
<a href="#">FRAGMENT_DELETE Procedure</a> on page 82-43	Deletes the data at the specified offset for the specified length from the LOB
<a href="#">FRAGMENT_INSERT Procedures</a> on page 82-44	Inserts the specified data (limited to 32K) into the LOB at the specified offset

**Table 82–9 (Cont.) DBMS\_LOB Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">FRAGMENT_MOVE Procedure</a> on page 82-45	Moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified
<a href="#">FRAGMENT_REPLACE Procedures</a> on page 82-46	Replaces the data at the specified offset with the specified data (not to exceed 32k)
<a href="#">FREETEMPORARY Procedures</a> on page 82-48	Frees the temporary BLOB or CLOB in the default temporary tablespace
<a href="#">GET_DBFS_LINK Functions</a> on page 82-49	Returns the DBFS Link path associated with the specified SecureFile
<a href="#">GET_DBFS_LINK_STATE Procedures</a> on page 82-50	Retrieves the current DBFS Link state of the specified SecureFile
<a href="#">GETCHUNKSIZE Functions</a> on page 82-53	Returns the amount of space used in the LOB chunk to store the LOB value
<a href="#">GETCONTENTTYPE Functions</a> on page 82-51	Returns the content ID string previously set by means of the <a href="#">SETCONTENTTYPE Procedure</a>
<a href="#">GETLENGTH Functions</a> on page 82-55	Gets the length of the LOB value
<a href="#">GETOPTIONS Functions</a> on page 82-56	Obtains settings corresponding to the <code>option_type</code> field for a particular LOB
<a href="#">GET_STORAGE_LIMIT Function</a> on page 82-52	Returns the storage limit for LOBs in your database configuration
<a href="#">INSTR Functions</a> on page 82-57	Returns the matching position of the <i>n</i> th occurrence of the pattern in the LOB
<a href="#">ISOPEN Functions</a> on page 82-59	Checks to see if the LOB was already opened using the input locator
<a href="#">ISTEMPORARY Functions</a> on page 82-60	Checks if the locator is pointing to a temporary LOB
<a href="#">LOADBLOBFROMFILE Procedure</a> on page 82-61	Loads BFILE data into an internal BLOB
<a href="#">LOADCLOBFROMFILE Procedure</a> on page 82-63	Loads BFILE data into an internal CLOB
<a href="#">LOADFROMFILE Procedure</a> on page 82-67	Loads BFILE data into an internal LOB
<a href="#">MOVE_TO_DBFS_LINK Procedures</a> on page 82-69	Writes the specified SecureFile data to the DBFS store
<a href="#">OPEN Procedures</a> on page 82-70	Opens a LOB (internal, external, or temporary) in the indicated mode
<a href="#">READ Procedures</a> on page 82-72	Reads data from the LOB starting at the specified offset
<a href="#">SET_DBFS_LINK Procedures</a> on page 82-74	Links the specified SecureFile to the specified path name. It does not copy the data to the path
<a href="#">SETCONTENTTYPE Procedure</a> on page 82-75	Sets the content type string for the data in the LOB
<a href="#">SETOPTIONS Procedures</a> on page 82-76	Enables CSCE features on a per-LOB basis, overriding the default LOB column settings
<a href="#">SUBSTR Functions</a> on page 82-77	Returns part of the LOB value starting at the specified offset

**Table 82–9 (Cont.) DBMS\_LOB Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">TRIM Procedures</a> on page 82-79	Trims the LOB value to the specified shorter length
<a href="#">WRITE Procedures</a> on page 82-81	Writes data to the LOB from a specified offset
<a href="#">WRITEAPPEND Procedures</a> on page 82-83	Writes a buffer to the end of a LOB

## APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

### Syntax

```
DBMS_LOB.APPEND (
  dest_lob IN OUT NOCOPY BLOB,
  src_lob  IN          BLOB);

DBMS_LOB.APPEND (
  dest_lob IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob  IN          CLOB  CHARACTER SET dest_lob%CHARSET);
```

### Parameters

**Table 82–10 APPEND Procedure Parameters**

Parameter	Description
dest_lob	Locator for the internal LOB to which the data is to be appended.
src_lob	Locator for the internal LOB from which the data is to be read.

### Exceptions

**Table 82–11 APPEND Procedure Exceptions**

Exception	Description
VALUE_ERROR	Either the source or the destination LOB is NULL.
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

### Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- If APPEND is called on a LOB that has been archived, it implicitly gets the LOB before the first byte is written

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

### Syntax

```
DBMS_LOB.CLOSE (
    lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (
    lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (
    file_loc   IN OUT NOCOPY BFILE);
```

### Parameters

**Table 82–12** *CLOSE Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

### Exceptions

No error is returned if the BFILE exists but is not opened. An error is returned if the LOB is not open.

### Usage Notes

CLOSE requires a round-trip to the server for both internal and external LOBs. For internal LOBs, CLOSE triggers other code that relies on the close call, and for external LOBs (BFILES), CLOSE actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

### Syntax

```
DBMS_LOB.COMPARE (
  lob_1          IN BLOB,
  lob_2          IN BLOB,
  amount         IN INTEGER := DBMS_LOB.LOBMAXSIZE,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.COMPARE (
  lob_1          IN CLOB CHARACTER SET ANY_CS,
  lob_2          IN CLOB CHARACTER SET lob_1%CHARSET,
  amount         IN INTEGER := DBMS_LOB.LOBMAXSIZE,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.COMPARE (
  lob_1          IN BFILE,
  lob_2          IN BFILE,
  amount         IN INTEGER,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

### Parameters

**Table 82–13 COMPARE Function Parameters**

Parameter	Description
lob_1	LOB locator of first target for comparison.
lob_2	LOB locator of second target for comparison.
amount	Number of bytes (for BLOBs) or characters (for CLOBs/NCLOBs) to compare.
offset_1	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.
offset_2	Offset in bytes or characters on the second LOB (origin: 1) for the comparison.

### Return Values

- INTEGER: 0 if the comparison succeeds, nonzero if not.
- NULL, if any of amount, offset\_1 or offset\_2 is not a valid LOB offset value. A valid offset is within the range of 1 to LOBMAXSIZE inclusive.

## Usage Notes

- You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.
- COMPARE returns 0 if the data exactly matches over the range specified by the offset and amount parameters. COMPARE returns -1 if the first CLOB is less than the second, and 1 if it is greater.
- For fixed-width  $n$ -byte CLOBs, if the input amount for COMPARE is specified to be greater than  $(DBMS\_LOB.LOBMAXSIZE/n)$ , then COMPARE matches characters in a range of size  $(DBMS\_LOB.LOBMAXSIZE/n)$ , or  $\text{Max}(\text{length}(\text{clob1}), \text{length}(\text{clob2}))$ , whichever is lesser.
- If COMPARE is called on any LOB that has been archived, it implicitly gets the LOB before the compare begins.

## Exceptions

**Table 82–14 COMPARE Function Exceptions for BFILE operations**

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

### Syntax

```
DBMS_LOB.CONVERTTOBLOB (
  dest_lob      IN OUT  NOCOPY  BLOB,
  src_clob      IN      CLOB CHARACTER SET ANY_CS,
  amount        IN      INTEGER,
  dest_offset   IN OUT  INTEGER,
  src_offset    IN OUT  INTEGER,
  blob_csid     IN      NUMBER,
  lang_context  IN OUT  INTEGER,
  warning       OUT     INTEGER);
```

### Parameters

**Table 82–15** *CONVERTTOBLOB Procedure Parameters*

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_clob	LOB locator of the source LOB instance.
amount	Number of characters to convert from the source LOB. If you want to copy the entire LOB, pass the constant DBMS_LOB.LOBBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the LOB.
dest_offset	(IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in bytes after the end of the write.
src_offset	(IN) Offset in characters in the source LOB for the start of the read. (OUT) Offset in characters in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

**Table 82–15 (Cont.) CONVERTTOBLOB Procedure Parameters**

Parameter	Description
warning	<p>(OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message.</p> <p>Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package.</p>

## Usage Notes

### Preconditions

Before calling the `CONVERTTOBLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

### Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

[Table 82–16](#) gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

**Table 82–16 DBMS\_LOB.CONVERTTOBLOB Typical Values**

Parameter	Value	Description
amount	<code>LOBMAXSIZE</code> (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
blob_csid	<code>DEFAULT_CSID</code> (IN)	default CSID, use same CSID as source LOB
lang_context	<code>DEFAULT_LANG_CTX</code> (IN)	default language context
warning	<code>NO_WARNING</code> (OUT)	no warning message, success
	<code>WARN_INCONVERTIBLE_CHAR</code> (OUT)	character in source cannot be properly converted

### General Notes

- You must specify the desired character set for the destination LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the desired character set is the same as the source LOB character set.

- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The `amount` and `src_offset` values are in characters and the `dest_offset` is in bytes. To convert the entire LOB, you can specify `LOBMAXSIZE` for the `amount` parameter.
- `CONVERTTLOBLOB` gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

## Exceptions

Table 82–17 gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

**Table 82–17** *CONVERTTLOBLOB Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: <ul style="list-style-type: none"> <li>- <code>src_offset</code> or <code>dest_offset</code> &lt; 1.</li> <li>- <code>src_offset</code> or <code>dest_offset</code> &gt; <code>LOBMAXSIZE</code>.</li> <li>- <code>amount</code> &lt; 1.</li> <li>- <code>amount</code> &gt; <code>LOBMAXSIZE</code>.</li> </ul>

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

## CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

### Syntax

```
DBMS_LOB.CONVERTTOCLOB (
    dest_lob      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    src_blob      IN              BLOB,
    amount        IN              INTEGER,
    dest_offset   IN OUT          INTEGER,
    src_offset    IN OUT          INTEGER,
    blob_csid     IN              NUMBER,
    lang_context  IN OUT          INTEGER,
    warning       OUT             INTEGER);
```

### Parameters

**Table 82–18** *CONVERTTOCLOB Procedure Parameters*

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of bytes to convert from the source LOB.  If you want to copy the entire BLOB, pass the constant <code>DBMS_LOB.LOBMAXSIZE</code> . If you pass any other value, it must be less than or equal to the size of the BLOB.
dest_offset	(IN) Offset in characters in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB.  (OUT) The new offset in characters after the end of the write. This offset always points to the beginning of the first complete character after the end of the write.
src_offset	(IN) Offset in bytes in the source LOB for the start of the read.  (OUT) Offset in bytes in the source LOB right after the end of the read.
blob_csid	The character set ID of the source data
lang_context	(IN) Language context, such as shift status, for the current conversion.  (OUT) The language context at the time when the current conversion is done.  This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

**Table 82–18 (Cont.) CONVERTTOCLOB Procedure Parameters**

Parameter	Description
warning	Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message.  Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package.

## Usage Notes

### Preconditions

Before calling the `CONVERTTOCLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the `CONVERTTOCLOB` procedure. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

### Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

[Table 82–19](#) gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

**Table 82–19 DBMS\_LOB.CONVERTTOCLOB Typical Values**

Parameter	Value	Description
amount	<code>LOBMAXSIZE</code> (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	<code>DEFAULT_CSID</code> (IN)	default CSID, use destination CSID
lang_context	<code>DEFAULT_LANG_CTX</code> (IN)	default language context
warning	<code>NO_WARNING</code> (OUT)  <code>WARN_INCONVERTIBLE_CHAR</code> (OUT)	no warning message, success  character in source cannot be properly converted

### General Notes

- You must specify the desired character set for the destination LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the desired character set is the same as the source LOB character set.

- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The `amount` and `src_offset` values are in characters and the `dest_offset` is in bytes. To convert the entire LOB, you can specify `LOBMAXSIZE` for the `amount` parameter.
- `CONVERTTOCLOB` gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

## Exceptions

**Table 82–20** *CONVERTTOCLOB Procedure Exceptions*

Exception	Description
<code>VALUE_ERROR</code>	Any of the input parameters are <code>NULL</code> or <code>INVALID</code> .
<code>INVALID_ARGVAL</code>	One or more of the following: <ul style="list-style-type: none"> <li>- <code>src_offset</code> or <code>dest_offset</code> &lt; 1.</li> <li>- <code>src_offset</code> or <code>dest_offset</code> &gt; <code>LOBMAXSIZE</code>.</li> <li>- <code>amount</code> &lt; 1.</li> <li>- <code>amount</code> &gt; <code>LOBMAXSIZE</code>.</li> </ul>

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

## COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

### Syntax

```
DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY BLOB,
  src_lob    IN           BLOB,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset IN           INTEGER := 1);
```

```
DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob    IN           CLOB CHARACTER SET dest_lob%CHARSET,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset IN           INTEGER := 1);
```

### Parameters

**Table 82–21 COPY Procedure Parameters**

Parameter	Description
dest_lob	LOB locator of the copy target.
src_lob	LOB locator of source for the copy.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to copy.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.
src_offset	Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.

### Exceptions

**Table 82–22 COPY Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or invalid.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- src_offset or dest_offset &lt; 1</li> <li>- src_offset or dest_offset &gt; LOBMAXSIZE</li> <li>- amount &lt; 1</li> <li>- amount &gt; LOBMAXSIZE</li> </ul>
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

## Usage Notes

- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the `src_offset` to the end of the source LOB.
- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- Prior to copy, the source and destination LOBs are gotten, if they are currently archived. For a complete over-write, the destination LOB is not be retrieved.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## COPY\_DBFS\_LINK Procedures

This procedure copies the DBFS link in the source LOB to the destination LOB.

### Syntax

```
DBMS_LOB.COPY_DBFS_LINK (
  lob_loc_dst   IN OUT BLOB,
  lob_loc_src   IN     BLOB,
  flags         IN     PLS_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

```
DBMS_LOB.COPY_DBFS_LINK (
  lob_loc_dst   IN OUT CLOB CHARACTER SET ANY_CS,
  lob_loc_src   IN     CLOB CHARACTER SET ANY_CS,
  flags         IN     PLS_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

### Parameters

**Table 82–23** COPY\_DBFS\_LINK Procedure Parameters

Parameter	Description
lob_loc_dst	LOB to be made to reference the same storage data as lob_loc_src
lob_loc_src	LOB from which to copy the reference
flags	Options to COPY_DBFS_LINK: <ul style="list-style-type: none"> <li>▪ DBFS_LINK_NOCACHE specifies to only copy the DBFS Link</li> <li>▪ DBFS_LINK_CACHE specifies to copy the DBFS Link and read the data into the database LOB specified by lob_loc_dst so that the data is cached</li> </ul>

### Exceptions

**Table 82–24** COPY\_DBFS\_LINK Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Either lob_loc_src or lob_loc_dst is not a SECUREFILE
INVALID_ARGVAL	lob_loc_src LOB has not been archived
ORA-01555	If the source LOB has been retrieved, never archived, or if the LOB has been migrated in and out (modified or not) since the locator was gotten.

## COPY\_FROM\_DBFS\_LINK

This procedure reads the archived data from the DBFS store and writes it back into the LOB.

### Syntax

```
DBMS_LOB.COPY_FROM_DBFS_LINK (  
  lob_loc      IN OUT BLOB);
```

```
DBMS_LOB.COPY_FROM_DBFS_LINK (  
  lob_loc      IN OUT CLOB CHARACTER SET ANY_CS);
```

### Parameters

**Table 82–25** *COPY\_FROM\_DBFS\_LINK Procedure Parameters*

Parameter	Description
lob_loc	LOB to be retrieved from the archive

### Usage Note

Note that COPY\_FROM\_DBFS\_LINK does not remove the underlying DBFS file.

### Exceptions

**Table 82–26** *COPY\_FROM\_DBFS\_LINK Procedure Exceptions*

Exception	Description
SECUREFILE_ BADLOB	lob_loc is not a SECUREFILE
ORA-01555	If the LOB has already been retrieved and has been modified since retrieval, if the LOB has been migrated in and out (modified or not) since the locator was retrieved

## CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

### Syntax

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB,
  cache   IN           BOOLEAN,
  dur     IN           PLS_INTEGER := DBMS_LOB.SESSION);
```

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  cache   IN           BOOLEAN,
  dur     IN           PLS_INTEGER := 10);
```

### Parameters

**Table 82–27 CREATETEMPORARY Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
cache	Specifies if LOB should be read into buffer cache or not.
dur	1 of 3 predefined duration values (SESSION, TRANSACTION, or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session, transaction or call.  If dur is omitted, then the session duration is used.

#### See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure
- *Oracle Database PL/SQL Language Reference* for more information about NOCOPY and passing temporary lob as parameters

## DBFS\_LINK\_GENERATE\_PATH Functions

This subprogram returns a unique file path name for use in creating a DBFS Link.

### Syntax

```
DBMS_LOB.DBFS_LINK_GENERATE_PATH (  
  lob_loc      IN BLOB,  
  storage_dir  IN VARCHAR2)  
RETURN VARCHAR2;  
  
DBMS_LOB.DBFS_LINK_GENERATE_PATH (  
  lob_loc      IN CLOB CHARACTER SET ANY_CS,  
  storage_dir  IN VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 82–28** *DBFS\_LINK\_GENERATE\_PATH Function Parameters*

Parameter	Description
lob_loc	LOB to be retrieved from DBFS
storage_dir	DBFS directory that will be the parent directory of the file

### Exceptions

**Table 82–29** *DBFS\_LINK\_GENERATE\_PATH Function Exceptions*

Exception	Description
SECUREFILE_ WRONGTYPE	lob_loc is not a SECUREFILE

## ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

### Syntax

```
DBMS_LOB.ERASE (
  lob_loc          IN OUT NOCOPY BLOB,
  amount          IN OUT NOCOPY INTEGER,
  offset          IN              INTEGER := 1);

DBMS_LOB.ERASE (
  lob_loc          IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount          IN OUT NOCOPY INTEGER,
  offset          IN              INTEGER := 1);
```

### Parameters

**Table 82–30 ERASE Procedure Parameters**

Parameter	Description
lob_loc	Locator for the LOB to be erased. For more information, see <a href="#">Operational Notes</a> .
amount	Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.
offset	Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).

### Usage Notes

- When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.
- The actual number of bytes or characters erased can differ from the number you specified in the `amount` parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the `amount` parameter.
- ERASE gets the LOB if it is archived, unless the erase covers the entire LOB.

---

**Note:** The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "[TRIM Procedures](#)" on page 82-79.

---

### Exceptions

**Table 82–31 ERASE Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any input parameter is NULL.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- amount &lt; 1 or amount &gt; LOBMAXSIZE</li> <li>- offset &lt; 1 or offset &gt; LOBMAXSIZE</li> </ul>

**Table 82–31 (Cont.) ERASE Procedure Exceptions**

Exception	Description
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

## Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- ["TRIM Procedures"](#) on page 82-79
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## FILECLOSE Procedure

This procedure closes a BFILE that has already been opened through the input locator.

---

**Note:** The database has only read-only access to BFILES. This means that BFILES cannot be written through the database.

---

### Syntax

```
DBMS_LOB.FILECLOSE (
    file_loc IN OUT NOCOPY BFILE);
```

### Parameters

**Table 82–32 FILECLOSE Procedure Parameters**

Parameter	Description
file_loc	Locator for the BFILE to be closed.

### Exceptions

**Table 82–33 FILECLOSE Procedure Exceptions**

Exception	Description
VALUE_ERROR	NULL input value for file_loc.
UNOPENED_FILE	File was not opened with the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

#### See Also:

- ["FILEOPEN Procedure"](#) on page 82-42
- ["FILECLOSEALL Procedure"](#) on page 82-38
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## FILECLOSEALL Procedure

This procedure closes all BFILEs opened in the session.

### Syntax

```
DBMS_LOB.FILECLOSEALL;
```

### Exceptions

**Table 82–34 FILECLOSEALL Procedure Exception**

Exception	Description
UNOPENED_FILE	No file has been opened in the session.

**See Also:**

- ["FILEOPEN Procedure"](#) on page 82-42
- ["FILECLOSE Procedure"](#) on page 82-37
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## FILEEXISTS Function

This function finds out if a specified BFILE locator points to a file that actually exists on the server's file system.

### Syntax

```
DBMS_LOB.FILEEXISTS (
    file_loc    IN    BFILE)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 82–35 FILEEXISTS Function Parameter**

Parameter	Description
file_loc	Locator for the BFILE.

### Return Values

**Table 82–36 FILEEXISTS Function Return Values**

Return	Description
0	Physical file does not exist.
1	Physical file exists.

### Exceptions

**Table 82–37 FILEEXISTS Function Exceptions**

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

#### See Also:

- ["FILEISOPEN Function"](#) on page 82-41.
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator. This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the `dir_alias` buffer is 30, and for the entire path name, it is 2000.

### Syntax

```
DBMS_LOB.FILEGETNAME (  
    file_loc   IN    BFILE,  
    dir_alias  OUT   VARCHAR2,  
    filename  OUT   VARCHAR2);
```

### Parameters

**Table 82–38 FILEGETNAME Procedure Parameters**

Parameter	Description
<code>file_loc</code>	Locator for the BFILE
<code>dir_alias</code>	Directory object name
<code>filename</code>	Name of the BFILE

### Exceptions

**Table 82–39 FILEGETNAME Procedure Exceptions**

Exception	Description
<code>VALUE_ERROR</code>	Any of the input parameters are NULL or INVALID.
<code>INVALID_ARGVAL</code>	<code>dir_alias</code> or <code>filename</code> are NULL.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## FILEISOPEN Function

This function finds out whether a BFILE was opened with the specified FILE locator.

### Syntax

```
DBMS_LOB.FILEISOPEN (
    file_loc IN BFILE)
RETURN INTEGER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 82–40 FILEISOPEN Function Parameter**

Parameter	Description
file_loc	Locator for the BFILE.

### Return Values

INTEGER: 0 = file is not open, 1 = file is open

### Usage Notes

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

### Exceptions

**Table 82–41 FILEISOPEN Function Exceptions**

Exception	Description
NOEXIST_ DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_ DIRECTORY	Directory has been invalidated after the file was opened.

#### See Also:

- ["FILEEXISTS Function"](#) on page 82-39
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

### Syntax

```
DBMS_LOB.FILEOPEN (
    file_loc   IN OUT NOCOPY BFILE,
    open_mode  IN             BINARY_INTEGER := file_readonly);
```

### Parameters

**Table 82–42 FILEOPEN Procedure Parameters**

Parameter	Description
file_loc	Locator for the BFILE.
open_mode	File access is read-only.

### Exceptions

**Table 82–43 FILEOPEN Procedure Exceptions**

Exception	Description
VALUE_ERROR	file_loc or open_mode is NULL.
INVALID_ARGVAL	open_mode is not equal to FILE_READONLY.
OPEN_TOOMANY	Number of open files in the session exceeds session_max_open_files.
NOEXIST_DIRECTORY	Directory associated with file_loc does not exist.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

#### See Also:

- ["FILECLOSE Procedure"](#) on page 82-37
- ["FILECLOSEALL Procedure"](#) on page 82-38
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## FRAGMENT\_DELETE Procedure

This procedure deletes the data at the specified offset for the specified length from the LOB without having to rewrite all the data in the LOB following the specified offset.

### Syntax

```
DBMS_LOB.FRAGMENT_DELETE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  offset       IN           INTEGER);

DBMS_LOB.FRAGMENT_DELETE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  offset       IN           INTEGER);
```

### Parameters

**Table 82–44** *FRAGMENT\_DELETE Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be removed from the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the deletion

### Exceptions

**Table 82–45** *FRAGMENT\_DELETE Procedure Exceptions*

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

## FRAGMENT\_INSERT Procedures

This procedure inserts the specified data (limited to 32K) into the LOB at the specified offset.

### Syntax

```
DBMS_LOB.FRAGMENT_INSERT (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  offset       IN           INTEGER,
  buffer       IN           RAW);

DBMS_LOB.FRAGMENT_INSERT (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  offset       IN           INTEGER,
  buffer       IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

### Parameters

**Table 82–46** *FRAGMENT\_INSERT Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be inserted into the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the insertion
buffer	Data to insert into the LOB

### Exceptions

**Table 82–47** *FRAGMENT\_INSERT Procedure Exceptions*

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

### Usage Notes

FRAGMENT\_INSERT gets the LOB, if necessary, before performing operations on the LOB.

## FRAGMENT\_MOVE Procedure

This procedure moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified.

### Syntax

```
DBMS_LOB.FRAGMENT_MOVE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  src_offset   IN           INTEGER,
  dest_offset  IN           INTEGER);
```

```
DBMS_LOB.FRAGMENT_MOVE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  src_offset   IN           INTEGER,
  dest_offset  IN           INTEGER);
```

### Parameters

**Table 82–48 FRAGMENT\_MOVE Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be moved in the LOB
src_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
dest_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to remove the data

### Exceptions

**Table 82–49 FRAGMENT\_MOVE Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

### Usage Notes

- All offsets are pre-move offsets.
- Offsets of more than 1 past the end of the LOB are not permitted.
- FRAGMENT\_MOVE gets the LOB, if necessary, before performing operations on the LOB.

## FRAGMENT\_REPLACE Procedures

This procedure replaces the data at the specified offset with the specified data (not to exceed 32k).

### Syntax

```
DBMS_LOB.FRAGMENT_REPLACE (
  lob_loc      IN OUT NOCOPY BLOB,
  old_amount   IN             INTEGER,
  new_amount   IN             INTEGER,
  offset       IN             INTEGER,
  buffer       IN             RAW);

DBMS_LOB.FRAGMENT_REPLACE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  old_amount   IN             INTEGER,
  new_amount   IN             INTEGER,
  offset       IN             INTEGER,
  buffer       IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

### Parameters

**Table 82–50 FRAGMENT\_REPLACE Function Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
old_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be replaced in the LOB
new_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to written to the LOB
offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
buffer	Data to insert into the LOB

### Exceptions

**Table 82–51 FRAGMENT\_REPLACE Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

### Usage Notes

- Invoking this procedure is equivalent to deleting the old amount of bytes/characters at offset and then inserting the new amount of bytes/characters at offset.

- `FRAGMENT_REPLACE` gets the LOB, if necessary, before performing operations on the LOB.

## FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in the default temporary tablespace.

### Syntax

```
DBMS_LOB.FREETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB);

DBMS_LOB.FREETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);
```

### Parameters

**Table 82–52** *FREETEMPORARY Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

### Usage Notes

- When a new temporary LOB is created, and there is currently no temporary LOB in use with the same duration (session, transaction, call), a new temporary LOB segment is created. When the temporary LOB is freed, the space it consumed is released to the temporary segment. If there are no other temporary LOBs for the same duration, the temporary segment is also freed.
- After the call to `FREETEMPORARY`, the LOB locator that was freed is marked as invalid.
- If an invalid LOB locator is assigned to another LOB locator using `OCILobLocatorAssign` in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## GET\_DBFS\_LINK Functions

This function returns the DBFS Link path associated with the specified SecureFile.

### Syntax

```
DBMS_LOB.GET_DBFS_LINK (
  lob_loc          IN      BLOB,
  storage_path     OUT VARCHA2(DBFS_LINK_PATH_MAX_SIZE) ,
  lob_length       OUT NUMBER);
```

```
DBMS_LOB.GET_DBFS_LINK (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  storage_path     OUT VARCHA2(DBFS_LINK_PATH_MAX_SIZE) ,
  lob_length       OUT NUMBER);
```

### Parameters

**Table 82–53** *GET\_DBFS\_LINK Function Parameters*

Parameter	Description
lob_loc	LOB to be retrieved from DBFS
storage_path	Path where the LOB is stored in DBFS
lob_length	LOB length at the time of write to DBFS

### Return Values

The Archive ID

### Exceptions

**Table 82–54** *GET\_DBFS\_LINK Function Exceptions*

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE
ORA-01555	If the LOB has already been retrieved and has been modified since retrieval, if the LOB has been migrated in and out (modified or not) since the locator was retrieved

## GET\_DBFS\_LINK\_STATE Procedures

This procedure retrieves the current DBFS Link state of the specified SecureFile.

### Syntax

```
DBMS_LOB.GET_DBFS_LINK_STATE (
  lob_loc      IN BLOB,
  storage_path OUT VARCHAR2 (DBFS_LINK_PATH_MAX_SIZE),
  state        OUT NUMBER,
  cached       OUT BOOLEAN);
```

```
DBMS_LOB.GET_DBFS_LINK_STATE (
  lob_loc      IN CLOB CHARACTER SET ANY_CS,
  storage_path OUT VARCHAR2 (DBFS_LINK_PATH_MAX_SIZE),
  state        OUT NUMBER,
  cached       OUT BOOLEAN);
```

### Parameters

**Table 82–55** GET\_DBFS\_LINK\_STATE Procedure Parameters

Parameter	Description
lob_loc	LOB to be retrieved from the archive
storage_path	Path where the LOB is stored in DBFS
state	One of DBFS_LINK_NEVER, DBFS_LINK_NO or DBFS_LINK_YES
cached	If the LOB is archived and the data was specified to be cached on put

### Exceptions

**Table 82–56** GET\_DBFS\_LINK\_STATE Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

### Usage Notes

- If the LOB has never been archived, state is set to DBMS\_LOB.DBFS\_LINK\_NEVER. If the LOB has been archived, state is set to DBMS\_LOB.DBFS\_LINK\_YES. If the LOB has been previously retrieved from the archive, state is set to DBFS\_LINK\_NO.
- If the LOB was archived, but the data was left in the RDBMS, cached is set to TRUE. Cached is set to FALSE if the data was removed after the put, and NULL if state is DBMS\_LOB.DBFS\_LINK\_NEVER.

## GETCONTENTTYPE Functions

This procedure returns the content type string previously set by means of the [SETCONTENTTYPE Procedure](#).

### Syntax

```
DBMS_LOB.GETCONTENTTYPE (
  lob_loc IN BLOB)
RETURN VARCHAR2;

DBMS_LOB.GETCONTENTTYPE (
  lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(getcontenttype, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 82–57** *GETCONTENTTYPE Function Parameters*

Parameter	Description
lob_loc	LOB whose content type is to be retrieved

### Return Values

The returned content type.

### Exceptions

**Table 82–58** *GETCONTENTTYPE Function Exceptions*

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

## GET\_STORAGE\_LIMIT Function

This function returns the LOB storage limit for the specified LOB.

### Syntax

```
DBMS_LOB.GET_STORAGE_LIMIT (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;

DBMS_LOB.GET_STORAGE_LIMIT (
    lob_loc IN BLOB)
RETURN INTEGER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(get_storage_limit, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 82–59** GET\_STORAGE\_LIMIT Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

### Return Value

The value returned from this function is the maximum allowable size for specified LOB locator. For BLOBs, the return value depends on the block size of the tablespace the LOB resides in and is calculated as  $(2^{32})-1$  (4294967295) times the block size of the tablespace. For CLOBs/NCLOBs, the value returned is the  $(2^{32})-1$  (4294967295) times the block size of the tablespace divided by the character width of the CLOB/NCLOB.

### Usage

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for details on LOB storage limits

## GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, a multiple of tablespace blocks in bytes. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value.

This function returns the amount of space used in the LOB chunk to store the LOB value.

### Syntax

```
DBMS_LOB.GETCHUNKSIZE (
    lob_loc IN BLOB)
    RETURN INTEGER;

DBMS_LOB.GETCHUNKSIZE (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
    RETURN INTEGER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(getchunksizesize, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 82–60** GETCHUNKSIZE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

### Return Values

The return value is a usable chunk size in bytes.

### Usage Notes

- With regard to basic LOB files, performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the WRITE until you have enough for a chunk, instead of issuing several WRITE calls for the same chunk.

These tactics of performance improvement do not apply to SecureFiles.

- Note that chunk size is independent of LOB type (BLOB, CLOB, NCLOB, Unicode or other character set).

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## Exceptions

**Table 82–61** *GETCHUNKSIZE Procedure Exceptions*

<b>Exception</b>	<b>Description</b>
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

## GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

### Syntax

```
DBMS_LOB.GETLENGTH (
  lob_loc   IN BLOB)
RETURN INTEGER;

DBMS_LOB.GETLENGTH (
  lob_loc   IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;

DBMS_LOB.GETLENGTH (
  file_loc  IN BFILE)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

### Parameters

**Table 82–62** GETLENGTH Function Parameter

Parameter	Description
file_loc	The file locator for the LOB whose length is to be returned.

### Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob\_loc is NULL. An error is returned in the following cases for BFILES:

- lob\_loc does not have the necessary directory and operating system privileges
- lob\_loc cannot be read because of an operating system read error

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

### Exceptions

**Table 82–63** GETLENGTH Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

## GETOPTIONS Functions

This function obtains settings corresponding to the `option_type` field for a particular LOB.

### Syntax

```
DBMS_LOB.GETOPTIONS (
  lob_loc          IN      BLOB,
  option_types     IN      PLS_INTEGER)
RETURN PLS_INTEGER;

DBMS_LOB.GETOPTIONS (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  option_types     IN      PLS_INTEGER)
RETURN PLS_INTEGER;
```

### Parameters

**Table 82–64** *GETOPTIONS Function Parameter*

Parameter	Description
<code>lob_loc</code>	Locator for the LOB to be examined. For more information, see <a href="#">Operational Notes</a> .
<code>option_type</code>	See <a href="#">DBMS_LOB Constants - Option Types</a> on page 82-5

### Return Values

The return values are a combination of `COMPRESS_ON`, `ENCRYPT_ON` and `DEDUPLICATE_ON` (see [DBMS\\_LOB Constants - Option Values](#) on page 82-5) depending on which option types (see [DBMS\\_LOB Constants - Option Types](#) on page 82-5) are passed in.

### Exceptions

**Table 82–65** *GETOPTIONS Procedure Exceptions*

Exception	Description
<code>INVALID_ARGVAL</code>	A parameter value was invalid
<code>QUERY_WRITE</code>	Cannot perform operation during a query
<code>BUFFERING_ENABLED</code>	Cannot perform operation with LOB buffering enabled
<code>SECUREFILE_BADLOB</code>	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call

### Usage Notes

You cannot turn compression or deduplication on or off for a SecureFile column that does not have those features on. The `GetOptions` Functions and [SETOPTIONS Procedures](#) work on individual SecureFiles. You can turn off a feature on a particular SecureFile and turn on a feature that has already been turned off by `SetOptions`, but you cannot turn on an option that has not been given to the SecureFile when the table was created.

## INSTR Functions

This function returns the matching position of the *n*th occurrence of the pattern in the LOB, starting from the offset you specify.

### Syntax

```
DBMS_LOB.INSTR (
  lob_loc    IN    BLOB,
  pattern    IN    RAW,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (
  lob_loc    IN    CLOB          CHARACTER SET ANY_CS,
  pattern    IN    VARCHAR2     CHARACTER SET lob_loc%CHARSET,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (
  file_loc   IN    BFILE,
  pattern    IN    RAW,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

### Parameters

**Table 82–66 INSTR Function Parameters**

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see <a href="#">Operational Notes</a> .
file_loc	The file locator for the LOB to be examined.
pattern	Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs. The maximum size of the pattern is 16383 bytes.
offset	Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)
nth	Occurrence number, starting at 1.

### Return Values

**Table 82–67 INSTR Function Return Values**

Return	Description
INTEGER	Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.

**Table 82–67 (Cont.) INSTR Function Return Values**

Return	Description
NULL	Either: -any one or more of the IN parameters was NULL or INVALID. -offset < 1 or offset > LOBMAXSIZE. -nth < 1. -nth > LOBMAXSIZE.

## Usage Notes

The form of the VARCHAR2 buffer (the `pattern` parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILES, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

## Exceptions

**Table 82–68 INSTR Function Exceptions for BFILES**

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

### See Also:

- ["SUBSTR Functions"](#) on page 82-77
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

### Syntax

```
DBMS_LOB.ISOPEN (
  lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
  lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
  file_loc IN BFILE)
  RETURN INTEGER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 82–69 ISOPEN Function Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
file_loc	File locator.

### Return Values

The return value is 1 if the LOB is open, 0 otherwise.

### Usage Notes

For BFILES, openness is associated with the locator. If the input locator was never passed to OPEN, the BFILE is not considered to be opened by this locator. However, a different locator may have opened the BFILE. More than one OPEN can be performed on the same BFILE using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, ISOPEN requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.

For external LOBs (BFILES), ISOPEN also requires a round-trip, because that's where the state is kept.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## ISTEMPORARY Functions

This function determines whether a LOB instance is temporary.

### Syntax

```
DBMS_LOB.ISTEMPORARY (
    lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.ISTEMPORARY (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 82–70** *ISTEMPORARY Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .

### Return Values

The return value is 1 if the LOB is temporary and exists; 0 if the LOB is not temporary or does not exist; NULL if the given locator is NULL.

### Usage Notes

When you free a Temporary LOB with `FREETEMPORARY`, the LOB locator is not set to NULL. Consequently, `ISTEMPORARY` will return 0 for a locator that has been freed but not explicitly reset to NULL.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as LOADFROMFILE, and returns the new offsets.

### Syntax

```
DBMS_LOB.LOADBLOBFROMFILE (
  dest_lob    IN OUT NOCOPY BLOB,
  src_bfile   IN          BFILE,
  amount      IN          INTEGER,
  dest_offset IN OUT     INTEGER,
  src_offset  IN OUT     INTEGER);
```

### Parameters

**Table 82–71** *LOADBLOBFROMFILE Procedure Parameters*

Parameter	Description
dest_lob	BLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.

### Usage Notes

- You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src\_offset, because they refer to the BFILE, are in terms of bytes, and the dest\_offset is in bytes for BLOBs.
- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely

affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- LOADFROMFILE gets the destination LOB prior to the load unless the load covers the entire LOB.

### Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for IN/OUT parameter or provide a default value for the IN parameter. Here is a summary of the constants and the defaults that can be used.

**Table 82–72 Suggested Values of the Parameter**

Parameter	Default Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Constants defined in DBMSLOB.SQL

```
lobmaxsize          CONSTANT INTEGER          := DBMS_LOB.LOBMAXSIZE;
```

### Exceptions

**Table 82–73 LOADBLOBFROMFILE Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- src_offset or dest_offset &lt; 1.</li> <li>- src_offset or dest_offset &gt; LOBMAXSIZE.</li> <li>- amount &lt; 1.</li> <li>- amount &gt; LOBMAXSIZE.</li> </ul>
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the BLOB

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

### Syntax

```
DBMS_LOB.LOADCLOBFROMFILE (
  dest_lob      IN OUT NOCOPY  NOCOPY CLOB CHARACTER SET ANY_CS,
  src_bfile     IN              BFILE,
  amount        IN              INTEGER,
  dest_offset   IN OUT         INTEGER,
  src_offset    IN OUT         INTEGER,
  bfile_csid    IN              NUMBER,
  lang_context  IN OUT         INTEGER,
  warning       OUT            INTEGER);
```

### Parameters

**Table 82–74** *LOADCLOBFROMFILE Procedure Parameters*

Parameter	Description
dest_lob	CLOB/NCLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. Use DBMS_LOB.LOBBMAXSIZE of load until the end of the BFILE.
dest_offset	(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.
bfile_csid	Character set id of the source (BFILE) file.
lang_context	(IN) Language context, such as shift status, for the current load.  (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call

**Table 82–74 (Cont.) LOADCLOBFROMFILE Procedure Parameters**

Parameter	Description
warning	(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined the constant value <code>DBMS_LOB.WARN_INCONVERTIBLE_CHAR</code> .

## Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is `LOBMAXSIZE` which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.
- `csid=0` indicates the default behavior that uses database `csid` for CLOB and national `csid` for NCLOB in the place of source `csid`. Conversion is still necessary if it is of varying width
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

The source BFILE can contain data in the Unicode character set. The Unicode standard defines many encoding schemes that provide mappings from Unicode characters to sequences of bytes. [Table 82–75, "Supported Unicode Encoding Schemes"](#) lists Unicode encodings schemes supported by this subprogram.

**Table 82–75 Supported Unicode Encoding Schemes**

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-8	AL32UTF8	873
UTF-16BE	AL16UTF16	2000

**Table 82–75 (Cont.) Supported Unicode Encoding Schemes**

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-16LE	AL16UTF16LE	2002
CESU-8	UTF8	871
UTF-EBCDIC	UTFE	872
UTF-16	UTF16	1000

All three UTF-16 encoding schemes encode Unicode characters as 2-byte unsigned integers. Integers can be stored in big-endian or in little-endian byte order. The UTF-16BE encoding scheme defines big-endian data. The UTF-16LE scheme defines little-endian data. The UTF-16 scheme requires that the source BFILE contains the Byte Order Mark (BOM) character in the first two bytes to define the byte order. The BOM code is 0xFEFF. If the code is stored as {0xFE, 0xFF}, the data is interpreted as big-endian. If it is stored as {0xFF, 0xFE}, the data is interpreted as little-endian.

In UTF-8 and in CESU-8 encodings the Byte Order Mark is stored as {0xEF, 0xBB, 0xBF}. With any of the Unicode encodings, the corresponding BOM sequence at the beginning of the file is recognized and not loaded into the destination LOB.

## Constants

Here is a summary of the constants and the suggested values that can be used.

**Table 82–76 Suggested Values of the Parameter**

Parameter	Suggested Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	0 (IN)	default csid, use destination csid
lang_context	0 (IN)	default language context
warning	0 (OUT)	no warning message, everything is ok

Constants defined in DBMSLOB.SQL

lobmaxsize	CONSTANT INTEGER	:= 18446744073709551615;
warn_inconvertible_char	CONSTANT INTEGER	:= 1;
default_csid	CONSTANT INTEGER	:= 0;
default_lang_ctx	CONSTANT INTEGER	:= 0;
no_warning	CONSTANT INTEGER	:= 0;

## Exceptions

**Table 82–77 LOADCLOBFROMFILE Procedure Exceptions**

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.

**Table 82–77 (Cont.) LOADCLOBFROMFILE Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	Either: <ul style="list-style-type: none"><li>- src_offset or dest_offset &lt; 1.</li><li>- src_offset or dest_offset &gt; LOBMAXSIZE.</li><li>- amount &lt; 1.</li><li>- amount &gt; LOBMAXSIZE.</li></ul>
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the CLOB

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## LOADFROMFILE Procedure

This procedure copies all, or a part of, a source external LOB (BFILE) to a destination internal LOB.

### Syntax

```
DBMS_LOB.LOADFROMFILE (
  dest_lob   IN OUT NOCOPY BLOB,
  src_file   IN           BFILE,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset IN           INTEGER := 1);
```

### Parameters

**Table 82–78** *LOADFROMFILE Procedure Parameters*

Parameter	Description
dest_lob	LOB locator of the target for the load.
src_file	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.
src_offset	Offset in bytes in the source BFILE (origin: 1) for the start of the load.

### Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is either in bytes or characters for BLOBs and CLOBs respectively.

---

**Note:** The input BFILE must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary BFILE data is loaded into a CLOB. The BFILE data must already be in the same character set as the CLOB in the database. No error checking is performed to verify this.

---

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.

---

---

**Note:** If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using `DBMS_LOB.LOADFROMFILE`, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use `sql*loader` instead of `LOADFROMFILE` to load data into a CLOB or NCLOB because `sql*loader` provides the necessary character set conversions.

---

---

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

## Exceptions

**Table 82–79** *LOADFROMFILE Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- <code>src_offset</code> or <code>dest_offset</code> &lt; 1.</li> <li>- <code>src_offset</code> or <code>dest_offset</code> &gt; LOBMAXSIZE.</li> <li>- <code>amount</code> &lt; 1.</li> <li>- <code>amount</code> &gt; LOBMAXSIZE.</li> </ul>

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## MOVE\_TO\_DBFS\_LINK Procedures

This procedure writes the specified SecureFile data to the DBFS store.

### Syntax

```
DBMS_LOB.MOVE_TO_DBFS_LINK (
  lob_loc      IN OUT BLOB,
  storage_path IN    VARCHAR2(dbfs_link_path_max_size),
  flags        IN    BINARY_INTEGER DEFAULT DBFS_LINK_NOCACHE);

DBMS_LOB.MOVE_TO_DBFS_LINK (
  lob_loc      IN OUT CLOB CHARACTER SET ANY_CS,
  storage_path IN    VARCHAR2(dbfs_link_path_max_size),
  flags        IN    BINARY_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

### Parameters

**Table 82–80 MOVE\_TO\_DBFS\_LINK Procedure Parameters**

Parameter	Description
lob_loc	LOB to be archived
storage_path	Path where the LOB will be stored
flags	Either DBFS_LINK_CACHE or DBFS_LINK_NOCACHE. If DBFS_LINK_CACHE is specified, the LOB data continues to be stored in the RDBMS as well as being written to the DBFS store. DBFS_LINK_NOCACHE specifies that the LOB data should be deleted from the RDBMS once written to the DBFS.

### Exceptions

**Table 82–81 MOVE\_TO\_DBFS\_LINK Procedure Exceptions**

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

### Usage Notes

- If the LOB is already archived, the procedure silently returns as if the put was successful. In that case, if DBFS\_LINK\_NOCACHE is specified, or flags is defaulted, the LOB data is removed from the RDBMS.
- Calling this procedure multiple times on the same LOB with the same flags has no effect.
- Calling the procedure on a LOB that is already archived causes the LOB to be cached (DBFS\_LINK\_CACHE) or removed (DBFS\_LINK\_NOCACHE) according to the flag setting.

## OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

### Syntax

```
DBMS_LOB.OPEN (
  lob_loc  IN OUT NOCOPY BLOB,
  open_mode IN          BINARY_INTEGER);

DBMS_LOB.OPEN (
  lob_loc  IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  open_mode IN          BINARY_INTEGER);

DBMS_LOB.OPEN (
  file_loc IN OUT NOCOPY BFILE,
  open_mode IN          BINARY_INTEGER := file_readonly);
```

### Parameters

**Table 82–82 OPEN Procedure Parameters**

Parameter	Description
lob_loc	LOB locator. For more information, see <a href="#">Operational Notes</a> .
open_mode	Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY.

### Usage Notes

---

**Note:** If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

---

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILES), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the buffer parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the amount parameter. If the input `offset` points past the End of LOB, then amount is set to 0, and a `NO_DATA_FOUND` exception is raised.

### Syntax

```
DBMS_LOB.READ (
  lob_loc   IN          BLOB,
  amount    IN OUT NOCOPY INTEGER,
  offset    IN          INTEGER,
  buffer    OUT         RAW);

DBMS_LOB.READ (
  lob_loc   IN          CLOB CHARACTER SET ANY_CS,
  amount    IN OUT NOCOPY INTEGER,
  offset    IN          INTEGER,
  buffer    OUT         VARCHAR2 CHARACTER SET lob_loc%CHARSET);

DBMS_LOB.READ (
  file_loc  IN          BFILE,
  amount    IN OUT NOCOPY INTEGER,
  offset    IN          INTEGER,
  buffer    OUT         RAW);
```

### Parameters

**Table 82–83 READ Procedure Parameters**

Parameter	Description
<code>lob_loc</code>	Locator for the LOB to be read. For more information, see <a href="#">Operational Notes</a> .
<code>file_loc</code>	The file locator for the LOB to be examined.
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read.
<code>offset</code>	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).
<code>buffer</code>	Output buffer for the read operation.

### Exceptions

[Table 82–84](#) lists exceptions that apply to any LOB instance. [Table 82–85](#) lists exceptions that apply only to BFILES.

**Table 82–84 READ Procedure Exceptions**

Exception	Description
<code>VALUE_ERROR</code>	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL.

**Table 82–84 (Cont.) READ Procedure Exceptions**

Exception	Description
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- amount &lt; 1</li> <li>- amount &gt; MAXBUFSIZE</li> <li>- offset &lt; 1</li> <li>- offset &gt; LOBMAXSIZE</li> <li>- amount is greater, in bytes or characters, than the capacity of buffer.</li> </ul>
NO_DATA_FOUND	End of the LOB is reached, and there are no more bytes or characters to read from the LOB: amount has a value of 0.

**Table 82–85 READ Procedure Exceptions for BFILES**

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

## Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.
- When calling DBMS\_LOB.READ from the client (for example, in a BEGIN/END block from within SQL\*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.
- READ gets the LOB, if necessary, before the read.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## SET\_DBFS\_LINK Procedures

This function links the specified SecureFile to the specified path name. It does not copy the data to the path.

### Syntax

```
DBMS_LOB.SET_DBFS_LINK (
  lob_loc      IN OUT BLOB,
  archive_id   IN     RAW(1024));

DBMS_LOB.SET_DBFS_LINK(
  lob_loc_dst  IN OUT CLOB CHARACTER SET ANY_CS,
  archive_id   IN     RAW(1024));
```

### Parameters

**Table 82–86** SET\_DBFS\_LINK Procedure Parameters

Parameter	Description
lob_loc	LOB for which to store the reference value
archive_id	Archive ID as returned by calling either of the <a href="#">GET_DBFS_LINK Functions</a> Functions

### Exceptions

**Table 82–87** SET\_DBFS\_LINK Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

## SETCONTENTTYPE Procedure

This procedure sets the content type string for the data in the LOB.

### Syntax

```
DBMS_LOB.SETCONTENTTYPE (
  lob_loc      IN OUT NOCOPY BLOB,
  contenttype  IN          VARCHAR2);

DBMS_LOB.SETCONTENTTYPE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  contenttype  IN          VARCHAR2);
```

### Parameters

**Table 82–88** SETCONTENTTYPE Procedure Parameters

Parameter	Description
lob_loc	LOB to be assigned the content type
contenttype	String to be assigned

### Exceptions

**Table 82–89** SETCONTENTTYPE Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

### Usage Notes

To clear an existing contenttype associated with a SECUREFILE, invoke SETCONTENTTYPE with contenttype set to empty string.

## SETOPTIONS Procedures

This procedure enables/disables CSCE features on a per-LOB basis, overriding the default LOB column settings.

### Syntax

```

DBMS_LOB.SETOPTIONS (
  lob_loc          IN      BLOB,
  option_types     IN      PLS_INTEGER,
  options          IN      PLS_INTEGER);

DBMS_LOB.SETOPTIONS (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  option_types     IN      PLS_INTEGER,
  options          IN      PLS_INTEGER);

```

### Parameters

**Table 82–90** SETOPTIONS Procedure Parameter

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see <a href="#">Operational Notes</a> .
option_type	See <a href="#">DBMS_LOB Constants - Option Types</a> on page 82-5
options	See <a href="#">DBMS_LOB Constants - Option Values</a> on page 82-5

### Exceptions

**Table 82–91** SETOPTIONS Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled

### Usage Notes

- DBMS\_LOB.SETOPTIONS cannot be used to enable or disable encryption on individual LOBs.
- You cannot turn compression or deduplication on or off for a SecureFile column that does not have those features on. The [GETOPTIONS Functions](#) and [SetOptions Procedures](#) work on individual SecureFiles. You can turn off a feature on a particular SecureFile and turn on a feature that has already been turned off by [SetOptions](#), but you cannot turn on an option that has not been given to the SecureFile when the table was created.

## SUBSTR Functions

This function returns amount bytes or characters of a LOB, starting from an absolute offset from the beginning of the LOB.

For fixed-width n-byte CLOBs, if the input amount for SUBSTR is greater than  $(32767/n)$ , then SUBSTR returns a character buffer of length  $(32767/n)$ , or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, n is the maximum byte-width used for characters in the CLOB.

### Syntax

```
DBMS_LOB.SUBSTR (
  lob_loc      IN      BLOB,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;

DBMS_LOB.SUBSTR (
  lob_loc      IN      CLOB CHARACTER SET ANY_CS,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;

DBMS_LOB.SUBSTR (
  file_loc     IN      BFILE,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

### Parameters

**Table 82–92 SUBSTR Function Parameters**

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see <a href="#">Operational Notes</a> .
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to be read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).

### Return Values

**Table 82–93 SUBSTR Function Return Values**

Return	Description
RAW	Function overloading that has a BLOB or BFILE in parameter.
VARCHAR2	CLOB version.

**Table 82–93 (Cont.) SUBSTR Function Return Values**

Return	Description
NULL	Either: <ul style="list-style-type: none"> <li>- any input parameter is NULL</li> <li>- amount &lt; 1</li> <li>- amount &gt; 32767</li> <li>- offset &lt; 1</li> <li>- offset &gt; LOBMAXSIZE</li> </ul>

## Exceptions

**Table 82–94 SUBSTR Function Exceptions for BFILE operations**

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

## Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.
- When calling DBMS\_LOB.SUBSTR from the client (for example, in a BEGIN/END block from within SQL\*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.
- DBMS\_LOB.SUBSTR will return 8191 or more characters based on the characters stored in the LOBs. If all characters are not returned as a consequence of the character byte size exceeding the available buffer, the user should either call DBMS\_LOB.SUBSTR with a new offset to read the remaining characters, or call the subprogram on loop until all the data is extracted.
- SUBSTR gets the LOB, if necessary, before read.

### See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the `newlen` parameter. Specify the length in bytes for BLOBs, and specify the length in characters for CLOBs.

---

**Note:** The TRIM procedure decreases the length of the LOB to the value specified in the `newlen` parameter.

---

If you attempt to TRIM an empty LOB, then nothing occurs, and TRIM returns no error. If the new length that you specify in `newlen` is greater than the size of the LOB, then an exception is raised.

### Syntax

```
DBMS_LOB.TRIM (
  lob_loc      IN OUT NOCOPY BLOB,
  newlen      IN          INTEGER);

DBMS_LOB.TRIM (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  newlen      IN          INTEGER);
```

### Parameters

**Table 82–95 TRIM Procedure Parameters**

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB whose length is to be trimmed. For more information, see <a href="#">Operational Notes</a> .
<code>newlen</code>	New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.

### Exceptions

**Table 82–96 TRIM Procedure Exceptions**

Exception	Description
VALUE_ERROR	<code>lob_loc</code> is NULL.
INVALID_ARGVAL	Either: - <code>new_len</code> < 0 - <code>new_len</code> > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

### Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close

it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- TRIM gets the LOB, if necessary, before altering the length of the LOB, unless the new length specified is '0'

**See Also:**

- ["ERASE Procedures"](#) on page 82-35
- ["WRITEAPPEND Procedures"](#) on page 82-83
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the `buffer` parameter.

WRITE replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

### Syntax

```
DBMS_LOB.WRITE (
  lob_loc  IN OUT NOCOPY BLOB,
  amount   IN           INTEGER,
  offset   IN           INTEGER,
  buffer   IN           RAW);

DBMS_LOB.WRITE (
  lob_loc  IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount   IN           INTEGER,
  offset   IN           INTEGER,
  buffer   IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

### Parameters

**Table 82–97** WRITE Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB to be written to. For more information, see <a href="#">Operational Notes</a>
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to write
<code>offset</code>	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation.
<code>buffer</code>	Input buffer for the write

### Exceptions

**Table 82–98** WRITE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> <li>- <code>amount</code> &lt; 1</li> <li>- <code>amount</code> &gt; MAXBUFSIZE</li> <li>- <code>offset</code> &lt; 1</li> <li>- <code>offset</code> &gt; LOBMAXSIZE</li> </ul>
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

**Table 82–98 (Cont.) WRITE Procedure Exceptions**

Exception	Description
SECUREFILE_OUTOFBOUNDS	Attempted to perform a write operation past the end of a LOB having <code>FRAGMENT_*</code> on it

## Usage Notes

- There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.
- The form of the `VARCHAR2` buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.
- When calling `DBMS_LOB.WRITE` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.
- It is not mandatory that you wrap the LOB operation inside the `Open/Close` interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the `Open/Close` API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- `WRITE` gets the LOB, if necessary, before writing the LOB, unless the write is specified to overwrite the entire LOB.

### See Also:

- ["APPEND Procedures"](#) on page 82-19
- ["COPY Procedures"](#) on page 82-29
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

## WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the `buffer` parameter.

### Syntax

```
DBMS_LOB.WRITEAPPEND (
  lob_loc IN OUT NOCOPY BLOB,
  amount  IN           INTEGER,
  buffer  IN           RAW);

DBMS_LOB.WRITEAPPEND (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount  IN           INTEGER,
  buffer  IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

### Parameters

**Table 82–99** *WRITEAPPEND Procedure Parameters*

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB to be written to. For more information, see <a href="#">Operational Notes</a>
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to write
<code>buffer</code>	Input buffer for the write

### Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

### Exceptions

**Table 82–100** *WRITEAPPEND Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - <code>amount</code> < 1 - <code>amount</code> > MAXBUFSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

### Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

- When calling `DBMS_LOB.WRITEAPPEND` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the `LOB`.
- It is not mandatory that you wrap the `LOB` operation inside the `Open/Close` interfaces. If you did not open the `LOB` before performing the operation, the functional and domain indexes on the `LOB` column are updated during the call. However, if you opened the `LOB` before performing the operation, you must close it before you commit or rollback the transaction. When an internal `LOB` is closed, it updates the functional and domain indexes on the `LOB` column.
- If you do not wrap the `LOB` operation inside the `Open/Close` API, the functional and domain indexes are updated each time you write to the `LOB`. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the `LOB` within the `OPEN` or `CLOSE` statement.
- `WRITEAPPEND` gets the `LOB`, if necessary, before appending to the `LOB`.

The DBMS\_LOCK package provides an interface to Oracle Lock Management services. You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

**See Also:** For more information, and an example of how to use the DBMS\_LOCK package, see "About User Locks" in *Oracle Database Advanced Application Developer's Guide*

This chapter contains the following topics:

- [Using DBMS\\_LOCK](#)
  - Overview
  - Security Model
  - Constants
  - Rules and Limits
  - Operational Notes
- [Summary of DBMS\\_LOCK Subprograms](#)

---

## Using DBMS\_LOCK

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Rules and Limits](#)
- [Operational Notes](#)

## Overview

Some uses of user locks:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

## Security Model

There might be operating system-specific limits on the maximum number of total locks available. This *must* be considered when using locks or making this package available to other users. Consider granting the `EXECUTE` privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant `EXECUTE` privilege to specific users. An example of a cover package is documented in the `DBMS_LOCK.SQL` package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.

## Constants

The DBMS\_LOCK package uses the constants shown in [Table 83-1](#).

**Table 83-1 DBMS\_LOCK Constants**

Name	Alternate Name(s)	Type	Value	OEM Abbreviation	Description
NL_MODE	NuLl	INTEGER	1	-	-
SS_MODE	Sub Shared	INTEGER	2	ULRS	This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object.
SX_MODE	<ul style="list-style-type: none"> <li>■ Sub eXclusive</li> <li>■ Row Exclusive Mode</li> </ul>	INTEGER	3	ULRX	This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object.
S_MODE	<ul style="list-style-type: none"> <li>■ Shared</li> <li>■ Row Exclusive Mode</li> <li>■ Intended Exclusive</li> </ul>	INTEGER	4	ULRSX	-
SSX_MODE	<ul style="list-style-type: none"> <li>■ Shared Sub eXclusive</li> <li>■ Share Row Exclusive Mode</li> </ul>	INTEGER	5	-	This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.
X_MODE	Exclusive	INTEGER	6	ULX	-

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

## Rules and Limits

When another process holds "held", an attempt to get "get" does the following:

**Table 83–2 Lock Compatibility**

<b>HELD MODE</b>	<b>GET NL</b>	<b>GET SS</b>	<b>GET SX</b>	<b>GET S</b>	<b>GET SSX</b>	<b>GET X</b>
NL	Success	Success	Success	Success	Success	Success
SS	Success	Success	Success	Success	Success	Fail
SX	Success	Success	Success	Fail	Fail	Fail
S	Success	Success	Fail	Success	Fail	Fail
SSX	Success	Success	Fail	Fail	Fail	Fail
X	Success	Fail	Fail	Fail	Fail	Fail

```
maxwait constant integer := 32767;
```

The constant `maxwait` waits forever.

## Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views. User locks are automatically released when a session terminates. The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

DBMS\_LOCK is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

## Summary of DBMS\_LOCK Subprograms

**Table 83–3** *DBMS\_LOCK Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">ALLOCATE_UNIQUE Procedure</a> on page 83-9	Allocates a unique lock ID to a named lock
<a href="#">CONVERT Function</a> on page 83-11	Converts a lock from one mode to another
<a href="#">RELEASE Function</a> on page 83-12	Releases a lock
<a href="#">REQUEST Function</a> on page 83-13	Requests a lock of a specific mode.
<a href="#">SLEEP Procedure</a> on page 83-14	Puts a session to sleep for a specific time

## ALLOCATE\_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) a specified lock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

### Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (
    lockname          IN  VARCHAR2,
    lockhandle       OUT VARCHAR2,
    expiration_secs  IN  INTEGER  DEFAULT 864000);
```

### Parameters

**Table 83–4** *ALLOCATE\_UNIQUE Procedure Parameters*

Parameter	Description
lockname	Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA\$; these are reserved for products supplied by Oracle.
lockhandle	Returns the handle to the lock ID generated by <code>ALLOCATE_UNIQUE</code> .  You can use this handle in subsequent calls to <code>REQUEST</code> , <code>CONVERT</code> , and <code>RELEASE</code> .  A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package.  LOCKHANDLE can be up to VARCHAR2 (128).  All sessions using a lock handle returned by <code>ALLOCATE_UNIQUE</code> with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another.
expiration_secs	Number of seconds to wait after the last <code>ALLOCATE_UNIQUE</code> has been performed on a specified lock, before permitting that lock to be deleted from the <code>DBMS_LOCK_ALLOCATED</code> table.  The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to <code>ALLOCATE_UNIQUE</code> may delete expired locks to recover space.

### Usage Notes

If you choose to identify locks by name, you can use `ALLOCATE_UNIQUE` to generate a unique lock identification number for these named locks.

The first session to call `ALLOCATE_UNIQUE` with a new lock name causes a unique lock ID to be generated and stored in the `dbms_lock_allocated` table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least `expiration_secs` (defaults to 10 days) past the last call to `ALLOCATE_UNIQUE` with the specified lock name. After this time, the row in the `dbms_lock_allocated` table for this lock name may be deleted in order to recover space. `ALLOCATE_UNIQUE` performs a commit.

**Note:** Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a specified name.

### Exceptions

ORA-20000, ORU-10003: Unable to find or insert lock <lockname> into catalog dbms\_lock\_allocated.

## CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE\_UNIQUE procedure.

### Syntax

```
DBMS_LOCK.CONVERT(
  id          IN INTEGER ||
  lockhandle  IN VARCHAR2,
  lockmode   IN INTEGER,
  timeout     IN NUMBER DEFAULT MAXWAIT)
RETURN INTEGER;
```

### Parameters

**Table 83–5** CONVERT Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change
lockmode	New mode that you want to assign to the specified lock. For the available modes and their associated integer identifiers, see <a href="#">Constants</a> on page 83-5.
timeout	Number of seconds to continue trying to change the lock mode.  If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).

### Return Values

**Table 83–6** CONVERT Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Don't own lock specified by id or lockhandle
5	Illegal lock handle

## RELEASE Function

This function explicitly releases a lock previously acquired using the `REQUEST` function. Locks are automatically released at the end of a session. `RELEASE` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

### Syntax

```
DBMS_LOCK.RELEASE (  
    id          IN INTEGER)  
RETURN INTEGER;
```

```
DBMS_LOCK.RELEASE (  
    lockhandle IN VARCHAR2)  
RETURN INTEGER;
```

### Parameters

**Table 83–7** *RELEASE Function Parameter*

Parameter	Description
<code>id</code> or <code>lockhandle</code>	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change

### Return Values

**Table 83–8** *RELEASE Function Return Values*

Return Value	Description
0	Success
3	Parameter error
4	Do not own lock specified by <code>id</code> or <code>lockhandle</code>
5	Illegal lock handle

## REQUEST Function

This function requests a lock with a specified mode. `REQUEST` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

### Syntax

```
DBMS_LOCK.REQUEST(
  id                IN  INTEGER ||
  lockhandle        IN  VARCHAR2,
  lockmode          IN  INTEGER DEFAULT X_MODE,
  timeout           IN  INTEGER DEFAULT MAXWAIT,
  release_on_commit IN  BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

The current default values, such as `X_MODE` and `MAXWAIT`, are defined in the `DBMS_LOCK` package specification.

### Parameters

**Table 83–9** *REQUEST Function Parameters*

Parameter	Description
<code>id</code> or <code>lockhandle</code>	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change
<code>lockmode</code>	Mode that you are requesting for the lock. For the available modes and their associated integer identifiers, see <a href="#">Constants</a> on page 83-5.
<code>timeout</code>	Number of seconds to continue trying to grant the lock. If the lock cannot be granted within this time period, then the call returns a value of 1 ( <code>timeout</code> ).
<code>release_on_commit</code>	Set this parameter to <code>TRUE</code> to release the lock on commit or roll-back. Otherwise, the lock is held until it is explicitly released or until the end of the session.

### Return Values

**Table 83–10** *REQUEST Function Return Values*

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Already own lock specified by <code>id</code> or <code>lockhandle</code>
5	Illegal lock handle

## SLEEP Procedure

This procedure suspends the session for a specified period of time.

### Syntax

```
DBMS_LOCK.SLEEP (  
    seconds IN NUMBER);
```

### Parameters

**Table 83–11 SLEEP Procedure Parameters**

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

The DBMS\_LOGMNR package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

**See Also:** *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

- [Using DBMS\\_LOGMNR](#)
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- [Summary of DBMS\\_LOGMNR Subprograms](#)

## Using DBMS\_LOGMNR

This section contains the following topics, which relate to using the DBMS\_LOGMNR package:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

## Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.

**See Also:** [Chapter 85, "DBMS\\_LOGMNR\\_D"](#) for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

## Security Model

You must have the EXECUTE\_CATALOG\_ROLE role to use the DBMS\_LOGMNR package.

## Constants

The DBMS\_LOGMNR package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS\_LOGMNR.NEW.

Table 84–1 describes the constants for the ADD\_LOGFILE options flag in the DBMS\_LOGMNR package.

**Table 84–1 Constants for ADD\_LOGFILE Options Flag**

Constant	Description
NEW	Implicitly calls the DBMS_LOGMNR.END_LOGMNR procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.
ADDFILE	Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified.

Table 84–2 describes the constants for the START\_LOGMNR options flag in the DBMS\_LOGMNR package.

**Table 84–2 Constants for START\_LOGMNR Options Flag**

Constant	Description
COMMITTED_DATA_ONLY	<p>If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on).</p> <p>If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).</p>
SKIP_CORRUPTION	<p>Directs a select operation on the V\$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V\$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.</p>
DDL_DICT_TRACKING	<p>If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open.</p> <p>This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9i.</p>

**Table 84–2 (Cont.) Constants for START\_LOGMNR Options Flag**

Constant	Description
<p>DICT_FROM_ONLINE_CATALOG</p>	<p>Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed.</p> <p>This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files.</p> <p>Expect to see a value of 2 in the STATUS column of the V\$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.</p>
<p>DICT_FROM_REDO_LOGS</p>	<p>If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.</p>
<p>NO_SQL_DELIMITER</p>	<p>If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.</p>
<p>NO_ROWID_IN_STMT</p>	<p>If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled.</p> <p>When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.</p>
<p>PRINT_PRETTY_SQL</p>	<p>If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.</p>
<p>CONTINUOUS_MINE</p>	<p>Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files. It also requires that the database be mounted and that archiving be enabled.</p> <p>Beginning with Oracle Database release 10.1, the CONTINUOUS_MINE options is supported for use in an Oracle Real Application Clusters (Oracle RAC) environment.</p>
<p>STRING_LITERALS_IN_STMT</p>	<p>If set, SQL_REDO and SQL_UNDO use literals for numbers and datetime and interval column types.</p>

## Views

The DBMS\_LOGMNR package uses the views listed in the section on Accessing LogMiner Operational Information in Views in *Oracle Database Utilities*.

## Operational Notes

A **LogMiner session** begins with a call to `DBMS_LOGMNR.ADD_LOGFILE` or `DBMS_LOGMNR.START_LOGMNR` (the former if you plan to specify log files explicitly; the latter if you plan to use continuous mining). The session ends with a call to `DBMS_LOGMNR.END_LOGMNR`. Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue `SQL SELECT` statements against the `V$LOGMNR_CONTENTS` view to retrieve the data of interest.

---

## Summary of DBMS\_LOGMNR Subprograms

**Table 84–3 DBMS\_LOGMNR Package Subprograms**

Subprogram	Description
<a href="#">ADD_LOGFILE Procedure</a> on page 84-10	Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session
<a href="#">COLUMN_PRESENT Function</a> on page 84-12	Call this function for any row returned from the V\$LOGMNR_CONTENTS view to determine if undo or redo column values exist for the column specified by the <code>column_name</code> input parameter to this function
<a href="#">END_LOGMNR Procedure</a> on page 84-14	Finishes a LogMiner session
<a href="#">MINE_VALUE Function</a> on page 84-15	Call this function for any row returned from the V\$LOGMNR_CONTENTS view to retrieve the undo or redo column value of the column specified by the <code>column_name</code> input parameter to this function
<a href="#">REMOVE_LOGFILE Procedure</a> on page 84-17	Removes a redo log file from the list of redo log files for LogMiner to process
<a href="#">START_LOGMNR Procedure</a> on page 84-18	Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to <code>DBMS_LOGMNR.ADD_LOGFILE</code> )

## ADD\_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

### Syntax

```
DBMS_LOGMNR.ADD_LOGFILE (
  LogFileName      IN VARCHAR2,
  options          IN BINARY_INTEGER default ADDFILE );
```

### Parameters

**Table 84–4 ADD\_LOGFILE Procedure Parameters**

Parameter	Description
LogFileName	Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.
options	Does one of the following: <ul style="list-style-type: none"> <li>■ Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW)</li> <li>■ Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE)</li> </ul> See <a href="#">Table 84–1, "Constants for ADD_LOGFILE Options Flag"</a> .

### Exceptions

**Table 84–5 ADD\_LOGFILE Procedure Exceptions**

Exception	Description
ORA-01284	Specified file cannot be opened.
ORA-01287	Specified file is from a different database incarnation.
ORA-01289	Specified file has already been added to the list. Duplicate redo log files cannot be added.
ORA-01290	Specified file is not in the current list and therefore cannot be removed from the list.
ORA-01324	Specified file cannot be added to the list because there is a DB_ID mismatch.

### Usage Notes

- Before querying the V\$LOGMNR\_CONTENTS view, you must make a successful call to the DBMS\_LOGMNR.START\_LOGMNR procedure (within the current LogMiner session).
- Unless you specify the CONTINUOUS\_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD\_LOGFILE procedure to specify the list of redo log files to analyze.
- If you are not using the CONTINUOUS\_MINE option and you want to analyze more than one redo log file, you must call the ADD\_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.

- Both archived and online redo log files can be mined.
- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)
- To analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END\_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD\_LOGFILE procedure.
- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

## COLUMN\_PRESENT Function

This function is designed to be used in conjunction with the `MINE_VALUE` function.

If the `MINE_VALUE` function returns a `NULL` value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a `NULL` value.

To distinguish between these two cases, use the `COLUMN_PRESENT` function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

### Syntax

```
DBMS_LOGMNR.COLUMN_PRESENT (
    sql_redo_undo      IN RAW,
    column_name        IN VARCHAR2 default '') RETURN NUMBER;
```

### Parameters

**Table 84–6** *COLUMN\_PRESENT Function Parameters*

Parameter	Description
<code>sql_redo_undo</code>	Specifies either the <code>REDO_VALUE</code> or the <code>UNDO_VALUE</code> column in the <code>V\$logmnr_contents</code> view from which to extract data values. See the Usage Notes for more information.
<code>column_name</code>	Specifies the fully qualified name ( <code>schema.table.column</code> ) of the column for which this function will return information.

### Return Values

[Table 84–7](#) describes the return values for the `COLUMN_PRESENT` function. The `COLUMN_PRESENT` function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of `NULL` values returned by the `DBMS_LOGMNR.MINE_VALUE` function.

**Table 84–7** *Return Values for COLUMN\_PRESENT Function*

Return	Description
0	Specified column is not present in this row of <code>V\$logmnr_contents</code> .
1	Column is present in this row of <code>V\$logmnr_contents</code> .

### Exceptions

**Table 84–8** *COLUMN\_PRESENT Function Exceptions*

Exception	Description
ORA-01323	Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Value specified for the <code>column_name</code> parameter is not a fully qualified column name.

## Usage Notes

- To use the COLUMN\_PRESENT function, you must have successfully started LogMiner.
- The COLUMN\_PRESENT function must be invoked in the context of a select operation on the V\$logmnr\_contents view.
- The COLUMN\_PRESENT function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql\_redo\_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO\_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO\_VALUE.
  - If an insert operation was performed, typically you would specify REDO\_VALUE (because the value of a column prior to an insert operation will always be NULL).
  - If a delete operation was performed, typically you would specify UNDO\_VALUE (because the value of a column after a delete operation will always be NULL).

## END\_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the `NEW` option.

### Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

### Exceptions

**Table 84–9** *END\_LOGMNR Procedure Exception*

Exception	Description
ORA-01307	No LogMiner session is currently active. The <code>END_LOGMNR</code> procedure was called without adding any log files or before the <code>START_LOGMNR</code> procedure was called

## MINE\_VALUE Function

This function facilitates queries based on a column's data value. This function takes two arguments. The first one specifies whether to mine the redo (REDO\_VALUE) or undo (UNDO\_VALUE) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The MINE\_VALUE function always returns a string that can be converted back to the original datatype.

### Syntax

```
DBMS_LOGMNR.MINE_VALUE (
    sql_redo_undo      IN RAW,
    column_name        IN VARCHAR2 default '') RETURN VARCHAR2;
```

### Parameters

**Table 84–10 MINE\_VALUE Function Parameters**

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V\$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

### Return Values

**Table 84–11 Return Values for MINE\_VALUE Function**

Return	Description
NULL	The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.
NON-NULL	The column is contained within the self-describing record; the value is returned in string format.

### Exceptions

**Table 84–12 MINE\_VALUE Function Exceptions**

Exception	Description
ORA-01323	Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Invalid identifier. The value specified for the column_name parameter was not a fully qualified column name.

### Usage Notes

- To use the MINE\_VALUE function, you must have successfully started LogMiner.
- The MINE\_VALUE function must be invoked in the context of a select operation from the V\$LOGMNR\_CONTENTS view.

- The MINE\_VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the `sql_redo_undo` parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify `UNDO_VALUE`.
  - If an update operation was performed and you want to know what the value is after the update operation, specify `REDO_VALUE`.
  - If an insert operation was performed, typically you would specify `REDO_VALUE` (because the value of a column prior to an insert operation will always be null).
  - If a delete operation was performed, typically you would specify `UNDO_VALUE` (because the value of a column after a delete operation will always be null).

## REMOVE\_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

---

**Note:** This procedure replaces the REMOVEFILE constant that was an option on the ADD\_LOGFILE procedure prior to Oracle Database 10g.

---

### Syntax

```
DBMS_LOGMNR.REMOVE_LOGFILE (
    LogFileName      IN VARCHAR2);
```

### Parameters

**Table 84–13 REMOVE\_LOGFILE Procedure Parameters**

Parameter	Description
LogFileName	Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.

### Exceptions

**Table 84–14 REMOVE\_LOGFILE Procedure Exception**

Exception	Description
ORA-01290	Cannot remove unlisted log file

### Usage Notes

- Before querying the V\$LOGMNR\_CONTENTS view, you must make a successful call to the DBMS\_LOGMNR.START\_LOGMNR procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the END\_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD\_LOGFILE procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the ADD\_LOGFILE procedure must match the database ID and RESETLOGS SCN of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END\_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD\_LOGFILE procedure.

## START\_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

### Syntax

```
DBMS_LOGMNR.START_LOGMNR (
  startScn          IN NUMBER default 0,
  endScn            IN NUMBER default 0,
  startTime         IN DATE default '01-jan-1988',
  endTime           IN DATE default '31-dec-2110',
  DictFileName      IN VARCHAR2 default '',
  Options           IN BINARY_INTEGER default 0 );
```

### Parameters

**Table 84–15** START\_LOGMNR Procedure Parameters

Parameter	Description
startScn	Directs LogMiner to return only redo records with an SCN greater than or equal to the <code>startScn</code> specified. This fails if there is no redo log file containing the specified <code>startScn</code> value. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)
endScn	Directs LogMiner to return only redo records with an SCN less than or equal to the <code>endScn</code> specified. If you specify an <code>endScn</code> value that is beyond the value in any redo log file, then LogMiner uses the greatest <code>endScn</code> value in the redo log file that contains the most recent changes. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)
startTime	Directs LogMiner to return only redo records with a timestamp greater than or equal to the <code>startTime</code> specified. This fails if there is no redo log file containing the specified <code>startTime</code> value. (You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.)  This parameter is ignored if <code>startScn</code> is specified. See the Usage Notes for additional information.
endTime	Directs LogMiner to return only redo records with a timestamp less than or equal to the <code>endTime</code> specified. If you specify an <code>endTime</code> value that is beyond the value in any redo log file, then LogMiner will use the greatest <code>endTime</code> in the redo log file that contains the most recent changes. You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.)  This parameter is ignored if <code>endScn</code> is specified. See the Usage Notes for additional information.

**Table 84–15 (Cont.) START\_LOGMNR Procedure Parameters**

Parameter	Description
DictFileName	Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct <code>SQL_REDO</code> and <code>SQL_UNDO</code> columns in <code>V\$LOGMNR_CONTENTS</code> , as well as to fully translate <code>SEG_NAME</code> , <code>SEG_OWNER</code> , <code>SEG_TYPE_NAME</code> , <code>TABLE_NAME</code> , and <code>TABLE_SPACE</code> columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the <code>DBMS_LOGMNR_D.BUILD</code> procedure.)  You need to specify this parameter only if neither <code>DICT_FROM_REDO_LOGS</code> nor <code>DICT_FROM_ONLINE_CATALOG</code> is specified.
options	See <a href="#">Table 84–2, "Constants for START_LOGMNR Options Flag"</a> .

## Exceptions

**Table 84–16 START\_LOGMNR Procedure Exceptions**

Exception	Description
ORA-01280	Internal error encountered.
ORA-01281	<code>startScn</code> or <code>endScn</code> parameter value is not a valid SCN, or <code>endScn</code> is less than <code>startScn</code> .
ORA-01282	value for the <code>startTime</code> parameter was greater than the value specified for the <code>endTime</code> parameter, or there was no redo log file that was compatible with the date range specified with the <code>startTime</code> and <code>endTime</code> parameters.
ORA-01283	Options parameter specified is invalid.
ORA-01284	LogMiner dictionary file specified in the <code>DictFileName</code> parameter has a full path length greater than 256 characters, or the file cannot be opened.
ORA-01285	Error reading specified file.
ORA-01291	Redo log files that are needed to satisfy the user's requested SCN or time range are missing.
ORA-01292	No log file has been specified for the current LogMiner session.
ORA-01293	Mounted database required for specified LogMiner options.
ORA-01294	Error occurred while processing information in the specified dictionary file, possible corruption.
ORA-01295	Specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed.
ORA-01296	Character set mismatch between specified LogMiner dictionary and log files.
ORA-01297	Redo version mismatch between LogMiner dictionary and log files.
ORA-01299	Specified LogMiner dictionary corresponds to a different database incarnation.
ORA-01300	Writable database required for specified LogMiner options.

## Usage Notes

- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system. See *Oracle Database Utilities* and

Chapter 85, "DBMS\_LOGMNR\_D" in this manual for more information about the LogMiner dictionary.

- After executing the `START_LOGMNR` procedure, you can query the following views:
  - `V$LOGMNR_CONTENTS` - contains history of information in redo log files
  - `V$LOGMNR_DICTIONARY` - contains current information about the LogMiner dictionary file extracted to a flat file
  - `V$LOGMNR_PARAMETERS` - contains information about the LogMiner session(You can query the `V$LOGMNR_LOGS` view after a redo log file list has been added to the list of files that LogMiner is to mine.)
- Parameters and options are not persistent across calls to `DBMS_LOGMNR.START_LOGMNR`. You must specify all desired parameters and options (including SCN and time ranges) each time you call `DBMS_LOGMNR.START_LOGMNR`
- Be aware that specifying redo log files using a timestamp is not precise.
- The `CONTINUOUS_MINE` option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the `CONTINUOUS_MINE` option:
  - The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the `V$ARCHIVED_LOGS` view to determine which redo log file entries will be found by LogMiner.

Even if an entry is listed in the database control file (and the `V$ARCHIVED_LOGS` view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be available.
  - If you specify the `CONTINUOUS_MINE` option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the `V$LOGMNR_CONTENTS` view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.
  - LogMiner can mine online redo logs. However, if the `CONTINUOUS_MINE` option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.
- Keep the following in mind regarding starting and ending times or SCN ranges:

- If you specify neither a `startTime` nor a `startScn` parameter, LogMiner will set the `startScn` parameter to use the lowest SCN value from the redo log file that contains the oldest changes.
- If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.
- If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.
- If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` without the `CONTINUOUS_MINE` option, and you specify:
  - \* 0 for the `startTime` or `startScn` value, then the lowest SCN in the LogMiner redo log file list will be used as the `startScn`
  - \* A nonzero number for the `startTime` or `startScn` value, then an error is returned
  - \* 0 or a nonzero number for the `endTime` or `endScn` value, then the highest SCN in the LogMiner redo log file list will be used as the `endScn`
- If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` with the `CONTINUOUS_MINE` option, and you specify:
  - \* 0 for the `startTime` or `startScn` value, then an error is returned.
  - \* A `startTime` or `startScn` value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the `V$LOGMNR_CONTENTS` view.
  - \* An `endTime` or `endScn` parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
  - \* 0 for the `endTime` or `endScn` parameter value, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until you enter `CTL+C` or you terminate the PL/SQL cursor.

---

## DBMS\_LOGMNR\_D

The DBMS\_LOGMNR\_D package, one of a set of LogMiner packages, contains two subprograms:

- The BUILD procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The SET\_TABLESPACE procedure re-creates all LogMiner tables in an alternate tablespace.

The **LogMiner data dictionary** consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the **LogMiner dictionary** throughout the LogMiner documentation.

**See Also:** *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

- [Using DBMS\\_LOGMNR\\_D](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_LOGMNR\\_D Subprograms](#)

## Using DBMS\_LOGMNR\_D

This section contains the following topics, which relate to using the DBMS\_LOGMNR\_D package:

- [Overview](#)
- [Security Model](#)

## Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you. LogMiner gives you three options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.

**See Also:** [DBMS\\_LOGMNR](#) for information on the package subprograms used in running a LogMiner session.

## Security Model

You must have the EXECUTE\_CATALOG\_ROLE role to use the DBMS\_LOGMNR\_D package.

## Summary of DBMS\_LOGMNR\_D Subprograms

**Table 85-1 DBMS\_LOGMNR\_D Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">BUILD Procedure</a> on page 85-6	Extracts the LogMiner dictionary to either a flat file or one or more redo log files
<a href="#">SET_TABLESPACE Procedure</a> on page 85-9	Re-creates all LogMiner tables in an alternate tablespace

## BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

### Syntax

```
DBMS_LOGMNR_D.BUILD (
    dictionary_filename IN VARCHAR2,
    dictionary_location IN VARCHAR2,
    options             IN NUMBER);
```

### Parameters

**Table 85–2 BUILD Procedure Parameters**

Parameter	Description
dictionary_filename	Specifies the name of the LogMiner dictionary file.
dictionary_location	Specifies the path to the LogMiner dictionary file directory.
options	Specifies that the LogMiner dictionary is written to either a flat file (STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).

### Exceptions

**Table 85–3 BUILD Procedure Exceptions**

Exception	Description
ora-01302	Dictionary build options are missing or incorrect. This error is returned under the following conditions: <ul style="list-style-type: none"> <li>■ If the value of the OPTIONS parameter is not one of the supported values (STORE_IN_REDO_LOGS, STORE_IN_FLAT_FILE) or is not specified</li> <li>■ If the STORE_IN_REDO_LOGS option is not specified and neither the dictionary_filename nor the dictionary_location parameter is specified</li> <li>■ If the STORE_IN_REDO_LOGS option is specified and either the dictionary_filename or the dictionary_location parameter is specified</li> </ul>
ora-01308	Initialization parameter UTL_FILE_DIR is not set.
ora-01336	Specified dictionary file cannot be opened. This error is returned under the following conditions: <ul style="list-style-type: none"> <li>■ The specified value for the dictionary_location does not exist.</li> <li>■ The UTL_FILE_DIR initialization parameter is not set to have access to the dictionary_location</li> <li>■ The dictionary file is read-only.</li> </ul>

### Usage Notes

- To extract the LogMiner dictionary to a flat file, you must supply a filename and location.

To extract the LogMiner dictionary to the redo log files, specify only the `STORE_IN_REDO_LOGS` option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

- If you do not specify any parameters, an error is returned.
- If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
- If you specify a filename and location, as well as the `STORE_IN_FLAT_FILE` option, the LogMiner dictionary is extracted to a flat file with the specified name.
- If you do not specify a filename and location, but do specify the `STORE_IN_REDO_LOGS` option, the LogMiner dictionary is extracted to the redo log files.
- If you specify a filename and location, as well as the `STORE_IN_REDO_LOGS` option, an error is returned.
- If you do not specify a filename and location, but do specify the `STORE_IN_FLAT_FILE` option, an error is returned.
- Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9i release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
- Do not run the `DBMS_LOGMNR_D.BUILD` procedure if there are any ongoing DDL operations.
- The database must be open when you run the `DBMS_LOGMNR_D.BUILD` procedure.
- When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:
  - You must specify a directory for use by the PL/SQL procedure. To do so, set the initialization parameter `UTL_FILE_DIR` in the initialization parameter file. For example:
 

```
UTL_FILE_DIR = /oracle/dictionary
```

After setting the parameter, you must shut down and restart the database for this parameter to take effect. If you do not set this parameter, the procedure will fail.
  - You must ensure that no DDL operations occur while the LogMiner dictionary build is running. Otherwise, the LogMiner dictionary file may not contain a consistent snapshot of the database dictionary.

Be aware that the `DDL_DICT_TRACKING` option to the `DBMS_LOGMNR.START_LOGMNR` procedure is not supported for flat file dictionaries created prior to Oracle9i. If you attempt to use the `DDL_DICT_TRACKING` option with a LogMiner database extracted to a flat file prior to Oracle9i, the ORA-01330 error (problem loading a required build table) is returned.

- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:

- The `DBMS_LOGMNR_D.BUILD` procedure must be run on a system that is running Oracle9i or later.
- Archivelog mode must be enabled in order to generate usable redo log files.
- The `COMPATIBLE` parameter in the initialization parameter file must be set to 9.2.0 or higher.
- The database to which LogMiner is attached must be Oracle9i or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers. See *Oracle Database Utilities* for information about using supplemental logging with LogMiner.

## Examples

### Example 1: Extracting the LogMiner Dictionary to a Flat File

The following example extracts the LogMiner dictionary file to a flat file named `dictionary.ora` in a specified path (`/oracle/database`).

```
SQL> EXECUTE dbms_logmnr_d.build('dictionary.ora', -  
    '/oracle/database/', -  
    options => dbms_logmnr_d.store_in_flat_file);
```

### Example 2: Extracting the LogMiner Dictionary to the Redo Log Files

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -  
    options => dbms_logmnr_d.store_in_redo_logs);
```

## SET\_TABLESPACE Procedure

By default, all LogMiner tables are created to use the SYS\_AUX tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to an alternate tablespace.

### Syntax

```
DBMS_LOGMNR_D.SET_TABLESPACE (
    new_tablespace      IN VARCHAR2);
```

### Parameters

**Table 85–4 SET\_TABLESPACE Parameter**

Parameter	Description
new_tablespace	A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter.

### Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the SYSTEM tablespace. Oracle encourages such users to consider using the SET\_TABLESPACE procedure to move the tables to the SYS\_AUX tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

**See Also:** *Oracle Database Concepts* and *Oracle Database SQL Language Reference* for information about tablespaces and how to create them

### Example: Using the DBMS\_LOGMNR\_D.SET\_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the DBMS\_LOGMNR\_D.SET\_TABLESPACE procedure.

```
SQL> CREATE TABLESPACE logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'
      SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;

SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```

---

---

## DBMS\_LOGSTDBY

The DBMS\_LOGSTDBY package provides subprograms for configuring and managing the logical standby database environment.

**See Also:** *Oracle Data Guard Concepts and Administration* for more information about SQL Apply and logical standby databases

This chapter contains the following topics:

- [Using DBMS\\_LOGSTDBY](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_LOGSTDBY Subprograms](#)

---

## Using DBMS\_LOGSTDBY

This section contains topics which relate to using the DBMS\_LOGSTDBY package.

- [Overview](#)
- [Security Model](#)

## Overview

The DBMS\_LOGSTDBY package helps you manage the SQL Apply (logical standby database) environment. The subprograms in the DBMS\_LOGSTDBY package help you to accomplish the following main objectives:

- Manage configuration parameters used by SQL Apply.  
For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.
- Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.
- Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.
- Allow controlled access to tables in the logical standby database that may require maintenance.

## Security Model

You must have the DBA role to use the DBMS\_LOGSTDBY package.

A prototype role, LOGSTDBY\_ADMINISTRATOR, is created by default with RESOURCE, and EXECUTE privileges on DBMS\_LOGSTDBY. If you choose to use this role, consider granting ALTER DATABASE and ALTER SESSION privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard.

The procedures associated with skipping transactions (SKIP and UNSKIP, SKIP\_ERROR and UNSKIP\_ERROR, and SKIP\_TRANSACTION and UNSKIP\_TRANSACTION) all require DBA privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where SKIP procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, SYS).

## Summary of DBMS\_LOGSTDBY Subprograms

**Table 86–1 DBMS\_LOGSTDBY Package Subprograms**

Subprogram	Description
<a href="#">APPLY_SET Procedure</a> on page 86-7	Sets the values of various parameters that configure and maintain SQL Apply
<a href="#">APPLY_UNSET Procedure</a> on page 86-10	Restores the default values of various parameters that configure and maintain SQL Apply
<a href="#">BUILD Procedure</a> on page 86-11	Ensures supplemental logging is enabled properly and builds the LogMiner dictionary
<a href="#">INSTANTIATE_TABLE Procedure</a> on page 86-12	Creates and populates a table in the standby database from a corresponding table in the primary database
<a href="#">IS_APPLY_SERVER Function</a> on page 86-14	This function returns TRUE if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the <code>fire_once</code> parameter in the <code>DBMS_DDL.SET_TRIGGER FIRING_PROPERTY</code> subprogram set to FALSE (the default is TRUE). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.
<a href="#">MAP_PRIMARY_SCN Function</a> on page 86-15	Maps an SCN relevant to the primary database to a corresponding SCN at the logical standby database. The mapped SCN is conservative in nature, and can thus be used to flash back the logical standby database to compensate for a flashback database operation performed at the primary database.
<a href="#">PREPARE_FOR_NEW_PRIMARY Procedure</a> on page 86-16	Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency
<a href="#">PURGE_SESSION Procedure</a> on page 86-18	Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply
<a href="#">REBUILD Procedure</a> on page 86-19	Records relevant metadata (including the LogMiner dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process
<a href="#">SET_TABLESPACE Procedure</a> on page 86-20	Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the <code>SYSAUX</code> tablespace.
<a href="#">SKIP Procedure</a> on page 86-21	Specifies rules that control database operations that should not be applied to the logical standby database
<a href="#">SKIP_ERROR Procedure</a> on page 86-29	Specifies rules regarding what action to take upon encountering errors

**Table 86–1 (Cont.) DBMS\_LOGSTDBY Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SKIP_TRANSACTION Procedure</a> on page 86-33	Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database.
<a href="#">UNSKIP Procedure</a> on page 86-35	Deletes rules specified by the SKIP procedure
<a href="#">UNSKIP_ERROR Procedure</a> on page 86-37	Deletes rules specified by the SKIP_ERROR procedure
<a href="#">UNSKIP_TRANSACTION Procedure</a> on page 86-39	Deletes rules specified by the SKIP_TRANSACTION procedure

## APPLY\_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. All parameters, except for `PRESERVE_COMMIT_ORDER`, can be changed without having to stop SQL Apply.

### Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
    inname          IN VARCHAR,
    value           IN VARCHAR);
```

### Parameters

**Table 86–2 APPLY\_SET Procedure Parameters**

Parameter	Description
<code>APPLY_SERVERS</code>	Controls the number of <code>APPLIER</code> processes used to apply changes. The maximum number allowed is 1024, provided the <code>MAX_SERVERS</code> parameter is set to accommodate this.
<code>EVENT_LOG_DEST</code>	<p>Controls where SQL Apply records the occurrence of an interesting event. It takes the following values:</p> <ul style="list-style-type: none"> <li>▪ <code>DEST_ALL</code> - All events will be recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view and in the alert log.</li> <li>▪ <code>DEST_EVENTS_TABLE</code> - All events that contain information about user data will be recorded only in the <code>DBA_LOGSTDBY_EVENTS</code> view. This is the default value.</li> </ul> <p>For example, if SQL Apply receives an <code>ORA-1403</code> error, the whole event is recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view. Whereas, the alert log records only that SQL Apply stopped because of <code>ORA-1403</code>. No information regarding the user table or offending statement is logged in the alert log. However, if you stop the SQL Apply engine, it gets recorded in both the <code>DBA_LOGSTDBY_EVENTS</code> view and in the alert log.</p> <p>Note that this parameter affects the behavior of the following parameters: <code>RECORD_APPLIED_DDL</code>, <code>RECORD_SKIP_DDL</code>, <code>RECORD_SKIP_ERRORS</code>, and <code>RECORD_UNSUPPORTED_OPERATIONS</code>. For example, if <code>RECORD_APPLIED_DDL</code> is set to <code>TRUE</code>, but <code>EVENT_LOG_DEST</code> is set to <code>DEST_EVENTS_TABLE</code>, then the applied DDL string will only be recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view.</p>
<code>LOG_AUTO_DEL_RETENTION_TARGET</code>	This parameter setting is only meaningful if <code>LOG_AUTO_DELETE</code> has been set to <code>TRUE</code> . The value you supply for this parameter controls how long (in minutes) a remote archived log that is received from the primary database will be retained at the logical standby database once all redo records contained in the log have been applied at the logical standby database. The default value is 1440 minutes.
<code>LOG_AUTO_DELETE</code>	Automatically deletes foreign archived redo log files as soon as they have been applied on the logical standby database. By default, a foreign archived redo log file is not deleted until 24 hours (the default value of <code>LOG_AUTO_DEL_RETENTION_TARGET</code> parameter) after it has been applied at the logical standby database. Set to <code>TRUE</code> to enable automatic deletion of archived redo log files. Set to <code>FALSE</code> to disable automatic deletion. The default value is <code>TRUE</code> .

**Table 86–2 (Cont.) APPLY\_SET Procedure Parameters**

Parameter	Description
MAX_EVENTS_RECORDED	Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value. The default value is 10,000.
MAX_SERVERS	Number of processes that SQL Apply uses to read and apply redo. The default value is 9. The maximum number allowed is 2048.
MAX_SGA	Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower. The maximum size allowed is 4095 megabytes.
PREPARE_SERVERS	Controls the number of PREPARER processes used to prepare changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.
PRESERVE_COMMIT_ORDER	<p>TRUE: Transactions are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting.</p> <p>FALSE: Transactions containing non-overlapping sets of rows may be committed in a different order than they were committed on the primary database.</p> <p>Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened on the primary database. See the Usage Notes for details and recommendations.</p> <p>You cannot modify this parameter while SQL Apply is running.</p>
RECORD_APPLIED_DDL	<p>Controls whether DDL statements that have been applied to the logical standby database are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:</p> <p>TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.</p> <p>FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting.</p>
RECORD_SKIP_DDL	<p>Controls whether skipped DDL statements are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:</p> <p>TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting.</p> <p>FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.</p>

**Table 86–2 (Cont.) APPLY\_SET Procedure Parameters**

Parameter	Description
RECORD_SKIP_ERRORS	Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:  TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting.  FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.
RECORD_UNSUPPORTED_OPERATIONS	Captures information about transactions running on the primary database that will not be supported by a logical standby database. This procedure records its information as events in the DBA_LOGSTDBY_EVENTS table.

If a parameter is changed while SQL Apply is running, the change will take effect at some point in the future. In such a case, an informational row is inserted into the DBA\_LOGSTDBY\_EVENTS view at the time the parameter change takes effect.

Additionally, if you are modifying a parameter while SQL Apply is running on an Oracle RAC configuration, you must be connected to the same instance where SQL Apply is running.

## Exceptions

**Table 86–3 APPLY\_SET Procedure Exceptions**

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

## Usage Notes

- Use the APPLY\_UNSET procedure to restore the default settings of a parameter.
- See *Oracle Data Guard Concepts and Administration* for help with tuning SQL Apply and for information about setting appropriate values for different parameters.

## Examples

To record DDLs in the DBA\_LOGSTDBY\_EVENTS view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

## APPLY\_UNSET Procedure

Use the `APPLY_UNSET` procedure to restore the default values of the parameters that you changed with the `APPLY_SET` procedure.

### Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (
    inname          IN VARCHAR);
```

### Parameters

The parameter information for the `APPLY_UNSET` procedure is the same as that described for the `APPLY_SET` procedure. See [Table 86–2](#) for complete parameter information.

### Exceptions

**Table 86–4** *APPLY\_UNSET Procedure Exceptions*

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

### Usage Notes

- Use the `APPLY_SET` procedure to specify a nondefault value for a parameter.

### Examples

If you previously specified that applied DDLs show up in the `DBA_LOGSTDBY_EVENTS` view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

## BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply. This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

---

**Note:** In databases created using Oracle Database 11g release 2 (11.2) or later, supplemental logging information is automatically propagated to any existing physical standby databases. However, for databases in earlier releases, or if the database was created using an earlier release and then upgraded to 11.2, you must check whether supplemental logging is enabled at the physical standby(s) if it is also enabled at the primary database. If it is not enabled at the physical standby(s), then before performing a switchover or failover, you must enable supplemental logging on all existing physical standby databases. To do so, issue the following SQL command on each physical standby:

```
SQL> ALTER DATABASE ADD SUPPLEMENTAL LOG DATA (PRIMARY KEY, UNIQUE INDEX) COLUMNS;
```

If you do not do this, then any logical standby that is also in the same Data Guard configuration will be unusable if a switchover or failover is performed to one of the physical standby databases. If a switchover or failover has already occurred and supplemental logging was not enabled, then you must recreate all logical standby databases.

---

## Syntax

```
DBMS_LOGSTDBY.BUILD;
```

## Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- DBMS\_LOGSTDBY.BUILD should be run only once for each logical standby database you want to create. You do not need to use DBMS\_LOGSTDBY.BUILD for each Oracle RAC instance.
- DBMS\_LOGSTDBY.BUILD waits for all transactions (including distributed transactions) that are active at the time of the procedure invocation to complete before returning. See *Oracle Database Administrator's Guide* for information about how to handle in-doubt transactions.

## Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```

## INSTANTIATE\_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database. The table requires the name of the database link (`dblink`) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the `INSTANTIATE_TABLE` procedure to:

- Add a table to a standby database.
- Re-create a table in a standby database.

### Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    dblink           IN VARCHAR2);
```

### Parameters

**Table 86–5** INSTANTIATE\_TABLE Procedure Parameters

Parameter	Description
<code>schema_name</code>	Name of the schema
<code>table_name</code>	Name of the table to be created or re-created in the standby database
<code>dblink</code>	Name of the database link account that has privileges to read and lock the table in the primary database, as well as the <code>SELECT_CATALOG_ROLE</code> on the primary database

### Exceptions

**Table 86–6** INSTANTIATE\_TABLE Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress
ORA-16276	Specified database link does not correspond to primary database
ORA-16277	Specified table is not supported by logical standby database
ORA-16278	Specified table has a multi-object skip rule defined

### Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until SQL Apply encounters redo that occurred after the table was instantiated from the primary. The SCN at which the table was instantiated from the primary database is available in the `DBA_LOGSTDBY_EVENTS` view.

- The specified table must be a table that is supported by logical standby (that is, it does not appear in the `DBA_LOGSTDBY_UNSUPPORTED_TABLES` view on the primary database).
- If there are any skip rules that specifically name this table (without any wildcards), those skip rules will be dropped as part of `INSTANTIATE_TABLE`, so that the table will be properly maintained by SQL Apply in the future. If there are skip rules that indirectly reference this table (match a skip rule with a wildcard in the `schema_name` or `table_name`, and have a `TABLE`, `DML`, or `SCHEMA_DDL` statement type), `INSTANTIATE_TABLE` will fail with an ORA-16278 error. Any multiobject skip rules that pertain to the table must be dropped or changed before re-attempting the `INSTANTIATE_TABLE` call.

## Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-  
    SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -  
    DBLINK => 'INSTANTIATE_TBL_LINK');
```

## IS\_APPLY\_SERVER Function

This function returns `TRUE` if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the `fire_once` parameter in the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram set to `FALSE` (the default is `TRUE`). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.

**See Also:** *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram.

### Syntax

```
DBMS_LOGSTDBY.IS_APPLY_SERVER  
RETURN BOOLEAN;
```

### Parameters

None

## MAP\_PRIMARY\_SCN Function

Returns an SCN on the standby that predates the supplied SCN from the primary database by at least 5 minutes. This function can be used to determine a safe SCN to use in a compensating flashback database operation at the logical standby database, following a flashback database operation or a point-in-time recovery operation at the primary database.

### Syntax

```
DBMS_LOGSTDBY.MAP_PRIMARY_SCN(primary_scn NUMBER) RETURN NUMBER;
```

### Exceptions

**Table 86–7 MAP\_PRIMARY\_SCN Function Exceptions**

Exception	Description
ORA-20001	Primary SCN is before mapped range
ORA-20002	SCN mapping requires PRESERVE_COMMIT_ORDER to be TRUE

### Usage Notes

Use this function to get a conservative SCN at the logical standby database that corresponds to an SCN at the primary database. This function is useful in the context of doing compensating flashback database operations at the logical standby following a flashback database or a point-in-time recovery operation done at the primary database.

## PREPARE\_FOR\_NEW\_PRIMARY Procedure

The `PREPARE_FOR_NEW_PRIMARY` procedure must be invoked at a logical standby database following a failover if that standby database was not the target of the failover operation. Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the `alert.log`. These logs must be copied to the logical standby and registered using the `ALTER DATABASE REGISTER LOGICAL LOGFILE` statement.

### Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
    FORMER_STANDBY_TYPE    IN VARCHAR2,
    DBLINK                  IN VARCHAR2);
```

### Parameters

**Table 86–8** *PREPARE\_FOR\_NEW\_PRIMARY Procedure Parameters*

Parameter	Description
FORMER_STANDBY_TYPE	The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database.
DBLINK	The name of a database link to the new primary database

### Exceptions

**Table 86–9** *PREPARE\_FOR\_NEW\_PRIMARY Procedure Exceptions*

Exception	Description
ORA-16104	Invalid Logical Standby option.
ORA-16109	Failed to apply log data from previous primary.

### Usage Notes

- This routine is intended only for logical standby systems.
- This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully.
- Log files displayed in the alert log will be referred to as *terminal logs*. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally.
- Upon manual registration of the terminal logs, users should complete the process by calling either `START LOGICAL STANDBY APPLY` if the new primary database was formerly a physical standby database or `START LOGICAL STANDBY APPLY NEW PRIMARY` if the new primary database was formerly a logical standby database.
- See the alert log for more details regarding the reasons for any exception.

**Examples**

```
SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY ( -  
        FORMER_STANDBY_TYPE => 'LOGICAL',      -  
        DBLINK => 'dblink_to_newprimary');
```

## PURGE\_SESSION Procedure

Identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply. Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

### Syntax

```
DBMS_LOGSTDBY.PURGE_SESSION;
```

### Exceptions

**Table 86–10 PURGE\_SESSION Procedure Exceptions**

Exception	Description
ORA-01309	Invalid session

### Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the DBA\_LOGMNR\_PURGED\_LOG view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10g Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the LOG\_AUTO\_DELETE parameter described in the DBMS\_LOGSTDBY.APPLY\_SET procedure described on page 86-7.

### Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:

```
SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;
```

2. Query the DBA\_LOGMNR\_PURGED\_LOG view to list the archived redo log files that can be removed:

```
SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;
```

```
FILE_NAME
-----
/boston/arc_dest/arc_1_40_509538672.log
/boston/arc_dest/arc_1_41_509538672.log
/boston/arc_dest/arc_1_42_509538672.log
/boston/arc_dest/arc_1_43_509538672.log
/boston/arc_dest/arc_1_44_509538672.log
/boston/arc_dest/arc_1_45_509538672.log
/boston/arc_dest/arc_1_46_509538672.log
/boston/arc_dest/arc_1_47_509538672.log
```

3. Use operating system-specific commands to delete archived redo log files from the file system.

## REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner dictionary) in the redo stream required for other logical standby databases.

### Syntax

```
DBMS_LOGSTDBY.REBUILD;
```

### Usage Notes

- LogMiner dictionary information is logged in the redo log files.
- The standby redo log files (if present) are archived.

### Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

## SET\_TABLESPACE Procedure

Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the `SYSAUX` tablespace. SQL Apply cannot be running when you invoke this procedure.

### Syntax

```
DBMS_LOGSTDBY.SET_TABLESPACE (
    NEW_TABLESPACE IN VARCHAR2)
```

### Parameters

**Table 86–11 SET\_TABLESPACE Procedure Parameters**

Parameter	Description
<code>NEW_TABLESPACE</code>	Name of the new tablespace where metadata tables will reside.

### Exceptions

**Table 86–12 SET\_TABLESPACE Procedure Exceptions**

Exception	Description
<code>ORA-16103</code>	Logical Standby apply must be stopped to allow this operation
<code>ORA-16236</code>	Logical Standby metadata operation in progress

### Examples

To move metadata tables to a new tablespace named `LOGSTDBY_TBS`, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

## SKIP Procedure

The `SKIP` procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database. For example, the `SKIP` procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

### Syntax

```
DBMS_LOGSTDBY.SKIP (
    stmt                IN VARCHAR2,
    schema_name        IN VARCHAR2 DEFAULT NULL,
    object_name        IN VARCHAR2 DEFAULT NULL,
    proc_name          IN VARCHAR2 DEFAULT NULL,
    use_like           IN BOOLEAN DEFAULT TRUE,
    esc                IN CHAR1 DEFAULT NULL);
```

### Parameters

**Table 86–13** SKIP Procedure Parameters

Parameter	Description
<code>stmt</code>	<p>Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. <a href="#">Table 86–14</a> shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.</p> <p>The keyword <code>PL/SQL</code> is used for the execution of Oracle-supplied packages which are supported for replication. See <i>Oracle Data Guard Concepts and Administration</i> for information about supported packages.</p>
<code>schema_name</code>	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code> .
<code>object_name</code>	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> . If not applicable, this value must be set to <code>NULL</code> .

**Table 86–13 (Cont.) SKIP Procedure Parameters**

Parameter	Description
<code>proc_name</code>	<p>Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>' schema . package . procedure '</pre> <p>This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement.</p> <p>For DDLs, SQL Apply calls the stored procedure with the following call signature:</p> <ul style="list-style-type: none"> <li>▪ <code>IN STATEMENT VARCHAR2</code> -- The SQL statement that matches the filter</li> <li>▪ <code>IN STATEMENT_TYPE VARCHAR2</code> -- The <code>stmt</code> of the filter</li> <li>▪ <code>IN SCHEMA VARCHAR2</code> -- The <code>schema_name</code> of the filter, if applicable</li> <li>▪ <code>IN NAME VARCHAR2</code> -- The <code>object_name</code> of the filter, if applicable</li> <li>▪ <code>IN XIDUSN NUMBER</code> -- Transaction ID part 1</li> <li>▪ <code>IN XIDSLT NUMBER</code> -- Transaction ID part 2</li> <li>▪ <code>IN XIDSQN NUMBER</code> -- Transaction ID part 3</li> <li>▪ <code>OUT SKIP_ACTION NUMBER</code> -- Action to be taken by SQL Apply upon completion of this routine. Valid values are: <ul style="list-style-type: none"> <li><code>SKIP_ACTION_APPLY</code> -- Execute the statement</li> <li><code>SKIP_ACTION_SKIP</code> -- Skip the statement</li> <li><code>SKIP_ACTION_ERROR</code> -- Halt apply so the DBA can take appropriate steps (for example, take compensating action)</li> <li><code>SKIP_ACTION_REPLACE</code> -- Execute the replacement statement supplied in the <code>NEW_STATEMENT</code> output parameter</li> </ul> </li> </ul> <p>For PL/SQL, SQL Apply calls the stored procedure with the following call signature:</p> <ul style="list-style-type: none"> <li>▪ <code>IN STATEMENT VARCHAR2</code> -- The SQL statement that matches the filter</li> <li>▪ <code>IN PACKAGE_SCHEMA VARCHAR2</code> -- The schema of the package being skipped (for example, <code>SYS</code> or <code>XDB</code>)</li> <li>▪ <code>IN PACKAGE_NAME VARCHAR2</code> -- The name of the package being skipped (for example, <code>DEMS_RLS</code>)</li> <li>▪ <code>IN PROCEDURE_NAME VARCHAR2</code> -- The name of the procedure being skipped (for example, <code>ADD_POLICY</code>)</li> <li>▪ <code>IN CURRENT_SCHEMA VARCHAR2</code> -- The name of the current schema in which the PL/SQL was executed on the primary</li> <li>▪ <code>IN XIDUSN NUMBER</code> -- Transaction ID part 1</li> <li>▪ <code>IN XIDSLT NUMBER</code> -- Transaction ID part 2</li> <li>▪ <code>IN XIDSQN NUMBER</code> -- Transaction ID part 3</li> <li>▪ <code>IN EXIT_STATUS</code> -- 0 (Zero) if the PL/SQL succeeded on the primary, or 1</li> </ul>

**Table 86–13 (Cont.) SKIP Procedure Parameters**

Parameter	Description
proc_name (cont.)	<ul style="list-style-type: none"> <li>OUT SKIP_ACTION NUMBER -- Action to be taken by SQL Apply upon completion of this routine. Valid return values are:  SKIP_ACTION_APPLY -- Execute the statement  SKIP_ACTION_APPLY -- Execute the statement  SKIP_ACTION_ERROR – Raise an error which halts apply so that the DBA can take appropriate steps</li> </ul> <p><b>Note 1:</b> SKIP_ACTION_REPLACE is not supported for PL/SQL.</p> <p><b>Note 2:</b> SQL Apply calls the skip handler when the procedure's exit is processed.</p> <p><b>Note 3:</b> The use_like parameter must be set to FALSE for PL/SQL since wildcarding PL/SQL is not supported.</p> <p>The following example shows how to have a conditional skip rule on DBMS_RLS.DROP_POLICY:</p> <pre> Create or replace procedure sec_mgr.skip_drop_policy ( statement      in varchar2, pkgown         in varchar2, pkgname        in varchar2, procnm         in varchar2, cuser          in varchar2, xidusn         in number, xidslt         in number, xidsgn         in number, exstatus       in number, skip_action    out number) Is Begin   If 0 = exstatus Then     Insert Into sec_mgr.logit Values       ('Success: '    pkgown    '.'    pkgname    '.'    procnm    ' by '    cuser);      If cuser != 'TESTSCHEMA' Then       skip_action := DBMS_LOGSTDBY.SKIP_ACTION_APPLY;     Else       skip_action := DBMS_LOGSTDBY.SKIP_ACTION_SKIP;     End If;   End If; End skip_drop_policy;  EXECUTE DBMS_LOGSTDBY.SKIP( -   stmt =&gt; 'PL/SQL', -   schema_name =&gt; 'SYS', -   object_name =&gt; 'DBMS_RLS.DROP_POLICY', -   proc_name =&gt; 'SEC_MGR.SKIP_DROP_POLICY' -   use_like=&gt; FALSE); </pre>
use_like	<p>Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the <i>Oracle Database SQL Language Reference</i>.</p>

**Table 86–13 (Cont.) SKIP Procedure Parameters**

Parameter	Description
esc	Identifies an escape character (such as the character "/" ) that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <i>Oracle Database SQL Language Reference</i> for more information about pattern matching.

## Usage Notes

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104 :  
invalid Logical Standby option requested error:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'DML', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'DML_HANDLER');
```

Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the SCHEMA\_DDL event for the HR.EMPLOYEES table, and a rule for the ALTER TABLE event for the HR.EMPLOYEES table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'SCHEMA DDL', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'SCHEMA_DDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'TABLE_ALTER_HANDLER');
```

On encountering an ALTER TABLE statement, the schema\_ddl\_handler procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement.

Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the following example will result in the empddl\_handler procedure being invoked upon encountering the ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMP%', -
      proc_name => 'EMPDDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'EMPLOYEE_DDL_HANDLER');
```

- Use the `SKIP` procedure with caution, particularly when skipping DDL statements. If a `CREATE TABLE` statement is skipped, for example, you must also specify other DDL statements that refer to that table in the `SKIP` procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.
- Before calling the `SKIP` procedure, SQL Apply must be halted. Do this by issuing an `ALTER DATABASE STOP LOGICAL STANDBY APPLY` statement. Once all desired filters have been specified, issue an `ALTER DATABASE START LOGICAL STANDBY APPLY IMMEDIATE` statement to start SQL Apply using the new filter settings.
- See the `UNSKIP` procedure on page 86-35 for information about reversing (undoing) the settings of the `SKIP` procedure.
- For `USER` statements, the `SCHEMA_NAME` parameter will be the user and specify '%' for the `OBJECT_NAME` parameter.
- If the `PROC_NAME` parameter is supplied, it must already exist in `DBA_PROCEEDURES` and it must execute with `DEFINER` rights. If the procedure is declared with `INVOKER` rights, the `ORA-1031: insufficient privileges` message will be returned.
- If the procedure returns a `REPLACEMENT` statement, the `REPLACEMENT` statement will be executed using the `SYSTEM` and `OBJECT` privileges of the owner of the procedure.
- The PL/SQL block of a `SKIP` procedure cannot contain transaction control statements (for example, `COMMIT`, `ROLLBACK`, `SAVEPOINT`, and `SET CONSTRAINT`) unless the block is declared to be an autonomous transaction.

### Skip Statement Options

Table 86-14 lists the supported values for the `stmt` parameter of the `SKIP` procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. In addition, any of the SQL statements listed in the `sys.audit_actions` table (shown in the right column of Table 86-14) are also valid values. Note that keywords are generally defined by database object.

**Table 86-14 Supported Values for the `stmt` Parameter**

Keyword	Associated SQL Statements
There is no keyword for this group of SQL statements.	GRANT REVOKE ANALYZE TABLE ANALYZE INDEX ANALYZE CLUSTER
CLUSTER	AUDIT CLUSTER CREATE CLUSTER DROP CLUSTER TRUNCATE CLUSTER
CONTEXT	CREATE CONTEXT DROP CONTEXT
DATABASE LINK	CREATE DATABASE LINK CREATE PUBLIC DATABASE LINK DROP DATABASE LINK DROP PUBLIC DATABASE LINK

**Table 86–14 (Cont.) Supported Values for the stmt Parameter**

<b>Keyword</b>	<b>Associated SQL Statements</b>
DIMENSION	ALTER DIMENSION CREATE DIMENSION DROP DIMENSION
DIRECTORY <sup>1</sup>	CREATE DIRECTORY DROP DIRECTORY
DML	Includes DML statements on a table (for example: INSERT, UPDATE, and DELETE)
INDEX	ALTER INDEX CREATE INDEX DROP INDEX
NON_SCHEMA_DDL	<i>All DDL that does not pertain to a particular schema</i> <b>Note:</b> SCHEMA_NAME and OBJECT_NAME must be null
PL/SQL <sup>2</sup>	Execute Oracle-supplied package.
PROCEDURE <sup>3</sup>	ALTER FUNCTION ALTER PACKAGE ALTER PACKAGE BODY ALTER PROCEDURE CREATE FUNCTION CREATE LIBRARY CREATE PACKAGE CREATE PACKAGE BODY CREATE PROCEDURE DROP FUNCTION DROP LIBRARY DROP PACKAGE DROP PACKAGE BODY DROP PROCEDURE
PROFILE	ALTER PROFILE CREATE PROFILE DROP PROFILE
ROLE	ALTER ROLE CREATE ROLE DROP ROLE SET ROLE
ROLLBACK STATEMENT	ALTER ROLLBACK SEGMENT CREATE ROLLBACK SEGMENT DROP ROLLBACK SEGMENT
SCHEMA_DDL	<i>All DDL statements that create, modify, or drop schema objects (for example: tables, indexes, and columns)</i> <b>Note:</b> SCHEMA_NAME and OBJECT_NAME must <i>not</i> be null
SEQUENCE	ALTER SEQUENCE CREATE SEQUENCE DROP SEQUENCE
SYNONYM	CREATE PUBLIC SYNONYM CREATE SYNONYM DROP PUBLIC SYNONYM DROP SYNONYM
SYSTEM AUDIT	AUDIT <i>SQL_statements</i> NOAUDIT <i>SQL_statements</i>

**Table 86–14 (Cont.) Supported Values for the `stmt` Parameter**

<b>Keyword</b>	<b>Associated SQL Statements</b>
TABLE	CREATE TABLE ALTER TABLE DROP TABLE TRUNCATE TABLE
TABLESPACE	CREATE TABLESPACE DROP TABLESPACE ALTER TABLESPACE
TRIGGER	ALTER TRIGGER CREATE TRIGGER DISABLE ALL TRIGGERS DISABLE TRIGGER DROP TRIGGER ENABLE ALL TRIGGERS ENABLE TRIGGER
TYPE	ALTER TYPE ALTER TYPE BODY CREATE TYPE CREATE TYPE BODY DROP TYPE DROP TYPE BODY
USER	ALTER USER CREATE USER DROP USER
VIEW	CREATE VIEW DROP VIEW
VIEW	CREATE VIEW DROP VIEW

<sup>1</sup> All directory objects are owned by `SYS`, but for the purpose of filtering them with a skip directive the schema should be specified as `%`.

<sup>2</sup> See *Oracle Data Guard Concepts and Administration* for information about supported packages.

<sup>3</sup> Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

## Exceptions

**Table 86–15 DBMS\_LOGSTDBY.SKIP Procedure Exceptions**

<b>Exception</b>	<b>Description</b>
ORA-01031	Insufficient privileges: <ul style="list-style-type: none"> <li>■ Procedure used <code>INVOKER</code> rights</li> <li>■ Procedure needs <code>DBA</code> privileges</li> </ul>
ORA-16103	Logical standby apply must be stopped to allow this operation.
ORA-16104	Invalid logical standby option requested.
ORA-16203	"Unable to interpret <code>SKIP</code> procedure return values." Indicates that a <code>SKIP</code> procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the <code>DBA_LOGSTDBY_EVENTS</code> view.
ORA-16236	Logical standby metadata operation in progress.

## Examples

### Example 1 Skipping all DML and DDL changes made to a schema

The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the HR schema.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'SCHEMA DDL', -
    schema_name => 'HR', -
    object_name => '%', -
    proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'DML', -
    schema_name => 'HR', -
    object_name => '%', -
    proc_name => null);
```

### Example 2 Creating a procedure to handle different file system organization

For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a `SKIP` procedure to handle DDL statements with file specifications transparently.

The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

1. Create the `SKIP` procedure to handle tablespace DDL statements:

```
CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl (

    old_stmt IN VARCHAR2,
    stmt_typ IN VARCHAR2,
    schema IN VARCHAR2,
    name IN VARCHAR2,
    xidusn IN NUMBER,
    xidslt IN NUMBER,
    xidsqn IN NUMBER,
    action OUT NUMBER,
    new_stmt OUT VARCHAR2
) AS
BEGIN

    -- All primary file specification that contains a directory
    -- /usr/orcl/primary/dbs
    -- should go to /usr/orcl/standby directory specification

    new_stmt = replace(old_stmt,
        '/usr/orcl/primary/dbs',
        '/usr/orcl/standby');

    action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;

EXCEPTION
    WHEN OTHERS THEN
        action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;
        new_stmt := NULL;
END handle_tbs_ddl;
```

2. Register the `SKIP` procedure with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', -
    proc_name => 'SYS.HANDLE_TBS_DDL');
```

## SKIP\_ERROR Procedure

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine a course of action. The default action when a match is found is to skip the error and continue with applying changes. However, if a procedure is supplied, then `SKIP_ERROR` can take other actions depending on the situation. It can do nothing, which causes SQL Apply to stop, or it can change the error message text and stop SQL Apply, or it can actually skip the error.

### Syntax

```
DBMS_LOGSTDBY.SKIP_ERROR (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL,
    proc_name           IN VARCHAR2 DEFAULT NULL,
    use_like             IN BOOLEAN  DEFAULT NULL,
    esc                 IN CHAR1    DEFAULT NULL);
```

### Parameters

**Table 86–16** SKIP\_ERROR Procedure Parameters

Parameter	Description
<code>stmt</code>	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. <a href="#">Table 86–14</a> shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
<code>schema_name</code>	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code> .
<code>object_name</code>	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> . If not applicable, this value must be set to <code>NULL</code> .

**Table 86–16 (Cont.) SKIP\_ERROR Procedure Parameters**

Parameter	Description
proc_name	<p>Name of a stored procedure to call when SQL Apply encounters an error and determines a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>' "schema" . "package" . "procedure" '</pre> <p>This procedure returns an error message that directs SQL Apply to perform one of the following actions:</p> <ul style="list-style-type: none"> <li>■ Silently skip the error and continue with SQL Apply</li> <li>■ Replace the error message that would have been created with a custom one, and stop SQL Apply</li> <li>■ Do nothing, causing SQL Apply to stop and the original error message to be logged</li> </ul> <p>SQL Apply calls the stored procedure with the following call signature:</p> <ul style="list-style-type: none"> <li>■ IN STATEMENT VARCHAR(4000) -- The first 4K of the statement</li> <li>■ IN STATEMENT_TYPE VARCHAR2 -- The <code>stmt</code> of the filter</li> <li>■ IN SCHEMA VARCHAR2 -- The <code>schema_name</code> of the filter, if applicable</li> <li>■ IN NAME VARCHAR2 -- The <code>object_name</code> of the filter, if applicable</li> <li>■ IN XIDUSN NUMBER -- Transaction ID part 1</li> <li>■ IN XIDSLT NUMBER -- Transaction ID part 2</li> <li>■ IN XIDSQN NUMBER -- Transaction ID part 3</li> <li>■ IN ERROR VARCHAR(4000) -- Text of the original error to be recorded</li> <li>■ OUT NEW_ERROR VARCHAR(4000) -- Null or modified error text</li> </ul>
use_like	<p>Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The <code>use_like</code> parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the <i>Oracle Database SQL Language Reference</i>.</p>
esc	<p>Identifies an escape character (such as the characters "%" or "_") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <i>Oracle Database SQL Language Reference</i> for more information about pattern matching.</p>

## Usage Notes

- A stored procedure provided to the `SKIP_ERROR` procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.
- Running this stored procedure affects the error being written in the `STATUS` column of the `DBA_LOGSTDBY_EVENTS` table. The `STATUS_CODE` column remains unchanged. If the stored procedure is to have no effect, that is, apply will be

stopped, then the `NEW_ERROR` is written to the events table. To truly have no effect, set `NEW_ERROR` to `ERROR` in the procedure.

- If the stored procedure requires that a shutdown be avoided, then you must set `NEW_ERROR` to `NULL`.
- This procedure requires `DBA` privileges to execute.
- For `USER` statements, the `SCHEMA_NAME` parameter will be the user and you should specify `'%'` for the `OBJECT_NAME` parameter.
- If the `PROC_NAME` parameter is specified, it must already exist in `DBA_PROCEEDURES` and it must execute with `DEFINERS` rights. If the procedure is declared with `INVOKERS` rights, the `ORA-1031: insufficient privileges` message will be returned.
- The PL/SQL block of a `SKIP_ERROR` procedure cannot contain transaction control statements (for example: `COMMIT`, `ROLLBACK`, `SAVEPOINT`, and `SET CONSTRAINT`) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

## Exceptions

**Table 86–17** *SKIP\_ERROR Procedure Exceptions*

Exception	Description
ORA-01031	Insufficient privileges: <ul style="list-style-type: none"> <li>■ Procedure used <code>INVOKER</code> rights</li> <li>■ Procedure needs <code>DBA</code> privileges</li> </ul>
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

## Example 1

The following example shows how to specify rules so that SQL Apply will skip any error raised from any `GRANT DDL` command.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR('GRANT')
```

## Example 2

To skip errors on `GRANT` statements on `SYS` or `HR` schemas, define a procedure `handle_error_ddl` and register it. In the following example, assume that `handle_error_ddl` is a free-standing procedure in the `SYS` schema.

1. Create the error-handler procedure:

```
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl (
  old_stmt IN VARCHAR2,
  stmt_type IN VARCHAR2,
  schema IN VARCHAR2,
  name IN VARCHAR2,
  xidusn IN NUMBER,
  xidslt IN NUMBER,
  xidsqn IN NUMBER,
  error IN VARCHAR2,
```

```
new_error OUT VARCHAR2
) AS
BEGIN
-- Default to what we already have
new_error := error;
-- Ignore any GRANT errors on SYS or HR schemas
IF INSTR(UPPER(old_stmt), 'GRANT') > 0
THEN
IF schema IS NULL
OR (schema IS NOT NULL AND
(UPPER(schema) = 'SYS' OR UPPER(schema) = 'HR' )
THEN
new_error := NULL;
-- record the fact that we just skipped an error on 'SYS' or 'HR' schemas
-- code not shown here
END IF;
END IF;
END handle_error_ddl;
/
```

## 2. Register the error handler with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
      statement => 'NON_SCHEMA_DDL', -
      schema_name => NULL, -
      object_name => NULL, -
      proc_name => 'SYS.HANDLE_ERROR_DDL');
```

## SKIP\_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

### Syntax

```
DBMS_LOGSTDBY.SKIP_TRANSACTION (
    xidusn          IN NUMBER,
    xidslt          IN NUMBER,
    xidsqn          IN NUMBER);
```

### Parameters

**Table 86–18** SKIP\_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN NUMBER	Transaction ID undo segment number of the transaction being skipped
XIDSLT NUMBER	Transaction ID slot number of the transaction being skipped
XIDSQN NUMBER	Transaction ID sequence number of the transaction being skipped

### Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

---

**CAUTION:** `SKIP_TRANSACTION` is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the `V$LOGMNR_CONTENTS` view and have taken compensating actions at the logical standby database. `SKIP_TRANSACTION` is not the appropriate procedure to invoke to skip DML changes to a table.

To skip a DML failure, use a `SKIP` procedure, such as `SKIP('DML', 'MySchema', 'MyFailed Table')`. Using the `SKIP_TRANSACTION` procedure for DML transactions may skip changes for other tables, thus logically corrupting them.

---

- This procedure requires DBA privileges to execute.
- Use the `DBA_LOGSTDBY_SKIP_TRANSACTION` view to list the transactions that are going to be skipped by SQL Apply.
- Also, see the `ALTER DATABASE START LOGICAL STANDBY SKIP FAILED TRANSACTION` statement in *Oracle Database SQL Language Reference*.

## Exceptions

**Table 86–19** SKIP\_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

## Examples

To skip a DDL transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-  
      XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

## UNSKIP Procedure

Use the UNSKIP procedure to delete rules specified earlier with the SKIP procedure. The parameters specified in the UNSKIP procedure must match exactly for it to delete an already-specified rule.

### Syntax

```
DBMS_LOGSTDBY.UNSKIP (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL);
```

### Parameters

The parameter information for the UNSKIP procedure is the same as that described for the SKIP procedure. See [Table 86–13](#) on page 86-21 for complete parameter information.

### Exceptions

**Table 86–20 UNSKIP Procedure Exceptions**

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

### Usage Notes

---

**CAUTION:** If DML changes for a table have been skipped and not compensated for, you must follow the call to the UNSKIP procedure with a call to the **INSTANTIATE\_TABLE** procedure to synchronize this table with those maintained by SQL Apply.

---

- This procedure requires DBA privileges to execute.
- Wildcards passed in the `schema_name` or the `object_name` parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the UNSKIP procedure, and you will need a distinct UNSKIP procedure call to delete each rule that was previously specified.

For example, assume you have specified the following two rules to skip applying DML statements to the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => null);
```

In the following example, the wildcard in the `TABLE_NAME` parameter cannot be used to delete the rules that were specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML', -  
    SCHEMA_NAME => 'HR', -  
    OBJECT_NAME => 'EMP%');
```

In fact, this `UNSKIP` procedure matches neither of the rules, because the wildcard character in the `TABLE_NAME` parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding `SKIP` rule.

## UNSKIP\_ERROR Procedure

Use the UNSKIP\_ERROR procedure to delete rules specified earlier with the SKIP\_ERROR procedure. The parameters specified in the UNSKIP\_ERROR procedure must match exactly for the procedure to delete an already-specified rule.

### Syntax

```
DBMS_LOGSTDBY.UNSKIP_ERROR (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL);
```

### Parameters

The parameter information for the UNSKIP\_ERROR procedure is the same as that described for the SKIP\_ERROR procedure. See [Table 86–16](#) for complete parameter information.

### Exceptions

**Table 86–21 UNSKIP\_ERROR Procedure Exceptions**

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

### Usage Notes

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema\_name or the object\_name parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the UNSKIP\_ERROR procedure, and you need a distinct UNSKIP\_ERROR procedure call to delete each rule that you previously specified.

For example, assume you have specified the following two rules to handle the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => 'hr_employee_handler');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => 'hr_tempemp_handler');
```

In this case, the following UNSKIP procedure cannot be used to delete the rules that you have specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMP%');
```

In fact, the UNSKIP procedure will match neither of the rules, because the wildcard character in the OBJECT\_NAME parameter will not be expanded.

### Example

To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

```
DBMS_LOGSTDBY.UNSKIP_ERROR ( -  
    statement => 'NON_SCHEMA_DDL', -  
    schema_name => NULL, -  
    object_name => NULL);
```

## UNSKIP\_TRANSACTION Procedure

Use the UNSKIP\_TRANSACTION procedure to delete rules specified earlier with the SKIP\_TRANSACTION procedure. The parameters specified in the UNSKIP\_TRANSACTION procedure must match exactly for the procedure to delete an already-specified rule.

### Syntax

```
DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
    xidusn_p      IN NUMBER,
    xidslt_p      IN NUMBER,
    xidsqn_p      IN NUMBER);
```

### Parameters

**Table 86–22 UNSKIP\_TRANSACTION Procedure Parameters**

Parameter	Description
XIDUSN	Transaction ID undo segment number of the transaction being skipped
XIDSLT	Transaction ID slot number of the transaction being skipped
XIDSQN	Transaction ID sequence number of the transaction being skipped

### Exceptions

**Table 86–23 UNSKIP\_TRANSACTION Procedure Exceptions**

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

### Usage Notes

- This procedure requires DBA privileges to execute.
- Query the DBA\_LOGSTDBY\_SKIP\_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

### Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

---

---

## DBMS\_METADATA

The DBMS\_METADATA package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

**See Also:** *Oracle Database Utilities* for more information and for examples of using the Metadata API

This chapter contains the following topics:

- [Using DBMS\\_METADATA](#)
  - Overview
  - Security Model
  - Rules and Limits
- [Data Structures - Object and Table Types](#)
- [Subprogram Groupings](#)
  - Subprograms for Retrieving Multiple Objects From the Database
  - Subprograms for Submitting XML to the Database
- [Summary of All DBMS\\_METADATA Subprograms](#)

---

## Using DBMS\_METADATA

This section contains topics which relate to using the DBMS\_METADATA package.

- [Overview](#)
- [Security Model](#)
- [Rules and Limits](#)

## Overview

You can use the DBMS\_METADATA package to retrieve metadata and also to submit XML, as described in the following sections.

- [Retrieving Metadata](#)
- [Submitting XML](#)

### Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

DBMS\_METADATA provides the following retrieval interfaces:

- For programmatic use: OPEN, SET\_FILTER, SET\_COUNT, GET\_QUERY, SET\_PARSE\_ITEM, ADD\_TRANSFORM, SET\_TRANSFORM\_PARAM, SET\_REMAP\_PARAM, FETCH\_XXX, and CLOSE retrieve multiple objects.
- For use in SQL queries and for browsing: GET\_XML, GET\_DDL and GET\_SXML return metadata for a single named object. The GET\_DEPENDENT\_XML, GET\_DEPENDENT\_DDL, GET\_GRANTED\_XML, and GET\_GRANTED\_DDL interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

### Submitting XML

If you are submitting XML, you specify:

- The type of object
- Optional transform parameters to modify the object (for example, changing the object's owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS\_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: OPENW, ADD\_TRANSFORM, SET\_TRANSFORM\_PARAM, SET\_REMAP\_PARAM, SET\_PARSE\_ITEM, CONVERT, PUT, and CLOSE.

## Security Model

The `DBMS_METADATA` package considers a privileged user to be one who is connected as user `SYS` or who has the `SELECT_CATALOG_ROLE` role. The object views of the Oracle metadata model implement security as follows:

- Nonprivileged users can see the metadata of only their own objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to `PUBLIC`.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program invokers-rights.
- For all objects that have passwords (for example, db links, users, and roles), the following rules apply:
  - A user who has the `SELECT_CATALOG_ROLE` can see all metadata for an object except the passwords for that object.
  - The `SYS` user, users who have the `EXP_FULL_DATABASE` role, and users who own an object can see all metadata for that object, including passwords.

## Rules and Limits

In an Oracle Shared Server (OSS) environment, the `DBMS_METADATA` package must disable session migration and connection pooling. This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the `MAX_SHARED_SERVERS` initialization parameter.

## Data Structures - Object and Table Types

The DBMS\_METADATA package defines, in the SYS schema, the following OBJECT and TABLE types.

```
CREATE TYPE sys.ku$_parsed_item AS OBJECT (  
    item          VARCHAR2(30),  
    value         VARCHAR2(4000),  
    object_row    NUMBER )  
/  
  
CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;  
  
CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item  
/  
  
CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;  
  
CREATE TYPE sys.ku$_ddl AS OBJECT (  
    ddlText      CLOB,  
    parsedItem  sys.ku$_parsed_items )  
/  
  
CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;  
  
CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl  
/  
  
CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;  
  
CREATE TYPE sys.ku$_multi_ddl AS OBJECT (  
    object_row   NUMBER,  
    ddls         sys.ku$_ddls )  
/  
  
CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;  
  
CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;  
/  
  
CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR  
    sys.ku$_multi_ddls;  
  
CREATE TYPE sys.ku$_ErrorLine IS OBJECT (  
    errorNumber  NUMBER,  
    errorText    VARCHAR2(2000) )  
/  
  
CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;  
  
CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine  
/  
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;  
  
CREATE TYPE sys.ku$_SubmitResult AS OBJECT (  
    ddl          sys.ku$_ddl,  
    errorLines  sys.ku$_ErrorLines );  
/  

```

```
CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult  
/  
  
CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;
```

---

## Subprogram Groupings

The `DBMS_METADATA` subprograms are used to retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- [Table 87-1](#) provides a summary, in alphabetical order, of `DBMS_METADATA` subprograms used to retrieve multiple objects from a database.
- [Table 87-2](#) provides a summary, in alphabetical order, of `DBMS_METADATA` subprograms used to submit XML metadata to a database.

## Subprograms for Retrieving Multiple Objects From the Database

Table 87–1 lists the subprograms used for retrieving multiple objects from the database.

**Table 87–1 DBMS\_METADATA Subprograms for Retrieving Multiple Objects**

Subprogram	Description
<a href="#">ADD_TRANSFORM Function</a> on page 87-12	Specifies a transform that <code>FETCH_XXX</code> applies to the XML representation of the retrieved objects
<a href="#">CLOSE Procedure</a> on page 87-16	Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state
<a href="#">FETCH_XXX Functions and Procedures</a> on page 87-19	Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on
<a href="#">GET_QUERY Function</a> on page 87-26	Returns the text of the queries that are used by <code>FETCH_XXX</code>
<a href="#">GET_XXX Functions</a> on page 87-22	Fetches the metadata for a specified object as XML, SXML, or DDL, using only a single call
<a href="#">OPEN Function</a> on page 87-27	Specifies the type of object to be retrieved, the version of its metadata, and the object model
<a href="#">SET_COUNT Procedure</a> on page 87-36	Specifies the maximum number of objects to be retrieved in a single <code>FETCH_XXX</code> call
<a href="#">SET_FILTER Procedure</a> on page 87-37	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
<a href="#">SET_PARSE_ITEM Procedure</a> on page 87-47	Enables output parsing by specifying an object attribute to be parsed and returned
<a href="#">SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures</a> on page 87-50	Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code>

## Subprograms for Submitting XML to the Database

Table 87–2 lists the subprograms used for submitting XML to the database.

**Table 87–2 DBMS\_METADATA Subprograms for Submitting XML**

Subprogram	Description
<a href="#">ADD_TRANSFORM Function</a> on page 87-12	Specifies a transform for the XML documents
<a href="#">CLOSE Procedure</a> on page 87-16	Closes the context opened with <code>OPENW</code>
<a href="#">CONVERT Functions and Procedures</a> on page 87-17	Converts an XML document to DDL
<a href="#">OPENW Function</a> on page 87-33	Opens a write context
<a href="#">PUT Function</a> on page 87-34	Submits an XML document to the database
<a href="#">SET_PARSE_ITEM Procedure</a> on page 87-47	Specifies an object attribute to be parsed
<a href="#">SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures</a> on page 87-50	<code>SET_TRANSFORM_PARAM</code> specifies a parameter to a transform <code>SET_REMAP_PARAM</code> specifies a remapping for a transform

---

## Summary of All DBMS\_METADATA Subprograms

**Table 87-3 DBMS\_METADATA Package Subprograms**

Subprogram	Description
<a href="#">ADD_TRANSFORM Function</a> on page 87-12	Specifies a transform that <code>FETCH_xxx</code> applies to the XML representation of the retrieved objects
<a href="#">CLOSE Procedure</a> on page 87-16	Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state
<a href="#">CONVERT Functions and Procedures</a> on page 87-17	Converts an XML document to DDL.
<a href="#">FETCH_xxx Functions and Procedures</a> on page 87-19	Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on
<a href="#">GET_xxx Functions</a> on page 87-22	Fetches the metadata for a specified object as XML, SXML, or DDL, using only a single call
<a href="#">GET_QUERY Function</a> on page 87-26	Returns the text of the queries that are used by <code>FETCH_xxx</code>
<a href="#">OPEN Function</a> on page 87-27	Specifies the type of object to be retrieved, the version of its metadata, and the object model
<a href="#">OPENW Function</a> on page 87-33	Opens a write context
<a href="#">PUT Function</a> on page 87-34	Submits an XML document to the database
<a href="#">SET_COUNT Procedure</a> on page 87-36	Specifies the maximum number of objects to be retrieved in a single <code>FETCH_xxx</code> call
<a href="#">SET_FILTER Procedure</a> on page 87-37	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
<a href="#">SET_PARSE_ITEM Procedure</a> on page 87-47	Enables output parsing by specifying an object attribute to be parsed and returned
<a href="#">SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures</a> on page 87-50	Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code>

## ADD\_TRANSFORM Function

This function is used for both retrieval and submission:

- When this procedure is used to retrieve objects, it specifies a transform that `FETCH_XXX` applies to the XML representation of the retrieved objects.
- When used to submit objects, it specifies a transform that `CONVERT` or `PUT` applies to the XML representation of the submitted objects. It is possible to add more than one transform.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9
- [Subprograms for Submitting XML to the Database](#) on page 87-10

### Syntax

```
DBMS_METADATA.ADD_TRANSFORM (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    encoding    IN VARCHAR2 DEFAULT NULL,
    object_type IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

### Parameters

**Table 87–4** ADD\_TRANSFORM Function Parameters

Parameters	Description
handle	The handle returned from <code>OPEN</code> when this transform is used to retrieve objects. Or the handle returned from <code>OPENW</code> when this transform is used in the submission of XML metadata.

**Table 87-4 (Cont.) ADD\_TRANSFORM Function Parameters**

Parameters	Description
name	<p>The name of the transform. If name contains a period, colon, or forward slash, it is interpreted as the URL of a user-supplied XSLT script. See <i>Oracle XML DB Developer's Guide</i>.</p> <p>Otherwise, name designates a transform implemented by DBMS_METADATA. The following transforms are defined:</p> <ul style="list-style-type: none"> <li>■ ALTERDDL - The document is converted from ALTER_XML format to SQL DDL.</li> <li>■ ALTERXML - The document is converted from SXML difference format to ALTER_XML format. See the DBMS_METADATA_DIFF PL/SQL package for more information about SXML difference format.</li> <li>■ DDL - The document is transformed to DDL that creates the object. The output of this transform is <i>not</i> an XML document.</li> <li>■ MODIFY - The document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged.</li> <li>■ MODIFYSXML - The SXML format document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged.</li> <li>■ SXML - The document is converted to SXML format. This transform is only valid for a subset of object types. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW.</li> <li>■ SXMLDDL - The SXML format document is transformed to DDL that creates the object.</li> </ul>
encoding	<p>The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left NULL and the URL is external to the database, UTF-8 encoding is assumed. If left NULL and the URL is internal to the database (that is, it begins with /oradb/), then the encoding is assumed to be the database character set.</p>

**Table 87–4 (Cont.) ADD\_TRANSFORM Function Parameters**

Parameters	Description
object_type	<p>The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata.</p> <ol style="list-style-type: none"> <li>When you use ADD_TRANSFORM to retrieve objects, the following definition of object_type applies: <p>Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur:</p> <ul style="list-style-type: none"> <li>if object_type is omitted, the transform applies to all object types within the heterogeneous collection</li> <li>if object_type is specified, the transform only applies to that specific object type within the collection</li> </ul> <p>If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type.</p> </li> <li>When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, the caller would normally leave this parameter NULL in the ADD_TRANSFORM calls.</li> </ol>

## Return Values

The opaque handle that is returned is used as input to SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

## Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD\_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.
- You can call ADD\_TRANSFORM more than once to apply multiple transforms to XML documents. Transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.
- The output of a DDL transform is *not* an XML document. Therefore, no transform should be added after the DDL transform.

- Each transform expects a certain format XML document as input. If the input document is unspecified, metadata XML format is assumed.

## Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `ADD_TRANSFORM` was called after the first call to `FETCH_XXX` for the `OPEN` context. After the first call to `FETCH_XXX` is made, no further calls to `ADD_TRANSFORM` for the current `OPEN` context are permitted.
- `INCONSISTENT_ARGS`. The arguments are inconsistent. Possible inconsistencies include the following:
  - `encoding` is specified even though `name` is not a URL
  - `object_type` is not part of the collection designated by `handle`

## CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by `OPEN` (or `OPENW`) and cleans up the associated state.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9
- [Subprograms for Submitting XML to the Database](#) on page 87-10

### Syntax

```
DBMS_METADATA.CLOSE (
    handle IN NUMBER);
```

### Parameters

**Table 87-5** *CLOSE Procedure Parameters*

Parameter	Description
handle	The handle returned from <code>OPEN</code> (or <code>OPENW</code> ).

### Usage Notes

---

---

**Note:** The following notes apply only to object retrieval

---

---

You can prematurely terminate the stream of objects established by `OPEN` or (`OPENW`).

- If a call to `FETCH_XXX` returns `NULL`, indicating no more objects, a call to `CLOSE` is made transparently. In this case, you can still call `CLOSE` on the handle and not get an exception. (The call to `CLOSE` is not required.)
- If you know that only one specific object will be returned, you should explicitly call `CLOSE` after the single `FETCH_XXX` call to free resources held by the handle.

### Exceptions

- `INVALID_ARGVAL`. The value for the `handle` parameter is `NULL` or invalid.

## CONVERT Functions and Procedures

The `CONVERT` functions and procedures transform input XML documents. The `CONVERT` functions return creation DDL. The `CONVERT` procedures return either XML or DDL, depending on the specified transforms.

**See Also:** For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 87-10

### Syntax

The `CONVERT` functions are as follows:

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN sys.XMLType)
RETURN sys.ku$_multi_ddls;
```

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN CLOB)
RETURN sys.ku$_multi_ddls;
```

The `CONVERT` procedures are as follows:

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN sys.XMLType,
    result IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN CLOB,
    result IN OUT NOCOPY CLOB);
```

### Parameters

**Table 87–6** *CONVERT Subprogram Parameters*

Parameter	Description
handle	The handle returned from <code>OPENW</code> .
document	The XML document containing object metadata of the type of the <code>OPENW</code> handle.
result	The converted document.

### Return Values

Either XML or DDL, depending on the specified transforms.

### Usage Notes

You can think of `CONVERT` as the second half of `FETCH_xxx`, either `FETCH_DDL` (for the function variants) or `FETCH_CLOB` (for the procedure variants). There are two differences:

- `FETCH_XXX` gets its XML document from the database, but `CONVERT` gets its XML document from the caller
- `FETCH_DDL` returns its results in a `sys.ku$_ddls` nested table, but `CONVERT` returns a `sys.ku$_multi_ddls` nested table

The transforms specified with `ADD_TRANSFORM` are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the `parsedItems` column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in `OPENW`.

## Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. No transform was specified. The DDL transform was not specified (function variants only).
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

## FETCH\_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by OPEN, SET\_FILTER, SET\_COUNT, ADD\_TRANSFORM, and so on. See "Usage Notes" on page 87-20 for the variants.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9

### Syntax

The FETCH functions are as follows:

```
DBMS_METADATA.FETCH_XML (
    handle IN NUMBER)
RETURN sys.XMLType;
```

**See Also:** *Oracle XML DB Developer's Guide* for a description of XMLType

```
DBMS_METADATA.FETCH_DDL (
    handle IN NUMBER)
RETURN sys.ku$_ddl;
```

```
DBMS_METADATA.FETCH_CLOB (
    handle          IN NUMBER,
    cache_lob       IN BOOLEAN DEFAULT TRUE,
    lob_duration    IN PLS_INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The FETCH procedures are as follows:

```
DBMS_METADATA.FETCH_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.FETCH_XML_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB,
    parsed_items OUT sys.ku$_parsed_items,
    object_type_path OUT VARCHAR2);
```

### Parameters

**Table 87-7** *FETCH\_xxx Function Parameters*

Parameters	Description
handle	The handle returned from OPEN.
cache_lob	TRUE=read LOB into buffer cache
lob_duration	The duration for the temporary LOB created by FETCH_CLOB, either DBMS_LOB.SESSION (the default) or DBMS_LOB.CALL.
doc	The metadata for the objects, or NULL if all objects have been returned.

**Table 87–7 (Cont.) FETCH\_XXX Function Parameters**

Parameters	Description
<code>parsed_items</code>	A nested table containing the items specified by <code>SET_PARSE_ITEM</code> . If <code>SET_PARSE_ITEM</code> was not called, a NULL is returned.
<code>object_type_path</code>	For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to <code>FETCH_XXX</code> . If <code>handle</code> designates a homogeneous object type, a NULL is returned.

## Return Values

The metadata for the objects or NULL if all objects have been returned.

## Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to `OPEN` that returned the handle, and subsequent calls to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on. Each call to `FETCH_XXX` returns the number of objects specified by `SET_COUNT` (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to `FETCH_XXX` return NULL and cause the stream created by `OPEN` to be transparently closed.

There are several different `FETCH_XXX` functions and procedures:

- The `FETCH_XML` function returns the XML metadata for an object as an `XMLType`. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The `FETCH_DDL` function returns the DDL (to create the object) in a `sys.ku$_ddl`s nested table. It assumes that the DDL transform has been specified. Each row of the `sys.ku$_ddl`s nested table contains a single DDL statement in the `ddlText` column; if requested, parsed items for the DDL statement will be returned in the `parsedItems` column. Multiple DDL statements may be returned under the following circumstances:
  - When you call `SET_COUNT` to specify a count greater than 1
  - When an object is transformed into multiple DDL statements. For example, A `TYPE` object that has a DDL transform applied to it can be transformed into both `CREATE TYPE` and `CREATE TYPE BODY` statements. A `TABLE` object can be transformed into a `CREATE TABLE`, and one or more `ALTER TABLE` statements
- The `FETCH_CLOB` function simply returns the object, transformed or not, as a CLOB. By default, the CLOB is read into the buffer cache and has session duration, but these defaults can be overridden with the `cache_lob` and `lob_duration` parameters.
- The `FETCH_CLOB` procedure returns the objects by reference in an `IN OUT NOCOPY` parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.
- The `FETCH_XML_CLOB` procedure returns the XML metadata for the objects as a CLOB in an `IN OUT NOCOPY` parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.

- All LOBs returned by `FETCH_xxx` are temporary LOBs. You must free the LOB. If the LOB is supplied as an `IN OUT NOCOPY` parameter, you must also create the LOB.
- If `SET_PARSE_ITEM` was called, `FETCH_DDL` and `FETCH_XML_CLOB` return attributes of the object's metadata (or the DDL statement) in a `sys.ku$_parsed_items` nested table. For `FETCH_XML_CLOB`, the nested table is an `OUT` parameter. For `FETCH_DDL`, it is a column in the returned `sys.ku$_ddl`s nested table. Each row of the nested table corresponds to an item specified by `SET_PARSE_ITEM` and contains the following columns:
  - `item`—the name of the attribute as specified in the `name` parameter to `SET_PARSE_ITEM`.
  - `value`—the attribute value, or `NULL` if the attribute is not present in the DDL statement.
  - `object_row`—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by `FETCH_xxx`, (because `SET_COUNT` specified a count greater than 1) then `object_row=1` for all items for the first object, 2 for the second, and so on.
- The rows of the `sys.ku$_parsed_items` nested table are ordered by ascending `object_row`, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on `item`.
- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be `NULL`.
- If `SET_PARSE_ITEM` was not called, `NULL` is returned as the value of the parsed items nested table.
- It is expected that the same variant of `FETCH_xxx` will be called for all objects selected by `OPEN`. That is, programs will not intermix calls to `FETCH_XML`, `FETCH_DDL`, `FETCH_CLOB`, and so on using the same `OPEN` handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.
- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the `FETCH_xxx` calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

## Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. Either `FETCH_XML` was called when the DDL transform had been specified, or `FETCH_DDL` was called when the DDL transform had *not* been specified.

## GET\_xxx Functions

The following GET\_xxx functions let you fetch metadata for objects with a single call:

- GET\_XML
- GET\_DDL
- GET\_SXML
- GET\_DEPENDENT\_XML
- GET\_DEPENDENT\_DDL
- GET\_GRANTED\_XML
- GET\_GRANTED\_DDL

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9

### Syntax

```
DBMS_METADATA.GET_XML (  
object_type      IN VARCHAR2,  
name             IN VARCHAR2,  
schema          IN VARCHAR2 DEFAULT NULL,  
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model           IN VARCHAR2 DEFAULT 'ORACLE',  
transform       IN VARCHAR2 DEFAULT NULL)  
RETURN CLOB;
```

```
DBMS_METADATA.GET_DDL (  
object_type      IN VARCHAR2,  
name             IN VARCHAR2,  
schema          IN VARCHAR2 DEFAULT NULL,  
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model           IN VARCHAR2 DEFAULT 'ORACLE',  
transform       IN VARCHAR2 DEFAULT 'DDL')  
RETURN CLOB;
```

```
DBMS_METADATA.GET_SXML (  
object_type      IN VARCHAR2,  
name             IN VARCHAR2 DEFAULT NULL,  
schema          IN VARCHAR2 DEFAULT NULL,  
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model           IN VARCHAR2 DEFAULT 'ORACLE',  
transform       IN VARCHAR2 DEFAULT 'SXML')  
RETURN CLOB;
```

```
DBMS_METADATA.GET_DEPENDENT_XML (  
object_type      IN VARCHAR2,  
base_object_name IN VARCHAR2,  
base_object_schema IN VARCHAR2 DEFAULT NULL,  
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model           IN VARCHAR2 DEFAULT 'ORACLE',  
transform       IN VARCHAR2 DEFAULT NULL,  
object_count    IN NUMBER   DEFAULT 10000)  
RETURN CLOB;
```

```

DBMS_METADATA.GET_DEPENDENT_DDL (
object_type      IN VARCHAR2,
base_object_name IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model          IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL',
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

```

DBMS_METADATA.GET_GRANTED_XML (
object_type      IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model          IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL,
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

```

DBMS_METADATA.GET_GRANTED_DDL (
object_type      IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model          IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL',
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

## Parameters

**Table 87–8** *GET\_xxx Function Parameters*

Parameter	Description
object_type	The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.
name	The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified. See Table 87–17 for a list of filters.
schema	The object schema. It is used internally in a SCHEMA filter. The default is the current user.
version	The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.
model	The object model to use. This parameter takes the same values as the OPEN model parameter.
transform	The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.
base_object_name	The base object name. It is used internally in a BASE_OBJECT_NAME filter.
base_object_schema	The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.

**Table 87–8 (Cont.) GET\_xxx Function Parameters**

Parameter	Description
grantee	The grantee. It is used internally in a GRANTEE filter. The default is the current user.
object_count	The maximum number of objects to return. See <a href="#">SET_COUNT Procedure</a> on page 87-36.

## Return Values

The metadata for the specified object as XML or DDL.

## Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET\_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML, SXML, or DDL.
  - GET\_xxx is used to fetch named objects, especially schema objects (tables, views).
  - GET\_DEPENDENT\_xxx is used to fetch dependent objects (audits, object grants).
  - GET\_GRANTED\_xxx is used to fetch granted objects (system grants, role grants).
- For some object types you can use more than one function. For example, you can use GET\_xxx to fetch an index by name, or GET\_DEPENDENT\_xxx to fetch the same index by specifying the table on which it is defined.
- GET\_xxx only returns a single named object.
- For GET\_DEPENDENT\_xxx and GET\_GRANTED\_xxx, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)
- If the DDL transform is specified, session-level transform parameters are inherited.
- If you invoke these functions from SQL\*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.

## Exceptions

- INVALID\_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT\_NOT\_FOUND. The specified object was not found in the database.

## Examples

### Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE', 'EMP', 'SCOTT')
```

```
FROM DUAL;
```

**Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments**

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses `SET_TRANSFORM_PARAM` (with the handle value = `DBMS_METADATA.SESSION_TRANSFORM` meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the `PAGESIZE` to 0 and set `LONG` to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM, 'STORAGE', false);
SELECT DBMS_METADATA.GET_DDL('TABLE', u.table_name)
       FROM USER_ALL_TABLES u
       WHERE u.nested='NO'
          AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM, 'DEFAULT');
```

**Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES**

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT',
    'EMPLOYEES', 'HR') FROM DUAL;
```

**Example: Fetch the DDL For All System Grants Granted To SCOTT**

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT', 'SCOTT')
       FROM DUAL;
```

## GET\_QUERY Function

This function returns the text of the queries that are used by `FETCH_XXX`. This function assists in debugging.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9

### Syntax

```
DBMS_METADATA.GET_QUERY (  
    handle IN NUMBER)  
RETURN VARCHAR2;
```

### Parameters

**Table 87-9** *GET\_QUERY Function Parameters*

Parameter	Description
handle	The handle returned from <code>OPEN</code> . It cannot be the handle for a heterogeneous object type.

### Return Values

The text of the queries that will be used by `FETCH_XXX`.

### Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for the `handle` parameter.

## OPEN Function

This function specifies the type of object to be retrieved, the version of its metadata, and the object model. The return value is an opaque context handle for the set of objects to be used in subsequent calls.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9

### Syntax

```
DBMS_METADATA.OPEN (
  object_type IN VARCHAR2,
  version     IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model       IN VARCHAR2 DEFAULT 'ORACLE',
  network_link IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

### Parameters

**Table 87–10 Open Function Parameters**

Parameter	Description
object_type	<p>The type of object to be retrieved. <a href="#">Table 87–11</a> lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see <a href="#">model</a> in this table).</p> <p>The Attributes column in <a href="#">Table 87–11</a> specifies some object type attributes:</p> <ul style="list-style-type: none"> <li>▪ Schema objects, such as tables, belong to schemas.</li> <li>▪ Named objects have unique names (if they are schema objects, the name is unique to the schema).</li> <li>▪ Dependent objects, such as indexes, are defined with reference to a base schema object.</li> <li>▪ Granted objects are granted or assigned to a user or role and therefore have a named grantee.</li> <li>▪ Heterogeneous object types denote a collection of related objects of different types. See <a href="#">Table 87–12</a> for a listing of object types returned for the heterogeneous object type.</li> </ul> <p>These attributes are relevant when choosing object selection criteria. See "<a href="#">SET_FILTER Procedure</a>" on page 87-37 for more information.</p>
version	<p>The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <p>COMPATIBLE (default)—the version of the metadata corresponds to the database compatibility level.</p> <p>LATEST—the version of the metadata corresponds to the database version.</p> <p>A specific database version. The value cannot be lower than 9.2.0.</p>

**Table 87–10 (Cont.) Open Function Parameters**

Parameter	Description
model	Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported.
network_link	The name of a database link to the database whose metadata is to be retrieved. If NULL (the default), metadata is retrieved from the database on which the caller is running

Table 87–11 provides the name, meaning, attributes, and notes for the DBMS\_METADATA package object types. In the attributes column, S represents a schema object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

**Table 87–11 DBMS\_METADATA: Object Types**

Type Name	Meaning	Attributes	Notes
AQ_QUEUE	queues	SND	Dependent on table
AQ_QUEUE_TABLE	additional metadata for queue tables	ND	Dependent on table
AQ_TRANSFORM	transforms	SN	None
ASSOCIATION	associate statistics	D	None
AUDIT	audits of SQL statements	DG	Modeled as dependent, granted object. The base object name is the statement audit option name (for example, ALTER SYSTEM). There is no base object schema. The grantee is the user or proxy whose statements are audited.
AUDIT_OBJ	audits of schema objects	D	None
CLUSTER	clusters	SN	None
COMMENT	comments	D	None
CONSTRAINT	constraints	SND	Does not include: <ul style="list-style-type: none"> <li>■ primary key constraint for IOT</li> <li>■ column NOT NULL constraints</li> <li>■ certain REF SCOPE and WITH ROWID constraints for tables with REF columns</li> </ul>
CONTEXT	application contexts	N	None
DATABASE_EXPORT	all metadata objects in a database	H	Corresponds to a full database export
DB_LINK	database links	SN	Modeled as schema objects because they have owners. For public links, the owner is PUBLIC. For private links, the creator is the owner.
DEFAULT_ROLE	default roles	G	Granted to a user by ALTER USER
DIMENSION	dimensions	SN	None
DIRECTORY	directories	N	None
FGA_POLICY	fine-grained audit policies	D	Not modeled as named object because policy names are not unique.

**Table 87-11 (Cont.) DBMS\_METADATA: Object Types**

Type Name	Meaning	Attributes	Notes
FUNCTION	stored functions	SN	None
INDEX_STATISTICS	precomputed statistics on indexes	D	The base object is the index's table.
INDEX	indexes	SND	None
INDEXTYPE	indextypes	SN	None
JAVA_SOURCE	Java sources	SN	None
JOB	jobs	S	None
LIBRARY	external procedure libraries	SN	None
MATERIALIZED_VIEW	materialized views	SN	None
MATERIALIZED_VIEW_LOG	materialized view logs	D	None
OBJECT_GRANT	object grants	DG	None
OPERATOR	operators	SN	None
PACKAGE	stored packages	SN	By default, both package specification and package body are retrieved. See " <a href="#">SET_FILTER Procedure</a> " on page 87-37.
PACKAGE_SPEC	package specifications	SN	None
PACKAGE_BODY	package bodies	SN	None
PROCEDURE	stored procedures	SN	None
PROFILE	profiles	N	None
PROXY	proxy authentications	G	Granted to a user by ALTER USER
REF_CONSTRAINT	referential constraint	SND	None
REFRESH_GROUP	refresh groups	SN	None
RESOURCE_COST	resource cost info		None
RLS_CONTEXT	driving contexts for enforcement of fine-grained access-control policies	D	Corresponds to the DBMS_RLS.ADD_POLICY_CONTENT procedure
RLS_GROUP	fine-grained access-control policy groups	D	Corresponds to the DBMS_RLS.CREATE_GROUP procedure
RLS_POLICY	fine-grained access-control policies	D	Corresponds to DBMS_RLS.ADD_GROUPED_POLICY. Not modeled as named objects because policy names are not unique.
RMGR_CONSUMER_GROUP	resource consumer groups	SN	Data Pump does not use these object types. Instead, it exports resource manager objects as procedural objects.
RMGR_INITIAL_CONSUMER_GROUP	assign initial consumer groups to users	G	None
RMGR_PLAN	resource plans	SN	None
RMGR_PLAN_DIRECTIVE	resource plan directives	D	Dependent on resource plan
ROLE	roles	N	None

**Table 87–11 (Cont.) DBMS\_METADATA: Object Types**

Type Name	Meaning	Attributes	Notes
ROLE_GRANT	role grants	G	None
ROLLBACK_SEGMENT	rollback segments	N	None
SCHEMA_EXPORT	all metadata objects in a schema	H	Corresponds to user-mode export.
SEQUENCE	sequences	SN	None
SYNONYM	synonyms	See notes	Private synonyms are schema objects. Public synonyms are not, but for the purposes of this API, their schema name is PUBLIC. The name of a synonym is considered to be the synonym itself. For example, in <code>CREATE PUBLIC SYNONYM FOO FOR BAR</code> , the resultant object is considered to have name FOO and schema PUBLIC.
SYSTEM_GRANT	system privilege grants	G	None
TABLE	tables	SN	None
TABLE_DATA	metadata describing row data for a table, nested table, or partition	SND	For partitions, the object name is the partition name.  For nested tables, the object name is the storage table name. The base object is the top-level table to which the table data belongs. For nested tables and partitioning, this is the top-level table ( <i>not</i> the parent table or partition). For nonpartitioned tables and non-nested tables this is the table itself.
TABLE_EXPORT	metadata for a table and its associated objects	H	Corresponds to table-mode export
TABLE_STATISTICS	precomputed statistics on tables	D	None
TABLESPACE	tablespaces	N	None
TABLESPACE_QUOTA	tablespace quotas	G	Granted with ALTER USER
TRANSPORTABLE_EXPORT	metadata for objects in a transportable tablespace set	H	Corresponds to transportable tablespace export
TRIGGER	triggers	SND	None
TRUSTED_DB_LINK	trusted links	N	None
TYPE	user-defined types	SN	By default, both type and type body are retrieved. See " <a href="#">SET_FILTER Procedure</a> " on page 87-37.
TYPE_SPEC	type specifications	SN	None
TYPE_BODY	type bodies	SN	None
USER	users	N	None
VIEW	views	SN	None
XMLSCHEMA	XML schema	SN	The object's name is its URL (which may be longer than 30 characters). Its schema is the user who registered it.

Table 87–12 lists the types of objects returned for the major heterogeneous object types. For SCHEMA\_EXPORT, certain object types are only returned if the INCLUDE\_USER filter is specified at TRUE. In the table, such object types are marked INCLUDE\_USER.

**Table 87–12 Object Types Returned for the Heterogeneous Object Type**

Object Type	DATABASE_EXPORT	SCHEMA_EXPORT	TABLE_EXPORT	TRANSPORTABLE_EXPORT

TYPE_SPEC	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
TYPE_BODY	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
USER	Yes	INCLUDE_USER	No	No
VIEW	Yes	Yes	No	No
XMLSCHEMA	Yes	Yes	No	No

## Return Values

An opaque handle to the class of objects. This handle is used as input to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, `GET_QUERY`, `SET_PARSE_ITEM`, `FETCH_xxx`, and `CLOSE`.

## Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The `version` or `model` parameter was not valid for the `object_type`.

## OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

**See Also:** For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 87-10

### Syntax

```
DBMS_METADATA.OPENW
(object_type IN VARCHAR2,
version      IN VARCHAR2 DEFAULT 'COMPATIBLE',
model       IN VARCHAR2 DEFAULT 'ORACLE')
RETURN NUMBER;
```

### Parameters

**Table 87–13** OPENW Function Parameters

Parameter	Description
object_type	The type of object to be submitted. Valid types names and their meanings are listed in <a href="#">Table 87–11</a> . The type cannot be a heterogeneous object type.
version	The version of DDL to be generated by the CONVERT function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows: <ul style="list-style-type: none"> <li>■ COMPATIBLE - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher.</li> <li>■ LATEST - The version of the DDL corresponds to the database version.</li> <li>■ A specific database version. The value cannot be lower than 9.2.0.</li> </ul>
model	Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by DBMS_METADATA.

### Return Values

An opaque handle to write context. This handle is used as input to the ADD\_TRANSFORM, CONVERT, PUT, and CLOSE procedures.

### Exceptions

- INVALID\_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID\_OBJECT\_PARAM. The model parameter was not valid for the object\_type.

## PUT Function

This function submits an XML document containing object metadata to the database to create the object.

**See Also:** For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 87-10

### Syntax

```
DBMS_METADATA.PUT (
    handle      IN          NUMBER,
    document    IN          sys.XMLType,
    flags       IN          NUMBER,
    results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

```
DBMS_METADATA.PUT (
    handle      IN          NUMBER,
    document    IN          CLOB,
    flags       IN          NUMBER,
    results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

### Parameters

**Table 87–14** PUT Function Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata for the type of the OPENW handle.
flags	Reserved for future use
results	Detailed results of the operation.

### Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.

### Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the `sys.ku$_SubmitResults` nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

**Exceptions**

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. The DDL transform was not specified.
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

## SET\_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single `FETCH_XXX` call. By default, each call to `FETCH_XXX` returns one object. You can use the `SET_COUNT` procedure to override this default. If `FETCH_XXX` is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single `FETCH_XXX` operation only returns objects of a single object type.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9

### Syntax

```
DBMS_METADATA.SET_COUNT (
    handle          IN NUMBER,
    value           IN NUMBER,
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 87–15** *SET\_COUNT Procedure Parameters*

Parameter	Description
handle	The handle returned from <code>OPEN</code> .
value	The maximum number of objects to retrieve.
object_type_path	A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> <li>▪ if <code>object_type_path</code> is omitted, the count applies to all object types within the heterogeneous collection</li> <li>▪ if <code>object_type_path</code> is specified, the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection</li> </ul>

### Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_COUNT` was called after the first call to `FETCH_XXX` for the `OPEN` context. After the first call to `FETCH_XXX` is made, no further calls to `SET_COUNT` for the current `OPEN` context are permitted.
- `INCONSISTENT_ARGS`. `object_type` parameter is not consistent with `handle`.

## SET\_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9

### Syntax

```
DBMS_METADATA.SET_FILTER (
  handle          IN NUMBER,
  name            IN VARCHAR2,
  value           IN VARCHAR2,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (
  handle          IN NUMBER,
  name            IN VARCHAR2,
  value           IN BOOLEAN DEFAULT TRUE,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (
  handle          IN NUMBER,
  name            IN VARCHAR2,
  value           IN NUMBER,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 87–16 SET\_FILTER Procedure Parameters**

Parameter	Description
handle	The handle returned from OPEN.
name	<p>The name of the filter. For each filter, <a href="#">Table 87–17</a> lists the <code>object_type</code> it applies to, its name, its datatype (text or Boolean) and its meaning or effect (including its default value, if any).</p> <p>The Datatype column of <a href="#">Table 87–17</a> also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (<i>not</i> a double quote) are needed to represent an apostrophe. For example, an example of a NAME_EXPR filter in PL/SQL is as follows:</p> <pre>' IN ( 'DEPT' , 'EMP' )'</pre> <p>The filter value is combined with a particular object attribute to produce a WHERE condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.</p>
value	The value of the filter. Text, Boolean, and Numeric filters are supported.

**Table 87–16 (Cont.) SET\_FILTER Procedure Parameters**

Parameter	Description
object_type_path	A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See <a href="#">Table 87–18</a> for a listing of some of the values for this parameter.

[Table 87–17](#) describes the object type, name, datatype, and meaning of the filters available with the SET\_FILTER procedure.

**Table 87–17 SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
Named objects	NAME	text	Objects with this exact name are selected.
Named objects	NAME_EXPR	text expression	The filter value is combined with the object attribute corresponding to the object name to produce a WHERE condition in the query that fetches the objects.  By default, all named objects of object_type are selected.
Named objects	EXCLUDE_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the object name to specify objects that are to be excluded from the set of objects fetched.  By default, all named objects of the object type are selected.
Schema objects	SCHEMA	text	Objects in this schema are selected. If the object type is SYNONYM, specify PUBLIC to select public synonyms.
Schema objects	SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's schema.  The default is determined as follows: - if BASE_OBJECT_SCHEMA is specified, then objects in that schema are selected; - otherwise, objects in the current schema are selected.
PACKAGE, TYPE	SPECIFICATION	Boolean	If TRUE, retrieve the package or type specification. Defaults to TRUE.
PACKAGE, TYPE	BODY	Boolean	If TRUE, retrieve the package or type body. Defaults to TRUE.
TABLE, CLUSTER, INDEX, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE	text	Objects in this tablespace (or having a partition in this tablespace) are selected.

**Table 87-17 (Cont.) SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's tablespace (or in the case of a partitioned table or index, the partition's tablespaces). By default, objects in all tablespaces are selected.
TABLE, objects dependent on tables	PRIMARY	Boolean	If TRUE, retrieve primary tables (that is, tables for which the secondary object bit in obj\$ is clear. Defaults to TRUE.
TABLE, objects dependent on tables	SECONDARY	Boolean	If TRUE, retrieve secondary tables (that is, tables for which the secondary object bit in obj\$ is set). Defaults to TRUE.
Dependent Objects	BASE_OBJECT_NAME	text	Objects are selected that are defined or granted on objects with this name. Specify SCHEMA for triggers on schemas. Specify DATABASE for database triggers. Column-level comments cannot be selected by column name; the base object name must be the name of the table, view, or materialized view containing the column.
Dependent Objects	BASE_OBJECT_SCHEMA	text	Objects are selected that are defined or granted on objects in this schema. If BASE_OBJECT_NAME is specified with a value other than SCHEMA or DATABASE, this defaults to the current schema.
Dependent Objects	BASE_OBJECT_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object. Not valid for schema and database triggers.
Dependent Objects	EXCLUDE_BASE_OBJECT_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object to specify objects that are to be excluded from the set of objects fetched. Not valid for schema and database triggers.
Dependent Objects	BASE_OBJECT_SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the schema of the base object.
Dependent Objects	BASE_OBJECT_TYPE	text	The object type of the base object.
Dependent Objects	BASE_OBJECT_TYPE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object type of the base object. By default no filtering is done on object type.
Dependent Objects	BASE_OBJECT_TABLESPACE	text	The tablespace of the base object.
Dependent Objects	BASE_OBJECT_TABLESPACE_EXPR	text expression	The filter value is combined with the attribute corresponding to the tablespaces of the base object. By default, no filtering is done on the tablespace.
INDEX, TRIGGER	SYSTEM_GENERATED	Boolean	If TRUE, select indexes or triggers even if they are system-generated. If FALSE, omit system-generated indexes or triggers. Defaults to TRUE.
Granted Objects	GRANTEE	text	Objects are selected that are granted to this user or role. Specify PUBLIC for grants to PUBLIC.
Granted Objects	PRIVNAME	text	The name of the privilege or role to be granted. For TABLESPACE_QUOTA, only UNLIMITED can be specified.

**Table 87–17 (Cont.) SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
Granted Objects	PRIVNAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the privilege or role name. By default, all privileges/roles are returned.
Granted Objects	GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name.
Granted Objects	EXCLUDE_ GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name to specify objects that are to be excluded from the set of objects fetched.
OBJECT_GRANT	GRANTOR	text	Object grants are selected that are granted by this user.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME	text	A name longer than 30 characters. Objects with this exact name are selected. If the object name is 30 characters or less, the NAME filter must be used.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME_EXPR	text	The filter value is combined with the attribute corresponding to the object's long name. By default, no filtering is done on the long name of an object.
All objects	CUSTOM_FILTER	text	<p>The text of a WHERE condition. The condition is appended to the query that fetches the objects. By default, no custom filter is used.</p> <p>The other filters are intended to meet the needs of the majority of users. Use CUSTOM_FILTER when no defined filters exists for your purpose. Of necessity such a filter depends on the detailed structure of the UDTs and views used in the query. Because filters may change from version to version, upward compatibility is not guaranteed.</p>
All objects	EDITION	text	The edition filter is accepted for any object type, but affects only objects that support editions. The filter is only accepted for local objects (that is, the network_link parameter is not specified in the OPEN call). The edition name must be a valid edition name. If an edition is not specified, the edition of the active session is used.
SCHEMA_EXPORT	SCHEMA	text	The schema whose objects are selected.
SCHEMA_EXPORT	SCHEMA_EXPR	text expression	<p>The filter value is either:</p> <ul style="list-style-type: none"> <li>combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches schema objects,</li> <li>combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches dependent objects.</li> </ul> <p>By default the current user's objects are selected.</p>
SCHEMA_EXPORT	INCLUDE_USER	Boolean	<p>If TRUE, retrieve objects containing privileged information about the user. For example, USER, PASSWORD_HISTORY, TABLESPACE_QUOTA.</p> <p>Defaults to FALSE.</p>
TABLE_EXPORT	SCHEMA	text	Objects (tables and their dependent objects) in this schema are selected.

**Table 87–17 (Cont.) SET\_FILTER: Filters**

Object Type	Name	Datatype	Meaning
TABLE_EXPORT	SCHEMA_EXPR	text expression	The filter value is either:  combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches the tables,  combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches the tables' dependent objects.  By default the current user's objects are selected.
TABLE_EXPORT	NAME	text	The table with this exact name is selected along with its dependent objects.
TABLE_EXPORT	NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects.  By default all tables in the selected schemas are selected, along with their dependent objects.
Heterogeneous objects	BEGIN_WITH	text	The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.
Heterogeneous objects	BEGIN_AFTER	text	The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.
Heterogeneous objects	END_BEFORE	text	The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.
Heterogeneous objects	END_WITH	text	The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.
Heterogeneous objects	INCLUDE_PATH_EXPR, EXCLUDE_PATH_EXPR	text expression	For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See <a href="#">Table 87–18</a> for valid path names that can be used with these filters.  BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.

## Usage Notes

- Each call to SET\_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are ANDed together, so you can use multiple SET\_FILTER calls to refine the set of objects to be returned.

For example to specify that you want the object named EMP in schema SCOTT, do the following:

```
SET_FILTER(handle, 'SCHEMA', 'SCOTT');
SET_FILTER(handle, 'NAME', 'EMP');
```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

```
SET_FILTER(handle, 'NAME_EXPR', '>=' 'FELIX' ');
SET_FILTER(handle, 'NAME_EXPR', '<=' 'OSCAR' ');
```

- With SET\_FILTER, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is SYS or has SELECT\_CATALOG\_ROLE, then any object can be retrieved; otherwise, only the following can be retrieved:
  - Schema objects owned by the current user
  - Public synonyms
  - System privileges granted to the current user or to PUBLIC
  - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as PUBLIC).
  - SCHEMA\_EXPORT where the name is the current user
  - TABLE\_EXPORT where SCHEMA is the current user

If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

In stored procedures, functions, and definers-rights packages, roles (such as SELECT\_CATALOG\_ROLE) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of SELECT\_CATALOG\_ROLE), you must make the program invokers-rights.

- For heterogeneous object types, the BEGIN\_WITH and BEGIN\_AFTER filters allow restart on an object type boundary. Appropriate filter values are returned by the FETCH\_XML\_CLOB procedure.

Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for SCHEMA\_EXPORT the NAME filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a NAME\_EXPR filter explicitly for the TABLE object type path. [Table 87-18](#) lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: DATABASE\_EXPORT\_OBJECTS, SCHEMA\_EXPORT\_OBJECTS, and TABLE\_EXPORT\_OBJECTS.) See [Table 87-17](#) for filters defined for each path name. These path names are valid in the INCLUDE\_PATH\_EXPR and EXCLUDE\_PATH\_EXPR filters. Path names marked with an asterisk (\*) are *only* valid in those filters; they cannot be used as values of the SET\_FILTER object\_type\_path parameter.

**Table 87–18 Object Type Path Names for Heterogeneous Object Types**

<b>Heterogeneous Type</b>	<b>Path Name (*=valid only in xxx_PATH_EXPR)</b>	<b>Scope</b>
TABLE_EXPORT	AUDIT_OBJ	Object audits on the selected tables
TABLE_EXPORT	COMMENT	Table and column comments for the selected tables
TABLE_EXPORT	CONSTRAINT	Constraints (including referential constraints) on the selected tables
TABLE_EXPORT	*GRANT	Object grants on the selected tables
TABLE_EXPORT	INDEX	Indexes (including domain indexes) on the selected tables
TABLE_EXPORT	OBJECT_GRANT	Object grants on the selected tables
TABLE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on the selected tables
TABLE_EXPORT	STATISTICS	Statistics on the selected tables
TABLE_EXPORT	TABLE_DATA	Row data for the selected tables
TABLE_EXPORT	TRIGGER	Triggers on the selected tables
SCHEMA_EXPORT	ASSOCIATION	Statistics type associations for objects in the selected schemas
SCHEMA_EXPORT	AUDIT_OBJ	Audits on all objects in the selected schemas
SCHEMA_EXPORT	CLUSTER	Clusters in the selected schemas and their indexes
SCHEMA_EXPORT	COMMENT	Comments on all objects in the selected schemas
SCHEMA_EXPORT	CONSTRAINT	Constraints (including referential constraints) on all objects in the selected schemas
SCHEMA_EXPORT	DB_LINK	Private database links in the selected schemas
SCHEMA_EXPORT	DEFAULT_ROLE	Default roles granted to users associated with the selected schemas
SCHEMA_EXPORT	DIMENSION	Dimensions in the selected schemas
SCHEMA_EXPORT	FUNCTION	Functions in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	*GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters in the selected schemas
SCHEMA_EXPORT	INDEXTYPE	Indextypes in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JAVA_SOURCE	Java sources in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JOB	Jobs in the selected schemas
SCHEMA_EXPORT	LIBRARY	External procedure libraries in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW	Materialized views in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs on tables in the selected schemas
SCHEMA_EXPORT	OBJECT_GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	OPERATOR	Operators in the selected schemas and their dependent grants and audits

**Table 87–18 (Cont.) Object Type Path Names for Heterogeneous Object Types**

<b>Heterogeneous Type</b>	<b>Path Name (*=valid only in xxx_PATH_EXPR)</b>	<b>Scope</b>
SCHEMA_EXPORT	PACKAGE	Packages (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE_BODY	Package bodies in the selected schemas
SCHEMA_EXPORT	PACKAGE_SPEC	Package specifications in the selected schemas
SCHEMA_EXPORT	PASSWORD_HISTORY	The password history for users associated with the selected schemas
SCHEMA_EXPORT	PROCEDURE	Procedures in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the selected schemas
SCHEMA_EXPORT	REFRESH_GROUP	Refresh groups in the selected schemas
SCHEMA_EXPORT	SEQUENCE	Sequences in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	STATISTICS	Statistics on tables and indexes in the selected schemas
SCHEMA_EXPORT	SYNONYM	Private synonyms in the selected schemas
SCHEMA_EXPORT	TABLE	Tables in the selected schemas and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
SCHEMA_EXPORT	TABLE_DATA	Row data for tables in the selected schemas
SCHEMA_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users associated with the selected schemas
SCHEMA_EXPORT	TRIGGER	Triggers on tables in the selected schemas
SCHEMA_EXPORT	TYPE	Types (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	TYPE_BODY	Type bodies in the selected schemas
SCHEMA_EXPORT	TYPE_SPEC	Type specifications in the selected schemas
SCHEMA_EXPORT	USER	User definitions for users associated with the selected schemas
SCHEMA_EXPORT	VIEW	Views in the selected schemas and their dependent objects (grants, constraints, comments, audits)
DATABASE_EXPORT	ASSOCIATION	Statistics type associations for objects in the database
DATABASE_EXPORT	AUDIT	Audits of SQL statements
DATABASE_EXPORT	AUDIT_OBJ	Audits on all objects in the database
DATABASE_EXPORT	CLUSTER	Clusters and their indexes
DATABASE_EXPORT	COMMENT	Comments on all objects
DATABASE_EXPORT	CONSTRAINT	Constraints (including referential constraints)
DATABASE_EXPORT	CONTEXT	Application contexts
DATABASE_EXPORT	DB_LINK	Private and public database links
DATABASE_EXPORT	DEFAULT_ROLE	Default roles granted to users in the database
DATABASE_EXPORT	DIMENSION	Dimensions in the database

**Table 87–18 (Cont.) Object Type Path Names for Heterogeneous Object Types**

<b>Heterogeneous Type</b>	<b>Path Name (*=valid only in xxx_PATH_EXPR)</b>	<b>Scope</b>
DATABASE_EXPORT	DIRECTORY	Directory objects in the database
DATABASE_EXPORT	FGA_POLICY	Fine-grained audit policies
DATABASE_EXPORT	FUNCTION	Functions
DATABASE_EXPORT	* GRANT	Object and system grants
DATABASE_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters
DATABASE_EXPORT	INDEXTYPE	Indextypes and their dependent grants and audits
DATABASE_EXPORT	JAVA_SOURCE	Java sources and their dependent grants and audits
DATABASE_EXPORT	JOB	Jobs
DATABASE_EXPORT	LIBRARY	External procedure libraries
DATABASE_EXPORT	MATERIALIZED_VIEW	Materialized views
DATABASE_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs
DATABASE_EXPORT	OBJECT_GRANT	All object grants in the database
DATABASE_EXPORT	OPERATOR	Operators and their dependent grants and audits
DATABASE_EXPORT	PACKAGE	Packages (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	PACKAGE_BODY	Package bodies
DATABASE_EXPORT	PACKAGE_SPEC	Package specifications
DATABASE_EXPORT	PASSWORD_HISTORY	Password histories for database users
DATABASE_EXPORT	*PASSWORD_VERIFY_FUNCTION	The password complexity verification function
DATABASE_EXPORT	PROCEDURE	Procedures and their dependent grants and objects
DATABASE_EXPORT	PROFILE	Profiles
DATABASE_EXPORT	PROXY	Proxy authentications
DATABASE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the database
DATABASE_EXPORT	REFRESH_GROUP	Refresh groups
DATABASE_EXPORT	*RESOURCE_COST	Resource cost information
DATABASE_EXPORT	RLS_CONTEXT	Fine-grained access-control driving contexts
DATABASE_EXPORT	RLS_GROUP	Fine-grained access-control policy groups
DATABASE_EXPORT	RLS_POLICY	Fine-grained access-control policies
DATABASE_EXPORT	ROLE	Roles
DATABASE_EXPORT	ROLE_GRANT	Role grants to users in the database
DATABASE_EXPORT	ROLLBACK_SEGMENT	Rollback segments

**Table 87–18 (Cont.) Object Type Path Names for Heterogeneous Object Types**

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	*SCHEMA (named object)	Database schemas including for each schema all related and dependent objects: user definitions and their attributes (default roles, role grants, tablespace quotas, and so on), objects in the schema (tables, view, packages, types, and so on), and their dependent objects (grants, audits, indexes, constraints, and so on). The NAME and NAME_EXPR filters can be used with this object type path name to designate the database schemas to be fetched.
DATABASE_EXPORT	SEQUENCE	Sequences
DATABASE_EXPORT	STATISTICS	Statistics on tables and indexes
DATABASE_EXPORT	SYNONYM	Public and private synonyms
DATABASE_EXPORT	SYSTEM_GRANT	System privilege grants
DATABASE_EXPORT	TABLE	Tables and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
DATABASE_EXPORT	TABLE_DATA	Row data for all tables
DATABASE_EXPORT	TABLESPACE	Tablespace definitions
DATABASE_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users in the database
DATABASE_EXPORT	TRIGGER	Triggers on the database, on schemas, and on schema objects
DATABASE_EXPORT	TRUSTED_DB_LINK	Trusted links
DATABASE_EXPORT	TYPE	Types (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	TYPE_BODY	Type bodies
DATABASE_EXPORT	TYPE_SPEC	Type specifications
DATABASE_EXPORT	USER	User definitions
DATABASE_EXPORT	VIEW	Views

## Exceptions

- **INVALID\_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID\_OPERATION.** SET\_FILTER was called after the first call to FETCH\_xxx for the OPEN context. After the first call to FETCH\_xxx is made, no further calls to SET\_FILTER are permitted.
- **INCONSISTENT\_ARGS.** The arguments are inconsistent. Possible inconsistencies include the following:
  - filter name not valid for the object type associated with the OPEN context
  - filter name not valid for the object\_type\_path
  - object\_type\_path not part of the collection designated by handle
  - filter value is the wrong datatype

## SET\_PARSE\_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9
- [Subprograms for Submitting XML to the Database](#) on page 87-10

### Syntax

The following syntax applies when SET\_PARSE\_ITEM is used for object retrieval:

```
DBMS_METADATA.SET_PARSE_ITEM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

The following syntax applies when SET\_PARSE\_ITEM is used for XML submission:

```
DBMS_METADATA.SET_PARSE_ITEM (
  handle      IN NUMBER,
  name        IN VARCHAR2);
```

### Parameters

**Table 87-19 SET\_PARSE\_ITEM Procedure Parameters**

Parameter	Description
handle	The handle returned from OPEN (or OPENW).
name	The name of the object attribute to be parsed and returned. See <a href="#">Table 87-20</a> for the attribute object type, name, and meaning.
object_type	Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> <li>▪ if object_type is omitted, the parse item applies to all object types within the heterogeneous collection</li> <li>▪ if object_type is specified, the parse item only applies to that specific object type within the collection</li> </ul> This parameter only applies when SET_PARSE_ITEM is used for object retrieval.

[Table 87-20](#) describes the object type, name, and meaning of the items available in the SET\_PARSE\_ITEM procedure.

**Table 87–20 SET\_PARSE\_ITEM: Parse Items**

Object Type	Name	Meaning
All objects	VERB	If <code>FETCH_XML_CLOB</code> is called, no value is returned.  If <code>FETCH_DDL</code> is called, then for every row in the <code>sys.ku\$_ddl</code> s nested table returned by <code>FETCH_DDL</code> the verb in the corresponding <code>ddlText</code> is returned. If the <code>ddlText</code> is a SQL DDL statement, then the SQL verb (for example, <code>CREATE</code> , <code>GRANT</code> , <code>AUDIT</code> ) is returned. If the <code>ddlText</code> is a procedure call (for example, <code>DBMS_AQADM.CREATE_QUEUE_TABLE()</code> ) then the <code>package.procedure-name</code> is returned.
All objects	OBJECT_TYPE	If <code>FETCH_XML_CLOB</code> is called, an object type name from <a href="#">Table 87–11</a> is returned.  If <code>FETCH_DDL</code> is called and the <code>ddlText</code> is a SQL DDL statement whose verb is <code>CREATE</code> or <code>ALTER</code> , the object type as used in the DDL statement is returned (for example, <code>TABLE</code> , <code>PACKAGE_BODY</code> , and so on). Otherwise, an object type name from <a href="#">Table 87–11</a> is returned.
Schema objects	SCHEMA	The object schema is returned. If the object is not a schema object, no value is returned.
Named objects	NAME	The object name is returned. If the object is not a named object, no value is returned.
TABLE, TABLE_DATA, INDEX	TABLESPACE	The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a <code>TABLE_DATA</code> object, this is always the tablespace where the rows are stored.
TRIGGER	ENABLE	If the trigger is enabled, <code>ENABLE</code> is returned. If the trigger is disabled, <code>DISABLE</code> is returned.
OBJECT_ GRANT, TABLESPACE_ QUOTA	GRANTOR	The grantor is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_NAME	The name of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_SCHEMA	The schema of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_TYPE	The object type of the base object is returned. If the object is not a dependent object, no value is returned.
Granted objects	GRANTEE	The grantee is returned. If the object is not a granted object, no value is returned.

## Usage Notes

These notes apply when using `SET_PARSE_ITEM` to retrieve objects.

By default, the `FETCH_xxx` routines return an object's metadata as XML or creation DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

You can call `SET_PARSE_ITEM` multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the `sys.ku$_parsed_items` nested table.

For `TABLE_DATA` objects, the following parse item return values are of interest:

If Object Is	NAME, SCHEMA	BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA
nonpartitioned table	table name, schema	table name, schema
table partition	partition name, schema	table name, schema
nested table	storage table name, schema	name and schema of top-level table ( <i>not</i> the parent nested table)

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the `BASE_OBJECT_NAME`, `BASE_OBJECT_SCHEMA` and `BASE_OBJECT_TYPE` parse items for secondary `TABLE` objects return the name, schema, and type of the domain index.

**See Also:**

- ["FETCH\\_xxx Functions and Procedures"](#) on page 87-19
- *Oracle Database Utilities* for information about using the Metadata API

By default, the `CONVERT` and `PUT` procedures simply transform an object's XML metadata to DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

## Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_PARSE_ITEM` was called after the first call to `FETCH_xxx` for the `OPEN` context. After the first call to `FETCH_xxx` is made, no further calls to `SET_PARSE_ITEM` are permitted.
- `INCONSISTENT_ARGS`. The attribute name is not valid for the object type associated with the `OPEN` context.

## SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM Procedures

These procedures are used for both retrieval and submission. SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM specify parameters to the XSLT stylesheet identified by transform\_handle. Use them to modify or customize the output of the transform.

**See Also:** For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 87-9
- [Subprograms for Submitting XML to the Database](#) on page 87-10

### Syntax

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
    transform_handle    IN NUMBER,
    name                IN VARCHAR2,
    value               IN VARCHAR2,
    object_type         IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
    transform_handle    IN NUMBER,
    name                IN VARCHAR2,
    value               IN BOOLEAN DEFAULT TRUE,
    object_type         IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
    transform_handle    IN NUMBER,
    name                IN VARCHAR2,
    value               IN NUMBER,
    object_type         IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_REMAP_PARAM (
    transform_handle    IN NUMBER,
    name                IN VARCHAR2,
    old_value           IN VARCHAR2,
    new_value           IN VARCHAR2,
    object_type         IN VARCHAR2 DEFAULT NULL);
```

### Parameters

[Table 87-21](#) describes the parameters for the SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM procedures.

**Table 87-21** SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM Parameters

Parameters	Description
transform_handle	<p>Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session.</p> <p>Note that the handle returned by OPEN is not a valid transform handle.</p> <p>For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.</p>

**Table 87–21 (Cont.) SET\_TRANSFORM\_PARAM and SET\_REMAP\_PARAM Parameters**

Parameters	Description
name	The name of the parameter.  Table 87–22 lists the transform parameters defined for the DDL transform, specifying the <code>object_type</code> it applies to, its datatype, and its meaning or effect. This includes its default value, if any, and whether the parameter is additive.  Table 87–23 describes the parameters for the MODIFY transform in the <code>SET_TRANSFORM_PARAM</code> procedure.  Table 87–24 describes the parameters for the MODIFY transform in the <code>SET_REMAP_PARAM</code> procedure.
value	The value of the transform. This parameter is valid only for <code>SET_TRANSFORM_PARAM</code> .
old_value	The old value for the remapping. This parameter is valid only for <code>SET_REMAP_PARAM</code> .
new_value	The new value for the remapping. This parameter is valid only for <code>SET_REMAP_PARAM</code> .
object_type	Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply: <ul style="list-style-type: none"> <li>▪ If <code>object_type</code> is omitted, the parameter applies to all applicable object types within the heterogeneous collection.</li> <li>▪ If <code>object_type</code> is specified, the parameter only applies to that object type.</li> </ul> <p>This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.</p>

Table 87–22 describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the `SET_TRANSFORM_PARAM` procedure.

**Table 87–22 SET\_TRANSFORM\_PARAM: Transform Parameters for the DDL Transform**

Object Type	Name	Datatype	Meaning
All objects	PRETTY	BOOLEAN	If TRUE, format the output with indentation and line feeds. Defaults to TRUE.
All objects	SQLTERMINATOR	BOOLEAN	If TRUE, append a SQL terminator (; or /) to each DDL statement. Defaults to FALSE.
TABLE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, include segment attributes clauses in the DDL. If FALSE, omit them. Defaults to TRUE.
TABLE	STORAGE	BOOLEAN	If TRUE, include storage clauses in the DDL. If FALSE, omit them. Defaults to TRUE. (Ignored if <code>SEGMENT_ATTRIBUTES</code> is FALSE.)
TABLE	TABLESPACE	BOOLEAN	If TRUE, include tablespace clauses in the DDL. If FALSE, omit them. (Ignored if <code>SEGMENT_ATTRIBUTES</code> is FALSE.) Defaults to TRUE.
TABLE	CONSTRAINTS	BOOLEAN	If TRUE, include all non-referential table constraints in the DDL. If FALSE, omit them. Defaults to TRUE.

**Table 87–22 (Cont.) SET\_TRANSFORM\_PARAM: Transform Parameters for the DDL Transform**

Object Type	Name	Datatype	Meaning
TABLE	REF_CONSTRAINTS	BOOLEAN	If TRUE, include all referential constraints (foreign keys) in the DDL. If FALSE, omit them. Defaults to TRUE.
TABLE	CONSTRAINTS_AS_ALTER	BOOLEAN	If TRUE, include table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE.
TABLE	OID	BOOLEAN	If TRUE, include the OID clause for object tables in the DDL. If FALSE, omit it. Defaults to FALSE.
TABLE	SIZE_BYTE_KEYWORD	BOOLEAN	If TRUE, include the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE.
TABLE, INDEX	PARTITIONING	BOOLEAN	If TRUE, include partitioning clauses in the DDL. If FALSE, omit them. Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER, TABLESPACE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the DDL. If FALSE, omit them. Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	STORAGE	BOOLEAN	If TRUE, include storage clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	TABLESPACE	BOOLEAN	If TRUE, include tablespace clauses in the DDL. If FALSE, omit them. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TYPE	SPECIFICATION	BOOLEAN	If TRUE, include the type specification in the DDL. If FALSE, omit it. Defaults to TRUE.
TYPE	BODY	BOOLEAN	If TRUE, include the type body in the DDL. If FALSE, omit it. Defaults to TRUE.
TYPE	OID	BOOLEAN	If TRUE, include the OID clause in the DDL. If FALSE, omit it. Defaults to FALSE.
PACKAGE	SPECIFICATION	BOOLEAN	If TRUE, include the package specification in the DDL. If FALSE, omit it. Defaults to TRUE.
PACKAGE	BODY	BOOLEAN	If TRUE, include the package body in the DDL. If FALSE, omit it. Defaults to TRUE.
VIEW	FORCE	BOOLEAN	If TRUE, use the FORCE keyword in the CREATE VIEW statement. If FALSE, do not use the FORCE keyword in the CREATE VIEW statement. Defaults to TRUE.
OUTLINE	INSERT	BOOLEAN	If TRUE, include the INSERT statements into the OL\$ dictionary tables that will create the outline and its hints. If FALSE, omit a CREATE OUTLINE statement. Defaults to FALSE.

Note: This object type is being deprecated.

**Table 87–22 (Cont.) SET\_TRANSFORM\_PARAM: Transform Parameters for the DDL Transform**

Object Type	Name	Datatype	Meaning
All objects	DEFAULT	BOOLEAN	Calling SET_TRANSFORM_PARAM with this parameter set to TRUE has the effect of resetting all parameters for the transform to their default values. Setting this FALSE has no effect. There is no default.
All objects	INHERIT	BOOLEAN	If TRUE, inherits session-level parameters. Defaults to FALSE. If an application calls ADD_TRANSFORM to add the DDL transform, then by default the only transform parameters that apply are those explicitly set for that transform handle. This has no effect if the transform handle is the session transform handle.
ROLE	REVOKE_FROM	Text	The name of a user from whom the role must be revoked. If this is a non-null string and if the CREATE ROLE statement grants you the role, a REVOKE statement is included in the DDL after the CREATE ROLE statement.  Note: When you issue a CREATE ROLE statement, Oracle may grant you the role. You can use this transform parameter to undo the grant.  Defaults to null string.
TABLESPACE	REUSE	BOOLEAN	If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. If FALSE, omit the REUSE parameter.  Defaults to FALSE.
CLUSTER, INDEX, ROLLBACK_ SEGMENT, TABLE, TABLESPACE	PCTSPACE	NUMBER	A number representing the percentage by which space allocation for the object type is to be modified. The value is the number of one-hundredths of the current allocation. For example, 100 means 100%.  If the object type is TABLESPACE, the following size values are affected: - in file specifications, the value of SIZE - MINIMUM EXTENT - EXTENT MANAGEMENT LOCAL UNIFORM SIZE  For other object types, INITIAL and NEXT are affected.

Table 87–23 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET\_TRANSFORM\_PARAM procedure.

**Table 87–23 SET\_TRANSFORM\_PARAM: Transform Parameters for the MODIFY Transform**

Object Type	Name	Datatype	Meaning
All objects	OBJECT_ROW	NUMBER	A number designating the object row for an object. The object in the document that corresponds to this number will be copied to the output document.  This parameter is additive.  By default, all objects are copied to the output document.

Table 87–24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET\_REMAP\_PARAM procedure.

**Table 87–24 SET\_REMAP\_PARAM: Transform Parameters for the MODIFY Transform**

Object Type	Name	Datatype	Meaning
LIBRARY, TABLESPACE, DIRECTORY	REMAP_DATAFILE	Text	<p>Objects in the document will have their filespecs renamed as follows: any filespec matching <code>old_value</code> will be changed to <code>new_value</code>. Filespecs should <i>not</i> be enclosed in quotes.</p> <p>This parameter is additive.</p> <p>By default, filespecs are not renamed.</p>
Schema Objects, Dependent Objects, Granted Objects, USER	REMAP_SCHEMA	Text	<p>Any schema object in the document whose name matches <code>old_value</code> will have its schema name changed to <code>new_value</code>.</p> <p>Any dependent object whose base object schema name matches <code>old_value</code> will have its base object schema name changed to <code>new_value</code>.</p> <p>Any granted object whose grantee name matches <code>old_value</code> will have its grantee name changed to <code>new_value</code>.</p> <p>Any user whose name matches <code>old_value</code> will have its name changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, schemas are not remapped.</p>
TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK_ SEGMENT, MATERIALIZED_ VIEW, MATERIALIZED_ VIEW_LOG, TABLESPACE_ QUOTA	REMAP_TABLESPACE	Text	<p>Objects in the document will have their tablespaces renamed as follows: any tablespace name matching <code>old_value</code> will be changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, tablespaces are not remapped.</p>
Named objects and all objects dependent on named objects	REMAP_NAME	Text	<p>Any named object in the document whose name matches <code>old_value</code> will have its name changed to <code>new_value</code>.</p> <p>Any dependent object whose base object name matches <code>old_value</code> will have its base schema name changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, names are not remapped.</p> <p>(Use <code>REMAP_TABLESPACE</code> to remap the name of a <code>TABLESPACE</code> object.)</p>

## Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. Either `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` was called after the first call to `FETCH_XXX` for the `OPEN` context. After the first

call to `FETCH_XXX` is made, no further calls to `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` are permitted.

- `INCONSISTENT_ARGS`. The arguments are inconsistent. This can mean the following:
  - The transform parameter name is not valid for the object type associated with the `OPEN` context or for the transform associated with the transform handle.
  - The transform applies to all object types in a heterogeneous collection, but `object_type` is not part of the collection.

## Usage Notes

XSLT allows parameters to be passed to stylesheets. You call `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` to specify the value of a parameter to be passed to the stylesheet identified by `transform_handle`.

Normally, if you call `SET_TRANSFORM_PARAMETER` multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the `STORAGE` transform parameter to `TRUE`.

```
SET_TRANSFORM_PARAM(tr_handle, 'STORAGE', false);
SET_TRANSFORM_PARAM(tr_handle, 'STORAGE', true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the `OBJECT_ROW` parameter to the `MODIFY` transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle, 'OBJECT_ROW', 5);
SET_TRANSFORM_PARAM(tr_handle, 'OBJECT_ROW', 8);
```

The `REMAP_TABLESPACE` parameter is also additive. If you specify the following, then tablespaces `TBS1` and `TBS3` are changed to `TBS2` and `TBS4`, respectively.

```
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS1', 'TBS2');
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS3', 'TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS1', 'TBS2');
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS2', 'TBS3');
```

---

**Note:** The number of remap parameters that can be specified for a `MODIFY` transform is limited to ten. That is, you can specify up to ten `REMAP_DATAFILE` parameters, up to ten `REMAP_SCHEMA` parameters and so on. Additional instances are ignored. To work around this, you can perform another `DBMS_METADATA.ADD_TRANSFORM` and specify additional remap parameters.

---

The `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant `SESSION_TRANSFORM` as the handle of the DDL transform at the session level. You can call `SET_TRANSFORM_PARAM` using `DBMS_METADATA.SESSION_TRANSFORM` as the transform handle to set transform parameters for the whole session. `GET_DDL`, `GET_`

DEPENDENT\_DDL, and GET GRANTED\_DDL inherit these parameters when they invoke the DDL transform.

---

---

**Note:** The enumerated constant must be prefixed with the package name `DBMS_METADATA.SESSION_TRANSFORM`.

---

---

---

---

## DBMS\_METADATA\_DIFF

The DBMS\_METADATA\_DIFF package contains the interfaces for comparing two metadata documents in SXML format.

**See Also:** *Oracle Database Utilities* for more information and for examples of using the Metadata API

This chapter contains the following topics:

- [Using DBMS\\_METADATA\\_DIFF](#)
  - [Overview](#)
  - [Security Model](#)
- [Browsing APIs for Fetching and Comparing Objects](#)
- [Summary of DBMS\\_METADATA\\_DIFF Subprograms](#)

---

## Using DBMS\_METADATA\_DIFF

This section contains topics which relate to using the DBMS\_METADATA\_DIFF package.

- [Overview](#)
- [Security Model](#)

## Overview

You can use the interfaces contained in the `DBMS_METADATA_DIFF` package to compare two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the `DBMS_METADATA` submit interface and the `CONVERT` API.

## Security Model

The browsing interface of the `DBMS_METADATA_DIFF` package actually uses the `DBMS_METADATA` package to fetch the metadata to be compared. Therefore, the security model used for `DBMS_METADATA` also applies to `DBMS_METADATA_DIFF`. (Note, however, that `DBMS_METADATA_DIFF` does not support all object types.)

**See Also:** [DBMS\\_METADATA](#) for information about the `DBMS_METADATA` security model

## Browsing APIs for Fetching and Comparing Objects

These functions allow you to compare the metadata for two objects with a single call.

### Syntax

```
DBMS_METADATA_DIFF.COMPARE_SXML (
  object_type  IN VARCHAR2,
  name1        IN VARCHAR2,
  name2        IN VARCHAR2,
  schema1      IN VARCHAR2 DEFAULT NULL,
  schema2      IN VARCHAR2 DEFAULT NULL,
  network_link1 IN VARCHAR2 DEFAULT NULL,
  network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.COMPARE_ALTER (
  object_type  IN VARCHAR2,
  name1        IN VARCHAR2,
  name2        IN VARCHAR2,
  schema1      IN VARCHAR2 DEFAULT NULL,
  schema2      IN VARCHAR2 DEFAULT NULL,
  network_link1 IN VARCHAR2 DEFAULT NULL,
  network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.COMPARE_ALTER_XML (
  object_type  IN VARCHAR2,
  name1        IN VARCHAR2,
  name2        IN VARCHAR2,
  schema1      IN VARCHAR2 DEFAULT NULL,
  schema2      IN VARCHAR2 DEFAULT NULL,
  network_link1 IN VARCHAR2 DEFAULT NULL,
  network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

### Parameters

**Table 88–1 COMPARE\_xxx Function Parameters**

Parameters	Description
object_type	The type of object to be compared. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW.
name1	The name of the first object in the comparison.
name2	The name of the second object in the comparison.
schema1	The schema of the first object in the comparison. The default is the current user.
schema2	The schema of the second object in the comparison. The default is the value of schema1.

**Table 88–1 (Cont.) COMPARE\_xxx Function Parameters**

Parameters	Description
<code>network_link1</code>	The name of a database link to the database on which the first object resides. If NULL (the default), then the object is assumed to be in the database on which the caller is running.
<code>network_link2</code>	The name of a database link to the database on which the second object resides. The default is the value of <code>network_link1</code> .

## Return Values

`DBMS_METADATA_DIFF.COMPARE_xxx` returns the differences between two objects.

## Exceptions

- `INVALID_ARGVAL`  
A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `OBJECT_NOT_FOUND`  
The specified object was not found in the database.

## Usage Notes

These functions encapsulate calls to both `DBMS_METADATA` and `DBMS_METADATA_DIFF` functions and procedures to fetch the metadata for each of the two objects and compare them.

Which function you use depends on the comparison format you want:

- `COMPARE_SXML` returns an SXML difference document.
- `COMPARE_ALTER` returns a set of ALTER statements for making the first object like the second object.
- `COMPARE_ALTER_XML` returns an ALTER\_XML document.

---

## Summary of DBMS\_METADATA\_DIFF Subprograms

The DBMS\_METADATA\_DIFF subprograms are used to:

- Specify the type of objects to be compared
- Specify the SXML documents to be compared
- Show the differences between the compared documents
- Clean up after the comparison

Table 88–2 provides a summary of DBMS\_METADATA\_DIFF subprograms.

**Table 88–2 DBMS\_METADATA\_DIFF Package Subprograms**

Subprogram	Description
<a href="#">OPENC Function</a> on page 88-8	Specifies the type of objects to be compared
<a href="#">ADD_DOCUMENT Procedure</a> on page 88-9	Specifies an SXML document to be compared
<a href="#">FETCH_CLOB Functions and Procedures</a> on page 88-10	Returns a CLOB showing the differences between the two documents specified by <code>ADD_DOCUMENT</code>
<a href="#">CLOSE Procedure</a> on page 88-11	Invalidates the handle returned by <code>OPENC</code> and cleans up associated state

## OPENC Function

This function specifies the type of objects to be compared. The return value is an opaque context handle.

### Syntax

```
DBMS_METADATA_DIFF.OPENC (
object_type IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 88–3** *OPENC Function Parameters*

Parameters	Description
object_type	The type of object to be compared. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW.

### Return Values

The opaque handle that is returned is used as input to ADD\_DOCUMENT, FETCH\_XXX and CLOSE.

### Exceptions

- INVALID\_ARGVAL  
A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

## ADD\_DOCUMENT Procedure

This procedure specifies an SXML document to be compared.

### Syntax

```
DBMS_METADATA_DIFF.ADD_DOCUMENT(  
handle IN NUMBER, document IN sys.XMLType);
```

```
DBMS_METADATA_DIFF.ADD_DOCUMENT(  
handle IN NUMBER, document IN CLOB);
```

### Parameters

**Table 88–4** *CLOSE Procedure Parameters*

Parameter	Description
handle	The handle returned from OPENC
document	A document to be compared. The document must be of the type specified in OPENC.

### Usage Notes

Because the comparison interface allows you to compare exactly two SXML documents, a program must call ADD\_DOCUMENT exactly twice for each OPENC handle. In the comparison result, the document specified by the first call is document 1, and the document specified by the second call is document 2.

### Exceptions

- **INVALID\_ARGVAL**  
A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

## FETCH\_CLOB Functions and Procedures

The `FETCH_CLOB` functions and procedures return a CLOB showing the differences between the two documents specified by `ADD_DOCUMENT`.

### Syntax

```
DBMS_METADATA_DIFF.FETCH_CLOB(
  handle IN NUMBER)
RETURN CLOB;
```

```
DBMS_METADATA_DIFF.FETCH_CLOB(
  handle IN NUMBER,
  doc    IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA_DIFF.FETCH_CLOB(
  handle IN NUMBER,
  doc    IN OUT NOCOPY CLOB
  diffs  OUT BOOLEAN);
```

### Parameters

**Table 88–5** *CONVERT Subprogram Parameters*

Parameter	Description
<code>handle</code>	The handle returned from <code>OPENC</code> .
<code>doc</code>	A CLOB containing the differences between documents 1 and 2.
<code>diffs</code>	<code>TRUE</code> if the documents are different or <code>FALSE</code> if they are identical.

### Return Values

The differences between documents 1 and 2.

### Exceptions

- `INVALID_ARGVAL`  
A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.

## CLOSE Procedure

This procedure invalidates the handle returned by `OPENC` and cleans up associated state.

### Syntax

```
DBMS_METADATA_DIFF.CLOSE(  
handle IN NUMBER);
```

### Parameters

**Table 88–6** *FETCH\_xxx Function Parameters*

Parameters	Description
handle	The handle returned from <code>OPENC</code>

### Exceptions

- `INVALID_ARGVAL`  
A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.

---

---

## DBMS\_MGD\_ID\_UTL

The DBMS\_MGD\_ID\_UTL package contains various functions and procedures that comprise the following utility subprograms:

- A logging utility that sets and gets Java and PL/SQL logging levels.
- A proxy utility consisting of two procedures used to set and unset the host and port of the proxy server.
- A metadata utility consisting of functions and procedures used for managing metadata.

**See Also:** *Oracle Database Advanced Application Developer's Guide* for more information.

This chapter describes each of these utility subprograms and contains the following topics:

- [Using DBMS\\_MGD\\_ID\\_UTL](#)
  - [Security Model](#)
  - [Constants](#)
  - [Exceptions](#)
- [Summary of DBMS\\_MGD\\_ID\\_UTL Subprograms](#)

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by password;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

## Using DBMS\_MGD\_ID\_UTL

- [Security Model](#)
- [Constants](#)
- [Exceptions](#)

## Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and Identity Code Package schema objects in the `MGDSYS` schema.

`DBMS_MGD_ID_UTL` is a `MGDSYS`-owned package. Any `DBMS_MGD_ID_UTL` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `DBMS_MGD_ID_UTL` package and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for these ADTs: `MGD_ID`, `MGD_ID_COMPONENT`, `MGD_ID_COMPONENT_VARRAY`, and for this package `DBMS_MGD_ID_UTL`.

`SELECT` privilege is granted to `PUBLIC` for these read-only views: `MGD_ID_CATEGORY` and `MGD_ID_SCHEME` and for these metadata views: `USER_MGD_ID_CATEGORY` and `USER_MGD_ID_SCHEME`, and for table `MGD_ID_XML_VALIDATOR`, and for sequence `MGD$SEQUENCE_CATEGORY`.

`INSERT`, `UPDATE` and `DELETE` privilege is granted to `PUBLIC` for these metadata views: `USER_MGD_ID_CATEGORY` and `USER_MGD_ID_SCHEME`.

Public synonyms, by the same name, are created for these ADTs: `MGD_ID`, `MGD_ID_COMPONENT`, `MGD_ID_COMPONENT_VARRAY` and for this package `DBMS_MGD_ID_UTL`, as well as for these read-only views: `MGD_ID_CATEGORY` and `MGD_ID_SCHEME` and for these metadata views: `USER_MGD_ID_CATEGORY` and `USER_MGD_ID_SCHEME`, and for table `MGD_ID_XML_VALIDATOR`.

## Constants

DBMS\_MGD\_ID\_UTL uses the constants shown in [Table 89-1](#).

**Table 89-1 DBMS\_MGD\_ID\_UTL Constants**

<b>Name</b>	<b>Value</b>
<b>Installed Category IDs and Names</b>	
EPC_ENCODING_CATEGORY_ID	1
EPC_ENCODING_CATEGORY_NAME	EPC
<b>Logging Levels</b>	
LOGGING_LEVEL_OFF	0
LOGGING_LEVEL_SEVERE	1
LOGGING_LEVEL_WARNING	2
LOGGING_LEVEL_INFO	3
LOGGING_LEVEL_FINE	4
LOGGING_LEVEL_FINER	5
LOGGING_LEVEL_FINEST	6
LOGGING_LEVEL_ALL	7

## Exceptions

Table 89–2 lists the DBMS\_MGD\_ID\_UTL exceptions.

**Table 89–2 Exceptions Raised by DBMS\_MGD\_ID\_UTL Package**

<b>Name</b>	<b>Error Code</b>	<b>Description</b>
TDTJavaException	-55200	During the tag data translation, a Java exception was raised.
TDTCategoryNotFound	-55201	The specified category was not found.
TDTSchemeNotFound	-55202	During the tag data translation, the specified scheme was not found.
TDTLevelNotFound	-55203	During the tag data translation, the specified level was not found.
TDTOptionNotFound	-55204	During the tag data translation, the specified option was not found.
TDTFieldValidationException	-55205	During the tag data translation, the validation operation failed on a field.
TDTUndefinedField	-55206	During the tag data translation, an undefined field was detected.
TDTRuleEvaluationFailed	-55207	During the tag data translation, the rule evaluation operation failed.
TDTTooManyMatchingLevels	-55208	During the tag data translation, too many matching levels were found.

---

## Summary of DBMS\_MGD\_ID\_UTL Subprograms

Table 89–3 describes the utility subprograms in the DBMS\_MGD\_ID\_UTL package.

All the values and names passed to the procedures defined in the DBMS\_MGD\_ID\_UTL package are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

**Table 89–3 DBMS\_MGD\_ID\_UTL Package Subprograms**

Subprogram	Description
ADD_SCHEME Procedure	Adds a tag data translation scheme to an existing category
CREATE_CATEGORY Function	Creates a new category or a new version of a category
EPC_TO_ORACLE_SCHEME Function	Converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML
GET_CATEGORY_ID Function	Returns the category ID given the category name and the category version
GET_COMPONENTS Function	Returns all relevant separated component names separated by semicolon (;) for the specified scheme
GET_ENCODINGS Function	Returns a list of semicolon (;) separated encodings (formats) for the specified scheme
GET_JAVA_LOGGING_LEVEL Function	Returns an integer representing the current Java trace logging level
GET_PLSQL_LOGGING_LEVEL Function	Returns an integer representing the current PL/SQL trace logging level
GET_SCHEME_NAMES Function	Returns a list of semicolon (;) separated scheme names for the specified category
GET_TDT_XML Function	Returns the Oracle tag data translation XML for the specified scheme
GET_VALIDATOR Function	Returns the Oracle Database tag data translation schema
REFRESH_CATEGORY Function	Refreshes the metadata information on the Java stack for the specified category
REMOVE_CATEGORY Procedure	Removes a category including all the related TDT XML if the value of <code>category_version</code> parameter is NULL
REMOVE_PROXY Procedure	Unsets the host and port of the proxy server
REMOVE_SCHEME Procedure	Removes a tag data translation scheme from a category
SET_JAVA_LOGGING_LEVEL Procedure	Sets the Java logging level
SET_PLSQL_LOGGING_LEVEL Procedure	Sets the PL/SQL tracing logging level
SET_PROXY Procedure	Sets the host and port of the proxy server for Internet access
VALIDATE_SCHEME Function	Validates the input tag data translation XML against the Oracle tag data translation schema

## ADD\_SCHEME Procedure

This procedure adds a tag data translation scheme to an existing category.

### Syntax

```
DBMS_MGD_ID_UTL.ADD_SCHEME (
  category_id IN VARCHAR2,
  tdt_xml     IN CLOB);
```

### Parameters

**Table 89–4 ADD\_SCHEME Procedure Parameters**

Parameter	Description
category_id	Category ID
tdt_xml	Tag data translation XML

### Examples

This example performs the following actions:

1. Creates a category.
2. Adds a contractor scheme and an employee scheme to the MGD\_SAMPLE\_CATEGORY category.
3. Validates the MGD\_SAMPLE\_CATEGORY scheme.
4. Tests the tag translation of the contractor scheme and the employee scheme.
5. Removes the contractor scheme.
6. Tests the tag translation of the contractor scheme and this returns the expected exception for the removed contractor scheme.
7. Tests the tag translation of the employee scheme and this returns the expected values.
8. Removes the MGD\_SAMPLE\_CATEGORY category.

```
--contents of add_scheme2.sql
SET LINESIZE 160
-----
---CREATE CATEGORY, ADD_SCHEME, REMOVE_SCHEME, REMOVE_CATEGORY-----

## CREATE\_CATEGORY Function

This function creates a new category or a new version of a category.

### Syntax

```
DBMS_MGD_ID_UTL.CREATE_CATEGORY (
  category_name  IN  VARCHAR2,
  category_version IN VARCHAR2,
  agency         IN  VARCHAR2,
  URI           IN  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 89–5 CREATE\_CATEGORY Function Parameters**

Parameter	Description
category_name	Name of category
category_version	Category version
agency	Organization that owns the category. For example, EPCglobal owns the category EPC.
URI	URI that provides additional information about the category

### Usage Notes

The return value is the category ID.

### Examples

See the [ADD\\_SCHEME Procedure](#) for an example of creating the MGD\_SAMPLE\_CATEGORY category.

## EPC\_TO\_ORACLE\_SCHEME Function

This function converts the EPCglobal tag data translation (TDT) XML to Oracle Database tag data translation XML.

### Syntax

```
DBMS_MGD_ID_UTL.EPC_TO_ORACLE_SCHEME (
    xml_scheme IN CLOB)
RETURN CLOB;
```

### Parameters

**Table 89–6 EPC\_TO\_ORACLE\_SCHEME Function Parameters**

Parameter	Description
xml_scheme	Name of EPC tag scheme to be converted

### Usage Notes

The return value is the contents of the CLOB containing the Oracle Database tag data translation XML.

### Examples

The following example converts standard EPCglobal Tag Data Translation (TDT) files into Oracle Database TDT files:

```
--Contents of MGD_ID_DOC2.sql
-----
-- EPC_TO_ORACLE_SCHEME --
-----
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');

BEGIN
  DBMS_JAVA.set_output(1000000);
  DBMS_OUTPUT.ENABLE(1000000);
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_SEVERE);
END;
/

DECLARE
  epcScheme          CLOB;

## GET\_CATEGORY\_ID Function

This function returns the category ID for a given category name and category version.

### Syntax

```
DBMS_MGD_ID_UTL.GET_CATEGORY_ID (
    category name      IN  VARCHAR2,
    category_version   IN  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 89–7 GET\_CATEGORY\_ID Function Parameters**

Parameter	Description
category_name	Name of category
category_version	Category version

### Usage Notes

- If the value of `category_version` is `NULL`, then the ID of the latest version of the specified category is returned.
- The return value is the category ID for the specified category name.

### Examples

The following example returns a category ID given a category name and its version:

```
-- Contents of get_category1.sql file
SELECT DBMS_MGD_ID_UTL.get_category_id('EPC', NULL) FROM DUAL;
```

```
SQL> @get_category1.sql
```

```
.
.
.
```

```
DBMS_MGD_ID_UTL.GET_CATEGORY_ID('EPC',NULL)
```

```
-----
```

```
1
.
.
.
```

## GET\_COMPONENTS Function

This function returns all relevant separated component names separated by semicolon (;) for the specified scheme.

### Syntax

```
DBMS_MGD_ID_UTL.GET_COMPONENTS (
    category_id IN VARCHAR2,
    scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 89–8** GET\_COMPONENTS Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

### Usage Notes

The return value contains the component names separated by a semicolon (;) for the specified scheme.

### Examples

The following example gets the components:

```
--Contents of get_components.sql
DECLARE
    id            mgd_id;
    getcomps     VARCHAR2(1000);
    getencodings VARCHAR2(1000);
    getschemenames VARCHAR2(1000);
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    getcomps := DBMS_MGD_ID_UTL.get_components(1, 'SGTIN-64');
    dbms_output.put_line('Component names are: ' || getcomps);
    getencodings := DBMS_MGD_ID_UTL.get_encodings(1, 'SGTIN-64');
    dbms_output.put_line('Encodings are: ' || getencodings);
    getschemenames := DBMS_MGD_ID_UTL.get_scheme_names(1);
    dbms_output.put_line('Scheme names are: ' || getschemenames);
END;
/
SHOW ERRORS;

## GET\_ENCODINGS Function

This function returns a list of semicolon (;) separated encodings (formats) for the specified scheme.

### Syntax

```
DBMS_MGD_ID_UTL.GET_ENCODINGS (  
    category_id IN VARCHAR2,  
    scheme_name IN VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 89–9** GET\_ENCODINGS Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

### Usage Notes

The return value contains the encodings separated by a semicolon (;) for the specified scheme.

### Examples

See the [GET\\_COMPONENTS Function](#) for an example.

## GET\_JAVA\_LOGGING\_LEVEL Function

This function returns an integer representing the current trace logging level.

### Syntax

```
DBMS_MGD_ID_UTL.GET_JAVA_LOGGING_LEVEL  
RETURN INTEGER;
```

### Parameters

None.

### Usage Notes

The return value is the integer value denoting the current Java logging level.

### Examples

The following example gets the Java logging level.

```
--Contents of getjavalogginglevel.sql  
DECLARE  
    loglevel    NUMBER;  
BEGIN  
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);  
    loglevel := DBMS_MGD_ID_UTL.get_java_logging_level();  
    dbms_output.put_line('Java logging level = ' || loglevel);  
END;  
/

```

## GET\_PLSQL\_LOGGING\_LEVEL Function

This function returns an integer representing the current PL/SQL trace logging level.

### Syntax

```
DBMS_MGD_ID_UTL.GET_PLSQL_LOGGING_LEVEL
RETURN INTEGER;

PRAGMA restrict_references(get_plsql_logging_level, WNDS);
```

### Parameters

None.

### Usage Notes

The return value is the integer value denoting the current PL/SQL logging level.

### Examples

The following example gets the PL/SQL logging level.

```
--Contents of getplsqllogginglevel.sql
DECLARE
    loglevel    NUMBER;
BEGIN
    DBMS_MGD_ID_UTL.set_plsql_logging_level(0);
    loglevel := DBMS_MGD_ID_UTL.get_plsql_logging_level();
    dbms_output.put_line('PL/SQL logging level = ' || loglevel);
END;
/
SHOW ERRORS;

SQL> @getplsqllogginglevel.sql

```

## GET\_SCHEME\_NAMES Function

This function returns a list of semicolon (;) separated scheme names for the specified category.

### Syntax

```
DBMS_MGD_ID_UTL.GET_SCHEME_NAMES (  
    category_id IN VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 89–10** *GET\_SCHEME\_NAMES Function Parameters*

Parameter	Description
category_id	Category ID

### Usage Notes

The return value contains the scheme names for the specified category ID.

### Examples

See the [GET\\_COMPONENTS Function](#) for an example.

## GET\_TDT\_XML Function

This function returns the Oracle Database tag data translation XML for the specified scheme.

### Syntax

```
DBMS_MGD_ID_UTL.GET_TDT_XML (
    category_id IN VARCHAR2,
    scheme_name IN VARCHAR2)
RETURN CLOB;
```

### Parameters

**Table 89-11** GET\_TDT\_XML Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

### Usage Notes

The return value contains the Oracle Database tag data translation XML for the specified scheme.

### Examples

The following example gets the Oracle Database TDT XML for the specified scheme:

```
--Contents of get_tdtxml.sql
DECLARE
    gettdtxml      CLOB;

BEGIN
    gettdtxml := DBMS_MGD_ID_UTL.get_tdt_xml(1, 'SGTIN-64');
    dbms_output.put_line('Length of tdt XML is '||DBMS_LOB.GETLENGTH(gettdtxml));
    dbms_output.put_line(DBMS_LOB.SUBSTR(gettdtxml, DBMS_LOB.GETLENGTH(gettdtxml), 1));
END;
/
SHOW ERRORS;

## GET\_VALIDATOR Function

This function returns the Oracle Database tag data translation schema.

### Syntax

```
DBMS_MGD_ID_UTL.GET_VALIDATOR
RETURN CLOB;
```

### Usage Notes

The return value contains the Oracle Database tag data translation schema.

### Examples

This example returns the Oracle Database TDT schema.

```
--Contents of get_validator.sql
DECLARE
  getvalidator          CLOB;
BEGIN
  getvalidator := DBMS_MGD_ID_UTL.get_validator;
  dbms_output.put_line('Length of validated oracle scheme xml is '||DBMS_

## REFRESH\_CATEGORY Function

This function refreshes the metadata information on the Java stack for the specified category. This function must be called before using MGD\_ID functions.

### Syntax

```
DBMS_MGD_ID_UTL.REFRESH_CATEGORY (
    category_id IN VARCHAR2);
```

### Parameters

**Table 89–12 REFRESH\_CATEGORY Function Parameters**

Parameter	Description
category_id	Category ID

### Examples

The following example refreshes the metadata information for the EPC category ID.

```
--Contents of tostring3.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
    id          MGD_ID;
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    dbms_output.put_line('..Testing to_string');
    DBMS_OUTPUT.PUT_LINE('test to_string');
    id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970',
'scheme=GID-96');
    DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
    DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @tostring3.sql
..Testing to_string
test to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970
```

PL/SQL procedure successfully completed.

## REMOVE\_CATEGORY Procedure

This procedure removes a category including all the related TDT XML. This procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Removes a category based on the specified category ID.

```
DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
    category_id      IN VARCHAR2);
```

Removes a category based on the specified category name and category version.

```
DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
    category_name    IN VARCHAR2,
    category_version IN VARCHAR2);
```

### Parameters

**Table 89–13 REMOVE\_CATEGORY Procedure Parameters**

Parameter	Description
category_id	Category ID
category_name	Name of category
category_version	Category version

### Usage Notes

If the value of `category_version` is `NULL`, all versions for the specified category will be removed.

### Examples

See the [ADD\\_SCHEME Procedure](#) for an example of removing a category.

## REMOVE\_PROXY Procedure

This procedure unsets the host and port of the proxy server.

### Syntax

```
DBMS_MGD_ID_UTL.REMOVE_PROXY;
```

### Examples

See the [REFRESH\\_CATEGORY Function](#) for an example.

## REMOVE\_SCHEME Procedure

This procedure removes a tag data translation scheme from a category.

### Syntax

```
DBMS_MGD_ID_UTL.REMOVE_SCHEME (  
  category_id IN VARCHAR2,  
  scheme_name IN VARCHAR2);
```

### Parameters

**Table 89–14 REMOVE\_SCHEME Procedure Parameters**

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

### Examples

See the [ADD\\_SCHEME Procedure](#) for an example of removing a scheme.

## SET\_JAVA\_LOGGING\_LEVEL Procedure

This procedure sets the Java trace logging level.

### Syntax

```
DBMS_MGD_ID_UTL.SET_JAVA_LOGGING_LEVEL (
    logginglevel IN INTEGER);
```

### Parameters

**Table 89–15 SET\_JAVA\_LOGGING\_LEVEL Procedure Parameters**

Parameter	Description
logginglevel	Logging level. The Java logging level can be one of the following values in descending order: <ul style="list-style-type: none"> <li>▪ LOGGING_LEVEL_OFF                    CONSTANT INTEGER := 0</li> <li>▪ LOGGING_LEVEL_SEVERE                CONSTANT INTEGER := 1</li> <li>▪ LOGGING_LEVEL_WARNING               CONSTANT INTEGER := 2</li> <li>▪ LOGGING_LEVEL_INFO                  CONSTANT INTEGER := 3</li> <li>▪ LOGGING_LEVEL_FINE                  CONSTANT INTEGER := 4</li> <li>▪ LOGGING_LEVEL_FINER                 CONSTANT INTEGER := 5</li> <li>▪ LOGGING_LEVEL_FINEST                CONSTANT INTEGER := 6</li> <li>▪ LOGGING_LEVEL_ALL                    CONSTANT INTEGER := 7</li> </ul>

### Examples

See the [GET\\_JAVA\\_LOGGING\\_LEVEL Function](#) for an example.

## SET\_PLSQL\_LOGGING\_LEVEL Procedure

This procedure sets the PL/SQL trace logging level.

### Syntax

```
DBMS_MGD_ID_UTL.SET_PLSQL_LOGGING_LEVEL (
    level IN INTEGER);

PRAGMA restrict_references(set_plsql_logging_level, WNDS);
```

### Parameters

**Table 89–16** *SET\_PLSQL\_LOGGING\_LEVEL Procedure Parameters*

Parameter	Description
level	Logging level. The PL/SQL logging level can be one of the following values in descending order: <ul style="list-style-type: none"> <li>▪ LOGGING_LEVEL_OFF                    CONSTANT INTEGER := 0</li> <li>▪ LOGGING_LEVEL_SEVERE                CONSTANT INTEGER := 1</li> <li>▪ LOGGING_LEVEL_WARNING               CONSTANT INTEGER := 2</li> <li>▪ LOGGING_LEVEL_INFO                  CONSTANT INTEGER := 3</li> <li>▪ LOGGING_LEVEL_FINE                  CONSTANT INTEGER := 4</li> <li>▪ LOGGING_LEVEL_FINER                 CONSTANT INTEGER := 5</li> <li>▪ LOGGING_LEVEL_FINEST                CONSTANT INTEGER := 6</li> <li>▪ LOGGING_LEVEL_ALL                    CONSTANT INTEGER := 7</li> </ul>

### Examples

See the [GET\\_PLSQL\\_LOGGING\\_LEVEL Function](#) for an example.

## SET\_PROXY Procedure

This procedure sets the host and port of the proxy server for Internet access. This procedure must be called if the database server accesses the Internet using a proxy server. Internet access is necessary because some rules need to look up the Object Naming Service (ONS) table to get the company prefix index.

You do not need to call this procedure if you are only using schemes that do not contain any rules requiring Internet access.

### Syntax

```
DBMS_MGD_ID_UTL.SET_PROXY (  
    prox_host IN VARCHAR2,  
    proxy_port IN VARCHAR2);
```

### Parameters

**Table 89–17** SET\_PROXY Procedure Parameters

Parameter	Description
proxy_host	Name of host
proxy_port	Host port number

### Examples

See the [REFRESH\\_CATEGORY Function](#) for an example.

## VALIDATE\_SCHEME Function

This function validates the input tag data translation XML against the Oracle Database tag data translation schema.

### Syntax

```
DBMS_MGD_ID_UTL.VALIDATE_SCHEME (  
    xml_scheme IN CLOB)  
RETURN VARCHAR2;
```

### Parameters

**Table 89–18** VALIDATE\_SCHEME Function Parameters

Parameter	Description
xml_scheme	Scheme to be validated.

### Usage Notes

The return value contains the components names for the specified scheme.

### Examples

See the [ADD\\_SCHEME Procedure](#) or the [EPC\\_TO\\_ORACLE\\_SCHEME Function](#) for an example.

---

---

## DBMS\_MGWADM

DBMS\_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

---

---

**Note:** You must run the `catmgw.sql` script to load the Messaging Gateway packages and types into the database.

---

---

**See Also:** *Oracle Streams Advanced Queuing User's Guide* contains information on loading database objects and using DBMS\_MGWADM

This chapter contains the following topics:

- [Using DBMS\\_MGWADM](#)
  - Constants
  - Deprecated Subprograms
- [Data Structures](#)
- [Summary of DBMS\\_MGWADM Subprograms](#)

---

## Using DBMS\_MGWADM

- [Deprecated Subprograms](#)
- [Constants](#)

## Deprecated Subprograms

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g Release 1 having been superseded by improved technology:

- [ADD\\_SUBSCRIBER Procedure](#) - use instead [CREATE\\_JOB Procedure](#)
- [ALTER\\_PROPAGATION\\_SCHEDULE Procedure](#) - use instead [ALTER\\_JOB Procedure](#)
- [ALTER\\_SUBSCRIBER Procedure](#) - use instead [ALTER\\_JOB Procedure](#)
- [DB\\_CONNECT\\_INFO Procedure](#) - use instead [ALTER\\_AGENT Procedures](#)
- [DISABLE\\_PROPAGATION\\_SCHEDULE Procedure](#) - use instead [DISABLE\\_JOB Procedure](#)
- [ENABLE\\_PROPAGATION\\_SCHEDULE Procedure](#) - use instead [ENABLE\\_JOB Procedure](#)
- [REMOVE\\_SUBSCRIBER Procedure](#) - use instead [REMOVE\\_JOB Procedure](#)
- [RESET\\_SUBSCRIBER Procedure](#) - use instead [RESET\\_JOB Procedure](#)
- [SCHEDULE\\_PROPAGATION Procedure](#) - use instead [CREATE\\_JOB Procedure](#)
- [UNSCHEDULE\\_PROPAGATION Procedure](#) - use instead [REMOVE\\_JOB Procedure](#)

## Constants

- [DBMS\\_MGWADM Constants—Cleanup Actions](#) on page 90-4
- [DBMS\\_MGWADM Constants—Force Values](#) on page 90-4
- [DBMS\\_MGWADM Constants—Logging Levels](#) on page 90-4
- [DBMS\\_MGWADM Constants—Named Property Constants](#) on page 90-5
- [DBMS\\_MGWADM Constants—Other Constants](#) on page 90-5
- [DBMS\\_MGWADM Constants—Propagation Types](#) on page 90-6
- [DBMS\\_MGWADM Constants—Queue Domain Types](#) on page 90-6
- [DBMS\\_MGWADM Constants—Shutdown Modes](#) on page 90-6
- [DBMS\\_MGWADM Constants—WebSphere MQ Interface Types](#) on page 90-6
- [DBMS\\_MGWADM Constants—target\\_type Argument of SET\\_OPTION and REMOVE\\_OPTION Procedures](#) on page 90-6
- [DBMS\\_MGWADM Constants—conntype Argument of CREATE\\_AGENT and ALTER\\_AGENT Procedures](#) on page 90-6

**Table 90–1 DBMS\_MGWADM Constants—Cleanup Actions**

Name	Type	Description
CLEAN_STARTUP_STATE	CONSTANT BINARY_INTEGER	Sets the Messaging Gateway agent to a known state so that it can be started
CLEAN_LOG_QUEUES	CONSTANT BINARY_INTEGER	Messaging Gateway agent will clean log queues for all configured messaging system links
RESET_SUB_MISSING_LOG_REC	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record
RESET_SUB_MISSING_MESSAGE	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message

**Table 90–2 DBMS\_MGWADM Constants—Force Values**

Name	Type	Description
FORCE	CONSTANT BINARY_INTEGER	Represents a forced action
NO_FORCE	CONSTANT BINARY_INTEGER	Represents a normal, nonforced action

**Table 90–3 DBMS\_MGWADM Constants—Logging Levels**

Name	Type	Description
BASIC_LOGGING	CONSTANT BINARY_INTEGER	The standard (the least) information written to the log file

**Table 90–3 (Cont.) DBMS\_MGWADM Constants—Logging Levels**

Name	Type	Description
TRACE_DEBUG_LOGGING	CONSTANT BINARY_INTEGER	The greatest information written to the log file
TRACE_HIGH_LOGGING	CONSTANT BINARY_INTEGER	The third level of detail of logging information written to the log file
TRACE_LITE_LOGGING	CONSTANT BINARY_INTEGER	The second level detail of logging information written to the log file

**Table 90–4 DBMS\_MGWADM Constants—Named Property Constants**

Name	Type	Description
MGWPROP_PREFIX	CONSTANT VARCHAR2	A constant (MGWPROP\$_) for the reserved property name prefix
MGWPROP_REMOVE	CONSTANT VARCHAR2	A constant (MGWPROP\$_REMOVE) for the reserved property name used to remove an existing property
MGWPROP_REMOVE_ALL	CONSTANT VARCHAR2	A constant (MGWPROP\$_REMOVE_ALL) for the reserved property name used to remove all properties

**Table 90–5 DBMS\_MGWADM Constants—Other Constants**

Name	Type	Description
JMS_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS connections will be used to access JMS destinations in a domain-independent manner that supports a unified messaging model
JMS_QUEUE_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS queue connections will be used to access JMS destinations
JMS_TOPIC_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS topic connections will be used to access JMS destinations
NO_CHANGE	CONSTANT VARCHAR2	Indicates that an existing value should be preserved (not changed). This is used for certain APIs where the desire is to change one or more parameters but leave others unchanged.
DEFAULT_AGENT	CONSTANT VARCHAR2	Name of the Messaging Gateway default agent

**Table 90–6 DBMS\_MGWADM Constants—Propagation Types**

Name	Type	Description
INBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for non-Oracle to Oracle Streams AQ propagation. The propagation source is a queue in a foreign (non-Oracle) messaging system and the destination is a local Oracle Streams AQ queue.
OUTBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for Oracle Streams AQ to non-Oracle propagation. The propagation source is a local Oracle Streams AQ queue and the destination is a queue in a foreign (non-Oracle) messaging system.

**Table 90–7 DBMS\_MGWADM Constants—Queue Domain Types**

Name	Type	Description
DOMAIN_QUEUE	CONSTANT BINARY_INTEGER	Represents a queue destination. A JMS queue (point-to-point model) is classified as a queue.
DOMAIN_TOPIC	CONSTANT BINARY_INTEGER	Represents a topic destination. A JMS topic (publish-subscribe model) is classified as a topic.

**Table 90–8 DBMS\_MGWADM Constants—Shutdown Modes**

Name	Type	Description
SHUTDOWN_IMMEDIATE	CONSTANT BINARY_INTEGER	Represents the immediate shutdown mode
SHUTDOWN_NORMAL	CONSTANT BINARY_INTEGER	Represents the normal shutdown mode

**Table 90–9 DBMS\_MGWADM Constants—WebSphere MQ Interface Types**

Name	Type	Description
MQSERIES_BASE_JAVA_INTERFACE	CONSTANT BINARY_INTEGER	Represents the Base Java interface for the WebSphere MQ messaging system

**Table 90–10 DBMS\_MGWADM Constants—target\_type Argument of SET\_OPTION and REMOVE\_OPTION Procedures**

Name	Type	Description
AGENT_JAVA_PROP	CONSTANT PLS_INTEGER	Used for an agent option used to set a Java System property
MSGLINK_OPTION	CONSTANT PLS_INTEGER	Used for a messaging system link option
JOB_OPTION	CONSTANT PLS_INTEGER	Used for a propagation job option

**Table 90–11 DBMS\_MGWADM Constants—conntype Argument of CREATE\_AGENT and ALTER\_AGENT Procedures**

Name	Type	Description
JDBC_OCI	CONSTANT VARCHAR2	Used to specify the JDBC OCI driver
JDBC_THIN	CONSTANT VARCHAR2	Used to specify the JDBC Thin driver

## Data Structures

---

The DBMS\_MGWADM package defines the following OBJECT types.

### Object Types

- [SYS.MGW\\_MQSERIES\\_PROPERTIES](#) Object Type
- [SYS.MGW\\_PROPERTIES](#) Object Type
- [SYS.MGW\\_PROPERTY](#) Object Type
- [SYS.MGW\\_TIBRV\\_PROPERTIES](#) Object Type

## SYS.MGW\_MQSERIES\_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

### Syntax

```

TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (
    queue_manager      VARCHAR2(64),
    hostname           VARCHAR2(64),
    port              INTEGER,
    channel            VARCHAR2(64),
    interface_type     INTEGER,
    max_connections   INTEGER,
    username           VARCHAR2(64),
    password           VARCHAR2(64),
    inbound_log_queue  VARCHAR2(64),
    outbound_log_queue VARCHAR2(64),

    -- Methods
    STATIC FUNCTION construct
    RETURN SYS.MGW_MQSERIES_PROPERTIES,

    STATIC FUNCTION alter_construct
    RETURN SYS.MGW_MQSERIES_PROPERTIES );

```

### Attributes

**Table 90–12** SYS.MGW\_MQSERIES\_PROPERTIES Attributes

Attribute	Description
queue_manager	The name of the WebSphere MQ queue manager
hostname	The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified.
port	The port number. This is used only for client connections; that is, when hostname is not NULL.
channel	The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL.
interface_type	The type of messaging interface to use. Values: <ul style="list-style-type: none"> <li>■ DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used.</li> <li>■ DBMS_MGWADM.JMS_CONNECTION if the link is to be used to access JMS destinations in a unified, domain-independent manner.</li> <li>■ DBMS_MGWADM.JMS_QUEUE_CONNECTION if the link is to be used for accessing JMS queues</li> <li>■ DBMS_MGWADM.JMS_TOPIC_CONNECTION if the link is to be used for accessing JMS topics.</li> </ul>
max_connections	The maximum number of messaging connections to the WebSphere MQ messaging system
username	The username used for authentication to the WebSphere MQ messaging system

**Table 90–12 (Cont.) SYS.MGW\_MQSERIES\_PROPERTIES Attributes**

Attribute	Description
password	The password used for authentication to the WebSphere MQ messaging system
inbound_log_queue	<p>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source:</p> <ul style="list-style-type: none"> <li>■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</li> <li>■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</li> <li>■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.</li> </ul>
outbound_log_queue	<p>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination:</p> <ul style="list-style-type: none"> <li>■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</li> <li>■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</li> <li>■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.</li> </ul>

## Methods

**Table 90–13 SYS.MGW\_MQSERIES\_PROPERTIES Methods**

Method	Description
construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL
alter_construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 data type are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other data types are assigned a value of NULL.

## SYS.MGW\_PROPERTIES Object Type

This type specifies an array of properties.

### Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

### Attributes

**Table 90–14 SYS.MGW\_PROPERTIES Attributes**

Attribute	Description
name	Property name
value	Property value

### Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the MGWPROP\$\_ prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
- You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- Add or modify property

```
MGW_PROPERTY.NAME = property_name
MGW_PROPERTY.VALUE = property_value
```

If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- Remove property

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
MGW_PROPERTY.VALUE = name_of_property_to_remove
```

No action is taken if the property name does not exist in the original list.

- Remove all properties

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
MGW_PROPERTY.VALUE = not used
```

**See Also:** "The DBMS\_MGWADM package defines constants to represent the reserved property names on [Table 90-4](#), "DBMS\_MGWADM Constants—Named Property Constants"

## SYS.MGW\_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

### Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
  name  VARCHAR2(500),
  value VARCHAR2(4000),

  -- Methods
  STATIC FUNCTION construct  --- (1)
  RETURN SYS.MGW_PROPERTY,

  STATIC FUNCTION construct(  --- (2)
    p_name  IN VARCHAR2,
    p_value IN VARCHAR2)
  RETURN SYS.MGW_PROPERTY );
```

### Attributes

**Table 90–15 SYS.MGW\_PROPERTY Attributes**

Attribute	Description
name	Property name
value	Property value

### Methods

**Table 90–16 SYS.MGW\_PROPERTY Methods**

Method	Description
construct --- (1)	Constructs a new MGW_PROPERTY instance. All attributes are assigned a value of NULL
construct --- (2)	Constructs a new MGW_PROPERTY instance initialized using the given parameters

## SYS.MGW\_TIBRV\_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

### Syntax

```
TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
  service  VARCHAR2(128),
  daemon   VARCHAR2(128),
  network  VARCHAR2(256),
  cm_name  VARCHAR2(256),
  cm_ledger VARCHAR2(256),

  -- Methods
  STATIC FUNCTION construct
  RETURN SYS.MGW_TIBRV_PROPERTIES,

  STATIC FUNCTION alter_construct
  RETURN SYS.MGW_TIBRV_PROPERTIES );
```

### Attributes

**Table 90–17 SYS.MGW\_TIBRV\_PROPERTIES Attributes**

Attribute	Description
<code>service</code>	The service parameter for the rvd transport
<code>daemon</code>	The daemon parameter for the rvd transport
<code>network</code>	The network parameter for the rvd transport
<code>cm_name</code>	The CM correspondent name. Reserved for future use.
<code>cm_ledger</code>	The CM ledger file name. Reserved for future use.

### Methods

**Table 90–18 SYS.MGW\_TIBRV\_PROPERTIES Methods**

Method	Description
<code>construct</code>	Constructs a new <code>SYS.MGW_TIBRV_PROPERTIES</code> instance. All attributes will be assigned a value of <code>NULL</code> .
<code>alter_construct</code>	Constructs a new <code>SYS.MGW_TIBRV_PROPERTIES</code> instance. This function is useful for altering the properties of an existing messaging link. All attributes having a <code>VARCHAR2</code> data type will be assigned a value of <code>DBMS_MGWADM.NO_CHANGE</code> . Attributes of other data types will be assigned a value of <code>NULL</code> .

---

## Summary of DBMS\_MGWADM Subprograms

**Table 90–19 DBMS\_MGWADM Package Subprograms**

Subprogram	Description
<a href="#">ADD_SUBSCRIBER Procedure</a> on page 90-16	Adds a subscriber used to consume messages from a source queue for propagation to a destination
<a href="#">ALTER_AGENT Procedures</a> on page 90-20	Alters Messaging Gateway agent parameters
<a href="#">ALTER_JOB Procedure</a> on page 90-22	Alters the properties of a propagation job
<a href="#">ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous</a> on page 90-24	Alters the properties of a TIB/Rendezvous messaging system link
<a href="#">ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ</a> on page 90-25	Alters the properties of a WebSphere MQ messaging system link
<a href="#">ALTER_PROPAGATION_SCHEDULE Procedure</a> on page 90-26	Alters a propagation schedule
<a href="#">ALTER_SUBSCRIBER Procedure</a> on page 90-27	Alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination
<a href="#">CLEANUP_GATEWAY Procedures</a> on page 90-29	Cleans up Messaging Gateway
<a href="#">CREATE_AGENT Procedure</a> on page 90-32	Creates a Messaging Gateway agent that will be used to process propagation jobs
<a href="#">CREATE_JOB Procedure</a> on page 90-34	Creates a job used to propagate message from a source to a destination
<a href="#">CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous</a> on page 90-38	Creates a messaging system link to a TIB/Rendezvous messaging system
<a href="#">CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ</a> on page 90-39	Creates a messaging system link to a WebSphere MQ messaging system
<a href="#">DB_CONNECT_INFO Procedure</a> on page 90-40	Configures connection information used by the Messaging Gateway agent for connections to Oracle Database
<a href="#">DISABLE_JOB Procedure</a> on page 90-41	Disables a propagation job
<a href="#">DISABLE_PROPAGATION_SCHEDULE Procedure</a> on page 90-42	Disables a propagation schedule
<a href="#">ENABLE_JOB Procedure</a> on page 90-43	Enables a propagation job
<a href="#">ENABLE_PROPAGATION_SCHEDULE Procedure</a> on page 90-44	Enables a propagation schedule
<a href="#">REGISTER_FOREIGN_QUEUE Procedure</a> on page 90-45	Registers a non-Oracle queue entity in Messaging Gateway

**Table 90–19 (Cont.) DBMS\_MGWADM Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">REMOVE_AGENT Procedure</a> on page 90-46	Removes a Messaging Gateway agent
<a href="#">REMOVE_JOB Procedure</a> on page 90-47	Removes a propagation job
<a href="#">REMOVE_MSGSYSTEM_LINK Procedure</a> on page 90-48	Removes a messaging system link for a non-Oracle messaging system
<a href="#">REMOVE_OPTION Procedure</a> on page 90-49	Removes a Messaging Gateway configuration option
<a href="#">REMOVE_SUBSCRIBER Procedure</a> on page 90-51	Removes a subscriber used to consume messages from a source queue for propagation to a destination
<a href="#">RESET_JOB Procedure</a> on page 90-52	Resets the propagation error state for a propagation job
<a href="#">RESET_SUBSCRIBER Procedure</a> on page 90-53	Resets the propagation error state for a subscriber
<a href="#">SCHEDULE_PROPAGATION Procedure</a> on page 90-54	Schedules message propagation from a source to a destination
<a href="#">SET_LOG_LEVEL Procedures</a> on page 90-56	Dynamically alters the Messaging Gateway agent logging level
<a href="#">SET_OPTION Procedure</a> on page 90-57	Sets a Messaging Gateway configuration option
<a href="#">SHUTDOWN Procedures</a> on page 90-59	Shuts down the Messaging Gateway agent
<a href="#">STARTUP Procedures</a> on page 90-60	Starts the Messaging Gateway agent
<a href="#">UNREGISTER_FOREIGN_QUEUE Procedure</a> on page 90-61	Removes a non-Oracle queue entity in Messaging Gateway
<a href="#">UNSCHEDULE_PROPAGATION Procedure</a> on page 90-62	Removes a propagation schedule

## ADD\_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

---

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [CREATE\\_JOB Procedure](#) on page 90-34), and is retained only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_MGWADM.ADD_SUBSCRIBER(
  subscriber_id      IN VARCHAR2,
  propagation_type  IN BINARY_INTEGER,
  queue_name        IN VARCHAR2,
  destination       IN VARCHAR2,
  rule              IN VARCHAR2 DEFAULT NULL,
  transformation     IN VARCHAR2 DEFAULT NULL,
  exception_queue   IN VARCHAR2 DEFAULT NULL,
  options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

### Parameters

**Table 90–20 ADD\_SUBSCRIBER Procedure Parameters**

Parameter	Description
subscriber_id	Specifies a user-defined name that identifies this subscriber
propagation_type	Specifies the type of message propagation. <code>DBMS_MGWADM.OUTBOUND_PROPAGATION</code> is for Oracle Streams AQ to non-Oracle propagation. <code>DBMS_MGWADM.INBOUND_PROPAGATION</code> is for non-Oracle to Oracle Streams AQ propagation
queue_name	Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
destination	Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is <code>NULL</code> if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code> .  If <code>NULL</code> , then the Oracle Streams AQ payload type must be supported by Messaging Gateway.

**Table 90–20 (Cont.) ADD\_SUBSCRIBER Procedure Parameters**

Parameter	Description
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type.  The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.

## Usage Notes

**See Also:** "Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Streams Advanced Queuing User's Guide* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

**See Also:** For additional information regarding subscriber options

- "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide*
- "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide*

### OUTBOUND\_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- queue\_name specifies the local Oracle Streams AQ queue that is the propagation source. This must have a syntax of schema.queue.
- destination specifies the foreign queue to which messages are propagated. This must have a syntax of registered\_queue@message\_link.
- rule specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Streams AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used.
- transformation specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a

known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Streams AQ interface is used, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$_agent('MGW_subscriber_id', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_subscriber_id`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Streams AQ queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

### **INBOUND\_PROPAGATION Subscribers**

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type.

Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

## ALTER\_AGENT Procedures

This procedure configures Messaging Gateway agent parameters.

### Syntax

```
DBMS_MGWADM.ALTER_AGENT (
    max_connections IN BINARY_INTEGER DEFAULT NULL,
    max_memory      IN BINARY_INTEGER DEFAULT NULL,
    max_threads     IN BINARY_INTEGER DEFAULT NULL,
    service         IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

```
DBMS_MGWADM.ALTER_AGENT (
    agent_name      IN VARCHAR2,
    username        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    password        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    database        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    conntype        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    max_memory      IN PLS_INTEGER DEFAULT NULL,
    max_threads     IN PLS_INTEGER DEFAULT NULL,
    service         IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    initfile        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    comment         IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

### Parameters

**Table 90–21 ALTER\_AGENT Procedure Parameters**

Parameter	Description
max_connections	The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.  <b>Caution: This parameter has been deprecated.</b>
max_memory	The maximum heap size, in MB, used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.
max_threads	The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In an Oracle RAC environment, this means that the Messaging Gateway agent will run on only those database instances that are assigned to the service. If NULL, the job class used by this agent will be altered to belong to the default service which is mapped to every instance. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.
username	Specifies the username used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. If a username is specified then a password must also be specified.

**Table 90–21 (Cont.) ALTER\_AGENT Procedure Parameters**

Parameter	Description
password	Specifies the password used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. A password must be specified if a username is specified.
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.  Oracle strongly recommends that a connect string, rather than NULL, be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database, DBMS_MGWADM.JDBC_OCI or DBMS_MGWADM.JDBC_THIN. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
comment	Optional comments for this agent. NULL if a comment is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.

---

**Note:** The `max_connections` parameter included in previous versions of this subprogram has been deprecated and is non-operational

---

## Usage Notes

- Default values for these configuration parameters are set when the Messaging Gateway agent is installed.
- Changes to the `max_memory` and `max_threads` parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.
- The `service` parameter is used to set an Oracle Scheduler job class attribute. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is NULL, the job class will belong to an internal service that is mapped to all instances.
- The `max_connections` parameter is being deprecated as of the Oracle RDBMS 11g release. The number of messaging connections used by the Messaging Gateway Agent is based on the value of the `max_threads` parameter.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the user and grant it the role `MGW_AGENT_ROLE`.

## ALTER\_JOB Procedure

This procedure alters the properties of a propagation job.

### Syntax

```
DBMS_MGWADM.ALTER_JOB (
  job_name      IN   VARCHAR2,
  rule          IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  poll_interval IN   PLS_INTEGER DEFAULT 0,
  options       IN   SYS.MGW_PROPERTIES DEFAULT NULL,
  comments      IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

### Parameters

**Table 90–22 ALTER\_JOB Procedure Parameters**

Parameter	Description
job_name	Identifies the propagation job
rule	Specifies an optional subscription rule used to dequeue messages from the propagation source. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type.  A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. In cases in which no exception queue is associated with the job, propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the propagation type.  A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
poll_interval	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.  Values: NULL, 0, or value > 0: <ul style="list-style-type: none"> <li>■ If zero (default), the current value will not be changed.</li> <li>■ If NULL, the current value will be reset and the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.</li> </ul>

**Table 90–22 (Cont.) ALTER\_JOB Procedure Parameters**

Parameter	Description
options	Optional job properties. If NULL, no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of job options.
comments	An optional comment for this agent, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, the current value will not be changed.

## Usage Notes

- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- The subscriber rule cannot be altered when propagating from a JMS source. Instead, the propagation job must be dropped and re-created with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be DBMS\_MGWADM.NO\_CHANGE (the default value).
- The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner; add a new property, replace an existing property, remove an existing property or remove all properties.

## ALTER\_MSGSYSTEM\_LINK Procedure for TIB/Rendezvous

Alters the properties of a TIB/Rendezvous messaging system link.

### Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment      IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

### Parameters

**Table 90–23 ALTER\_MSGSYSTEM\_LINK Procedure Parameters for TIB/Rendezvous**

Parameters	Description
linkname	The messaging system link name
properties	Basic properties for a TIB/Rendezvous messaging system link. If NULL, then no link properties will be changed.
options	Optional link properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.
comment	A user-specified description, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value will not be changed.

### Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 data type, specify DBMS\_MGWADM.NO\_CHANGE for that particular property. To preserve an existing value for a property of another data type, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

**See Also:** [SYS.MGW\\_PROPERTIES Object Type](#) on page 90-10

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

**See Also:** "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

## ALTER\_MSGSYSTEM\_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

### Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
  linkname IN VARCHAR2,
  properties IN SYS.MGW_MQSERIES_PROPERTIES,
  options IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

### Parameters

**Table 90–24 ALTER\_MSGSYSTEM\_LINK Procedure Parameters for WebSphere MQ**

Parameters	Description
linkname	The messaging system link name
properties	Basic properties for a WebSphere MQ messaging system link. If it is NULL, then no link properties are changed.
options	Optional link properties. NULL if no options are changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.
comment	An optional description or NULL if not desired. If DBMS_MGWADM.NO_CHANGE is specified, then the current value is not changed.

### Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 data type, specify DBMS\_MGWADM.NO\_CHANGE for that particular property. To preserve an existing value for a property of another data type, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

**See Also:** [SYS.MGW\\_PROPERTIES Object Type](#) on page 90-10

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

**See Also:** "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

## ALTER\_PROPAGATION\_SCHEDULE Procedure

This procedure alters a propagation schedule.

---

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [ALTER\\_JOB Procedure](#) on page 90-22), and is retained only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
    schedule_id IN VARCHAR2,
    duration     IN NUMBER DEFAULT NULL,
    next_time    IN VARCHAR2 DEFAULT NULL,
    latency      IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 90–25 ALTER\_PROPAGATION\_SCHEDULE Procedure Parameters**

Parameter	Description
schedule_id	Identifies the propagation schedule to be altered
duration	Reserved for future use
next_time	Reserved for future use
latency	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.  Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.

### Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

## ALTER\_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [ALTER\\_JOB Procedure](#) on page 90-22), and is retained only for reasons of backward compatibility.

---

### Syntax

```
DBMS_MGWADM.ALTER_SUBSCRIBER (
  subscriber_id  IN VARCHAR2,
  rule           IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

### Parameters

**Table 90–26 ALTER\_SUBSCRIBER Procedure Parameters**

Parameter	Description
subscriber_id	Identifies the subscriber to be altered
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type.  A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type.  A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type.  A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.  The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.

## Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

## CLEANUP\_GATEWAY Procedures

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The `MGW_GATEWAY` view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

### Syntax

```
DBMS_MGWADM.CLEANUP_GATEWAY (
  action      IN   BINARY_INTEGER,
  sarg        IN   VARCHAR2 DEFAULT NULL);
```

```
DBMS_MGWADM.CLEANUP_GATEWAY (
  agent_name  IN   VARCHAR2,
  action      IN   BINARY_INTEGER,
  sarg        IN   VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 90–27 CLEANUP\_GATEWAY Procedure Parameters**

Parameter	Description
<code>action</code>	The cleanup action to be performed. Values: <ul style="list-style-type: none"> <li>▪ <code>DBMS_MGWADM.CLEAN_STARTUP_STATE</code> for Messaging Gateway start up state recovery</li> <li>▪ <code>DBMS_MGWADM.CLEAN_LOG_QUEUES</code> for log queue cleanup</li> <li>▪ <code>DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC</code> for propagation job recovery due to missing log record</li> <li>▪ <code>DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE</code> for propagation job recovery due to missing message</li> </ul>
<code>sarg</code>	Optional argument whose meaning depends on the value specified for <code>action</code> . This should be <code>NULL</code> if it is not used for the specified action.
<code>agent_name</code>	Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.

### Usage Notes

#### CLEAN\_STARTUP\_STATE

`sarg` is not used and must be `NULL`.

The `CLEAN_STARTUP_STATE` action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The `CLEAN_STARTUP_STATE` action may be needed when the `MGW_GATEWAY` view shows that the `AGENT_STATUS` value is something other than `NOT_STARTED` or `START_SCHEDULED`, and the `AGENT_PING` value is `UNREACHABLE` for an extended period of time.

If the `AGENT_STATUS` value is `BROKEN`, then the Messaging Gateway agent cannot be started until the problem has been resolved and the `CLEAN_STARTUP_STATE` action used to reset the agent status. A `BROKEN` status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the Scheduler job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to `NOT_STARTED`.

Execution of this command fails if:

- The agent status is `NOT_STARTED` or `START_SCHEDULED`.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is `STARTING`.
- The Messaging Gateway agent is successfully contacted.

The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

---

---

**Note:** Terminate any Messaging Gateway agent process that may still be running after a `CLEAN_STARTUP_STATE` action has been successfully performed. This should be done before calling `DBMS_MGWADM.STARTUP` to start Messaging Gateway. The process is usually named `extprocmgwextproc`.

---

---

## **CLEAN\_LOG\_QUEUES**

`sarg` is not used and must be `NULL`.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

---

---

**Note:** The `CLEAN_LOG_QUEUES` action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

---

---

## **RESET\_SUB\_MISSING\_LOG\_REC**

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

---

---

**Caution:** If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

---

---

### **RESET\_SUB\_MISSING\_MESSAGE**

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that propagation job. The procedure will fail if the Messaging Gateway agent is not running.

## CREATE\_AGENT Procedure

This procedure creates a Messaging Gateway agent that will be used to process propagation jobs.

### Syntax

```
DBMS_MGWADM.CREATE_AGENT (
  agent_name      IN   VARCHAR2,
  username        IN   VARCHAR2 DEFAULT NULL,
  password        IN   VARCHAR2 DEFAULT NULL,
  database        IN   VARCHAR2 DEFAULT NULL,
  conntype       IN   VARCHAR2 DEFAULT DBMS_MGWADM.JDBC_OCI,
  max_memory     IN   PLS_INTEGER DEFAULT 64,
  max_threads    IN   PLS_INTEGER DEFAULT 1,
  service        IN   VARCHAR2 DEFAULT NULL,
  initfile       IN   VARCHAR2 DEFAULT NULL,
  comment        IN   VARCHAR2  DEFAULT NULL );
```

### Parameters

**Table 90–28 CREATE\_AGENT Procedure Parameters**

Parameter	Description
agent_name	A name used to identify the agent
username	Specifies the username used for connections to the Oracle Database
password	Specifies the password used for connections to the Oracle Database. A password must be specified if a username is specified.
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. A value can be specified only if username is specified. Oracle strongly recommends that a connect string, rather than NULL be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database. Values: DBMS_MGWADM.JDBC_OCI, DBMS_MGWADM.JDBC_THIN
max_memory	Specifies the maximum heap size, in MB, used by the Messaging Gateway agent
max_threads	Specifies the number of messaging threads that the Messaging Gateway agent creates. This determines the number of propagation jobs that the agent can concurrently process.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In an Oracle RAC environment, this means that the Messaging Gateway agent will only run on those database instances that are assigned to the service. If NULL, then the job class will belong to the default service which is mapped to every instance.
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file.
comment	An optional comment for this agent. NULL if one is not desired.

## Usage Notes

- The Messaging Gateway automatically configures a default agent when Messaging Gateway is installed. The name of the default agent is `DEFAULT_AGENT`. This procedure can be used to create additional agents.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the database user and grant it the role `MGW_AGENT_ROLE`. It is not mandatory that the connection information be specified when this procedure is called but it must be set before the agent can be started.
- The `service` parameter is used to create an Oracle Scheduler job class. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is `NULL`, the job class will belong to an internal service that is mapped to all instances.

## CREATE\_JOB Procedure

This procedure creates a job used to propagate message from a source to a destination.

### Syntax

```
DBMS_MGWADM.CREATE_JOB (
  job_name          IN  VARCHAR2,
  propagation_type IN  PLS_INTEGER,
  source            IN  VARCHAR2,
  destination       IN  VARCHAR2,
  rule              IN  VARCHAR2 DEFAULT NULL,
  transformation     IN  VARCHAR2 DEFAULT NULL,
  exception_queue   IN  VARCHAR2 DEFAULT NULL,
  poll_interval     IN  PLS_INTEGER DEFAULT NULL,
  options           IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  enabled           IN  BOOLEAN DEFAULT TRUE,
  comments          IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 90–29 CREATE\_JOB Procedure Parameters**

Parameter	Description
job_name	A user defined name to identify the propagation job
propagation_type	Specifies the type of message propagation. <ul style="list-style-type: none"> <li>■ DBMS_MGWADM.OUTBOUND_PROPAGATION for Oracle Streams AQ to non-Oracle propagation.</li> <li>■ DBMS_MGWADM.INBOUND_PROPAGATION for non-Oracle to Oracle Streams AQ propagation.</li> </ul>
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used to dequeue messages from the source queue. This should be NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type.  If no transformation is specified the Oracle Streams AQ payload type must be supported by Messaging Gateway.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, an exception queue will not be used and propagation will stop if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type.  The source queue and exception queue cannot be the same queue.

**Table 90–29 (Cont.) CREATE\_JOB Procedure Parameters**

Parameter	Description
<code>poll_interval</code>	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.  Values: NULL or value > 0. If NULL, then the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.
<code>options</code>	Optional job properties, NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.
<code>enabled</code>	Specifies whether this propagation job is enabled after creation. Values: TRUE, FALSE. <ul style="list-style-type: none"> <li>■ If TRUE (default), the job will be enabled after it is created.</li> <li>■ If FALSE, the job will be disabled after it is created. A propagation job must be enabled and the Messaging Gateway agent running before messages can be propagated.</li> </ul>
<code>comments</code>	An optional comment for this job. NULL if one is not desired.

## Usage Notes

- The job must be enabled and Messaging Gateway agent started in order for messages to be propagated.
- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

### OUTBOUND\_PROPAGATION Jobs

The parameters for an outbound propagation job are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue that is the propagation source. This must have syntax of `schema.queue`. This can be either a multiple consumer queue or a single consumer queue.
- `destination` specifies the non-Oracle queue to which messages are propagated. This must have syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Stream AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used. This parameter must be NULL if the native Oracle Stream AQ interface is used and the propagation source is a single consumer queue.
- `transformation` specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway. The full transformation name (`schema.name`) should be used if one is specified.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the non-Oracle messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. The syntax must be `schema.queue`.

If the native Oracle Streams AQ interface is used and the source is a multiple consumer queue, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not the Messaging Gateway agent is running. The local subscriber will be of the form `sys.aq$_agent('MGW_job_name', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_job_name`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following conditions:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source queue and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE`. Enqueue restrictions prevent Messaging Gateway from using an Oracle Streams AQ queue of type `DBMS_AQADM.EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

### INBOUND\_PROPAGATION Jobs

The parameters for an inbound propagation job are interpreted as follows:

- `source` specifies the non-Oracle queue that is the propagation source. The syntax must be `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. The syntax must be `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the non-Oracle messaging system. This should be `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type. The full transformation name (`schema.name`) should be used if one is specified

Messaging Gateway propagation dequeues messages from the non-Oracle messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a registered non-Oracle queue to which messages are moved if an exception occurs. The syntax must be `registered_queue@message_link`.

Whether or not a subscriber is needed for the source queue depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then the Messaging Gateway agent will create it. If the agent is not

running when this procedure is called, then the subscriber will be created on the non-Oracle messaging system the next time the agent starts.

The exception queue has the following conditions:

- The exception queue must be a registered non-Oracle queue.
- The source queue and exception queue must use the same messaging system link.

## CREATE\_MSGSYSTEM\_LINK Procedures for TIB/Rendezvous

Creates a link to a TIB/Rendezvous messaging system.

### Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN  VARCHAR2 DEFAULT NULL );
```

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  agent_name    IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN  VARCHAR2 DEFAULT NULL );
```

### Parameters

**Table 90–30** CREATE\_MSGSYSTEM\_LINK Procedure Parameters for TIB/Rendezvous

Parameter	Description
linkname	A user-defined name to identify this messaging system link
properties	Basic properties of a TIB/Rendezvous messaging system link.
options	Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system
comment	A user-specified description. NULL if one is not desired.
agent_name	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

### Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

**See Also:** "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

## CREATE\_MSGSYSTEM\_LINK Procedures for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

### Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
  linkname      IN VARCHAR2,
  properties    IN SYS.MGW_MQSERIES_PROPERTIES,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
  linkname      IN VARCHAR2,
  agent_name    IN VARCHAR2,
  properties    IN SYS.MGW_MQSERIES_PROPERTIES,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 90–31** CREATE\_MSGSYSTEM\_LINK Procedure Parameters for WebSphere MQ

Parameter	Description
linkname	A user-defined name to identify the messaging system link
properties	Basic properties of a WebSphere MQ messaging system link
options	Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system.
comment	A user-specified description. NULL if one is not desired
agent_name	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

### Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

**See Also:** "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

## DB\_CONNECT\_INFO Procedure

This procedure configures connection information used by the Messaging Gateway default agent for connections to Oracle Database.

---

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [ALTER\\_AGENT Procedures](#) on page 90-20), and is retained only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (
  username      IN VARCHAR2,
  password      IN VARCHAR2,
  database      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 90–32** *DB\_CONNECT\_INFO Procedure Parameters*

Parameter	Description
username	The username used for connections to Oracle Database. NULL is not allowed
password	The password used for connections to Oracle Database. NULL is not allowed
database	The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used.  Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from <code>tnsnames.ora</code> .

### Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role `MGW_AGENT_ROLE`, and then call this procedure to configure Messaging Gateway. Role `MGW_AGENT_ROLE` is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Streams AQ queues, and perform certain Oracle Streams AQ administration tasks.

## DISABLE\_JOB Procedure

This procedure disables a propagation job.

### Syntax

```
DBMS_MGWADM.DISABLE_JOB (  
    job_name IN VARCHAR2);
```

### Parameters

**Table 90–33** *DISABLE\_JOB Procedure Parameters*

Parameter	Description
job_name	Identifies the propagation job

## DISABLE\_PROPAGATION\_SCHEDULE Procedure

This procedure disables a propagation schedule.

---

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [DISABLE\\_JOB Procedure](#) on page 90-41), and is retained only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2);
```

### Parameters

**Table 90–34** *DISABLE\_PROPAGATION\_SCHEDULE Procedure Parameters*

Parameter	Description
schedule_id	Identifies the propagation schedule to be disabled

## ENABLE\_JOB Procedure

This procedure enables a propagation job.

### Syntax

```
DBMS_MGWADM.ENABLE_JOB (  
    job_name IN VARCHAR2 );
```

### Parameters

**Table 90–35** *ENABLE\_JOB Procedure Parameters*

Parameter	Description
job_name	Identifies the propagation job

## ENABLE\_PROPAGATION\_SCHEDULE Procedure

This procedure enables a propagation schedule.

---

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [ENABLE\\_JOB Procedure](#) on page 90-43), and is retained only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2 );
```

### Parameters

**Table 90–36** *ENABLE\_PROPAGATION\_SCHEDULE Procedure Parameters*

Parameter	Description
schedule_id	Identifies the propagation schedule to be enabled

## REGISTER\_FOREIGN\_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

### Syntax

```
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE (
  name           IN VARCHAR2,
  linkname       IN VARCHAR2,
  provider_queue IN VARCHAR2 DEFAULT NULL,
  domain         IN INTEGER DEFAULT NULL,
  options        IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 90–37 REGISTER\_FOREIGN\_QUEUE Procedure Parameters**

Parameters	Description
name	The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.
linkname	The link name for the messaging system on which this queue exists
provider_queue	The message provider (native) queue name. If NULL, then the value provided for the name parameter is used as the provider queue name.
domain	The domain type of the queue. NULL means the domain type is automatically determined based on the messaging system of the queue. DBMS_MGWADM.DOMAIN_QUEUE is for a queue (point-to-point model). DBMS_MGWADM.DOMAIN_TOPIC is for a topic (publish-subscribe model).
options	Optional queue properties
comment	A user-specified description. Can be NULL.

### Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

**See Also:** For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically "Optional Foreign Queue Configuration Properties" in *Oracle Streams Advanced Queuing User's Guide*.

## REMOVE\_AGENT Procedure

This procedure removes a Messaging Gateway agent.

### Syntax

```
DBMS_MGWADM.REMOVE_AGENT (  
    agent_name IN VARCHAR2 );
```

### Parameters

**Table 90–38 REMOVE\_AGENT Procedure Parameters**

Parameters	Description
agent_name	Identifies the Messaging Gateway agent

### Usage Notes

All messaging system links associated with this Messaging Gateway agent must be removed and the agent must be stopped before it can be removed. The Messaging Gateway default agent cannot be removed.

## REMOVE\_JOB Procedure

This procedure removes a propagation job.

### Syntax

```
DBMS_MGWADM.REMOVE_JOB (
  job_name  IN  VARCHAR2,
  force     IN  PLS_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

### Parameters

**Table 90–39 REMOVE\_JOB Procedure Parameters**

Parameters	Description
job_name	Identifies the propagation job
force	<p>Specifies whether the procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this propagation job.</p> <p>Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE</p> <ul style="list-style-type: none"> <li>■ NO_FORCE (default) means the job is not removed if Messaging Gateway is unable to clean up successfully</li> <li>■ FORCE means the job is removed even though all cleanup actions may not be done</li> </ul>

### Usage Notes

- The Messaging Gateway agent uses various resources of the Oracle Database and the non-Oracle messaging system for its propagation work. These resources need to be released when the job is removed. For example, Messaging Gateway may create a durable subscriber on the source queue that should be removed when the job is removed. Therefore, this procedure should normally be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this job.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue when the propagation source is a multiple consumer queue.

## REMOVE\_MSGSYSTEM\_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

### Syntax

```
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(  
    linkname IN VARCHAR2);
```

### Parameters

**Table 90–40 REMOVE\_MSGSYSTEM\_LINK Procedure Parameters**

Parameters	Description
linkname	The messaging system link name

### Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

## REMOVE\_OPTION Procedure

This procedure removes a Messaging Gateway configuration option. It can be used to remove an agent option, a messaging link option, or a propagation job option.

### Syntax

```
DBMS_MGWADM.REMOVE_OPTION (
    target_type IN PLS_INTEGER,
    target_name IN VARCHAR2,
    option_name IN VARCHAR2);
```

### Parameters

**Table 90–41 REMOVE\_OPTION Procedure Parameters**

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"> <li>■ DBMS_MGWADM.AGENT_JAVA_PROP to remove a Java System property for a Messaging Gateway agent</li> <li>■ DBMS_MGWADM.MSGLINK_OPTION to remove a messaging link option</li> <li>■ DBMS_MGWADM.JOB_OPTION to remove a propagation job option</li> </ul>
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.

**See Also:** [Table 90–10, "DBMS\\_MGWADM Constants—target\\_type Argument of SET\\_OPTION and REMOVE\\_OPTION Procedures"](#) on page 90-6 regarding options for the option\_type parameter

### Usage Notes

#### DBMS\_MGWADM.AGENT\_JAVA\_PROP Target

The procedure removes an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target\_name specifies the name of the Messaging Gateway agent. DBMS\_MGWADM.DEFAULT\_AGENT can be used for the default agent.
- option\_name specifies the Java System property
- encrypted can be either TRUE or FALSE

#### DBMS\_MGWADM.MSGLINK\_OPTION Target

The procedure removes a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS\_MGWADM.ALTER\_MSGSYSTEM\_LINK and using the options parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the message system link
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

**DBMS\_MGWADM.JOB\_OPTION Target**

The procedure removes a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the `options` parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

## REMOVE\_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [REMOVE\\_JOB Procedure](#) on page 90-47), and is retained only for reasons of backward compatibility.

---

### Syntax

```
DBMS_MGWADM.REMOVE_SUBSCRIBER (
  subscriber_id IN VARCHAR2,
  force         IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

### Parameters

**Table 90–42 REMOVE\_SUBSCRIBER Procedure Parameters**

Parameter	Description
subscriber_id	Identifies the subscriber to be removed
force	<p>Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber.</p> <p>Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE</p> <ul style="list-style-type: none"> <li>■ NO_FORCE means the subscriber is not removed if Messaging Gateway is unable to clean up successfully (default)</li> <li>■ FORCE means the subscriber is removed even though all cleanup actions may not be done</li> </ul>

### Usage Notes

- The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue.

## RESET\_JOB Procedure

This procedure resets the propagation error state for a propagation job.

### Syntax

```
DBMS_MGWADM.RESET_JOB (  
    job_name IN VARCHAR2);
```

### Parameters

**Table 90–43** *RESET\_JOB Procedure Parameters*

Parameter	Description
job_name	Identifies the propagation job

### Usage Notes

This procedure can be used to reset a propagation job that has been set to a failed state and propagation activities have been stopped. The administrator should correct the problem and then call this procedure to allow the agent to retry the propagation job. The `STATUS` field of the `MGW_JOBS` view indicates the job status.

## RESET\_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

---

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [RESET\\_JOB Procedure](#) on page 90-52), and is retained only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (  
    subscriber_id IN VARCHAR2 );
```

### Parameters

**Table 90–44** *RESET\_SUBSCRIBER Procedure Parameters*

Parameter	Description
subscriber_id	Identifies the subscriber

## SCHEDULE\_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination. The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

---

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [CREATE\\_JOB Procedure](#) on page 90-34), and is retained only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_MGWADM.SCHEDULE_PROPAGATION (
  schedule_id      IN VARCHAR2,
  propagation_type IN BINARY_INTEGER,
  source           IN VARCHAR2,
  destination      IN VARCHAR2,
  start_time       IN DATE DEFAULT SYSDATE,
  duration         IN NUMBER DEFAULT NULL,
  next_time        IN VARCHAR2 DEFAULT NULL,
  latency          IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 90–45** *SCHEDULE\_PROPAGATION Procedure Parameters*

Parameter	Description
<code>schedule_id</code>	Specifies a user-defined name that identifies the schedule
<code>propagation_type</code>	Specifies the type of message propagation. <code>DBMS_MGWADM.OUTBOUND_PROPAGATION</code> is for Oracle Streams AQ to non-Oracle propagation. <code>DBMS_MGWADM.INBOUND_PROPAGATION</code> is for non-Oracle to Oracle Streams AQ propagation.
<code>source</code>	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
<code>destination</code>	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
<code>start_time</code>	Reserved for future use
<code>duration</code>	Reserved for future use
<code>next_time</code>	Reserved for future use
<code>latency</code>	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.  Values: <code>NULL</code> or value > 0. If <code>latency</code> is <code>NULL</code> , then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.

## Usage Notes

For outbound propagation, parameters are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue from which messages are propagated. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- `source` specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

## SET\_LOG\_LEVEL Procedures

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

### Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (
    log_level    IN    BINARY_INTEGER);
```

```
DBMS_MGWADM.SET_LOG_LEVEL (
    agent_name   IN    VARCHAR2,
    log_level    IN    BINARY_INTEGER);
```

### Parameters

**Table 90–46** SET\_LOG\_LEVEL Procedure Parameters

Parameter	Description
log_level	Level at which the Messaging Gateway agent logs information. DBMS_MGWADM.BASIC_LOGGING generates the least information while DBMS_MGWADM.TRACE_DEBUG_LOGGING generates the most information.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

**See Also:** [Table 90–3, "DBMS\\_MGWADM Constants—Logging Levels"](#) on page 90-4 for details on the log\_level parameter

## SET\_OPTION Procedure

This procedure sets a Messaging Gateway configuration option. It can be used to set an agent option, a messaging link option, or a propagation job option.

### Syntax

```
DBMS_MGWADM.SET_OPTION (
  target_type  IN  PLS_INTEGER,
  target_name  IN  VARCHAR2,
  option_name  IN  VARCHAR2,
  option_value IN  VARCHAR2,
  encrypted    IN  BOOLEAN DEFAULT FALSE );
```

### Parameters

**Table 90–47 SET\_OPTION Procedure Parameters**

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"> <li>■ DBMS_MGWADM.AGENT_JAVA_PROP to set a Java System property for a Messaging Gateway agent</li> <li>■ DBMS_MGWADM.MSGLINK_OPTION to set a messaging link option</li> <li>■ DBMS_MGWADM.JOB_OPTION to set a propagation job option</li> </ul>
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.
option_value	Option value
encrypted	Indicates whether the value should be stored as encrypted: <ul style="list-style-type: none"> <li>■ TRUE if the value should be stored in an encrypted form</li> <li>■ FALSE if the value should be stored in a cleartext form</li> </ul>

**See Also:** [Table 90–10, "DBMS\\_MGWADM Constants—target\\_type Argument of SET\\_OPTION and REMOVE\\_OPTION Procedures"](#) on page 90-6 regarding options for the option\_type parameter

### Usage Notes

#### DBMS\_MGWADM.AGENT\_JAVA\_PROP Target

The procedure will store an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target\_name specifies the name of the Messaging Gateway agent. DBMS\_MGWADM.DEFAULT\_AGENT can be used for the default agent.
- option\_name specifies the Java System property

- `encrypted` can be either `TRUE` or `FALSE`

**DBMS\_MGWADM.MSGLINK\_OPTION Target**

The procedure will set or alter a single option for a Messaging Gateway messaging system link. This is equivalent to calling `DBMS_MGWADM.ALTER_MSGSYSTEM_LINK` and using the options parameter to set an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the message system link
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

**DBMS\_MGWADM.JOB\_OPTION Target**

The procedure will set or alter a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the options parameter to set an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

## SHUTDOWN Procedures

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

### Syntax

```
DBMS_MGWADM.SHUTDOWN (
  sdmode          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);
```

```
DBMS_MGWADM.SHUTDOWN (
  agent_name      IN VARCHAR2);
```

### Parameters

**Table 90–48 SHUTDOWN Procedure Parameters**

Parameter	Description
sdmode	The shutdown mode. The only value currently supported is <code>DBMS_MGWADM.SHUTDOWN_NORMAL</code> for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress.
agent_name	Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.

### Usage Notes

The Messaging Gateway default agent is shut down if no agent name is specified.

## STARTUP Procedures

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

### Syntax

```
DBMS_MGWADM.STARTUP (
  instance      IN  BINARY_INTEGER DEFAULT 0,
  force         IN  BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);

DBMS_MGWADM.STARTUP (
  agent_name    IN  VARCHAR2);
```

### Parameters

**Table 90–49** *STARTUP Procedure Parameters*

Parameter	Description
instance	Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance.  <b>Caution: This parameter has been deprecated.</b>
force	If this is <code>DBMS_MGWADM.FORCE</code> , then any positive integer is acceptable as the job instance. If this is <code>DBMS_MGWADM.NO_FORCE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception.  <b>Caution: This parameter has been deprecated.</b>
agent_name	Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.

### Usage Notes

- The Messaging Gateway default agent will be started if an agent name is not specified.
- The `force` and `instance` parameters are no longer used and will be ignored. If the `instance` affinity parameters were being used to start the default agent on a specific instance, the administrator will need to create a database service and then assign that service to the default agent using the `DBMS_MGWADM.ALTER_AGENT` procedure.
- The Messaging Gateway agent cannot be started until an agent user has been configured by the `DBMS_MGWADM.CREATE_AGENT` or `DBMS_MGWADM.ALTER_AGENT` subprograms.

## UNREGISTER\_FOREIGN\_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

### Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE (
  name          IN VARCHAR2,
  linkname     IN VARCHAR2);
```

### Parameters

**Table 90–50 UNREGISTER\_FOREIGN\_QUEUE Procedure Parameters**

Parameter	Description
name	The queue name
linkname	The link name for the messaging system on which the queue exists

### Usage Notes

- This procedure does not remove the physical queue in the non-Oracle messaging system.
- All propagation jobs, subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a propagation job, subscriber, or propagation schedule references the non-Oracle queue.

## UNSCCHEDULE\_PROPAGATION Procedure

This procedure removes a propagation schedule.

---

---

**Note:** This subprogram has been deprecated as a result of improved technology (see [REMOVE\\_JOB Procedure](#) on page 90-52), and is retained only for reasons of backward compatibility.

---

---

### Syntax

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (  
    schedule_id IN VARCHAR2 );
```

### Parameters

**Table 90–51 UNSCHEDULE\_PROPAGATION Procedure Parameters**

Parameter	Description
schedule_id	Identifies the propagation schedule to be removed

DBMS\_MGWMSG provides:

- Object types used by the canonical message types to convert message bodies.
- Methods, constants, and subprograms for working with Messaging Gateway message types.

**See Also:** [Chapter 90, "DBMS\\_MGWADM"](#) which describes the Messaging Gateway administrative interface, `DBMS_MGWADM`

This chapter contains the following topics:

- [Using DBMS\\_MGWMSG](#)
  - Security Model
  - Constants
  - Types
- [Summary of DBMS\\_MGWMSG Subprograms](#)

## Using DBMS\_MGWMSG

- [Security Model](#)
- [Constants](#)
- [Types](#)

## Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS\_MGWMSG package as well as the canonical types. The DBMS\_MGWMSG packages and object types are owned by SYS.

---

---

**Note:** You must run the `catmgw.sql` script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Streams Advanced Queuing User's Guide* for information on loading database objects and using DBMS\_MGWMSG.

---

---

## Constants

**Table 91–1 DBMS\_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW\_NAME\_VALUE\_T Object**

Value	Constant
TEXT_VALUE	CONSTANT BINARY_INTEGER := 1
RAW_VALUE	CONSTANT BINARY_INTEGER := 2
BOOLEAN_VALUE	CONSTANT BINARY_INTEGER := 3
BYTE_VALUE	CONSTANT BINARY_INTEGER := 4
SHORT_VALUE	CONSTANT BINARY_INTEGER := 5

- [SYS.MGW\\_TIBRV\\_FIELD\\_T Type](#)
- [SYS.MGW\\_TIBRV\\_MSG\\_T Type](#)

### SYS.MGW\_NAME\_VALUE\_T Type

This type specifies a named value. The name attribute, type attribute, and one of the <>\_value attributes are typically not NULL.

### Syntax

```

TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
  name          VARCHAR2(250),
  type          INTEGER,
  integer_value INTEGER,
  number_value  NUMBER,
  text_value    VARCHAR2(4000),
  raw_value     RAW(2000),
  date_value    DATE,

  -- Methods
  STATIC FUNCTION CONSTRUCT
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_BOOLEAN (
    name  IN VARCHAR2,
    value IN INTEGER )
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_BYTE (
    name  IN VARCHAR2,
    value IN INTEGER )
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_SHORT (
    name  IN VARCHAR2,
    value IN INTEGER )
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_INTEGER (
    name  IN VARCHAR2,
    value IN INTEGER )
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_LONG (
    name  IN VARCHAR2,
```

```

        value IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
    name   IN VARCHAR2,
    value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (
    name   IN VARCHAR2,
    value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_TEXT (
    name   IN VARCHAR2,
    value  IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
    name   IN VARCHAR2,
    value  IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
    name   IN VARCHAR2,
    value  IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );

```

## Attributes

**Table 91-5 SYS.MGW\_NAME\_VALUE\_T Attributes**

Attribute	Description
name	Name associated with the value
type	Value type. Refer to the DBMS_MGWMSG.<>_VALUE constants in <a href="#">Table 91-1</a> . This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value.
integer_value	Stores a numeric integer value
number_value	Stores a numeric float or large integer value
text_value	Stores a text value
raw_value	Stores a RAW (bytes) value
date_value	Stores a date value

## SYS.MGW\_NAME\_VALUE\_T Type-Attribute Mapping

[Table 91-6](#) shows the mapping between the value type and the attribute used to store the value.

**Table 91-6 SYS.MGW\_NAME\_VALUE\_T Type Attribute Mapping**

Type	Value Stored in Attribute
DBMS_MGWMSG.TEXT_VALUE	text_value
DBMS_MGWMSG.RAW_VALUE	raw_value
DBMS_MGWMSG.BOOLEAN_VALUE	integer_value

**Table 91–6 (Cont.) SYS.MGW\_NAME\_VALUE\_T Type Attribute Mapping**

Type	Value Stored in Attribute
DBMS_MGWMSG.BYTE_VALUE	integer_value
DBMS_MGWMSG.SHORT_VALUE	integer_value
DBMS_MGWMSG.INTEGER_VALUE	integer_value
DBMS_MGWMSG.LONG_VALUE	number_value
DBMS_MGWMSG.FLOAT_VALUE	number_value
DBMS_MGWMSG.DOUBLE_VALUE	number_value
DBMS_MGWMSG.DATE_VALUE	date_value

## CONSTRUCT Method

This method constructs a new SYS.MGW\_NAME\_VALUE\_T instance. All attributes are assigned a value of NULL.

### Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

## CONSTRUCT\_TYPE Methods

These methods construct a new SYS.MGW\_NAME\_VALUE\_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>\_value attributes, as shown in the mappings in [Table 91–6](#).

### Syntax

```
STATIC FUNCTION CONSTRUCT_<> (
    name    IN VARCHAR2,
    value   IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

### Usage Notes

The construct\_boolean method sets the value to either DBMS\_MGWMSG.BOOLEAN\_TRUE or DBMS\_MGWMSG.BOOLEAN\_FALSE.

## SYS.MGW\_NAME\_TYPE\_ARRAY\_T Type

This type specifies an array of name-value pairs. An object of SYS.MGW\_NAME\_VALUE\_ARRAY\_T type can have up to 1024 elements.

### Syntax

```
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```

## SYS.MGW\_TEXT\_VALUE\_T Type

This type specifies a TEXT value. It can store a large value as a CLOB or a smaller value (size <= 4000) as VARCHAR2. Only one of the < >\_value attributes should be set.

### Syntax

```
TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
    small_value VARCHAR2(4000),
```

```

    large_value CLOB,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T);

```

## Attributes

**Table 91-7 SYS.MGW\_TEXT\_VALUE\_T Attributes**

Attribute	Description
small_value	Small TEXT value. Used for values <= 4000.
large_value	Large TEXT value. Used when the value is too large for the small_value attribute.

## CONSTRUCT Method

This method constructs a new SYS.MGW\_TEXT\_VALUE\_T instance. All attributes are assigned a value of NULL.

### Syntax

```

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;

```

## SYS.MGW\_RAW\_VALUE\_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >\_value attributes.

## Syntax

```

TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
    small_value RAW(2000),
    large_value BLOB,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T);

```

## Attributes

**Table 91-8 SYS.MGW\_RAW\_VALUE\_T Attributes**

Attribute	Description
small_value	Small RAW (bytes) value <= 2000
large_value	Large RAW value. Used when the value is too large for the small_value attribute.

## CONSTRUCT Method

This method constructs a new SYS.MGW\_RAW\_VALUE\_T instance. All attributes are assigned a value of NULL.

### Syntax

```

STATIC FUNCTION CONSTRUCT

```

```
RETURN SYS.MGW_RAW_VALUE_T;
```

## SYS.MGW\_BASIC\_MSG\_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

### Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
  header      SYS.MGW_NAME_VALUE_ARRAY_T,
  text_body   SYS.MGW_TEXT_VALUE_T,
  raw_body    SYS.MGW_RAW_VALUE_T,

  --Methods
  STATIC FUNCTION CONSTRUCT
  RETURN SYS.MGW_BASIC_MSG_T);
```

### Attributes

**Table 91–9 SYS.MGW\_BASIC\_MSG\_T Attributes**

Attribute	Description
header	Message header information as an array of name-value pairs
text_body	Message body for a TEXT message
raw_body	Message body for a RAW (bytes) message

## CONSTRUCT Method

This method constructs a new SYS.MGW\_BASIC\_MSG\_T instance. All attributes are assigned a value of NULL.

### Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

## SYS.MGW\_NUMBER\_ARRAY\_T Type

A type that specifies an array of numbers.

### Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

## SYS.MGW\_TIBRV\_FIELD\_T Type

A type representing a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW\_TIBRV\_MSG\_T instance.

### Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
  field_name   VARCHAR2(256),
  field_id     INTEGER,
  field_type   INTEGER,
  number_value NUMBER,
  number_array_value SYS.MGW_NUMBER_ARRAY_T,
```

```

text_value    VARCHAR2 (4000) ,
raw_value     RAW(2000) ,
date_value    DATE,
clob_value    CLOB,
blob_value    BLOB);

```

## Attributes

**Table 91–10 SYS.MGW\_TIBRV\_FIELD\_T Attributes**

Attribute	Description
field_name	Field name. This will be NULL if the field has no name.
field_id	Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message.
field_type	Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.
number_value	Used to store a numeric value
number_array_value	Used to store a numeric array value
text_value	Used to store a small text value
raw_value	Used to store a small raw value
date_value	Used to store a date value
clob_value	Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.
blob_value	Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.

## SYS.MGW\_TIBRV\_FIELD\_T Type and Attribute Mapping

Table 91–11 describes the mapping in type SYS.MGW\_TIBRV\_FIELD\_T between the field type and attribute used to store the value.

**Table 91–11 SYS.MGW\_TIBRV\_FIELD\_T Type and Attribute Mapping**

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_BOOL	number_value
TIBRVMSG_F32	number_value
TIBRVMSG_F64	number_value
TIBRVMSG_I8	number_value
TIBRVMSG_I16	number_value
TIBRVMSG_I32	number_value
TIBRVMSG_I64	number_value
TIBRVMSG_IPADDR32	text_value
TIBRVMSG_IPPORT16	number_value
TIBRVMSG_DATETIME	date_value

**Table 91–11 (Cont.) SYS.MGW\_TIBRV\_FIELD\_T Type and Attribute Mapping**

<b>Field Type (DBMS_MGWMSG constant)</b>	<b>Value Stored in Attribute</b>
TIBRVMSG_F32ARRAY	number_array_value
TIBRVMSG_F64ARRAY	number_array_value
TIBRVMSG_I8ARRAY	number_array_value
TIBRVMSG_I16ARRAY	number_array_value
TIBRVMSG_I32ARRAY	number_array_value
TIBRVMSG_I64ARRAY	number_array_value
TIBRVMSG_OPAQUE	raw_value or blob_value
TIBRVMSG_STRING	text_value or clob_value
TIBRVMSG_XML	raw_value or blob_value

### SYS.MGW\_TIBRV\_MSG\_T Type

A type representing a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

### Syntax

```

TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
    send_subject    VARCHAR2(256),
    reply_subject   VARCHAR2(256),
    cm_time_limit   NUMBER,
    cm_sender_name  VARCHAR2(256),
    cm_sequence_num NUMBER,
    fields          SYS.MGW_TIBRV_IFIELDS_T,
    clob_data1      CLOB,
    clob_data2      CLOB,
    clob_data3      CLOB,
    blob_data1      BLOB,
    blob_data2      BLOB,
    blob_data3      BLOB,

    STATIC FUNCTION construct
    RETURN SYS.MGW_TIBRV_MSG_T,

RETURN INTEGER
);

```

## Attributes

**Table 91–12** *SYS.MGW\_TIBRV\_MSG\_T* Type Attributes

Attribute	Description
send_subject	Send subject name
reply_subject	Reply subject name
cm_time_limit	Time limit for a certified message
cm_sender_name	Sender name of a certified message
cm_sequence_num	Sequence number of a certified message
fields	Collection of message fields
clob_data1	Used to store a large text value
clob_data2	Used to store a large text value
clob_data3	Used to store a large text value
blob_data1	Used to store a large raw value
blob_data2	Used to store a large raw value
blob_data3	Used to store a large raw value

## Construct Method

Constructs a new `SYS.MGW_TIBRV_MSG_T` instance. All attributes are set to `NULL`.

### Syntax

```

STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;

```

## ADD\_<> Methods

Adds a new field to the message.

### Syntax

```
MEMBER PROCEDURE ADD_<> (
    name IN VARCHAR2,
    id   IN INTEGER,
    value IN datatype );
```

### Parameters

**Table 91–13** *SYS.MGW\_TIBRV\_MSG\_T ADD\_<> Method Parameters*

Parameter	Description
name	Field name
id	Field identifier
value	Field data

Table 91–14 shows, for each add method, the field type that will be assigned and valid values for the field data.

**Table 91–14** *MGW\_TIBRV\_MSG\_T Add Method Field Types*

Method Name	Field Type Assigned	Comment
add_bool	TIBRVMSG_BOOL	Valid values: 0 (false), 1 (true)
add_f32	TIBRVMSG_F32	n/a
add_f64	TIBRVMSG_F64	n/a
add_i8	TIBRVMSG_I8	Valid range: -128...127
add_i16	TIBRVMSG_I16	Valid range: -32768...32767
add_i32	TIBRVMSG_I32	Valid range: -2147483648...2147483647
add_i64	TIBRVMSG_I64	n/a
add_ipaddr32	TIBRVMSG_IPADDR32	n/a
add_ipport16	TIBRVMSG_IPPORT16	n/a
add_datetime	TIBRVMSG_DATETIME	n/a
add_f32array	TIBRVMSG_F32ARRAY	n/a
add_f64array	TIBRVMSG_F64ARRAY	n/a
add_i8array	TIBRVMSG_I8ARRAY	Valid range: -128...127
add_i16array	TIBRVMSG_I16ARRAY	Valid range: -32768...32767
add_i32array	TIBRVMSG_I32ARRAY	Valid range: -2147483648...2147483647
add_i64array	TIBRVMSG_I64ARRAY	n/a
add_opaque	TIBRVMSG_OPAQUE	Value stored as RAW if size < 2000; otherwise value stored in BLOB
add_string	TIBRVMSG_STRING	Value stored as VARCHAR2 if size < 4000; otherwise value stored in CLOB

**Table 91–14 (Cont.) MGW\_TIBRV\_MSG\_T Add Method Field Types**

Method Name	Field Type Assigned	Comment
add_xml	TIBRVMSG_XML	Value stored as RAW if size < 2000; otherwise value stored in BLOB

**SET\_<> Methods**

Accessor methods to set an instance attribute to a specific value.

**Syntax**

```
MEMBER PROCEDURE SET_<> (
    value IN datatype );
```

**Parameters****Table 91–15 SYS.MGW\_TIBRV\_MSG\_T SET\_<> Method Parameters**

Parameter	Description
value	Value to be assigned

**GET\_<> Methods**

Accessor methods to retrieve the value for an instance attribute.

**Syntax**

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

**Parameters**

None

**Return Values**

Returns the attribute value.

**GET\_FIELD\_COUNT Function**

Gets the number of message fields.

**Syntax**

```
MEMBER PROCEDURE get_field_count
RETURN INTEGER;
```

**Parameters**

None

**Return Values**

Returns the number of fields, or zero (0) if there are none.

**GET\_FIELD Function**

Retrieves field information for the field having a given field collection index. This method should only be called if the GET\_FIELD\_COUNT Function returns a nonzero

value and `idx` must specify a valid collection index; that is,  $1 \leq idx \leq \text{get\_field\_count}()$ .

### Syntax

```
MEMBER PROCEDURE get_field (
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

### Parameters

**Table 91–16** *SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD Function Parameters*

Parameter	Description
<code>idx</code>	Specifies the 1-based field collection index of the field to retrieve

**Note:** A 1-based index begins at one (1) instead of zero (0).

### Return Values

Returns the field information.

## GET\_FIELD\_BY\_NAME Function

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

### Syntax

```
MEMBER PROCEDURE get_field_by_name (
    name IN  VARCHAR2 )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

### Parameters

**Table 91–17** *SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD\_BY\_NAME Function Parameters*

Parameter	Description
<code>name</code>	Specifies the field name to search for. This can be <code>NULL</code> to find the first field that does not have a field name.

### Return Values

Returns the field information, or `NULL` if no match was found.

## GET\_FIELD\_BY\_ID Function

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or `NULL`, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

### Syntax

```
MEMBER PROCEDURE get_field_by_id (
    id    IN    INTEGER )
```

```
RETURN SYS.MGW_TIBRV_FIELD_T;
```

## Parameters

**Table 91-18** *SYS.MGW\_TIBRV\_MSG\_T GET\_FIELD\_BY\_ID Function Parameters*

Parameter	Description
id	Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.

## Return Values

Returns the field information, or NULL if no match was found.

## FIND\_FIELD\_NAME Function

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

## Syntax

```
MEMBER PROCEDURE find_field_name (
    name      IN VARCHAR2,
    start_idx IN INTEGER )
RETURN INTEGER;
```

## Parameters

**Table 91-19** *SYS.MGW\_TIBRV\_MSG\_T FIND\_FIELD\_NAME Function Parameters*

Parameter	Description
name	Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.
start_idx	Specifies the 1-based field collection index from which the search should start.

## Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

## FIND\_FIELD\_ID Function

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

## Syntax

```
MEMBER PROCEDURE find_field_id (
    id      IN INTEGER,
    start_idx IN INTEGER )
RETURN INTEGER;
```

## Parameters

**Table 91–20** *SYS.MGW\_TIBRV\_MSG\_T FIND\_FIELD\_ID Function Parameters*

Parameter	Description
<code>id</code>	Specifies the field identifier to search for. This can be zero (0) or <code>NULL</code> to find a field that does not have an identifier.
<code>start_idx</code>	Specifies the 1-based field collection index from which the search should start.

## Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

---

## Summary of DBMS\_MGWMSG Subprograms

**Table 91–21 DBMS\_MGWMSG Package Subprograms**

Subprogram	Description
<a href="#">LCR_TO_XML Function</a> on page 91-22	Converts a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD) to a SYS.XMLTYPE object
<a href="#">NVARRAY_ADD Procedure</a> on page 91-23	Appends a name-value element to the end of a name-value array
<a href="#">NVARRAY_FIND_NAME Function</a> on page 91-24	Searches a name-value array for the element with the name you specify in p_name
<a href="#">NVARRAY_FIND_NAME_TYPE Function</a> on page 91-25	Searches a name-value array for an element with the name and value type you specify
<a href="#">NVARRAY_GET Function</a> on page 91-26	Gets the name-value element of the name you specify in p_name from a name-value array
<a href="#">NVARRAY_GET_BOOLEAN Function</a> on page 91-27	Gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type
<a href="#">NVARRAY_GET_BYTE Function</a> on page 91-28	Gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type
<a href="#">NVARRAY_GET_DATE Function</a> on page 91-29	Gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type
<a href="#">NVARRAY_GET_DOUBLE Function</a> on page 91-30	Gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type
<a href="#">NVARRAY_GET_FLOAT Function</a> on page 91-31	Gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type
<a href="#">NVARRAY_GET_INTEGER Function</a> on page 91-32	Gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type
<a href="#">NVARRAY_GET_LONG Function</a> on page 91-33	Gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type
<a href="#">NVARRAY_GET_RAW Function</a> on page 91-34	Gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type
<a href="#">NVARRAY_GET_SHORT Function</a> on page 91-35	Gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type
<a href="#">NVARRAY_GET_TEXT Function</a> on page 91-36	Gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type
<a href="#">XML_TO_LCR Function</a> on page 91-37	Converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD)

## LCR\_TO\_XML Function

This function converts a `SYS.ANYDATA` object encapsulating a row LCR (Logical Change Record, in this case a `LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`) to a `SYS.XMLTYPE` object.

**See Also:** [XML\\_TO\\_LCR Function](#) on page 91-37

### Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
    p_anydata IN SYS.ANYDATA )
RETURN SYS.XMLTYPE;
```

### Parameters

**Table 91-22 LCR\_TO\_XML Function Parameters**

Parameter	Description
<code>p_anydata</code>	An <code>ANYDATA</code> object to be converted

### Return Values

Returns a `SYS.XMLTYPE` object.

### Usage Notes

An exception is raised if the encapsulated type `p_anydata` is not an LCR.

## NVARRAY\_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

### Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (  
    p_array IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_value IN     SYS.MGW_NAME_VALUE_T );
```

### Parameters

**Table 91-23 NVARRAY\_ADD Procedure Parameters**

Parameter	Description
p_array	On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance.
p_value	The value to add. If NULL, then p_array is not changed.

## NVARRAY\_FIND\_NAME Function

This function searches a name-value array for the element with the name you specify in `p_name`.

### Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

### Parameters

**Table 91–24 NVARRAY\_FIND\_NAME Function Parameters**

Parameters	Description
<code>p_array</code>	The name-value array to search
<code>p_name</code>	The name to find
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns a positive integer that is the array index of the matching element or zero (0) if the specified name is not found.

## NVARRAY\_FIND\_NAME\_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

### Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_type     IN BINARY_INTEGER
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

### Parameters

**Table 91–25 NVARRAY\_FIND\_NAME\_TYPE Function Parameters**

Parameter	Description
p_array	The name-value array to search
p_name	The name to find
p_type	The value type. Refer to the value type constants in <a href="#">Table 91–1</a> on page 91-4.
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

### Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

## NVARRAY\_GET Function

This function gets the name-value element of the name you specify in `p_name` from a name-value array.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN SYS.MGW_NAME_VALUE_T;
```

### Parameters

**Table 91–26** *NVARRAY\_GET Function Parameters*

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the matching element, or `NULL` if the specified name is not found.

## NVARRAY\_GET\_BOOLEAN Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `BOOLEAN_VALUE` value type .

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

### Parameters

**Table 91–27 NVARRAY\_GET\_BOOLEAN Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## NVARRAY\_GET\_BYTE Function

This function gets the value of the name-value array element that you specify in p\_name and with the BYTE\_VALUE value type .

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

### Parameters

**Table 91-28 NVARRAY\_GET\_BYTE Function Parameters**

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

### Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## NVARRAY\_GET\_DATE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DATE_VALUE` value type .

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

### Parameters

**Table 91–29 NVARRAY\_GET\_DATE Function Parameters**

Parameters	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## NVARARRAY\_GET\_DOUBLE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DOUBLE_VALUE` value type .

### Syntax

```
DBMS_MGWMSG.NVARARRAY_GET_DOUBLE (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

### Parameters

**Table 91–30** *NVARARRAY\_GET\_DOUBLE Function Parameters*

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## NVARRAY\_GET\_FLOAT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `FLOAT_VALUE` value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_FLOAT (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

### Parameters

**Table 91–31 NVARRAY\_GET\_FLOAT Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## NVARRAY\_GET\_INTEGER Function

This function gets the value of the name-value array element that you specify in p\_name and with the INTEGER\_VALUE value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

### Parameters

**Table 91–32 NVARRAY\_GET\_INTEGER Function Parameters**

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

### Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

## NVARRAY\_GET\_LONG Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `LONG_VALUE` value type .

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

### Parameters

**Table 91–33 NVARRAY\_GET\_LONG Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## NVARRAY\_GET\_RAW Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `RAW_VALUE` value type .

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

### Parameters

**Table 91–34 NVARRAY\_GET\_RAW Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## NVARRAY\_GET\_SHORT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `SHORT_VALUE` value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

### Parameters

**Table 91–35 NVARRAY\_GET\_SHORT Function Parameters**

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## NVARRAY\_GET\_TEXT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `TEXT_VALUE` value type.

### Syntax

```
DBMS_MGWMSG.NVARRAY_GET_TEXT (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN VARCHAR2;
```

### Parameters

**Table 91–36** *NVARRAY\_GET\_TEXT Function Parameters*

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

### Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

## XML\_TO\_LCR Function

This function converts a `SYS.XMLTYPE` object to a `SYS.ANYDATA` object encapsulating a row LCR (`LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`).

**See Also:** [LCR\\_TO\\_XML Function](#) on page 91-22

### Syntax

```
DBMS_MGWMSG.XML_TO_LCR (  
    p_xmldata IN SYS.XMLTYPE )  
    RETURN SYS.ANYDATA;
```

### Parameters

**Table 91-37 XML\_TO\_LCR Function Parameters**

Parameter	Description
<code>p_xmldata</code>	An <code>XMLTYPE</code> object representing an LCR

### Return Values

Returns a `SYS.ANYDATA` object.

### Usage Notes

An exception is raised if `p_xmldata` cannot be converted to an LCR.

---

---

## DBMS\_MONITOR

The DBMS\_MONITOR package let you use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- [Summary of DBMS\\_MONITOR Subprograms](#)

---

## Summary of DBMS\_MONITOR Subprograms

**Table 92–1 DBMS\_MONITOR Package Subprograms**

Subprogram	Description
<a href="#">CLIENT_ID_STAT_DISABLE Procedure</a> on page 92-3	Disables statistic gathering previously enabled for a given Client Identifier
<a href="#">CLIENT_ID_STAT_ENABLE Procedure</a> on page 92-4	Enables statistic gathering for a given Client Identifier
<a href="#">CLIENT_ID_TRACE_DISABLE Procedure</a> on page 92-5	Disables the trace previously enabled for a given Client Identifier globally for the database
<a href="#">CLIENT_ID_TRACE_ENABLE Procedure</a> on page 92-6	Enables the trace for a given Client Identifier globally for the database
<a href="#">DATABASE_TRACE_DISABLE Procedure</a> on page 92-7	Disables SQL trace for the whole database or a specific instance
<a href="#">DATABASE_TRACE_ENABLE Procedure</a> on page 92-8	Enables SQL trace for the whole database or a specific instance
<a href="#">SERV_MOD_ACT_STAT_DISABLE Procedure</a> on page 92-9	Disables statistic gathering enabled for a given combination of Service Name, MODULE and ACTION
<a href="#">SERV_MOD_ACT_STAT_ENABLE Procedure</a> on page 92-10	Enables statistic gathering for a given combination of Service Name, MODULE and ACTION
<a href="#">SERV_MOD_ACT_TRACE_DISABLE Procedure</a> on page 92-12	Disables the trace for ALL enabled instances for a or a given combination of Service Name, MODULE and ACTION name globally
<a href="#">SERV_MOD_ACT_TRACE_ENABLE Procedure</a> on page 92-13	Enables SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified
<a href="#">SESSION_TRACE_DISABLE Procedure</a> on page 92-15	Disables the previously enabled trace for a given database session identifier (SID) on the local instance
<a href="#">SESSION_TRACE_ENABLE Procedure</a> on page 92-16	Enables the trace for a given database session identifier (SID) on the local instance

## CLIENT\_ID\_STAT\_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V\$CLIENT\_STATS view enabled by the CLIENT\_ID\_STAT\_ENABLE Procedure.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(  
    client_id          IN  VARCHAR2);
```

### Parameters

**Table 92–2** CLIENT\_ID\_STAT\_DISABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is disabled

### Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

## CLIENT\_ID\_STAT\_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier. Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V\$CLIENT\_STATS views.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(  
    client_id          IN  VARCHAR2);
```

### Parameters

**Table 92–3** CLIENT\_ID\_STAT\_ENABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is enabled

### Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

## CLIENT\_ID\_TRACE\_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT\_ID\_TRACE\_ENABLE Procedure.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(  
  client_id  IN  VARCHAR2);
```

### Parameters

**Table 92–4** CLIENT\_ID\_TRACE\_DISABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which SQL tracing is disabled

### Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

## CLIENT\_ID\_TRACE\_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

### Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(
  client_id  IN  VARCHAR2,
  waits     IN  BOOLEAN DEFAULT TRUE,
  binds     IN  BOOLEAN DEFAULT FALSE,
  plan_stat IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 92–5** CLIENT\_ID\_TRACE\_ENABLE Procedure Parameters

Parameter	Description
client_id	Database Session Identifier for which SQL tracing is enabled
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

### Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

### Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,
FALSE);
```

## DATABASE\_TRACE\_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

### Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE(  
    instance_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 92–6** DATABASE\_TRACE\_DISABLE Procedure Parameters

Parameter	Description
instance_name	Disables tracing for the named instance

## DATABASE\_TRACE\_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

### Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE(  
    waits          IN BOOLEAN DEFAULT TRUE,  
    binds          IN BOOLEAN DEFAULT FALSE,  
    instance_name  IN VARCHAR2 DEFAULT NULL,  
    plan_stat      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 92–7 DATABASE\_TRACE\_ENABLE Procedure Parameters**

Parameter	Description
waits	If TRUE, wait information will be present in the trace
binds	If TRUE, bind information will be present in the trace
instance_name	If set, restricts tracing to the named instance
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

## SERV\_MOD\_ACT\_STAT\_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V\$SERV\_MOD\_ACT\_STATS view. Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
  service_name  IN VARCHAR2,
  module_name   IN VARCHAR2,
  action_name   IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

### Parameters

**Table 92-8** *SERV\_MOD\_ACT\_STAT\_DISABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which statistic aggregation is disabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level.

### Usage Notes

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

## SERV\_MOD\_ACT\_STAT\_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION. Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V\$SERV\_MOD\_ACT\_STATS view.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE (
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

### Parameters

**Table 92–9 SERV\_MOD\_ACT\_STAT\_ENABLE Procedure Parameters**

Parameter	Description
service_name	Name of the service for which statistic aggregation is enabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level.

### Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL\_ACTIONS for an action specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

### Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1', 'PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE  
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE('APPS1', 'GLEDGER', 'DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.
- For all actions in the PAYROLL Module.
- For the DEBIT\_ENTRY Action within the GLEDGER Module.

## SERV\_MOD\_ACT\_TRACE\_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
  service_name  IN  VARCHAR2,
  module_name   IN  VARCHAR2,
  action_name   IN  VARCHAR2 DEFAULT ALL_ACTIONS,
  instance_name IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 92–10** *SERV\_MOD\_ACT\_TRACE\_DISABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which tracing is disabled.
module_name	Name of the MODULE. An additional qualifier for the service
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name.
instance_name	If set, this restricts tracing to the named instance_name

### Usage Notes

Specifying NULL for the module\_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

### Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
  DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
  FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
  DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1', 'PAYROLL');
```

## SERV\_MOD\_ACT\_TRACE\_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance\_name is specified.

### Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
  service_name    IN VARCHAR2,
  module_name     IN VARCHAR2 DEFAULT ANY_MODULE,
  action_name     IN VARCHAR2 DEFAULT ANY_ACTION,
  waits          IN BOOLEAN DEFAULT TRUE,
  binds           IN BOOLEAN DEFAULT FALSE,
  instance_name  IN VARCHAR2 DEFAULT NULL,
  plan_stat      IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 92–11** *SERV\_MOD\_ACT\_TRACE\_ENABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which SQL trace is enabled
module_name	Name of the MODULE for which SQL trace is enabled. An optional additional qualifier for the service. If omitted, SQL trace is enabled for all modules and actions in a given service.
action_name	Name of the ACTION for which SQL trace is enabled. An optional additional qualifier for the Service and MODULE name. If omitted, SQL trace is enabled for all actions in a given module.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
instance_name	If set, this restricts tracing to the named instance_name
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

### Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONS. Using the ALL\_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The instance\_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.

- Specifying `NULL` for the `module_name` parameter means that statistics will be accumulated for the sessions which do not set the `MODULE` attribute.

## Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
        DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
        FALSE, NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
        DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

## SESSION\_TRACE\_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

### Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
  session_id      IN      BINARY_INTEGER DEFAULT NULL,
  serial_num      IN      BINARY_INTEGER DEFAULT NULL);
```

### Parameters

**Table 92–12** *SESSION\_TRACE\_DISABLE Procedure Parameters*

Parameter	Description
session_id	Database Session Identifier for which SQL trace is disabled
serial_num	Serial number for this session

### Usage Notes

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is no longer traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is no longer traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

### Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

## SESSION\_TRACE\_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

### Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE (
  session_id  IN  BINARY_INTEGER DEFAULT NULL,
  serial_num  IN  BINARY_INTEGER DEFAULT NULL,
  waits       IN  BOOLEAN DEFAULT TRUE,
  binds       IN  BOOLEAN DEFAULT FALSE,
  plan_stat   IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 92–13** SESSION\_TRACE\_ENABLE Procedure Parameters

Parameter	Description
session_id	Client Identifier for which SQL trace is enabled. If omitted (or NULL), the user's own session is assumed.
serial_num	Serial number for this session. If omitted (or NULL), only the session ID is used to determine a session.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

### Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

### Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

---

---

## DBMS\_MVIEW

DBMS\_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

---

---

**Note:** DBMS\_MVIEW is a synonym for DBMS\_SNAPSHOT.

---

---

**See Also:**

- *Oracle Database Advanced Replication* for more information about using materialized views in a replication environment
- *Oracle Database Data Warehousing Guide* for more information about using materialized views in a data warehousing environment

This chapter contains the following topics:

- [Using DBMS\\_MVIEW](#)
  - Operational Notes
  - Security Model
  - Rules and Limits
- [Summary of DBMS\\_MVIEW Subprograms](#)

## Using DBMS\_MVIEW

This section contains topics which relate to using the DBMS\_MVIEW package.

- [Operational Notes](#)
- [Security Model](#)
- [Rules and Limits](#)

## Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL\*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN . . END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

## Security Model

The `DBMS_MVIEW` package consists of a number of materialized view-related subprograms, each of which has different functionality and privilege requirements. The privilege model is generally based on the invoker's right. Each package subprogram is executed by first checking the privileges against the invoker. If all the required privileges are met, the subprogram will be executed. Otherwise, an insufficient privileges error will be thrown.

## Rules and Limits

The `EXPLAIN_REWRITE` procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the `EXPLAIN_MVIEW` procedure.

---

## Summary of DBMS\_MVIEW Subprograms

**Table 93–1 DBMS\_MVIEW Package Subprograms**

Subprogram	Description
<a href="#">BEGIN_TABLE_REORGANIZATION Procedure</a> on page 93-7	Performs a process to preserve materialized view data needed for refresh
<a href="#">END_TABLE_REORGANIZATION Procedure</a> on page 93-8	Ensures that the materialized view data for the master table is valid and that the master table is in the proper state
<a href="#">ESTIMATE_MVIEW_SIZE Procedure</a> on page 93-9	Estimates the size of a materialized view that you might create, in bytes and rows
<a href="#">EXPLAIN_MVIEW Procedure</a> on page 93-10	Explains what is possible with a materialized view or potential materialized view
<a href="#">EXPLAIN_REWRITE Procedure</a> on page 93-11	Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views
<a href="#">I_AM_A_REFRESH Function</a> on page 93-13	Returns the value of the I_AM_REFRESH package state
<a href="#">PMARKER Function</a> on page 93-14	Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)
<a href="#">PURGE_DIRECT_LOAD_LOG Procedure</a> on page 93-15	Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)
<a href="#">PURGE_LOG Procedure</a> on page 93-16	Purges rows from the materialized view log
<a href="#">PURGE_MVIEW_FROM_LOG Procedure</a> on page 93-17	Purges rows from the materialized view log
<a href="#">REFRESH Procedures</a> on page 93-18	Refreshes one or more materialized views that are not members of the same refresh group
<a href="#">REFRESH_ALL_MVIEWS Procedure</a> on page 93-20	Refreshes all materialized views that do not reflect changes to their master table or master materialized view
<a href="#">REFRESH_DEPENDENT Procedures</a> on page 93-21	Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views
<a href="#">REGISTER_MVIEW Procedure</a> on page 93-23	Enables the administration of individual materialized views
<a href="#">UNREGISTER_MVIEW Procedure</a> on page 93-25	Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view

## BEGIN\_TABLE\_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

### Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (  
  tabowner    IN   VARCHAR2,  
  tabname     IN   VARCHAR2);
```

### Parameters

**Table 93–2** *BEGIN\_TABLE\_REORGANIZATION Procedure Parameters*

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

## END\_TABLE\_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

### Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (  
    tabowner    IN    VARCHAR2,  
    tabname     IN    VARCHAR2);
```

### Parameters

**Table 93–3** *END\_TABLE\_REORGANIZATION Procedure Parameters*

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

## ESTIMATE\_MVIEW\_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

### Syntax

```
DBMS_MVIEW. ESTIMATE_MVIEW_SIZE (
  stmt_id      IN  VARCHAR2,
  select_clause IN  VARCHAR2,
  num_rows     OUT NUMBER,
  num_bytes    OUT NUMBER);
```

### Parameters

**Table 93–4** ESTIMATE\_MVIEW\_SIZE Procedure Parameters

Parameter	Description
stmt_id	Arbitrary string used to identify the statement in an EXPLAIN PLAN
select_clause	The SELECT statement to be analyzed
num_rows	Estimated cardinality
num_bytes	Estimated number of bytes

## EXPLAIN\_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call `DBMS_MVIEW.EXPLAIN_MVIEW`, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the `SELECT` string or `CREATE MATERIALIZED VIEW` statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called `MV_CAPABILITIES_TABLE`, which is the default, or to an array called `MSG_ARRAY`.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to `MV_CAPABILITIES_TABLE`.
- The second version is for explaining an existing or potential materialized view with output to a `VARRAY`.

### Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
  mv          IN VARCHAR2,
  statement_id IN VARCHAR2:= NULL);
```

```
DBMS_MVIEW.EXPLAIN_MVIEW (
  mv          IN VARCHAR2,
  msg_array   OUT SYS.ExplainMVArrayType);
```

### Parameters

**Table 93–5** *EXPLAIN\_MVIEW Procedure Parameters*

Parameter	Description
<code>mv</code>	The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a <code>SELECT</code> statement or a <code>CREATE MATERIALIZED VIEW</code> statement for a potential materialized view.
<code>statement_id</code>	A client-supplied unique identifier to associate output rows with specific invocations of <code>EXPLAIN_MVIEW</code>
<code>msg_array</code>	The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_MVIEW</code> 's output to a PL/SQL <code>VARRAY</code> rather than <code>MV_CAPABILITIES_TABLE</code> .

### Usage Notes

You must run the `utlxmlv.sql` script to create `MV_CAPABILITIES_TABLE` in the current schema prior to calling `EXPLAIN_MVIEW` except when you direct output to a `VARRAY`. The script is found in the `ADMIN` directory.

## EXPLAIN\_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used. Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the `EXPLAIN_REWRITE` statement is never actually executed.

A demo file, `xrwutl.sql`, is available to help format the output from `EXPLAIN_REWRITE`.

### Syntax

You can obtain the output from `DBMS_MVIEW.EXPLAIN_REWRITE` in two ways. The first is to use a table, while the second is to create a `VARRAY`. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
  query          VARCHAR2,
  mv             VARCHAR2(30),
  statement_id   VARCHAR2(30));
```

You can create an output table called `REWRITE_TABLE` by executing the `utl_xrw.sql` script.

The `query` parameter is a text string representing the SQL query. The parameter, `mv`, is a fully qualified materialized view name in the form of `schema.mv`. This is an optional parameter. When it is not specified, `EXPLAIN_REWRITE` returns any relevant messages regarding all the materialized views considered for rewriting the given query. When `schema` is omitted and only `mv` is specified, `EXPLAIN_REWRITE` looks for the materialized view in the current schema.

If you want to direct the output of `EXPLAIN_REWRITE` to a `VARRAY` instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
  query          [VARCHAR2 | CLOB],
  mv             VARCHAR2(30),
  output_array   SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, `EXPLAIN_REWRITE` can be easily invoked with the `EXECUTE` command from `SQL*Plus`. Otherwise, the recommended method is to use a `PL/SQL BEGIN . . . END` block, as shown in the examples in `/rdbms/demo/smxrw*`.

You can also use `EXPLAIN_REWRITE` with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views `mv1`, `mv2`, and `mv3` could be used to rewrite the query, `query_txt`, and, if not, why not, use `EXPLAIN_REWRITE` as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the `EXPLAIN_REWRITE` procedure.

## Parameters

**Table 93–6** *EXPLAIN\_REWRITE Procedure Parameters*

Parameter	Description
<code>query</code>	SQL <code>SELECT</code> statement to be explained
<code>mv</code>	The fully qualified name of an existing materialized view in the form of <code>SCHEMA.MV</code> . For multiple materialized views, you can provide a comma-delimited list of names.
<code>statement_id</code>	A client-supplied unique identifier to distinguish output messages
<code>msg_array</code>	The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_REWRITE</code> 's output to a PL/SQL <code>VARRAY</code> .

## Usage Notes

To obtain the output into a table, you must run the `utl_xrw.sql` script before calling `EXPLAIN_REWRITE`. This script creates a table named `REWRITE_TABLE` in the current schema.

## I\_AM\_A\_REFRESH Function

This function returns the value of the I\_AM\_REFRESH package state.

### Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH  
RETURN BOOLEAN;
```

### Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

## PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

### Syntax

```
DBMS_MVIEW.PMARKER(  
    rid IN ROWID)  
RETURN NUMBER;
```

### Parameters

**Table 93–7** *PMARKER Function Parameters*

Parameter	Description
<code>rid</code>	The rowid of a row entry in a master table

## PURGE\_DIRECT\_LOAD\_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

**See Also:** *Oracle Database Data Warehousing Guide* for more information

### Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG ( ) ;
```

## PURGE\_LOG Procedure

This procedure purges rows from the materialized view log.

### Syntax

```
DBMS_MVIEW.PURGE_LOG (
  master      IN   VARCHAR2,
  num         IN   BINARY_INTEGER := 1,
  flag        IN   VARCHAR2      := 'NOP');
```

### Parameters

**Table 93–8** *PURGE\_LOG Procedure Parameters*

Parameter	Description
<code>master</code>	Name of the master table or master materialized view.
<code>num</code>	<p>Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 2);</pre> <p>To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 9999);</pre> <p>This statement completely purges the materialized view log that corresponds to <code>master_table</code> if fewer than 9999 materialized views are based on <code>master_table</code>. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.</p>
<code>flag</code>	<p>Specify <code>delete</code> to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter <code>num</code>. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 1, 'delete');</pre>

## PURGE\_MVIEW\_FROM\_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by its `mview_id` or the combination of the `mviewowner`, `mviewname`, and the `mviewsite`. If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

### Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
  mview_id      IN  BINARY_INTEGER |
  mviewowner    IN  VARCHAR2,
  mviewname     IN  VARCHAR2,
  mviewsite     IN  VARCHAR2);
```

---

**Note:** This procedure is overloaded. The `mview_id` parameter is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

---

### Parameters

**Table 93–9** *PURGE\_MVIEW\_FROM\_LOG Procedure Parameters*

Parameter	Description
<code>mview_id</code>	<p>If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the <code>mview_id</code> parameter. Query the <code>DBA_BASE_TABLE_MVIEWS</code> view at the materialized view log site for a listing of materialized view IDs.</p> <p>Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (<code>DBA_REGISTERED_MVIEWS</code>).</p>
<code>mviewowner</code>	<p>If you do not specify an <code>mview_id</code>, enter the owner of the target materialized view using the <code>mviewowner</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view owners.</p>
<code>mviewname</code>	<p>If you do not specify an <code>mview_id</code>, enter the name of the target materialized view using the <code>mviewname</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view names.</p>
<code>mviewsite</code>	<p>If you do not specify an <code>mview_id</code>, enter the site of the target materialized view using the <code>mviewsite</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view sites.</p>

### Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

## REFRESH Procedures

This procedure refreshes a list of materialized views.

### Syntax

```
DBMS_MVIEW.REFRESH (
  { list          IN      VARCHAR2,
    | tab         IN      DBMS_UTILITY.UNCL_ARRAY, }
  method         IN      VARCHAR2      := NULL,
  rollback_seg   IN      VARCHAR2      := NULL,
  push_deferred_rpc IN    BOOLEAN      := true,
  refresh_after_errors IN    BOOLEAN    := false,
  purge_option   IN      BINARY_INTEGER := 1,
  parallelism    IN      BINARY_INTEGER := 0,
  heap_size      IN      BINARY_INTEGER := 0,
  atomic_refresh IN      BOOLEAN      := true,
  nested         IN      BOOLEAN      := false);
```

---

**Note:** This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

---

### Parameters

**Table 93–10 REFRESH Procedure Parameters**

Parameter	Description
<code>list   tab</code>	<p>Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database.</p> <p>Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view.</p>
<code>method</code>	<p>A string of refresh methods indicating how to refresh the listed materialized views. An <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following EXECUTE statement within SQL*Plus:</p> <pre>DBMS_MVIEW.REFRESH   ('countries_mv,regions_mv,hr.employees_mv','cf');</pre> <p>This statement performs a complete refresh of the <code>countries_mv</code> materialized view, a fast refresh of the <code>regions_mv</code> materialized view, and a default refresh of the <code>hr.employees</code> materialized view.</p>
<code>rollback_seg</code>	<p>Name of the materialized view site rollback segment to use while refreshing materialized views</p>

**Table 93–10 (Cont.) REFRESH Procedure Parameters**

Parameter	Description
push_deferred_rpc	Used by updatable materialized views only. Set this parameter to <code>true</code> if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.
refresh_after_errors	If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
purge_option	If you are using the parallel propagation mechanism (in other words, <code>parallelism</code> is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set <code>purge</code> to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute <code>PUSH</code> with this parameter set to 2 to reduce the queue.
parallelism	0 specifies serial propagation. $n > 1$ specifies parallel propagation with $n$ parallel processes. 1 specifies parallel propagation using only one parallel process.
heap_size	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.  Note: Do not set this parameter unless directed to do so by Oracle Support Services.
atomic_refresh	If this parameter is set to <code>true</code> , then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.  If this parameter is set to <code>false</code> , then each of the materialized views is refreshed in a separate transaction.  As part of complete refresh, if <code>truncate</code> is used (non-atomic refresh), unique index rebuild is executed. <code>INDEX REBUILD</code> automatically computes statistics. Thus, statistics are updated for truncated tables.
nested	If <code>true</code> , then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

## REFRESH\_ALL\_MVIEWS Procedure

This procedure refreshes all materialized views that have the following properties:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view `DBA_MVIEWS`.

This procedure is intended for use with data warehouses.

### Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
  number_of_failures    OUT  BINARY_INTEGER,
  method                IN   VARCHAR2         := NULL,
  rollback_seg         IN   VARCHAR2         := NULL,
  refresh_after_errors IN   BOOLEAN          := false,
  atomic_refresh       IN   BOOLEAN          := true);
```

### Parameters

**Table 93–11 REFRESH\_ALL\_MVIEWS Procedure Parameters**

Parameter	Description
<code>number_of_failures</code>	Returns the number of failures that occurred during processing
<code>method</code>	A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. <code>F</code> or <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
<code>rollback_seg</code>	Name of the materialized view site rollback segment to use while refreshing materialized views
<code>refresh_after_errors</code>	If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
<code>atomic_refresh</code>	If this parameter is set to <code>true</code> , then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.  If this parameter is set to <code>false</code> , then each of the refreshed materialized views is refreshed in a separate transaction.

## REFRESH\_DEPENDENT Procedures

This procedure refreshes all materialized views that have the following properties:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA\_MVIEWS.

This procedure is intended for use with data warehouses.

### Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
  number_of_failures  OUT  BINARY_INTEGER,
  { list              IN   VARCHAR2,
    | tab             IN   DBMS_UTILITY.UNCL_ARRAY, }
  method              IN   VARCHAR2      := NULL,
  rollback_seg        IN   VARCHAR2      := NULL,
  refresh_after_errors IN   BOOLEAN       := false,
  atomic_refresh      IN   BOOLEAN       := true,
  nested              IN   BOOLEAN       := false);
```

---

**Note:** This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

---

### Parameters

**Table 93–12** REFRESH\_DEPENDENT Procedure Parameters

Parameter	Description
<code>number_of_failures</code>	Returns the number of failures that occurred during processing
<code>list</code>   <code>tab</code>	Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database.  Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a table.

**Table 93–12 (Cont.) REFRESH\_DEPENDENT Procedure Parameters**

Parameter	Description
method	<p>A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus:</p> <pre>DBMS_MVIEW.REFRESH_DEPENDENT   ('employees,departments,hr.regions','cf');</pre> <p>performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table.</p>
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	<p>If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.</p> <p>If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.</p>
nested	If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

## REGISTER\_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

### Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
  mviewowner  IN  VARCHAR2,
  mviewname   IN  VARCHAR2,
  mviewsite   IN  VARCHAR2,
  mview_id    IN  DATE | BINARY_INTEGER,
  flag        IN  BINARY_INTEGER,
  qry_txt     IN  VARCHAR2,
  rep_type    IN  BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

### Parameters

**Table 93–13 REGISTER\_MVIEW Procedure Parameters**

Parameter	Description
mviewowner	Owner of the materialized view.
mviewname	Name of the materialized view.
mviewsite	Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.
mview_id	The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.
flag	A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter: DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view.
qry_txt	The first 32,000 bytes of the materialized view definition query.

**Table 93–13 (Cont.) REGISTER\_MVIEW Procedure Parameters**

Parameter	Description
rep_type	<p>Version of the materialized view. Valid constants that can be assigned include the following:</p> <p>DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site</p> <ul style="list-style-type: none"> <li>■ DBMS_MVIEW.REG_V8_SNAPSHOT</li> </ul> <p>if the materialized view is at an Oracle database version 8.x or higher site</p> <p>DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site</p>

## Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER\_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview\_id, flag, and qry\_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry\_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview\_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

## UNREGISTER\_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

### Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (  
    mviewowner      IN  VARCHAR2,  
    mviewname       IN  VARCHAR2,  
    mviewsite       IN  VARCHAR2);
```

### Parameters

**Table 93–14 UNREGISTER\_MVIEW Procedure Parameters**

Parameters	Description
mviewowner	Owner of the materialized view
mviewname	Name of the materialized view
mviewsite	Name of the materialized view site

## DBMS\_NETWORK\_ACL\_ADMIN

The DBMS\_NETWORK\_ACL\_ADMIN package provides the interface to administer the network Access Control List (ACL).

**See Also:** For more information, see "Managing Fine-grained Access to External Network Services" in Oracle Database Security Guide

The chapter contains the following topics:

- [Using DBMS\\_NETWORK\\_ACL\\_ADMIN](#)
  - Examples
- [Summary of DBMS\\_NETWORK\\_ACL\\_ADMIN Subprograms](#)

---

## Using DBMS\_NETWORK\_ACL\_ADMIN

- [Examples](#)

## Examples

### Example 1

Grant the connect and resolve privileges for host www.us.oracle.com to SCOTT.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(acl          => 'www.xml',
                                     description => 'WWW ACL',
                                     principal   => 'SCOTT',
                                     is_grant    => true,
                                     privilege   => 'connect');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(acl          => 'www.xml',
                                       principal   => 'SCOTT',
                                       is_grant    => true,
                                       privilege   => 'resolve');

  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(acl => 'www.xml',
                                   host => 'www.us.oracle.com');

END;
/
COMMIT;
```

### Example 2

Grant the resolve privilege for www.us.oracle.com to ADAMS. Since an ACL for www.us.oracle.com exists already, just add the privilege for ADAMS.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(acl          => 'www.xml',
                                       principal   => 'ADAMS',
                                       is_grant    => true,
                                       privilege   => 'resolve');

END;
/
COMMIT;
```

### Example 3

Assign the ACL www.xml to www-proxy.us.oracle.com so that SCOTT and ADAMS can access www-proxy.us.oracle.com also.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(acl => 'www.xml',
                                   host => 'www-proxy.us.oracle.com');

END;
/
COMMIT;
```

### Example 4

Unassign the ACL from www.us.oracle.com so that no access to www.us.oracle.com is allowed.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(host => 'www.us.oracle.com');

END;
/
COMMIT;
```

**Example 5**

The [DOMAINS Function](#) in the DBMS\_NETWORK\_ACL\_UTILILITY package returns all the domains to which a host belongs. It can be used in conjunction with the [CHECK\\_PRIVILEGE\\_ACLID Function](#) in this package to determine the privilege assignments affecting a user's permission to access a network host. The function [DOMAIN\\_LEVEL Function](#) in the DBMS\_NETWORK\_ACL\_UTILILITY package returns the level of each domain and can be used to order the ACL assignments by their precedence.

For example, for SCOTT's permission to connect to www.us.oracle.com:

```
SELECT host, lower_port, upper_port, acl,
       DECODE(
          DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
          1, 'GRANTED', 0, 'DENIED', NULL) privilege
FROM dba_network_acls
WHERE host IN
      (SELECT * FROM
       TABLE(DBMS_NETWORK_ACL_UTILILITY.DOMAINS('www.us.oracle.com')))
ORDER BY DBMS_NETWORK_ACL_UTILILITY.DOMAIN_LEVEL(host) desc, lower_port,
         upper_port;
```

HOST	LOWER_PORT	UPPER_PORT	ACL	PRIVILEGE
www.us.oracle.com	80	80	/sys/acls/www.xml	GRANTED
www.us.oracle.com	3000	3999	/sys/acls/www.xml	GRANTED
www.us.oracle.com			/sys/acls/www.xml	GRANTED
*.oracle.com			/sys/acls/all.xml	
*			/sys/acls/all.xml	

**Example 6**

For example, for SCOTT's permission to do domain name resolution for www.us.oracle.com:

```
SELECT host, acl,
       DECODE(
          DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
          1, 'GRANTED', 0, 'DENIED', NULL) privilege
FROM dba_network_acls
WHERE host IN
      (SELECT * FROM
       TABLE(DBMS_NETWORK_ACL_UTILILITY.DOMAINS('www.us.oracle.com'))) and
      lower_port IS NULL AND upper_port IS NULL
ORDER BY DBMS_NETWORK_ACL_UTILILITY.DOMAIN_LEVEL(host) desc;
```

HOST	ACL	PRIVILEGE
www.us.oracle.com	/sys/acls/www.xml	GRANTED
*.oracle.com	/sys/acls/all.xml	
*	/sys/acls/all.xml	

Note that the 'resolve' privilege takes effect only in ACLs assigned without any port range (when lower\_port and upper\_port are NULL). For this reason, the example does not include lower\_port and upper\_port columns in the query.

---

## Summary of DBMS\_NETWORK\_ACL\_ADMIN Subprograms

**Table 94–1 DBMS\_NETWORK\_ACL\_ADMIN Package Subprograms**

Subprogram	Description
<a href="#">ADD_PRIVILEGE Procedure</a> on page 94-6	Adds a privilege to grant or deny the network access to the user in an access control list (ACL)
<a href="#">ASSIGN_ACL Procedure</a> on page 94-8	Assigns an access control list (ACL) to a network host, and optionally specific to a TCP port range
<a href="#">ASSIGN_WALLET_ACL Procedure</a> on page 94-10	Assigns an access control list (ACL) to a wallet
<a href="#">CHECK_PRIVILEGE Function</a> on page 94-11	Checks if a privilege is granted to or denied from the user in an access control list (ACL)
<a href="#">CHECK_PRIVILEGE_ACLID Function</a> on page 94-12	Checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list
<a href="#">CREATE_ACL Procedure</a> on page 94-13	Creates an access control list (ACL) with an initial privilege setting
<a href="#">DELETE_PRIVILEGE Procedure</a> on page 94-14	Deletes a privilege in an access control list (ACL)
<a href="#">DROP_ACL Procedure</a> on page 94-15	Drops an access control list (ACL)
<a href="#">UNASSIGN_ACL Procedure</a> on page 94-16	Unassigns the access control list (ACL) currently assigned to a network host
<a href="#">UNASSIGN_WALLET_ACL Procedure</a> on page 94-17	Unassigns the access control list (ACL) currently assigned to a wallet

## ADD\_PRIVILEGE Procedure

This procedure adds a privilege to grant or deny the network access to the user. The access control entry (ACE) is created if it does not exist.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
  acl          IN VARCHAR2,
  principal    IN VARCHAR2,
  is_grant     IN BOOLEAN,
  privilege    IN VARCHAR2,
  position     IN PLS_INTEGER DEFAULT NULL,
  start_date   IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL,
  end_date     IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL );
```

### Parameters

**Table 94–2 ADD\_PRIVILEGE Function Parameters**

Parameter	Description
<code>acl</code>	Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code>
<code>principal</code>	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
<code>is_grant</code>	Network privilege to be granted or denied - <code>'connect   resolve'</code> (case sensitive). A database user needs the <code>connect</code> privilege to an external network host computer if he or she is connecting using the <code>UTL_TCP</code> , <code>UTL_HTTP</code> , <code>UTL_SMTP</code> , and <code>UTL_MAIL</code> utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the <code>UTL_INADDR</code> package, grant the database user the <code>resolve</code> privilege.
<code>privilege</code>	Network privilege to be granted or denied
<code>position</code>	Position (1-based) of the ACE. If a non-NULL value is given, the privilege will be added in a new ACE at the given position and there should not be another ACE for the principal with the same <code>is_grant</code> (grant or deny). If a NULL value is given, the privilege will be added to the ACE matching the principal and the <code>is_grant</code> if one exists, or to the end of the ACL if the matching ACE does not exist.
<code>start_date</code>	Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date. The <code>start_date</code> will be ignored if the privilege is added to an existing ACE.
<code>end_date</code>	End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The <code>end_date</code> must be greater than or equal to the <code>start_date</code> . The <code>end_date</code> will be ignored if the privilege is added to an existing ACE.

### Usage Notes

To remove the permission, use the [DELETE\\_PRIVILEGE Procedure](#).

### Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
```

```
acl          => 'us-oracle-com-permissions.xml',  
principal   => 'ST_USERS',  
is_grant    => TRUE,  
privilege   => 'connect')  
END;
```

## ASSIGN\_ACL Procedure

This procedure assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (
    acl          IN VARCHAR2,
    host         IN VARCHAR2,
    lower_port   IN PLS_INTEGER DEFAULT NULL,
    upper_port   IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 94–3** *ASSIGN\_ACL Function Parameters*

Parameter	Description
acl	Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> .
host	Host to which the ACL is to be assigned. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive.
lower_port	Lower bound of a TCP port range if not NULL
upper_port	Upper bound of a TCP port range. If NULL, lower_port is assumed.

### Usage Notes

- Only one ACL can be assigned to any host computer, domain, or IP subnet, and if specified, the TCP port range. When you assign a new access control list to a network target, Oracle Database unassigns the previous access control list that was assigned to the same target. However, Oracle Database does not drop the access control list. You can drop the access control list by using the [DROP\\_ACL Procedure](#). To remove an access control list assignment, use the [UNASSIGN\\_ACL Procedure](#).
- The ACL assigned to a domain takes a lower precedence than the other ACLs assigned sub-domains, which take a lower precedence than the ACLs assigned to the individual hosts. So for a given host, for example, "www.us.oracle.com", the following domains are listed in decreasing precedences:
  - www.us.oracle.com
  - \*.us.oracle.com
  - \*.oracle.com
  - \*.com
  - \*

In the same way, the ACL assigned to an subnet takes a lower precedence than the other ACLs assigned smaller subnets, which take a lower precedence than the ACLs assigned to the individual IP addresses. So for a given IP address, for example, "192.168.0.100", the following subnets are listed in decreasing precedences:

- 192.168.0.100
- 192.168.0.\*
- 192.168.\*
- 192.\*
- \*

- The port range is applicable only to the "connect" privilege assignments in the ACL. The "resolve" privilege assignments in an ACL have effects only when the ACL is assigned to a host without a port range.

For the "connect" privilege assignments, an ACL assigned to the host without a port range takes a lower precedence than other ACLs assigned to the same host with a port range.

- When specifying a TCP port range, both `lower_port` and `upper_port` must not be NULL and `upper_port` must be greater than or equal to `lower_port`. The port range must not overlap with any other port ranges for the same host assigned already.
- To remove the assignment, use [UNASSIGN\\_ACL Procedure](#).

## Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(
    acl      => 'us-oracle-com-permissions.xml',
    host     => '*.us.oracle.com',
    lower_port => 80);
END;
```

## ASSIGN\_WALLET\_ACL Procedure

This procedure assigns an access control list (ACL) to a wallet.

### Syntax

```
UTL_HTTP.ASSIGN_WALLET_ACL (
    acl          IN  VARCHAR2,
    wallet_path  IN  VARCHAR2);
```

### Parameters

**Table 94–4** *ASSIGN\_WALLET\_ACL Procedure Parameters*

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls"
wallet_path	Directory path of the wallet to which the ACL is to be assigned. The path is case-sensitive and of the format <i>file:directory-path</i> .

### Usage Notes

To remove the assignment, use the [UNASSIGN\\_WALLET\\_ACL Procedure](#).

### Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl          => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-client-certificates');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl          => 'wallet-acl.xml',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-passwords');

  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_ACL(
    acl          => 'wallet-acl.xml',
    wallet_path => 'file:/oracle/wallets/test_wallet');
END;
```

## CHECK\_PRIVILEGE Function

This function checks if a privilege is granted to or denied from the user in an ACL.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (
  acl          IN VARCHAR2,
  user         IN VARCHAR2,
  privilege    IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 94–5** CHECK\_PRIVILEGE Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
user	User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view.
privilege	Network privilege to check

### Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

### Examples

```
SELECT DECODE(
  DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE(
    'us-oracle-com-permissions.xml', 'SCOTT', 'resolve'),
  1, 'GRANTED', 0, 'DENIED', NULL) PRIVILEGE
FROM DUAL;
```

## CHECK\_PRIVILEGE\_ACLID Function

This function checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID (  
    aclid          IN RAW,  
    user           IN VARCHAR2 DEFAULT NULL)  
    privilege      IN VARCHAR2,  
    RETURN NUMBER;
```

### Parameters

**Table 94–6** CHECK\_PRIVILEGE\_ACLID Function Parameters

Parameter	Description
aclid	Object ID of the ACL
user	User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view.
privilege	Network privilege to check

### Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

## CREATE\_ACL Procedure

This procedure creates an access control list (ACL) with an initial privilege setting. An ACL must have at least one privilege setting. The ACL has no access control effect unless it is assigned to the network target.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.CREATE_ACL (
  acl           IN VARCHAR2,
  description   IN VARCHAR2,
  principal     IN VARCHAR2,
  is_grant      IN BOOLEAN,
  privilege     IN VARCHAR2,
  start_date    IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
  end_date      IN TIMESTAMP WITH TIMEZONE DEFAULT NULL );
```

### Parameters

**Table 94–7 CREATE\_ACL Procedure Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
description	Description attribute in the ACL
principal	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
is_grant	Privilege is granted or not (denied)
privilege	Network privilege to be granted or denied - 'connect   resolve' (case sensitive). A database user needs the connect privilege to an external network host computer if he or she is connecting using the UTL_TCP, UTL_HTTP, UTL_SMTP, and UTL_MAIL utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the UTL_INADDR package, grant the database user the resolve privilege.
start_date	Start date of the access control entry (ACE). When specified, the ACE is valid only on and after the specified date.
end_date	End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The end_date must be greater than or equal to the start_date.

### Usage Notes

To drop the access control list, use the [DROP\\_ACL Procedure](#).

### Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl           => 'us-oracle-com-permissions.xml',
    description   => 'Network permissions for *.us.oracle.com',
    principal     => 'SCOTT',
    is_grant      => TRUE,
    privilege     => 'connect');
END;
```

## DELETE\_PRIVILEGE Procedure

This procedure deletes a privilege in an access control list.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (  
    acl          IN VARCHAR2,  
    principal    IN VARCHAR2,  
    is_grant     IN BOOLEAN DEFAULT NULL,  
    privilege    IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 94–8** *DELETE\_PRIVILEGE Function Parameters*

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
principal	Principal (database user or role) for whom all the ACE will be deleted
is_grant	Privilege is granted or not (denied). If a NULL value is given, the deletion is applicable to both granted or denied privileges.
privilege	Network privilege to be deleted. If a NULL value is given, the deletion is applicable to all privileges.

### Examples

```
BEGIN  
    DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (  
        acl          => 'us-oracle-com-permissions.xml',  
        principal    => 'ST_USERS')  
END;
```

## DROP\_ACL Procedure

This procedure drops an access control list (ACL).

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.DROP_ACL (
    acl          IN VARCHAR2);
```

### Parameters

**Table 94–9** *DROP\_ACL Procedure Parameters*

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".

### Examples

```
BEGIN
    DBMS_NETWORK_ACL_ADMIN.DROP_ACL(
        acl => 'us-oracle-com-permissions.xml');
END;
```

## UNASSIGN\_ACL Procedure

This procedure unassigns the access control list (ACL) currently assigned to a network host.

### Syntax

```
DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL (
  acl          IN VARCHAR2 DEFAULT NULL,
  host         IN VARCHAR2 DEFAULT NULL,
  lower_port   IN PLS_INTEGER DEFAULT NULL,
  upper_port   IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 94–10 UNASSIGN\_ACL Function Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls". If ACL is NULL, any ACL assigned to the host is unassigned.
host	Host from which the ACL is to be removed. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. If host is NULL, the ACL will be unassigned from any host. If both host and acl are NULL, all ACLs assigned to any hosts are unassigned.
lower_port	Lower bound of a TCP port range if not NULL
upper_port	Upper bound of a TCP port range. If NULL, lower_port is assumed.

### Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(
    host         => '*.us.oracle.com',
    lower_port   => 80);
END;
```

## UNASSIGN\_WALLET\_ACL Procedure

This procedure unassigns the access control list (ACL) currently assigned to a wallet.

### Syntax

```
UTL_HTTP.UNASSIGN_WALLET_ACL (
  acl          IN  VARCHAR2 DEFAULT NULL,
  wallet_path  IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 94–11 UNASSIGN\_WALLET\_ACL Procedure Parameters**

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls". If acl is NULL, any ACL assigned to the wallet is unassigned.
wallet_path	Directory path of the wallet to which the ACL is assigned. The path is case-sensitive and of the format <i>file:directory-path</i> . If both acl and wallet_path are NULL, all ACLs assigned to any wallets are unassigned.

### Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_WALLET_ACL(
    acl          => 'wallet-acl.xml',
    wallet_path => 'file:/oracle/wallets/test_wallet');
END;
```

---

## DBMS\_NETWORK\_ACL\_UTILITY

The `DBMS_NETWORK_ACL_UTILITY` package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.

**See Also:** For more information, see ""Managing Fine-grained Access to External Network Services"" in *Oracle Database Security Guide*

The chapter contains the following topics:

- [Using DBMS\\_NETWORK\\_ACL\\_UTILITY](#)
  - Examples
- [Summary of DBMS\\_NETWORK\\_ACL\\_UTILITY Subprograms](#)

---

## Using DBMS\_NETWORK\_ACL\_UTILITY

- [Examples](#)

## Examples

The [CONTAINS\\_HOST Function](#) in this package indicates if a domain or subnet contains a given host or IP address. It can be used in conjunction with the [CHECK\\_PRIVILEGE\\_ACLID Function](#) in the [DBMS\\_NETWORK\\_ACL\\_ADMIN](#) package to determine the privilege assignments affecting a user's permission to access a network host. The return value of the [CONTAINS\\_HOST Function](#) in can also be used to order the ACL assignments by their precedence.

### Example 1

For example, for SCOTT's permission to connect to www.hr.example.com:

```
SELECT host, lower_port, upper_port, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
         1, 'GRANTED', 0, 'DENIED', NULL) privilege
FROM (SELECT host, acl, aclid, lower_port, upper_port,
            DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
            precedence
      FROM dba_network_acls)
WHERE precedence > 0
ORDER BY precedence DESC, lower_port nulls LAST;
```

HOST	LOWER_PORT	UPPER_PORT	ACL	PRIVILEGE
www.hr.example.com	80	80	/sys/acls/www.xml	GRANTED
www.hr.example.com	3000	3999	/sys/acls/www.xml	GRANTED
www.hr.example.com			/sys/acls/www.xml	GRANTED
*.hr.example.com			/sys/acls/all.xml	
*.example.com			/sys/acls/all.xml	

### Example 2

For example, for SCOTT's permission to do domain name resolution for www.hr.example.com:

```
SELECT host, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', null) privilege
FROM (SELECT host, acl, aclid,
            DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
            precedence
      FROM dba_network_acls
      WHERE lower_port IS NULL AND upper_port IS NULL)
WHERE precedence > 0
ORDER BY precedence DESC;
```

HOST	ACL	PRIVILEGE
www.hr.example.com	/sys/acls/hr-www.xml	GRANTED
*.hr.example.com	/sys/acls/hr-domain.xml	
*.example.com	/sys/acls/corp-domain.xml	

Note that the "resolve" privilege takes effect only in ACLs assigned without any port range (when `lower_port` and `upper_port` are NULL). For this reason, the example does not include `lower_port` and `upper_port` columns in the query.

## Summary of DBMS\_NETWORK\_ACL\_UTILITY Subprograms

**Table 95–1 DBMS\_NETWORK\_ACL\_UTILITY Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CONTAINS_HOST Function</a> on page 95-5	Determines if the given host is equal to or contained in the given host, domain, or subnet
<a href="#">DOMAIN_LEVEL Function</a> on page 95-6	Returns the domain level of the given host name, domain, or subnet
<a href="#">DOMAINS Function</a> on page 95-7	For a given host, this function returns the domains whose ACL assigned is used to determine if a user has the privilege to access the given host or not.
<a href="#">EQUALS_HOST Function</a> on page 95-8	Determines if the two given hosts, domains, or subnets are equal

## CONTAINS\_HOST Function

This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST (
    host      IN      VARCHAR2,
    domain    IN      VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 95–2 CONTAINS\_HOST Function Parameters**

Parameter	Description
host	Network host
domain	Network host, domain, or subnet

### Return Values

Returns a non-NULL value if the given host is equal to or contained in the related host, domain, or subnet:

- If `domain` is a hostname, returns the level of its domain + 1
- If `domain` is a domain name, returns the domain level
- If `domain` is an IP address or subnet, return the number of significant address bits of the IP address or subnet
- If `domain` is the wildcard "\*", returns 0

The non-NULL value returned indicates the precedence of the domain or subnet for ACL assignment. The higher the value, the higher is the precedence. NULL will be returned if the host is not equal to or contained in the given host, domain or subnet.

### Examples

```
SELECT host, acl, precedence
   FROM (select host, acl,
                DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('192.0.2.3', host)
                precedence
          FROM dba_network_acls)
 WHERE precedence > 0
 ORDER BY precedence DESC;
```

HOST	ACL	PRECEDENCE
192.0.2.3	/sys/acls/hr-www.xml	32
::ffff:192.0.2.0/120	/sys/acls/hr-domain.xml	24
::ffff:192.0.0.0/104	/sys/acls/corp-domain.xml	8

## DOMAIN\_LEVEL Function

This function returns the domain level of the given host name, domain, or subnet.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL (
    host IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 95–3 DOMAIN\_LEVEL Function Parameters**

Parameter	Description
host	Network host, domain, or subnet

### Return Values

The domain level of the given host, domain, or subnet.

### Usage Notes

Note that this function cannot handle IPv6 addresses and subnets, and subnets in CIDR notation.

### Examples

```
SELECT host, acl, domain_level
   FROM (select host, acl,
                DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) domain_level
         FROM dba_network_acls)
 order by domain_level desc;
```

HOST	ACL	DOMAIN_LEVEL
www.hr.example.com	/sys/acls/hr-www.xml	4
*.hr.example.com	/sys/acls/hr-domain.xml	3
*.example.com	/sys/acls/corp-domain.xml	2

## DOMAINS Function

For a given host, this function returns the domains whose ACL assigned determines if a user has the privilege to access the given host or not. When the IP address of the host is given, return the subnets instead.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAINS (
    host IN VARCHAR2)
RETURN DOMAIN_TABLE PIPELINED;
```

### Parameters

**Table 95–4** *DOMAINS Function Parameters*

Parameter	Description
host	Network host

### Return Values

The domains or subnets for the given host.

### Usage Notes

Note that this function cannot handle IPv6 addresses. Nor can it generate subnets of arbitrary number of prefix bits for an IPv4 address.

### Examples

```
select * from table(dbms_network_acl_utility.domains('www.hr.example.com'));
```

```
DOMAINS
-----
www.hr.example.com
*.hr.example.com
*.example.com
*.com
*
```

## EQUALS\_HOST Function

This function determines if the two given hosts, domains, or subnets are equal. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4- native address it represents. It does not perform domain name resolution when comparing the two hosts or domains.

### Syntax

```
DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST (
    host1     IN     VARCHAR2,
    host2     IN     VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 95–5** EQUALS\_HOST Function Parameters

Parameter	Description
host1	Network host, domain, or subnet to compare
host2	Network host, domain, or subnet to compare

### Return Values

1 if the two hosts, domains, or subnets are equal. 0 otherwise.

### Examples

```
SELECT host, acl
   FROM dba_network_acls
  WHERE DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST('192.0.2.*', host) = 1;
```

```
HOST          ACL
-----
::ffff:192.0.2.0/120  /sys/acls/hr-domain.xml
```

---

## DBMS\_OBFUSCATION\_TOOLKIT

DBMS\_OBFUSCATION\_TOOLKIT enables an application to encrypt data using either the Data Encryption Standard (DES) or the Triple DES algorithms.

---

---

**Note:** DBMS\_OBFUSCATION\_TOOLKIT is deprecated. DBMS\_CRYPTO is intended to replace the DBMS\_OBFUSCATION\_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. See [Chapter 39, "DBMS\\_CRYPTO"](#) for more information.

## Using DBMS\_OBFUSCATION\_TOOLKIT

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

## Overview

The Data Encryption Standard (DES), also known as the Data Encryption Algorithm (DEA) by the American National Standards Institute (ANSI) and DEA-1 by the International Standards Organization (ISO), has been a worldwide encryption standard for over 20 years. The banking industry has also adopted DES-based standards for transactions between private financial institutions, and between financial institutions and private individuals. DES will eventually be replaced by a new Advanced Encryption Standard (AES).

DES is a symmetric key cipher; that is, the same key is used to encrypt data as well as decrypt data. DES encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm ignores 8 bits of the 64-bit key that is supplied; however, you must supply a 64-bit key to the algorithm.

Triple DES (3DES) is a far stronger cipher than DES; the resulting ciphertext (encrypted data) is much harder to break using an exhaustive search:  $2^{112}$  or  $2^{168}$  attempts instead of  $2^{56}$  attempts. Triple DES is also not as vulnerable to certain types of cryptanalysis as is DES.

## Security Model

Oracle installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed. The package also grants access to the `PUBLIC` role so no explicit grant needs to be done.

## Operational Notes

- [Key Management](#)
- [Storing the Key in the Database](#)
- [Storing the Key in the Operating System](#)
- [User-Supplied Keys](#)

### Key Management

Key management, including both generation and secure storage of cryptographic keys, is one of the most important aspects of encryption. If keys are poorly chosen or stored improperly, then it is far easier for a malefactor to break the encryption. Rather than using an exhaustive key search attack (that is, cycling through all the possible keys in hopes of finding the correct decryption key), cryptanalysts typically seek weaknesses in the choice of keys, or the way in which keys are stored.

Key generation is an important aspect of encryption. Typically, keys are generated automatically through a random-number generator. Provided that the random number generation is cryptographically secure, this can be an acceptable form of key generation. However, if random numbers are not cryptographically secure, but have elements of predictability, the security of the encryption may be easily compromised.

The DBMS\_OBFUSCATION\_TOOLKIT package includes tools for generating random material that can be used for encryption keys, but it does not provide a mechanism for maintaining them. Care must be taken by the application developer to ensure the secure generation and storage of encryption keys used with this package.

Furthermore, the encryption and decryption done by the DBMS\_OBFUSCATION\_TOOLKIT takes place on the server, not the client. If the key is passed over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire. See *Oracle Database Advanced Security Administrator's Guide* for information about configuring and using network encryption for Oracle Net.

Key storage is one of the most important, yet difficult aspects of encryption and one of the hardest to manage properly. To recover data encrypted with a symmetric key, the key must be accessible to the application or user seeking to decrypt data. The key needs to be easy enough to retrieve that users can access encrypted data when they need to without significant performance degradation. The key also needs to be secure enough that it is not easily recoverable by unauthorized users trying to access encrypted data that they are not supposed to see.

The three options available are:

- Store the key in the database
- Store the key in the operating system
- Have the user manage the key

### Storing the Key in the Database

Storing the keys in the database cannot always provide bullet-proof security if you are trying to protect data against the DBA accessing encrypted data (since an all-privileged DBA can access tables containing encryption keys), but it can provide security against the casual snooper, or against someone compromising the database files on the operating system. Furthermore, the security you can obtain by storing keys in the database does not have to be bullet-proof in order to be extremely useful.

For example, suppose you want to encrypt an employee's social security number, one of the columns in table EMP. You could encrypt each employee's SSN using a key which is stored in a separate column in EMP. However, anyone with SELECT access on the EMP table could retrieve the encryption key and decrypt the matching social security number. Alternatively, you could store the encryption keys in another table, and use a package to retrieve the correct key for the encrypted data item, based on a primary key-foreign key relationship between the tables.

You can envelope both the DBMS\_OBFUSCATION\_TOOLKIT package and the procedure to retrieve the encryption keys supplied to the package. Furthermore, the encryption key itself could be transformed in some way (for example, XORed with the foreign key to the EMP table) so that the key itself is not stored in easily recoverable form.

Oracle recommends using the wrap utility of PL/SQL to obfuscate the code within a PL/SQL package itself that does the encryption. That prevents people from breaking the encryption by looking at the PL/SQL code that handles keys, calls encrypting routines, and so on. In other words, use the wrap utility to obfuscate the PL/SQL packages themselves. This scheme is secure enough to prevent users with SELECT access to EMP from reading unencrypted sensitive data, and a DBA from easily retrieving encryption keys and using them to decrypt data in the EMP table. It can be made more secure by changing encryption keys regularly, or having a better key storage algorithm (so the keys themselves are encrypted, for example).

### **Storing the Key in the Operating System**

Storing keys in a flat file in the operating system is another option. You can make callouts from PL/SQL, which you can use to retrieve encryption keys. If you store keys in a file and make callouts to retrieve the keys, the security of your encrypted data is only as secure as the protection of the key file on the operating system. Of course, a user retrieving keys from the operating system would have to be able to either access the Oracle database files (to decrypt encrypted data), or be able to gain access to the table in which the encrypted data is stored as a legitimate user.

### **User-Supplied Keys**

If you ask a user to supply the key, it is crucial that you use network encryption, such as that provided by Oracle Advanced Security, so the key is not passed from client to server in the clear. The user must remember the key, or your data is not recoverable.

---

## Summary of DBMS\_OBFUSCATION Subprograms

**Table 96–1 DBMS\_OBFUSCATION Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DES3DECRYPT Procedures and Functions</a> on page 96-8	Generates the decrypted form of the input data
<a href="#">DES3ENCRYPT Procedures and Functions</a> on page 96-10	Generates the encrypted form of the input data by passing it through the Triple DES encryption algorithm
<a href="#">DES3GETKEY Procedures and Functions</a> on page 96-8	Takes a random value and uses it to generate an encryption key, using Triple DES
<a href="#">DESDECRYPT Procedures and Functions</a> on page 96-13	Generates the decrypted form of the input data
<a href="#">DESENCRYPT Procedures and Functions</a> on page 96-15	Generates the encrypted form of the input data
<a href="#">DESGETKEY Procedures and Functions</a> on page 96-17	Takes a random value and uses it to generate an encryption key
<a href="#">MD5 Procedures and Functions</a> on page 96-18	Generates MD5 hashes of data

## DES3DECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

For a discussion of the initialization vector that you can use with this procedure, see the section, "[DES3ENCRYPT Procedures and Functions](#)" on page 96-10.

### Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input          IN   RAW,
  key            IN   RAW,
  decrypted_data OUT  RAW,
  which         IN   PLS_INTEGER DEFAULT TwoKeyMode
  iv           IN   RAW          DEFAULT NULL);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input_string  IN   VARCHAR2,
  key_string    IN   VARCHAR2,
  decrypted_string OUT VARCHAR2,
  which        IN   PLS_INTEGER DEFAULT TwoKeyMode
  iv_string    IN   VARCHAR2   DEFAULT NULL);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input      IN RAW,
  key       IN RAW,
  which     IN PLS_INTEGER DEFAULT TwoKeyMode
  iv      IN RAW          DEFAULT NULL)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input_string IN VARCHAR2,
  key_string   IN VARCHAR2,
  which       IN PLS_INTEGER DEFAULT TwoKeyMode
  iv_string   IN VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

### Parameters

**Table 96–2** *DES3DECRYPT Parameters for Raw Data*

Parameter	Description
input	Data to be decrypted
key	Decryption key
decrypted_data	Decrypted data
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
iv	Initialization vector
input_string	String to be decrypted
key_string	Decryption key string
decrypted_string	Decrypted string
iv_string	Initialization vector

## Usage Notes

If the input data or key given to the DES3DECRYPT procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DES3DECRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit." ORA-28233 is NOT applicable for the DES3DECRYPT function.

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the WHICH parameter, ORA-28236 "Invalid Triple DES mode" is generated. Only the values 0 (TwoKeyMode) and 1 (ThreeKeyMode) are valid.

## Restrictions

You must supply a single key of either 128 bits for a 2-key implementation (of which only 112 are used), or a single key of 192 bits for a 3-key implementation (of which 168 bits are used). Oracle automatically truncates the supplied key into 56-bit lengths for decryption. This key length is fixed and cannot be altered.

---

---

**Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

---

---

## DES3ENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data by passing it through the Triple DES (3DES) encryption algorithm.

Oracle's implementation of 3DES supports either a 2-key or 3-key implementation, in outer cipher-block-chaining (CBC) mode.

### Syntax

```

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input          IN      RAW,
  key            IN      RAW,
  encrypted_data OUT     RAW,
  which          IN      PLS_INTEGER DEFAULT TwoKeyMode
  iv            IN      RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input_string   IN      VARCHAR2,
  key_string     IN      VARCHAR2,
  encrypted_string OUT   VARCHAR2,
  which          IN      PLS_INTEGER DEFAULT TwoKeyMode
  iv_string      IN      VARCHAR2   DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input          IN RAW,
  key            IN RAW,
  which          IN PLS_INTEGER DEFAULT TwoKeyMode
  iv            IN RAW          DEFAULT NULL)
RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input_string IN VARCHAR2,
  key_string   IN VARCHAR2,
  which        IN PLS_INTEGER DEFAULT TwoKeyMode
  iv_string    IN VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

```

### Parameters

**Table 96–3** *DES3ENCRYPT Parameters Procedure and Function*

Parameter	Description
input	Data to be encrypted.
key	Encryption key.
encrypted_data	Encrypted data.
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
iv	Initialization vector.
input_string	String to be encrypted.
key_string	Encryption key string.
encrypted_string	Encrypted string.
iv_string	Initialization vector.

## Usage Notes

If you are using Oracle's 3DES interface with a 2-key implementation, you must supply a single key of 128 bits as an argument to the `DES3ENCRYPT` procedure. With a 3-key implementation, you must supply a single key of 192 bits. Oracle then breaks the supplied key into two 64-bit keys. As with DES, the 3DES algorithm throws away 8 bits of each derived key. However, you must supply a single 128-bit key for the 2-key 3DES implementation or a single 192-bit key for the 3-key 3DES implementation; otherwise the package will raise an error. The `DES3ENCRYPT` procedure uses the 2-key implementation by default.

You also have the option of providing an *initialization vector* (IV) with the `DES3ENCRYPT` procedure. An IV is a block of random data prepended to the data you intend to encrypt. The IV has no meaning. It is there to make each message unique. Prepending an IV to your input data avoids starting encrypted blocks of data with common header information, which may give cryptanalysts information they can use to decrypt your data.

If the input data or key given to the PL/SQL `DES3ENCRYPT` procedure is empty, then the procedure raises the error `ORA-28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the `DES3ENCRYPT` procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double encrypt data using the `DES3ENCRYPT` procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the `which` parameter, `ORA-28236 "Invalid Triple DES mode"` is generated. Only the values 0 (`TwoKeyMode`) and 1 (`ThreeKeyMode`) are valid.

## Restrictions

The `DES3ENCRYPT` procedure has two restrictions. The first is that the DES key length for encryption is fixed at 128 bits (for 2-key DES) or 192 bits (for 3-key DES); you cannot alter these key lengths.

The second is that you cannot execute multiple passes of encryption using 3DES. (Note: the 3DES algorithm itself encrypts data multiple times; however, you cannot call the `DES3ENCRYPT` function itself more than once to encrypt the same data using 3DES.)

---

---

**Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

---

---

## DES3GETKEY Procedures and Functions

These subprograms take a random value and uses it to generate an encryption key. For Triple DES, you specify the mode so that the returned key has the proper length.

### Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed       IN   RAW,
  key        OUT  RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed_string IN  VARCHAR2,
  key        OUT  VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which IN PLS_INTEGER DEFAULT TwoKeyMode,
  seed  IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed_string IN  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 96–4** *DES3GETKEY Procedure and Function Parameters*

Parameter	Description
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
seed	A value at least 80 characters long.
key	Encryption key.
seed_string	A value at least 80 characters long.
key	Encryption key.

## DESDECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

### Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input          IN  RAW,
  key            IN  RAW,
  decrypted_data OUT RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input_string   IN  VARCHAR2,
  key_string     IN  VARCHAR2,
  decrypted_string OUT VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input          IN  RAW,
  key            IN  RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input_string   IN  VARCHAR2,
  key_string     IN  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 96–5** *DESDECRYPT Procedure and Function Parameters*

Parameter	Description
input	Data to be decrypted.
key	Decryption key.
decrypted_data	Decrypted data.
input_string	String to be decrypted.
key_string	Decryption key string.
decrypted_string	Decrypted string.

### Usage Notes

If the input data or key given to the PL/SQL DESDECRYPT function is empty, then Oracle raises ORA error 28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DESDECRYPT function is not a multiple of 8 bytes, Oracle raises ORA error 28232 "Invalid input size for Obfuscation toolkit."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

---

**Note:** ORA-28233 is not applicable to the DESDECRYPT function.

---

## Restrictions

The DES key length for encryption is fixed at 64 bits (of which 56 bits are used); you cannot alter this key length.

---

---

**Note:** The key length limitation is a requirement of U.S. regulations governing the export of cryptographic products.

---

---

## DESENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data.

### Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input          IN   RAW,
  key            IN   RAW,
  encrypted_data OUT  RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input_string   IN   VARCHAR2,
  key_string     IN   VARCHAR2,
  encrypted_string OUT VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input          IN RAW,
  key            IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input_string IN VARCHAR2,
  key_string  IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 96–6** DESENCRYPT Procedure and Function Parameters

Parameter	Description
input	Data to be encrypted.
key	Encryption key.
encrypted_data	Encrypted data.
input_string	String to be encrypted.
key_string	Encryption key string.
encrypted_string	Encrypted string.

### Usage Notes

The DES algorithm encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm throws away 8 bits of the supplied key (the particular bits which are thrown away is beyond the scope of this documentation). However, when using the algorithm, you must supply a 64-bit key or the package will raise an error.

If the input data or key given to the PL/SQL DESEncrypt procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit".

If the input data given to the DESENCRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit."

If you try to double-encrypt data using the DESENCRYPT procedure, then the procedure raises the error ORA-28233 "Double encryption not supported."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

## Restrictions

The DESENCRYPT procedure has the following restrictions:

- The DES key length for encryption is fixed at 56 bits; you cannot alter this key length.
- You cannot execute multiple passes of encryption. That is, you cannot re-encrypt previously encrypted data by calling the function twice.

---

---

**Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

---

---

## DESGETKEY Procedures and Functions

These subprograms take a random value and use it to generate an encryption key.

### Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed      IN  RAW,
  key       OUT RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed_string IN  VARCHAR2,
  key         OUT  VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed_string IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 96–7** *DESGETKEY Procedure and Function Parameters*

Parameter	Description
seed	A value at least 80 characters long.
key	Encryption key.
seed_string	A value at least 80 characters long.
key	Encryption key.

## MD5 Procedures and Functions

These subprograms generate MD5 hashes of data. The MD5 algorithm ensures data integrity by generating a 128-bit cryptographic message digest value from given data.

### Syntax

```
DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input          IN  RAW,
  checksum       OUT raw_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input_string   IN  VARCHAR2,
  checksum_string OUT varchar2_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input          IN RAW)
RETURN raw_checksum;

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input_string IN VARCHAR2)
RETURN varchar2_checksum;
```

### Parameters

**Table 96–8 MD5 Procedure and Function Parameters**

Parameter Name	Description
input	Data to be hashed
checksum	128-bit cryptographic message digest
input_string	String to be hashed
checksum_string	128-bit cryptographic message digest

DBMS\_ODCI package contains a single user function related to the use of Data Cartridges.

**See Also:**

This chapter contains the following topic:

- [Summary of DBMS\\_ODCI Subprograms](#)

---

## Summary of DBMS\_ODCI Subprograms

**Table 97–1 DBMS\_ODCI Package Subprograms**

Subprogram	Description
<a href="#">ESTIMATE_CPU_UNITS Function</a> on page 97-3	Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)

## ESTIMATE\_CPU\_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, `ESTIMATE_CPU_UNITS` considers the speed of a single processor.

### Syntax

```
DBMS_ODCI.estimate_cpu_units (
    elapsed_time    NUMBER)
RETURN NUMBER;
```

### Parameters

Parameter	Description
<code>elapsed_time</code>	The elapsed time in seconds that it takes to execute a function.

### Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by `ESTIMATE_CPU_UNITS`; multiply the number returned by `ESTIMATE_CPU_UNITS` by 1,000.

---

---

## DBMS\_OFFLINE\_OG

The DBMS\_OFFLINE\_OG package contains the public interface for offline instantiation of master groups.

This chapter contains the following topics:

- [Documentation of DBMS\\_OFFLINE\\_OG](#)

---

## Documentation of DBMS\_OFFLINE\_OG

For a complete description of this package within the context of Replication, see DBMS\_OFFLINE\_OG in the *Oracle Database Advanced Replication Management API Reference*.

---

---

## DBMS\_OUTLN

The DBMS\_OUTLN package, synonymous with OUTLN\_PKG, contains the functional interface for subprograms associated with the management of stored outlines.

**See Also:** For more information about using the DBMS\_OUTLN package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

---

---

**Note:** Stored outlines will be desupported in a future release in favor of SQL plan management. In Oracle Database 11g Release 1 (11.1), stored outlines continue to function as in past releases. However, Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines.

If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD\\_PLANS\\_FROM\\_CURSOR\\_CACHE Functions](#) or [LOAD\\_PLANS\\_FROM\\_SQLSET Function](#) of the DBMS\_SPM package. When the migration is complete, you should disable or remove the stored outlines.

---

---

This chapter contains the following topics:

- [Using DBMS\\_OUTLN](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_OUTLN Subprograms](#)

## Using DBMS\_OUTLN

- [Overview](#)
- [Security Model](#)

## Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline. The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Stored outlines will be de-supported in a future release in favor of SQL plan management. As of 11g R1, stored outlines continue to function as in past releases, but Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines.

If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD\\_PLANS\\_FROM\\_CURSOR\\_CACHE Functions](#) or the [LOAD\\_PLANS\\_FROM\\_SQLSET Function](#) of the [DBMS\\_SPM](#) package. When the migration is complete, you should disable or remove the stored outlines.

## Security Model

DBMS\_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

---

## Summary of DBMS\_OUTLN Subprograms

**Table 99-1 DBMS\_OUTLN Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CLEAR_USED Procedure</a> on page 99-6	Clears the outline 'used' flag
<a href="#">CREATE_OUTLINE Procedure</a> on page 99-7	Generates outlines from the shared cursor identified by hash value and child number
<a href="#">DROP_BY_CAT Procedure</a> on page 99-8	Drops outlines that belong to a specified category
<a href="#">DROP_UNUSED Procedure</a> on page 99-9	Drops outlines that have never been applied in the compilation of a SQL statement
<a href="#">EXACT_TEXT_SIGNATURES Procedure</a> on page 99-10	Updates outline signatures to those that compute based on exact text matching
<a href="#">UPDATE_BY_CAT Procedure</a> on page 99-11	Changes the category of outlines in one category to a new category
<a href="#">UPDATE_SIGNATURES Procedure</a> on page 99-12	Updates outline signatures to the current version's signature

## CLEAR\_USED Procedure

This procedure clears the outline 'used' flag.

### Syntax

```
DBMS_OUTLN.CLEAR_USED (  
    name      IN      VARCHAR2);
```

### Parameters

**Table 99–2** *CLEAR\_USED Procedure Parameters*

Parameter	Description
name	Name of the outline.

## CREATE\_OUTLINE Procedure

This procedure generates an outline by reparsing the SQL statement from the shared cursor identified by hash value and child number.

### Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (  
    hash_value     IN NUMBER,  
    child_number  IN NUMBER,  
    category       IN VARCHAR2 DEFAULT 'DEFAULT');
```

### Parameters

**Table 99-3 CREATE\_OUTLINE Procedure Parameters**

Parameter	Description
hash_value	Hash value identifying the target shared cursor.
child_number	Child number of the target shared cursor.
category	Category in which to create outline (optional).

## DROP\_BY\_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the `DEFAULT` category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

### Syntax

```
DBMS_OUTLN.DROP_BY_CAT (  
    cat VARCHAR2);
```

### Parameters

**Table 99–4** *DROP\_BY\_CAT Procedure Parameters*

Parameter	Description
cat	Category of outlines to drop.

### Usage Notes

This procedure purges a category of outlines in a single call.

### Examples

This example drops all outlines in the `DEFAULT` category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

## DROP\_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

### Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

### Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

## **EXACT\_TEXT\_SIGNATURES Procedure**

This procedure updates outline signatures to those that compute based on exact text matching.

### **Syntax**

```
DBMS. OUTLN. EXACT_TEXT_SIGNATURES ;
```

### **Usage Notes**

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

## UPDATE\_BY\_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

### Syntax

```
DBMS.OUTLN.UPDATE_BY_CAT (  
  oldcat   VARCHAR2 default 'DEFAULT',  
  newcat   VARCHAR2 default 'DEFAULT');
```

### Parameters

**Table 99-5** *UPDATE\_BY\_CAT Procedure Parameters*

Parameter	Description
oldcat	The current category of outlines.
newcat	The new category of outlines.

## UPDATE\_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

### Syntax

```
DBMS. OUTLN. UPDATE_SIGNATURES;
```

### Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

The DBMS\_OUTPUT package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- [Using DBMS\\_OUTPUT](#)
  - Overview
  - Security Model
  - Operational Notes
  - Exceptions
  - Rules and Limits
  - Examples
- [Data Structures](#)
  - TABLE Types
  - OBJECT Types
- [Summary of DBMS\\_OUTPUT Subprograms](#)

## Using DBMS\_OUTPUT

This section contains topics which relate to using the DBMS\_OUTPUT package.

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)

## Overview

The package is typically used for debugging, or for displaying messages and reports to SQL\*DBA or SQL\*Plus (such as are produced by applying the SQL command DESCRIBE to procedures).

The [PUT Procedure](#) and [PUT\\_LINE Procedure](#) in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the [GET\\_LINE Procedure](#) and [GET\\_LINES Procedure](#).

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

## Security Model

The `dbmsotpt.sql` script must be run as user `SYS`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

---

## Operational Notes

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL\*Plus, the buffered messages are ignored.
- SQL\*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.
- Typing `SET SERVEROUTPUT ON` in SQL\*Plus has the effect of invoking `DBMS_OUTPUT.ENABLE (buffer_size => NULL);`  
with no limit on the output.
- You should generally avoid having application code invoke either the [DISABLE Procedure](#) or [ENABLE Procedure](#) because this could subvert the attempt of an external tool like SQL\*Plus to control whether or not to display output.

---

---

**Note:** Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

---

---

## Exceptions

DBMS\_OUTPUT subprograms raise the application error ORA-20000, and the output procedures can return the following errors:

**Table 100-1 DBMS\_OUTPUT Errors**

<b>Error</b>	<b>Description</b>
ORU-10027:	Buffer overflow
ORU-10028:	Line length overflow

## Rules and Limits

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

## Examples

### Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here: '||:new.col||' is the new value');
```

If you have enabled the DBMS\_OUTPUT package, then the text produced by this PUT\_LINE would be buffered, and you could, after executing the statement (presumably some INSERT, DELETE, or UPDATE that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
  DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to GET\_LINE until status comes back as nonzero. For better performance, you should use calls to [GET\\_LINES Procedure](#) which can return an array of lines.

### Example 2: Debugging Stored Procedures and Triggers

The DBMS\_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in ["Example 3: Retrieving Information About an Object"](#) on page 100-9.

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the PUT\_LINE procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
  CURSOR emp_cursor IS
    SELECT sal, comm FROM emp WHERE deptno = dnum;
  total_wages  NUMBER(11, 2) := 0;
  counter      NUMBER(10) := 1;
BEGIN

  FOR emp_record IN emp_cursor LOOP
    emp_record.comm := NVL(emp_record.comm, 0);
    total_wages := total_wages + emp_record.sal
      + emp_record.comm;
    DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
      ' ; Wages = ' || TO_CHAR(total_wages)); /* Debug line */
    counter := counter + 1; /* Increment debug counter */
  END LOOP;
  /* Debug line */
  DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
    TO_CHAR(total_wages));
  RETURN total_wages;

END dept_salary;
```

Assume the EMP table contains the following rows:

EMPNO	SAL	COMM	DEPT
1002	1500	500	20
1203	1000		30
1289	1000		10

```
1347          1000      250      20
```

Assume the user executes the following statements in SQL\*Plus:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250
```

PL/SQL procedure successfully executed.

### Example 3: Retrieving Information About an Object

In this example, the user has used the EXPLAIN PLAN command to retrieve information about the execution plan for a statement and has stored it in PLAN\_TABLE. The user has also assigned a statement ID to this statement. The example EXPLAIN\_OUT procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```

/*****
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                */
*****/
CREATE OR REPLACE PROCEDURE explain_out
(statement_id IN VARCHAR2) AS

-- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

CURSOR explain_rows IS
SELECT level, id, position, operation, options,
       object_name
FROM plan_table
WHERE statement_id = explain_out.statement_id
CONNECT BY PRIOR id = parent_id
       AND statement_id = explain_out.statement_id
START WITH id = 0
       ORDER BY id;

BEGIN

-- Loop through information retrieved from PLAN_TABLE:

FOR line IN explain_rows LOOP

-- At start of output, include heading with estimated cost.

IF line.id = 0 THEN
DBMS_OUTPUT.PUT_LINE ('Plan for statement '
|| statement_id
|| ', estimated cost = ' || line.position);
END IF;

-- Output formatted information. LEVEL determines indention level.

DBMS_OUTPUT.PUT_LINE (lpad(' ', 2*(line.level-1)) ||

```

```
        line.operation || ' ' || line.options || ' ' ||  
        line.object_name);  
    END LOOP;  
  
END;
```

**See Also:** [Chapter 223, "UTL\\_FILE"](#)

## Data Structures

The DBMS\_OUTPUT package declares 2 collection types for use with the [GET\\_LINES Procedure](#).

### TABLE Types

[CHARARR Table Type](#)

### OBJECT Types

[DBMSOUTPUT\\_LINESARRAY Object Type](#)

## CHARARR Table Type

This package type is to be used with the [GET\\_LINES Procedure](#) to obtain text submitted through the [PUT Procedure](#) and [PUT\\_LINE Procedure](#).

### Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

## DBMSOUTPUT\_LINESARRAY Object Type

This package type is to be used with the [GET\\_LINES Procedure](#) to obtain text submitted through the [PUT Procedure](#) and [PUT\\_LINE Procedure](#).

### Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS  
  VARRAY(2147483647) OF VARCHAR2(32767);
```

## Summary of DBMS\_OUTPUT Subprograms

**Table 100–2** *DBMS\_OUTPUT Package Subprograms*

Subprogram	Description
<a href="#">DISABLE Procedure</a> on page 100-15	Disables message output
<a href="#">ENABLE Procedure</a> on page 100-16	Enables message output
<a href="#">GET_LINE Procedure</a> on page 100-17	Retrieves one line from buffer
<a href="#">GET_LINES Procedure</a> on page 100-18	Retrieves an array of lines from buffer
<a href="#">NEW_LINE Procedure</a> on page 100-19	Terminates a line created with <code>PUT</code>
<a href="#">PUT Procedure</a> on page 100-20	Places a partial line in the buffer
<a href="#">PUT_LINE Procedure</a> on page 100-21	Places line in buffer

---

**Note:** The [PUT Procedure](#) that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

---

## DISABLE Procedure

This procedure disables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`, and purges the buffer of any remaining information.

As with the [ENABLE Procedure](#), you do not need to call this procedure if you are using the `SERVEROUTPUT` option of SQL\*Plus.

### Syntax

```
DBMS_OUTPUT.DISABLE;
```

### Pragmas

```
pragma restrict_references (disable, WNDS, RNDS);
```

## ENABLE Procedure

This procedure enables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`. Calls to these procedures are ignored if the `DBMS_OUTPUT` package is not activated.

### Syntax

```
DBMS_OUTPUT.ENABLE (  
    buffer_size IN INTEGER DEFAULT 20000);
```

### Pragmas

```
pragma restrict_references(enable,WNDS,RNDS);
```

### Parameters

**Table 100–3** *ENABLE Procedure Parameters*

Parameter	Description
<code>buffer_size</code>	Upper limit, in bytes, the amount of buffered information. Setting <code>buffer_size</code> to <code>NULL</code> specifies that there should be no limit.

### Usage Notes

- It is not necessary to call this procedure when you use the `SET SERVEROUTPUT` option of `SQL*Plus`.
- If there are multiple calls to `ENABLE`, then `buffer_size` is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies `buffer_size` (`NOT NULL`).
- `NULL` is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

## GET\_LINE Procedure

This procedure retrieves a single line of buffered information.

### Syntax

```
DBMS_OUTPUT.GET_LINE (
    line    OUT VARCHAR2,
    status  OUT INTEGER);
```

### Parameters

**Table 100–4** *GET\_LINE Procedure Parameters*

Parameter	Description
line	Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as VARCHAR2 (32767) to avoid the risk of "ORA-06502: PL/SQL: numeric or value error: character string buffer too small".
status	If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.

### Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET\_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET\_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL\*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET\_LINE or GET\_LINES, any lines not retrieved before the next call to PUT, PUT\_LINE, or NEW\_LINE are discarded to avoid confusing them with the next message.

## GET\_LINES Procedure

This procedure retrieves an array of lines from the buffer.

### Syntax

```
DBMS_OUTPUT.GET_LINES (
  lines      OUT   CHARARR,
  numlines   IN OUT INTEGER);

DBMS_OUTPUT.GET_LINES (
  lines      OUT   DBMSOUTPUT_LINESARRAY,
  numlines   IN OUT INTEGER);
```

### Parameters

**Table 100–5** GET\_LINES Procedure Parameters

Parameter	Description
lines	Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the VARRAY overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.
numlines	Number of lines you want to retrieve from the buffer.  After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.

### Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET\_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET\_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL\*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET\_LINE or GET\_LINES, any lines not retrieved before the next call to PUT, PUT\_LINE, or NEW\_LINE are discarded to avoid confusing them with the next message.

## NEW\_LINE Procedure

This procedure puts an end-of-line marker. The [GET\\_LINE Procedure](#) and the [GET\\_LINES Procedure](#) return "lines" as delimited by "newlines". Every call to the [PUT\\_LINE Procedure](#) or [NEW\\_LINE Procedure](#) generates a line that is returned by [GET\\_LINE\(S\)](#).

### Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

## PUT Procedure

This procedure places a partial line in the buffer.

---

---

**Note:** The PUT procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

---

---

### Syntax

```
DBMS_OUTPUT.PUT (
    item IN VARCHAR2);
```

### Parameters

**Table 100–6** PUT Procedure Parameters

Parameter	Description
item	Item to buffer.

### Exceptions

**Table 100–7** PUT Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

### Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT\_LINE.
- When you call PUT\_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW\_LINE. GET\_LINE and GET\_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using PUT or PUT\_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL\*Plus does not display DBMS\_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS\_OUTPUT buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

## PUT\_LINE Procedure

This procedure places a line in the buffer.

---

**Note:** The PUT\_LINE procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

---

### Syntax

```
DBMS_OUTPUT.PUT_LINE (
    item IN VARCHAR2);
```

### Parameters

**Table 100–8** PUT\_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

### Exceptions

**Table 100–9** PUT\_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

### Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT\_LINE.
- When you call PUT\_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW\_LINE. GET\_LINE and GET\_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using PUT or PUT\_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL\*Plus does not display DBMS\_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS\_OUTPUT buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
    2 DBMS_OUTPUT.PUT_LINE ('hello');
    3 DBMS_LOCK.SLEEP (10);
    4 END;
```

## DBMS\_PARALLEL\_EXECUTE

The DBMS\_PARALLEL\_EXECUTE package enables the user to incrementally update table data in parallel.

**See Also:**

- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database Reference*

This chapter contains the following topics:

- [Using DBMS\\_PARALLEL\\_EXECUTE](#)
  - Overview
  - Security Model
  - Constants
  - Views
  - Exceptions
  - Examples
- [Summary of DBMS\\_PARALLEL\\_EXECUTE Subprograms](#)

## Using DBMS\_PARALLEL\_EXECUTE

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Exceptions](#)
- [Examples](#)

## Overview

This package enables the user to incrementally update table data in parallel, in two high level steps:

1. Group sets of rows in the table into smaller sized chunks.
2. Run a user specified statement on these chunks in parallel, and commit when finished processing each chunk.

This package introduces the notion of *parallel execution task*. This task groups the various steps associated with the parallel execution of a PL/SQL block, which is typically updating table data.

All of the package subroutines (except the [GENERATE\\_TASK\\_NAME Function](#) and the [TASK\\_STATUS Procedure](#)) perform a commit.

## Security Model

DBMS\_PARALLEL\_EXECUTE is a SYS-owned package which is granted to PUBLIC.

Any user can create or operate his own parallel execution tasks and access the USER view.

Users who have the ADM\_PARALLEL\_EXECUTE\_TASK role can perform administrative routines (qualified by the prefix ADM\_) and access the DBA view.

Apart from the administrative routines, all the subprograms refer to tasks owned by the current user.

To execute chunks in parallel, the user must have CREATE JOB system privilege.

The CHUNK\_BY\_SQL, RUN\_TASK, and RESUME\_TASK subprograms require a query, and are executed using DBMS\_SQL. Invokers of the DBMS\_SQL interface must ensure that none of the queries passed-in contains SQL injection.

## Constants

The DBMS\_PARALLEL\_EXECUTE package uses the constants shown in following tables:

- [Table 101-1, "DBMS\\_PARALLEL\\_EXECUTE Constants - Chunk Status Value"](#)
- [Table 101-2, "DBMS\\_PARALLEL\\_EXECUTE Constants - Task Status Value"](#)

**Table 101-1 DBMS\_PARALLEL\_EXECUTE Constants - Chunk Status Value**

Constant	Type	Value	Description
ASSIGNED	NUMBER	1	Chunk has been assigned for processing
PROCESSED	NUMBER	2	Chunk has been processed successfully
PROCESSED_ WITH_ERROR	NUMBER	3	Chunk has been processed, but an error occurred during processing
UNASSIGNED	NUMBER	0	Chunk is unassigned

**Table 101-2 DBMS\_PARALLEL\_EXECUTE Constants - Task Status Value**

Constant	Type	Value	Description
CHUNKED	NUMBER	4	Table associated with the task has been chunked, but none of the chunk has been assigned for processing
CHUNKING	NUMBER	2	Table associated with the task is being chunked
CHUNKING_ FAILED	NUMBER	3	Chunking failed
CRASHED	NUMBER	8	Only applicable if parallel execution is used, this occurs if a job slave crashes or if the database crashes during EXECUTE, leaving a chunk in ASSIGNED or UNASSIGNED state.
CREATED	NUMBER	1	The task has been created by the <a href="#">CREATE_TASK Procedure</a>
FINISHED	NUMBER	6	All chunks processed without error
FINISHED_ WITH_ERROR	NUMBER	7	All chunks processed, but with errors in some cases
PROCESSING	NUMBER	5	Part of the chunk assigned for processing, or which has been processed

## Views

The `DBMS_PARALLEL_EXECUTE` package uses views listed in the *Oracle Database Reference*:

- `DBA_PARALLEL_EXECUTE_CHUNKS`
- `DBA_PARALLEL_EXECUTE_TASKS`
- `USER_PARALLEL_EXECUTE_CHUNKS`
- `USER_PARALLEL_EXECUTE_TASKS`

## Exceptions

The following table lists the exceptions raised by DBMS\_PARALLEL\_EXECUTE.

**Table 101-3 Exceptions Raised by DBMS\_PARALLEL\_EXECUTE**

Exception	Error Code	Description
CHUNK_NOT_FOUND	29499	Specified chunk does not exist
DUPLICATE_TASK_NAME	29497	Same task name has been used by an existing task
INVALID_STATE_FOR_CHUNK	29492	Attempts to chunk a table that is not in CREATED or CHUNKING_FAILED state
INVALID_STATE_FOR_REDSUME	29495	Attempts to resume execution, but the task is not in FINISHED_WITH_ERROR or CRASHED state
INVALID_STATE_FOR_RUN	29494	Attempts to execute the task that is not in CHUNKED state
INVALID_STATUS	29493	Attempts to set an invalid value to the chunk status
INVALID_TABLE	29491	Attempts to chunk a table by rowid in cases in which the table is not a physical table, or the table is an IOT
MISSING_ROLE	29490	User does not have the necessary ADM_PARALLEL_EXECUTE role
TASK_NOT_FOUND	29498	Specified task_name does not exist

## Examples

The following examples run on the Human Resources (HR) schema of the Oracle Database Sample Schemas. It requires that the HR schema be created with the `JOB SYSTEM` privilege.

### Chunk by ROWID

This example shows the most common usage of this package. After calling the [RUN\\_TASK Procedure](#), it checks for errors and re-runs in the case of error.

```

DECLARE
  l_sql_stmt VARCHAR2(1000);
  l_try NUMBER;
  l_status NUMBER;
BEGIN

  -- Create the TASK
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

  -- Chunk the table by ROWID
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true,
100);

  -- Execute the DML in parallel
  l_sql_stmt := 'update /*+ ROWID (dda) */ EMPLOYEES e
    SET e.salary = e.salary + 10
    WHERE rowid BETWEEN :start_id AND :end_id';
  DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
    parallel_level => 10);

  -- If there is an error, RESUME it for at most 2 times.
  L_try := 0;
  L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
  WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
  LOOP
    L_try := l_try + 1;
    DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
  END LOOP;

  -- Done with processing; drop the task
  DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

END;
/

```

### Chunk by User-Provided SQL

A user can specify their own chunk algorithm by using the [CREATE\\_CHUNKS\\_BY\\_SQL Procedure](#). This example shows that rows with the same `manager_id` are grouped together and processed in one chunk.

```

DECLARE
  l_chunk_sql VARCHAR2(1000);
  l_sql_stmt VARCHAR2(1000);
  l_try NUMBER;
  l_status NUMBER;
BEGIN

```

```

-- Create the TASK
DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

-- Chunk the table by MANAGER_ID
l_chunk_sql := 'SELECT distinct manager_id, manager_id FROM employees';
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL('mytask', l_chunk_sql, false);

-- Execute the DML in parallel
-- the WHERE clause contain a condition on manager_id, which is the chunk
-- column. In this case, grouping rows is by manager_id.
l_sql_stmt := 'update /*+ ROWID (dda) */ EMPLOYEES e
              SET e.salary = e.salary + 10
              WHERE manager_id between :start_id and :end_id';
DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
                               parallel_level => 10);

-- If there is error, RESUME it for at most 2 times.
L_try := 0;
L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
Loop
  L_try := l_try + 1;
  DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
  L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
END LOOP;

-- Done with processing; drop the task
DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

end;
/

```

### Executing Chunks in an User-defined Framework

The user can execute chunks in his own defined framework without using the [RUN\\_TASK Procedure](#). This example shows how to use [GET\\_ROWID\\_CHUNK Procedure](#), [EXECUTE IMMEDIATE](#), [SET\\_CHUNK\\_STATUS Procedure](#) to execute the chunks.

```

DECLARE
  l_sql_stmt varchar2(1000);
  l_try number;
  l_status number;
  l_chunk_id number;
  l_start_rowid rowid;
  l_end_rowid rowid;
  l_any_rows boolean;
  CURSOR c1 IS SELECT chunk_id
                FROM user_parallel_execute_chunks
                WHERE task_name = 'mytask'
                AND STATUS IN (DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR,
                              DBMS_PARALLEL_EXECUTE.ASSIGNED);
BEGIN
  -- Create the Objects, task, and chunk by ROWID
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true,
  100);

  l_sql_stmt := 'update /*+ ROWID (dda) */ EMPLOYEES e
                SET e.salary = e.salary + 10
                WHERE rowid BETWEEN :start_id AND :end_id';

```

```
-- Execute the DML in his own framework
--
-- Process each chunk and commit.
-- After processing one chunk, repeat this process until
-- all the chunks are processed.
--
<<main_processing>>
LOOP
  --
  -- Get a chunk to process; if there is nothing to process, then exit the
  -- loop;
  --
  DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK('mytask',
                                        l_chunk_id,
                                        l_start_rowid,
                                        l_end_rowid,
                                        l_any_rows);

  IF (l_any_rows = false) THEN EXIT; END IF;

  --
  -- The chunk is specified by start_id and end_id.
  -- Bind the start_id and end_id and then execute it
  --
  -- If no error occurred, set the chunk status to PROCESSED.
  --
  -- Catch any exception. If an exception occurred, store the error num/msg
  -- into the chunk table and then continue to process the next chunk.
  --
  BEGIN
    EXECUTE IMMEDIATE l_sql_stmt using l_start_rowid, l_end_rowid;
    DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS('mytask',l_chunk_id,
      DBMS_PARALLEL_EXECUTE.PROCESSED);
  EXCEPTION WHEN OTHERS THEN
    DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS('mytask', l_chunk_id,
      DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR, SQLCODE, SQLERRM);
  END;

  --
  -- Finished processing one chunk; Commit here
  --
  COMMIT;
END LOOP;
```

---

## Summary of DBMS\_PARALLEL\_EXECUTE Subprograms

**Table 101-4 DBMS\_PARALLEL\_EXECUTE Package Subprograms**

Subprogram	Description
<a href="#">ADM_DROP_CHUNKS Procedure</a> on page 101-12	Drops all chunks of the specified task owned by the specified owner
<a href="#">ADM_DROP_TASK Procedure</a> on page 101-13	Drops the task of the given user and all related chunks
<a href="#">ADM_TASK_STATUS Procedure</a> on page 101-14	Returns the task status
<a href="#">ADM_STOP_TASK Procedure</a> on page 101-15	Stops the task of the given owner and related job slaves
<a href="#">CREATE_TASK Procedure</a> on page 101-16	Creates a task for the current user
<a href="#">CREATE_CHUNKS_BY_NUMBER_COL Procedure</a> on page 101-17	Chunks the table associated with the given task by the specified column.
<a href="#">CREATE_CHUNKS_BY_ROWID Procedure</a> on page 101-18	Chunks the table associated with the given task by ROWID
<a href="#">CREATE_CHUNKS_BY_SQL Procedure</a> on page 101-19	Chunks the table associated with the given task by means of a user-provided SELECT statement
<a href="#">DROP_TASK Procedure</a> on page 101-20	Drops the task and all related chunks
<a href="#">DROP_CHUNKS Procedure</a> on page 101-21	Drops the task's chunks
<a href="#">GENERATE_TASK_NAME Function</a> on page 101-22	Returns a unique name for a task
<a href="#">GET_NUMBER_COL_CHUNK Procedure</a> on page 101-23	Picks an unassigned NUMBER chunk and changes it to ASSIGNED
<a href="#">GET_ROWID_CHUNK Procedure</a> on page 101-24	Picks an unassigned ROWID chunk and changes it to ASSIGNED
<a href="#">PURGE_PROCESSED_CHUNKS Procedure</a> on page 101-25	Deletes all the processed chunks whose status is PROCESSED or PROCESSED_WITH_ERROR
<a href="#">RESUME_TASK Procedures</a> on page 101-26	Retries the given the task if the <a href="#">RUN_TASK Procedure</a> finished with error, or resumes the task if a crash has occurred.
<a href="#">RUN_TASK Procedure</a> on page 101-28	Executes the specified SQL statement on the chunks in parallel
<a href="#">SET_CHUNK_STATUS Procedure</a> on page 101-30	Sets the status of the chunk
<a href="#">STOP_TASK Procedure</a> on page 101-31	Stops the task and related job slaves
<a href="#">TASK_STATUS Procedure</a> on page 101-32	Returns the task status

## ADM\_DROP\_CHUNKS Procedure

This procedure drops all chunks of the specified task owned by the specified owner.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_CHUNKS (  
    task_owner      IN  VARCHAR2,  
    task_name       IN  VARCHAR2);
```

### Parameters

**Table 101–5** ADM\_DROP\_CHUNKS Procedure Parameters

Parameter	Description
task_owner	Owner of the task
task_name	Name of the task

## ADM\_DROP\_TASK Procedure

This procedure drops the task of the specified user and all related chunks.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_TASK (  
    task_owner      IN VARCHAR2,  
    task_name       IN VARCHAR2);
```

### Parameters

**Table 101–6 ADM\_DROP\_TASK Procedure Parameters**

Parameter	Description
task_owner	Owner of the task
task_name	Name of the task

## ADM\_TASK\_STATUS Procedure

This function returns the task status.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_TASK_STATUS (  
    task_owner      IN  VARCHAR2,  
    task_name       IN  VARCHAR2)  
RETURN NUMBER;
```

### Parameters

**Table 101–7** ADM\_TASK\_STATUS Function Parameters

Parameter	Description
task_owner	Owner of the task
task_name	Name of the task

## ADM\_STOP\_TASK Procedure

This procedure stops the task of the specified owner and related job slaves.

### Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_STOP_TASK (  
    task_owner      IN  VARCHAR2,  
    task_name       IN  VARCHAR2);
```

### Parameters

**Table 101–8** ADM\_STOP\_TASK Procedure Parameters

Parameter	Description
task_owner	Owner of the task
task_name	Name of the task

## CREATE\_TASK Procedure

This procedure creates a task for the current user. The pairing of `task_name` and `current_user` must be unique.

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_TASK (  
    task_name      IN   VARCHAR2,  
    comment        IN   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 101–9 CREATE\_TASK Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task. The <code>task_name</code> can be any string in which related length must be less than or equal to 128 bytes.
<code>comment</code>	Comment field. The comment must be less than 4000 bytes.

## CREATE\_CHUNKS\_BY\_NUMBER\_COL Procedure

This procedure chunks the table (associated with the specified task) by the specified column. The specified column must be a NUMBER column. This procedure takes the MIN and MAX value of the column, and then divide the range evenly according to chunk\_size. The chunks are:

START_ID	END_ID
-----	-----
min_id_val	min_id_val+1*chunk_size-1
min_id_val+1*chunk_size	min_id_val+2*chunk_size-1
...	...
min_id_val+i*chunk_size	max_id_val

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_NUMBER_COL (
  task_name      IN  VARCHAR2,
  table_owner    IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  table_column   IN  VARCHAR2,
  chunk_size     IN  NUMBER);
```

### Parameters

**Table 101-10 CREATE\_CHUNKS\_BY\_NUMBER\_COL Procedure Parameters**

Parameter	Description
task_name	Name of the task
table_owner	Owner of the table
table_name	Name of the table
table_column	Name of the NUMBER column
chunk_size	Range of each chunk

## CREATE\_CHUNKS\_BY\_ROWID Procedure

This procedure chunks the table (associated with the specified task) by ROWID. `num_row` and `num_block` are approximate guidance for the size of each chunk. The table to be chunked must be a physical table with physical ROWID having views and table functions. Index Organized Tables are not allowed.

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID (  
    task_name      IN  VARCHAR2,  
    table_owner    IN  VARCHAR2,  
    table_name     IN  VARCHAR2,  
    by_row         IN  BOOLEAN,  
    chunk_size     IN  NUMBER);
```

### Parameters

**Table 101-11** CREATE\_CHUNKS\_BY\_ROWID Procedure Parameters

Parameter	Description
<code>task_name</code>	Name of the task
<code>table_owner</code>	Owner of the table
<code>table_name</code>	Name of the table
<code>by_row</code>	TRUE if <code>chunk_size</code> refers to the number of rows, otherwise, <code>chunk_size</code> refers to the number of blocks
<code>chunk_size</code>	Approximate number of rows/blocks to process for each commit cycle

## CREATE\_CHUNKS\_BY\_SQL Procedure

This procedure chunks the table (associated with the specified task) by means of a user-provided SELECT statement. The select statement which returns the range of each chunk must have two columns: `start_id` and `end_id`. If task is to chunk by ROWID, then the two columns must be of ROWID type. If the task is to chunk the table by NUMBER column, then the two columns must be of NUMBER type. The procedure provides the flexibility to users who want to deploy user-defined chunk algorithms.

### Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL (
    task_name      IN  VARCHAR2,
    sql_statement  IN  CLOB,
    by_rowid       IN  BOOLEAN);
```

### Parameters

**Table 101-12 CREATE\_CHUNKS\_BY\_SQL Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task
<code>sql_statment</code>	SQL which returns the chunk ranges
<code>by_rowid</code>	TRUE if the table is chunked by rowids

## DROP\_TASK Procedure

This procedure drops the task and all related chunks.

### Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_TASK (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 101–13** *DROP\_TASK Procedure Parameters*

Parameter	Description
task_name	Name of the task

## DROP\_CHUNKS Procedure

This procedure drops the task's chunks.

### Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_CHUNKS (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 101–14** *DROP\_CHUNKS Procedure Parameters*

Parameter	Description
task_name	Name of the task

## GENERATE\_TASK\_NAME Function

This function returns a unique name for a task. The name is of the form *prefix*N where N is a number from a sequence. If no prefix is specified, the generated name is, by default, be TASK\$\_1, TASK\$\_2, TASK\$\_3, and so on. If 'SCOTT' is specified as the prefix, the name is SCOTT1, SCOTT2, and so on.

### Syntax

```
DBMS_PARALLEL_EXECUTE.GENERATE_TASK_NAME (  
    prefix      IN      VARCHAR2 DEFAULT 'TASK$_'  
    RETURN VARCHAR2;
```

### Parameters

**Table 101–15** GENERATE\_TASK\_NAME Function Parameters

Parameter	Description
prefix	The prefix to use when generating the task name

## GET\_NUMBER\_COL\_CHUNK Procedure

This procedure picks an unassigned NUMBER chunk and changes it to ASSIGNED. If there are no more chunks to assign, `any_rows` is set to FALSE. Otherwise, the `chunk_id`, `start` and `end_id` of the chunk is returned as OUT parameters. The chunk info in `DBMS_PARALLEL_EXECUTE_CHUNKS$` is updated as follows: `STATUS` becomes ASSIGNED; `START_TIMESTAMP` records the current time; `END_TIMESTAMP` is cleared.

**See Also:** [Views](#) on page 101-6

### Syntax

```
DBMS_PARALLEL_EXECUTE.GET_NUMBER_COL_CHUNK (
    task_name      IN VARCHAR2,
    chunk_id       OUT NUMBER,
    start_rowid    OUT ROWID,
    end_id         OUT ROWID,
    any_rows       OUT BOOLEAN);
```

### Parameters

**Table 101–16** GET\_NUMBER\_COL\_CHUNK Procedure Parameters

Parameter	Description
<code>task_name</code>	Name of the task
<code>chunk_id</code>	Chunk_id of the chunk
<code>start_rowid</code>	Start rowid in the returned range
<code>end_id</code>	End rowid in the returned range
<code>any_rows</code>	Indicating if there could be any rows to process in the range

### Usage Notes

If the task is chunked by ROWID, then `get_rowid_range` should be used. If the task is chunked by NUMBER column, then `get_number_col_range` should be used. If the user makes the wrong function call, the returning `chunk_id` and `any_rows` has a valid value but `start/end_(row) id` is NULL.

## GET\_ROWID\_CHUNK Procedure

This procedure picks an unassigned ROWID chunk and changes it to ASSIGNED. If there are no more chunks to assign, any\_rows is set to FALSE. Otherwise, the chunk\_id, start and end\_id of the chunk is returned as OUT parameters. The chunk info in DBMS\_PARALLEL\_EXECUTE\_CHUNKS\$ is updated as follows: STATUS becomes ASSIGNED; START\_TIMESTAMP records the current time; END\_TIMESTAMP is cleared.

**See Also:** [Views](#) on page 101-6

### Syntax

```
DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK (
    task_name      IN VARCHAR2,
    chunk_id       OUT NUMBER,
    start_rowid    OUT ROWID,
    end_id         OUT ROWID,
    any_rows       OUT BOOLEAN);
```

### Parameters

**Table 101–17** GET\_ROWID\_CHUNK Procedure Parameters

Parameter	Description
task_name	Name of the task
chunk_id	Chunk_id of the chunk
start_rowid	Start rowid in the returned range
end_id	End rowid in the returned range
any_rows	Indicating if there could be any rows to process in the range

### Usage Notes

If the task is chunked by ROWID, then get\_rowid\_range should be used. If the task is chunked by NUMBER column, then get\_number\_col\_range should be used. If the user makes the wrong function call, the returning chunk\_id and any\_rows still have valid value but start/end\_(row) id is NULL.

## PURGE\_PROCESSED\_CHUNKS Procedure

This procedure deletes all the processed chunks whose status is PROCESSED or PROCESSED\_WITH\_ERROR.

### Syntax

```
DBMS_PARALLEL_EXECUTE.PURGE_PROCESSED_CHUNKS (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 101–18** *PURGE\_PROCESSED\_CHUNKS Procedure Parameters*

Parameter	Description
task_name	Name of the task

## RESUME\_TASK Procedures

This procedure retries the specified the task if the [RUN\\_TASK Procedure](#) finished with error, or resumes the task if a crash has occurred.

The user can only invoke this procedure if the task is in a CRASHED or FINISHED\_WITH\_ERROR state. For a crashed serial execution, the state remains in processing. The FORCE option allows user to resume any task in PROCESSING state. However, it is the user's responsibility to determine that a crash has occurred.

The procedure resumes processing the chunks which have not been processed. Also, chunks which are in PROCESSED\_WITH\_ERROR or ASSIGNED (due to crash) state are processed because those chunks did not commit.

This procedure takes the same argument as the [RUN\\_TASK Procedure](#).

The overload which takes `task_name` as the only input argument re-uses the arguments provided in the previous invoking of the [RUN\\_TASK Procedure](#) or [RESUME\\_TASK Procedures](#).

**See Also:** [Table 101-2, "DBMS\\_PARALLEL\\_EXECUTE Constants - Task Status Value"](#) on page 101-5

### Syntax

```
DBMS_PARALLEL_EXECUTE.RESUME_TASK (
    task_name          IN  VARCHAR2,
    sql_stmt           IN  CLOB,
    language_flag      IN  NUMBER,
    edition            IN  VARCHAR2  DEFAULT NULL,
    apply_crossedition_trigger IN  VARCHAR2  DEFAULT NULL,
    fire_apply_trigger IN  BOOLEAN   DEFAULT TRUE,
    parallel_level     IN  NUMBER   DEFAULT 0,
    job_class          IN  VARCHAR2  DEFAULT 'DEFAULT_JOB_CLASS',
    force              IN  BOOLEAN   DEFAULT FALSE);

DBMS_PARALLEL_EXECUTE.RESUME_TASK (
    task_name          IN  VARCHAR2,
    force              IN  BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 101-19 RESUME\_TASK Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task
<code>sql_stmt</code>	SQL statement; must have <code>:start_id</code> and <code>:end_id</code> placeholder
<code>language_flag</code>	Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> <li>▪ V6 (or 0) specifies version 6 behavior</li> <li>▪ NATIVE (or 1) specifies normal behavior for the database to which the program is connected</li> <li>▪ V7 (or 2) specifies Oracle database version 7 behavior</li> </ul>
<code>edition</code>	Specifies the edition to run the statement in. Default is the current edition.

**Table 101–19 (Cont.) RESUME\_TASK Procedure Parameters**

Parameter	Description
apply_crossedition_trigger	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user who executes the statement.
fire_apply_trigger	Indicates whether the specified apply_crossedition_trigger is itself to be executed, or should only be a guide used in selecting other triggers
parallel_level	Number of parallel jobs; zero if run in serial; NULL uses the default parallelism
job_class	If running in parallel, the jobs all belong to the specified job class
force	If TRUE, do not raise an error if the status is PROCESSING.

## Examples

Suppose the chunk table contains the following chunk ranges:

START_ID	END_ID
-----	-----
1	10
11	20
21	30

And the specified SQL statement is:

```
UPDATE employees
   SET salary = salary + 10
   WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id BETWEEN 1 and 10;
COMMIT;
```

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id between 11 and 20;
COMMIT;
```

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id between 21 and 30;
COMMIT;
```

## RUN\_TASK Procedure

This procedure executes the specified statement (`sql_stmt`) on the chunks in parallel. It commits after processing each chunk. The specified statement must have two placeholders called `start_id`, and `end_id` respectively, which represent the range of the chunk to be processed. The types of the placeholder must be `rowid` where `ROWID` based chunking was used, or `NUMBER` where number based chunking was used. The specified statement should not commit unless it is idempotent.

The SQL statement is executed as the current user.

If `apply_crossedition_trigger` is specified, `DBMS_CROSSEDITION_TRIGGER.IS_APPLYING` returns true for the sessions executing the SQL. Therefore, for parallel execution, `DBMS_CROSSEDITION_TRIGGER.IS_APPLYING` returns true in the Job slaves session.

Chunks can be executed in parallel by `DBMS_SCHEDULER` Job slaves. Therefore, parallel execution requires `CREATE JOB` system privilege. The Job slaves is created under the current user. The default number of Job slaves is computed as the product of Oracle parameters `cpu_count` and `parallel_threads_per_cpu`. On a Real Application Clusters installation, the number of Job slaves is the sum of individual settings on each node in the cluster. This procedure returns only when all the chunks are processed. In parallel cases, this procedure returns only when all the Job slaves finished.

### Syntax

```
DBMS_PARALLEL_EXECUTE.RUN_TASK (
    task_name          IN VARCHAR2,
    sql_stmt           IN CLOB,
    language_flag     IN NUMBER,
    edition            IN VARCHAR2 DEFAULT NULL,
    apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN BOOLEAN  DEFAULT TRUE,
    parallel_level     IN NUMBER   DEFAULT 0,
    job_class          IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS');
```

### Parameters

**Table 101–20 RUN\_TASK Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task
<code>sql_stmt</code>	SQL statement; must have <code>:start_id</code> and <code>:end_id</code> placeholder
<code>language_flag</code>	Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> <li>▪ V6 (or 0) specifies version 6 behavior</li> <li>▪ NATIVE (or 1) specifies normal behavior for the database to which the program is connected</li> <li>▪ V7 (or 2) specifies Oracle database version 7 behavior</li> </ul>
<code>edition</code>	Specifies the edition to run the statement in. Default is the current edition.

**Table 101–20 (Cont.) RUN\_TASK Procedure Parameters**

Parameter	Description
apply_crossedition_trigger	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user executes the statement.
fire_apply_trigger	Indicates whether the specified apply_crossedition_trigger is itself to be executed, or should only be a guide used in selecting other triggers.
parallel_level	Number of parallel jobs; zero if run in serial; NULL uses the default parallelism.\
job_class	If running in parallel, the jobs belong to the specified job class

## Examples

Suppose the chunk table contains the following chunk ranges:

START_ID	END_ID
-----	-----
1	10
11	20
21	30

And the specified SQL statement is:

```
UPDATE employees
   SET salary = salary + 10
   WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id BETWEEN 1 and 10;
COMMIT;
```

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id between 11 and 20;
COMMIT;
```

```
UPDATE employees
   SET salary =.salary + 10 WHERE employee_id between 21 and 30;
COMMIT;
```

## SET\_CHUNK\_STATUS Procedure

This procedure sets the status of the chunk. The `START_TIMESTAMP` and `END_TIMESTAMP` of the chunk is updated according to the new status:

Value of the new Status	Side Effect
-----	-----
UNASSIGNED	<code>START_TIMESTAMP</code> and <code>END_TIMESTAMP</code> will be cleared
ASSIGNED	<code>START_TIMESTAMP</code> will be the current time and <code>END_TIMESTAMP</code> will be cleared.
PROCESSED or PROCESSED_WITH_ERROR	The current time will be recorded in <code>END_TIMESTAMP</code>

**See Also:** [Views](#) on page 101-6

### Syntax

```
DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS (
    task_name      IN VARCHAR2,
    chunk_id       OUT NUMBER,
    status         IN NUMBER,
    err_num        IN NUMBER DEFAULT NULL,
    err_msg        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 101–21 SET\_CHUNK\_STATUS Procedure Parameters**

Parameter	Description
<code>task_name</code>	Name of the task
<code>chunk_id</code>	Chunk_id of the chunk
<code>status</code>	Status of the chunk: UNASSIGNED, ASSIGNED, PROCESSED, PROCESSED_WITH_ERROR
<code>err_num</code>	Error code returned during the processing of the chunk
<code>err_msg</code>	Error message returned during the processing of the chunk

## STOP\_TASK Procedure

This procedure stops the task and related job slaves.

### Syntax

```
DBMS_PARALLEL_EXECUTE.STOP_TASK (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 101–22 STOP\_TASK Procedure Parameters**

Parameter	Description
task_name	Name of the task

## TASK\_STATUS Procedure

This function returns the task status.

### Syntax

```
DBMS_PARALLEL_EXECUTE.TASK_STATUS (  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 101–23** *TASK\_STATUS Procedure Parameters*

Parameter	Description
task_name	Name of the task

The DBMS\_PCLXUTIL package provides intra-partition parallelism for creating partition-wise local indexes. DBMS\_PCLXUTIL circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one slave process for each partition is used.

**See Also:** There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Using DBMS\\_PCLXUTIL](#)
  - Overview
  - Security Model
  - Operational Notes
  - Rules and Limits
- [Summary of DBMS\\_PCLXUTIL Subprograms](#)

---

## Using DBMS\_PCLXUTIL

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)

## Overview

DBMS\_PCLXUTIL uses the DBMS\_JOB package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with DBMS\_JOB), in combination with intra-partition parallelism using the parallel query slave processes.

DBMS\_PCLXUTIL works with both range and range-hash composite partitioning.

The DBMS\_PCLXUTIL package can be used during the following DBA tasks:

### 1. Local index creation

The procedure `BUILD_PART_INDEX` assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the `UNUSABLE` option.

```
CREATE INDEX <idx_name> on <tab_name>(…) local(…) unusable;
```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure `BUILD_PART_INDEX` causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

### 2. Local index maintenance

By marking desired partitions usable or unusable, the `BUILD_PART_INDEX` procedure also enables selective rebuilding of local indexes. The `force_opt` parameter provides a way to override this and build local indexes for all partitions.

```
ALTER INDEX <idx_name> local(…) unusable;
```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using `force_opt = TRUE`:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the `DBMS_OUTPUT` package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

## **Security Model**

This utility can be run only as table owner, and not as any other user.

## Operational Notes

DBMS\_PCLXUTIL submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the `INIT.ORA` parameter `JOB_QUEUE_PROCESSES` correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

## Rules and Limits

---

---

**Note:** For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8*i*.

---

---

Because DBMS\_PCLXUTIL uses the DBMS\_JOB package, you must be aware of the following limitations pertaining to DBMS\_JOB:

- You must decide appropriate values for the `job_queue_processes` initialization parameter. Clearly, if the job processes are not started before calling `BUILD_PART_INDEX()`, then the package will not function properly. The background processes are specified by the following `init.ora` parameters:  

```
job_queue_processes=n    #the number of background processes = n
```
- Failure conditions are reported only in the trace files (a DBMS\_JOB limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the `j*.trc` trace files.

## Summary of DBMS\_PCLXUTIL Subprograms

---

**Table 102–1** *DBMS\_PCLXUTIL Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">BUILD_PART_INDEX Procedure</a> on page 102-8	Provides intra-partition parallelism for creating partition-wise local indexes

## BUILD\_PART\_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

### Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (
  jobs_per_batch IN NUMBER   DEFAULT 1,
  procs_per_job  IN NUMBER   DEFAULT 1,
  tab_name       IN VARCHAR2 DEFAULT NULL,
  idx_name       IN VARCHAR2 DEFAULT NULL,
  force_opt      IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 102–2 BUILD\_PART\_INDEX Procedure Parameters**

Parameter	Description
jobs_per_batch	The number of concurrent partition-wise "local index builds".
procs_per_job	The number of parallel query slaves to be utilized for each local index build (1 <= procs_per_job <= max_slaves).
tab_name	The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).
idx_name	The name given to the local index (an exception is raised if a local index is not created on the table tab_name).
force_opt	If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.

### Usage Notes

This utility can be run only as table owner, and not as any other user.

### Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD\_PART\_INDEX (2, 4, 'PROJECT', 'IDX', TRUE) produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);
Statement processed.
INFO: Job #21 created for partition PROJ002 with 4 slaves
INFO: Job #22 created for partition PROJ001 with 4 slaves
```

The `DBMS_PIPE` package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

- [Using DBMS\\_PIPE](#)
  - Overview
  - Security Model
  - Constants
  - Operational Notes
  - Exceptions
  - Examples
- [Summary of DBMS\\_PIPE Subprograms](#)

## Using DBMS\_PIPE

---

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)

## Overview

Pipe functionality has several potential applications:

- **External service interface:** You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- **Independent transactions:** The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- **Alerters (non-transactional):** You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "SELECT FOR UPDATE" to make sure it read the correct data.
- **Debugging:** Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- **Concentrator:** This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

## Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either [Public Pipes](#) or [Private Pipes](#).

## Constants

```
maxwait  constant integer := 86400000; /* 1000 days */
```

This is the maximum time to wait attempting to send or receive a message.

## Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

---

---

**Caution: Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.**

---

---

The operation of DBMS\_PIPE is considered with regard to the following topics:

- [Public Pipes](#)
- [Writing and Reading Pipes](#)
- [Private Pipes](#)

### Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the CREATE\_PIPE function with the private flag set to FALSE. You must deallocate explicitly-created pipes by calling the REMOVE\_PIPE function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

### Writing and Reading Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have EXECUTE permission on the DBMS\_PIPE package, and they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the PACK\_MESSAGE procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the SEND\_MESSAGE function, designating the pipe name to be used to send the message. When SEND\_MESSAGE is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the RECEIVE\_MESSAGE function, designating the pipe name from which to receive the message. The process then calls the UNPACK\_MESSAGE procedure to access each of the items in the message.

### Private Pipes

You explicitly create a private pipe by calling the CREATE\_PIPE function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the REMOVE\_PIPE function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, `CREATE_PIPE` returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as `SYSDBA`

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to `PACK_MESSAGE` before calling `SEND_MESSAGE`. Similarly, you must call `RECEIVE_MESSAGE` to retrieve the message before accessing the items in the message by calling `UNPACK_MESSAGE`.

## Exceptions

DBMS\_PIPE package subprograms can return the following errors:

**Table 103–1 DBMS\_PIPE Errors**

<b>Error</b>	<b>Description</b>
ORA-23321:	Pipename may not be null. This can be returned by the CREATE_PIPE function, or any subprogram that takes a pipe name as a parameter.
ORA-23322:	Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.

## Examples

- [Example 1: Debugging - PL/SQL](#)
- [Example 3: Execute System Commands](#)
- [Example 4: External Service Interface](#)

### Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
    DBMS_PIPE.PACK_MESSAGE(msg);
    status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
    IF status != 0 THEN
        raise_application_error(-20099, 'Debug error');
    END IF;
END debug;
```

### Example 2: Debugging - Pro\*C

The following Pro\*C code receives messages from the PLSQL\_DEBUG pipe in the previous example, and displays the messages. If the Pro\*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
    VARCHAR username[20];
    int      status;
    int      msg_length;
    char     retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{
    -- Prepare username:
    strcpy(username.arr, "SCOTT/TIGER");
    username.len = strlen(username.arr);

    EXEC SQL WHENEVER SQLERROR DO sql_error();
    EXEC SQL CONNECT :username;

    printf("connected\n");

    -- Start an endless loop to look for and print messages on the pipe:
    FOR (;;)

```

```

    {
        EXEC SQL EXECUTE
            DECLARE
                len INTEGER;
                typ INTEGER;
                sta INTEGER;
                chr VARCHAR2(2000);
            BEGIN
                chr := '';
                sta := dbms_pipe.receive_message('plsql_debug');
                IF sta = 0 THEN
                    DBMS_PIPE.UNPACK_MESSAGE(len);
                    DBMS_PIPE.UNPACK_MESSAGE(chr);
                END IF;
                :status := sta;
                :retval := chr;
                IF len IS NOT NULL THEN
                    :msg_length := len;
                ELSE
                    :msg_length := 2000;
                END IF;
            END;
        END-EXEC;
        IF (status == 0)
            printf("\n%.*s\n", msg_length, retval);
        ELSE
            printf("abnormal status, value is %d\n", status);
        }
    }

void sql_error()
{
    char msg[1024];
    int rlen, len;
    len = sizeof(msg);
    sqlglm(msg, &len, &rlen);
    printf("ORACLE ERROR\n");
    printf("%.*s\n", rlen, msg);
    exit(1);
}

```

### Example 3: Execute System Commands

This example shows PL/SQL and Pro\*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro\*C program that is listening for them.

The Pro\*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro\*C program processes it, carrying out the required action, such as executing a UNIX command through the *system()* call or executing a SQL command using embedded SQL.

DAEMON.SQL is the source code for the PL/SQL package. This package contains procedures that use the DBMS\_PIPE package to send and receive message to and from the Pro\*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the STOP command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro\*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL\*Plus or Enterprise Manager. For example:

```
SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');
```

On a UNIX system, this causes the Pro\*C daemon to execute the command *system("ls -la")*.

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL\*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS\_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL DAEMON package:

```
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                      timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER IS

    status      NUMBER;
    result      VARCHAR2(20);
    command_code NUMBER;
    pipe_name   VARCHAR2(30);
  BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SYSTEM');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20010,
        'Execute_system: Error while sending. Status = ' ||
        status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20011,
        'Execute_system: Error while receiving.
        Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
```

```
        RAISE_APPLICATION_ERROR(-20012,
        'Execute_system: Done not received.');
```

---

```
END IF;

DBMS_PIPE.UNPACK_MESSAGE(command_code);
DBMS_OUTPUT.PUT_LINE('System command executed. result = ' ||
                    command_code);
RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
                    timeout NUMBER DEFAULT 10)
RETURN NUMBER IS

    status      NUMBER;
    result      VARCHAR2(20);
    command_code NUMBER;
    pipe_name   VARCHAR2(30);

BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SQL');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20020,
        'Execute_sql: Error while sending. Status = ' || status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);

    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20021,
        'execute_sql: Error while receiving.
        Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
        RAISE_APPLICATION_ERROR(-20022,
        'execute_sql: done not received.');
```

---

```
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(command_code);
    DBMS_OUTPUT.PUT_LINE
        ('SQL command executed. sqlcode = ' || command_code);
    RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE('STOP');
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20030,
        'stop: error while sending. status = ' || status);
    END IF;
```

```

    END stop;
END daemon;

```

daemon.pc Example. This is the code for the Pro\*C daemon. You must precompile this using the Pro\*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.

---

---

**Note:** To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

---

---

```
proc iname=daemon userid=scott/tiger sqlcheck=semantics
```

Then C-compile and link in the normal way.

```

#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
    char *uid = "scott/tiger";
    int status;
    VARCHAR command[20];
    VARCHAR value[2000];
    VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while connecting:\n");
    printf("%. *s\n", msg_length, msg_buffer);
    printf("Daemon quitting.\n");
    exit(1);
}

void
sql_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while executing:\n");
    printf("%. *s\n", msg_length, msg_buffer);
    printf("Daemon continuing.\n");
}

main()
{
    command.len = 20; /*initialize length components*/

```

```
value.len = 2000;
return_name.len = 30;
EXEC SQL WHENEVER SQLERROR DO connect_error();
EXEC SQL CONNECT :uid;
printf("Daemon connected.\n");

EXEC SQL WHENEVER SQLERROR DO sql_error();
printf("Daemon waiting...\n");
while (1) {
    EXEC SQL EXECUTE
        BEGIN
            :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
            IF :status = 0 THEN
                DBMS_PIPE.UNPACK_MESSAGE(:command);
            END IF;
        END;
    END-EXEC;
    IF (status == 0)

            }
        }
        ELSE IF (!strcmp((char *) command.arr, "SQL")) {
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.UNPACK_MESSAGE(:return_name);
                    DBMS_PIPE.UNPACK_MESSAGE(:value);
                END;
            END-EXEC;
```

```

value.arr[value.len] = '\0';
printf("Will execute sql command '%s'\n", value.arr);

EXEC SQL WHENEVER SQLERROR CONTINUE;
EXEC SQL EXECUTE IMMEDIATE :value;
status = sqlca.sqlcode;

EXEC SQL WHENEVER SQLERROR DO sql_error();
EXEC SQL EXECUTE
  BEGIN
    DBMS_PIPE.PACK_MESSAGE('done');
    DBMS_PIPE.PACK_MESSAGE(:status);
    :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
  END;
END-EXEC;

IF (status)
{
  printf("Daemon error while responding to sql command.");
  printf("  status: %d\n", status);
}
}
ELSE
{
  printf
    ("Daemon error: invalid command '%s' received.\n",
     command.arr);
}
}
ELSE
{
  printf("Daemon error while waiting for signal.");
  printf("  status = %d\n", status);
}
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);

```

#### Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

protocol_version	VARCHAR2	- '1', 10 bytes or less
returnpipe	VARCHAR2	- 30 bytes or less
service	VARCHAR2	- 30 bytes or less
arg1	VARCHAR2/NUMBER/DATE	
...		
argn	VARCHAR2/NUMBER/DATE	

The recommended format for returning the result is:

success	VARCHAR2	- 'SUCCESS' if OK, otherwise error message
arg1	VARCHAR2/NUMBER/DATE	
...		

```
argn                                VARCHAR2/NUMBER/DATE
```

The "stock price request server" would do, using OCI or PRO\* (in pseudo-code):

```
<loop forever>
BEGIN dbms_stock_server.get_request(:stocksymbol); END;
<figure out price based on stocksymbol (probably from some radio
  signal), set error if can't find such a stock>
BEGIN dbms_stock_server.return_price(:error, :price); END;
```

A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```
CREATE OR REPLACE PACKAGE dbms_stock_server IS
  PROCEDURE get_request(symbol OUT VARCHAR2);
  PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
  returnpipe  VARCHAR2(30);

  PROCEDURE returnerror(reason VARCHAR2) IS
    s INTEGER;
  BEGIN
    dbms_pipe.pack_message(reason);
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error: ' || to_char(s) ||
        ' sending on pipe');
    END IF;
  END;

  PROCEDURE get_request(symbol OUT VARCHAR2) IS
    protocol_version VARCHAR2(10);
    s                 INTEGER;
    service           VARCHAR2(30);
  BEGIN
    s := dbms_pipe.receive_message('stock_service');
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error: ' || to_char(s) ||
        ' reading pipe');
    END IF;
    dbms_pipe.unpack_message(protocol_version);
    IF protocol_version <> '1' THEN
      raise_application_error(-20000, 'Bad protocol: ' ||
        protocol_version);
    END IF;
    dbms_pipe.unpack_message(returnpipe);
    dbms_pipe.unpack_message(service);
    IF service != 'getprice' THEN
      returnerror('Service ' || service || ' not supported');
    END IF;
    dbms_pipe.unpack_message(symbol);
  END;

  PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
    s INTEGER;
```

```

BEGIN
  IF errormsg IS NULL THEN
    dbms_pipe.pack_message('SUCCESS');
    dbms_pipe.pack_message(price);
  ELSE
    dbms_pipe.pack_message(errormsg);
  END IF;
  s := dbms_pipe.send_message(returnpipe);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' sending on pipe');
  END IF;
END;

```

The procedure called by the client is:

```

CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
RETURN VARCHAR2 IS
  s      INTEGER;
  price  VARCHAR2(20);
  errormsg VARCHAR2(512);
BEGIN
  dbms_pipe.pack_message('1'); -- protocol version
  dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
  dbms_pipe.pack_message('getprice');
  dbms_pipe.pack_message(symbol);
  s := dbms_pipe.send_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' sending on pipe');
  END IF;
  s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' receiving on pipe');
  END IF;
  dbms_pipe.unpack_message(errormsg);
  IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
  END IF;
  dbms_pipe.unpack_message(price);
  RETURN price;
END;

```

You would typically only GRANT EXECUTE on DBMS\_STOCK\_SERVICE to the stock service application server, and would only GRANT EXECUTE on stock\_request to those users allowed to use the service.

## Summary of DBMS\_PIPE Subprograms

**Table 103–2 DBMS\_PIPE Package Subprograms**

Subprogram	Description
<a href="#">CREATE_PIPE Function</a> on page 103-19	Creates a pipe (necessary for private pipes)
<a href="#">NEXT_ITEM_TYPE Function</a> on page 103-21	Returns datatype of next item in buffer
<a href="#">PACK_MESSAGE Procedures</a> on page 103-22	Builds message in local buffer
<a href="#">PURGE Procedure</a> on page 103-24	Purges contents of named pipe
<a href="#">RECEIVE_MESSAGE Function</a> on page 103-25	Copies message from named pipe into local buffer
<a href="#">REMOVE_PIPE Function</a> on page 103-28	Removes the named pipe
<a href="#">RESET_BUFFER Procedure</a> on page 103-27	Purges contents of local buffer
<a href="#">SEND_MESSAGE Function</a> on page 103-29	Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist
<a href="#">UNIQUE_SESSION_NAME Function</a> on page 103-31	Returns unique session name
<a href="#">UNPACK_MESSAGE Procedures</a> on page 103-32	Accesses next item in buffer

## CREATE\_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

### Syntax

```
DBMS_PIPE.CREATE_PIPE (
    pipename      IN VARCHAR2,
    maxpipesize   IN INTEGER DEFAULT 8192,
    private       IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

### Parameters

**Table 103–3 CREATE\_PIPE Function Parameters**

Parameter	Description
<code>pipename</code>	<p>Name of the pipe you are creating.</p> <p>You must use this name when you call <code>SEND_MESSAGE</code> and <code>RECEIVE_MESSAGE</code>. This name must be unique across the instance.</p> <p>Caution: Do not use pipe names beginning with <code>ORA\$</code>. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.</p>
<code>maxpipesize</code>	<p>The maximum size allowed for the pipe, in bytes.</p> <p>The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default <code>maxpipesize</code> is 8192 bytes.</p> <p>The <code>maxpipesize</code> for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of <code>SEND_MESSAGE</code> with larger values cause the <code>maxpipesize</code> to be increased. Callers with a smaller value use the existing, larger value.</p>
<code>private</code>	<p>Uses the default, <code>TRUE</code>, to create a private pipe.</p> <p>Public pipes can be implicitly created when you call <code>SEND_MESSAGE</code>.</p>

## Return Values

**Table 103–4 CREATE\_PIPE Function Return Values**

Return	Description
0	Successful.  If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.  If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
ORA-23322	Failure due to naming conflict.  If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

## Exceptions

**Table 103–5 CREATE\_PIPE Function Exception**

Exception	Description
Null pipe name	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

## NEXT\_ITEM\_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called `RECEIVE_MESSAGE` to place pipe information in a local buffer, call `NEXT_ITEM_TYPE`.

### Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references (next_item_type, WNDS, RNDS);
```

### Return Values

**Table 103–6** *NEXT\_ITEM\_TYPE* Function Return Values

Return	Description
0	No more items
6	NUMBER
9	VARCHAR2
11	ROWID
12	DATE
23	RAW

## PACK\_MESSAGE Procedures

This procedure builds your message in the local message buffer. To send a message, first make one or more calls to `PACK_MESSAGE`. Then, call `SEND_MESSAGE` to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type `VARCHAR2`, `NCHAR`, `NUMBER`, `DATE`, `RAW` and `ROWID` items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message. The overhead for all types other than `VARCHAR` is 4 bytes.

### Syntax

```
DBMS_PIPE.PACK_MESSAGE (
    item IN VARCHAR2);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN NCHAR);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN NUMBER);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN DATE);
```

```
DBMS_PIPE.PACK_MESSAGE_RAW (
    item IN RAW);
```

```
DBMS_PIPE.PACK_MESSAGE_ROWID (
    item IN ROWID);
```

### Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

### Parameters

**Table 103–7 PACK\_MESSAGE Procedure Parameters**

Parameter	Description
item	Item to pack into the local message buffer.

### Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call `SEND_MESSAGE` to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

**Exceptions**

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

## PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling `PURGE` lets you free the memory associated with an implicitly-created pipe.

### Syntax

```
DBMS_PIPE.PURGE (  
    pipename IN VARCHAR2);
```

### Pragmas

```
pragma restrict_references (purge, WNDS, RNDS);
```

### Parameters

**Table 103–8** *PURGE Procedure Parameters*

Parameter	Description
<code>pipename</code>	Name of pipe from which to remove all messages.  The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive.

### Usage Notes

Because `PURGE` calls `RECEIVE_MESSAGE`, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an `ORA-23322` (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

### Exceptions

Permission error if pipe belongs to another user.

## RECEIVE\_MESSAGE Function

This function copies the message into the local message buffer.

### Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references (receive_message, WNDS, RNDS);
```

### Parameters

**Table 103–9 RECEIVE\_MESSAGE Function Parameters**

Parameter	Description
pipename	Name of the pipe on which you want to receive a message. Names beginning with ORA\$ are reserved for use by Oracle
timeout	Time to wait for a message, in seconds.  The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking.

### Return Values

**Table 103–10 RECEIVE\_MESSAGE Function Return Values**

Return	Description
0	Success
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer. (This should not happen.)
3	An interrupt occurred.
ORA-23322	User has insufficient privileges to read from the pipe.

### Usage Notes

To receive a message from a pipe, first call `RECEIVE_MESSAGE`. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call `RECEIVE_MESSAGE` does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to `UNPACK_MESSAGE` to access the individual items in the message. The `UNPACK_MESSAGE` procedure is

overloaded to unpack items of type DATE, NUMBER, VARCHAR2, and there are two additional procedures to unpack RAW and ROWID items. If you do not know the type of data that you are attempting to unpack, then call NEXT\_ITEM\_TYPE to determine the type of the next item in the buffer.

## Exceptions

**Table 103–11** *RECEIVE\_MESSAGE Function Exceptions*

<b>Exception</b>	<b>Description</b>
Null pipe name	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

## RESET\_BUFFER Procedure

This procedure resets the `PACK_MESSAGE` and `UNPACK_MESSAGE` positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

### Syntax

```
DBMS_PIPE.RESET_BUFFER;
```

### Pragmas

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

## REMOVE\_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by `SEND_MESSAGE` are automatically removed when empty. However, pipes created explicitly by `CREATE_PIPE` are removed only by calling `REMOVE_PIPE`, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling `PURGE` on an implicitly-created pipe.

### Syntax

```
DBMS_PIPE.REMOVE_PIPE (
    pipename IN VARCHAR2)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

### Parameters

**Table 103–12 REMOVE\_PIPE Function Parameters**

Parameter	Description
pipename	Name of pipe that you want to remove.

### Return Values

**Table 103–13 REMOVE\_PIPE Function Return Values**

Return	Description
0	Success  If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.
ORA-23322	Insufficient privileges.  If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.

### Exceptions

**Table 103–14 REMOVE\_PIPE Function Exception**

Exception	Description
Null pipe name	Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.

## SEND\_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to `PACK_MESSAGE`. You can create a pipe explicitly using `CREATE_PIPE`, otherwise, it is created implicitly.

### Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER DEFAULT MAXWAIT,
    maxpipesize   IN INTEGER DEFAULT 8192)
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references (send_message, WNDS, RNDS);
```

### Parameters

**Table 103–15 SEND\_MESSAGE Function Parameters**

Parameter	Description
<code>pipename</code>	<p>Name of the pipe on which you want to place the message.</p> <p>If you are using an explicit pipe, then this is the name that you specified when you called <code>CREATE_PIPE</code>.</p> <p>Caution: Do not use pipe names beginning with 'ORA\$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.</p>
<code>timeout</code>	<p>Time to wait while attempting to place a message on a pipe, in seconds.</p> <p>The default value is the constant <code>MAXWAIT</code>, which is defined as 86400000 (1000 days).</p>
<code>maxpipesize</code>	<p>Maximum size allowed for the pipe, in bytes.</p> <p>The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes.</p> <p>The <code>maxpipesize</code> for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of <code>SEND_MESSAGE</code> with larger values cause the <code>maxpipesize</code> to be increased. Callers with a smaller value simply use the existing, larger value.</p> <p>Specifying <code>maxpipesize</code> as part of the <code>SEND_MESSAGE</code> procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional <code>maxpipesize</code> parameter to override the creation pipe size specifications.</p>

## Return Values

**Table 103–16 SEND\_MESSAGE Function Return Values**

Return	Description
0	<p>Success.</p> <p>If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.</p> <p>If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</p>
1	<p>Timed out.</p> <p>This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.</p>
3	<p>An interrupt occurred.</p> <p>If the pipe was implicitly created and is empty, then it is removed.</p>
ORA-23322	<p>Insufficient privileges.</p> <p>If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.</p>

## Exceptions

**Table 103–17 SEND\_MESSAGE Function Exception**

Exception	Description
Null pipe name	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

## UNIQUE\_SESSION\_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the `PIPENAME` parameter for your `SEND_MESSAGE` and `RECEIVE_MESSAGE` calls.

### Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

### Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

## UNPACK\_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called `RECEIVE_MESSAGE` to place pipe information in a local buffer, call `UNPACK_MESSAGE`.

---

---

**Note:** The `UNPACK_MESSAGE` procedure is overloaded to return items of type `VARCHAR2`, `NCHAR`, `NUMBER`, or `DATE`. There are two additional procedures to unpack `RAW` and `ROWID` items.

---

---

### Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT VARCHAR2);
```

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT NCHAR);
```

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT NUMBER);
```

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT DATE);
```

```
DBMS_PIPE.UNPACK_MESSAGE_RAW (
    item OUT RAW);
```

```
DBMS_PIPE.UNPACK_MESSAGE_ROWID (
    item OUT ROWID);
```

### Pragmas

```
pragma restrict_references (unpack_message, WNDS, RNDS);
pragma restrict_references (unpack_message_raw, WNDS, RNDS);
pragma restrict_references (unpack_message_rowid, WNDS, RNDS);
```

### Parameters

**Table 103–18 UNPACK\_MESSAGE Procedure Parameters**

Parameter	Description
<code>item</code>	Argument to receive the next unpacked item from the local message buffer.

### Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

---

---

## DBMS\_PREDICTIVE\_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining.

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

**See Also:** *Oracle Data Mining Concepts* for an overview of Oracle predictive analytics, including information about the Oracle Spreadsheet Add-In for Predictive Analytics.

This chapter contains the following topics:

- [Using DBMS\\_PREDICTIVE\\_ANALYTICS](#)
  - [Overview](#)
  - [Security Model](#)
- [Summary of DBMS\\_PREDICTIVE\\_ANALYTICS Subprograms](#)

---

## Using DBMS\_PREDICTIVE\_ANALYTICS

This section contains topics that relate to using the DBMS\_PREDICTIVE\_ANALYTICS package.

- [Overview](#)
- [Security Model](#)

## Overview

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

DBMS\_PREDICTIVE\_ANALYTICS automates parts of step 3 — 5 of this process.

Predictive analytics procedures analyze and prepare the input data, create and test mining models using the input data, and then use the input data for scoring. The results of scoring are returned to the user. The models and supporting objects are not preserved after the operation completes.

## Security Model

The `DBMS_PREDICTIVE_ANALYTICS` package is owned by user `SYS` and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The `DBMS_PREDICTIVE_ANALYTICS` package exposes APIs which are leveraged by the Oracle Data Mining option. Users who wish to invoke procedures in this package require the `CREATE MINING MODEL` system privilege (as well as the `CREATE TABLE` and `CREATE VIEW` system privilege).

## Summary of DBMS\_PREDICTIVE\_ANALYTICS Subprograms

**Table 104-1** *DBMS\_PREDICTIVE\_ANALYTICS Package Subprograms*

<b>Subprogram</b>	<b>Purpose</b>
<a href="#">EXPLAIN Procedure</a> on page 104-6	Ranks attributes in order of influence in explaining a target column.
<a href="#">PREDICT Procedure</a> on page 104-8	Predicts the value of a target column based on values in the input data.
<a href="#">PROFILE Procedure</a> on page 104-10	Generates rules that identify the records that have the same target value.

## EXPLAIN Procedure

The `EXPLAIN` procedure identifies the attributes that are important in explaining the variation in values of a target column.

The input data must contain some records where the target value is known (not `NULL`). These records are used by the procedure to train a model that calculates the attribute importance.

---

**Note:** `EXPLAIN` supports `DATE` and `TIMESTAMP` data types in addition to the numeric, character, and nested data types supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide*.

---

The `EXPLAIN` procedure creates a result table that lists the attributes in order of their explanatory power. The result table is described in the Usage Notes.

### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (
    data_table_name      IN VARCHAR2,
    explain_column_name  IN VARCHAR2,
    result_table_name    IN VARCHAR2,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 104–2** *EXPLAIN Procedure Parameters*

Parameter	Description
<code>data_table_name</code>	Name of input table or view
<code>explain_column_name</code>	Name of the column to be explained
<code>result_table_name</code>	Name of the table where results are saved
<code>data_schema_name</code>	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

### Usage Notes

The `EXPLAIN` procedure creates a result table with the columns described in [Table 104–3](#).

**Table 104–3 EXPLAIN Procedure Result Table**

Column Name	Data Type	Description
ATTRIBUTE_NAME	VARCHAR2 (30)	Name of a column in the input data; all columns except the explained column are listed in the result table.
EXPLANATORY_VALUE	NUMBER	Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1.  An individual column's explanatory value is independent of other columns in the input table. The values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column.  An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for PREDICT. In practice, an explanatory power equal to 1 is rarely returned.
RANK	NUMBER	Ranking of explanatory power. Rows with equal values for explanatory_value have the same rank. Rank values are not skipped in the event of ties.

## Example

The following example performs an EXPLAIN operation on the SUPPLEMENTARY\_DEMOGRAPHICS table of Sales History.

```
--Perform EXPLAIN operation
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
    data_table_name => 'supplementary_demographics',
    explain_column_name => 'home_theater_package',
    result_table_name => 'demographics_explain_result');
END;
/
--Display results
SELECT * FROM demographics_explain_result;
```

ATTRIBUTE_NAME	EXPLANATORY_VALUE	RANK
Y_BOX_GAMES	.524311073	1
YRS_RESIDENCE	.495987246	2
HOUSEHOLD_SIZE	.146208506	3
AFFINITY_CARD	.0598227	4
EDUCATION	.018462703	5
OCCUPATION	.009721543	6
FLAT_PANEL_MONITOR	.00013733	7
PRINTER_SUPPLIES	0	8
OS_DOC_SET_KANJI	0	8
BULK_PACK_DISKETTES	0	8
BOOKKEEPING_APPLICATION	0	8
COMMENTS	0	8
CUST_ID	0	8

The results show that Y\_BOX\_GAMES, YRS\_RESIDENCE, and HOUSEHOLD\_SIZE are the best predictors of HOME\_THEATER\_PACKAGE.

## PREDICT Procedure

The PREDICT procedure predicts the values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train and test a model that makes the predictions.

---

**Note:** PREDICT supports DATE and TIMESTAMP data types in addition to the numeric, character, and nested data types supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide*.

---

The PREDICT procedure creates a result table that contains a predicted target value for every record. The result table is described in the Usage Notes.

### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
  accuracy          OUT NUMBER,
  data_table_name   IN VARCHAR2,
  case_id_column_name IN VARCHAR2,
  target_column_name IN VARCHAR2,
  result_table_name IN VARCHAR2,
  data_schema_name  IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 104–4 PREDICT Procedure Parameters**

Parameter	Description
accuracy	Output parameter that returns the predictive confidence, a measure of the accuracy of the predicted values. The predictive confidence for a categorical target is the most common target value; the predictive confidence for a numerical target is the mean.
data_table_name	Name of the input table or view.
case_id_column_name	Name of the column that uniquely identifies each case (record) in the input data.
target_column_name	Name of the column to predict.
result_table_name	Name of the table where results will be saved.
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

### Usage Notes

The PREDICT procedure creates a result table with the columns described in [Table 104–5](#).

**Table 104–5 PREDICT Procedure Result Table**

Column Name	Data Type	Description
Case ID column name	VARCHAR2 or NUMBER	The name of the case ID column in the input data.
PREDICTION	VARCHAR2 or NUMBER	The predicted value of the target column for the given case.
PROBABILITY	NUMBER	For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains NULL.

---

**Note:** Make sure that the name of the case ID column is not 'PREDICTION' or 'PROBABILITY'.

---

Predictions are returned for all cases whether or not they contained target values in the input.

Predicted values for known cases may be interesting in some situations. For example, you could perform deviation analysis to compare predicted values and actual values.

## Example

The following example performs a PREDICT operation and displays the first 10 predictions. The results show an accuracy of 79% in predicting whether each customer has an affinity card.

```
--Perform PREDICT operation
DECLARE
    v_accuracy NUMBER(10,9);
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PREDICT(
        accuracy          => v_accuracy,
        data_table_name   => 'supplementary_demographics',
        case_id_column_name => 'cust_id',
        target_column_name => 'affinity_card',
        result_table_name => 'pa_demographics_predict_result');
    DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/
```

Accuracy = .788696903

```
--Display results
SELECT * FROM pa_demographics_predict_result WHERE rownum < 10;
```

```

CUST_ID PREDICTION PROBABILITY
-----
101501          1 .834069848
101502          0 .991269965
101503          0 .99978311
101504          1 .971643388
101505          1 .541754127
101506          0 .803719133
101507          0 .999999303
101508          0 .999999987
101509          0 .999953074
```

## PROFILE Procedure

The `PROFILE` procedure generates rules that describe the cases (records) from the input data. For example, if a target column `CHURN` has values 'Yes' and 'No', `PROFILE` generates a set of rules describing the expected outcomes. Each profile includes a rule, record count, and a score distribution.

The input data must contain some cases where the target value is known (not `NULL`). These cases are used by the procedure to build a model that calculates the rules.

---

**Note:** `PROFILE` does not support nested types or dates.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide*.

---

The `PROFILE` procedure creates a result table that specifies rules (profiles) and their corresponding target values. The result table is described in the Usage Notes.

### Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PROFILE (
  data_table_name          IN VARCHAR2,
  target_column_name      IN VARCHAR2,
  result_table_name       IN VARCHAR2,
  data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 104–6 PROFILE Procedure Parameters**

Parameter	Description
<code>data_table_name</code>	Name of the table containing the data to be analyzed.
<code>target_column_name</code>	Name of the target column.
<code>result_table_name</code>	Name of the table where the results will be saved.
<code>data_schema_name</code>	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

### Usage Notes

The `PROFILE` procedure creates a result table with the columns described in [Table 104–7](#).

**Table 104–7 PROFILE Procedure Result Table**

Column Name	Data Type	Description
<code>PROFILE_ID</code>	NUMBER	A unique identifier for this profile (rule).
<code>RECORD_COUNT</code>	NUMBER	The number of records described by the profile.
<code>DESCRIPTION</code>	<code>SYS.XMLTYPE</code>	The profile rule. See " <a href="#">XML Schema for Profile Rules</a> ".

#### XML Schema for Profile Rules

The `DESCRIPTION` column of the result table contains XML that conforms to the following XSD:

```

<xs:element name="SimpleRule">
  <xs:complexType>
    <xs:sequence>
      <xs:group ref="PREDICATE"/>
      <xs:element ref="ScoreDistribution" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="id" type="xs:string" use="optional"/>
    <xs:attribute name="score" type="xs:string" use="required"/>
    <xs:attribute name="recordCount" type="NUMBER" use="optional"/>
  </xs:complexType>
</xs:element>

```

## Example

This example generates a rule describing customers who are likely to use an affinity card (target value is 1) and a set of rules describing customers who are not likely to use an affinity card (target value is 0). The rules are based on only two predictors: education and occupation.

```

SET serveroutput ON
SET trimspool ON
SET pages 10000
SET long 10000
SET pagesize 10000
SET linesize 150
CREATE VIEW cust_edu_occ_view AS
    SELECT cust_id, education, occupation, affinity_card
    FROM sh.supplementary_demographics;
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.PROFILE(
    DATA_TABLE_NAME => 'cust_edu_occ_view',
    TARGET_COLUMN_NAME => 'affinity_card',
    RESULT_TABLE_NAME => 'profile_result');
END;
/

```

This example generates eight rules in the result table `profile_result`. Seven of the rules suggest a target value of 0; one rule suggests a target value of 1. The `score` attribute on a rule identifies the target value.

This `SELECT` statement returns all the rules in the result table.

```

SELECT a.profile_id, a.record_count, a.description.getstringval()
FROM profile_result a;

```

This `SELECT` statement returns the rules for a target value of 0.

```

SELECT *
FROM profile_result t
WHERE extractvalue(t.description, '/SimpleRule/@score') = 0;

```

To obtain more readable output, you can cut and paste the XML for a rule into a text file, save it with the `.xml` extension, and view the rule in a browser. The eight rules generated by this example are displayed as follows.

```

<SimpleRule id="1" score="0" recordCount="443">
  <CompoundPredicate booleanOperator="and">
    <SimpleSetPredicate field="OCCUPATION" booleanOperator="isIn">
      <Array type="string">"Armed-F" "Exec." "Prof." "Protec."

  <ScoreDistribution value="1" recordCount="25"/>
</SimpleRule>

```

---

---

## DBMS\_PREPROCESSOR

The DBMS\_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics

- [Using DBMS\\_PREPROCESSOR](#)
  - Overview
  - Operating Notes
- [Data Structures](#)
  - Table Types
- [Summary of DBMS\\_PREPROCESSOR Subprograms](#)

## Using DBMS\_PREPROCESSOR

- [Overview](#)
- [Operating Notes](#)

## Overview

There are three styles of subprograms.

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a `VARCHAR2` string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a `VARCHAR2` index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is `VALID` and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single `VARCHAR2` string in the second style, or as a `VARCHAR2` index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the `VARCHAR2` length limit.

## Operating Notes

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be `VALID`. Likewise, the source text passed in as a `VARCHAR2` string or a `VARCHAR2` index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.
- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as `CREATE` or `REPLACE`. In general, the input source should be syntactically prepared in a way as if it were obtained from the `ALL_SOURCE` view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

anonymous block	(BEGIN   DECLARE) ...
package	PACKAGE <name> ...
package body	PACKAGE BODY <name> ...
procedure	PROCEDURE <name> ...
function	FUNCTION <name> ...
type	TYPE <name> ...
type body	TYPE BODY <name> ...
trigger	(BEGIN   DECLARE) ...

If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.

- If the text of a wrapped PL/SQL unit is obtained from the `ALL_SOURCE` view, the keyword `WRAPPED` always immediately follows the name of the unit, as in this example:

```
PROCEDURE "some proc" WRAPPED
a000000
b2
...
```

If such source text is presented to one of the [GET\\_POST\\_PROCESSED\\_SOURCE Functions](#) or to one of the [PRINT\\_POST\\_PROCESSED\\_SOURCE Procedures](#), the exception `DBMS_PREPROCESSOR.WRAPPED_INPUT` is raised.

## Data Structures

The DBMS\_PREPROCESSOR package defines a TABLE type.

### Table Types

[SOURCE\\_LINES\\_T Table Type](#)

## SOURCE\_LINES\_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

### Syntax

```
TYPE source_lines_t IS  
    TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

## Summary of DBMS\_PREPROCESSOR Subprograms

**Table 105-1 DBMS\_PREPROCESSOR Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET_POST_PROCESSED_SOURCE Functions</a> on page 105-8	Returns the post-processed source text
<a href="#">PRINT_POST_PROCESSED_SOURCE Procedures</a> on page 105-10	Prints post-processed source text

## GET\_POST\_PROCESSED\_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

### Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    object_type    IN VARCHAR2,
    schema_name    IN VARCHAR2,
    object_name    IN VARCHAR2)
RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         IN VARCHAR2)
RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         IN source_lines_t)
RETURN source_lines_t;
```

### Parameters

**Table 105–2** GET\_POST\_PROCESSED\_SOURCE Function Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

### Return Values

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

### Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

## Exceptions

**Table 105-3** *GET\_POST\_PROCESSED\_SOURCE* Function Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.
ORA-06502	Numeric or value error: <ul style="list-style-type: none"><li>Character string buffer too small</li><li>A line is too long (&gt; 32767 bytes)</li></ul>

## PRINT\_POST\_PROCESSED\_SOURCE Procedures

This overloaded procedure calls `DBMS_OUTPUT.PUT_LINE` to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

### Syntax

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
  object_type  IN VARCHAR2,
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
  source       IN VARCHAR2);
```

Prints post-processed source text of an `INDEX-BY` table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
  source       IN source_lines_t);
```

### Parameters

**Table 105–4 PRINT\_POST\_PROCESSED\_SOURCE Procedure Parameters**

Parameter	Description
<code>object_type</code>	Must be one of <code>PACKAGE</code> , <code>PACKAGE BODY</code> , <code>PROCEDURE</code> , <code>FUNCTION</code> , <code>TYPE</code> , <code>TYPE, BODY</code> or <code>TRIGGER</code> . Case sensitive.
<code>schema_name</code>	The schema name. Case insensitive unless a quoted identifier is used. If <code>NULL</code> , use current schema.
<code>object_name</code>	The name of the object. The <code>object_type</code> is always case insensitive. Case insensitive unless a quoted identifier is used.
<code>source</code>	The source text of the compilation unit
<code>source_lines_t</code>	<code>INDEX-BY</code> table containing the source text of the compilation unit. The source text is a concatenation of all the non- <code>NULL</code> <code>INDEX-BY</code> table elements in ascending index order.

### Exceptions

**Table 105–5 PRINT\_POST\_PROCESSED\_SOURCE Procedure Exceptions**

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of <code>PACKAGE</code> , <code>PACKAGE BODY</code> , <code>PROCEDURE</code> , <code>FUNCTION</code> , <code>TYPE</code> , <code>TYPE, BODY</code> or <code>TRIGGER</code> .
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The <code>object_name</code> should not be <code>NULL</code> .

**Table 105-5 (Cont.) PRINT\_POST\_PROCESSED\_SOURCE Procedure Exceptions**

<b>Exception</b>	<b>Description</b>
ORA-06502	Numeric or value error: <ul style="list-style-type: none"><li>▪ Character string buffer too small</li><li>▪ A line is too long (&gt; 32767 bytes)</li></ul>

**Usage Notes**

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

The DBMS\_PROFILER package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- [Using DBMS\\_PROFILER](#)
  - Overview
  - Security Model
  - Operational Notes
  - Exceptions
- [Summary of DBMS\\_PROFILER Subprograms](#)

---

## Using DBMS\_PROFILER

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)

## Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

---

**Note:** It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

---

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in [Table 106–1](#), [Table 106–2](#), and [Table 106–3](#).

**Table 106–1 Columns in Table `PLSQL_PROFILER_RUNS`**

Column	Datatype	Definition
<code>runid</code>	NUMBER PRIMARY KEY	Unique run identifier from <code>plsql_profiler_runnumber</code>
<code>related_run</code>	NUMBER	Runid of related run (for client/server correlation)
<code>run_owner</code>	VARCHAR2 (32)	User who started run
<code>run_date</code>	DATE	Start time of run
<code>run_comment</code>	VARCHAR2 (2047)	User provided comment for this run
<code>run_total_time</code>	NUMBER	Elapsed time for this run in nanoseconds
<code>run_system_info</code>	VARCHAR2 (2047)	Currently unused
<code>run_comment1</code>	VARCHAR2 (2047)	Additional comment
<code>spare1</code>	VARCHAR2 (256)	Unused

**Table 106–2 Columns in Table `PLSQL_PROFILER_UNITS`**

Column	Datatype	Definition
<code>runid</code>	NUMBER	Primary key, references <code>plsql_profiler_runs</code> ,
<code>unit_number</code>	NUMBER	Primary key, internally generated library unit #
<code>unit_type</code>	VARCHAR2 (32)	Library unit type
<code>unit_owner</code>	VARCHAR2 (32)	Library unit owner name
<code>unit_name</code>	VARCHAR2 (32)	Library unit name timestamp on library unit
<code>unit_timestamp</code>	DATE	In the future will be used to detect changes to unit between runs

**Table 106–2 (Cont.) Columns in Table PLSQL\_PROFILER\_UNITS**

Column	Datatype	Definition
total_time	NUMBER	Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools.
spare1	NUMBER	Unused
spare2	NUMBER	Unused

**Table 106–3 Columns in Table PLSQL\_PROFILER\_DATA**

Column	Datatype	Definition
runid	NUMBER	Primary key, unique (generated) run identifier
unit_number	NUMBER	Primary key, internally generated library unit number
line#	NUMBER	Primary key, not null, line number in unit
total_occur	NUMBER	Number of times line was executed
total_time	NUMBER	Total time spent executing line in nanoseconds
min_time	NUMBER	Minimum execution time for this line in nanoseconds
max_time	NUMBER	Maximum execution time for this line in nanoseconds
spare1	NUMBER	Unused
spare2	NUMBER	Unused
spare3	NUMBER	Unused
spare4	NUMBER	Unused

With Oracle database version 8.x, a sample textual report writer(`profrep.sql`) is provided with the PL/SQL demo scripts.

## Security Model

The profiler only gathers data for units for which a user has `CREATE` privilege; you cannot use the package to profile units for which `EXECUTE ONLY` access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled `DEBUG`. Oracle advises that modules that are being profiled should be compiled `DEBUG`, since this provides additional information about the unit in the database.

---

---

**Note:** `DBMS_PROFILER` treats any program unit that is compiled in `NATIVE` mode as if you do not have `CREATE` privilege, that is, you will not get any output.

---

---

## Operational Notes

- [Typical Run](#)
- [Two Methods of Exception Generation](#)

### Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a "run". A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

A typical run involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

---

---

**Note:** The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

---

---

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures.

Flushing the collected data involves storing collected data in database tables. The tables should already exist in the profiler user's schema. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, "warm up" the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the `SYSADMIN` should use a modified `PROFLOAD.SQL` script which:

- Creates the profiler tables and sequence
- Grants SELECT/INSERT/UPDATE on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

---

---

**Note:** Do not alter the actual fields of the tables.

---

---

**See Also:** ["FLUSH\\_DATA Function and Procedure"](#) on page 106-10.

## Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

## Exceptions

**Table 106–4** *DBMS\_PROFILER Exceptions*

Exception	Description
<code>version_mismatch</code>	Corresponds to <code>error_version</code> .
<code>profiler_error</code>	Corresponds to either "error_param" or "error_io".

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'  
`error_param` constant `binary_integer` := 1;
- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'  
`error_io` constant `binary_integer` := 2;
- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the `DBMS_PROFILER` package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.  
`error_version` constant `binary_integer` := -1;

---

## Summary of DBMS\_PROFILER Subprograms

**Table 106–5** *DBMS\_PROFILER Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">FLUSH_DATA Function and Procedure</a> on page 106-10	Flushes profiler data collected in the user's session
<a href="#">GET_VERSION Procedure</a> on page 106-11	Gets the version of this API
<a href="#">INTERNAL_VERSION_CHECK Function</a> on page 106-12	Verifies that this version of the DBMS_PROFILER package can work with the implementation in the database
<a href="#">PAUSE_PROFILER Function and Procedure</a> on page 106-13	Pauses profiler data collection
<a href="#">RESUME_PROFILER Function and Procedure</a> on page 106-14	Resumes profiler data collection
<a href="#">START_PROFILER Functions and Procedures</a> on page 106-15	Starts profiler data collection in the user's session
<a href="#">STOP_PROFILER Function and Procedure</a> on page 106-16	Stops profiler data collection in the user's session

## FLUSH\_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

---

---

**Note:** Use the `PROFTAB.SQL` script to create the tables and other data structures required for persistently storing the profiler data.

---

---

### Syntax

```
DBMS_PROFILER.FLUSH_DATA  
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.FLUSH_DATA;
```

## GET\_VERSION Procedure

This procedure gets the version of this API.

### Syntax

```
DBMS_PROFILER.GET_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

### Parameters

**Table 106–6** *GET\_VERSION Procedure Parameters*

Parameter	Description
major	Major version of DBMS_PROFILER.
minor	Minor version of DBMS_PROFILER.

## INTERNAL\_VERSION\_CHECK Function

This function verifies that this version of the DBMS\_PROFILER package can work with the implementation in the database.

### Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK  
RETURN BINARY_INTEGER;
```

## PAUSE\_PROFILER Function and Procedure

This function pauses profiler data collection.

### Syntax

```
DBMS_PROFILER.PAUSE_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.PAUSE_PROFILER;
```

## RESUME\_PROFILER Function and Procedure

This function resumes profiler data collection.

### Syntax

```
DBMS_PROFILER.RESUME_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.RESUME_PROFILER;
```

## START\_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the `START_PROFILER` function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

### Syntax

```
DBMS_PROFILER.START_PROFILER(
    run_comment    IN VARCHAR2 := sysdate,
    run_comment1   IN VARCHAR2 := '',
    run_number     OUT BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER(
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '')
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER(
    run_comment    IN VARCHAR2 := sysdate,
    run_comment1   IN VARCHAR2 := '',
    run_number     OUT BINARY_INTEGER);
```

```
DBMS_PROFILER.START_PROFILER(
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '');
```

### Parameters

**Table 106–7** *START\_PROFILER Function Parameters*

Parameter	Description
<code>run_comment</code>	Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.
<code>run_number</code>	Stores the number of the run so you can store and later recall the run's data.
<code>run_comment1</code>	Allows you to make interesting comments about the run.

## STOP\_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

### Syntax

```
DBMS_PROFILER.STOP_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.STOP_PROFILER;
```

---

---

## DBMS\_PROPAGATION\_ADM

The DBMS\_PROPAGATION\_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

This chapter contains the following topics:

- [Using DBMS\\_PROPAGATION\\_ADM](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_PROPAGATION\\_ADM Subprograms](#)

---

## Using DBMS\_PROPAGATION\_ADM

This section contains topics which relate to using the DBMS\_CAPTURE\_ADM package.

- [Overview](#)
- [Security Model](#)

## Overview

This package provides interfaces to start, stop, and configure a propagation.

**See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and propagations

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

When the DBMS\_PROPAGATION\_ADM package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

**See Also:** *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator

---

## Summary of DBMS\_PROPAGATION\_ADM Subprograms

**Table 107-1 DBMS\_PROPAGATION\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ALTER_PROPAGATION Procedure</a> on page 107-6	Adds, alters, or removes a rule set for a propagation
<a href="#">CREATE_PROPAGATION Procedure</a> on page 107-8	Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation
<a href="#">DROP_PROPAGATION Procedure</a> on page 107-11	Drops a propagation
<a href="#">START_PROPAGATION Procedure</a> on page 107-13	Starts a propagation
<a href="#">STOP_PROPAGATION Procedure</a> on page 107-14	Stops a propagation

---

**Note:** All subprograms commit unless specified otherwise.

---

## ALTER\_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

**See Also:** *Oracle Streams Concepts and Administration* and [Chapter 127, "DBMS\\_RULE\\_ADM"](#) for more information about rules and rule sets

### Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
  propagation_name      IN  VARCHAR2,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set      IN  BOOLEAN   DEFAULT FALSE,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 107–2 ALTER\_PROPAGATION Procedure Parameters**

Parameter	Description
propagation_name	The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[ schema_name. ] rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p>
remove_rule_set	<p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages.</p> <p>If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified propagation.</p> <p>If the <code>rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

**Table 107-2 (Cont.) ALTER\_PROPAGATION Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages.</p> <p>If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified propagation.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

## CREATE\_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

### Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION (
  propagation_name      IN  VARCHAR2,
  source_queue          IN  VARCHAR2,
  destination_queue     IN  VARCHAR2,
  destination_dblink    IN  VARCHAR2  DEFAULT NULL,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  queue_to_queue        IN  BOOLEAN   DEFAULT NULL,
  original_propagation_name IN VARCHAR2  DEFAULT NULL,
  auto_merge_threshold  IN  NUMBER    DEFAULT NULL);
```

### Parameters

**Table 107-3 CREATE\_PROPAGATION Procedure Parameters**

Parameter	Description
<code>propagation_name</code>	The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner.  <b>Note:</b> The <code>propagation_name</code> setting cannot be altered after the propagation is created.
<code>source_queue</code>	The name of the source queue, specified as [ <i>schema_name</i> .] <i>queue_name</i> . The current database must contain the source queue.  For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>destination_queue</code>	The name of the destination queue, specified as [ <i>schema_name</i> .] <i>queue_name</i> .  For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>destination_dblink</code>	The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue.  If NULL, then the source queue and destination queue must be in the same database.  <b>Note:</b> Connection qualifiers are not allowed.

**Table 107-3 (Cont.) CREATE\_PROPAGATION Procedure Parameters**

Parameter	Description
rule_set_name	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[ schema_name. ] rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p>
negative_rule_set_name	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[ schema_name. ] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>
queue_to_queue	<p>If <code>TRUE</code> or <code>NULL</code>, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code>, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p><b>See Also:</b> <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

**Table 107–3 (Cont.) CREATE\_PROPAGATION Procedure Parameters**

Parameter	Description
<code>original_propagation_name</code>	<p>Specify the original propagation name if the propagation being created is part of a split and merge operation initiated by the <code>SPLIT_STREAMS</code> procedure in the <code>DBMS_STREAMS_ADM</code> package. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream using the <code>MERGE_STREAMS</code> procedure in the <code>DBMS_STREAMS_ADM</code> package.</p> <p>Specify NULL if the propagation being created is not part of a split and merge operation.</p> <p><b>See Also:</b> <a href="#">SPLIT_STREAMS Procedure</a> on page 144-175 and <a href="#">MERGE_STREAMS Procedure</a> on page 144-130</p>
<code>auto_merge_theshold</code>	<p>Specify a positive number if both of the following conditions are met:</p> <ul style="list-style-type: none"> <li>■ The propagation being created is part of a split and merge operation initiated by the <code>SPLIT_STREAMS</code> procedure in the <code>DBMS_STREAMS_ADM</code> package.</li> <li>■ The stream will be merged back to the original stream automatically.</li> </ul> <p>Specify NULL if either of the following conditions are met:</p> <ul style="list-style-type: none"> <li>■ The propagation being created is not part of a split and merge operation.</li> <li>■ The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically.</li> </ul> <p><b>See Also:</b> <a href="#">SPLIT_STREAMS Procedure</a> on page 144-175 and <a href="#">MERGE_STREAMS Procedure</a> on page 144-130</p>

## Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

**See Also:**

- [Chapter 127, "DBMS\\_RULE\\_ADM"](#)
- *Oracle Streams Concepts and Administration* for more information about propagations, the privileges required to propagate messages, propagation jobs, and propagation schedules

## DROP\_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

### Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
  propagation_name      IN VARCHAR2,
  drop_unused_rule_sets IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 107–4** *DROP\_PROPAGATION Procedure Parameters*

Parameter	Description
propagation_name	The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.  If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.

### Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the DBMS\_STREAMS\_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

**See Also:** *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

The following are the data dictionary views for Oracle Streams rules:

- ALL\_STREAMS\_GLOBAL\_RULES
- DBA\_STREAMS\_GLOBAL\_RULES
- ALL\_STREAMS\_MESSAGE\_RULES
- DBA\_STREAMS\_MESSAGE\_RULES
- ALL\_STREAMS\_SCHEMA\_RULES
- DBA\_STREAMS\_SCHEMA\_RULES
- ALL\_STREAMS\_TABLE\_RULES
- DBA\_STREAMS\_TABLE\_RULES

---

---

**Note:** When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

---

---

## START\_PROPAGATION Procedure

This procedure starts a propagation.

### Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(  
    propagation_name IN VARCHAR2);
```

### Parameter

**Table 107-5** *START\_PROPAGATION Procedure Parameter*

Parameter	Description
propagation_name	The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.

### Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

## STOP\_PROPAGATION Procedure

This procedure stops a propagation.

### Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(  
    propagation_name IN VARCHAR2,  
    force             IN BOOLEAN DEFAULT FALSE);
```

### Parameter

**Table 107–6 STOP\_PROPAGATION Procedure Parameter**

Parameter	Description
propagation_name	The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.
force	If <b>TRUE</b> , then the procedure stops the propagation and clears the statistics for the propagation.  If <b>FALSE</b> , then the procedure stops the propagation without clearing the statistics for the propagation.

### Usage Notes

The propagation status is persistently recorded. Hence, if the status is **DISABLED** or **ABORTED**, then the propagation is not started upon database instance startup.

The DBMS\_RANDOM package provides a built-in random number generator. DBMS\_RANDOM is not intended for cryptography.

This chapter contains the following topics:

- [Using DBMS\\_RANDOM](#)
  - Deprecated Subprograms
  - Security Model
  - Operational Notes
- [Summary of DBMS\\_RANDOM Subprograms](#)

---

## Using DBMS\_RANDOM

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)

## Deprecated Subprograms

---

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

The following subprograms are deprecated with Oracle Database 11g:

- [INITIALIZE Procedure](#)
- [RANDOM Procedure](#)
- [TERMINATE Procedure](#)

## Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session. Oracle recommends that users who need to execute this package should be given `EXECUTE` privilege explicitly and should not rely on `PUBLIC EXECUTE` privilege.

## Operational Notes

- `DBMS_RANDOM.RANDOM` produces integers in  $[-2^{31}, 2^{31})$ .
- `DBMS_RANDOM.VALUE` produces numbers in  $[0,1)$  with 38 digits of precision.

`DBMS_RANDOM` can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, user ID, and process ID if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

---

## Summary of DBMS\_RANDOM Subprograms

**Table 108–1 DBMS\_RANDOM Package Subprograms**

Subprogram	Description
<a href="#">INITIALIZE Procedure</a> on page 108-7	Initializes the package with a seed value
<a href="#">NORMAL Function</a> on page 108-8	Returns random numbers in a normal distribution
<a href="#">RANDOM Procedure</a> on page 108-9	Generates a random number
<a href="#">SEED Procedures</a> on page 108-10	Resets the seed
<a href="#">STRING Function</a> on page 108-11	Gets a random string
<a href="#">TERMINATE Procedure</a> on page 108-12	Terminates package
<a href="#">VALUE Functions</a> on page 108-13	Gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number <i>x</i> , where <i>x</i> is greater than or equal to <i>low</i> and less than <i>high</i>

## INITIALIZE Procedure

This procedure initializes the generator.

---

---

**Note:** This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

---

---

### Syntax

```
DBMS_RANDOM.INITIALIZE (  
    val IN BINARY_INTEGER);
```

### Pragmas

```
PRAGMA restrict_references (initialize, WNDS);
```

### Parameters

**Table 108–2 INITIALIZE Procedure Parameters**

Parameter	Description
val	Seed number used to generate a random number

### Usage Notes

This procedure is obsolete as it simply calls the [SEED Procedures](#) on page 108-10.

## NORMAL Function

This function returns random numbers in a standard normal distribution.

### Syntax

```
DBMS_RANDOM.NORMAL  
RETURN NUMBER;
```

### Pragmas

```
PRAGMA restrict_references (normal, WNDS);
```

### Return Values

**Table 108–3** *NORMAL Function Parameters*

Parameter	Description
number	Returns a random number

## RANDOM Procedure

This procedure generates a random number.

---

---

**Note:** This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

---

---

### Syntax

```
DBMS_RANDOM.RANDOM  
RETURN binary_integer;
```

### Pragmas

```
PRAGMA restrict_references (random, WNDS);
```

### Return Values

**Table 108–4** *RANDOM Procedure Parameters*

Parameter	Description
binary_integer	Returns a random integer greater or equal to $-\text{power}(2,31)$ and less than $\text{power}(2,31)$

## SEED Procedures

This procedure resets the seed.

### Syntax

```
DBMS_RANDOM.SEED (  
    val IN BINARY_INTEGER);
```

```
DBMS_RANDOM.SEED (  
    val IN VARCHAR2);
```

### Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

### Parameters

**Table 108–5 SEED Procedure Parameters**

Parameter	Description
val	Seed number or string used to generate a random number

### Usage Notes

The seed can be a string up to length 2000.

## STRING Function

This function gets a random string.

### Syntax

```
DBMS_RANDOM.STRING
  opt IN CHAR,
  len IN NUMBER)
RETURN VARCHAR2;
```

### Pragmas

```
PRAGMA restrict_references (string, WNDS);
```

### Parameters

**Table 108–6** *STRING Function Parameters*

Parameter	Description
opt	Specifies what the returning string looks like: <ul style="list-style-type: none"> <li>▪ 'u', 'U' - returning string in uppercase alpha characters</li> <li>▪ 'l', 'L' - returning string in lowercase alpha characters</li> <li>▪ 'a', 'A' - returning string in mixed case alpha characters</li> <li>▪ 'x', 'X' - returning string in uppercase alpha-numeric characters</li> <li>▪ 'p', 'P' - returning string in any printable characters.</li> </ul> Otherwise the returning string is in uppercase alpha characters.
len	Length of the returning string

### Return Values

**Table 108–7** *STRING Function Return Values*

Parameter	Description
VARCHAR2	Returns a VARCHAR2

## TERMINATE Procedure

When you are finished with the package, call the `TERMINATE` procedure.

---

---

**Note:** This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

---

---

### Syntax

```
DBMS_RANDOM.TERMINATE;
```

## VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number *x*, where *x* is greater than or equal to *low* and less than *high*.

### Syntax

```
DBMS_RANDOM.VALUE
  RETURN NUMBER;
```

```
DBMS_RANDOM.VALUE (
  low IN NUMBER,
  high IN NUMBER)
  RETURN NUMBER;
```

### Parameters

**Table 108–8** VALUE Function Parameters

Parameter	Description
low	Lowest number in a range from which to generate a random number. The number generated may be equal to low
high	Highest number below which to generate a random number. The number generated will be less than high

### Return Values

**Table 108–9** VALUE Function Return Values

Parameter	Description
NUMBER	Returns an Oracle Number

---

---

## DBMS\_RECTIFIER\_DIFF

The DBMS\_RECTIFIER\_DIFF package provides an interface used to detect and resolve data inconsistencies between two replicated sites.

- [Documentation of DBMS\\_RECTIFIER\\_DIFF](#)

---

## Documentation of DBMS\_RECTIFIER\_DIFF

For a complete description of this package within the context of Replication, see DBMS\_RECTIFIER\_DIFF in the *Oracle Database Advanced Replication Management API Reference*.

---

---

## DBMS\_REDEFINITION

The DBMS\_REDEFINITION package provides an interface to perform an online redefinition of tables.

**See Also:** *Oracle Database Administrator's Guide* for more information about online redefinition of tables

This chapter contains the following topics:

- [Using DBMS\\_REDEFINITION](#)
  - Overview
  - Constants
  - Operational Notes
- [Summary of DBMS\\_REDEFINITION Subprograms](#)

## Using DBMS\_REDEFINITION

- [Overview](#)
- [Constants](#)
- [Operational Notes](#)

## Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

## Constants

The `DBMS_REDEFINITION` package uses the constants shown in [Table 110–1, "DBMS\\_REDEFINITION Constants"](#):

**Table 110–1 DBMS\_REDEFINITION Constants**

Constant	Type	Value	Description
<code>CONS_CONSTRAINT</code>	<code>PLS_INTEGER</code>	3	Used to specify that dependent object type is a constraint
<code>CONS_INDEX</code>	<code>PLS_INTEGER</code>	2	Used to specify that dependent object type is a index
<code>CONS_MVLOG</code>	<code>PLS_INTEGER</code>	10	Used to (un)register a materialized view log, as a dependent object of the table, through the <a href="#">REGISTER_DEPENDENT_OBJECT Procedure</a> and the <a href="#">UNREGISTER_DEPENDENT_OBJECT Procedure</a> .
<code>CONS_ORIG_PARAMS</code>	<code>PLS_INTEGER</code>	1	Used to specify that indexes should be cloned with their original storage parameters
<code>CONS_TRIGGER</code>	<code>PLS_INTEGER</code>	4	Used to specify that dependent object type is a trigger
<code>CONS_USE_PK</code>	<code>BINARY_INTEGER</code>	1	Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)
<code>CONS_USE_ROWID</code>	<code>BINARY_INTEGER</code>	2	Used to indicate that the redefinition should be done using rowids

## Operational Notes

- `CONS_USE_PK` and `CONS_USE_ROWID` are constants used as input to the "options\_flag" parameter in both the [START\\_REDEF\\_TABLE Procedure](#) and [CAN\\_REDEF\\_TABLE Procedure](#). `CONS_USE_ROWID` is used to indicate that the redefinition should be done using rowids while `CONS_USE_PK` implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- `CONS_INDEX`, `CONS_MVLOG`, `CONS_TRIGGER` and `CONS_CONSTRAINT` are used to specify the type of the dependent object being (un)registered in [REGISTER\\_DEPENDENT\\_OBJECT Procedure](#) and [UNREGISTER\\_DEPENDENT\\_OBJECT Procedure](#) (parameter "dep\_type").  
`CONS_INDEX ==>` dependent object is of type INDEX  
`CONS_TRIGGER ==>` dependent object is of type TRIGGER  
`CONS_CONSTRAINT==>` dependent object type is of type CONSTRAINT  
`CONS_MVLOG ==>` dependent object is of type MATERIALIZED VIEW LOG
- `CONS_ORIG_PARAMS` as used as input to the "copy\_indexes" parameter in [COPY\\_TABLE\\_DEPENDENTS Procedure](#). Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

## Rules and Limits

For information about various rules and limits that apply to implementation of this package, see the *Oracle Database Administrator's Guide*.

---

## Summary of DBMS\_REDEFINITION Subprograms

**Table 110–2 DBMS\_REDEFINITION Package Subprograms**

Subprogram	Description
<a href="#">ABORT_REDEF_TABLE Procedure</a> on page 110-8	Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process
<a href="#">CAN_REDEF_TABLE Procedure</a> on page 110-9	Determines if a given table can be redefined online
<a href="#">COPY_TABLE_DEPENDENTS Procedure</a> on page 110-10	Copies the dependent objects of the original table onto the interim table
<a href="#">FINISH_REDEF_TABLE Procedure</a> on page 110-12	Completes the redefinition process.
<a href="#">REGISTER_DEPENDENT_OBJECT Procedure</a> on page 110-13	Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table
<a href="#">START_REDEF_TABLE Procedure</a> on page 110-14	Initiates the redefinition process
<a href="#">SYNC_INTERIM_TABLE Procedure</a> on page 110-15	Keeps the interim table synchronized with the original table
<a href="#">UNREGISTER_DEPENDENT_OBJECT Procedure</a> on page 110-16	Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table

## ABORT\_REDEF\_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process. This procedure can also be used to terminate the redefinition process any time after the [START\\_REDEF\\_TABLE Procedure](#) has been called and before the [FINISH\\_REDEF\\_TABLE Procedure](#) is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

### Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (  
    uname          IN VARCHAR2,  
    orig_table     IN VARCHAR2,  
    int_table      IN VARCHAR2,  
    part_name      IN  VARCHAR2 := NULL);
```

### Parameters

**Table 110–3** *ABORT\_REDEF\_TABLE Procedure Parameters*

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

## CAN\_REDEF\_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

### Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
  uname          IN  VARCHAR2,
  tname          IN  VARCHAR2,
  options_flag   IN  PLS_INTEGER := 1,
  part_name      IN  VARCHAR2 := NULL);
```

### Parameters

**Table 110–4 CAN\_REDEF\_TABLE Procedure Parameters**

Parameter	Description
uname	Schema name of the table
tname	Name of the table to be re-organized
options_flag	Indicates the type of redefinition method to use. <ul style="list-style-type: none"> <li>■ If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys.</li> <li>■ If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.</li> </ul>
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

### Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

## COPY\_TABLE\_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

### Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  copy_indexes    IN PLS_INTEGER := 1,
  copy_triggers   IN BOOLEAN := TRUE,
  copy_constraints IN BOOLEAN := TRUE,
  copy_privileges IN BOOLEAN := TRUE,
  ignore_errors   IN BOOLEAN := FALSE,
  num_errors      OUT PLS_INTEGER,
  copy_statistics IN BOOLEAN := FALSE,
  copy_mvlog      IN BOOLEAN := FALSE);
```

### Parameters

**Table 110–5 COPY\_TABLE\_DEPENDENTS Procedure Parameters**

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table being redefined
int_table	Name of the interim table
copy_indexes	Flag indicating whether to copy the indexes <ul style="list-style-type: none"> <li>■ 0 - do not copy any index</li> <li>■ dbms_redefinition.cons_orig_params - copy the indexes using the physical parameters of the source indexes</li> </ul>
copy_triggers	TRUE = clone triggers, FALSE = do nothing
copy_constraints	TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints
copy_privileges	TRUE = clone privileges, FALSE = do nothing
ignore_errors	TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.
num_errors	Number of errors that occurred while cloning dependent objects
copy_statistics	TRUE = copy statistics, FALSE = do nothing
copy_mvlog	TRUE = copy materialized view log, FALSE = do nothing

## Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the [COPY\\_TABLE\\_DEPENDENTS Procedure](#) again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the [REGISTER\\_DEPENDENT\\_OBJECT Procedure](#).
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

## FINISH\_REDEF\_TABLE Procedure

This procedure completes the redefinition process. Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

### Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (  
    uname          IN VARCHAR2,  
    orig_table     IN VARCHAR2,  
    int_table      IN VARCHAR2,  
    part_name      IN VARCHAR2 := NULL);
```

### Parameters

**Table 110–6** FINISH\_REDEF\_TABLE Procedure Parameters

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

## REGISTER\_DEPENDENT\_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

### Syntax

```
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  dep_type        IN PLS_INTEGER,
  dep_owner       IN VARCHAR2,
  dep_orig_name   IN VARCHAR2,
  dep_int_name    IN VARCHAR2);
```

### Parameters

**Table 110-7 REGISTER\_DEPENDENT\_OBJECT Procedure Parameters**

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table
dep_type	Type of the dependent object (see <a href="#">Constants</a> on page 110-4 and <a href="#">Operational Notes</a> on page 110-5)
dep_owner	Owner of the dependent object
dep_orig_name	Name of the original dependent object
dep_int_name	Name of the interim dependent object

### Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA\_REDEFINITION\_ERRORS if an entry exists for that object.

## START\_REDEF\_TABLE Procedure

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

### Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  col_mapping    IN VARCHAR2 := NULL,
  options_flag   IN BINARY_INTEGER := 1,
  orderby_cols  IN VARCHAR2 := NULL,
  part_name     IN VARCHAR2 := NULL);
```

### Parameters

**Table 110–8** START\_REDEF\_TABLE Procedure Parameters

Parameter	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table
col_mapping	Mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition.
options_flag	Indicates the type of redefinition method to use: <ul style="list-style-type: none"> <li>■ If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys.</li> <li>■ If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.</li> </ul>
orderby_cols	This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

## SYNC\_INTERIM\_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

### Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  part_name      IN VARCHAR2 := NULL);
```

### Parameters

**Table 110–9 SYNC\_INTERIM\_TABLE Procedure Parameters**

Parameter	Description
uname	Schema name of the table
orig_table	Name of the table to be redefined
int_table	Name of the interim table
part_name	Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

### Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the [FINISH\\_REDEF\\_TABLE Procedure](#) before completing the online redefinition.
- This procedure can be called between long running operations (such as CREATE INDEX) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

## UNREGISTER\_DEPENDENT\_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

### Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPEPENDENT_OBJECT (  
    uname           IN VARCHAR2,  
    orig_table      IN VARCHAR2,  
    int_table       IN VARCHAR2,  
    dep_type        IN PLS_INTEGER,  
    dep_owner       IN VARCHAR2,  
    dep_orig_name   IN VARCHAR2,  
    dep_int_name    IN VARCHAR2);
```

### Parameters

**Table 110–10 UNREGISTER\_DEPENDENT\_OBJECT Procedure Parameters**

Parameters	Description
uname	Schema name of the tables
orig_table	Name of the table to be redefined
int_table	Name of the interim table
dep_type	Type of the dependent object
dep_owner	Owner of the dependent object
dep_orig_name	Name of the original dependent object
dep_int_name	Name of the interim dependent object

---

---

## DBMS\_REFRESH

The DBMS\_REFRESH package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time.

- [Documentation of DBMS\\_REFRESH](#)

---

## Documentation of DBMS\_REFRESH

For a complete description of this package within the context of Replication, see DBMS\_REFRESH in the *Oracle Database Advanced Replication Management API Reference*.

The DBMS\_REPAIR package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

**See Also:** For detailed information about using the DBMS\_REPAIR package, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Using DBMS\\_REPAIR](#)
  - Overview
  - Security Model
  - Constants
  - Operating Notes
  - Exceptions
  - Examples
- [Summary of DBMS\\_REPAIR Subprograms](#)

## Using DBMS\_REPAIR

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Notes](#)
- [Exceptions](#)
- [Examples](#)

## Overview

---

---

**Note:** The DBMS\_REPAIR package is intended for use by database administrators only. It is not intended for use by application developers.

---

---

## Security Model

The package is owned by SYS. Execution privilege is not granted to other users.

## Constants

The DBMS\_REPAIR package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS\_REPAIR.TABLE\_OBJECT.

Table 112-1 lists the parameters and the enumerated constants.

**Table 112-1 DBMS\_REPAIR Parameters with Enumerated Constants**

Parameter	Option	Type	Description
object_type	■ TABLE_OBJECT	BINARY_	-
	■ INDEX_OBJECT	INTEGER	
	■ CLUSTER_OBJECT		
action	■ CREATE_ACTION	BINARY_	-
	■ DROP_ACTION	INTEGER	
	■ PURGE_ACTION		
table_type	■ REPAIR_TABLE	BINARY_	-
	■ ORPHAN_TABLE	INTEGER	
flags	■ SKIP_FLAG	BINARY_	-
	■ NOSKIP_FLAG	INTEGER	
object_id	■ ALL_INDEX_ID := 0	BINARY_ INTEGER	Clean up all objects that qualify
wait_for_lock	■ LOCK_WAIT := 1	BINARY_	Specifies whether to try getting DML locks on underlying table [[sub]partition] object
	■ LOCK_NOWAIT := 0	INTEGER	

---

**Note:** The default table\_name will be REPAIR\_TABLE when table\_type is REPAIR\_TABLE, and will be ORPHAN\_KEY\_TABLE when table\_type is ORPHAN\_TABLE.

---

## Operating Notes

The procedure to create the `ORPHAN_KEYS_TABLE` is similar to the one used to create the `REPAIR_TABLE`.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the [CHECK\\_OBJECT Procedure](#) would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR\_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN\_' prefix. The following code is also legal:

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;
```

When invoking the [CHECK\\_OBJECT Procedure](#) the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the [ADMIN\\_TABLES Procedure](#) or `CREATE_ACTION`.

Other actions in the [ADMIN\\_TABLES Procedure](#) can be used to purge/delete the `REPAIR_TABLE` and the `ORPHAN_KEYS_TABLE`.

## Exceptions

**Table 112–2 DBMS\_REPAIR Exceptions**

Exception	Description	Action
942	Reported by DBMS_REPAIR.ADMIN_TABLES during a DROP_ACTION when the specified table doesn't exist.	-
955	Reported by DBMS_REPAIR.CREATE_ACTION when the specified table already exists.	-
24120	An invalid parameter was passed to the specified DBMS_REPAIR procedure.	Specify a valid parameter value or use the parameter's default.
24122	An incorrect block range was specified.	Specify correct values for the BLOCK_START and BLOCK_END parameters.
24123	An attempt was made to use the specified feature, but the feature is not yet implemented.	Do not attempt to use the feature.
24124	An invalid ACTION parameter was specified.	Specify CREATE_ACTION, PURGE_ACTION or DROP_ACTION for the ACTION parameter.
24125	An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since DBMS_REPAIR.CHECK_OBJECT was run.	Use DBMS_REPAIR.ADMIN_TABLES to purge the repair table and run DBMS_REPAIR.CHECK_OBJECT to determine whether there are any corrupt blocks to be fixed.
24127	TABLESPACE parameter specified with an ACTION other than CREATE_ACTION.	Do not specify TABLESPACE when performing actions other than CREATE_ACTION.
24128	A partition name was specified for an object that is not partitioned.	Specify a partition name only if the object is partitioned.
24129	An attempt was made to pass a table name parameter without the specified prefix.	Pass a valid table name parameter.
24130	An attempt was made to specify a repair or orphan table that does not exist.	Specify a valid table name parameter.
24131	An attempt was made to specify a repair or orphan table that does not have a correct definition.	Specify a table name that refers to a properly created table.
24132	An attempt was made to specify a table name is greater than 30 characters long.	Specify a valid table name parameter.

## Examples

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */  
  
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');  
  
/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/  
  
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

---

## Summary of DBMS\_REPAIR Subprograms

**Table 112-3 DBMS\_REPAIR Package Subprograms**

Subprogram	Description
<a href="#">ADMIN_TABLES Procedure</a> on page 112-10	Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions
<a href="#">CHECK_OBJECT Procedure</a> on page 112-11	Detects and reports corruptions in a table or index
<a href="#">DUMP_ORPHAN_KEYS Procedure</a> on page 112-13	Reports on index entries that point to rows in corrupt data blocks
<a href="#">FIX_CORRUPT_BLOCKS Procedure</a> on page 112-14	Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT
<a href="#">ONLINE_INDEX_CLEAN Function</a> on page 112-15	Performs a manual cleanup of failed or interrupted online index builds or rebuilds
<a href="#">REBUILD_FREELISTS Procedure</a> on page 112-16	Rebuilds an object's freelists
<a href="#">SEGMENT_FIX_STATUS Procedure</a> on page 112-17	Fixes the corrupted state of a bitmap entry
<a href="#">SKIP_CORRUPT_BLOCKS Procedure</a> on page 112-18	Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered

## ADMIN\_TABLES Procedure

This procedure provides administrative functions for the DBMS\_REPAIR package repair and orphan key tables.

### Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
  table_name IN VARCHAR2,
  table_type IN BINARY_INTEGER,
  action      IN BINARY_INTEGER,
  tablespace IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 112–4 ADMIN\_TABLES Procedure Parameters**

Parameter	Description
table_name	Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.
table_type	Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE.  See " <a href="#">Constants</a> " on page 112-5.
action	Indicates what administrative action to perform.  Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned.  When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated.  Created in the SYS schema.  See " <a href="#">Constants</a> " on page 112-5.
tablespace	Indicates the tablespace to use when creating a table.  By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.

## CHECK\_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

### Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  relative_fno    IN BINARY_INTEGER DEFAULT NULL,
  block_start     IN BINARY_INTEGER DEFAULT NULL,
  block_end       IN BINARY_INTEGER DEFAULT NULL,
  corrupt_count   OUT BINARY_INTEGER);
```

### Parameters

**Table 112-5 CHECK\_OBJECT Procedure Parameters**

Parameter	Description
schema_name	Schema name of the object to be checked.
object_name	Name of the table or index to be checked.
partition_name	Partition or subpartition name to be checked.  If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.
object_type	Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> .  See " <a href="#">Constants</a> " on page 112-5.
repair_table_name	Name of the repair table to be populated.  The table must exist in the <code>SYS</code> schema. Use the <code>ADMIN_TABLES</code> Procedure to create a repair table. The default name is <code>REPAIR_TABLE</code> .
flags	Reserved for future use.
relative_fno	Relative file number: Used when specifying a block range.
block_start	First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.
block_end	Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of <code>block_start</code> or <code>block_end</code> is specified, then the other defaults to the first or last block in the file respectively.
corrupt_count	Number of corruptions reported.

## Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

## DUMP\_ORPHAN\_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

### Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT INDEX_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  orphan_table_name IN  VARCHAR2      DEFAULT 'ORPHAN_KEYS_TABLE',
  flags            IN  BINARY_INTEGER DEFAULT NULL,
  key_count        OUT BINARY_INTEGER);
```

### Parameters

**Table 112–6 DUMP\_ORPHAN\_KEYS Procedure Parameters**

Parameter	Description
schema_name	Schema name.
object_name	Object name.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. The default is <code>INDEX_OBJECT</code> . See " <a href="#">Constants</a> " on page 112-5.
repair_table_name	Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.
orphan_table_name	Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.
flags	Reserved for future use.
key_count	Number of index entries processed.

## FIX\_CORRUPT\_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the [CHECK\\_OBJECT Procedure](#).

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

### Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN  BINARY_INTEGER DEFAULT NULL,
  fix_count       OUT BINARY_INTEGER);
```

### Parameters

**Table 112–7** *FIX\_CORRUPT\_BLOCKS Procedure Parameters*

Parameter	Description
schema_name	Schema name.
object_name	Name of the object with corrupt blocks to be fixed.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> . See " <a href="#">Constants</a> " on page 112-5.
repair_table_name	Name of the repair table with the repair directives. Must exist in the <code>SYS</code> schema.
flags	Reserved for future use.
fix_count	Number of blocks fixed.

## ONLINE\_INDEX\_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds. This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns TRUE if all indexes specified were cleaned up and FALSE if one or more indexes could not be cleaned up.

### Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
    object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
    wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
RETURN BOOLEAN;
```

### Parameters

**Table 112–8 ONLINE\_INDEX\_CLEAN Function Parameters**

Parameter	Description
object_id	Object id of index to be cleaned up. The default cleans up all object ids that qualify.
wait_for_lock	This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If LOCK_NOWAIT is specified, then the lock get does not retry.

## REBUILD\_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object. All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

### Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (
  schema_name      IN VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN VARCHAR2 DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

### Parameters

**Table 112–9 REBUILD\_FREELISTS Procedure Parameters**

Parameter	Description
schema_name	Schema name.
object_name	Name of the object whose freelists are to be rebuilt.
partition_name	Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See " <a href="#">Constants</a> " on page 112-5.

## SEGMENT\_FIX\_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

### Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
  segment_owner  IN VARCHAR2,
  segment_name   IN VARCHAR2,
  segment_type   IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  file_number    IN BINARY_INTEGER DEFAULT NULL,
  block_number   IN BINARY_INTEGER DEFAULT NULL,
  status_value   IN BINARY_INTEGER DEFAULT NULL,
  partition_name IN VARCHAR2 DEFAULT NULL,);
```

### Parameters

**Table 112–10** *SEGMENT\_FIX\_STATUS Procedure Parameters*

Parameter	Description
schema_owner	Schema name of the segment.
segment_name	Segment name.
partition_name	Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.
segment_type	Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.
file_number	(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
block_number	(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
status_value	(optional) The value to which the block status described by the file_number and block_number will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values: <ul style="list-style-type: none"> <li>■ 1 = block is full</li> <li>■ 2 = block is 0-25% free</li> <li>■ 3 = block is 25-50% free</li> <li>■ 4 = block is 50-75% free</li> <li>■ 5 = block is 75-100% free</li> </ul> The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.

## SKIP\_CORRUPT\_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

---

---

**Note:** When Oracle performs an index range scan on a corrupt index after DBMS\_REPAIR.SKIP\_CORRUPT\_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

---

---

### Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
    schema_name  IN VARCHAR2,
    object_name  IN VARCHAR2,
    object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
    flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

### Parameters

**Table 112-11** SKIP\_CORRUPT\_BLOCKS Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be processed.
object_name	Name of the object.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or CLUSTER_OBJECT. See " <a href="#">Constants</a> " on page 112-5.
flags	If SKIP_FLAG is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If NOSKIP_FLAG is specified, then scans that encounter software corrupt blocks return an ORA-1578. See " <a href="#">Constants</a> " on page 112-5.

The DBMS\_REPCAT package provides routines to administer and update the replication catalog and environment.

- [Documentation of DBMS\\_REPCAT](#)

---

## Documentation of DBMS\_REPCAT

For a complete description of this package within the context of Replication, see DBMS\_REPCAT in the *Oracle Database Advanced Replication Management API Reference*.

---

---

## DBMS\_REPCAT\_ADMIN

The DBMS\_REPCAT\_ADMIN package enables you to create users with the privileges needed by the symmetric replication facility.

- [Documentation of DBMS\\_REPCAT\\_ADMIN](#)

---

## Documentation of DBMS\_REPCAT\_ADMIN

For a complete description of this package within the context of Replication, see DBMS\_REPCAT\_ADMIN in the *Oracle Database Advanced Replication Management API Reference*.

---

---

## DBMS\_REPCAT\_INSTANTIATE

The DBMS\_REPCAT\_INSTANTIATE package instantiates deployment templates.

- [Documentation of DBMS\\_REPCAT\\_INSTANTIATE](#)

---

## Documentation of DBMS\_REPUTIL

For a complete description of this package within the context of Replication, see DBMS\_REPUTIL in the *Oracle Database Advanced Replication Management API Reference*.

The DBMS\_RESCONFIG package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

**See Also:** *Oracle XML DB Developer's Guide* for more information about "Resource Configuration".

This chapter contains the following topics:

- [Using DBMS\\_RESCONFIG](#)
  - Overview
- [Summary of DBMS\\_RESCONFIG Subprograms](#)

## Using DBMS\_RESCONFIG

---

- [Overview](#)

## Overview

The DBMS\_RESCONFIG package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

---

## Summary of DBMS\_RESCONFIG Subprograms

This table lists the package subprograms in alphabetical order.

**Table 118–1 DBMS\_RESCONFIG Package Subprograms**

Subprogram	Description
<a href="#">ADDREPOSITORYRESCONFIG Procedure</a> on page 118-5	Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list
<a href="#">ADDRESCONFIG Procedure</a> on page 118-6	Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list
<a href="#">APPENDRESCONFIG Procedure</a> on page 118-7	Appends the resource configuration specified by rpath to the target resource's configuration list if it is not already included in the list
<a href="#">DELETEREPOSITORYRESCONFIG Procedure</a> on page 118-8	Removes the configuration at the given position in the repository's configuration list.
<a href="#">DELETERESCONFIG Procedures</a> on page 118-9	Removes the configuration at the given position in the target resource's configuration list. 1
<a href="#">GETLISTENERS Function</a> on page 118-10	Returns the list of listeners applicable for a given resource
<a href="#">GETREPOSITORYRESCONFIG Function</a> on page 118-11	Returns the resource configuration at the specified position of the repository's configuration list
<a href="#">GETREPOSITORYRESCONFIGPATHS Function</a> on page 118-12	Returns a list of resource configuration paths defined for the repository
<a href="#">GETRESCONFIG Function</a> on page 118-13	Returns the resource configuration at the specified position of the target resource's configuration list
<a href="#">GETRESCONFIGPATHS Function</a> on page 118-14	Returns a list of resource configuration paths defined in the target resource's configuration list
<a href="#">PATCHREPOSITORYRESCONFIGLIST Procedure</a> on page 118-15	Removes invalid references from the repository resource configuration list, and makes the repository available

## ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

### Syntax

```
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG (
  rcpath      IN   VARCHAR2,
  pos         IN   PLS_INTEGER := NULL);
```

### Parameters

**Table 118–2 ADDREPOSITORYRESCONFIG Function Parameters**

Parameter	Description
rcpath	Absolute path of the resource configuration to be inserted. An exception is raised if <code>rcpath</code> already exists in the target's configuration list.
pos	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;</code> the size of the target resource's configuration list).

### Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `XDBADMIN` role and `READ` privilege on the resource configuration to be inserted; otherwise, an error is returned.

## ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

### Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
  respath   IN   VARCHAR2,
  rcpath    IN   VARCHAR2,
  pos       IN   PLS_INTEGER := NULL);
```

### Parameters

**Table 118–3 ADDRESCONFIG Function Parameters**

Parameter	Description
respath	Absolute path of the target resource
rcpath	Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.
pos	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ( $pos < 0$ or $pos >$ the size of the target resource's configuration list).

### Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

## APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by `rspath` to the target resource's configuration list if it is not already included in the list.

### Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
  respath      IN   VARCHAR2,
  rspath       IN   VARCHAR2,
  appendOption IN   PLS_INTEGER);
```

### Parameters

**Table 118–4 ADDRESCONFIG Function Parameters**

Parameter	Description
<code>respath</code>	Absolute path of the target resource
<code>rspath</code>	Absolute path of the resource configuration to be appended at the end of the target's configuration list. If <code>rspath</code> already exists in the list then nothing is appended.
<code>appendOption</code>	Either <code>APPEND_RESOURCE</code> or <code>APPEND_RECURSIVE</code> . If <code>APPEND_RESOURCE</code> is specified then only the target resource is affected. If <code>APPEND_RECURSIVE</code> is specified then the target resource and all its descendents will be affected.

### Usage Notes

- An error is raised if the document referenced by `rspath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

## DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

### Syntax

```
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG(  
    pos          IN    PLS_INTEGER);
```

### Parameters

**Table 118–5 DELETEREPOSITORYRESCONFIG Function Parameters**

Parameter	Description
pos	The index of the configuration to be removed. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;=</code> the size of the target resource's configuration list).

### Usage Notes

- Users must have `XDBADMIN` role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.

## DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

### Syntax

```
DBMS_RESCONFIG.DELETERESCONFIG(
  respath      IN  VARCHAR2,
  pos          IN  PLS_INTEGER);
```

```
DBMS_RESCONFIG.DELETERESCONFIG(
  respath      IN  VARCHAR2,
  rcpath       IN  VARCHAR2,
  deleteOption IN  PLS_INTEGER);
```

### Parameters

**Table 118–6 DELETERESCONFIG Procedure Parameters**

Parameter	Description
respath	Absolute path of the target resource
pos	The index of the configuration to be removed. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;=</code> the size of the target resource's configuration list).
rcpath	Absolute path of the resource configuration to be deleted if found in list.
deleteOption	Either <code>DELETE_RESOURCE</code> or <code>DELETE_RECURSIVE</code> . If <code>DELETE_RESOURCE</code> is specified then only the configuration list of the target resource is affected. If <code>DELETE_RECURSIVE</code> is specified then the configuration list of the target resource and all its descendents will be affected.

### Usage Notes

Users must have `WRITE-CONFIG` privilege on the target resource to execute this.

## GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the `<event-listeners>` element of the `XDBResconfig.xsd` schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the `EXTRACT` operator to retrieve the listeners defined for a specific event.

### Syntax

```
DBMS_RESCONFIG.GETLISTENERS(  
    path    IN    VARCHAR2)  
RETURN XMLTYPE;
```

### Parameters

**Table 118–7** *GETLISTENERS Function Parameters*

Parameter	Description
path	Absolute path of the target resource

### Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

## GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG(  
    pos    IN    PLS_INTEGER)  
RETURN XMLTYPE;
```

### Parameters

**Table 118–8** *GETREPOSITORYRESCONFIG Function Parameters*

Parameter	Description
pos	Index of element to return. An exception is raised if the index is out of range ( $pos < 0$ or $pos \geq$ the size of the repository's configuration list).

### Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

## GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

### Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS  
RETURN XDB$STRING_LIST_T;
```

### Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

## GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETRESCONFIG(
    respath IN VARCHAR2,
    pos IN PLS_INTEGER)
RETURN XMLTYPE;
```

### Parameters

**Table 118–9** *GETRESCONFIG Function Parameters*

Parameter	Description
respath	Absolute path of the target resource
pos	Index of element to return. An exception is raised if the index is out of range ( <code>pos &lt; 0</code> or <code>pos &gt;=</code> the size of the target resource's configuration list).

### Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

## GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

### Syntax

```
DBMS_RESCONFIG.GETRESCONFIGPATHS (  
    respath IN VARCHAR2)  
RETURN XDB$STRING_LIST_T;
```

### Parameters

**Table 118–10** *GETRESCONFIGPATHS Function Parameters*

Parameter	Description
respath	Absolute path of the target resource

### Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

## PATCHREPOSITORYRESCONFIGLIST Procedure

Under normal circumstances, deletion of a resource configuration resource cannot be performed if it is part of the repository resource configuration list. If, for some reason, the deletion of a resource configuration resource that is part of the repository resource configuration list succeeds, then any repository operation results in a 'dangling reference' error. This procedure removes invalid references from the repository resource configuration list, and makes the repository available. This procedure must be run as SYS.

### Syntax

```
DBMS_RESCONFIG.PATCHREPOSITORYRESCONFIGLIST;
```

---

---

## DBMS\_RESOURCE\_MANAGER

The DBMS\_RESOURCE\_MANAGER package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

**See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Using DBMS\\_RESOURCE\\_MANAGER](#)
  - Deprecated Subprograms
  - Security Model
  - Constants
- [Summary of DBMS\\_RESOURCE\\_MANAGER Subprograms](#)

---

## Using DBMS\_RESOURCE\_MANAGER

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)

## Deprecated Subprograms

---

---

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

---

---

The following subprograms are deprecated with Oracle Database 11g:

- [SET\\_INITIAL\\_CONSUMER\\_GROUP Procedure](#)

## Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures. The procedures to grant and revoke this privilege are in the package [Chapter 120, "DBMS\\_RESOURCE\\_MANAGER\\_PRIVS"](#).

## Constants

**Table 119–1 DBMS\_RESOURCE\_MANAGER Constants**

Constant	Type	Value	Description
CLIENT_MACHINE	VARCHAR2 (30)	CLIENT_MACHINE	Name of the computer from which the client is making the connection
CLIENT_OS_USER	VARCHAR2 (30)	CLIENT_OS_USER	Operating system user name of the client that is logging in
CLIENT_PROGRAM	VARCHAR2 (30)	CLIENT_PROGRAM	Name of the client program used to log in to the server
MODULE_NAME	VARCHAR2 (30)	MODULE_NAME	Module name in the currently running application as set by the <a href="#">SET_MODULE Procedure</a> in the <a href="#">DBMS_APPLICATION_INFO</a> package, or the equivalent OCI attribute setting
MODULE_NAME_ACTION	VARCHAR2 (30)	MODULE_NAME_ACTION	<p>A combination of the current module and the action being performed as set by either of the following procedures in the <a href="#">DBMS_APPLICATION_INFO</a> package, or their equivalent OCI attribute setting:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">SET_MODULE Procedure</a></li> <li>▪ <a href="#">SET_ACTION Procedure</a></li> </ul> <p>The attribute is specified as the module name followed by a period (.), followed by the action name (<i>module_name.action_name</i>).</p>
ORACLE_FUNCTION	VARCHAR2 (30)	ORACLE_FUNCTION	Function the session is currently executing. Valid functions are the BACKUP, COPY, and DATALOAD. BACKUP is set for sessions that are doing backup operations using RMAN. COPY is set for sessions that are doing image copies using RMAN. DATALOAD is set for sessions that are loading data using datapump.
ORACLE_USER	VARCHAR2 (30)	ORACLE_USER	Oracle Database user name
SERVICE_MODULE	VARCHAR2 (30)	SERVICE_MODULE	Combination of service and module names in this form: <i>service_name.module_name</i>
SERVICE_MODULE_ACTION	VARCHAR2 (30)	SERVICE_MODULE_ACTION	Combination of service name, module name, and action name, in this form: <i>service_name.module_name.action_name</i>
SERVICE_NAME	VARCHAR2 (30)	SERVICE_NAME	Service name used by the client to establish a connection

**Table 119-1 (Cont.) DBMS\_RESOURCE\_MANAGER Constants**

<b>Constant</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
PERFORMANCE_ CLASS	VARCHAR2 (30)	PERFORMANCE_ CLASS	Oracle Database user name

## Summary of DBMS\_RESOURCE\_MANAGER Subprograms

**Table 119–2 DBMS\_RESOURCE\_MANAGER Package Subprograms**

Subprogram	Description
<a href="#">BEGIN_SQL_BLOCK Procedure</a> on page 119-9	Indicates the start of a block of SQL statements to be treated as a group by resource manager
<a href="#">CALIBRATE_IO Procedure</a> on page 119-10	Calibrates the I/O capabilities of storage
<a href="#">CLEAR_PENDING_AREA Procedure</a> on page 119-13	Clears the work area for the resource manager
<a href="#">CREATE_CATEGORY Procedure</a> on page 119-14	Creates a new resource consumer group category
<a href="#">CREATE_CONSUMER_GROUP Procedure</a> on page 119-15	Creates entries which define resource consumer groups
<a href="#">CREATE_PENDING_AREA Procedure</a> on page 119-16	Creates a work area for changes to resource manager objects
<a href="#">CREATE_PLAN Procedure</a> on page 119-18	Creates entries which define resource plans
<a href="#">CREATE_PLAN_DIRECTIVE Procedure</a> on page 119-19	Creates resource plan directives
<a href="#">CREATE_SIMPLE_PLAN Procedure</a> on page 119-23	Creates a single-level resource plan containing up to eight consumer groups in one step
<a href="#">DELETE_CATEGORY Procedure</a> on page 119-25	Deletes an existing resource consumer group category
<a href="#">DELETE_CONSUMER_GROUP Procedure</a> on page 119-26	Deletes entries which define resource consumer groups
<a href="#">DELETE_PLAN Procedure</a> on page 119-27	Deletes the specified plan as well as all the plan directives it refers to
<a href="#">DELETE_PLAN_CASCADE Procedure</a> on page 119-28	Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)
<a href="#">DELETE_PLAN_DIRECTIVE Procedure</a> on page 119-29	Deletes resource plan directives
<a href="#">END_SQL_BLOCK Procedure</a> on page 119-30	Indicates the end of a block of SQL statements that should be treated as a group by resource manager
<a href="#">SET_CONSUMER_GROUP_MAPPING Procedure</a> on page 119-31	Adds, deletes, or modifies entries for the login and run-time attribute mappings
<a href="#">SET_CONSUMER_GROUP_MAPPING_PRI Procedure</a> on page 119-32	Creates the session attribute mapping priority list
<a href="#">SET_INITIAL_CONSUMER_GROUP Procedure</a> on page 119-33	Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram)
<a href="#">SUBMIT_PENDING_AREA Procedure</a> on page 119-34	Submits pending changes for the resource manager

**Table 119–2 (Cont.) DBMS\_RESOURCE\_MANAGER Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SWITCH_CONSUMER_GROUP_FOR_SESS Procedure</a> on page 119-35	Changes the resource consumer group of a specific session
<a href="#">SWITCH_CONSUMER_GROUP_FOR_USER Procedure</a> on page 119-36	Changes the resource consumer group for all sessions with a given user name
<a href="#">SWITCH_PLAN Procedure</a> on page 119-37	Sets the current resource manager plan
<a href="#">UPDATE_CATEGORY Procedure</a> on page 119-38	Updates an existing resource consumer group category
<a href="#">UPDATE_CONSUMER_GROUP Procedure</a> on page 119-39	Updates entries which define resource consumer groups
<a href="#">UPDATE_PLAN Procedure</a> on page 119-40	Updates entries which define resource plans
<a href="#">UPDATE_PLAN_DIRECTIVE Procedure</a> on page 119-41	Updates resource plan directives
<a href="#">VALIDATE_PENDING_AREA Procedure</a> on page 119-45	Validates pending changes for the resource manager

## BEGIN\_SQL\_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the start of a block of SQL statements that should be treated as a group by resource manager.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
DBMS_RESOURCE_MANAGER.BEGIN_SQL_BLOCK;
```

### Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

## CALIBRATE\_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the `V$IO_CALIBRATION_STATUS` view and results for a successful calibration run are located in `DBA_RSRC_IO_CALIBRATE` table.

### Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (
    num_physical_disks    IN  PLS_INTEGER DEFAULT 1,
    max_latency           IN  PLS_INTEGER DEFAULT 20,
    max_iops              OUT PLS_INTEGER,
    max_mbps              OUT PLS_INTEGER,
    actual_latency        OUT PLS_INTEGER);
```

### Parameters

**Table 119–3 CALIBRATE\_IO Procedure Parameters**

Parameter	Description
<code>num_physical_disks</code>	Approximate number of physical disks in the database storage
<code>max_latency</code>	Maximum tolerable latency in milliseconds for database-block-sized IO requests
<code>max_iops</code>	Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads.
<code>max_mbps</code>	Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads.
<code>actual_latency</code>	Average latency of database-block-sized I/O requests at <code>max_iops</code> rate, expressed in milliseconds

### Usage Notes

- Only users with the `SYSDBA` privilege can run this procedure. Qualified users must also turn on `timed_statistics`, and ensure `asynch_io` is enabled for datafiles. This can be achieved by setting `filesystemio_options` to either `ASYNCH` or `SETALL`. One can also query the `asynch_io` status by means of the following SQL statement:
 

```
col name format a50
SELECT name, asynch_io FROM v$datafile f,v$iostat_file i
WHERE f.file#      = i.file_no
AND  filetype_name = 'Data File'
/
```
- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.
- For an Oracle Real Application Clusters (Oracle RAC) database, the workload is simultaneously generated from all instances.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about calibration

## Examples

### Example of using I/O Calibration procedure

```

SET SERVEROUTPUT ON
DECLARE
    lat INTEGER;
    iops INTEGER;
    mbps INTEGER;
BEGIN
-- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
    DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);

    DBMS_OUTPUT.PUT_LINE ('max_iops = ' || iops);
    DBMS_OUTPUT.PUT_LINE ('latency = ' || lat);
    DBMS_OUTPUT.PUT_LINE ('max_mbps = ' || mbps);
end;
/

```

### View for I/O calibration results

```
SQL> desc V$IO_CALIBRATION_STATUS
```

Name	Null?	Type
STATUS		VARCHAR2(13)
CALIBRATION_TIME		TIMESTAMP(3)

```
SQL> desc gv$io_calibration_status
```

Name	Null?	Type
INST_ID		NUMBER
STATUS		VARCHAR2(13)
CALIBRATION_TIME		TIMESTAMP(3)

Column explanation:

-----

STATUS:

IN PROGRESS : Calibration in Progress (Results from previous calibration run displayed, if available)

READY : Results ready and available from earlier run

NOT AVAILABLE : Calibration results not available.

CALIBRATION\_TIME: End time of the last calibration run

### DBA table that stores I/O Calibration results

```
SQL> desc DBA_RSRC_IO_CALIBRATE
```

Name	Null?	Type
START_TIME		TIMESTAMP(6)
END_TIME		TIMESTAMP(6)
MAX_IOPS		NUMBER
MAX_MBPS		NUMBER
MAX_PMBPS		NUMBER
LATENCY		NUMBER
NUM_PHYSICAL_DISKS		NUMBER

comment on table DBA\_RSRC\_IO\_CALIBRATE is  
'Results of the most recent I/O calibration'

/

comment on column DBA\_RSRC\_IO\_CALIBRATE.START\_TIME is

```
'start time of the most recent I/O calibration'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.END_TIME is  
'end time of the most recent I/O calibration'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.MAX_IOPS is  
'maximum number of data-block read requests that can be sustained per second'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.MAX_MBPS is  
'maximum megabytes per second of maximum-sized read requests that can be  
sustained'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.MAX_PMBPS is  
'maximum megabytes per second of large I/O requests that  
can be sustained by a single process'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.LATENCY is  
'latency for data-block read requests'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.NUM_PHYSICAL_DISKS is  
'number of physical disks in the storage subsystem (as specified by user)'  
/
```

## **CLEAR\_PENDING\_AREA Procedure**

This procedure clears pending changes for the resource manager.

### **Syntax**

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

## CREATE\_CATEGORY Procedure

This procedure creates a new consumer group category. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view `DBA_RSRC_CATEGORIES` defines the currently defined categories. The `ADMINISTRATIVE`, `INTERACTIVE`, `BATCH`, `MAINTENANCE`, and `OTHER` categories are available.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CATEGORY (  
    category    IN    VARCHAR2,  
    comment     IN    VARCHAR2);
```

### Parameters

**Table 119–4** *CREATE\_CATEGORY Procedure Parameters*

Parameter	Description
<code>category</code>	Name of consumer group category
<code>comment</code>	User's comment

## CREATE\_CONSUMER\_GROUP Procedure

This procedure creates entries which define resource consumer groups.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (
  consumer_group IN VARCHAR2,
  comment        IN VARCHAR2,
  cpu_mth        IN VARCHAR2 DEFAULT NULL,
  mgmt_mth       IN VARCHAR2 DEFAULT 'ROUND-ROBIN',
  category       IN VARCHAR2 DEFAULT 'OTHER');
```

### Parameters

**Table 119–5** CREATE\_CONSUMER\_GROUP Procedure Parameters

Parameter	Description
consumer_group	Name of the consumer group
comment	User's comment
cpu_mth	Name of CPU resource allocation method (deprecated)
mgmt_mth	Name of CPU resource allocation method
category	Describes the category of the consumer group. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view <code>DBA_RSRC_CATEGORIES</code> defines the currently defined categories. Categories can be modified, using the <a href="#">CREATE_CATEGORY Procedure</a> , <a href="#">UPDATE_CATEGORY Procedure</a> , and <a href="#">DELETE_CATEGORY Procedure</a> .

## CREATE\_PENDING\_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

### Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you have made are valid. You do not have to perform your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

---

---

**Note:** Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

---

---

The following rules must be adhered to, and they are checked whenever the `validate` or `submit` procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- The plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 28 plan directives coming from any given plan (that is, no plan can have more than 28 children).
- There cannot be more than 28 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix one or more problems and reissue the `validate` or `submit` procedures.

## CREATE\_PLAN Procedure

This procedure creates entries which define resource plans.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
  plan                IN  VARCHAR2,
  comment             IN  VARCHAR2,
  cpu_mth             IN  VARCHAR2 DEFAULT NULL, -- deprecated
  active_sess_pool_mth IN  VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
  parallel_degree_limit_mth IN  VARCHAR2 DEFAULT
    'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
  queueing_mth       IN  VARCHAR2 DEFAULT 'FIFO_TIMEOUT',
  mgmt_mth           IN  VARCHAR2 DEFAULT 'EMPHASIS',
  sub_plan           IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 119–6 CREATE\_PLAN Procedure Parameters**

Parameter	Description
plan	Name of the resource plan
comment	User's comment
cpu_mth	Allocation method for CPU resources (deprecated)
active_sess_pool_mth	Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.
parallel_degree_limit_mth	Resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.
queueing_mth	Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available
mgmt_mth	Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> <li>▪ EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups</li> <li>▪ RATIO - for single-level plans that use ratios to specify how I/O resources are distributed</li> </ul>
sub_plan	If TRUE, indicates that this plan is only intended for use as a sub-plan. Sub-plans are not required to have an OTHER_GROUPS directive. Default is FALSE.

### Usage Notes

If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

## CREATE\_PLAN\_DIRECTIVE Procedure

This procedure creates resource plan directives.

---

---

**Note:** The functionality associated with the `parallel_target_percentage` and `parallel_queue_timeout` parameters is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
  plan                IN VARCHAR2,
  group_or_subplan    IN VARCHAR2,
  comment             IN VARCHAR2,
  cpu_p1              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p2              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p3              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p4              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p5              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p6              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p7              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p8              IN NUMBER   DEFAULT NULL, -- deprecated
  active_sess_pool_p1 IN NUMBER   DEFAULT NULL,
  queueing_p1         IN NUMBER   DEFAULT NULL,
  parallel_degree_limit_p1 IN NUMBER DEFAULT NULL,
  switch_group        IN VARCHAR2 DEFAULT NULL,
  switch_time         IN NUMBER   DEFAULT NULL,
  switch_estimate     IN BOOLEAN  DEFAULT FALSE,
  max_est_exec_time   IN NUMBER   DEFAULT NULL,
  undo_pool           IN NUMBER   DEFAULT NULL,
  max_idle_time       IN NUMBER   DEFAULT NULL,
  max_idle_blocker_time IN NUMBER DEFAULT NULL,
  switch_time_in_call IN NUMBER   DEFAULT NULL, -- deprecated
  mgmt_p1             IN NUMBER   DEFAULT NULL,
  mgmt_p2             IN NUMBER   DEFAULT NULL,
  mgmt_p3             IN NUMBER   DEFAULT NULL,
  mgmt_p4             IN NUMBER   DEFAULT NULL,
  mgmt_p5             IN NUMBER   DEFAULT NULL,
  mgmt_p6             IN NUMBER   DEFAULT NULL,
  mgmt_p7             IN NUMBER   DEFAULT NULL,
  mgmt_p8             IN NUMBER   DEFAULT NULL,
  switch_io_megabytes IN NUMBER   DEFAULT NULL,
  switch_io_reqs      IN NUMBER   DEFAULT NULL,
  switch_for_call     IN BOOLEAN  DEFAULT NULL,
  max_utilization_limit IN NUMBER DEFAULT NULL,
  parallel_target_percentage IN NUMBER DEFAULT NULL,
  parallel_queue_timeout IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 119–7 CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>plan</code>	Name of the resource plan
<code>group_or_subplan</code>	Name of the consumer group or subplan
<code>comment</code>	Comment for the plan directive

**Table 119–7 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
cpu_p1	-- deprecated: use mgmt_p1 instead
cpu_p2	-- deprecated: use mgmt_p2 instead)
cpu_p3	-- deprecated: use mgmt_p3 instead)
cpu_p4	-- deprecated: use mgmt_p4 instead)
cpu_p5	-- deprecated: use mgmt_p5 instead)
cpu_p6	-- deprecated: use mgmt_p6 instead)
cpu_p7	-- deprecated: use mgmt_p7 instead)
cpu_p8	-- deprecated: use mgmt_p8 instead)
active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
parallel_degree_limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
switch_group	Specifies consumer group to switch to, once a switch condition is met. If the group name is 'CANCEL_SQL', then the current call is canceled when the switch condition is met. If the group name is 'KILL_SESSION', then the session is killed when the switch condition is met. Default is NULL.
switch_time	Specifies time (in CPU seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
max_est_exec_time	Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
undo_pool	Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group
max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
max_idle_blocker_time	Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource
switch_time_in_call	Deprecated. If this parameter is specified, switch_time is set to switch_time_in_call (in seconds) and switch_for_call is effectively set to TRUE. It is better to use switch_time and switch_for_call.
mgmt_p1	Resource allocation value for level 1 (replaces cpu_p1): <ul style="list-style-type: none"> <li>■ EMPHASIS - specifies the resource percentage at the first level</li> <li>■ RATIO - specifies the weight of resource usage</li> </ul>

**Table 119-7 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
mgmt_p2	Resource allocation value for level 2 (replaces <code>cpu_p2</code> ) <ul style="list-style-type: none"> <li>▪ EMPHASIS - specifies the resource percentage at the second level</li> <li>▪ RATIO - non-applicable</li> </ul>
mgmt_p3	Resource allocation value for level 3 (replaces <code>cpu_p3</code> ) <ul style="list-style-type: none"> <li>▪ EMPHASIS - specifies the resource percentage at the third level</li> <li>▪ RATIO - non-applicable</li> </ul>
mgmt_p4	Resource allocation value for level 4 (replaces <code>cpu_p4</code> ) <ul style="list-style-type: none"> <li>▪ EMPHASIS - specifies the resource percentage at the fourth level</li> <li>▪ RATIO - non-applicable</li> </ul>
mgmt_p5	Resource allocation value for level 5 (replaces <code>cpu_p5</code> ) <ul style="list-style-type: none"> <li>▪ EMPHASIS - specifies the resource percentage at the fifth level</li> <li>▪ RATIO - non-applicable</li> </ul>
mgmt_p6	Resource allocation value for level 6 (replaces <code>cpu_p6</code> ) <ul style="list-style-type: none"> <li>▪ EMPHASIS - specifies the resource percentage at the sixth level</li> <li>▪ RATIO - non-applicable</li> </ul>
mgmt_p7	Resource allocation value for level 7 (replaces <code>cpu_p7</code> ) <ul style="list-style-type: none"> <li>▪ EMPHASIS - specifies the resource percentage at the seventh level</li> <li>▪ RATIO - non-applicable</li> </ul>
mgmt_p8	Resource allocation value for level 8 (replaces <code>cpu_p8</code> ) <ul style="list-style-type: none"> <li>▪ EMPHASIS - specifies the resource percentage at the eighth level</li> <li>▪ RATIO - non-applicable</li> </ul>
switch_io_megabytes	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
switch_io_reqs	Specifies the number of I/O requests that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
switch_for_call	Specifies that if an action is taken because of the <code>switch_time</code> , <code>switch_io_megabytes</code> , or <code>switch_io_reqs</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is <code>FALSE</code> , which means that the original consumer group is not restored at the end of the top call.
max_utilization_limit	Specifies the maximum percentage of CPU that this Consumer Group or Sub-Plan can utilize. Valid values are 0% to 100%. <code>NULL</code> implies that there is no limit, or equivalently 100%. You can specify this attribute and leave <code>mgmt_p1</code> through <code>mgmt_p8</code> <code>NULL</code> .

**Table 119–7 (Cont.) CREATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>parallel_target_percentage</code>	<p>Specifies the maximum percentage of the target number of parallel servers in an Oracle RAC environment that a consumer group can use. Any additional parallel statements that are launched from this consumer group will be queued. The default is <code>NULL</code>, which means that the limit is 100% of the target number. Valid values for queuing are in the range of 0 to 100 (%). For updates to the plan directive, the value of -1 will reset the value to <code>NULL</code>.</p> <p>If a consumer group does not have any parallel statements running within an Oracle RAC database, the first parallel statement is allowed to exceed this limit.</p> <p>The target number of parallel servers in an Oracle RAC environment is the sum of the parameter <code>parallel_server_target</code> across all instances.</p>
<code>parallel_queue_timeout</code>	<p>Specifies the time (in seconds) that a query may remain in its Consumer Group's parallel statement queue before it is removed and terminated with an error (ORA-07454).</p>

### Usage Notes

- All parameters default to `NULL`. However, for the `EMPHASIS` CPU resource allocation method, this case would severely limit resources to all the users.
- For `max_idle_time` and `max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using `switch_time_in_call`, the resource usage of one client will not affect a future client that happens to be executed on the same session.

## CREATE\_SIMPLE\_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the CREATE\_CONSUMER\_GROUP and CREATE\_RESOURCE\_PLAN\_DIRECTIVES procedures separately.

### Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
  simple_plan      IN  VARCHAR2  DEFAULT NULL,
  consumer_group1  IN  VARCHAR2  DEFAULT NULL,
  group1_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
  consumer_group2  IN  VARCHAR2  DEFAULT NULL,
  group2_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
  consumer_group3  IN  VARCHAR2  DEFAULT NULL,
  group3_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
  consumer_group4  IN  VARCHAR2  DEFAULT NULL,
  group4_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
  consumer_group5  IN  VARCHAR2  DEFAULT NULL,
  group5_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
  consumer_group6  IN  VARCHAR2  DEFAULT NULL,
  group6_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
  consumer_group7  IN  VARCHAR2  DEFAULT NULL,
  group7_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
  consumer_group8  IN  VARCHAR2  DEFAULT NULL,
  group8_cpu       IN  NUMBER     DEFAULT NULL,    -- deprecated
  group1_percent   IN  NUMBER     DEFAULT NULL,
  group2_percent   IN  NUMBER     DEFAULT NULL,
  group3_percent   IN  NUMBER     DEFAULT NULL,
  group4_percent   IN  NUMBER     DEFAULT NULL,
  group5_percent   IN  NUMBER     DEFAULT NULL,
  group6_percent   IN  NUMBER     DEFAULT NULL,
  group7_percent   IN  NUMBER     DEFAULT NULL,
  group8_percent   IN  NUMBER     DEFAULT NULL);
```

### Parameters

**Table 119–8 CREATE\_SIMPLE\_PLAN Procedure Parameters**

Parameter	Description
simple_plan	Name of the resource plan
consumer_group1	Name of the consumer group
group1_cpu	Percentage for group (deprecated)
consumer_group2	Name of the consumer group
group2_cpu	Percentage for group (deprecated)
consumer_group3	Name of the consumer group
group3_cpu	Percentage for group (deprecated)
consumer_group4	Name of the consumer group
group4_cpu	Percentage for group (deprecated)
consumer_group5	Name of the consumer group
group5_cpu	Percentage for group (deprecated)

**Table 119–8 (Cont.) CREATE\_SIMPLE\_PLAN Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
consumer_group6	Name of the consumer group
group6_cpu	Percentage for group (deprecated)
consumer_group7	Name of the consumer group
group7_cpu	Percentage for group (deprecated)
consumer_group8	Name of the consumer group
group8_cpu	Percentage for group (deprecated)
group1_percent	Percentage of resources allocated for this consumer group
group2_percent	Percentage of resources allocated for this consumer group
group3_percent	Percentage of resources allocated for this consumer group
group4_percent	Percentage of resources allocated for this consumer group
group5_percent	Percentage of resources allocated for this consumer group
group6_percent	Percentage of resources allocated for this consumer group
group7_percent	Percentage of resources allocated for this consumer group
group8_percent	Percentage of resources allocated for this consumer group

## DELETE\_CATEGORY Procedure

This procedure deletes an existing resource consumer group category.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CATEGORY (  
    category      IN    VARCHAR2,  
    new_comment   IN    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 119–9** *DELETE\_CATEGORY Procedure Parameters*

Parameter	Description
category	Name of consumer group category

## DELETE\_CONSUMER\_GROUP Procedure

This procedure deletes entries which define resource consumer groups.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (  
    consumer_group IN VARCHAR2);
```

### Parameters

**Table 119–10** *DELETE\_CONSUMER\_GROUP Procedure Parameters*

Parameters	Description
consumer_group	Name of the consumer group to be deleted

## DELETE\_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (  
    plan IN VARCHAR2);
```

### Parameters

**Table 119–11** *DELETE\_PLAN Procedure Parameters*

Parameter	Description
plan	Name of the resource plan to delete

## DELETE\_PLAN\_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (  
    plan IN VARCHAR2);
```

### Parameters

**Table 119–12** *DELETE\_PLAN\_CASCADE Procedure Parameters*

Parameters	Description
plan	Name of the plan

### Usage Notes

If `DELETE_PLAN_CASCADE` encounters any error, then it rolls back the operation, and nothing is deleted.

## DELETE\_PLAN\_DIRECTIVE Procedure

This procedure deletes resource plan directives.

### Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (  
    plan           IN VARCHAR2,  
    group_or_subplan IN VARCHAR2);
```

### Parameters

**Table 119–13** *DELETE\_PLAN\_DIRECTIVE Procedure Parameters*

Parameter	Description
plan	Name of the resource plan
group_or_subplan	Name of the group or subplan

## END\_SQL\_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the end of a block of SQL statements that should be treated as a group by resource manager.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
DBMS_RESOURCE_MANAGER.END_SQL_BLOCK;
```

### Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in *Oracle Database VLDB and Partitioning Guide*.

## SET\_CONSUMER\_GROUP\_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING (
  attribute      IN VARCHAR2,
  value         IN VARCHAR2,
  consumer_group IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 119-14 SET\_CONSUMER\_GROUP\_MAPPING Procedure Parameters**

Parameters	Description
attribute	Mapping attribute to add or modify. It can be one of the <a href="#">Constants</a> listed.
value	Attribute value to match. This includes both absolute mapping and regular expressions.
consumer_group	Name of the mapped consumer group, or NULL to delete a mapping

### Usage Notes

- If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the consumer\_group argument is NULL, then any mapping from the given attribute and value will be deleted.
- The subprogram supports simple regex expressions for the value parameter. It implements the same semantics as the SQL 'LIKE' operator. Specifically, it uses '%' as a multicharacter wildcard and '\_' as a single character wildcard. The '\' character can be used to escape the wildcards. Note that wildcards can only be used if the attribute is one of the following:
  - CLIENT\_OS\_USER
  - CLIENT\_PROGRAM
  - CLIENT\_MACHINE
  - MODULE\_NAME
  - MODULE\_NAME\_ACTION
  - SERVICE\_MODULE
  - SERVICE\_MODULE\_ACTION

## SET\_CONSUMER\_GROUP\_MAPPING\_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI (
  explicit          IN NUMBER,
  oracle_user      IN NUMBER,
  service_name     IN NUMBER,
  client_os_user   IN NUMBER,
  client_program   IN NUMBER,
  client_machine   IN NUMBER,
  module_name      IN NUMBER,
  module_name_action IN NUMBER,
  service_module   IN NUMBER,
  service_module_action IN NUMBER);
```

### Parameters

**Table 119–15 SET\_CONSUMER\_GROUP\_MAPPING\_PRI Procedure Parameters**

Parameters	Description
explicit	Priority of the explicit mapping
oracle_user	Priority of the Oracle user name mapping
service_name	Priority of the client service name mapping
client_os_user	Priority of the client operating system user name mapping
client_program	Priority of the client program mapping
client_machine	Priority of the client machine mapping
module_name	Priority of the application module name mapping
module_name_action	Priority of the application module name and action mapping
service_module	Priority of the service name and application module name mapping
module_name_action	Priority of the service name, application module name, and application action mapping

### Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
  - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 10. Together, they establish an ordering where 1 is the highest priority and 10 is the lowest.

## SET\_INITIAL\_CONSUMER\_GROUP Procedure

---

**Note:** This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

---

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs. This procedure sets the initial resource consumer group for a user.

### Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user          IN  VARCHAR2,
    consumer_group IN  VARCHAR2);
```

### Parameters

**Table 119–16** SET\_INITIAL\_CONSUMER\_GROUP Procedure Parameters

Parameters	Description
user	Name of the user
consumer_group	User's initial consumer group

### Usage Notes

- The ADMINISTER\_RESOURCE\_MANAGER or the ALTER USER system privilege are required to be able to execute this procedure. The user, or PUBLIC, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

---

**Note:** These semantics are similar to those for ALTER USER DEFAULT ROLE.

---

- If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: DEFAULT\_CONSUMER\_GROUP.
- DEFAULT\_CONSUMER\_GROUP has switch privileges granted to PUBLIC; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have DEFAULT\_CONSUMER\_GROUP as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to DEFAULT\_CONSUMER\_GROUP.

## SUBMIT\_PENDING\_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

---

---

**Note:** A call to `SUBMIT_PENDING_AREA` may fail even if `VALIDATE_PENDING_AREA` succeeds. This may happen if a plan being deleted is loaded by an instance after a call to `VALIDATE_PENDING_AREA`, but before a call to `SUBMIT_PENDING_AREA`.

---

---

### Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

## SWITCH\_CONSUMER\_GROUP\_FOR\_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any (PQ) slave sessions that are related to the top user session.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (  
    session_id      IN NUMBER,  
    session_serial  IN NUMBER,  
    consumer_group  IN VARCHAR2);
```

### Parameters

**Table 119–17 SWITCH\_CONSUMER\_GROUP\_FOR\_SESS Procedure Parameters**

Parameter	Description
session_id	SID column from the view V\$SESSION
session_serial	SERIAL# column from view V\$SESSION.
consumer_group	Name of the consumer group to which to switch

## SWITCH\_CONSUMER\_GROUP\_FOR\_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also changes the consumer group of any (PQ) slave sessions that are related to the top user session.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (  
    user          IN VARCHAR2,  
    consumer_group IN VARCHAR2);
```

### Parameters

**Table 119–18 SWITCH\_CONSUMER\_GROUP\_FOR\_USER Procedure Parameters**

Parameter	Description
user	Name of the user
consumer_group	Name of the consumer group to which to switch

### Usage Notes

- The [SWITCH\\_CONSUMER\\_GROUP\\_FOR\\_SESS Procedure](#) and the SWITCH\_CONSUMER\_GROUP\_FOR\_USER procedures let you raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the nice command on UNIX.
- These procedures cause the session to be moved into the newly specified consumer group immediately.

## SWITCH\_PLAN Procedure

This procedure sets the current resource manager plan.

### Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
  plan_name          IN  VARCHAR2,
  sid                IN  VARCHAR2 DEFAULT '*',
  allow_scheduler_plan_switches IN  BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 119–19 SWITCH\_PLAN Procedure Parameters**

Parameter	Description
plan_name	Name of the plan to which to switch. Passing in an empty string (") for the plan_name, disables the resource manager
sid	The sid parameter is relevant only in an Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.
allow_scheduler_plan_switches	FALSE - disables automated plan switches by the job scheduler at window boundaries. To reenab automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled.

## UPDATE\_CATEGORY Procedure

This procedure updates an existing resource consumer group category.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CATEGORY (  
    category      IN    VARCHAR2,  
    new_comment   IN    VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 119–20 UPDATE\_CATEGORY Procedure Parameters**

Parameter	Description
category	Name of consumer group category
new_comment	User's comment

## UPDATE\_CONSUMER\_GROUP Procedure

This procedure updates entries which define resource consumer groups.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
  consumer_group IN VARCHAR2,
  new_comment    IN VARCHAR2 DEFAULT NULL,
  new_cpu_mth    IN VARCHAR2 DEFAULT NULL,
  new_mgmt_mth   IN VARCHAR2 DEFAULT NULL,
  new_category   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 119–21 UPDATE\_CONSUMER\_GROUP Procedure Parameter**

Parameter	Description
consumer_group	Name of consumer group
new_comment	New user's comment
new_cpu_mth	Name of new method for CPU resource allocation (deprecated)
new_mgmt_mth	Name of new method for CPU resource allocation
new_category	New consumer group category

### Usage Notes

If the parameters to the UPDATE\_CONSUMER\_GROUP procedure are not specified, then they remain unchanged in the data dictionary.

## UPDATE\_PLAN Procedure

This procedure updates entries which define resource plans.

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
  plan                IN VARCHAR2,
  new_comment         IN VARCHAR2 DEFAULT NULL,
  new_cpu_mth        IN VARCHAR2 DEFAULT NULL, -- deprecated
  new_active_sess_pool_mth IN VARCHAR2 DEFAULT NULL,
  new_parallel_degree_limit_mth IN VARCHAR2 DEFAULT NULL,
  new_queueing_mth   IN VARCHAR2 DEFAULT NULL,
  new_mgmt_mth       IN VARCHAR2 DEFAULT NULL,
  new_sub_plan        IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 119–22 UPDATE\_PLAN Procedure Parameters**

Parameter	Description
plan	Name of resource plan
new_comment	New user's comment
new_cpu_mth	Name of new allocation method for CPU resources (deprecated)
new_active_sess_pool_mth	Name of new method for maximum active sessions
new_parallel_degree_limit_mth	Name of new method for degree of parallelism
new_queueing_mth	Specifies type of queuing policy to use with active session pool feature
new_mgmt_mth	Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> <li>▪ <b>EMPHASIS</b> - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups.</li> <li>▪ <b>RATIO</b> - for single-level plans that use ratios to specify how I/O resources are distributed.</li> </ul>
new_sub_plan	New setting for whether the plan is only intended for use as a sub-plan

### Usage Notes

- If the parameters to [UPDATE\\_PLAN Procedure](#) are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

## UPDATE\_PLAN\_DIRECTIVE Procedure

This procedure updates resource plan directives.

---

**Note:** The functionality associated with the `new_parallel_target_percentage` and `new_parallel_queue_timeout` parameters is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

### Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
  plan                               IN VARCHAR2,
  group_or_subplan                   IN VARCHAR2,
  new_comment                         IN VARCHAR2 DEFAULT NULL,
  new_cpu_p1                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p2                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p3                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p4                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p5                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p6                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p7                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p8                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_active_sess_pool_p1            IN NUMBER   DEFAULT NULL,
  new_queueing_p1                    IN NUMBER   DEFAULT NULL,
  new_parallel_degree_limit_p1       IN NUMBER   DEFAULT NULL,
  new_switch_group                   IN VARCHAR2 DEFAULT NULL,
  new_switch_time                    IN NUMBER   DEFAULT NULL,
  new_switch_estimate                IN BOOLEAN  DEFAULT FALSE,
  new_max_est_exec_time              IN NUMBER   DEFAULT NULL,
  new_undo_pool                      IN NUMBER   DEFAULT NULL,
  new_max_idle_time                  IN NUMBER   DEFAULT NULL,
  new_max_idle_blocker_time          IN NUMBER   DEFAULT NULL,
  switch_time_in_call                IN NUMBER   DEFAULT NULL, -- deprecated
  new_mgmt_p1                        IN NUMBER   DEFAULT NULL,
  new_mgmt_p2                        IN NUMBER   DEFAULT NULL,
  new_mgmt_p3                        IN NUMBER   DEFAULT NULL,

  new_parallel_target_percentage     IN NUMBER   DEFAULT NULL,
  new_parallel_queue_timeout         IN NUMBER   DEFAULT NULL);
```

### Parameters

**Table 119–23** UPDATE\_PLAN\_DIRECTIVE Procedure Parameters

Parameter	Description
<code>plan</code>	Name of the resource plan
<code>group_or_subplan</code>	Name of the consumer group or subplan

**Table 119–23 (Cont.) UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>new_comment</code>	Comment for the plan directive
<code>new_cpu_p1</code>	First parameter for the CPU resources allocation method ((deprecated - use <code>new_mgmt_p1</code> instead)
<code>new_cpu_p2</code>	Parameter for the CPU resources allocation method ((deprecated - use <code>new_mgmt_p2</code> instead)
<code>new_cpu_p3</code>	Parameter for the CPU resources allocation method (deprecated - use <code>new_mgmt_p3</code> instead)
<code>new_cpu_p4</code>	Parameter for the CPU resources allocation method (deprecated- use <code>new_mgmt_p4</code> instead)
<code>new_cpu_p5</code>	Parameter for the CPU resources allocation method (deprecated - use <code>new_mgmt_p5</code> instead)
<code>new_cpu_p6</code>	Parameter for the CPU resources allocation method (deprecated- use <code>new_mgmt_p6</code> instead)
<code>new_cpu_p7</code>	Parameter for the CPU resources allocation method (deprecated- use <code>new_mgmt_p7</code> instead)
<code>new_cpu_p8</code>	Parameter for the CPU resources allocation method (deprecated- use <code>new_mgmt_p8</code> instead)
<code>new_active_sess_pool_p1</code>	Specifies maximum number of concurrently active sessions for a consumer group. Default is <code>NULL</code> , which means unlimited.
<code>new_queueing_p1</code>	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is <code>NULL</code> , which means unlimited.
<code>new_parallel_degree_limit_p1</code>	Specifies a limit on the degree of parallelism for any operation. Default is <code>NULL</code> , which means unlimited.
<code>new_switch_group</code>	Specifies consumer group to which this session is switched if other switch criteria are met. Default is <code>NULL</code> . If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
<code>new_switch_time</code>	Specifies time (in CPU seconds) that a session can execute before an action is taken. Default is <code>NULL</code> , which means unlimited.
<code>new_switch_estimate</code>	If <code>TRUE</code> , tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is <code>FALSE</code> .
<code>new_max_est_exec_time</code>	Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than <code>MAX_EST_EXEC_TIME</code> , the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is <code>NULL</code> , which means unlimited.
<code>new_undo_pool</code>	Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group
<code>new_max_idle_time</code>	Indicates the maximum session idle time. Default is <code>NULL</code> , which means unlimited.
<code>new_max_idle_blocker_time</code>	Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource

**Table 119–23 (Cont.) UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>new_switch_time_in_call</code>	Deprecated. If this parameter is specified, <code>new_switch_time</code> will be effectively set to <code>new_switch_time_in_call</code> and <code>new_switch_for_call</code> will be effectively set to <code>TRUE</code> .
<code>new_mgmt_p1</code>	Resource allocation value for level 1 (replaces <code>new_cpu_p1</code> ): <ul style="list-style-type: none"> <li>■ <b>EMPHASIS</b> - specifies the resource percentage at the first level</li> <li>■ <b>RATIO</b> - specifies the weight of resource usage</li> </ul>
<code>new_mgmt_p2</code>	Resource allocation value for level 2 (replaces <code>new_cpu_p2</code> ): <ul style="list-style-type: none"> <li>■ <b>EMPHASIS</b> - specifies the resource percentage at the second level</li> <li>■ <b>RATIO</b> - non-applicable</li> </ul>
<code>new_mgmt_p3</code>	Resource allocation value for level 3 (replaces <code>new_cpu_p3</code> ): <ul style="list-style-type: none"> <li>■ <b>EMPHASIS</b> - specifies the resource percentage at the third level</li> <li>■ <b>RATIO</b> - non-applicable</li> </ul>
<code>new_mgmt_p4</code>	Resource allocation value for level 4 (replaces <code>new_cpu_p4</code> ): <ul style="list-style-type: none"> <li>■ <b>EMPHASIS</b> - specifies the resource percentage at the fourth level</li> <li>■ <b>RATIO</b> - non-applicable</li> </ul>
<code>new_mgmt_p5</code>	Resource allocation value for level 5 (replaces <code>new_cpu_p5</code> ): <ul style="list-style-type: none"> <li>■ <b>EMPHASIS</b> - specifies the resource percentage at the fifth level</li> <li>■ <b>RATIO</b> - non-applicable</li> </ul>
<code>new_mgmt_p6</code>	Resource allocation value for level 6 (replaces <code>new_cpu_p6</code> ): <ul style="list-style-type: none"> <li>■ <b>EMPHASIS</b> - specifies the resource percentage at the sixth level</li> <li>■ <b>RATIO</b> - non-applicable</li> </ul>
<code>new_mgmt_p7</code>	Resource allocation value for level 7 (replaces <code>new_cpu_p7</code> ): <ul style="list-style-type: none"> <li>■ <b>EMPHASIS</b> - specifies the resource percentage at the seventh level</li> <li>■ <b>RATIO</b> - non-applicable</li> </ul>
<code>new_mgmt_p8</code>	Resource allocation value for level 8 (replaces <code>new_cpu_p8</code> ): <ul style="list-style-type: none"> <li>■ <b>EMPHASIS</b> - specifies the resource percentage at the eighth level</li> <li>■ <b>RATIO</b> - non-applicable</li> </ul>
<code>new_switch_io_megabytes</code>	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
<code>new_switch_io_reqs</code>	Specifies the number of I/O requests that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
<code>new_switch_for_call</code>	Specifies that if an action is taken because of the <code>new_switch_time</code> , <code>new_switch_io_megabytes</code> , or <code>new_switch_io_reqs</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is <code>FALSE</code> , which means that the original consumer group is not restored at the end of the top call.

**Table 119–23 (Cont.) UPDATE\_PLAN\_DIRECTIVE Procedure Parameters**

Parameter	Description
<code>new_max_utilization_limit</code>	Specifies the maximum percentage of CPU that this Consumer Group or Sub-Plan can utilize. Valid values are 0% to 100%. To unset the limit, use -1.
<code>new_parallel_target_percentage</code>	<p>Specifies the maximum percentage of the target number of parallel servers in an Oracle RAC environment a consumer group can use. Any additional parallel statements that are launched from this consumer group will be queued. The default is NULL, which means that the limit is 100% of the target number. Valid values for queuing are in the range of 0 to 100 (%). For updates to the plan directive, the value of -1 will reset the value to NULL.</p> <p>If a consumer group does not have any parallel statements running within an Oracle RAC database, the first parallel statement is allowed to exceed this limit.</p> <p>The target number of parallel servers in an Oracle RAC environment is the sum of the parameter <code>parallel_server_target</code> across all instances.</p>
<code>new_parallel_queue_timeout</code>	Specifies the time (in seconds) that a query may remain in its Consumer Group's parallel statement queue before it is removed and terminated with an error (ORA- 07454).

## Usage Notes

- If the parameters for `UPDATE_PLAN_DIRECTIVE` are left unspecified, then they remain unchanged in the data dictionary.
- For `new_max_idle_time` and `new_max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.
- To clear (zero or nullify) any numeric parameter in a resource plan directive, set it to -1 using the `UPDATE_PLAN_DIRECTIVE` Procedure.

## **VALIDATE\_PENDING\_AREA Procedure**

This procedure validates pending changes for the resource manager.

### **Syntax**

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

---

---

## DBMS\_RESOURCE\_MANAGER\_PRIVS

The DBMS\_RESOURCE\_MANAGER\_PRIVS package maintains privileges associated with the Resource Manager.

**See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Summary of DBMS\\_RESOURCE\\_MANAGER\\_PRIVS Subprograms](#)

---

## Summary of DBMS\_RESOURCE\_MANAGER\_PRIVS Subprograms

**Table 120–1** *DBMS\_RESOURCE\_MANAGER\_PRIVS Package Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">GRANT_SWITCH_CONSUMER_GROUP</a> Procedure on page 120-3	Grants the privilege to switch to resource consumer groups
<a href="#">GRANT_SYSTEM_PRIVILEGE</a> Procedure on page 120-4	Performs a grant of a system privilege
<a href="#">REVOKE_SWITCH_CONSUMER_GROUP</a> Procedure on page 120-5	Revokes the privilege to switch to resource consumer groups.
<a href="#">REVOKE_SYSTEM_PRIVILEGE</a> Procedure on page 120-6	Performs a revoke of a system privilege

## GRANT\_SWITCH\_CONSUMER\_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
  grantee_name  IN VARCHAR2,
  consumer_group IN VARCHAR2,
  grant_option  IN BOOLEAN);
```

### Parameters

**Table 120–2 GRANT\_SWITCH\_CONSUMER\_GROUP Procedure Parameters**

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
consumer_group	Name of consumer group.
grant_option	TRUE if grantee should be allowed to grant access, FALSE otherwise.

### Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the `grant_option` parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

**See Also:** [Chapter 119, "DBMS\\_RESOURCE\\_MANAGER"](#)

### Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
  'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
  dbms_resource_manager.oracle_user, 'scott','mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

## GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
    grantee_name    IN VARCHAR2,
    privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
    admin_option    IN BOOLEAN);
```

### Parameters

**Table 120–3 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
privilege_name	Name of the privilege to be granted.
admin_option	TRUE if the grant is with <code>admin_option</code> , FALSE otherwise.

### Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: `ADMINISTER_RESOURCE_MANAGER`. Database administrators have this system privilege with the `ADMIN` option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the `ADMIN` option can also grant this privilege to others.

### Examples

The following call grants this privilege to a user called `scott` without the `ADMIN` option:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
    grantee_name => 'scott',
    privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
    admin_option => FALSE);
END;
/
```

## REVOKE\_SWITCH\_CONSUMER\_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
    revokee_name  IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

### Parameters

**Table 120–4 REVOKE\_SWITCH\_CONSUMER\_GROUP Procedure Parameter**

Parameter	Description
revokee_name	Name of user/role from which to revoke access.
consumer_group	Name of consumer group.

### Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the DEFAULT\_CONSUMER\_GROUP consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from PUBLIC, then any users who could previously only use the consumer group through PUBLIC will not be able to switch to that consumer group.

### Examples

The following example revokes the privileges to switch to mail\_maintenance\_group from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
    'scott', 'mail_maintenance_group');
END;
/
```

## REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

### Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (  
    revokee_name    IN VARCHAR2,  
    privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

### Parameters

**Table 120–5 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
revokee_name	Name of the user or role from whom privilege is to be revoked.
privilege_name	Name of the privilege to be revoked.

### Examples

The following call revokes the ADMINISTER\_RESOURCE\_MANAGER from user scott:

```
BEGIN  
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');  
END;  
/
```

---

---

## DBMS\_RESULT\_CACHE

The `DBMS_RESULT_CACHE` package provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache. Both these caches use the same infrastructure. Therefore, for example, `DBMS_RESULT_CACHE.BYPASS` determines whether both caches are bypassed or both caches are used, and `DBMS_RESULT_CACHE.FLUSH` flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

**See Also:**

- *Oracle Database PL/SQL Language Reference* for more information about "Using the Cross-Session PL/SQL Function Result Cache"
- *Oracle Database Performance Tuning Guide* for more information about "Result Cache Concepts"

This chapter contains the following topics:

- [Using DBMS\\_RESULT\\_CACHE](#)
  - Constants
- [Summary of DBMS\\_RESULT\\_CACHE Subprograms](#)

## Using DBMS\_RESULT\_CACHE

---

- [Constants](#)

## Constants

**Table 121-1 DBMS\_RESULT\_CACHE Constants**

<b>Constant</b>	<b>Definition</b>
STATUS_BYPS	CONSTANT VARCHAR(10) := 'BYPASS';
STATUS_CORR	CONSTANT VARCHAR(10) := 'CORRUPT';
STATUS_DISA	CONSTANT VARCHAR(10) := 'DISABLED';
STATUS_ENAB	CONSTANT VARCHAR(10) := 'ENABLED';
STATUS_SYNC	CONSTANT VARCHAR(10) := 'SYNC';

## Summary of DBMS\_RESULT\_CACHE Subprograms

**Table 121–2 DBMS\_RESULT\_CACHE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">BYPASS Procedure</a> on page 121-5	Sets the bypass mode for the Result Cache
<a href="#">FLUSH Function &amp; Procedure</a> on page 121-7	Attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics
<a href="#">INVALIDATE Functions &amp; Procedures</a> on page 121-8	Invalidates all the result-set objects that dependent upon the specified dependency object
<a href="#">INVALIDATE_OBJECT Functions &amp; Procedures</a> on page 121-9	Invalidates the specified result-set object(s)
<a href="#">MEMORY_REPORT Procedure</a> on page 121-10	Produces the memory usage report for the Result Cache
<a href="#">STATUS Function</a> on page 121-11	Checks the status of the Result Cache

## BYPASS Procedure

This procedure sets the bypass mode for the Result Cache:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

### Syntax

```
DBMS_RESULT_CACHE.BYPASS (
    bypass_mode    IN    BOOLEAN,
    session        IN    BOOLEAN);
```

### Parameters

**Table 121–3** *BYPASS Procedure Parameters*

Parameter	Description
bypass_mode	<ul style="list-style-type: none"> <li>■ TRUE =&gt; Result Cache usage is bypassed</li> <li>■ FALSE =&gt; Result Cache usage is turned on</li> </ul>
session	<ul style="list-style-type: none"> <li>■ TRUE =&gt; Applies to current session</li> <li>■ FALSE (default) =&gt; Applies to all sessions</li> </ul>

### Usage Notes

This operation is database instance specific.

### Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated with the result cache function are not automatically flushed (if the instance is not restarted/bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.

```
BEGIN
    DBMS_RESULT_CACHE.BYPASS(TRUE);
    DBMS_RESULT_CACHE.FLUSH;
END;
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.
3. Resume use of the result cache, by turning off the cache bypass mode.

```
BEGIN
    DBMS_RESULT_CACHE.BYPASS(FALSE);
END;
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

## FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

### Syntax

```
DBMS_RESULT_CACHE.FLUSH (
  retainMem IN BOOLEAN DEFAULT FALSE,
  retainSta IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBMS_RESULT_CACHE.FLUSH (
  retainMem IN BOOLEAN DEFAULT FALSE,
  retainSta IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 121–4 FLUSH Function & Procedure Parameters**

Parameter	Description
retainMem	<ul style="list-style-type: none"> <li>▪ TRUE =&gt; retains the free memory in the cache</li> <li>▪ FALSE (default) =&gt; releases the free memory to the system</li> </ul>
retainSta	<ul style="list-style-type: none"> <li>▪ TRUE =&gt; retains the existing cache statistics</li> <li>▪ FALSE (default) =&gt; clears the existing cache statistics</li> </ul>

### Return Values

TRUE if successful in removing all the objects.

## INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

### Syntax

```
DBMS_RESULT_CACHE.INVALIDATE (  
  owner      IN VARCHAR2,  
  name       IN VARCHAR2)  
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (  
  owner      IN VARCHAR2,  
  name       IN VARCHAR2);
```

```
DBMS_RESULT_CACHE.INVALIDATE (  
  object_id  IN BINARY_INTEGER)  
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (  
  object_id  IN BINARY_INTEGER);
```

### Parameters

**Table 121–5** *INVALIDATE Function & Procedure Parameters*

Parameter	Description
owner	Schema name
name	Object name
object_id	Dictionary object number

### Return Values

The number of objects invalidated.

## INVALIDATE\_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

### Syntax

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  id          IN BINARY_INTEGER)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  id          IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  cache_id    IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  cache_id    IN VARCHAR2);
```

### Parameters

**Table 121–6** *INVALIDATE Function & Procedure Parameters*

Parameter	Description
id	Address of the cache object in the Result Cache
cache_id	Cache-id

### Return Values

The number of objects invalidated.

## MEMORY\_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

### Syntax

```
DBMS_RESULT_CACHE.MEMORY_REPORT (  
    detailed IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 121–7 MEMORY\_REPORT Procedure Parameters**

Parameter	Description
detailed	<ul style="list-style-type: none"><li>TRUE =&gt; produces a more detailed report</li><li>FALSE (default) =&gt; produces the standard report</li></ul>

### Usage Notes

Invoking this procedure from SQL\*Plus requires that the serveroutput be turned on.

## STATUS Function

This function checks the status of the Result Cache.

### Syntax

```
DBMS_RESULT_CACHE.STATUS  
RETURN VARCHAR2;
```

### Return Values

One of the following values:

- STATUS\_DISA - Cache is not available
- STATUS\_ENAB - Cache is available
- STATUS\_BYPS: Cache has been made temporarilyunavailable.
- STATUS\_SYNC - Cache is available, but synchronizing with Oracle RAC nodes

---

---

## DBMS\_RESUMABLE

With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- [Using DBMS\\_RESUMABLE](#)
  - Operational Notes
- [Summary of DBMS\\_RESUMABLE Subprograms](#)

## Using DBMS\_RESUMABLE

- [Operational Notes](#)

## Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

## Summary of DBMS\_RESUMABLE Subprograms

**Table 122–1 DBMS\_RESUMABLE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">ABORT Procedure</a> on page 122-5	Aborts a suspended resumable space allocation
<a href="#">GET_SESSION_TIMEOUT Function</a> on page 122-6	Returns the current timeout value of the resumable space allocations for a session with <code>session_id</code>
<a href="#">GET_TIMEOUT Function</a> on page 122-7	Returns the current timeout value of resumable space allocations for the current session
<a href="#">SET_SESSION_TIMEOUT Procedure</a> on page 122-8	Sets the timeout of resumable space allocations for a session with <code>session_id</code>
<a href="#">SET_TIMEOUT Procedure</a> on page 122-9	Sets the timeout of resumable space allocations for the current session
<a href="#">SPACE_ERROR_INFO Function</a> on page 122-10	Looks for space-related errors in the error stack, otherwise returning <code>FALSE</code>

## ABORT Procedure

This procedure aborts a suspended resumable space allocation. The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

### Syntax

```
DBMS_RESUMABLE.ABORT (  
    session_id IN NUMBER);
```

### Parameters

**Table 122–2** *ABORT Procedure Parameters*

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

### Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

## GET\_SESSION\_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

### Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (  
    session_id IN NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 122–3** *GET\_SESSION\_TIMEOUT Function Parameters*

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

### Return Values

**Table 122–4** *GET\_SESSION\_TIMEOUT Function Return Values*

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for a session with <code>session_id</code> . The timeout is returned in seconds.

### Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

## GET\_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

### Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT  
RETURN NUMBER;
```

### Return Values

**Table 122-5** *GET\_TIMEOUT Function Return Values*

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for the current session. The returned value is in seconds.

### Usage Notes

If the current session is not resumable enabled, the GET\_TIMEOUT function returns -1.

## SET\_SESSION\_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`. The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

### Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (  
    session_id IN NUMBER,  
    timeout    IN NUMBER);
```

### Parameters

**Table 122–6** *SET\_SESSION\_TIMEOUT Procedure Parameters*

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.
<code>timeout</code>	The timeout of the resumable space allocation.

## SET\_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

### Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (  
    timeout IN NUMBER);
```

### Parameters

**Table 122–7** *SET\_TIMEOUT Procedure Parameters*

Parameter	Description
timeout	The timeout of the resumable space allocation.

## SPACE\_ERROR\_INFO Function

This function looks for space-related errors in the error stack. If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

### Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
  error_type      OUT VARCHAR2,
  object_type     OUT VARCHAR2,
  object_owner    OUT VARCHAR2,
  table_space_name OUT VARCHAR2,
  object_name     OUT VARCHAR2,
  sub_object_name OUT VARCHAR2)
RETURN BOOLEAN;
```

### Parameters

**Table 122–8** SPACE\_ERROR\_INFO Function Parameters

Parameter	Description
error_type	The space error type. It will be one of the following: <ul style="list-style-type: none"> <li>▪ NO MORE SPACE</li> <li>▪ MAX EXTENTS REACHED</li> <li>▪ SPACE QUOTA EXCEEDED</li> </ul>
object_type	The object type. It will be one of the following: <ul style="list-style-type: none"> <li>▪ TABLE</li> <li>▪ INDEX</li> <li>▪ CLUSTER</li> <li>▪ TABLE SPACE</li> <li>▪ ROLLBACK SEGMENT</li> <li>▪ UNDO SEGMENT</li> <li>▪ LOB SEGMENT</li> <li>▪ TEMP SEGMENT</li> <li>▪ INDEX PARTITION</li> <li>▪ TABLE PARTITION</li> <li>▪ LOB PARTITION</li> <li>▪ TABLE SUBPARTITION</li> <li>▪ INDEX SUBPARTITION</li> <li>▪ LOB SUBPARTITION</li> </ul> <p>The type can also be <code>NULL</code> if it does not apply.</p>
object_owner	The owner of the object. <code>NULL</code> if it cannot be determined.
table_space_name	The table space where the object resides. <code>NULL</code> if it cannot be determined.
object_name	The name of rollback segment, temp segment, table, index, or cluster.
sub_object_name	The partition name or sub-partition name of <code>LOB</code> , <code>TABLE</code> , or <code>INDEX</code> . <code>NULL</code> if it cannot be determined.

---

---

**Note:** This functionality is deprecated with Oracle Database Release 11.2 and obsoleted with Release 12.1. For details regarding obsolescence, see My Oracle Support Note ID 1244535.1

---

---

The DBMS\_RLMGR package contains various procedures to create and manage rules and rule sessions by the Rules Manager.

**See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topic:

- [Using DBMS\\_RLMGR](#)
- [Summary of Rules Manager Subprograms](#)

---

## Using DBMS\_RLMGR

This section contains topics that relate to using the Rules Manager DBMS\_RLMGR package.

- [Security Model](#)

## Security Model

The Oracle Database installation runs the `catrul.sql` script to load the DBMS\_RLMGR package and create the required Rules Manager schema objects in the EXFSYS Schema.

DBMS\_RLMGR is an EXFSYS-owned package compiled with `AUTHID CURRENT_USER`. Any DBMS\_RLMGR subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted `CONNECT` and `RESOURCE` roles, `EXECUTE` privilege on `DBMS_LOCK`, and `CREATE VIEW` privilege to use this package.

For successful creation of a rule class, you must have sufficient privileges to create views, object types, tables, packages, and procedures.

The owner of the rule class always has privileges to drop a rule class, process rules in a rule class, add rules and delete rules from a rules class. Only the owner of the rule class can drop a rule class and this privilege cannot be granted to another user. Rule class privileges cannot be revoked from the owner of the rule class.

A user who is not the owner of the rule class must be granted appropriate types of privileges to perform certain tasks. The types of privileges that can be granted are:

- **PROCESS RULES:** A user with `PROCESS RULES` privilege on a rule class can process the rules in the rule class using the `PROCESS_RULES` procedure or the `ADD_EVENT` procedure. Also, the user with this privilege can select from the corresponding rule class results view.
- **ADD RULE:** A user with `ADD RULE` privilege on a rule class can add rules to a rule class. Alternatively, the owner of the rule class can grant the `INSERT` privilege on one rule class table to other users.
- **DELETE RULE:** A user with `DELETE RULE` privilege on a rule class can delete rules from a rule class. Alternatively, the owner of the rule class can grant the `DELETE` privilege on one rule class table to other users.
- **ALL:** Granting the `ALL` privilege on a rule class is equivalent to granting all the above privileges on the rule class to the user.

A user must have the `EXECUTE` privilege on the primitive event types associated with a rule class before that user can make use of the corresponding rule class results view.

The owner of the rule class can add the rules using `SQL INSERT` statement on the rule class table (that shares the same name as the rule class). Note that the owner of the rule class can also grant direct DML privileges on the rule class table to other users. When you use the schema extended name for the rule class, the user must have the `ADD RULE` privilege on the rule class to add a rule to the rule class.

The owner of the rule class can use an `SQL DELETE` statement on one rule class table to delete a rule. When you use the schema extended name for the rule class, the user must have the `DELETE RULE` privilege on the rule class.

When the schema extended name is used for the rule class, the user must have `PROCESS RULES` privilege on the rule class.

A user must have `EXECUTE` privilege on the `CTX_DDL` package for successful synchronization of the text indexes using the `DBMS_RLMGR.SYNC_TEXT_INDEXES` procedure.

The `USER_RLMGR_PRIVILEGES` view lists privileges of the current user for the rule classes.

## Summary of Rules Manager Subprograms

Table 123–1 describes the subprograms in the DBMS\_RLMGR package.

All the values and names passed to the procedures defined in the DBMS\_RLMGR package are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

**Table 123–1 DBMS\_RLMGR Package Subprograms**

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the event structure and the Expression Filter attribute set
ADD_EVENT Procedure	Adds an event to a rule class in an active session
ADD_FUNCTIONS Procedure	Adds a Function, a Type, or a Package to the approved list of functions with an event structure and to the Expression Filter attribute set
ADD_RULE Procedure	Adds a rule to the rule class
CONDITION_REF Function	Retrieves the primitive rule condition reference from a rule condition for composite events
CONSUME_EVENT Function	Consumes an event using its identifiers and prepares the corresponding rule for action execution
CONSUME_PRIM_EVENTS Function	Consumes one or more primitive events with all or none semantics
CREATE_CONDITIONS_TABLE Procedure	Creates a repository for the primitive rule conditions that can be shared by multiple rules from the same or different rule classes
CREATE_EVENT_STRUCT Procedure	Creates an event structure
CREATE_EXPFIL_INDEXES Procedure	Creates expression filter indexes for the rule class if the default indexes have been dropped
CREATE_INTERFACE Procedure	Creates a rule class interface package to directly operate on the rule class
CREATE_RULE_CLASS Procedure	Creates a rule class
DELETE_RULE Procedure	Deletes a rule from a rule class
DROP_CONDITIONS_TABLE Procedure	Drops the conditions table
DROP_EVENT_STRUCT Procedure	Drops an event structure
DROP_EXPFIL_INDEXES Procedure	Drops Expression Filter indexes for the rule conditions
DROP_INTERFACE Procedure	Drops the rule class interface package
DROP_RULE_CLASS Procedure	Drops a rule class
EXTEND_EVENT_STRUCT Procedure	Adds an attribute to the primitive event structure
GET_AGGREGATE_VALUE Function	Retrieves the aggregate value computed for a collection event
GRANT_PRIVILEGE Procedure	Grants a privilege on a rule class to another user
PROCESS_RULES Procedure	Process the rules for a given event

**Table 123-1 (Cont.) DBMS\_RLMGR Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">PURGE_EVENTS Procedure</a>	Resets the rule class by removing all the events associated with the rule class and purging any state information pertaining to rules matching some events
<a href="#">RESET_SESSION Procedure</a>	Starts a new rule session within a database session
<a href="#">REVOKE_PRIVILEGE Procedure</a>	Revokes a privilege on a rule class from a user
<a href="#">SYNC_TEXT_INDEXES Procedure</a>	Synchronizes the indexes defined to process the predicates involving the CONTAINS operator in rule conditions

## ADD\_ELEMENTARY\_ATTRIBUTE Procedures

This procedure adds the specified attribute to an event structure, which is also the Expression Filter attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct IN VARCHAR2,
    attr_name    IN VARCHAR2,
    attr_type    IN VARCHAR2,
    attr_defv1   IN VARCHAR2 default NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the event structure:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct IN VARCHAR2,
    attr_name    IN VARCHAR2,
    tab_alias    IN rlm$table_alias);
```

Allows addition of text attributes to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct IN VARCHAR2,
    attr_name    IN VARCHAR2,
    attr_type    IN VARCHAR2,
    text_pref    IN EXP$TEXT);
```

### Parameters

**Table 123–2 ADD\_ELEMENTARY\_ATTRIBUTE Procedure Parameters**

Parameter	Description
event_struct	Name of the event structure or attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
tab_alias	The type that identifies the database table to which the attribute is aliased
attr_defv1	Default value for the elementary attribute
text_pref	Text preferences such as LEXER and WORDLIST specification

### Usage Notes

- This procedure adds an elementary attribute to an event structure. The event structure is internally managed as the Expression Filter attribute set. If the event structure was originally created from an existing object type, then additional attributes cannot be added.

Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions, which is equivalent to an event structure that is used for a rule class.

- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more information about table aliases, see *Oracle Database Rules Manager and Expression Filter Developer's Guide*.
- You cannot add elementary attributes to an attribute set that is already assigned to a column storing expressions.
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER\_EXPFIL\_ATTRIBUTE\_SETS and USER\_EXPFIL\_ATTRIBUTES.
- This procedure with a text preference bound to the text\_pref argument creates a text attribute in the attribute set. The data type for such an attribute should be a VARCHAR2 or a CLOB. The preferences specified for a text attribute are used to process the predicates involving CONTAINS operator on the attributes. The valid preferences are those that are valid in the PARAMETERS clause of CTXRULE index creation. See *Oracle Text Application Developer's Guide* for the syntax.

## Examples

The following command adds two elementary attributes to an attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'HRAttrSet',
    ATTR_NAME => 'HRREP',
    attr_type => 'VARCHAR2');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'HRAttrSet',
    ATTR_NAME => 'DEPT',
    TAB_ALIAS => RLM$TABLE_ALIAS('DEPT'));
END;
```

The following commands create an attribute set with each hotel reservation including some additional information, described as the Add1Info attribute of CLOB data type. Rule conditions specified for this event structure can include text predicates on this attribute.

```
BEGIN
  DBMS_RLMGR.CREATE_EVENT_STRUCT (EVENT_STRUCT => 'AddFlight');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'AddHotel',
    ATTR_NAME => 'CustId',
    ATTR_TYPE => 'NUMBER');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'AddHotel',
    ATTR_NAME => 'Type',
    ATTR_TYPE => 'VARCHAR2(20)');
  . . .
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'AddHotel',
```

```
ATTR_NAME => 'AddlInfo',  
ATTR_TYPE => 'CLOB',  
TEXT_PREF => EXF$TEXT('LEXER hotelreserv_lexer');  
  
END;
```

## ADD\_EVENT Procedure

This procedure adds a primitive event to a rule class in an active rule session. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Adds a string representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
    rule_class      IN VARCHAR2,
    event_inst      IN VARCHAR2,
    event_type      IN VARCHAR2 default null);
```

Adds an AnyData representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
    rule_class      IN VARCHAR2,
    event_inst      IN sys.AnyData);
```

### Parameters

**Table 123–3 ADD\_EVENT Procedure Parameters**

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

### Usage Notes

- This procedure is used to add a primitive or a simple event to a rule class within an active rule session. By default, a rule session is the same as the database session. Optionally, multiple (sequential) rule sessions can be started within a database session by using the `RESET_SESSION` or `PROCESS_RULES` procedures.
- When the rule class is configured for simple events (consisting of only one primitive event structure), the `event_type` argument for the `ADD_EVENT` procedure can be ignored. Also, when the AnyData format of the event instance is passed, the event type information is embedded in the AnyData instance. In all other cases, the name of the primitive event structure being added to the rule class should be assigned to the `event_type` argument.
- For a valid event instance, the `ADD_EVENT` procedure processes the rules in the rule class and captures the results in the rule class results view (configured at the time of rule class creation). These results are preserved until the end of the rule session.
- When schema extended name is used for the rule class, you should have `PROCESS_RULES` privilege on the rule class. See the [GRANT\\_PRIVILEGE Procedure](#) for additional information. The value specified for the `event_type` argument is always resolved in the rule class owner's schema and should not use schema extended names. When a composite event structure is configured with a table alias

primitive event type, the name of the corresponding table should be assigned to the `event_type` argument.

## Examples

The following commands add two events to the `CompTravelPromo` rule class that is configured for two types of primitive events (`AddFlight` and `AddRentalCar`).

```
BEGIN
  DBMS_RLMGR.ADD_EVENT(rule_class => 'CompTravelPromo',
                      event_inst =>
                        AddFlight.getVarchar(987, 'Abcair', 'Boston',
                                             'Orlando', '01-APR-2003', '08-APR-2003'),
                      event_type => 'AddFlight');

  DBMS_RLMGR.ADD_EVENT(rule_class => 'Scott.CompTravelPromo',
                      event_inst =>
                        AnyData.convertObject(
                          AddRentalCar(987, 'Luxury', '03-APR-2003',
                                       '08-APR-2003', NULL)));

END;
/
```

## ADD\_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the event structure, which is also the Expression Filter attribute set.

### Syntax

```
DBMS_RLMGR.ADD_FUNCTIONS (
    event_struct IN VARCHAR2,
    funcs_name  IN VARCHAR2);
```

### Parameters

**Table 123–4 ADD\_FUNCTIONS Procedure Parameters**

Parameter	Description
event_struct	Name of the event structure to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

### Usage Notes

- By default, an attribute set implicitly allows references to all Oracle Database-supplied SQL functions for use in the rule conditions. If the expression set refers to a user-defined function, the expression set must be explicitly added to the attribute set.
- The ADD\_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list.
- You can specify the function or the package name with a schema extension. If you specify a function name without a schema extension, only such references in the rule condition are considered valid. You can restrict the conditional expression to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding functions to an attribute set.
- Related views: USER\_EXPFIL\_ATTRIBUTE\_SETS and USER\_EXPFIL\_ASET\_FUNCTIONS

### Examples

The following command adds two functions to the attribute set:

```
BEGIN
    DBMS_RLMGR.ADD_FUNCTIONS (attr_set => 'Car4Sale',
                             funcs_name => 'HorsePower');
    DBMS_RLMGR.ADD_FUNCTIONS (attr_set => 'Car4Sale',
                             funcs_name => 'Scott.CrashTestRating');
END;
/
```

## ADD\_RULE Procedure

This procedure adds new rules to a rule class.

### Syntax

```
DBMS_RLMGR.ADD_RULE (
    rule_class      IN  VARCHAR2,
    rule_id         IN  VARCHAR2,
    rule_cond       IN  VARCHAR2,
    actprf_nml     IN  VARCHAR2 DEFAULT NULL,
    actprf_vall    IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 123–5 ADD\_RULE Procedure Parameters**

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Unique identifier for the rule within the rule class
rule_cond	The condition for the rule. The condition uses the variables defined in the rule class's event structure.
actprf_nml	The list of action preference names for which values will be assigned through the actprf_vall argument
actprf_vall	The list of action preference values for the names list assigned to the actprf_nml argument

### Usage Notes

- This procedure is used to add new rules to the rule class. The rule condition passed to the ADD\_RULE procedure is validated using the event structure associated with the rule class. The action preferences names list is a subset of action preference categories configured during rule class creation.
- When schema extended name is used for the rule class, you should have ADD RULE privilege on the rule class. See the [GRANT\\_PRIVILEGE Procedure](#) for more information.
- Alternately, the owner of the rule class can add the rules using SQL INSERT statement on the rule class table (that shares the same name as the rule class). Note that the owner of the rule class can also grant direct DML privileges on the rule class table to other users.

---

**Note:** The AUTOCOMMIT property of the rule class is ignored if the new rules are added using the SQL INSERT statement instead of the ADD\_RULE procedure.

---

- See the [CREATE\\_RULE\\_CLASS Procedure](#) procedure for the structure of the rule class table.

### Examples

The following command adds a rule to the rule class.

```

BEGIN
DBMS_RLMGR.ADD_RULE (
    rule_class => 'CompTravelPromo',
    rule_id => 'AB_AV_FL',
    rule_cond =>
        '<condition>
            <and join="Flt.CustId = Car.CustId">
                <object name="Flt">
                    Airline='Abcair' and ToCity='Orlando'
                </object>
                <object name="Car">
                    CarType = 'Luxury'
                </object>
            </and>
        </condition>',
    actprf_nml => 'PromoType, OfferedBy',
    actprf_vall => ''RentalCar', 'Acar'');
END;

```

With proper privileges, the following SQL INSERT statement can be used to add the rule to the rule class.

```

INSERT INTO CompTravelPromo (rlm$ruleid, rlm$rulecond, PromoType, OfferedBy)
VALUES ('AB_AV_FL',
    '<condition>
        <and join="Flt.CustId = Car.CustId">
            <object name="Flt">
                Airline='Abcair' and ToCity='Orlando'
            </object>
            <object name="Car">
                CarType = 'Luxury'
            </object>
        </and>
    </condition>',
    'RentalCar', 'Acar');

```

## CONDITION\_REF Function

This function retrieves the primitive rule condition reference from a rule condition for composite events.

### Syntax

```
DBMS_RLMGR.CONDITION_REF (
    rule_cond IN  VARCHAR2,
    eventnm   IN  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 123–6** *CONDITION\_REF Function Parameters*

Parameter	Description
rule_cond	Rule condition in XML format
eventnm	Name of the event for which the reference should be retrieved

### Usage Notes

- For a rule condition in XML format, with a root `<condition>` element, this function retrieves the reference to a shared conditional expression on a particular primitive event.
- Use this function in a query operating on the rule class table to find all the references to a given primitive rule condition. To speed-up such queries, one or more functional indexes are defined on the `rlm$rulecond` column of the rule class table using this function signature. In order to make use of the index for a lookup query, the value assigned to the `eventnm` argument should be case sensitive.

### Examples

The following command joins the rule class table with the primitive conditions table to identify all the rule conditions that have references to the shareable primitive conditions (the query uses a functional index defined on the `rlm$rulecond` column). This query identifies all the rule conditions that refer to any shared conditions stored in the `FlightConditions` table.

```
select ctp.rlm$ruleid from CompTravelPromo ctp, FlightConditions fc
where dbms_rlmgr.condition_ref(ctp.rlm$rulecond, 'FLT') = fc.rlm$condid;
```

## CONSUME\_EVENT Function

This function consumes an event and prepares the corresponding rule for action execution. This is required only when the action (or rule execution) is carried by the user's application and not in the callback.

### Syntax

```
DBMS_RLMGR.CONSUME_EVENT (
    rule_class      IN VARCHAR2,
    event_ident     IN VARCHAR2)
RETURN NUMBER;
```

### Parameters

**Table 123–7 CONSUME\_EVENT Function Parameters**

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifier obtained from the corresponding rule class results view (or arguments of the action callback procedure in the case of rule class configured for RULE based consumption policy)

### Returns

The function returns:

- 1 -- If the event is successfully consumed.
- 0 -- If the event is expired (owing to duration policy) or consumed by another session prior to this call.

### Usage Notes

- When an EXCLUSIVE consumption policy is set for the events in a rule class, an event must be deleted from the system immediately after the rule it matched is executed (action is executed). When the rule action is carried in the rule class callback procedure by calling the PROCESS\_RULES procedure, the rule manager automatically handles the consumption of the events. However, when you request the results from matching events with rules in a rule class results view using the ADD\_EVENT procedure, you should take appropriate action to indicate the exact rule-event combination that is to be used for rule execution. The CONSUME\_EVENT function performs the required housekeeping services when the unique identifier for the event used in a rule execution is passed in.
- Because there could be a time lag between fetching the rule class matching results and the execution of the user initiated action, the application must execute the action only if the CONSUME\_EVENT call succeeds in consuming the event. This avoids any race condition with parallel sessions trying to consume the same events. When the event is successfully consumed, this call returns 1. In all other cases, it returns 0. A return value of 0 implies that the event is already consumed by another session and hence it is not available for this session.
- The CONSUME\_EVENT function deletes the events configured with EXCLUSIVE consumption policy and does nothing for events configured for 4 consumption policy.

- Unlike the `EXCLUSIVE` and `SHARED` consumption policies, which are determined at the rule class level, you use a `RULE` consumption policy to determine the consumption of an event on a rule by rule basis. That is a subset of the rules in a rule class may be configured such that when they are matched, the event is deleted from the system. At the same time the other set of rules could leave the event in the system even after executing the corresponding action. In this scenario, the action callback procedure implemented by the application developer can call `CONSUME_EVENT` function (with appropriate arguments) to conditionally consume the event for certain rules. Also see the use of [CONSUME\\_PRIM\\_EVENTS Function](#) for rule classes configured for `RULE` consumption policy

## Examples

The following commands identify an event that is used for a rule execution and consumes it using its identifier.

```
var eventid VARCHAR(40);
var evtcnsmd NUMBER;

BEGIN
  SELECT rlm$eventid INTO :eventid FROM MatchingPromos WHERE rownum < 2;

  -- carry the required action for a rule matched by the above event --
  :evtcnsmd := DBMS_RLMGR.CONSUME_EVENT(rule_class => 'TravelPromotion',
                                       event_ident => :eventid);
END;
```

## CONSUME\_PRIM\_EVENTS Function

This function consumes a set of primitive events with all or nothing semantics in the case of a rule class configured with `RULE` based consumption policy.

### Syntax

```
DBMS_RLMGR.CONSUME_PRIM_EVENTS (
    rule_class      IN VARCHAR2,
    event_idents   IN RLM$EVENTIDS)
RETURN NUMBER;
```

### Parameters

**Table 123–8 CONSUME\_PRIM\_EVENTS Function Parameters**

Parameter	Description
<code>rule_class</code>	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
<code>event_ident</code>	Event identifiers obtained from the corresponding rule class results view or the arguments of the action callback procedure

### Returns

The function returns:

- 1 -- If all the events, the identifiers for which are passed in, are successfully consumed.
- 0 -- If one or more primitive event could not be consumed.

### Usage Notes

- When you configure the rule class for `RULE` based consumption policy, it uses the `CONSUME_PRIM_EVENTS` function to consume one or more primitive events that constitute a composite event. This operation succeeds only when all the events passed in are still valid and are available for consumption. Any user initiated action must be implemented after checking the return value of the `CONSUME_PRIM_EVENTS` call.

### Examples

The following commands show the body of the action callback procedure for a rule class configured for `RULE` consumption policy. This demonstrates the use of `CONSUME_PRIM_EVENTS` function to consume the events before executing the action for the matched rules.

```
create or replace procedure PromoAction (
    Flt      AddFlight,
    Flt_EvtId ROWID,    --- rowid for the flight primitive event
    Car      AddRentalCar,
    Car_EvtId ROWID,
    rlm$rule TravelPromotions%ROWTYPE) is
    evtcnsmd NUMBER;
BEGIN
    evtcnsmd := DBMS_RLMGR.CONSUME_PRIM_EVENTS(
        rule_class => 'TravelPromotions',
        event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));
```

```
    if (evtcnsmd = 1) then
        -- consume operation was successful; perform the action ---
        OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
    end if;
END;
/
```

## CREATE\_CONDITIONS\_TABLE Procedure

This procedure creates a conditions table, which is a repository for the primitive rule conditions that can be shared by multiple rules from the same or different rule classes. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Creates a conditions table to store shareable primitive conditions defined for a primitive event.

```
DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
    cond_table     IN  VARCHAR2,
    pevent_struct  IN  VARCHAR2,
    stg_clause     IN  VARCHAR2 DEFAULT NULL);
```

Creates a conditions table to store shareable primitive conditions defined for a relational table identified through table aliases.

```
DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
    cond_table     IN  VARCHAR2,
    tab_alias      IN  rlm$table_alias,
    stg_clause     IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 123–9 CREATE\_CONDITIONS\_TABLE Procedure Parameters**

Parameter	Description
pevent_struct	Primitive event structure for which the shareable primitive rule conditions are defined
cond_table	Name of the table storing the primitive rule conditions
stg_clause	Storage clause for the conditions table
tab_alias	Type that identifies the database table for which the shareable primitive rule conditions are defined

### Usage Notes

- This procedure creates a relational table to store the primitive rule conditions that can be shared by multiple rules. It creates the table with the user specified name and it has a VARCHAR2 column to store the unique identifier for each primitive rule condition (`rlm$condid`), an expression data type column to store the conditional expressions (`rlm$condition`), and a VARCHAR2 column to store the descriptions for the primitive rule conditions in plain text (`rlm$conddesc`).
- Once it creates the table, the primitive rule condition can be added or modified using standard DML operations on the conditions table. The conditions table is configured to validate the primitive rule conditions (in the `rlm$condition` column) using the primitive event structure specified for the `pevent_struct` argument.
- A rule class configured with a primitive event structure can include some rule conditions that refer to rows in the conditions table using corresponding identifiers.

## Examples

The following command creates a conditions table that can store shareable primitive rule conditions for the AddRentalCar event structure:

```
BEGIN
  DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
    cond_table    => 'FlightConditions',
    pevent_struct => 'AddFlight',
    stg_clause    => 'TABLESPACE TBS_1');
END;
/
```

## CREATE\_EVENT\_STRUCT Procedure

This procedure creates an event structure.

### Syntax

```
DBMS_RLMGR.CREATE_EVENT_STRUCT (
    event_struct IN VARCHAR2);
```

### Parameters

**Table 123–10** CREATE\_EVENT\_STRUCT Procedure Parameter

Parameter	Description
event_struct	Name of the event structure to be created in the current schema

### Usage Notes

- This procedure creates a dummy event structure in the current schema. One or more attributes can be added to this event structure using the ADD\_ELEMENTARY\_ATTRIBUTE procedure.

### Examples

The following command creates the event structure.

```
BEGIN
    DBMS_RLMGR.CREATE_EVENT_STRUCT(event_struct => 'AddFlight');
END;
```

## CREATE\_EXPFIL\_INDEXES Procedure

This procedure creates expression filter indexes for the rule class if the default indexes have been dropped. If a representative set of rules is stored in the rule class table, the indexes can be tuned for these expressions by collecting statistics.

### Syntax

```
DBMS_RLMGR.CREATE_EXPFIL_INDEXES (
    rule_class IN VARCHAR2,
    coll_stats IN VARCHAR2 default 'NO');
```

### Parameters

**Table 123–11** CREATE\_EXPFIL\_INDEXES Procedure Parameter

Parameter	Description
rule_class	Name of the rule class
coll_stats	To collect expression statistics for building the indexes

### Usage Notes

- Expression filter indexes are used to identify the rule conditions in a rule class for appropriate events. The default indexes created at the time of rule class creation assume that all types of predicates (equality, inequality, and so forth) involving scalar attributes in an event structure are equally likely. The performance of a rule class can be improved by tuning the expression filter indexes for a specific workload. This is achieved either by collecting statistics on a representative workload or by identifying the most common predicate constructs with some domain knowledge.
- The default expression filter indexes created for the rule class can be dropped using the `DBMS_RLMGR.DROP_EXPFIL_INDEXES` procedure. Once the indexes are dropped, they can be recreated using the `DBMS_RLMGR.CREATE_EXPFIL_INDEXES` procedure. When the `coll_stats` argument of the `CREATE_EXPFIL_INDEXES` procedure is set to `YES`, rule condition statistics are collected for the most common predicate constructs and the indexes are created using these statistics. Alternately, a domain expert can manually set the index parameters by identifying the most common and discriminating predicate constructs and then create the indexes with these parameters. Note that the index parameters can be set for each of the primitive event structures associated with the rule class. The index parameters can be assigned to the event structure (which is also the Expression Filter attribute set) using the `DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS` procedure. When the `coll_stats` argument of the `CREATE_EXPFIL_INDEXES` procedure is set to `NO`, the expression filter indexes created for the rule class make use of the default index parameters associated with each primitive event structure. (See the chapter on indexing expressions in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for additional information on tuning the Expression Filter indexes for better performance).
- Related view: `USER_EXPFIL_DEF_INDEX_PARAMS`

## Examples

The following commands collect the statistics for the rules defined in the `CompTravelPromo` rule class and create the expression filter indexes that are based on the most common predicates in the set.

```
BEGIN
DBMS_RLMGR.CREATE_EXPFIL_INDEXES (rule_class => 'CompTravelPromo',
                                coll_stats => 'yes');

END;
/
```

This is an Expression Filter tuning example where the domain knowledge is used to assign specific index parameters. The following commands associate specific index parameters to the `AddFlight` event structure such that the expression filter index created for corresponding expressions are optimized accordingly. The subsequent `CREATE_EXPFIL_INDEXES` step makes use of these index parameters.

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS('AddFlight',
    exf$attribute_list (
      exf$attribute (attr_name => 'Airline',
                    attr_oper => exf$indexoper('='),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'ToCity',
                    attr_oper => exf$indexoper('='),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'Depart',
                    attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
                    attr_indexed => 'FALSE')
    )
  );
  -- create the indexes after assigning the index parameters --
  DBMS_RLMGR.CREATE_EXPFIL_INDEXES (rule_class => 'CompTravelPromo');

END;
/
```

## CREATE\_INTERFACE Procedure

This procedure creates a rule class interface package that can be used to directly operate on the rule class for efficiency and ease of use.

### Syntax

```
DBMS_RLMGR.CREATE_INTERFACE (
    rule_class IN VARCHAR2,
    interface_nm IN VARCHAR2);
```

### Parameters

**Table 123–12 CREATE\_INTERFACE Procedure Parameter**

Parameter	Description
rule_class	Name of the rule class for which the interface package is created
interface_nm	Name of the PL/SQL package that acts as the interface to the rule application

### Usage Notes

- The common set of DBMS\_RLMGR procedures used for runtime operations such as processing the rules for some events, consuming the events and resetting the session make use of the rule class name passed in as one of the arguments and associate them to the corresponding operations on the rule class. You can the overhead involved in this step by creating a rule class interface package that is used to directly operate on the rule class.
- The rule class interface package is a PL/SQL package that has procedures or functions to process rules (PROCESS\_RULES), add event (ADD\_EVENT), consume events (CONSUME\_EVENT, CONSUME\_PRIM\_EVENTS) and reset rule session (RESET\_SESSION). The operational characteristics of these procedures and functions are the same as those of DBMS\_RLMGR procedures and functions with matching names with two exceptions. Since the rule class interface package is created for a specific rule class, the rule class name is implicit and it need not be passed in as an argument to the procedures and functions of the rule class interface package. Additionally, the rule class interface package has separate PROCESS\_RULES and ADD\_EVENT procedures to accept each primitive event type configured with the rule class. This is in contrast to the same procedures in the DBMS\_RLMGR package, which are generalized to accept the event instances only as a VARCHAR or an AnyData instance.

### Examples

The following commands create the rule class interface package for the CompTravelPromo rule class.

```
BEGIN
    DBMS_RLMGR.CREATE_INTERFACE (rule_class => 'CompTravelPromo',
                                interface_nm => 'TravelPromoRules');
END;
```

The following commands make use of the interface created in previous step to process the rules for an instance of AddFlight event.

```
BEGIN
```

```
TravelPromoRules.process_rules (event_inst =>
    AddFlight(987, 'Abcair', 'Boston', 'Orlando',
              '01-APR-2009', '08-APR-2009');
END;
```

## CREATE\_RULE\_CLASS Procedure

This procedure creates a rule class.

### Syntax

```
DBMS_RLMGR.CREATE_RULE_CLASS (
  rule_class      IN  VARCHAR2,
  event_struct    IN  VARCHAR2,
  action_cbk     IN  VARCHAR2,
  actprf_spec    IN  VARCHAR2  default null,
  rslt_viewnm    IN  VARCHAR2  default null,
  rlcls_prop     IN  VARCHAR2  default <simple/>);
```

### Parameters

**Table 123–13** CREATE\_RULE\_CLASS Procedure Parameters

Parameter	Description
rule_class	Name of the rule class to be created in the current schema
event_struct	Name of the object type or an Expression Filter attribute set in the current schema that represents the event structure for the rule class
action_cbk	Name of the action callback procedure to be created for the rule class
actprf_spec	Specification (name and SQL datatype pairs) for the action preferences associated with the rule class
rslt_viewnm	Name of rule class results view that lists the matching events and rules within a session. A view with this name is created in the current schema.
rlcls_prop	XML document for setting the rule class properties. By default, the rule class created is for simple events (non-composite).

### Usage Notes

- For successful creation of a rule class, you must have sufficient privileges to create views, object types, tables, packages, and procedures.
- This command creates the rule class and its dependent objects in the user's schema. For this operation to succeed the name specified for the event structure must refer to an existing object type or an Expression Filter attribute set in the user's schema. When an object type is used for an event structure, the CREATE\_RULE\_CLASS procedure implicitly creates an attribute set for the object type. In the case of a rule class configured for composite events, the previous procedure also creates attribute sets for the object types that are directly embedded in the event structure's object type (or the attribute set). A maximum of 32 embedded objects (and or or table aliases) can be specified with an event structure that is used for a composite rule class. The types of dependent objects created with this procedure and their structure depend on the properties of the rule class and its event structure. The minimum set of dependent objects created for a rule class is as follows:
  - Rule class table – A rule class table that shares the name of the rule class is created in the user's schema to store the rule definitions (rule identifiers, rule conditions, rule descriptions, and action preferences). This table implicitly has four columns, rlm\$ruleid, rlm\$rulecond, rlm\$enabled, and rlm\$ruledesc to store the rule identifiers, rule conditions, rule states, and rule descriptions respectively. In addition to these four columns, the rule class

table has few columns according to the action preference specification for the rule class. For example, if a `TravelPromotion` rule class uses 'PromoType VARCHAR(20), OfferedBy VARCHAR(20)' as its action preference specification (assigned to `actpref_spec` argument), the rule class table is created with the following structure.

```
TABLE TravelPromotion (
    rlm$ruleid VARCHAR(100),      -- rule identifier column --
    PromoType VARCHAR(20),       -- action preference 1 --
    OfferedBy VARCHAR(20),       -- action preference 2 --
    rlm$rulecond VARCHAR(4000),  -- rule condition --
    rlm$ruledesc VARCHAR(1000),  -- rule description --
    rlm$enabled CHAR(1));       -- rule status --
```

The rule class table structure varies from one rule class to another based on the exact list of action preference categories specified for the rule class.

- Action Callback Procedure – You create the skeleton for the action callback procedure with the given name in the user's schema and it is associated with the rule class. During rule evaluation, the callback procedure is called for each matching rule and event. You must implement the body of the action callback procedure to perform the appropriate action for each rule. The exact action for a rule can be determined based on the event that matched the rule and rule definition along with its action preferences. This information is passed to the action callback procedure through its arguments. Hence, the argument list for the action callback procedure depends on the event structure associated with the rule class and the rule class itself.

In the case of a rule class configured for simple events (`<simple/>` assigned to the properties of the rule class), the event that matches a rule is passed through a `rlm$event` argument that is declared to be of the same type as the event structure. Additionally, the rule definitions are passed to the action callback procedure using an `rlm$rule` argument that is declared as ROWTYPE of the corresponding rule class table. For example, the structure of the `PromoAction` action callback procedure created for a `TravelPromotion` rule class configured for a simple (non-composite) `AddFlight` event structure is as follows:

```
PROCEDURE PromoAction (rlm$event AddFlight,
    rlm$rule TravlePromotion%ROWTYPE);
```

In the case of a rule class created for composite events (`<composite/>` assigned to the properties of the rule class), the action callback procedure is created to pass each primitive event as a separate argument. For example, the `CompPromoAction` action callback procedure created for a rule class `CompTravelPromo` configured for a composite event with `AddFlight` and `AddRentalCar` primitive events are shown as follows:

```
-- composite event structure --
TYPE TSCompEvent (Flt AddFlight,
    Car AddRentalCar);
-- corresponding action callback procedure --
PROCEDURE PromoAction (Flt AddFlight,
    Car AddRentalCar,
    rlm$rule CompTravelPromo%ROWTYPE)
```

The action callback procedure includes additional arguments when the rule class is configured for the `RULE` consumption policy or when the rule class is enabled for one or more collection events. The arguments in these cases

include the identifiers for the events (ROWID data type) in addition to the event instances. You can use these event identifiers to further operate on the matched rules. For example, in the case of the rule class configured for rule consumption, the event identifiers are used to consume the events with `DBMS_RLMGR.CONSUME_PRIM_EVENTS` function. In the case of rule class enabled for collection events, the same identifiers for the collection events can be used to fetch specific aggregate values with the `DBMS_RLMGR.GET_AGGREGATE_VALUE` function.

- Rule class results view – A view to display the results from matching some events with rules is created in the same schema as the rule class. By default, this view is created with a system-generated name. Optionally, the rule class creator can specify a name for this view with the `rlst_viewnm` argument of the `CREATE_RULE_CLASS` procedure. When the events are added to the rule manager within a rule session using the `ADD_EVENT` procedure, the list of matching events and rules are displayed in the rule class results view.

The structure of the view defined for the rule class results depends on the event structure and the action preferences configured with the rule class. Minimally, the view has three columns to display the system generated event identifier (`rlm$eventid`), the identifier of the rule it matches (`rlm$ruleid`), and the rule condition (`rlm$rulecond`). Additionally, it has columns to display the event information and the rule action preferences.

In the case of a rule class configured for simple events, the event information is displayed as `rlm$event` that is declared to be of the event structure type. So, a `MatchingPromos` view created for the `TravelPromotion` rule class configured for a simple `AddFlight` event structure is as follows:

```
VIEW MatchingPromos (
    rlm$eventid ROWID,
    rlm$event AddFlight,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

In the case of a rule class configured for composite events, the primitive events matching a rule are displayed separately using corresponding columns. For the above `CompTravelPromo` rule class, a `MatchingCompPromos` view is created with the following structure.

```
VIEW MatchingCompPromos (
    rlm$eventid ROWID,
    Flt AddFlight,
    Car AddRentalCar,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

The values from the `rlm$eventid` column are used to enforce rule class consumption policies when the corresponding rule is executed. See the [CONSUME\\_EVENT Function](#) for more information.

## Examples

The following commands create a rule class for simple events (of AddFlight type).

```
CREATE or REPLACE TYPE AddFlight AS OBJECT (
    CustId NUMBER,
    Airline VARCHAR(20),
    FromCity VARCHAR(30),
    ToCity VARCHAR(30),
    Depart DATE,
    Return DATE);
BEGIN
    DBMS_RLMGR.CREATE_RULE_CLASS (
        rule_class => 'TravelPromotion', -- rule class name --
        event_struct => 'AddFlight', -- event struct name --
        action_cbk => 'PromoAction', -- callback proc name --
        rslt_viewnm => 'MatchingPromos', -- results view --
        actprf_spec => 'PromoType VARCHAR(20),
                        OfferedBy VARCHAR(20)');
END;
```

The following commands create a rule class for composite events consisting of two primitive events (AddFlight and AddRentalCar).

```
CREATE or REPLACE TYPE TSCompEvent (Flt AddFlight,
                                    Car AddRentalCar);
BEGIN
    DBMS_RLMGR.CREATE_RULE_CLASS (
        rule_class => 'CompTravelPromo', -- rule class name --
        event_struct => 'TSCompEvent', -- event struct name --
        action_cbk => 'CompPromoAction', -- callback proc name --
        rslt_viewnm => 'MatchingCompPromos', -- results view --
        actprf_spec => 'PromoType VARCHAR(20),
                        OfferedBy VARCHAR(20)',
        properties => '<composite/>');
END;
```

## DELETE\_RULE Procedure

This procedure deletes a rule from a rule class.

### Syntax

```
DBMS_RLMGR.DELETE_RULE (
    rule_class    IN    VARCHAR2,
    rule_id       IN    VARCHAR2);
```

### Parameters

**Table 123–14** *DELETE\_RULE Procedure Parameters*

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Identifier for the rule to be deleted

### Usage Notes

- Use this procedure to delete a rule from the rule class. The identifier for the rule to be deleted can be obtained by querying the rule class table (that shares the same name as the rule class). Alternately, the owner of the rule class can use a SQL `DELETE` statement on one rule class table to delete a rule.
- When you use the schema extended name for the rule class, you must have the `DELETE RULE` privilege on the rule class. See the [GRANT\\_PRIVILEGE Procedure](#) for more information.

---

**Note:** `AUTOCOMMIT` property of the rule class is ignored if the rules are deleted with the SQL `DELETE` statement instead of the `DELETE_RULE` procedure.

---

- See the [CREATE\\_RULE\\_CLASS Procedure](#) for the structure of the rule class table.

### Examples

The following command deletes a rule from the rule class.

```
BEGIN
    DBMS_RLMGR.DELETE_RULE (
        rule_class => 'CompTravelPromo',
        rule_id    => 'AB_AV_FL');
END;
```

Alternately, you can issue the following SQL `DELETE` statement to delete the above rule from the rule class.

```
DELETE FROM CompTravelPromo WHERE rlm$ruleid = 'AB_AV_FL';
```

## DROP\_CONDITIONS\_TABLE Procedure

This procedure drops the conditions table.

### Syntax

```
DBMS_RLMGR.DROP_CONDITIONS_TABLE (
    cond_table IN VARCHAR2);
```

### Parameters

**Table 123–15** *DROP\_CONDITIONS\_TABLE Procedure Parameters*

Parameter	Description
cond_table	Name of conditions table in the user schema

### Usage Notes

- This procedure drops the table that stores the shareable conditional expressions. If one of the conditional expressions in this table is used to form a rule condition in a rule class, the drop operation fails with an appropriate error.

### Examples

The following command drops the conditions table:

```
BEGIN
    DBMS_RLMGR.DROP_CONDITIONS_TABLE (cond_table => 'FlightConditions');
END;
/
```

## DROP\_EVENT\_STRUCT Procedure

This procedure drops an event structure.

### Syntax

```
DBMS_RLMGR.DROP_EVENT_STRUCT (  
    event_struct IN VARCHAR2);
```

### Parameters

**Table 123–16** *DROP\_EVENT\_STRUCT Procedure Parameter*

Parameter	Description
event_struct	Name of event structure in the current schema

### Usage Notes

- This procedure drops the event structure from the current schema. This drops all the dependent objects created to manage the event structure.

### Examples

The following command drops the event structure.

```
BEGIN  
    DBMS_RLMGR.DROP_EVENT_STRUCT(event_struct => 'AddFlight');  
END;
```

## DROP\_EXPFIL\_INDEXES Procedure

This procedure drops the expression filter indexes created for a rule class.

### Syntax

```
DBMS_RLMGR.DROP_EXPFIL_INDEXES (
  rule_class IN VARCHAR2);
```

### Parameters

**Table 123–17** *DROP\_EXPFIL\_INDEXES Procedure Parameter*

Parameter	Description
rule_class	Name of the rule class

### Usage Notes

This procedure drops all the expression filter indexes associated with a rule class. You can recreate the indexes using the `DBMS_RLMGR.CREATE_EXPFIL_INDEXES` call.

### Examples

The following command drops the expression filter indexes created for the `CompTravelPromo` rule class.

```
BEGIN
DBMS_RLMGR.DROP_EXPFIL_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

## DROP\_INTERFACE Procedure

This procedure drops the rule class interface package created for a rules application.

### Syntax

```
DBMS_RLMGR.DROP_INTERFACE (  
    interface_nm IN VARCHAR2);
```

### Parameters

**Table 123–18** *DROP\_INTERFACE Procedure Parameter*

Parameter	Description
interface_nm	Name of the PL/SQL package that acts as the interface to the rule application

### Usage Notes

This procedure drops the rule class interface package created with the `DBMS_RLMGR.CREATE_INTERFACE` call.

### Examples

The following command drops the rule class interface package `TravelPromoRules`.

```
BEGIN  
    DBMS_RLMGR.DROP_INTERFACE (interface_nm => 'TravelPromoRules'  
    END;
```

## DROP\_RULE\_CLASS Procedure

This procedure drops a rule class.

### Syntax

```
DBMS_RLMGR.DROP_RULE_CLASS (
    rule_class IN VARCHAR2);
```

### Parameters

**Table 123–19** *DROP\_RULE\_CLASS Procedure Parameter*

Parameter	Description
rule_class	Name of rule class in the current schema

### Usage Notes

- This procedure drops the rule class from the current schema. This drops all the dependent objects created to manage the rule class. Because an event structure in a user's schema can be shared across multiple rule classes, the event structure is not dropped with this command. You must use the `DROP_EVENT_STRUCTURE` procedure for the composite event as well as the individual primitive events to cleanup unused event structures.

### Examples

The following command drops the rule class.

```
BEGIN
    DBMS_RLMGR.DROP_RULE_CLASS(rule_class => 'CompTravelPromo');
END;
```

## EXTEND\_EVENT\_STRUCT Procedure

This is used to extend the primitive event structure used by one or more rule classes by adding a new attribute.

### Syntax

```
DBMS_RLMGR.EXTEND_EVENT_STRUCT (
    event_struct    IN   VARCHAR2,
    attr_name       IN   VARCHAR2,
    attr_type       IN   VARCHAR2,
    attr_defvl     IN   VARCHAR2 default NULL);
```

### Parameters

**Table 123–20** *EXTEND\_EVENT\_STRUCT Procedure Parameter*

Parameter	Description
event_struct	Name of the event structure to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Data type of the attribute. This argument accepts any standard SQL data type or the name of an object type that is accessible to the current user.
attr_defvl	Default value for the elementary attribute

### Usage Notes

- This procedure extends a primitive event structure already associated with a rule class to include a new attribute. You can use this procedure mostly to migrate a fully developed rules application to use extended event structures and you should not use it in the place of the `ADD_ELEMENTARY_ATTRIBUTE` call. Unlike the `ADD_ELEMENTARY_ATTRIBUTE` call, which builds an event structure one attribute at a time, the `EXTEND_EVENT_STRUCT` call evolves the object type associated with the event structure to include the new attributes and performs some maintenance operations on the dependent objects.
- The usage of the `EXTEND_EVENT_STRUCT` call is similar to that of the `ADD_ELEMENTARY_ATTRIBUTE` call with the same set of arguments. Table alias attributes and attributes of text and spatial data types cannot be added to the event structure using the `EXTEND_EVENT_STRUCT` call.

### Examples

The following commands add an attribute to the `AddRentalCar` event structure that is used by the `CompTravelPromo` rule class.

```
BEGIN
    DBMS_RLMGR.EXTEND_EVENT_STRUCT (
        event_struct => 'AddRentalCar',
        attr_name     => 'PrefMemberId',
        attr_type     => 'VARCHAR2(30)');
END;
```

## GET\_AGGREGATE\_VALUE Function

This function retrieves the aggregate value computed for a collection event.

### Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE (
  rule_class      IN VARCHAR2,
  event_ident     IN VARCHAR2,
  aggr_func       IN VARCHAR2) RETURN VARCHAR2;
```

### Parameters

**Table 123–21** GET\_AGGREGATE\_VALUE Function Parameters

Parameter	Description
rule_class	Name of the rule class for the collection event
event_ident	System-generated identifier for the collection event
aggr_func	Signature for the aggregate value to be retrieved

### Usage Notes

- When a rule condition with `collection` construct matches a set of events, an instance representing the collection event and a system-generated identifier for the collection event are passed into the action callback procedure. This event identifier can be used to fetch any aggregate values that are computed as part of the collection event evaluation.
- Within a collection construct in a rule condition, the aggregate functions can be included in the `HAVING` clause or in the `COMPUTE` clause. For example, the following rule condition computes three aggregate values for `sum(amount)`, `count(*)`, and `max(amount)`. At the time of action execution, these values can be obtained using the identifier for the collection event that represents all the instances of `BankTransaction` with the same `subjectId` (the attribute on which the events are grouped).

```
<condition>
  <collection name="bank" groupby="subjectId"
    having="sum(amount) > 10000"
    compute="max(amount), count(*)" />
</condition>
```

- The signature for the aggregate function is bound to the `aggr_func` argument of the `GET_AGGREGATE_VALUE` function to fetch the specific aggregate value. If the value is a `NUMBER` or a `DATE` data type, it returns the equivalent `VARCHAR` representation. It returns a `NULL` value if an attempt was made to fetch an aggregate value that is never computed as part of the collection event.

### Examples

The following example shows a sample implementation of the action callback procedure that prints the computed aggregate values as part of action execution. In this particular case, the `BankTransaction` primitive event is enabled for collections.

```
CREATE OR REPLACE PROCEDURE LAWENFORCEMENTCBK (
  bank            banktransaction,
  bankcollid      rowid,
```

```
transport          transportation,
fldrpt            fieldreport,
rlm$rule          LawEnforcementRC%ROWTYPE) IS
aggrval           VARCHAR(30);
begin
  dbms_output.put_line('Mathing Rule : '||rlm$rule.rlm$ruleid||chr(10));

  if (bank is not null) then
    dbms_output.put_line('-->Bank Transactions by ('||bank.subjectId||')'||chr(10));

    aggrval := dbms_rlmgr.get_aggregate_value(rule_class =>'LawEnforcementRC',
                                              event_ident => bankcollid,
                                              aggr_func  => 'sum(amount)');

    if (aggrval is not null) then
      dbms_output.put_line('---> Sum of the amounts is : '||aggrval||chr(10));
    end if;
    . . .
  end if;
end;
```

## GRANT\_PRIVILEGE Procedure

This procedure grants privileges on a rule class to another user.

### Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE (
  rule_class      IN  VARCHAR2,
  priv_type       IN  VARCHAR2,
  to_user         IN  VARCHAR2);
```

### Parameters

**Table 123–22 GRANT\_PRIVILEGE Procedure Parameters**

Parameter	Description
rule_class	Name of the rule class in the current schema
priv_type	Type of rule class privilege to be granted
to_user	User to whom the privilege is to be granted

### Usage Notes

- This procedure grants appropriate privileges to a user who is not the owner of the rule class. The types of privileges that can be granted to a user are:
  - PROCESS RULES: A user with PROCESS RULES privilege on a rule class can process the rules in the rule class using the PROCESS\_RULES procedure or the ADD\_EVENT procedure. Also, the user with this privilege can select from the corresponding rule class results view.
  - ADD RULE: A user with ADD RULE privilege on a rule class can add rules to a rule class. Alternatively, the owner of the rule class can grant the INSERT privilege on one rule class table to other users.
  - DELETE RULE: A user with DELETE RULE privilege on a rule class can delete rules from a rule class. Alternatively, the owner of the rule class can grant the DELETE privilege on one rule class table to other users.
  - ALL: Granting the ALL privilege on a rule class is equivalent to granting all the above privileges on the rule class to the user.
- The owner of the rule class always has privileges to drop a rule class, process rules in a rule class, add rules and delete rules from a rules class. Only the owner of the rule class can drop a rule class and this privilege cannot be granted to another user.
- You must have the EXECUTE privilege on the primitive event types associated with a rule class before you make use of the corresponding rule class results view.

### Examples

The following command grants PROCESS RULES privilege on TravelPromo rule class to the user SCOTT.

```
BEGIN
  DBMS_RLMGR.GRANT_PRIVILEGE(rule_class => 'TravelPromo',
                              priv_type => 'PROCESS RULES',
                              to_user => 'SCOTT');
END;
```

## PROCESS\_RULES Procedure

This procedure processes the rules for a given event. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Processes the rules for a string representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES (
    rule_class    IN VARCHAR2,
    event_inst    IN VARCHAR2,
    event_type    IN VARCHAR2 default null);
```

Processes the rules for an AnyData representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES (
    rule_class    IN VARCHAR2,
    event_inst    IN sys.AnyData);
```

### Parameters

**Table 123–23** *PROCESS\_RULES Procedure Parameters*

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

### Usage Notes

- This procedure is used to process the rules in a rule class for an event instance assigned to the event\_inst argument.
- In the case of a rule class configured for simple events (non-composite), the event instance is an instantiation of the corresponding event structure. The rules are evaluated (conclusively) for this event and the corresponding action callback procedure is called for each matching rule. If the event does not match any rule, no further action is performed. If the event matches two or more rules, the ordering clause configured for the rule class is used to order them accordingly to invoke the action callback procedure. If the rule class is configured for EXCLUSIVE consumption policy, once the first rule in this order is executed (and the corresponding action callback procedure is called), the rest of the rules that matched the event are ignored.
- In the case of a rule class configured for composite events, the event instance assigned to the event\_inst argument is an instantiation of one of the primitive type within the composite event. When the instance is represented as a string, the corresponding type name should be assigned to the event\_type argument. The PROCESS\_RULES call on a rule class configured for composite events performs

various actions depending on the state of the rule class and the kind of rules in the rule class. Note the following.

- The rules operating only on the primitive event passed in are evaluated conclusively and the action callback procedure is called for the matching rules, as described in previous paragraph.
- In the case of a rule operating on more than one primitive event, the event instance passed through `PROCESS_RULES` procedure could match only a part of the rule.
  - \* If there are other primitive event instances that matches the rest of the rule, the current event instance is combined with the other instances to form a complete composite event that matches a rule in the rule class. So, the event instance assigned to the `event_inst` argument of the `PROCESS_RULES` procedure could be combined with various other primitive events (previously processed) to evaluate one or more rules conclusively. The action callback procedure for the rule class is called for each such combination of primitive events (composite event) and the rule. The ordering clause for the rule class and the consumption policy for the primitive events in taken into account while invoking the action callback procedure.
  - \* If there is no other primitive event that matches the rest of the rule, the current event instance and its (incremental) evaluation results are recorded in the database. These results are preserved until either the event is consumed or deleted from the system owing to the duration policy used for the rule class.

## Examples

The following command processes the rules in the `TravelPromotion` rule class for the given events.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES (
    rule_class => 'TravelPromotion',
    event_inst =>
      AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                          '01-APR-2003', '08-APR-2003'));
END;
```

The following commands process the rules in the `CompTravelPromo` rule class for the two primitive events shown.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES(
    rule_class => 'CompTravelPromo',
    event_inst =>
      AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                          '01-APR-2003', '08-APR-2003'),
    event_type => 'AddFlight');
  DBMS_RLMGR.PROCESS_RULES(
    rule_class => 'Scott.CompTravelPromo',
    event_inst =>
      AnyData.convertObject(AddRentalCar(987, 'Luxury', '03-APR-2003',
                                          '08-APR-2003', NULL));
END;
```

## PURGE\_EVENTS Procedure

This procedure resets the incremental state maintained by the rule class by removing all the events associated with the rule class and purging any state information pertaining to rules matching some events.

### Syntax

```
DBMS_RLMGR.PURGE_EVENTS (  
    rule_class IN VARCHAR2);
```

### Parameters

**Table 123–24 PURGE\_EVENTS Procedure Parameters**

Parameter	Description
rule_class	Name of rule class in the current schema

### Usage Notes

- Use this procedure while developing rules applications using Rules Manager. You can test the rules defined in the rule class with hypothetical events and then remove all these events by issuing this procedure call. This call cleans up all the events in the events repository and purges any partial state information associated with the matching rules.

### Examples

The following command removes the events associated with the `CompTravelPromo` rule class:

```
BEGIN  
    DBMS_RLMGR.PURGE_EVENTS (rule_class => 'CompTravelPromo');  
END;  
/
```

## RESET\_SESSION Procedure

This procedure starts a new session and thus discards the results in the rule class results view.

### Syntax

```
DBMS_RLMGR.RESET_SESSION (
    rule_class IN VARCHAR2);
```

### Parameters

**Table 123–25** *RESET\_SESSION Procedure Parameter*

Parameter	Description
rule_class	Name of rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.

### Usage Notes

- When you use the `ADD_EVENT` procedure to add events to the rule class, the results from matching rules with events are recorded in the rule class results view. By default, these results are reset at the end of the database session. Alternately, you can use the [RESET\\_SESSION Procedure](#) to reset and start a new rule session within a database session.
- This procedure is only applicable while using [ADD\\_EVENT Procedure](#) to evaluate the rules.

### Examples

The following command resets a rule class session.

```
BEGIN
    DBMS_RLMGR.RESET_SESSION(
        rule_class => 'CompTravelPromo');
END;
```

## REVOKE\_PRIVILEGE Procedure

This procedure revokes privileges on a rule class from another user.

### Syntax

```
DBMS_RLMGR.REVOKE_PRIVILEGE (
    rule_class    IN  VARCHAR2,
    priv_type     IN  VARCHAR2,
    from_user     IN  VARCHAR2);
```

### Parameters

**Table 123–26 REVOKE\_PRIVILEGE Procedure Parameters**

Parameter	Description
rule_class	Name of the rule class in the current schema
priv_type	Type of rule class privilege to be revoked
from_user	User from whom the privilege is to be revoked

### Usage Notes

- This procedure revokes appropriate privileges from a user. The types of privileges that can be revoked are the same as the types listed in the description of the [GRANT\\_PRIVILEGE Procedure](#). Rule class privileges cannot be revoked from the owner of the rule class.

### Examples

The following command revokes PROCESS RULES privilege on TravelPromo rule class from the user SCOTT.

```
BEGIN
    DBMS_RLMGR.REVOKE_PRIVILEGE(rule_class => 'TravelPromo',
                                priv_type  => 'PROCESS RULES',
                                from_user  => 'SCOTT');
END;
```

## SYNC\_TEXT\_INDEXES Procedure

This procedure synchronizes the indexes defined to process the predicates involving the CONTAINS operator in rule conditions.

### Syntax

```
DBMS_RLMGR.SYNC_TEXT_INDEXES (
    rule_class IN VARCHAR2);
```

### Parameters

**Table 123–27 SYNC\_TEXT\_INDEXES Procedure Parameters**

Parameter	Description
rule_class	Name of the rule class in the current schema

### Usage Notes

- When a rule class is configured for events with one or more text attributes, the text predicates in the corresponding rule conditions are processed using CTXRULE indexes. Unlike other types of indexes (bitmap for scalar and XML predicates or spatial for spatial predicates) used to process other types of predicates in the rule conditions, the CTXRULE indexes are not transactional in nature. That is, if the text predicates in a rule condition are modified in a database transaction, the new predicates are not automatically reflected in the corresponding CTXRULE index. This could result in inconsistent results while matching events with the rule conditions. All the CTXRULE indexes associated with a rule class can be synchronized with the latest rule conditions using this procedure.

You must have EXECUTE privilege on the CTX\_DDL package for successful synchronization of the text indexes.

### Examples

The following command synchronizes any text indexes associated CompTravelPromo rule class:

```
BEGIN
    DBMS_RLMGR.SYNC_TEXT_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

The DBMS\_RLS package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD). DBMS\_RLS is available with the Enterprise Edition only.

**See Also:** *Oracle Database Security Guide* for usage information on DBMS\_RLS .

This chapter contains the following topics:

  - Security Model
  - Operational Notes
- [Summary of DBMS\\_RLS Subprograms](#)

---

## Using DBMS\_RLS

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

## Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (
    'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select');
```

Whenever the EMPLOYEES table, under the HR schema, is referenced in a query or subquery (SELECT), the server calls the EMP\_SEC function (under the HR schema). This function returns a predicate specific to the current user for the EMP\_POLICY policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: INDEX, SELECT, INSERT, UPDATE, or DELETE.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, P1 (for example, where SAL > 10000, or even a subquery) is the predicate returned from the EMP\_SEC function. The server treats the EMPLOYEES table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require EXECUTE privilege on the policy function, because the server makes the call with the function definer's right.

---

**Note:** The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no JOIN, ORDER BY, GROUP BY, and so on.

---

DBMS\_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the EMP\_POLICY with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', TRUE);
```

## Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

## Operational Notes

The DBMS\_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS\_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS\_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from v\$vpd\_policies.

A synonym can reference only a view or a table.

---

## Summary of DBMS\_RLS Subprograms

**Table 124–1 DBMS\_RLS Package Subprograms**

Subprogram	Description
<a href="#">ADD_GROUPED_POLICY Procedure</a> on page 124-7	Adds a policy associated with a policy group
<a href="#">ADD_POLICY Procedure</a> on page 124-9	Adds a fine-grained access control policy to a table, view, or synonym
<a href="#">ADD_POLICY_CONTEXT Procedure</a> on page 124-13	Adds the context for the active application
<a href="#">CREATE_POLICY_GROUP Procedure</a> on page 124-14	Creates a policy group
<a href="#">DELETE_POLICY_GROUP Procedure</a> on page 124-15	Deletes a policy group
<a href="#">DISABLE_GROUPED_POLICY Procedure</a> on page 124-16	Disables a row-level group security policy
<a href="#">DROP_GROUPED_POLICY Procedure</a> on page 124-17	Drops a policy associated with a policy group
<a href="#">DROP_POLICY Procedure</a> on page 124-18	Drops a fine-grained access control policy from a table, view, or synonym
<a href="#">DROP_POLICY_CONTEXT Procedure</a> on page 124-19	Drops a driving context from the object so that it will have one less driving context
<a href="#">ENABLE_GROUPED_POLICY Procedure</a> on page 124-20	Enables or disables a row-level group security policy
<a href="#">ENABLE_POLICY Procedure</a> on page 124-21	Enables or disables a fine-grained access control policy
<a href="#">REFRESH_GROUPED_POLICY Procedure</a> on page 124-22	Reparses the SQL statements associated with a refreshed policy
<a href="#">REFRESH_POLICY Procedure</a> on page 124-23	Causes all the cached statements associated with the policy to be reparsed

## ADD\_GROUPED\_POLICY Procedure

This procedure adds a policy associated with a policy group.

### Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY (
  object_schema      IN VARCHAR2 NULL,
  object_name        IN VARCHAR2,
  policy_group       IN VARCHAR2 'SYS_DEFAULT',
  policy_name        IN VARCHAR2,
  function_schema    IN VARCHAR2 NULL,
  policy_function     IN VARCHAR2,
  statement_types    IN VARCHAR2 NULL,
  update_check       IN BOOLEAN FALSE,
  enable             IN BOOLEAN TRUE,
  static_policy      IN BOOLEAN FALSE,
  policy_type        IN BINARY_INTEGER NULL,
  long_predicate     BOOLEAN FALSE,
  sec_relevant_cols  IN VARCHAR2,
  sec_relevant_cols_opt IN BINARY_INTEGER NULL);
```

### Parameters

**Table 124–2 ADD\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_schema	The schema containing the table, view, or synonym. The default is NULL, which means that the current user schema is used as the object_schema.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.
policy_name	The name of the policy; must be unique for the same table or view.
function_schema	The schema owning the policy function. The default is NULL, which means that the current user schema is used as the function_schema.
policy_function	The name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.
enable	Indicates if the policy is enable when it is added. The default is TRUE.
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.

**Table 124–2 (Cont.) ADD\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
<code>policy_type</code>	Default is <code>NULL</code> , which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in <a href="#">Table 124–4</a> . Specifying any of these policy types overrides the value of <code>static_policy</code> .
<code>long_predicate</code>	Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>sec_relevant_cols_opt</code>	Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries ( <code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_rls.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See " <a href="#">Usage Notes</a> " on page 124-11 for restrictions and additional information about this option.

## Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the [CREATE\\_POLICY\\_GROUP Procedure](#) on page 124-14.
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, `SYS_DEFAULT`, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with `EXEMPT ACCESS POLICY` system privilege.
- If no `object_schema` is specified, the current user's schema is assumed.
- If no `function_schema` is specified, the current user's schema is assumed.

## ADD\_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

**See Also:** [Operational Notes](#) on page 124-5

A COMMIT is also performed at the end of the operation.

### Syntax

```
DBMS_RLS.ADD_POLICY (
    object_schema          IN VARCHAR2 NULL,
    object_name            IN VARCHAR2,
    policy_name            IN VARCHAR2,
    function_schema        IN VARCHAR2 NULL,
    policy_function        IN VARCHAR2,
    statement_types        IN VARCHAR2 NULL,
    update_check           IN BOOLEAN  FALSE,
    enable                 IN BOOLEAN  TRUE,
    static_policy          IN BOOLEAN  FALSE,
    policy_type            IN BINARY_INTEGER NULL,
    long_predicate         IN BOOLEAN  FALSE,
    sec_relevant_cols      IN VARCHAR2 NULL,
    sec_relevant_cols_opt IN BINARY_INTEGER NULL);
```

### Parameters

**Table 124–3 ADD\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified, the current user's schema is assumed.
object_name	Name of table, view, or synonym to which the policy is added.
policy_name	Name of policy to be added. It must be unique for the same table or view.
function_schema	Schema of the policy function (current default schema, if NULL). If no function_schema is specified, the current user's schema is assumed.
policy_function	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	Optional argument for INSERT or UPDATE statement types. The default is FALSE. Setting update_check to TRUE causes the server to also check the policy against the value after insert or update.
enable	Indicates if the policy is enabled when it is added. The default is TRUE.

**Table 124–3 (Cont.) ADD\_POLICY Procedure Parameters**

Parameter	Description
<code>static_policy</code>	The default is <code>FALSE</code> . If it is set to <code>TRUE</code> , the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for <code>SYS</code> or the privileged user who has the <code>EXEMPT ACCESS POLICY</code> privilege.
<code>policy_type</code>	Default is <code>NULL</code> , which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in <a href="#">Table 124–4</a> . Specifying any of these policy types overrides the value of <code>static_policy</code> .
<code>long_predicate</code>	Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>sec_relevant_cols_opt</code>	Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries ( <code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_rls.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See "Usage Notes" on page 124-11 for restrictions and additional information about this option.

**Table 124–4 DBMS\_RLS.ADD\_POLICY Policy Types**

Policy Type	Description
<code>STATIC</code>	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as <code>SYS_CONTEXT</code> or <code>SYSDATE</code> . Applies to only one object.
<code>SHARED_STATIC</code>	Same as <code>STATIC</code> except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
<code>CONTEXT_SENSITIVE</code>	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
<code>SHARED_CONTEXT_SENSITIVE</code>	Same as <code>CONTEXT_SENSITIVE</code> except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
<code>DYNAMIC</code>	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function upon each statement parsing and execution. Applies to only one object.

## Usage Notes

- SYS is free of any security policy.
- If no `object_schema` is specified, the current user's schema is assumed.
- If no `function_schema` is specified, the current user's schema is assumed.
- The policy functions are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table or view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```

- The policy functions must have the purity level of `WNDS` (write no database state).

**See Also:** The *Oracle Database Advanced Application Developer's Guide* has more details about the `RESTRICT_REFERENCES` pragma.

- Predicates generated from different VPD policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.
- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with `sec_relevant_cols_opt => dbms_ols.ALL_ROWS`) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as `NULL`. The restrictions for this option are as follows:
  - Only applies to `SELECT` statements
  - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
  - If your application performs calculations, or does not expect `NULL` values, then you should use the default behavior of column-level VPD, which is specified with the `sec_relevant_cols` parameter.
  - If you use `UPDATE AS SELECT` with this option, then only the values in the columns you are allowed to see will be updated.
  - This option may prevent some rows from displaying. For example:

```
select * from employees
where salary = 10
```

This query may not return rows if the `salary` column returns a `NULL` value because the column masking option has been set.

- When you add a VPD policy to a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`.

## Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```
BEGIN
dbms_ols.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hr_policy',
function_schema => 'hr',
policy_function => 'hrfun',
statement_types => 'select,index',
policy_type => dbms_ols.CONTEXT_SENSITIVE,
sec_relevant_cols=>'salary,birthdate,ssn');
END;
/
```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```
BEGIN
dbms_ols.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hosting_policy',
function_schema => 'hr',
policy_function => 'subfun',
policy_type => dbms_ols.SHARED_STATIC);
END;
/
```

## ADD\_POLICY\_CONTEXT Procedure

This procedure adds the context for the active application.

### Syntax

```
DBMS_RLS.ADD_POLICY_CONTEXT (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  namespace     IN VARCHAR2,
  attribute      IN VARCHAR2);
```

### Parameters

**Table 124–5 ADD\_POLICY\_CONTEXT Procedure Parameters**

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
namespace	The namespace of the driving context
attribute	The attribute of the driving context.

### Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- If no object\_schema is specified, the current user's schema is assumed.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS\_DEFAULT policy group.
- To add a policy to table hr.employees in group access\_control\_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_
group','policy1','SYS','HR.ACCESS');
```

## CREATE\_POLICY\_GROUP Procedure

This procedure creates a policy group.

### Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    policy_group     IN VARCHAR2);
```

### Parameters

**Table 124–6 CREATE\_POLICY\_GROUP Procedure Parameters**

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym.
<code>object_name</code>	Name of the table, view, or synonym to which the policy is added.
<code>policy_group</code>	Name of the policy group that the policy belongs to.

### Usage Notes

The group must be unique for each table or view.

## DELETE\_POLICY\_GROUP Procedure

This procedure deletes a policy group.

### Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (  
  object_schema  IN VARCHAR2 NULL,  
  object_name    IN VARCHAR2,  
  policy_group   IN VARCHAR2);
```

### Parameters

**Table 124–7** *DELETE\_POLICY\_GROUP Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.

### Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

## DISABLE\_GROUPED\_POLICY Procedure

This procedure disables a row-level group security policy.

### Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    group_name       IN VARCHAR2,  
    policy_name      IN VARCHAR2);
```

### Parameters

**Table 124–8** *ENABLE\_GROUPED\_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym with which the policy is associated.
group_name	The name of the group of the policy.
policy_name	The name of the policy to be enabled or disabled.

### Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE\_GROUPED\_POLICY procedure is executed with "enable" set to FALSE.

## DROP\_GROUPED\_POLICY Procedure

This procedure drops a policy associated with a policy group.

### Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (  
    object_schema  IN VARCHAR2 NULL,  
    object_name    IN VARCHAR2,  
    policy_group   IN VARCHAR2 'SYS_DEFAULT',  
    policy_name    IN VARCHAR2);
```

### Parameters

**Table 124–9** *DROP\_GROUPED\_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is dropped.
policy_group	The name of the policy group that the policy belongs to.
policy_name	The name of the policy.

## DROP\_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

**See Also:** [Operational Notes](#) on page 124-5

A COMMIT is also performed at the end of the operation.

### Syntax

```
DBMS_RLS.DROP_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  policy_name    IN VARCHAR2);
```

### Parameters

**Table 124–10 DROP\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed.
object_name	Name of the table, view, or synonym for which the policy is dropped.
policy_name	Name of policy to be dropped from table, view, or synonym.

### Usage Notes

- When you drop a VPD policy from a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked INVALID.

## DROP\_POLICY\_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

### Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2,  
    namespace    IN VARCHAR2,  
    attribute     IN VARCHAR2);
```

### Parameters

**Table 124–11** *DROP\_POLICY\_CONTEXT Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed.
object_name	The name of the table, view, or synonym to which the policy is dropped.
namespace	The namespace of the driving context.
attribute	The attribute of the driving context.

## ENABLE\_GROUPED\_POLICY Procedure

This procedure enables or disables a row-level group security policy.

### Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2,
  group_name     IN VARCHAR2,
  policy_name    IN VARCHAR2,
  enable        IN BOOLEAN TRUE);
```

### Parameters

**Table 124–12** *ENABLE\_GROUPED\_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed.
object_name	The name of the table, view, or synonym with which the policy is associated.
group_name	The name of the group of the policy.
policy_name	The name of the policy to be enabled or disabled.
enable	TRUE enables the policy; FALSE disables the policy.

### Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

## ENABLE\_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

**See Also:** [Operational Notes](#) on page 124-5

A COMMIT is also performed at the end of the operation.

### Syntax

```
DBMS_RLS.ENABLE_POLICY (
  object_schema IN VARCHAR2 NULL,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2,
  enable       IN BOOLEAN TRUE);
```

### Parameters

**Table 124–13** *ENABLE\_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema containing table, view, or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed.
object_name	Name of table, view, or synonym with which the policy is associated.
policy_name	Name of policy to be enabled or disabled.
enable	TRUE to enable the policy, FALSE to disable the policy.

## REFRESH\_GROUPED\_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

### Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (
  object_schema  IN VARCHAR2 NULL,
  object_name    IN VARCHAR2 NULL,
  group_name     IN VARCHAR2 NULL,
  policy_name    IN VARCHAR2 NULL);
```

### Parameters

**Table 124–14 REFRESH\_GROUPED\_POLICY Procedure Parameters**

Parameter	Description
object_schema	The schema containing the table, view, or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed.
object_name	The name of the table, view, or synonym with which the policy is associated.
group_name	The name of the group of the policy.
policy_name	The name of the policy.

### Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.

## REFRESH\_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

**See Also:** [Operational Notes](#) on page 124-5

A COMMIT is also performed at the end of the operation.

### Syntax

```
DBMS_RLS.REFRESH_POLICY (
  object_schema IN VARCHAR2 NULL,
  object_name   IN VARCHAR2 NULL,
  policy_name   IN VARCHAR2 NULL);
```

### Parameters

**Table 124–15 REFRESH\_POLICY Procedure Parameters**

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified, or NULL is provided, then the current user's schema is assumed.
object_name	Name of table, view, or synonym with which the policy is associated.
policy_name	Name of policy to be refreshed.

### Usage Notes

The procedure returns an error if it tries to refresh a disabled policy.

The DBMS\_ROWID package lets you create ROWIDs and obtain information about ROWIDs from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other ROWID components without writing code to interpret the base-64 character external ROWID. DBMS\_ROWID is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

---

---

**Note:** DBMS\_ROWID is not to be used with universal ROWIDs (UROWIDs).

---

---

This chapter contains the following topics:

- [Using DBMS\\_ROWID](#)
  - Security Model
  - Types
  - Exceptions
  - Operational Notes
  - Examples
- [Summary of DBMS\\_ROWID Subprograms](#)

## Using DBMS\_ROWID

- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

## Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

## Types

- [Extension and Restriction Types](#)
- [Verification Types](#)
- [Object Types](#)
- [Conversion Types](#)

### Extension and Restriction Types

The types are as follows:

- RESTRICTED—restricted ROWID
- EXTENDED—extended ROWID

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

---

---

**Note:** Extended ROWIDs are only used in Oracle database version 8.Xi and higher.

---

---

### Verification Types

**Table 125–1** *Verification Types*

Result	Description
VALID	Valid ROWID
INVALID	Invalid ROWID

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

### Object Types

**Table 125–2** *Object Types*

Result	Description
UNDEFINED	Object Number not defined (for restricted ROWIDs)

For example:

```
rowid_object_undefined constant integer := 0;
```

### Conversion Types

**Table 125–3** *Conversion Types*

Result	Description
INTERNAL	Convert to/from column of ROWID type

**Table 125-3 (Cont.) Conversion Types**

<b>Result</b>	<b>Description</b>
EXTERNAL	Convert to/from string format

For example:

```
rowid_convert_internal constant integer := 0;  
rowid_convert_external constant integer := 1;
```

## Exceptions

**Table 125-4** *Exceptions*

<b>Exception</b>	<b>Description</b>
ROWID_INVALID	Invalid rowid format
ROWID_BAD_BLOCK	Block is beyond end of file

For example:

```
ROWID_INVALID exception;  
  pragma exception_init(ROWID_INVALID, -1410);
```

```
ROWID_BAD_BLOCK exception;  
  pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

## Operational Notes

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SQL ROWID, either restricted or extended, as required.
- You can call the DBMS\_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

---

---

**Note:** ROWID\_INFO is a procedure. It can only be used in PL/SQL code.

---

---

- You can use functions from the DBMS\_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID\_BLOCK\_NUMBER function is used to return just the block number of a single row in the EMP table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
       FROM emp
       WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict\_references, it could mean the violation is due to:
  - A problem with the current procedure or function
  - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
  - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

## Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID\_OBJECT function in the DBMS\_ROWID package, then displays the object number:

```
DECLARE
  object_no  INTEGER;
  row_id     ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
     WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
```

---

## Summary of DBMS\_ROWID Subprograms

**Table 125–5 DBMS\_ROWID Package Subprograms**

Subprogram	Description
<a href="#">ROWID_BLOCK_NUMBER Function</a> on page 125-10	Returns the block number of a ROWID
<a href="#">ROWID_CREATE Function</a> on page 125-11	Creates a ROWID, for testing only
<a href="#">ROWID_INFO Procedure</a> on page 125-12	Returns the type and components of a ROWID
<a href="#">ROWID_OBJECT Function</a> on page 125-13	Returns the object number of the extended ROWID
<a href="#">ROWID_RELATIVE_FNO Function</a> on page 125-14	Returns the file number of a ROWID
<a href="#">ROWID_ROW_NUMBER Function</a> on page 125-15	Returns the row number
<a href="#">ROWID_TO_ABSOLUTE_FNO Function</a> on page 125-16	Returns the absolute file number associated with the ROWID for a row in a specific table
<a href="#">ROWID_TO_EXTENDED Function</a> on page 125-17	Converts a ROWID from restricted format to extended
<a href="#">ROWID_TO_RESTRICTED Function</a> on page 125-19	Converts an extended ROWID to restricted format
<a href="#">ROWID_TYPE Function</a> on page 125-20	Returns the ROWID type: 0 is restricted, 1 is extended
<a href="#">ROWID_VERIFY Function</a> on page 125-21	Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function

## ROWID\_BLOCK\_NUMBER Function

This function returns the database block number for the input ROWID.

### Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (  
    row_id      IN    ROWID,  
    ts_type_in  IN    VARCHAR2 DEFAULT 'SMALLFILE')  
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 125–6** ROWID\_BLOCK\_NUMBER Function Parameters

Parameter	Description
row_id	ROWID to be interpreted
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs

### Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')  
    FROM some_table  
    WHERE key_value = 42);
```

## ROWID\_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

### Syntax

```
DBMS_ROWID.ROWID_CREATE (
  rowid_type    IN NUMBER,
  object_number IN NUMBER,
  relative_fno  IN NUMBER,
  block_number  IN NUMBER,
  row_number    IN NUMBER)
RETURN ROWID;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 125–7 ROWID\_CREATE Function Parameters**

Parameter	Description
rowid_type	Type (restricted or extended) Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.
object_number	Data object number (rowid_object_undefined for restricted)
relative_fno	Relative file number
block_number	Block number in this file
row_number	Returns row number in this block

### Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid\_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj\_number now contains 9999.

## ROWID\_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID. This is a procedure, and it cannot be used in a SQL statement.

### Syntax

```
DBMS_ROWID.ROWID_INFO (
  rowid_in      IN  ROWID,
  rowid_type    OUT NUMBER,
  object_number OUT NUMBER,
  relative_fno  OUT NUMBER,
  block_number  OUT NUMBER,
  row_number    OUT NUMBER);
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 125–8 ROWID\_INFO Procedure Parameters**

Parameter	Description
rowid_in	ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.
rowid_type	Returns type (restricted/extended)
object_number	Returns data object number (rowid_object_undefined for restricted)
relative_fno	Returns relative file number
block_number	Returns block number in this file
row_number	Returns row number in this block

**See Also:** ["ROWID\\_TYPE Function"](#) on page 125-20

### Examples

This example reads back the values for the ROWID that you created in the ROWID\_CREATE:

```
DBMS_ROWID.ROWID_INFO (
  my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

## ROWID\_OBJECT Function

This function returns the data object number for an extended ROWID. The function returns zero if the input ROWID is a restricted ROWID.

### Syntax

```
DBMS_ROWID.ROWID_OBJECT (
  rowid_id IN ROWID)
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (rowid_object, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 125–9** ROWID\_OBJECT Function Parameters

Parameter	Description
row_id	ROWID to be interpreted

---

**Note:** The ROWID\_OBJECT\_UNDEFINED constant is returned for restricted ROWIDs.

---

### Examples

```
SELECT dbms_rowid.rowid_object(ROWID)
FROM emp
WHERE empno = 7499;
```

## ROWID\_RELATIVE\_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

### Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (
    rowid_id      IN   ROWID,
    ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 125–10 ROWID\_RELATIVE\_FNO Function Parameters**

Parameter	Description
row_id	ROWID to be interpreted
ts_type_in	Type of the tablespace (bigfile/smallfile) to which the row belongs

### Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE
    file_number    INTEGER;
    rowid_val      ROWID;
BEGIN
    SELECT ROWID INTO rowid_val
        FROM dept
        WHERE loc = 'Boston';
    file_number :=
        dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...
```

## ROWID\_ROW\_NUMBER Function

This function extracts the row number from the ROWID IN parameter.

### Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (  
    row_id IN ROWID)  
RETURN NUMBER;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES (rowid_row_number, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 125–11** ROWID\_ROW\_NUMBER Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

### Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)  
FROM emp  
WHERE ename = 'ALLEN';
```

## ROWID\_TO\_ABSOLUTE\_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table. The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

### Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (  
    row_id      IN ROWID,  
    schema_name IN VARCHAR2,  
    object_name IN VARCHAR2)  
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

### Parameters

**Table 125–12** ROWID\_TO\_ABSOLUTE\_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted
schema_name	Name of the schema which contains the table
object_name	Table name

### Examples

```
DECLARE  
    abs_fno      INTEGER;  
    rowid_val    CHAR(18);  
    object_name  VARCHAR2(20) := 'EMP';  
BEGIN  
    SELECT ROWID INTO rowid_val  
    FROM emp  
    WHERE empno = 9999;  
    abs_fno := dbms_rowid.rowid_to_absolute_fno(  
        rowid_val, 'SCOTT', object_name);
```

---

---

**Note:** For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

---

---

## ROWID\_TO\_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format. Later, it may be removed from this package into a different place.

### Syntax

```
DBMS_ROWID.ROWID_TO_EXTENDED (
  old_rowid      IN ROWID,
  schema_name    IN VARCHAR2,
  object_name    IN VARCHAR2,
  conversion_type IN INTEGER)
RETURN ROWID;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

### Parameters

**Table 125–13 ROWID\_TO\_EXTENDED Function Parameters**

Parameter	Description
old_rowid	ROWID to be converted
schema_name	Name of the schema which contains the table (optional)
object_name	Table name (optional).
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

### Return Values

ROWID\_TO\_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

### Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID\_COL that holds ROWIDs (restricted), and a column TABLE\_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
SET rowid_col =
  dbms_rowid.rowid_to_extended (
    rowid_col, 'SCOTT', TABLE_COL, 0);
```

### Usage Notes

- If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID\_TO\_EXTENDED returns a value, however, does not guarantee that the

converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.

- If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.
- If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the `INVALID_ROWID` exception is raised. If they do match, the input ROWID is returned.
- `ROWID_TO_EXTENDED` cannot be used with partition tables.

**See Also:** The [ROWID\\_VERIFY Function](#) has a method to determine if a given ROWID can be converted to the extended format.

## ROWID\_TO\_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

### Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
    old_rowid      IN ROWID,
    conversion_type IN INTEGER)
RETURN ROWID;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

### Parameters

**Table 125–14 ROWID\_TO\_RESTRICTED Function Parameters**

Parameter	Description
old_rowid	ROWID to be converted
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

## ROWID\_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

### Syntax

```
DBMS_ROWID.ROWID_TYPE (  
    rowid_id IN ROWID)  
RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES (rowid_type, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 125–15** ROWID\_TYPE Function Parameters

Parameter	Description
row_id	ROWID to be interpreted

### Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN  
    my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

## ROWID\_VERIFY Function

This function verifies the ROWID. It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

---

---

**Note:** You can use this function in a WHERE clause of a SQL statement, as shown in the example.

---

---

### Syntax

```
DBMS_ROWID.ROWID_VERIFY (
    rowid_in          IN ROWID,
    schema_name       IN VARCHAR2,
    object_name       IN VARCHAR2,
    conversion_type   IN INTEGER
) RETURN NUMBER;
```

### Pragmas

```
pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

### Parameters

**Table 125–16** ROWID\_VERIFY Function Parameters

Parameter	Description
rowid_in	ROWID to be verified
schema_name	Name of the schema which contains the table
object_name	Table name
conversion_type	The following constants are defined: ROWID_CONVERT_INTERNAL (:=0) ROWID_CONVERT_EXTERNAL (:=1)

### Examples

Considering the schema in the example for the ROWID\_TO\_EXTENDED function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
   FROM SCOTT.RIDS
  WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

## Summary of DBMS\_RULE Subprograms

**Table 126–1 DBMS\_RULE Package Subprograms**

Subprogram	Description
<a href="#">CLOSE_ITERATOR Procedure</a> on page 126-6	Closes an open iterator
<a href="#">EVALUATE Procedures</a> on page 126-7	Evaluates the rules in the specified rule set that use the evaluation context specified
<a href="#">GET_NEXT_HIT Function</a> on page 126-11	Returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator; returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

## CLOSE\_ITERATOR Procedure

This procedure closes an open iterator.

### Syntax

```
DBMS_RULE.CLOSE_ITERATOR(  
    iterator IN BINARY_INTEGER);
```

### Parameter

**Table 126–2** *CLOSE\_ITERATOR Procedure Parameter*

Parameter	Description
<code>iterator</code>	The iterator to be closed

### Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

**See Also:** [EVALUATE Procedures](#) on page 126-7

## EVALUATE Procedures

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

### Syntax

```
DBMS_RULE.EVALUATE (
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2,
  event_context      IN  SYS.RE$NV_LIST           DEFAULT NULL,
  table_values       IN  SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values      IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values    IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values   IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  stop_on_first_hit  IN  BOOLEAN                 DEFAULT FALSE,
  simple_rules_only  IN  BOOLEAN                 DEFAULT FALSE,
  true_rules         OUT SYS.RE$RULE_HIT_LIST,
  maybe_rules        OUT SYS.RE$RULE_HIT_LIST);
```

```
DBMS_RULE.EVALUATE (
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2,
  event_context      IN  SYS.RE$NV_LIST           DEFAULT NULL,
  table_values       IN  SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values      IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values    IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values   IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  simple_rules_only  IN  BOOLEAN                 DEFAULT FALSE,
  true_rules_iterator OUT BINARY_INTEGER,
  maybe_rules_iterator OUT BINARY_INTEGER);
```

### Parameters

**Table 126–3 EVALUATE Procedure Parameters**

Parameter	Description
<code>rule_set_name</code>	Name of the rule set in the form [ <i>schema_name.</i> ] <i>rule_set_name</i> . For example, to evaluate all of the rules in a rule set named <code>hr_rules</code> in the <code>hr</code> schema, enter <code>hr.hr_rules</code> for this parameter. If the schema is not specified, then the schema of the current user is used.
<code>evaluation_context</code>	An evaluation context name in the form [ <i>schema_name.</i> ] <i>evaluation_context_name</i> . If the schema is not specified, then the name of the current user is used.  Only rules that use the specified evaluation context are evaluated.
<code>event_context</code>	A list of name-value pairs that identify events that cause evaluation

**Table 126–3 (Cont.) EVALUATE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>table_values</code>	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
<code>column_values</code>	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in <code>table_values</code> .
<code>variable_values</code>	A list containing the data for variables.  The only way for an explicit variable value to be known is to specify its value in this list.  If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
<code>attribute_values</code>	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in <code>variable_values</code> .
<code>stop_on_first_hit</code>	If <code>TRUE</code> , then the rules engine stops evaluation as soon as it finds a <code>TRUE</code> rule.  If <code>TRUE</code> and there are no <code>TRUE</code> rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to <code>TRUE</code> given more data.  If <code>FALSE</code> , then the rules engine continues to evaluate rules even after it finds a <code>TRUE</code> rule.
<code>simple_rules_only</code>	If <code>TRUE</code> , then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation.  If <code>FALSE</code> , then evaluates all rules.
<code>true_rules</code>	Receives the output of the <code>EVALUATE</code> procedure into a varray of <code>RE\$RULE_HIT_LIST</code> type.  If no rules evaluate to <code>TRUE</code> , then <code>true_rules</code> is empty.  If at least one rule evaluates to <code>TRUE</code> and <code>stop_on_first_hit</code> is <code>TRUE</code> , then <code>true_rules</code> contains one rule that evaluates to <code>TRUE</code> .  If <code>stop_on_first_hit</code> is <code>FALSE</code> , then <code>true_rules</code> contains all rules that evaluate to <code>TRUE</code> .
<code>maybe_rules</code>	If all rules can be evaluated completely, without requiring any additional data, then <code>maybe_rules</code> is empty.  If <code>stop_on_first_hit</code> is <code>TRUE</code> , then if there is at least one rule that may evaluate to <code>TRUE</code> given more data, and no rules evaluate to <code>TRUE</code> , then <code>maybe_rules</code> contains one rule that may evaluate to <code>TRUE</code> .  If <code>stop_on_first_hit</code> is <code>FALSE</code> , then <code>maybe_rules</code> contains all rules that may evaluate to <code>TRUE</code> given more data.
<code>true_rules_iterator</code>	Contains the iterator for accessing rules that are <code>TRUE</code>
<code>maybe_rules_iterator</code>	Contains the iterator for accessing rules that may be <code>TRUE</code> given additional data or the ability to issue SQL

## Usage Notes

---

**Note:** Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

---

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first TRUE rule or the first MAYBE rule (if there are no TRUE rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as MAYBE rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as MAYBE rules, unless they can be determined to be TRUE or FALSE based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as TRUE, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- TRUE rules, which is the list of rules that evaluate to TRUE based on the given data. These rules are returned either in the OUT parameter `true_rules`, which returns all of the rules that evaluate to TRUE, or in the OUT parameter `true_rules_iterator`, which returns each rule that evaluates to TRUE one at a time.
- MAYBE rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
  - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as TRUE, or partial data is available.

Maybe rules are returned either in the OUT parameter `maybe_rules`, which returns all of the rules that evaluate to MAYBE, or in the OUT parameter `maybe_rules_iterator`, which returns each rule that evaluates to MAYBE one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to TRUE and MAYBE for the event or an iterator for rules that evaluate to TRUE and MAYBE. A true rules iterator enables the client to fetch each rule that evaluates to TRUE one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to MAYBE one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to TRUE or MAYBE from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free

resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

---

---

**Note:** The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

---

---

**See Also:**

- [Chapter 256, "Rule TYPES"](#) for more information about the types used with the `DBMS_RULE` package
- [GET\\_NEXT\\_HIT Function](#) on page 126-11
- [CLOSE\\_ITERATOR Procedure](#) on page 126-6

## GET\_NEXT\_HIT Function

This function returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator. The function returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

### Syntax

```
DBMS_RULE.GET_NEXT_HIT(  
    iterator IN BINARY_INTEGER)  
RETURN SYS.RE$RULE_HIT;
```

### Parameter

**Table 126-4** *GET\_NEXT\_HIT Function Parameter*

Parameter	Description
iterator	The iterator from which the rule that evaluated to <code>TRUE</code> or <code>MAYBE</code> is retrieved

### Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns `NULL`, it is closed automatically. If an open iterator is no longer needed, then use the `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package to close it.

---

**Note:** This function raises an error if the rule set being evaluated was modified after the call to the `DBMS_RULE.EVALUATE` procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

---

  - Overview
  - Security Model
- [Summary of DBMS\\_RULE\\_ADM Subprograms](#)

## Using DBMS\_RULE\_ADM

This section contains topics which relate to using the DBMS\_RULE\_ADM package.

- [Overview](#)
- [Security Model](#)

## Overview

This package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

**See Also:**

- [Chapter 256, "Rule TYPES"](#) for more information about the types used with the DBMS\_RULE\_ADM package
- [Chapter 126, "DBMS\\_RULE"](#) and *Oracle Streams Concepts and Administration* for more information about this package and rules

## Security Model

PUBLIC is granted EXECUTE privilege on this package.

**See Also:** *Oracle Database Security Guide* for more information about user group PUBLIC

---

## Summary of DBMS\_RULE\_ADM Subprograms

**Table 127-1 DBMS\_RULE\_ADM Package Subprograms**

Subprogram	Description
<a href="#">ADD_RULE Procedure</a> on page 127-6	Adds the specified rule to the specified rule set
<a href="#">ALTER_EVALUATION_CONTEXT Procedure</a> on page 127-8	Alters a rule evaluation context
<a href="#">ALTER_RULE Procedure</a> on page 127-11	Changes one or more aspects of the specified rule
<a href="#">CREATE_EVALUATION_CONTEXT Procedure</a> on page 127-13	Creates a rule evaluation context
<a href="#">CREATE_RULE Procedure</a> on page 127-15	Creates a rule with the specified name
<a href="#">CREATE_RULE_SET Procedure</a> on page 127-17	Creates a rule set with the specified name
<a href="#">DROP_EVALUATION_CONTEXT Procedure</a> on page 127-18	Drops the rule evaluation context with the specified name
<a href="#">DROP_RULE Procedure</a> on page 127-19	Drops the rule with the specified name
<a href="#">DROP_RULE_SET Procedure</a> on page 127-20	Drops the rule set with the specified name
<a href="#">GRANT_OBJECT_PRIVILEGE Procedure</a> on page 127-21	Grants the specified object privilege on the specified object to the specified user or role
<a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a> on page 127-23	Grants the specified system privilege to the specified user or role
<a href="#">REMOVE_RULE Procedure</a> on page 127-25	Removes the specified rule from the specified rule set
<a href="#">REVOKE_OBJECT_PRIVILEGE Procedure</a> on page 127-27	Revokes the specified object privilege on the specified object from the specified user or role
<a href="#">REVOKE_SYSTEM_PRIVILEGE Procedure</a> on page 127-28	Revokes the specified system privilege from the specified user or role

---

**Note:** All subprograms commit unless specified otherwise.

---

## ADD\_RULE Procedure

This procedure adds the specified rule to the specified rule set.

### Syntax

```
DBMS_RULE_ADM.ADD_RULE(
    rule_name          IN  VARCHAR2,
    rule_set_name     IN  VARCHAR2,
    evaluation_context IN  VARCHAR2  DEFAULT NULL,
    rule_comment      IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 127–2 ADD\_RULE Procedure Parameters**

Parameter	Description
rule_name	The name of the rule you are adding to the rule set, specified as <code>[schema_name.] rule_name</code> . For example, to add a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set to which you are adding the rule, specified as <code>[schema_name.] rule_set_name</code> . For example, to add the rule to a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An evaluation context name in the form <code>[schema_name.] evaluation_context_name</code> . If the schema is not specified, then the current user is the default.  Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
rule_comment	Optional description, which can contain the reason for adding the rule to the rule set

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE_SET` privilege on the rule set
- Have `ALTER_ANY_RULE_SET` system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE` privilege on the rule
- Have `EXECUTE_ANY_RULE` system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have EXECUTE\_ON\_EVALUATION\_CONTEXT privilege on the evaluation context
- Have EXECUTE\_ANY\_EVALUATION\_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

## ALTER\_EVALUATION\_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

### Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT (
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST   DEFAULT NULL,
  remove_table_aliases        IN  BOOLEAN                   DEFAULT FALSE,
  variable_types              IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  remove_variable_types       IN  BOOLEAN                   DEFAULT FALSE,
  evaluation_function          IN  VARCHAR2                 DEFAULT NULL,
  remove_evaluation_function   IN  BOOLEAN                   DEFAULT FALSE,
  evaluation_context_comment   IN  VARCHAR2                 DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                   DEFAULT FALSE);
```

### Parameters

**Table 127-3 ALTER\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
<code>evaluation_context_name</code>	<p>The name of the evaluation context you are altering, specified as <code>[schema_name.] evaluation_context_name</code>.</p> <p>For example, to alter an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.</p>
<code>table_aliases</code>	<p>If <code>NULL</code> and <code>remove_table_aliases</code> is <code>FALSE</code>, then the procedure retains the existing table aliases. If <code>NULL</code> and <code>remove_table_aliases</code> is <code>TRUE</code>, then the procedure removes the existing table aliases.</p> <p>If non-<code>NULL</code>, then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases.</p> <p>Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.</p>
<code>remove_table_aliases</code>	<p>If <code>TRUE</code> and <code>table_aliases</code> is <code>NULL</code>, then the procedure removes the existing table aliases for the evaluation context. If <code>TRUE</code> and <code>table_aliases</code> is non-<code>NULL</code>, then the procedure raises an error.</p> <p>If <code>FALSE</code>, then the procedure does not remove table aliases.</p>
<code>variable_types</code>	<p>If <code>NULL</code> and <code>remove_variable_types</code> is <code>FALSE</code>, then the procedure retains the variable types. If <code>NULL</code> and <code>remove_variable_types</code> is <code>TRUE</code>, then the procedure removes the existing variable types.</p> <p>If non-<code>NULL</code>, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.</p>

**Table 127-3 (Cont.) ALTER\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
remove_variable_types	<p>If TRUE and variable_types is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and variable_types is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the variable types.</p>
evaluation_function	<p>If NULL and remove_evaluation_function is FALSE, then the procedure retains the existing evaluation function. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation function.</p> <p>If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function.</p> <p>An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default.</p> <p>See <a href="#">CREATE_EVALUATION_CONTEXT Procedure</a> on page 127-13 for more information about evaluation functions.</p>
remove_evaluation_function	<p>If TRUE and evaluation_function is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and evaluation_function is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation function.</p>
evaluation_context_comment	<p>If NULL and remove_eval_context_comment is FALSE, then the procedure retains the existing evaluation context comment. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation context comment.</p> <p>If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment.</p> <p>An evaluation context comment is an optional description of the rule evaluation context.</p>
remove_eval_context_comment	<p>If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation context comment.</p>

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL\_ON\_EVALUATION\_CONTEXT or ALTER\_ON\_EVALUATION\_CONTEXT object privilege on an evaluation context owned by another user

- Have ALTER\_ANY\_EVALUATION\_CONTEXT system privilege

**See Also:** [Chapter 256, "Rule TYPES"](#) for more information about the types used with the DBMS\_RULE\_ADM package

## ALTER\_RULE Procedure

This procedure changes one or more aspects of the specified rule.

### Syntax

```
DBMS_RULE_ADM.ALTER_RULE (
  rule_name           IN  VARCHAR2,
  condition           IN  VARCHAR2           DEFAULT NULL,
  evaluation_context  IN  VARCHAR2           DEFAULT NULL,
  remove_evaluation_context IN  BOOLEAN       DEFAULT FALSE,
  action_context     IN  SYS.RE$NV_LIST     DEFAULT NULL,
  remove_action_context IN  BOOLEAN         DEFAULT FALSE,
  rule_comment       IN  VARCHAR2           DEFAULT NULL,
  remove_rule_comment IN  BOOLEAN           DEFAULT FALSE);
```

### Parameters

**Table 127-4 ALTER\_RULE Procedure Parameters**

Parameter	Description
rule_name	The name of the rule you are altering, specified as [ <i>schema_name</i> .] <i>rule_name</i> . For example, to alter a rule named <i>all_a</i> in the <i>hr</i> schema, enter <i>hr.all_a</i> for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
evaluation_context	An evaluation context name in the form [ <i>schema_name</i> .] <i>evaluation_context_name</i> . If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
remove_evaluation_context	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the <i>evaluation_context</i> parameter is non-NULL, then this parameter should be set to FALSE.
action_context	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
remove_action_context	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the <i>action_context</i> parameter is non-NULL, then this parameter should be set to FALSE.
rule_comment	If non-NULL, then the existing comment of the rule is replaced by the specified comment.

**Table 127-4 (Cont.) ALTER\_RULE Procedure Parameters**

Parameter	Description
<code>remove_rule_comment</code>	<p>If <code>TRUE</code>, then the procedure sets the comment for the rule to <code>NULL</code>, which effectively removes the comment from the rule.</p> <p>If <code>FALSE</code>, then the procedure retains any comment for the specified rule.</p> <p>If the <code>rule_comment</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `ALTER_ON_RULE` privilege on the rule
- Have `ALTER_ANY_RULE` system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

**See Also:** [Chapter 256, "Rule TYPES"](#) for more information about the types used with the `DBMS_RULE_ADM` package

## CREATE\_EVALUATION\_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

### Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT (
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST   DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST DEFAULT NULL,
  evaluation_function           IN  VARCHAR2                 DEFAULT NULL,
  evaluation_context_comment   IN  VARCHAR2                 DEFAULT NULL);
```

### Parameters

**Table 127–5 CREATE\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
evaluation_context_name	The name of the evaluation context you are creating, specified as <i>[schema_name.] evaluation_context_name</i> .  For example, to create an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
variable_types	A list of variables for the evaluation context
evaluation_function	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the <code>DBMS_RULE.EVALUATE</code> procedure. If the schema is not specified, then the current user is the default.  See "Usage Notes" for more information about the evaluation function.
evaluation_context_comment	An optional description of the rule evaluation context.

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have `CREATE_EVALUATION_CONTEXT_OBJ` system privilege
- Have `CREATE_ANY_EVALUATION_CONTEXT` system privilege

**See Also:** [Chapter 256, "Rule TYPES"](#) for more information about the types used with the `DBMS_RULE_ADM` package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name      IN  VARCHAR2,
```

```

evaluation_context IN VARCHAR2,
event_context     IN SYS.RE$NV_LIST           DEFAULT NULL,
table_values      IN SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
column_values     IN SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
variable_values   IN SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
attribute_values  IN SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
stop_on_first_hit IN BOOLEAN                 DEFAULT FALSE,
simple_rules_only  IN BOOLEAN                 DEFAULT FALSE,
true_rules        OUT SYS.RE$RULE_HIT_LIST,
maybe_rules      OUT SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;

```

---

**Note:** Each parameter is required and must have the specified data type. However, you can change the names of the parameters.

---

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.
- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

## CREATE\_RULE Procedure

This procedure creates a rule.

### Syntax

```
DBMS_RULE_ADM.CREATE_RULE(
  rule_name          IN  VARCHAR2,
  condition          IN  VARCHAR2,
  evaluation_context IN  VARCHAR2          DEFAULT NULL,
  action_context     IN  SYS.RE$NV_LIST  DEFAULT NULL,
  rule_comment       IN  VARCHAR2          DEFAULT NULL);
```

### Parameters

**Table 127–6 CREATE\_RULE Procedure Parameters**

Parameter	Description
rule_name	The name of the rule you are creating, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . For example, to create a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. A condition evaluates to TRUE or FALSE and can be any condition allowed in the WHERE clause of a SELECT statement. For example, the following is a valid rule condition:  department_id = 30  Ensure that the proper case is used for text in rule conditions. <b>Note:</b> Do not include the word "WHERE" in the condition.
evaluation_context	An optional evaluation context name in the form [ <i>schema_name.</i> ] <i>evaluation_context_name</i> , which is associated with the rule. If the schema is not specified, then the current user is the default.  If <i>evaluation_context</i> is not specified, then the rule inherits the evaluation context from its rule set.
action_context	The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
rule_comment	An optional description of the rule

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the CREATE\_RULE\_OBJ system privilege
- Have CREATE\_ANY\_RULE system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE\_ON\_EVALUATION\_CONTEXT privilege on the evaluation context
- Have EXECUTE\_ANY\_EVALUATION\_CONTEXT system privilege, and the owner of the evaluation context must not be SYS.

- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

**See Also:** [Chapter 256, "Rule TYPES"](#) for more information about the types used with the `DBMS_RULE_ADM` package

## CREATE\_RULE\_SET Procedure

This procedure creates a rule set.

### Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  rule_set_comment   IN  VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 127-7 CREATE\_RULE\_SET Procedure Parameters**

Parameter	Description
rule_set_name	The name of the rule set you are creating, specified as [ <i>schema_name</i> .] <i>rule_set_name</i> . For example, to create a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An optional evaluation context name in the form [ <i>schema_name</i> .] <i>evaluation_context_name</i> , which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
rule_set_comment	An optional description of the rule set

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

## DROP\_EVALUATION\_CONTEXT Procedure

This procedure drops a rule evaluation context.

### Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT (
  evaluation_context_name IN VARCHAR2,
  force                    IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 127–8 DROP\_EVALUATION\_CONTEXT Procedure Parameters**

Parameter	Description
evaluation_context_name	<p>The name of the evaluation context you are dropping, specified as [<i>schema_name</i>.]<i>evaluation_context_name</i>.</p> <p>For example, to drop an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.</p>
force	<p>If <code>TRUE</code>, then the procedure removes the rule evaluation context from all rules and rule sets that use it.</p> <p>If <code>FALSE</code> and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context.</p> <p>If <code>FALSE</code> and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception.</p> <p><b>Caution:</b> Setting <code>force</code> to <code>TRUE</code> can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated.</p>

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege

## DROP\_RULE Procedure

This procedure drops a rule.

### Syntax

```
DBMS_RULE_ADM.DROP_RULE(
  rule_name IN VARCHAR2,
  force     IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 127–9 DROP\_RULE Procedure Parameters**

Parameter	Description
rule_name	The name of the rule you are dropping, specified as [ <i>schema_name.</i> ] <i>rule_name</i> . For example, to drop a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
force	If <code>TRUE</code> , then the procedure removes the rule from all rule sets that contain it.  If <code>FALSE</code> and no rule sets contain the rule, then the procedure drops the rule.  If <code>FALSE</code> and one or more rule sets contain the rule, then the procedure raises an exception.

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have `DROP_ANY_RULE` system privilege

---

---

**Note:**

- To remove a rule from a rule set without dropping the rule from the database, use the `REMOVE_RULE` procedure.
  - The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.
- 
-

## DROP\_RULE\_SET Procedure

This procedure drops a rule set.

### Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
    rule_set_name IN VARCHAR2,
    delete_rules IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 127–10 DROP\_RULE\_SET Procedure Parameters**

Parameter	Description
rule_set_name	The name of the rule set you are dropping, specified as <code>[schema_name.] rule_set_name</code> . For example, to drop a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
delete_rules	If <code>TRUE</code> , then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped.  If <code>FALSE</code> , then the procedure does not drop the rules in the rule set.

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have `DROP_ANY_RULE_SET` system privilege
- Be the owner of the rule set

---

---

**Note:** The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

---

---

## GRANT\_OBJECT\_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

### Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE (
  privilege      IN  BINARY_INTEGER,
  object_name    IN  VARCHAR2,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 127–11 GRANT\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The name of the object privilege to grant to the grantee on the object. See "Usage Notes" on page 127-21 for the available object privileges.
object_name	The name of the object for which you are granting the privilege to the grantee, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, to grant the privilege on a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant this privilege to others.  If FALSE, then the specified user or users granted the specified privilege cannot grant this privilege to others.

### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have EXECUTE privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

[Table 127–12](#) lists the object privileges.

**Table 127–12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets**

Privilege	Description
<code>SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT</code>	Alter and execute a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.ALL_ON_RULE</code>	Alter and execute a particular rule in another user's schema
<code>SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET</code>	Alter and execute a particular rule set in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT</code>	Alter a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_RULE</code>	Alter a particular rule in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET</code>	Alter a particular rule set in another user's schema
<code>SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT</code>	Execute a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE</code>	Execute a particular rule in another user's schema
<code>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET</code>	Execute a particular rule set in another user's schema

## Examples

For example, to grant the HR user the privilege to alter a rule named `hr_dml` in the `strmadmin` schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name  => 'strmadmin.hr_dml',
    grantee     => 'hr',
    grant_option => FALSE);
END;
/
```

## GRANT\_SYSTEM\_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

### Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE (
  privilege      IN  BINARY_INTEGER,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 127–13 GRANT\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The name of the system privilege to grant to the grantee.
grantee	The name of the user or role for which the privilege is granted
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

### Usage Notes

[Table 127–14](#) lists the system privileges.

**Table 127–14 System Privileges for Evaluation Contexts, Rules, and Rule Sets**

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT	Alter any evaluation context owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE	Alter any rule owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET	Alter any rule set owned by any user
SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT	Create a new evaluation context in any schema
SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ	Create a new evaluation context in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE	Create a new rule in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ	Create a new rule in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET	Create a new rule set in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ	Create a new rule set in the grantee's schema
SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT	Drop any evaluation context in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE	Drop any rule in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET	Drop any rule set in any schema

**Table 127–14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets**

Privilege	Description
<code>SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT</code>	Execute any evaluation context owned by any user
<code>SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE</code>	Execute any rule owned by any user
<code>SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET</code>	Execute any rule set owned by any user

For example, to grant the `strmadmin` user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee   => 'strmadmin',
    grant_option => FALSE);
END;
/
```

---

**Note:** When you grant a privilege on "ANY" object (for example, `ALTER_ANY_RULE`), and the initialization parameter `O7_DICTIONARY_ACCESSIBILITY` is set to `FALSE`, you give the user access to that type of object in all schemas except the `SYS` schema. By default, the initialization parameter `O7_DICTIONARY_ACCESSIBILITY` is set to `FALSE`.

If you want to grant access to an object in the `SYS` schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the `O7_DICTIONARY_ACCESSIBILITY` initialization parameter to `TRUE`. Then privileges granted on "ANY" object allows access to any schema, including `SYS`.

---

## REMOVE\_RULE Procedure

This procedure removes the specified rule from the specified rule set.

### Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
  rule_name           IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  all_evaluation_contexts IN  BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 127–15 REMOVE\_RULE Procedure Parameters**

Parameter	Description
rule_name	The name of the rule you are removing from the rule set, specified as [ <i>schema_name</i> .] <i>rule_name</i> . For example, to remove a rule named <i>all_a</i> in the <i>hr</i> schema, enter <i>hr.all_a</i> for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set from which you are removing the rule, specified as [ <i>schema_name</i> .] <i>rule_set_name</i> . For example, to remove the rule from a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context_name	The name of the evaluation context associated with the rule you are removing, specified as [ <i>schema_name</i> .] <i>evaluation_context_name</i> . For example, to specify an evaluation context named <i>dept_eval_context</i> in the <i>hr</i> schema, enter <i>hr.dept_eval_context</i> for this parameter. If the schema is not specified, then the current user is the default.  If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the <i>ADD_RULE</i> procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error.  Specify <i>NULL</i> if you did not specify an evaluation context when you added the rule to the rule set. If you specify <i>NULL</i> and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.
all_evaluation_contexts	If <i>TRUE</i> , then the procedure removes the rule from the rule set with all of its associated evaluation contexts.  If <i>FALSE</i> , then the procedure only removes the rule with the specified evaluation context.  This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.

## Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER\_ON\_RULE\_SET privilege on the rule set
- Have ALTER\_ANY\_RULE\_SET system privilege
- Be the owner of the rule set

---

---

**Note:** This procedure does not drop a rule from the database. To drop a rule from the database, use the DROP\_RULE procedure.

---

---

## REVOKE\_OBJECT\_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

### Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE (
  privilege      IN  BINARY_INTEGER,
  object_name    IN  VARCHAR2,
  revokee       IN  VARCHAR2);
```

### Parameters

**Table 127–16 REVOKE\_OBJECT\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The name of the object privilege on the object to revoke from the revokee. See <a href="#">GRANT_OBJECT_PRIVILEGE Procedure</a> on page 127-21 for a list of the object privileges.
object_name	The name of the object for which you are revoking the privilege from the revokee, specified as [ <i>schema_name</i> .] <i>object_name</i> . For example, to revoke an object privilege on a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
revokee	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

## REVOKE\_SYSTEM\_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

### Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(  
    privilege IN BINARY_INTEGER,  
    revokee   IN VARCHAR2);
```

### Parameters

**Table 127–17 REVOKE\_SYSTEM\_PRIVILEGE Procedure Parameters**

Parameter	Description
privilege	The name of the system privilege to revoke from the revokee. See <a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a> on page 127-23 for a list of the system privileges.
revokee	The name of the user or role from which the privilege is revoked

## DBMS\_SCHEDULER

The DBMS\_SCHEDULER package provides a collection of scheduling functions and procedures that can be called from any PL/SQL program.

**See Also:** *Oracle Database Administrator's Guide* for more information regarding how to use DBMS\_SCHEDULER

This chapter contains the following topics:

- [Data Structures](#)
- [Using DBMS\\_SCHEDULER](#)
  - Security Model
  - Rules and Limits
  - Operational Notes
- [Summary of DBMS\\_SCHEDULER Subprograms](#)

## Data Structures

The DBMS\_SCHEDULER package defines OBJECT types and TABLE types.

### OBJECT Types

- [JOBARG Object Type](#)
- [JOB Object Type](#)
- [JOB\\_DEFINITION Object Type](#)
- [JOBATTR Object Type](#)
- [SCHEDULER\\$\\_STEP\\_TYPE Object Type](#)
- [SCHEDULER\\$\\_EVENT\\_INFO Object Type](#)
- [SCHEDULER\\_FILEWATCHER\\_RESULT Object Type](#)
- [SCHEDULER\\_FILEWATCHER\\_REQUEST Object Type](#)

### TABLE Types

- [JOBARG\\_ARRAY Table Type](#)
- [JOB\\_ARRAY Table Type](#)
- [JOB\\_DEFINITION\\_ARRAY Table Type](#)
- [JOBATTR\\_ARRAY Table Type](#)
- [SCHEDULER\\$\\_STEP\\_TYPE\\_LIST Table Type](#)

## JOBARG Object Type

This type is used by the JOB and JOBATTR object types. It represents a job argument in a batch of job arguments.

### Syntax

```
TYPE jobarg IS OBJECT (
  arg_position      NUMBER,
  arg_text_value    VARCHAR2(4000),
  arg_anydata_value ANYDATA,
  arg_operation     VARCHAR2(5));
```

### Attributes

**Table 128–1** JOBARG Object Type Attributes

Attribute	Description
arg_position	Position of the argument
arg_text_value	Value of the argument if the type is VARCHAR2
arg_anydata_value	Value of the argument if the type is AnyData
arg_operation	Type of the operation: <ul style="list-style-type: none"> <li>■ SET</li> <li>■ RESET</li> </ul>

## JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded to construct job arguments with different types of values.

### Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN VARCHAR2)
RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN ANYDATA)
RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_reset        IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;
```

## Parameters

**Table 128–2** *JOBARG Constructor Function Parameters*

Parameter	Description
<code>arg_position</code>	Position of the argument
<code>arg_value</code>	Value of the argument
<code>arg_reset</code>	If <code>arg_reset</code> is <code>TRUE</code> , then the argument at that position is reset. Setting <code>arg_reset</code> to <code>FALSE</code> (which is the default) will create an argument with a <code>NULL</code> value.

## JOBARG\_ARRAY Table Type

### Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

## **JOB Object Type**

**\*\*\*\* Deprecated.** Use the `JOB_DEFINITION` object type instead.

## **JOB\_ARRAY Table Type**

**\*\*\* Deprecated.** Use the `JOB_DEFINITION_ARRAY` table type instead.

## JOB\_DEFINITION Object Type

This type is used by the CREATE\_JOBS procedure and represents a job in a batch of jobs.

### Syntax

```

TYPE job_definition IS OBJECT (
  job_name          VARCHAR2(100),
  job_class         VARCHAR2(32),
  job_style         VARCHAR2(11),
  program_name     VARCHAR2(100),
  job_action        VARCHAR2(4000),
  job_type          VARCHAR2(20),
  schedule_name    VARCHAR2(65),
  repeat_interval  VARCHAR2(4000),
  schedule_limit   INTERVAL DAY TO SECOND,
  start_date       TIMESTAMP WITH TIME ZONE,
  end_date         TIMESTAMP WITH TIME ZONE,
  event_condition  VARCHAR2(4000),
  queue_spec       VARCHAR2(100),
  number_of_arguments NUMBER,
  arguments        SYS.JOBARG_ARRAY,
  job_priority     NUMBER,
  job_weight       NUMBER,
  max_run_duration INTERVAL DAY TO SECOND,
  max_runs         NUMBER,
  max_failures     NUMBER,
  logging_level    NUMBER,
  restartable     VARCHAR2(5),
  stop_on_window_close VARCHAR2(5),
  raise_events     NUMBER,
  comments        VARCHAR2(240),
  auto_drop       VARCHAR2(5),
  enabled         VARCHAR2(5),
  follow_default_timezone VARCHAR2(5),
  parallel_instances VARCHAR2(5),
  aq_job          VARCHAR2(5),
  instance_id     NUMBER,
  credential_name VARCHAR2(65),
  destination     VARCHAR2(4000),
  database_role   VARCHAR2(20),
  allow_runs_in_restricted_mode VARCHAR2(5));

```

### Object Attributes

Table 128–3 provides brief descriptions of the attributes of the JOB\_DEFINITION object type. For more complete information about these attributes, see the "CREATE\_JOB Procedure" on page 128-57 and the "SET\_ATTRIBUTE Procedure" on page 128-130.

**Table 128–3** JOB\_DEFINITION Object Type Attributes

Attribute	Description
job_name	Name of the job
job_class	Name of the job class

**Table 128–3 (Cont.) JOB\_DEFINITION Object Type Attributes**

Attribute	Description
job_style	Style of the job: <ul style="list-style-type: none"> <li>■ REGULAR</li> <li>■ LIGHTWEIGHT</li> </ul>
program_name	Name of the program that the job runs
job_action	Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external executable, or chain.
job_type	Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', or 'CHAIN')
schedule_name	Name of the schedule that specifies when the job has to execute
repeat_interval	Inline time-based schedule
schedule_limit	Maximum delay time between scheduled and actual job start before a job run is canceled
start_date	Start date and time of the job
end_date	End date and time of the job
event_condition	Event condition for event-based jobs
queue_spec	File watcher name or queue specification for event-based jobs
number_of_arguments	Number of job arguments
arguments	Array of job arguments
job_priority	Job priority
job_weight	*** Deprecated in Oracle Database 11g Release 2 (11.2). Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.
max_run_duration	Maximum run duration of the job
max_runs	Maximum number of runs before the job is marked as completed
max_failures	Maximum number of failures tolerated before the job is marked as broken
logging_level	Job logging level
restartable	Indicates whether the job is restartable (TRUE) or not (FALSE)
stop_on_window_exit	Indicates whether the job is stopped when the window that it runs in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the <a href="#">SET_ATTRIBUTE Procedure</a> .
raise_events	State changes that raise events
comments	Comments on the job
auto_drop	If TRUE (the default), indicates that the job should be dropped once completed
enabled	Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)
follow_default_timezone	If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.

**Table 128–3 (Cont.) JOB\_DEFINITION Object Type Attributes**

Attribute	Description
parallel_instances	For event-based jobs only.  If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel.  If FALSE, then an event is discarded if it is raised while the job that handles it is already running,
aq_job	For internal use only
instance_id	The instance ID of the instance that the job must run on
credential_name	The credential to use for a single destination or the default credential for a group of destinations
destination	The name of a single external destination or database destination, or a group name of type external destination or database destination
database_role	In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs
allow_runs_in_restricted_mode	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode

## JOB\_DEFINITION Constructor Function

This constructor function constructs a `job_definition` object.

### Syntax

```

constructor function job_definition (
  job_name           IN      VARCHAR2,
  job_style          IN      VARCHAR2 DEFAULT 'REGULAR',
  program_name      IN      VARCHAR2 DEFAULT NULL,
  job_action        IN      VARCHAR2 DEFAULT NULL,
  job_type          IN      VARCHAR2 DEFAULT NULL,
  schedule_name     IN      VARCHAR2 DEFAULT NULL,
  repeat_interval   IN      VARCHAR2 DEFAULT NULL,
  event_condition   IN      VARCHAR2 DEFAULT NULL,
  queue_spec        IN      VARCHAR2 DEFAULT NULL,
  start_date        IN      TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  end_date          IN      TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  number_of_arguments IN    NATURAL DEFAULT NULL,
  arguments         IN      SYS.JOBARG_ARRAY DEFAULT NULL,
  job_class         IN      VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
  schedule_limit    IN      INTERVAL DAY TO SECOND DEFAULT NULL,
  job_priority      IN      NATURAL DEFAULT NULL,
  job_weight        IN      NATURAL DEFAULT NULL,
  max_run_duration  IN      INTERVAL DAY TO SECOND DEFAULT NULL,
  max_runs          IN      NATURAL DEFAULT NULL,
  max_failures      IN      NATURAL DEFAULT NULL,
  logging_level     IN      NATURALN DEFAULT 64,
  restartable       IN      BOOLEAN DEFAULT FALSE,
  stop_on_window_close IN    BOOLEAN DEFAULT FALSE,
  raise_events      IN      NATURAL DEFAULT NULL,
  comments         IN      VARCHAR2 DEFAULT NULL,
  auto_drop         IN      BOOLEAN DEFAULT TRUE,
  enabled           IN      BOOLEAN DEFAULT FALSE,
  follow_default_timezone IN  BOOLEAN DEFAULT FALSE,

```

---

```
parallel_instances    IN    BOOLEAN DEFAULT FALSE,  
aq_job               IN    BOOLEAN DEFAULT FALSE,  
instance_id         IN    NATURAL DEFAULT NULL,  
credential_name      IN    VARCHAR2 DEFAULT NULL,  
destination          IN    VARCHAR2 DEFAULT NULL,  
database_role        IN    VARCHAR2 DEFAULT NULL,  
allow_runs_in_restricted_mode IN BOOLEAN DEFAULT FALSE)  
RETURN SELF AS RESULT;
```

## **JOB\_DEFINITION\_ARRAY Table Type**

### **Syntax**

```
TYPE job_definition_array IS TABLE OF job_definition;
```

## JOBATTR Object Type

This type is used by the `SET_JOB_ATTRIBUTES` procedure and represents a job attribute in a batch of job attributes.

### Syntax

```
TYPE jobattr IS OBJECT (
  job_name          VARCHAR2(100),
  attr_name         VARCHAR2(30),
  char_value        VARCHAR2(4000),
  char_value2       VARCHAR2(4000),
  args_value        JOBARG_ARRAY,
  num_value         NUMBER,
  timestamp_value   TIMESTAMP(6) WITH TIME ZONE,
  interval_value    INTERVAL DAY(2) TO SECOND(6));
```

### Attributes

**Table 128–4** *JOBATTR Object Type Attributes*

Attribute	Description
<code>job_name</code>	Name of the job
<code>attr_name</code>	Name of the attribute
<code>char_value</code>	Value of the argument if the type is <code>VARCHAR2</code>
<code>char_value2</code>	Second <code>VARCHAR2</code> attribute value
<code>args_value</code>	Value of the argument if the type is a <code>JOBARG</code> array
<code>num_value</code>	Value of the argument if the type is <code>NUMBER</code>
<code>timestamp_value</code>	Value of the argument if the type is <code>TIMESTAMP WITH TIME ZONE</code>
<code>interval_value</code>	Value of the argument if the type is <code>INTERVAL DAY TO SECOND</code>

### JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: `VARCHAR2`, `NUMBER`, `TIMESTAMP WITH TIME ZONE`, `INTERVAL DAY TO SECOND`, and an array of `JOBARG` types.

### Syntax

```
constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN VARCHAR2,
  attr_value2       IN VARCHAR2 DEFAULT NULL)
  RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN [NUMBER, BOOLEAN,
  TIMESTAMP WITH TIME ZONE,
  INTERVAL DAY TO SECOND, JOBARG_ARRAY])
```

```
RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2)
RETURN SELF AS RESULT;
```

## Parameters

**Table 128–5** *JOBATTR Constructor Function Parameters*

Parameter	Description
job_name	Name of the job
attr_name	Name of the argument
attr_value	Value of the argument
attr_value2	Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value.

## JOBATTR\_ARRAY Table Type

### Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

## SCHEDULER\$\_STEP\_TYPE Object Type

This type is used by RUN\_CHAIN to return a list of chain steps with an initial state.

### Syntax

```
TYPE scheduler$_step_type IS OBJECT (  
    step_name VARCHAR2(32),  
    step_type VARCHAR2(32));
```

### Attributes

**Table 128–6 SCHEDULER\$\_STEP\_TYPE Object Type Attributes**

Attribute	Description
step_name	Name of the step
step_type	State of the step

## SCHEDULER\$\_STEP\_TYPE\_LIST Table Type

### Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

## SCHEDULER\$\_EVENT\_INFO Object Type

This is the data type of the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, from which your application consumes job state events raised by the Scheduler. It is a secure queue owned by `SYS`.

### Syntax

```
TYPE SCHEDULER$_EVENT_INFO IS OBJECT (
  event_type          VARCHAR2(4000),
  object_owner       VARCHAR2(4000),
  object_name        VARCHAR2(4000),
  event_timestamp    TIMESTAMP WITH TIME ZONE,
  error_code         NUMBER,
  error_msg          VARCHAR2(4000),
  event_status       NUMBER,
  log_id             NUMBER,
  run_count          NUMBER,
  failure_count      NUMBER,
  retry_count        NUMBER,
  spare1             NUMBER,
  spare2             NUMBER,
  spare3             VARCHAR2(4000),
  spare4             VARCHAR2(4000),
  spare5             TIMESTAMP WITH TIME ZONE,
  spare6             TIMESTAMP WITH TIME ZONE,
  spare7             RAW(2000),
  spare8            RAW(2000));
```

### Attributes

**Table 128–7 SCHEDULER\_EVENT\_INFO Object Type Attributes**

Attribute	Description
event_type	One of "JOB_STARTED", "JOB_SUCCEEDED", "JOB_FAILED", "JOB_BROKEN", "JOB_COMPLETED", "JOB_STOPPED", "JOB_SCH_LIM_REACHED", "JOB_DISABLED", "JOB_CHAIN_STALLED", "JOB_OVER_MAX_DUR".  For descriptions of these event types, see <a href="#">Table 128–82, "Event Types Raised by the Scheduler"</a> on page 128-138.
object_owner	Owner of the job that raised the event
object_name	Name of the job that raised the event
event_timestamp	Time at which the event occurred
error_code	Applicable only when an error is thrown during job execution. Contains the top-level error code.
error_msg	Applicable only when an error is thrown during job execution. Contains the entire error stack.

**Table 128-7 (Cont.) SCHEDULER\_EVENT\_INFO Object Type Attributes**

<b>Attribute</b>	<b>Description</b>
event_status	<p>Adds further qualification to the event type. If event_type is "JOB_STARTED," status 1 indicates that it is a normal start, and status 2 indicates that it is a retry.</p> <p>If event_type is "JOB_FAILED," status 4 indicates that it was a failure due to an error that was thrown during job execution, and status 8 indicates that it was an abnormal termination of some kind.</p> <p>If event_type is "JOB_STOPPED," status 16 indicates that it was a normal stop, and status 32 indicates that it was a stop with the FORCE option set to TRUE.</p>
log_id	Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL.
run_count	Run count for the job when the event was raised.
failure_count	Failure count for the job when the event was raised.
retry_count	Retry count for the job when the event was raised.
spare1 - spare8	Not currently in use.

## SCHEDULER\_FILEWATCHER\_RESULT Object Type

This is the data type of a file arrival event message. You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

### Syntax

```
TYPE scheduler_filewatcher_result IS OBJECT (
  destination          VARCHAR2(4000),
  directory_path       VARCHAR2(4000),
  actual_file_name     VARCHAR2(4000),
  file_size            NUMBER,
  file_timestamp       TIMESTAMP WITH TIME ZONE,
  ts_ms_from_epoch    NUMBER,
  matching_requests    SYS.SCHEDULER_FILEWATCHER_REQ_LIST);
```

### Attributes

**Table 128–8 SCHEDULER\_FILEWATCHER\_RESULT Object Type Attributes**

Attribute	Description
destination	Destination at which the file was found, expressed as a host name or IP address.
directory_path	Absolute path of directory in which the file was found.
actual_file_name	Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher.
file_size	Size of the file that was found, in bytes.
file_timestamp	Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes.
ts_ms_from_epoch	For internal use only.
matching_requests	List of matching requests. This is a TABLE of type objects SCHEDULER_FILEWATCHER_REQUEST. Each matching request corresponds to a file watcher whose destination, directory_path, and file_name attributes matched the arrived file. See " <a href="#">SCHEDULER_FILEWATCHER_REQUEST Object Type</a> " on page 128-16.

## SCHEDULER\_FILEWATCHER\_REQUEST Object Type

This type is returned in the `matching_requests` attribute of the [SCHEDULER\\_FILEWATCHER\\_RESULT Object Type](#). Its attributes are similar to the attributes of a file watcher.

### Syntax

```
TYPE scheduler_filewatcher_request IS OBJECT (
  owner          VARCHAR2(4000),
  name           VARCHAR2(4000),
  requested_path_name VARCHAR2(4000),
  requested_file_name VARCHAR2(4000),
  credential_owner VARCHAR2(4000),
  credential_name VARCHAR2(4000),
  min_file_size  NUMBER,
  steady_state_dur NUMBER);
```

### Attributes

**Table 128–9 SCHEDULER\_FILEWATCHER\_RESULT Object Type Attributes**

Attribute	Description
<code>owner</code>	Owner of the matched file watcher.
<code>name</code>	Name of the matched file watcher.
<code>requested_path_name</code>	Value of the <code>directory_path</code> attribute of the matched file watcher.
<code>requested_file_name</code>	Value of the <code>file_name</code> attribute of the matched file watcher.
<code>credential_owner</code>	Owner of the credential referenced by the matched file watcher.
<code>credential_name</code>	Name of the credential referenced by the matched file watcher.
<code>min_file_size</code>	Value of the <code>min_file_size</code> attribute of the matched file watcher.
<code>steady_state_dur</code>	Value of the <code>steady_state_duration</code> attribute of the matched file watcher.

## Using DBMS\_SCHEDULER

This section contains:

- [Security Model](#)
- [Rules and Limits](#)
- [Operational Notes](#)

## Security Model

The `DBMS_SCHEDULER` package ignores privileges granted on scheduler objects, such as jobs or chains, through roles. Object privileges must be granted directly to the user.

## Rules and Limits

The following rules apply when using the DBMS\_SCHEDULER package:

- Only SYS can perform actions on objects in the SYS schema.
- Several of the procedures accept comma-delimited lists of object names. If you provide a list of names, then the Scheduler stops executing the list at the first object that returns an error. Therefore, the Scheduler does not perform the tasks needed for the remaining objects on the list.

For example, consider the statement `DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3');`

If job3 cannot be stopped, then the jobs that follow it, jobclass1, jobclass2, and jobclass3 cannot be stopped. The jobs that preceded job3, job1 and job2, are stopped.

- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

## Operational Notes

The Scheduler uses a rich **calendar**ing syntax to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

## Calendaring Syntax

This section starts with the calendaring syntax. It is followed by descriptions of various parts of the syntax.

In the calendaring syntax, \* means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule

regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause] [";" periods_clause]
[";" byperiod_clause]

combined_schedule = schedule_list

frequency_clause = "FREQ" "=" ( predefined_frequency | user_defined_frequency )
predefined_frequency = "YEARLY" | "MONTHLY" | "WEEKLY" | "DAILY" |
    "HOURLY" | "MINUTELY" | "SECONDLY"
user_defined_frequency = named_schedule

interval_clause = "INTERVAL" "=" intervalnum
    intervalnum = 1 through 99
bymonth_clause = "BYMONTH" "=" monthlist
    monthlist = month ( "," month)*
    month = numeric_month | char_month
    numeric_month = 1 | 2 | 3 ... 12
    char_month = "JAN" | "FEB" | "MAR" | "APR" | "MAY" | "JUN" |
        "JUL" | "AUG" | "SEP" | "OCT" | "NOV" | "DEC"
byweekno_clause = "BYWEEKNO" "=" weeknumber_list
    weeknumber_list = weeknumber ( "," weeknumber)*
    weeknumber = [minus] weekno
    weekno = 1 through 53
byyearday_clause = "BYYEARDAY" "=" yearday_list
    yearday_list = yearday ( "," yearday)*
    yearday = [minus] yeardaynum
    yeardaynum = 1 through 366
bydate_clause = "BYDATE" "=" date_list
    date_list = date ( "," date)*
    date = [YYYY]MMDD [ offset | span ]
bymonthday_clause = "BYMONTHDAY" "=" monthday_list
    monthday_list = monthday ( "," monthday)*
    monthday = [minus] monthdaynum
    monthdaynum = 1 through 31
byday_clause = "BYDAY" "=" byday_list
```

```

byday_list = byday ( "," byday)*
byday = [weekdaynum] day
weekdaynum = [minus] daynum
daynum = 1 through 53 /* if frequency is yearly */
daynum = 1 through 5 /* if frequency is monthly */
day = "MON" | "TUE" | "WED" | "THU" | "FRI" | "SAT" | "SUN"
byhour_clause = "BYHOUR" "=" hour_list
hour_list = hour ( "," hour)*
hour = 0 through 23
byminute_clause = "BYMINUTE" "=" minute_list
minute_list = minute ( "," minute)*
minute = 0 through 59
bysecond_clause = "BYSECOND" "=" second_list
second_list = second ( "," second)*
second = 0 through 59

**Table 128–10 Values for repeat\_interval**

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.

**Table 128–10 (Cont.) Values for repeat\_interval**

Name	Description
BYWEEKNO	<p>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. The first week is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th.</p> <p>The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year.</p> <p>As an example, in the year 1998, the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01, and January 1st, 1999, is in the ISO week 1998-53.</p> <p>byweekno is only valid for YEARLY.</p> <p>Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY; BYWEEKNO=53; BYMONTH=1".</p>
BYYEARDAY	<p>This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.</p>
BYDATE	<p>This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause follows:</p> <pre data-bbox="537 1056 1110 1077">BYDATE=0115,0315,0615,0915,1215,20060115</pre> <p>The following SPAN example is equivalent to  BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10:</p> <pre data-bbox="537 1186 813 1207">BYDATE=0110+SPAN:5D</pre> <p>The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of <i>n</i> days or weeks centered around the supplied date. If <i>n</i> is an even number, it is adjusted up to the next odd number.</p> <p>Offsets adjust the supplied date by adding or subtracting <i>n</i> days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.</p>
BYMONTHDAY	<p>This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.</p>
BYDAY	<p>This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.</p>
BYHOUR	<p>This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.</p>
BYMINUTE	<p>This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.</p>

**Table 128–10 (Cont.) Values for repeat\_interval**

Name	Description
BYSECOND	<p>This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.</p>
BYSETPOS	<p>This selects one or more items, by position, in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be:</p> <pre data-bbox="618 562 1260 583">FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1</pre> <p>Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies.</p> <p>The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.</p>
INCLUDE	<p>This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure.</p>
EXCLUDE	<p>This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the CREATE_SCHEDULE procedure.</p>
INTERSECT	<p>This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.</p> <p>For example, assume that the named schedule <code>last_sat</code> indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule <code>end_qtr</code> indicates the last day of each quarter in 2005:</p> <pre data-bbox="618 1566 1146 1587">3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005</pre> <p>These calendaring expressions result in the dates that follow:</p> <pre data-bbox="618 1671 1284 1692">3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005</pre> <pre data-bbox="618 1734 1292 1755">FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr</pre> <p>In this example, the terms <code>FREQ=MONTHLY; BYMONTHDAY=-1</code> indicate the last day of each month.</p>

**Table 128–10 (Cont.) Values for repeat\_interval**

Name	Description
PERIODS	This identifies the number of periods that together form one cycle of a user-defined frequency. It is used in the <code>repeat_interval</code> expression of the schedule that defines the user-defined frequency. It is mandatory when the <code>repeat_interval</code> expression in the main schedule contains a <code>BYPERIOD</code> clause. The following example defines the quarters of a fiscal year.  FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
BYPERIOD	This selects periods from a user-defined frequency. For example, if a main schedule names a user-defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause <code>BYPERIOD=2,4</code> in the main schedule selects the 2nd and 4th fiscal quarters.

**Combining Schedules** There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules  
For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule.
- Embedding other schedules into the main schedule using `include`, `exclude`, and `intersect` clauses

With this method, the embedded schedules inherit certain attributes from the main schedule.

- Timestamps generated by the `INCLUDE` clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the `INTERVAL` clause, the `BYPERIOD` clause, or the `BYMONTH` clause for `freq=monthly`.
- Days that are added by the `INCLUDE` clause follow the hourly/ minutely/secondly execution pattern of the main schedule.
- When the `INCLUDE` clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See "[Start Dates and Repeat Intervals](#)", later in this section.) For example, a `repeat_interval` of `FREQ=MONTHLY; INCLUDE=HOLIDAY` executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the `INTERVAL` clause. If the start date of the main schedule is 1/1/2005, then 2/20 is not added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

**User-Defined Frequencies** Instead of using predefined frequencies like DAILY, WEEKLY, MONTHLY, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following `repeat_interval` expression is used in a schedule named `fiscal_year` that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the `fiscal_year` schedule as a user-defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user-defined frequency do not have to be equal in length. In the main schedule, the `BYSETPOS` clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the `BYPERIOD` clause in the main schedule. To enable this, the schedule that is used as the user-defined frequency must include a `PERIODS` clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the `repeat_interval` clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

**Start Dates and Repeat Intervals** The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the `repeat_interval`. For example, if the specified frequency is yearly and there is no `BYMONTH` or `BYMONTHDAY` clause in the repeat interval, then the month and day that the job runs on are retrieved from the start date. Similarly, if frequency is monthly but there is no `BYMONTHDAY` clause in the repeat interval, then the day of the month that the job runs on is retrieved from the start date. If present, `BYHOUR`, `BYMINUTE`, and `BYSECOND` defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the `INCLUDE`, `EXCLUDE`, or `INTERSECT` clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are.

The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a `repeat_interval` of `FREQ=YEARLY;BYDATE=0701`.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an `INCLUDE` clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

**General Rules** When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semicolon, and each clause can be present at most once, with the exception of the `include`, `exclude`, and `intersect` clauses.
- Spaces are allowed between syntax elements and the strings are case-insensitive.
- The list of values for a specific `BY` clause do not need to be ordered.
- When not enough `BY` clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "`FREQ=YEARLY`" with a start date of 02/15/2003 becomes "`FREQ=YEARLY ; BYMONTH=FEB ; BYMONTHDAY=15`", which means every year on the 15th of February.  
"`FREQ=YEARLY ; BYMONTH=JAN, JUL`" with start date 01/21/2003 becomes "`FREQ=YEARLY ; BYMONTH=JAN, JUL ; BYMONTHDAY=21`", which means every year on January 21 and July 21.
- The `byweekno` clause is only allowed if the frequency is `YEARLY`. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a `BYDAY` clause. For example, "`FREQ=YEARLY ; BYWEEKNO=2`" with a start date of 01/01/2003 will return:

```
01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, ... and so on.
```

Note that when the `byweekno` clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "`FREQ=YEARLY ; BYWEEKNO=1, 53`" for the specified week numbers in 2004, it will return the dates:

```
12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
```

- For those `BY` clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying `BYMONTHDAY=31` will not give you the last day of every month, because not every month has 31 days. Instead, `BYMONTHDAY=-1` will give you the last day of the month.

This is not supported for `BY` clauses that are fixed in size. In other words, `BYMONTH`, `BYHOUR`, `BYMINUTE`, and `BYSECOND` are not supported.

- The basic values for the `BYDAY` clause are the days of the week. When the frequency is `YEARLY`, or `MONTHLY`, you are allowed to specify a positive or negative number in front of each day of the week. In the case of `YEARLY`, `BYDAY=40MON`, indicates the 40th Monday of the year. In the case of `MONTHLY`, `BYDAY=-2SAT`, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.
- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the `start_date` argument. If jobs must follow daylight savings adjustments, then you must specify a region name for the time zone of the `start_date`. For example specifying the `start_date` time zone as 'US/Eastern' in New York ensures that daylight saving adjustments are automatically applied. If instead, the time zone of the `start_date` is set to an absolute offset, such as '-5:00', then daylight savings adjustments are not followed and your job execution is off by an hour for half the year.
- When `start_date` is NULL, the Scheduler determines the time zone for the repeat interval as follows:
  1. It checks whether or not the session time zone is a region name. The session time zone can be set by either:
    - Issuing an ALTER SESSION statement, for example:
 

```
SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
```
    - Setting the ORA\_SDTZ environment variable.
  2. If the session time zone is an absolute offset instead of a region name, the Scheduler uses the value of the DEFAULT\_TIMEZONE Scheduler attribute. For more information, see the [SET\\_SCHEDULER\\_ATTRIBUTE Procedure](#).
  3. If the DEFAULT\_TIMEZONE attribute is NULL, the Scheduler uses the time zone of `sysimestamp` when the job or window is enabled.

**BYSETPOS Clause Rules** The following are rules for the BYSETPOS clause.

- The BYSETPOS clause is the last clause to be evaluated. It is processed after all other BY clauses and the INCLUDE, EXCLUDE and INTERSECT clauses have been evaluated.
- The INTERVAL clause does not change the size of the period to which the BYSETPOS clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which BYSETPOS is applied is generated from a month, not a quarter. The only impact of the INTERVAL clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY; INTERVAL=3; BYDAY=MON, TUE, WED, THU, FRI; BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which BYSETPOS is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

```
FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
```

on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

**BYDATE Clause Rules** The following are rules for the BYDATE clause.

- If dates in the BYDATE clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the BY clauses in the calendaring expression. For example, if `repeat_interval` is defined as

```
freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
```

then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

**EXCLUDE Clause Rules** Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

**OFFSET Rules** You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

### **Example 128–1 Putting It All Together**

This example demonstrates the use of user-defined frequencies, spans, offsets, and the BYSETPOS and INCLUDE clauses. (Note that the `OFFSET:` keyword is optional in an offset clause.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
dbms_scheduler.create_schedule('year_start', repeat_interval=>
'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
dbms_scheduler.create_schedule('retail_fiscal_year',
to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
```

```
end;  
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing holiday schedule.

```
begin  
  dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>  
    'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;  
    BYPERIOD=2,4;BYSETPOS=5');  
end;  
/
```

---

## Summary of DBMS\_SCHEDULER Subprograms

**Table 128–11 DBMS\_SCHEDULER Package Subprograms**

Subprogram	Description
<a href="#">ADD_EVENT_QUEUE_SUBSCRIBER Procedure</a> on page 128-34	Adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE
<a href="#">ADD_GROUP_MEMBER Procedure</a> on page 128-35	Adds one or more members to an existing group
<a href="#">ADD_JOB_EMAIL_NOTIFICATION Procedure</a> on page 128-36	Adds e-mail notifications for a job for a list of recipients and a list of job state events
<a href="#">ADD_WINDOW_GROUP_MEMBER Procedure</a> on page 128-39	***Deprecated. Use CREATE_GROUP and ADD_GROUP_MEMBER instead
<a href="#">ALTER_CHAIN Procedure</a> on page 128-40	Alters specified steps of a chain
<a href="#">ALTER_RUNNING_CHAIN Procedure</a> on page 128-43	Alters specified steps of a running chain
<a href="#">CLOSE_WINDOW Procedure</a> on page 128-45	Closes an open window prematurely
<a href="#">COPY_JOB Procedure</a> on page 128-46	Copies an existing job
<a href="#">CREATE_CHAIN Procedure</a> on page 128-47	Creates a chain, which is a named series of programs that are linked together for a combined objective
<a href="#">CREATE_CREDENTIAL Procedure</a> on page 128-49	Creates a credential
<a href="#">CREATE_DATABASE_DESTINATION Procedure</a> on page 128-50	Creates a database destination for use with remote database jobs
<a href="#">CREATE_EVENT_SCHEDULE Procedure</a> on page 128-51	Creates an event schedule, which is a schedule that starts a job based on the detection of an event
<a href="#">CREATE_FILE_WATCHER Procedure</a> on page 128-53	Creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job
<a href="#">CREATE_GROUP Procedure</a> on page 128-55	Creates a group
<a href="#">CREATE_JOB Procedure</a> on page 128-57	Creates a single job
<a href="#">CREATE_JOB_CLASS Procedure</a> on page 128-64	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
<a href="#">CREATE_JOBS Procedure</a> on page 128-66	Creates multiple jobs
<a href="#">CREATE_PROGRAM Procedure</a> on page 128-67	Creates a program
<a href="#">CREATE_SCHEDULE Procedure</a> on page 128-70	Creates a schedule
<a href="#">CREATE_WINDOW Procedure</a> on page 128-71	Creates a window, which provides a way to automatically activate different resource plans at different times
<a href="#">CREATE_WINDOW_GROUP Procedure</a> on page 128-74	*** Deprecated. Use CREATE_GROUP

**Table 128–11 (Cont.) DBMS\_SCHEDULER Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DEFINE_ANYDATA_ARGUMENT Procedure</a> on page 128-75	Defines a program argument whose value is of a complex type and must be passed encapsulated in an AnyData object
<a href="#">DEFINE_CHAIN_EVENT_STEP Procedure</a> on page 128-76	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: <a href="#">DEFINE_CHAIN_STEP</a> .
<a href="#">DEFINE_CHAIN_RULE Procedure</a> on page 128-77	Adds a rule to an existing chain
<a href="#">DEFINE_CHAIN_STEP Procedure</a> on page 128-80	Defines a chain step, which can be a program or another (nested) chain. See also: <a href="#">DEFINE_CHAIN_EVENT_STEP</a> .
<a href="#">DEFINE_METADATA_ARGUMENT Procedure</a> on page 128-81	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument.
<a href="#">DEFINE_PROGRAM_ARGUMENT Procedure</a> on page 128-83	Defines a program argument whose value can be passed as a string literal to the program
<a href="#">DISABLE Procedure</a> on page 128-85	Disables a program, job, chain, window, database destination, external destination, file watcher, or group
<a href="#">DROP_AGENT_DESTINATION Procedure</a> on page 128-88	Drops one or more external destinations. Use only when the preferred method of dropping external destinations—unregistering the Scheduler agent with the database—fails.
<a href="#">DROP_CHAIN Procedure</a> on page 128-89	Drops an existing chain
<a href="#">DROP_CHAIN_RULE Procedure</a> on page 128-90	Removes a rule from an existing chain
<a href="#">DROP_CHAIN_STEP Procedure</a> on page 128-91	Drops a chain step
<a href="#">DROP_CREDENTIAL Procedure</a> on page 128-92	Drops a credential
<a href="#">DROP_DATABASE_DESTINATION Procedure</a> on page 128-93	Drops one or more database destinations
<a href="#">DROP_FILE_WATCHER Procedure</a> on page 128-94	Drops one or more file watchers
<a href="#">DROP_GROUP Procedure</a> on page 128-95	Drops one or more groups
<a href="#">DROP_JOB Procedure</a> on page 128-96	Drops a job or all jobs in a job class
<a href="#">DROP_JOB_CLASS Procedure</a> on page 128-97	Drops a job class
<a href="#">DROP_PROGRAM Procedure</a> on page 128-98	Drops a program
<a href="#">DROP_PROGRAM_ARGUMENT Procedure</a> on page 128-99	Drops a program argument
<a href="#">DROP_SCHEDULE Procedure</a> on page 128-100	Drops a schedule
<a href="#">DROP_WINDOW Procedure</a> on page 128-101	Drops a window
<a href="#">DROP_WINDOW_GROUP Procedure</a> on page 128-102	*** Deprecated. Use <a href="#">CREATE_GROUP</a> and <a href="#">DROP_GROUP</a> instead.

**Table 128–11 (Cont.) DBMS\_SCHEDULER Package Subprograms**

Subprogram	Description
<a href="#">ENABLE Procedure</a> on page 128-103	Enables a program, job, chain, window, database destination, external destination, file watcher, or group
<a href="#">END_DETACHED_JOB_RUN Procedure</a> on page 128-105	Ends a running detached job
<a href="#">EVALUATE_CALENDAR_STRING Procedure</a> on page 128-106	Evaluates the calendar string and tells you what the next execution date of a job or window will be
<a href="#">EVALUATE_RUNNING_CHAIN Procedure</a> on page 128-108	Forces reevaluation of the rules of a running chain to trigger any rules for conditions that have been satisfied
<a href="#">GENERATE_JOB_NAME Function</a> on page 128-109	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named <code>sally1</code> , <code>sally2</code> , and so on
<a href="#">"GET_AGENT_INFO Function"</a> on page 128-110	Returns job information specific to an agent, such as how many are running and so on, depending on the attribute selected
<a href="#">"GET_AGENT_VERSION Function"</a> on page 128-111	Returns the version string of a Scheduler agent that is registered with the database and is currently running
<a href="#">GET_ATTRIBUTE Procedure</a> on page 128-112	Retrieves the value of an attribute of an object
<a href="#">GET_FILE Procedure</a> on page 128-113	Retrieves a file from a host
<a href="#">GET_SCHEDULER_ATTRIBUTE Procedure</a> on page 128-115	Retrieves the value of a Scheduler attribute
<a href="#">OPEN_WINDOW Procedure</a> on page 128-116	Opens a window prematurely. The window is opened immediately for the duration
<a href="#">PURGE_LOG Procedure</a> on page 128-118	Purges specific rows from the job and window logs
<a href="#">PUT_FILE Procedure</a> on page 128-119	Saves a file to one or more hosts
<a href="#">REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure</a> on page 128-120	Unsubscribes a user from the Scheduler event queue <code>SYS.SCHEDULER\$_EVENT_QUEUE</code>
<a href="#">REMOVE_GROUP_MEMBER Procedure</a> on page 128-121	Removes one or more members from a group
<a href="#">REMOVE_JOB_EMAIL_NOTIFICATION Procedure</a> on page 128-122	Removes e-mail notifications for a job
<a href="#">REMOVE_WINDOW_GROUP_MEMBER Procedure</a> on page 128-123	***Deprecated. Use <code>CREATE_GROUP</code> and <code>REMOVE_GROUP_MEMBER</code> instead
<a href="#">RESET_JOB_ARGUMENT_VALUE Procedure</a> on page 128-124	Resets the current value assigned to an argument defined with the associated program
<a href="#">RUN_CHAIN Procedure</a> on page 128-125	Immediately runs a chain by creating a run-once job
<a href="#">RUN_JOB Procedure</a> on page 128-127	Runs a job immediately
<a href="#">SET_AGENT_REGISTRATION_PASS Procedure</a> on page 128-129	Sets the agent registration password for a database
<a href="#">SET_ATTRIBUTE Procedure</a> on page 128-130	Changes an attribute of a job, schedule, or other Scheduler object

**Table 128-11 (Cont.) DBMS\_SCHEDULER Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SET_ATTRIBUTE_NULL Procedure</a> on page 128-145	Changes an attribute of an object to NULL
<a href="#">SET_JOB_ANYDATA_VALUE Procedure</a> on page 128-146	Sets the value of a job argument encapsulated in an AnyData object
<a href="#">SET_JOB_ARGUMENT_VALUE Procedure</a> on page 128-147	Sets the value of a job argument
<a href="#">SET_JOB_ATTRIBUTES Procedure</a> on page 128-149	Sets the value of a job attribute
<a href="#">SET_SCHEDULER_ATTRIBUTE Procedure</a> on page 128-150	Sets the value of a Scheduler attribute
<a href="#">STOP_JOB Procedure</a> on page 128-153	Stops a currently running job or all jobs in a job class

## ADD\_EVENT\_QUEUE\_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, and grants the user permission to dequeue from this queue using the designated agent.

### Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (  
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–12 ADD\_EVENT\_QUEUE\_SUBSCRIBER Procedure Parameters**

Parameter	Description
<code>subscriber_name</code>	Name of the Oracle Streams Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If <code>NULL</code> , an agent is created and assigned the user name of the calling user.

### Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

## ADD\_GROUP\_MEMBER Procedure

This procedure adds one or more members to an existing group.

### Syntax

```
DBMS_SCHEDULER.ADD_GROUP_MEMBER (
  group_name          IN VARCHAR2,
  member              IN VARCHAR2);
```

### Parameters

**Table 128–13** ADD\_GROUP\_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member	<p>A comma-separated list of members to add to the group. Members must match the group type. A group of the same type can be a member. The Scheduler immediately expands the included group name into its list of members.</p> <p>An error is returned if any of the members do not exist. A member that is already in the group is skipped, and no error is generated.</p> <p>The keyword LOCAL can be included as a member for database destination or external destination groups. See the "<a href="#">CREATE_GROUP Procedure</a>" on page 55 for information about this keyword.</p>

### Usage Notes

The following users may add members to a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to add a member to a group of type WINDOW.

**See Also:** "[CREATE\\_GROUP Procedure](#)" on page 128-55

## ADD\_JOB\_EMAIL\_NOTIFICATION Procedure

This procedure adds e-mail notifications for a job. E-mails are then sent to the specified list of recipients whenever any of the specified job state events is raised.

### Syntax

```
DBMS_SCHEDULER.ADD_JOB_EMAIL_NOTIFICATION (
  job_name          IN VARCHAR2,
  recipients        IN VARCHAR2,
  sender            IN VARCHAR2 DEFAULT NULL,
  subject           IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_SUBJECT,
  body              IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_BODY,
  events            IN VARCHAR2 DEFAULT 'JOB_FAILED,JOB_BROKEN,JOB_SCH_LIM_REACHED,
  JOB_CHAIN_STALLED,JOB_OVER_MAX_DUR',
  filter_condition IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–14 ADD\_JOB\_EMAIL\_NOTIFICATION Procedure Parameters**

Parameter	Description
job_name	Name of the job that e-mail notifications are added for. Cannot be NULL.
recipients	Comma-separated list of e-mail addresses to send notifications to. E-mail notifications for all listed events are sent to all recipients. Cannot be NULL.
sender	e-mail address to use as the sender address (the From: address) in the e-mail header. If NULL or omitted, the e-mail address specified in the Scheduler attribute <code>email_sender</code> is used. See <i>Oracle Database Administrator's Guide</i> for more information on this Scheduler attribute.
subject	The subject to use in the e-mail header. <a href="#">Table 128–15</a> describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>subject</code> is omitted, the default subject is used. The default subject is the following text, where text enclosed in the '%' character represents a variable:  'Oracle Scheduler Job Notification - %job_owner%.%job_name%.%job_subname% %event_type%'
body	The body of the e-mail message. <a href="#">Table 128–15</a> describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>body</code> is omitted, the default body is used. The default body is the following text, where text enclosed in the '%' character represents a variable:  'Job: %job_owner%.%job_name%.%job_subname% Event: %event_type% Date: %event_timestamp% Log id: %log_id% Job class: %job_class_name% Run count: %run_count% Failure count: %failure_count% Retry count: %retry_count% Error code: %error_code% Error message: %error_message%'

**Table 128–14 (Cont.) ADD\_JOB\_EMAIL\_NOTIFICATION Procedure Parameters**

Parameter	Description
events	Comma-separated list of job state events to send e-mail notifications for. Cannot be NULL. A notification is sent to all recipients if any of the listed events is raised. <a href="#">Table 128–82</a> on page 128-138 lists the valid events for this parameter. If <code>events</code> is omitted, notifications are sent for the following default events:  JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR
filter_condition	Used to filter events to send e-mail notifications for. If NULL, all occurrences of the specified events cause e-mail notifications to be sent. <code>filter_condition</code> must be a boolean SQL WHERE clause that may refer to the <code>:event</code> bind variable. This bind variable is automatically bound to an object of type <code>SCHEDULER\$_EVENT_INFO</code> that represents the raised event.  For example, to send an e-mail notification only when the error number in an event is 600 or 700, use the following <code>filter_condition</code> :  <code>:event.error_code=600 or :event.error_code=700</code>  See " <a href="#">SCHEDULER\$_EVENT_INFO Object Type</a> " on page 128-13.

[Table 128–15](#) lists the variables that you can use in the subject and body arguments.

**Table 128–15 Variables Used in the SUBJECT and BODY Parameters**

Variable	Comment
<code>%job_owner%</code>	Schema in which job was created
<code>%job_name%</code>	Name of the job that e-mail notifications are added for
<code>%job_subname%</code>	Present for event-based jobs with the <code>parallel_instances</code> attribute set and for chain steps
<code>%event_type%</code>	Valid values are listed in <a href="#">Table 128–82</a> on page 128-138
<code>%event_timestamp%</code>	Time at which the event occurred
<code>%log_id%</code>	Refers to the <code>LOG_ID</code> column in views <code>*_SCHEDULER_JOB_LOG</code> and <code>*_SCHEDULER_JOB_RUN_DETAILS</code>
<code>%error_code%</code>	Number of the error code.
<code>%error_message%</code>	The text of the error message
<code>%run_count%</code>	Run count for the job when the event was raised
<code>%failure_count%</code>	Failure count for the job when the event was raised
<code>%retry_count%</code>	Retry count for the job when the event was raised

## Usage Notes

You can call `ADD_JOB_EMAIL_NOTIFICATION` once for each different set of notifications that you want to configure for a particular job. For example, you may want to send notifications for the `JOB_FAILED`, `JOB_BROKEN`, `JOB_SCH_LIM_REACHED`, and `JOB_CHAIN_STALLED` events to the principle DBA and all senior DBAs, but send a notification for the `JOB_OVER_MAX_DUR` event only to the principle DBA.

This procedure succeeds only if the Scheduler attribute `email_server` is set to a valid SMTP server. See *Oracle Database Administrator's Guide* for more information.

To call this procedure, you must be the job owner or have the `CREATE ANY JOB` system privilege or have the `ALTER` object privilege on the job.

## ADD\_WINDOW\_GROUP\_MEMBER Procedure

**\*\*\* Deprecated in Oracle Database 11g Release 2 (11.2). Use ADD\_GROUP\_MEMBER instead.**

This procedure adds one or more windows to an existing window group.

### Syntax

```
DBMS_SCHEDULER.ADD_WINDOW_GROUP_MEMBER (
    group_name          IN VARCHAR2,
    window_list        IN VARCHAR2);
```

### Parameters

**Table 128–16 ADD\_WINDOW\_GROUP\_MEMBER Procedure Parameters**

Parameter	Description
group_name	The name of the window group
window_list	The name of the window or windows

### Usage Notes

If an already open window is added to a window group, the Scheduler will not pick up jobs that point to this window group until the next window in the window group opens.

Adding a window to a group requires the `MANAGE SCHEDULER` privilege.

Note that a window group cannot be a member of another window group.

## ALTER\_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

### Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  attribute            IN VARCHAR2,
  value               IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  attribute            IN VARCHAR2,
  char_value          IN VARCHAR2);
```

### Parameters

**Table 128–17 ALTER\_CHAIN Procedure Parameters**

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step or a comma-separated list of steps to alter. This cannot be NULL.

**Table 128–17 (Cont.) ALTER\_CHAIN Procedure Parameters**

Parameter	Description
attribute	<p>The attribute of the steps to change. Must be one of the following:</p> <ul style="list-style-type: none"> <li> <p>■ 'PAUSE'</p> <p>If set to TRUE for a step, after the step has run, its state changes to PAUSED (and the completed attribute remains FALSE).</p> <p>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE.</p> <p>Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps.</p> </li> <li> <p>■ 'PAUSED_BEFORE'</p> <p>If set to TRUE for a step and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</p> <p>If PAUSED_BEFORE is reset to FALSE for a chain step that has paused before starting (using ALTER_RUNNING_CHAIN), then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting PAUSED_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> </li> <li> <p>■ 'SKIP'</p> <p>If set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED.</p> </li> <li> <p>■ 'RESTART_ON_FAILURE'</p> <p>If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED.</p> <p>If set to FALSE (the default), a failed chain step is immediately marked FAILED.</p> </li> <li> <p>■ 'RESTART_ON_RECOVERY'</p> <p>If set to TRUE for a step and the step is stopped by a database shutdown, then the step is restarted when the database is recovered.</p> <p>If set to FALSE, and the step is stopped by a database shutdown, then the step is marked as stopped when the database is recovered and the chain continues.</p> </li> <li> <p>■ 'DESTINATION_NAME'</p> <p>The name of an existing database destination or external destination. You can view external destination names in the view ALL_SCHEDULER_EXTERNAL_DESTS, and database destination names in the views *_SCHEDULER_DB_DESTS. You cannot specify a destination group for this attribute. This parameter is NULL by default.</p> </li> <li> <p>■ 'CREDENTIAL_NAME'</p> <p>The credential to use when running this step. NULL by default.</p> </li> </ul>

**Table 128–17 (Cont.) ALTER\_CHAIN Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
value	The value to set for the attribute (for a boolean attribute).
char_value	The value to set for the attribute (for a character attribute).

**Usage Notes**

Altering a chain requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

## ALTER\_RUNNING\_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

### Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
  job_name          IN VARCHAR2,
  step_name        IN VARCHAR2,
  attribute         IN VARCHAR2,
  value            IN {BOOLEAN|VARCHAR2});
```

### Parameters

**Table 128–18 ALTER\_RUNNING\_CHAIN Procedure Parameters**

Parameter	Description
job_name	The name of the job that is running the chain
step_name	The name of the step or a comma-separated list of steps to alter. If this is set to NULL and attribute is PAUSE or SKIP, then all steps of the running chain are altered.
attribute	<p>The attribute of the steps to change. Valid values are:</p> <ul style="list-style-type: none"> <li> <p>■ 'PAUSE'</p> <p>If the PAUSE attribute is set TRUE for a step, then after the step runs, its state changes to PAUSED (and the completed attribute remains false).</p> <p>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to completion (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE. Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE is set to TRUE for all steps of this running chain.</p> </li> <li> <p>■ 'PAUSE_BEFORE'</p> <p>If set to TRUE for a step that has not yet run and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</p> <p>If PAUSE_BEFORE is reset to FALSE for a chain step that has paused before starting, then the step starts running if any of the rule conditions that start the step are true.</p> <p>Setting PAUSE_BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</p> <p>If step_name is set to NULL, then PAUSE_BEFORE is set to the specified value for all steps of this running chain.</p> </li> </ul>

**Table 128–18 (Cont.) ALTER\_RUNNING\_CHAIN Procedure Parameters**

Parameter	Description
attribute CONTINUED	<ul style="list-style-type: none"> <li>■ 'SKIP' If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run.  If step_name is set to NULL, SKIP is set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step immediately changes to state PAUSED.</li> <li>■ 'RESTART_ON_FAILURE' If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED.  If set to FALSE (the default), a failed chain step is immediately marked FAILED.</li> <li>■ 'RESTART_ON_RECOVERY' If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered.  If set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues.</li> <li>■ 'STATE' This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following:  'NOT_STARTED', 'SUCCEEDED', 'FAILED error_code'  If the state is being changed to FAILED, an error code must be included (this must be a positive integer).</li> </ul>
value	The value to set for the attribute. Valid values are: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED error_code'

## Usage Notes

Altering a running chain requires you to have alter privileges on the job that is running (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

## CLOSE\_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler switches the resource plan to the one that is in effect outside the window, or in the case of overlapping windows, to another window.

### Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
    window_name          IN VARCHAR2);
```

### Parameters

**Table 128–19** *CLOSE\_WINDOW Procedure Parameters*

Parameter	Description
window_name	The name of the window

### Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running does not stop when the window it is running in closes, unless the attribute `stop_on_window_close` is set to `TRUE` for the job. However, the resources allocated to the job can change if the resource plan changes.

When a running job has a group of type `WINDOW` as its schedule, the job is not stopped when its window is closed if another window in the same window group becomes active. This is the case even if the job has the attribute `stop_on_window_close` set to `TRUE`.

Closing a window requires the `MANAGE SCHEDULER` privilege.

## COPY\_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

### Syntax

```
DBMS_SCHEDULER.COPY_JOB (  
    old_job          IN VARCHAR2,  
    new_job          IN VARCHAR2);
```

### Parameters

**Table 128–20** *COPY\_JOB Procedure Parameters*

Parameter	Description
old_job	The name of the existing job
new_job	The name of the new job

### Usage Notes

To copy a job, you must have privileges to create a job in the schema of the new job (the `CREATE JOB` system privilege if it is in your own schema, otherwise, the `CREATE ANY JOB` system privilege). If the old job is not in your own schema, then you must also have `ALTER` privileges on the old job or the `CREATE ANY JOB` system privilege.

## CREATE\_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, `myschema.mychain`).

A chain is always created as disabled and must be enabled with the [ENABLE Procedure](#) before it can be used.

### Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
  chain_name          IN VARCHAR2,
  rule_set_name       IN VARCHAR2 DEFAULT NULL,
  evaluation_interval IN INTERVAL DAY TO SECOND DEFAULT NULL,
  comments            IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–21 CREATE\_CHAIN Procedure Parameters**

Parameter	Description
<code>chain_name</code>	The name to assign to the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, therefore, there cannot already be a table or other object with this name and schema.
<code>rule_set_name</code>	In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them.  Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form <code>SCHED_RULESET\${N}</code> and the evaluation context created is of the form <code>SCHED_EVCTX\${N}</code> .  See <i>Oracle Streams Concepts and Administration</i> for information on rules and rule sets.
<code>evaluation_interval</code>	If this is <code>NULL</code> , reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non- <code>NULL</code> value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at <code>NULL</code> if possible. <code>evaluation_interval</code> cannot be less than a minute or greater than a day.
<code>comments</code>	An optional comment describing the purpose of the chain

### Usage Notes

To create a chain in your own schema, you must have the `CREATE JOB` system privilege. To create a chain in a different schema you must have the `CREATE ANY JOB` system privilege. If you do not provide a `rule_set_name`, a rule set and evaluation context is created in the schema that the chain is being created in, so you must have the privileges required to create these objects. See the `DBMS_RULE_ADM.CREATE_`

RULE\_SET and DBMS\_RULE\_ADM.CREATE\_EVALUATION\_CONTEXT procedures for more information.

## CREATE\_CREDENTIAL Procedure

This procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

### Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
  credential_name      IN VARCHAR2,
  username             IN VARCHAR2,
  password             IN VARCHAR2,
  database_role        IN VARCHAR2 DEFAULT NULL,
  windows_domain       IN VARCHAR2 DEFAULT NULL,
  comments              IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–22 CREATE\_CREDENTIAL Procedure Parameters**

Parameter	Description
credential_name	The name to assign to the credential. It can optionally be prefixed with a schema name. It cannot be set to NULL. It is converted to uppercase unless enclosed in double-quotes.
username	The user name for logging into to the host operating system or remote Oracle database. This cannot be set to NULL and is case-sensitive. It cannot contain double quotes or spaces. Maximum length is 64.
password	The password for the user name. This cannot be set to NULL and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views. Maximum length is 128.
database_role	The value of the database_role attribute is used as the system privilege for logging into a remote database to run a remote database job. Valid values are: SYSDBA and SYSOPER
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically. Maximum length is 64.
comments	A text string that can be used to describe the credential. Scheduler does not use this parameter. Maximum length is 240.

### Usage Notes

Credentials reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a credential in a schema other than your own, you must have the CREATE ANY JOB privilege.

## CREATE\_DATABASE\_DESTINATION Procedure

This procedure creates a database destination. A database destination represents an Oracle database on which remote database jobs run.

The host that the remote database resides on must have a running Scheduler agent that is registered with the database that this procedure is called from.

### Syntax

```
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (
    destination_name    IN VARCHAR2,
    agent               IN VARCHAR2,
    tns_name            IN VARCHAR2,
    comments            IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–23 CREATE\_DATABASE\_DESTINATION Procedure Parameters**

Parameter	Description
<code>destination_name</code>	The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be <code>NULL</code> . It is converted to uppercase unless enclosed in double-quotes.
<code>agent</code>	The external destination name of the Scheduler agent to connect. Equivalent to an agent name.  The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance.  An agent's name is specified in its agent configuration file. If it is not specified, it defaults to the first part (before the first period) of the name of the host it resides on.
<code>tns_name</code>	An Oracle Net connect identifier that is resolved to the Oracle database instance being connected to. The exact syntax depends on the Oracle Net configuration.  The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a <i>net service name</i> , which is an alias for a connect descriptor. The alias must be resolved in the <code>tnsnames.ora</code> file on the local computer. The maximum size for <code>tns_name</code> is 2000 characters.  If <code>tns_name</code> is <code>NULL</code> , the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the <code>ORACLE_HOME</code> and <code>ORACLE_SID</code> parameters in the agent configuration file, <code>schagent.conf</code> , located in the agent home directory.  See <i>Oracle Database Net Services Administrator's Guide</i> for more information on connect identifiers.
<code>comments</code>	A text string that describes the database destination. Scheduler does not use this argument.

### Usage Notes

Database destinations reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a database destination in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

## CREATE\_EVENT\_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

### Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
  schedule_name          IN VARCHAR2,
  start_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  event_condition        IN VARCHAR2 DEFAULT NULL,
  queue_spec             IN VARCHAR2,
  end_date               IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  comments               IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–24 CREATE\_EVENT\_SCHEDULE Parameters**

Parameter	Description
schedule_name	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the date and time that this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression, provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.
queue_spec	This argument specifies either a file watcher name or the queue into which events that start this particular job are enqueued (the <b>source queue</b> ). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <code>queue_name, agent name</code> . For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
end_date	The date and time after which jobs do not run and windows do not open.  An event schedule that has no <code>end_date</code> is valid forever.  <code>end_date</code> must be after the <code>start_date</code> . If it is not, then an error is generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is <code>NULL</code> .

### Usage Notes

You must have the `CREATE JOB` privilege to create a schedule in your own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be

used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

**See Also:** ["CREATE\\_FILE\\_WATCHER Procedure"](#) on page 128-53

## CREATE\_FILE\_WATCHER Procedure

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

### Syntax

```
DBMS_SCHEDULER.CREATE_FILE_WATCHER (
  file_watcher_name      IN VARCHAR2,
  directory_path         IN VARCHAR2,
  file_name              IN VARCHAR2,
  credential_name        IN VARCHAR2,
  destination           IN VARCHAR2 DEFAULT NULL,
  min_file_size          IN PLS_INTEGER DEFAULT 0,
  steady_state_duration IN INTERVAL DAY TO SECOND DEFAULT NULL,
  comments               IN VARCHAR2 DEFAULT NULL,
  enabled                IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 128–25 CREATE\_FILE\_WATCHER Parameters**

Parameter	Description
file_watcher_name	The name to assign to the file watcher. The name must be unique in the SQL namespace. For example, a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be NULL.
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.
file_name	Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid Scheduler credential object.  The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL.
destination	Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view ALL_SCHEDULER_EXTERNAL_DESTS for valid external destination names. If this parameter is NULL, the file watcher is created on the local host.
min_file_size	Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If NULL, an internal value is used.
comments	Optional comment.
enabled	If TRUE (the default), the file watcher is enabled.

## Usage Notes

You must have the `CREATE JOB` system privilege to create a file watcher in your own schema. You require the `CREATE ANY JOB` system privilege to create a file watcher in a schema different from your own (except the `SYS` schema, which is disallowed).

## CREATE\_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other DBMS\_SCHEDULER package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the `DESTINATION_NAME` parameter of the job.

### Syntax

```
DBMS_SCHEDULER.CREATE_GROUP (
  group_name      IN VARCHAR2,
  group_type      IN VARCHAR2,
  member          IN VARCHAR2 DEFAULT NULL,
  comments        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–26 CREATE\_GROUP Procedure Parameters**

Parameter	Description
<code>group_name</code>	The name to assign to the group. It can optionally be prefixed with a schema name. It cannot be <code>NULL</code> . It is converted to uppercase unless enclosed in double-quotes.
<code>group_type</code>	<p>The type of members in the group. All members must be of the same type. Possible types are:</p> <ul style="list-style-type: none"> <li>▪ <code>'DB_DEST'</code> Database destination: Members are database destinations, for running remote database jobs.</li> <li>▪ <code>'EXTERNAL_DEST'</code> External destination: Members are external destinations, for running remote external jobs.</li> <li>▪ <code>'WINDOW'</code> Members are Scheduler windows. You must have the <code>MANAGE SCHEDULER</code> privilege to create a group of this type.</li> </ul> <p>Members in database destination and external destination groups have the following format:</p> <pre>[[<i>schema.</i>]<i>credential</i>@][<i>schema.</i>]<i>destination</i></pre> <p>where:</p> <ul style="list-style-type: none"> <li>▪ <i>credential</i> is the name of an existing credential.</li> <li>▪ <i>destination</i> is the name of an existing database destination or external destination.</li> </ul> <p>The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential.</p> <p>Members in window groups are window names. Because all Scheduler windows reside in the <code>SYS</code> schema, you do not specify a schema name for windows.</p>

**Table 128–26 (Cont.) CREATE\_GROUP Procedure Parameters**

Parameter	Description
<code>member</code>	<p>Optional comma-separated list of group members. The default is <code>NULL</code>. If <code>NULL</code>, use the <code>ADD_GROUP_MEMBER</code> procedure to add members. You can also use <code>ADD_GROUP_MEMBER</code> to add additional members at a later time.</p> <p>The keyword <code>LOCAL</code> can be used as a member in database destination groups and external destination groups.</p> <ul style="list-style-type: none"> <li>▪ In database destination groups, <code>LOCAL</code> represents the source database on which the job is created. It cannot be preceded with a credential.</li> <li>▪ In external destination groups, <code>LOCAL</code> represents the host on which the source database resides. It can be optionally preceded with a credential name. If no credential is provided, jobs that use this group as their destination must have a default credential.</li> </ul>
<code>comments</code>	A text string that describes the group. Scheduler does not use this argument.

## Usage Notes

Groups reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a group in a schema other than your own, you must have the `CREATE ANY JOB` privilege. The group name must be unique among all Scheduler objects.

You can grant the `SELECT` privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the `ALTER` privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the group members do not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

This procedure supersedes the procedure `CREATE_WINDOW_GROUP`, which is deprecated in Oracle Database 11g Release 2 (11.2).

## Example

The following PL/SQL block creates a group named `production_dest1`, whose members are database destinations for a collection of production databases.

```
BEGIN
  DBMS_SCHEDULER.CREATE_GROUP (
    GROUP_NAME => 'production_dest1',
    GROUP_TYPE => 'DB_DEST',
    MEMBER     => 'LOCAL, oracle_cred@prodbost1, prodbost2',
    COMMENTS  => 'All sector1 production machines');
END;
```

## CREATE\_JOB Procedure

This procedure creates a single job (regular or lightweight). If you create the job as enabled by setting the `enabled` attribute to `TRUE`, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the [SET\\_ATTRIBUTE Procedure](#).

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

### Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  job_type          IN VARCHAR2,
  job_action        IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER          DEFAULT 0,
  start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval   IN VARCHAR2              DEFAULT NULL,
  end_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled           IN BOOLEAN                DEFAULT FALSE,
  auto_drop         IN BOOLEAN                DEFAULT TRUE,
  comments          IN VARCHAR2              DEFAULT NULL,
  credential_name   IN VARCHAR2              DEFAULT NULL,
  destination_name  IN VARCHAR2              DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  program_name      IN VARCHAR2,
  schedule_name     IN VARCHAR2,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled           IN BOOLEAN                DEFAULT FALSE,
  auto_drop         IN BOOLEAN                DEFAULT TRUE,
  comments          IN VARCHAR2              DEFAULT NULL,
  job_style         IN VARCHAR2              DEFAULT 'REGULAR',
  credential_name   IN VARCHAR2              DEFAULT NULL,
  destination_name  IN VARCHAR2              DEFAULT NULL);
```

Creates a job using a named program object and an inlined schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  program_name      IN VARCHAR2,
  start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval   IN VARCHAR2              DEFAULT NULL,
  end_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled           IN BOOLEAN                DEFAULT FALSE,
  auto_drop         IN BOOLEAN                DEFAULT TRUE,
  comments          IN VARCHAR2              DEFAULT NULL,
  job_style         IN VARCHAR2              DEFAULT 'REGULAR',
  credential_name   IN VARCHAR2              DEFAULT NULL,
  destination_name  IN VARCHAR2              DEFAULT NULL);
```

Creates a job using a named schedule object and an inlined program:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  schedule_name     IN VARCHAR2,
  job_type          IN VARCHAR2,
  job_action        IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER          DEFAULT 0,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled          IN BOOLEAN               DEFAULT FALSE,
  auto_drop        IN BOOLEAN               DEFAULT TRUE,
  comments         IN VARCHAR2              DEFAULT NULL,
  credential_name  IN VARCHAR2              DEFAULT NULL,
  destination_name IN VARCHAR2              DEFAULT NULL);

```

Creates a job using an inlined program and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  job_type          IN VARCHAR2,
  job_action        IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER          DEFAULT 0,
  start_date       IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  event_condition  IN VARCHAR2              DEFAULT NULL,
  queue_spec       IN VARCHAR2,
  end_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled          IN BOOLEAN               DEFAULT FALSE,
  auto_drop        IN BOOLEAN               DEFAULT TRUE,
  comments         IN VARCHAR2              DEFAULT NULL,
  credential_name  IN VARCHAR2              DEFAULT NULL,
  destination_name IN VARCHAR2              DEFAULT NULL);

```

Creates a job using a named program object and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  program_name      IN VARCHAR2,
  start_date       IN TIMESTAMP WITH TIME ZONE,
  event_condition  IN VARCHAR2,
  queue_spec       IN VARCHAR2,
  end_date         IN TIMESTAMP WITH TIME ZONE,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled          IN BOOLEAN               DEFAULT FALSE,
  auto_drop        IN BOOLEAN               DEFAULT TRUE,
  comments         IN VARCHAR2              DEFAULT NULL,
  job_style        IN VARCHAR2              DEFAULT 'REGULAR',
  credential_name  IN VARCHAR2              DEFAULT NULL,
  destination_name IN VARCHAR2              DEFAULT NULL);

```

## Parameters

**Table 128–27 CREATE\_JOB Procedure Parameters**

Parameter	Description
job_name	<p>The name to assign to the job. The name must be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name.</p> <p>If <code>job_name</code> is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the <code>GENERATE_JOB_NAME</code> procedure to generate a name and then use the output in the <code>CREATE_JOB</code> procedure. The <code>GENERATE_JOB_NAME</code> procedure generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "<a href="#">GENERATE_JOB_NAME Function</a>" on page 128-109 for more information.</p>
job_type	<p>This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. The supported values are:</p> <ul style="list-style-type: none"> <li> <p>■ 'PLSQL_BLOCK'</p> <p>This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0.</p> </li> <li> <p>■ 'STORED_PROCEDURE'</p> <p>This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported.</p> </li> <li> <p>■ 'EXECUTABLE'</p> <p>This specifies that the job is external to the database. External jobs are anything that can be executed from the command line of the operating system. Anydata arguments are not supported with a job or program type of <code>EXECUTABLE</code>. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege before the job can be enabled or run.</p> </li> <li> <p>■ 'CHAIN'</p> <p>This specifies that the job is a chain. Arguments are not supported for a chain, so <code>number_of_arguments</code> must be 0.</p> </li> </ul>

**Table 128–27 (Cont.) CREATE\_JOB Procedure Parameters**

Parameter	Description
<code>job_action</code>	<p>This attribute specifies the action of the job. If <code>job_action</code> is not specified for an inline program, then an error is generated when creating the job.</p> <p>The following actions are possible:</p> <ul style="list-style-type: none"> <li>■ For a PL/SQL block: <p>The action is to execute PL/SQL code. These blocks must end with a semicolon. For example, <code>my_proc()</code>; or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END;</code>.</p> <p>Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.</p> <p>See <a href="#">Table 128–39</a> on page 128-81 for details on available metadata attributes.</p> </li> <li>■ For a stored procedure: <p>The action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>job_action=&gt;' "Schema" ." Procedure"'</code>.</p> <p>PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported as <code>job_action</code> when the job or program type is <code>STORED_ PROCEDURE</code>.</p> </li> <li>■ For an executable: <p>The action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance.</p> </li> <li>■ For a chain: <p>The action is the name of a Scheduler chain object. You must specify the schema of the chain if it resides in a different schema than the job.</p> </li> </ul>
<code>number_of_arguments</code>	This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.
<code>program_name</code>	The name of the program associated with this job. If the program is of type <code>EXECUTABLE</code> , the job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege before the job can be enabled or run.
<code>start_date</code>	<p>This attribute specifies the first date and time on which this job is scheduled to start. If <code>start_date</code> and <code>repeat_interval</code> are left null, then the job is scheduled to run as soon as the job is enabled.</p> <p>For repeating jobs that use a calendaring expression to specify the repeat interval, <code>start_date</code> is used as a reference date. The first time the job runs is the first match of the calendaring expression that is on or after the current date and time.</p> <p>The Scheduler cannot guarantee that a job executes on an exact time because the system may be overloaded and thus resources unavailable.</p>

**Table 128–27 (Cont.) CREATE\_JOB Procedure Parameters**

Parameter	Description
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.
queue_spec	This argument specifies either of the following: <ul style="list-style-type: none"> <li>■ The source queue where events that start this particular job are enqueued. If it is secure, then the <code>queue_spec</code> argument is a pair of values of the form <code>queue_name, agent_name</code>. If it is not secure, then only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.</li> <li>■ A file watcher name. For more information on this option, see <i>Oracle Database Administrator's Guide</i>.</li> </ul>
repeat_interval	This attribute specifies how often the job repeats. You can specify the repeat interval by using calendaring or PL/SQL expressions.  The expression specified is evaluated to determine the next time the job should run. If <code>repeat_interval</code> is not specified, the job runs only once at the specified start date. See "Calendaring Syntax" on page 128-20 for further information.
schedule_name	The name of the schedule, window, or window group associated with this job.
job_class	The class this job is associated with.
end_date	This attribute specifies the date and time after which the job expires and is no longer run. After the <code>end_date</code> , if <code>auto_drop</code> is <code>TRUE</code> , the job is dropped. If <code>auto_drop</code> is <code>FALSE</code> , the job is disabled and the <code>STATE</code> of the job is set to <code>COMPLETED</code> .  If no value for <code>end_date</code> is specified, the job repeats forever unless <code>max_runs</code> or <code>max_failures</code> is set, in which case the job stops when either value is reached.  The value for <code>end_date</code> must be after the value for <code>start_date</code> . If it is not, an error is generated when the job is enabled.
comments	This attribute specifies a comment about the job. By default, this attribute is <code>NULL</code> .
job_style	Style of the job being created. This argument can have one of the following values: <ul style="list-style-type: none"> <li>■ 'REGULAR' creates a regular job. This is the default.</li> <li>■ 'LIGHTWEIGHT' creates a lightweight job. This value is permitted only when the job references a program object. Use lightweight jobs when you have many short-duration jobs that run frequently. Under certain circumstances, using lightweight jobs can deliver a small performance gain.</li> </ul>
credential_name	The default credential to use with the job. Applicable only to remote database jobs, remote external jobs, local external jobs, and event-based jobs that process file arrival events. The credential must exist.  For local database jobs, it must be <code>NULL</code> .  For local external jobs only, if this attribute is <code>NULL</code> (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.  See also: "CREATE_CREDENTIAL Procedure" on page 128-49

**Table 128–27 (Cont.) CREATE\_JOB Procedure Parameters**

Parameter	Description
<code>destination_name</code>	<p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. Must be <code>NULL</code> for jobs running on the local database or for local external jobs (executables).</p> <p>This attribute can be a single destination name or the name of a group of type <code>'EXTERNAL_DEST'</code> or <code>'DB_DEST'</code>. The single destination or group must already exist.</p> <p>The following applies to this attribute:</p> <ul style="list-style-type: none"> <li>■ If it is a database destination, it must have been created by the <a href="#">CREATE_DATABASE_DESTINATION Procedure</a>.</li> <li>■ If it is an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database.</li> <li>■ If it is a group, each member of the group must exist, and the job must run on all destinations named in the group. See "<a href="#">CREATE_GROUP Procedure</a>" on page 128-55.</li> </ul> <p><code>destination_name</code> cannot reference a destination group when:</p> <ul style="list-style-type: none"> <li>■ The job type is <code>'CHAIN'</code></li> <li>■ The job style is <code>'LIGHTWEIGHT'</code></li> </ul> <p>If the <code>credential_name</code> argument of <code>CREATE_JOB</code> is <code>NULL</code>, each destination must be preceded by a credential, in the following format:</p> <p><i>credential.destination</i></p> <p>The credential must already exist. If the <code>credential_name</code> argument is provided, then it serves as the default credential for every destination that is not preceded by a credential.</p> <p>You can query the views <code>*_SCHEDULER_DB_DESTS</code> and <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> for existing destinations and <code>*_SCHEDULER_GROUP_MEMBERS</code> for existing groups and their members.</p> <p>*** <code>destination_name</code> supersedes the <code>destination</code> job attribute, which is deprecated in Oracle Database 11g Release 2 (11.2).</p>
<code>enabled</code>	<p>This attribute specifies whether the job is created enabled or not. The possible settings are <code>TRUE</code> or <code>FALSE</code>. By default, this attribute is set to <code>FALSE</code> and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured, and the job exists as a database object. However, the Scheduler ignores the job and the job coordinator does not pick it for processing. In order for the job coordinator to process the job, the job must be enabled. You can enable a job by setting this argument to <code>TRUE</code> or by using the <code>ENABLE</code> procedure.</p>
<code>auto_drop</code>	<p>This flag, if <code>TRUE</code>, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> <li>■ Its end date (or the end date of the job schedule) has passed.</li> <li>■ It has run <code>max_runs</code> number of times. <code>max_runs</code> must be set with <code>SET_ATTRIBUTE</code>.</li> <li>■ It is not a repeating job and has run once.</li> </ul> <p>A job is disabled when it has failed <code>max_failures</code> times. <code>max_failures</code> is also set with <code>SET_ATTRIBUTE</code>.</p> <p>If this flag is set to <code>FALSE</code>, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the <code>DROP_JOB</code> procedure.</p> <p>By default, jobs are created with <code>auto_drop</code> set to <code>TRUE</code>.</p>

## Usage Notes

Jobs are created as disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

The `JOB_QUEUE_PROCESSES` initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. Beginning with Oracle Database 11g Release 2 (11.2), `JOB_QUEUE_PROCESSES` applies to `DBMS_SCHEDULER` jobs. Setting this parameter to 0 disables `DBMS_SCHEDULER` jobs.

To create a job in your own schema, you need to have the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires `EXECUTE` privileges for that class or program.

Not all possible job attributes can be set with `CREATE_JOB`. Some must be set after the job is created. For example, job arguments must be set with the [SET\\_JOB\\_ARGUMENT\\_VALUE Procedure](#) or the [SET\\_JOB\\_ANYDATA\\_VALUE Procedure](#). Other job attributes, such as `job_priority` and `max_runs`, are set with the [SET\\_ATTRIBUTE Procedure](#).

To create multiple jobs efficiently, use the `CREATE_JOBS` procedure.

---

---

**Note:** The Scheduler runs event-based jobs for each occurrence of an event that matches the event condition of the job. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

---

---

## CREATE\_JOB\_CLASS Procedure

This procedure creates a job class. Job classes are created in the SYS schema.

### Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
  job_class_name          IN VARCHAR2,
  resource_consumer_group IN VARCHAR2 DEFAULT NULL,
  service                 IN VARCHAR2 DEFAULT NULL,
  logging_level           IN PLS_INTEGER
                          DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
  log_history             IN PLS_INTEGER DEFAULT NULL,
  comments                IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–28 CREATE\_JOB\_CLASS Procedure Parameters**

Parameter	Description
job_class_name	<p>The name to assign to the job class. Job classes can only be created in the SYS schema.</p> <p>This attribute specifies the name of the job class and uniquely identifies the job class. The name must be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.</p>
resource_consumer_group	<p>This attribute specifies the resource consumer group that this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with determines the resources that are allocated to the job class.</p> <p>If a resource consumer group is dropped, job classes associated with it are then associated with the default resource consumer group.</p> <p>If no resource consumer group is specified, job classes are associated with the default resource consumer group.</p> <p>If the specified resource consumer group does not exist when creating the job class, an error occurs.</p>
service	<p>This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service.</p> <p>Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See <code>DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING</code> for details. If both the <code>resource_consumer_group</code> and <code>service</code> attributes are specified, and if the service is mapped to a resource consumer group, the <code>resource_consumer_group</code> attribute takes precedence.</p> <p>If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service.</p> <p>If the specified service does not exist when creating the job class, then an error occurs.</p>

**Table 128–28 (Cont.) CREATE\_JOB\_CLASS Procedure Parameters**

Parameter	Description
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <ul style="list-style-type: none"> <li>■ <code>DBMS_SCHEDULER.LOGGING_OFF</code> No logging is performed for any jobs in this class.</li> <li>■ <code>DBMS_SCHEDULER.LOGGING_RUNS</code> The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default.</li> <li>■ <code>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</code> The Scheduler logs only jobs that failed in this class.</li> <li>■ <code>DBMS_SCHEDULER.LOGGING_FULL</code> In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with <code>SET_ATTRIBUTE</code>), stopped, and so, an entry is recorded in the log.</li> </ul>
log_history	<p>This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately.</p> <p>The range of valid values is 0 through 1000000. If set to 0, no history is kept. If <code>NULL</code> (the default), retention days are set by the <code>log_history</code> Scheduler attribute (set with <code>SET_SCHEDULER_ATTRIBUTE</code>).</p>
comments	<p>This attribute is for an optional comment about the job class. By default, this attribute is <code>NULL</code>.</p>

## Usage Notes

For users to create jobs that belong to a job class, the job owner must have `EXECUTE` privileges on the job class. Therefore, after the job class has been created, `EXECUTE` privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the `EXECUTE` privilege to a role.

Creating a job class requires the `MANAGE SCHEDULER` system privilege.

## CREATE\_JOBS Procedure

This procedure creates multiple jobs (regular or lightweight) and sets the values of their arguments in a single call.

### Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
  jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
  commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 128–29 CREATE\_JOBS Procedure Parameters**

Parameter	Description
jobdef_array	The array of job definitions. See "Data Structures" on page 128-2 for a description of the JOB_DEFINITION_ARRAY and JOB_DEFINITION data types.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> <li>▪ STOP_ON_FIRST_ERROR returns on the first error. Previous successfully created jobs are committed to disk. This is the default.</li> <li>▪ TRANSACTIONAL returns on the first error and everything that happened before that error is rolled back.</li> <li>▪ ABSORB_ERRORS tries to absorb any errors and attempts to create the rest of the jobs on the list. It commits all successfully created jobs. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.</li> </ul>

### Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size. Calling CREATE\_JOBS with a small array size may not be much faster than calling CREATE\_JOB once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the destination attribute of the job\_definition object cannot reference a destination group.

### Examples

See *Oracle Database Administrator's Guide*.

## CREATE\_PROGRAM Procedure

This procedure creates a program.

### Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (
    program_name          IN VARCHAR2,
    program_type          IN VARCHAR2,
    program_action        IN VARCHAR2,
    number_of_arguments  IN PLS_INTEGER DEFAULT 0,
    enabled                IN BOOLEAN DEFAULT FALSE,
    comments              IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–30 CREATE\_PROGRAM Procedure Parameters**

Parameter	Description
program_name	The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
program_type	This attribute specifies the type of program you are creating. If it is not specified then you get an error. There are three supported values for program_type: <ul style="list-style-type: none"> <li>▪ 'PLSQL_BLOCK' This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0.</li> <li>▪ 'STORED_PROCEDURE' This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported.</li> <li>▪ 'EXECUTABLE' This specifies that the program is external to the database. External programs imply anything that can be executed from the operating system command line. AnyData arguments are not supported with job or program type EXECUTABLE.</li> </ul>

**Table 128–30 (Cont.) CREATE\_PROGRAM Procedure Parameters**

Parameter	Description
<code>program_action</code>	<p>This attribute specifies the action of the program. The following actions are possible:</p> <ul style="list-style-type: none"> <li>For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon.  For example, <code>my_proc();</code> or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END;</code>.</li> </ul> <p>Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See <a href="#">Table 128–39</a> on page 128-81 for details on available metadata attributes.</p> <p>If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: <code>job_name</code>, <code>job_owner</code>, <code>job_start</code>, <code>window_start</code>, <code>window_end</code>. For more information, see the <a href="#">"DEFINE_METADATA_ARGUMENT Procedure"</a> on page 128-81.</p> <ul style="list-style-type: none"> <li>For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job.  If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, <code>program_action=&gt;' "Schema" . "Procedure" '</code>.</li> <li>For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark (?), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign (@) and the job is local, the at sign is replaced with the SID of the current Oracle instance.</li> </ul> <p>If <code>program_action</code> is not specified, an error is generated</p>
<code>number_of_arguments</code>	<p>This attribute specifies the number of arguments the program takes. If this parameter is not specified, then the default is 0. A program can have a maximum of 255 arguments.</p> <p>If the <code>program_type</code> is <code>PLSQL_BLOCK</code>, then this parameter is ignored.</p>
<code>enabled</code>	<p>This flag specifies whether the program should be created as enabled or not. If the flag is set to <code>TRUE</code>, then validity checks are made and the program is created as <code>ENABLED</code> if all the checks be successful. By default, this flag is set to <code>FALSE</code>, meaning not created enabled. You can also call the <code>ENABLE</code> procedure to enable the program before it can be used.</p>
<code>comments</code>	<p>A comment about the program. By default, this attribute is <code>NULL</code>.</p>

## Usage Notes

To create a program in their own schema, users need the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the `enabled` parameter is set to `TRUE`). It cannot be executed by a job until it is enabled.

To use your programs, other users must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

**See Also:** ["DEFINE\\_PROGRAM\\_ARGUMENT Procedure"](#) on page 128-83

## CREATE\_SCHEDULE Procedure

This procedure creates a schedule.

### Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
  schedule_name      IN VARCHAR2,
  start_date         IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
  repeat_interval    IN VARCHAR2,
  end_date           IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
  comments           IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–31 CREATE\_SCHEDULE Procedure Parameters**

Parameter	Description
schedule_name	The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date; it depends on the repeat interval specified. start_date is used to determine the first instance of the schedule.  If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval if it is not specified.  If start_date is null, then the date that the job or window is enabled is used. start_date and repeat_interval cannot both be null.
repeat_interval	This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See " <a href="#">Calendaring Syntax</a> " on page 128-20 for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.
end_date	The date and time after which jobs will not run and windows will not open.  A non-repeating schedule that has no end_date is valid forever.  end_date has to be after the start_date. If this is not the case, then an error is generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

### Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in your own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying schema . schedule\_name. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

## CREATE\_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the `SYS` schema.

The procedure is overloaded.

### Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
    window_name          IN VARCHAR2,
    resource_plan        IN VARCHAR2,
    schedule_name       IN VARCHAR2,
    duration             IN INTERVAL DAY TO SECOND,
    window_priority     IN VARCHAR2 DEFAULT 'LOW',
    comments            IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
    window_name          IN VARCHAR2,
    resource_plan        IN VARCHAR2,
    start_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    repeat_interval     IN VARCHAR2,
    end_date            IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    duration            IN INTERVAL DAY TO SECOND,
    window_priority     IN VARCHAR2 DEFAULT 'LOW',
    comments            IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–32 CREATE\_WINDOW Procedure Parameters**

Parameter	Description
<code>window_name</code>	The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the <code>SYS</code> schema, so the preface 'SYS' is optional.
<code>resource_plan</code>	<p>This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window.</p> <p>Only one resource plan can be associated with a window. It may be <code>NULL</code> or the empty string (''). When it is <code>NULL</code>, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p> <p>If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</p>

**Table 128–32 (Cont.) CREATE\_WINDOW Procedure Parameters**

Parameter	Description
start_date	<p>This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created.</p> <p>For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.</p>
duration	<p>This attribute specifies how long the window stays open. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if no value is specified when the window is created, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.</p>
schedule_name	<p>This attribute specifies the name of the schedule associated with the window.</p>
repeat_interval	<p>This attribute specifies how often the window repeats. It is expressed using the Scheduler calendaring syntax. See <a href="#">"Calendaring Syntax"</a> on page 128-20 for more information.</p> <p>A PL/SQL expression cannot be used to specify the repeat interval for a window.</p> <p>The expression specified is evaluated to determine the next time the window opens. If no repeat_interval is specified, the window opens only once at the specified start date.</p>
end_date	<p>This attribute specifies the date and time after which the window no longer opens. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window is set to FALSE.</p> <p>A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified, then the window keeps repeating forever.</p> <p>The end_date must be after the start_date. If it is not, then an error is generated when the window is created.</p>
window_priority	<p>This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority determines which window opens. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, therefore, the low priority window does not open if it overlaps a high priority window. By default, windows are created with priority 'LOW'.</p>
comments	<p>This attribute specifies an optional comment about the window. By default, this attribute is NULL.</p>

## Usage Notes

Creating a window requires the `MANAGE SCHEDULER` privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the `ALTER SYSTEM SET RESOURCE_MANAGER_PLAN` statement or the `DBMS_RESOURCE_MANAGER.SWITCH_PLAN` package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler

windows. For more information, see *Oracle Database Administrator's Guide* and "[SWITCH\\_PLAN Procedure](#)" on page 119-37.

## CREATE\_WINDOW\_GROUP Procedure

**\*\*\* Deprecated in Oracle Database 11g Release 2 (11.2). Use CREATE\_GROUP instead.**

This procedure creates a new window group. A window group is defined by a list of Scheduler windows. You can assign a window group as a job schedule. The job then runs when any of the windows in the group become active.

Window groups are created in the SYS schema.

### Syntax

```
DBMS_SCHEDULER.CREATE_WINDOW_GROUP (
  group_name          IN VARCHAR2,
  window_list        IN VARCHAR2 DEFAULT NULL,
  comments            IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–33 CREATE\_WINDOW\_GROUP Procedure Parameters**

Parameter	Description
group_name	The name to assign to the window group
window_list	A list of the windows assigned to the window group. If a window that does not exist is specified, an error is generated and the window group is not created.  Windows can also be added using the ADD_WINDOW_GROUP_MEMBER procedure. A window group cannot be a member of another window group.  Can be NULL.
comments	A comment about the window group

### Usage Notes

Creating a window group requires the `MANAGE SCHEDULER` privilege. Window groups, like windows, are created with access to `PUBLIC`, therefore, no privileges are required to access window groups.

A window group cannot contain another window group.

## DEFINE\_ANYDATA\_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an ANYDATA object. A job that references the program can override the default value.

### Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
  program_name          IN VARCHAR2,
  argument_position     IN PLS_INTEGER,
  argument_name         IN VARCHAR2 DEFAULT NULL,
  argument_type         IN VARCHAR2,
  default_value         IN SYS.ANYDATA,
  out_argument          IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–34** DEFINE\_ANYDATA\_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique, so it can replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the <a href="#">SET_JOB_ANYDATA_VALUE Procedure</a> .
argument_type	The data type of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
default_value	The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

### Usage Notes

All program arguments from one to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

- ["DEFINE\\_PROGRAM\\_ARGUMENT Procedure"](#) on page 128-83
- ["SET\\_JOB\\_ANYDATA\\_VALUE Procedure"](#) on page 128-146

## DEFINE\_CHAIN\_EVENT\_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event. Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

### Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    event_schedule_name IN VARCHAR2,
    timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    event_condition     IN VARCHAR2,
    queue_spec          IN VARCHAR2,
    timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

### Parameters

**Table 128–35** DEFINE\_CHAIN\_EVENT\_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain that the step is in
step_name	The name of the step
event_schedule_name	The name of the event schedule that the step waits for
timeout	This parameter is reserved for future use
event_condition	See the <a href="#">CREATE_EVENT_SCHEDULE Procedure</a>
queue_spec	See the <a href="#">CREATE_EVENT_SCHEDULE Procedure</a>

### Usage Notes

Defining a chain step requires ALTER privileges on the chain either as the owner of the chain, or as a user with the ALTER object privilege on the chain or the CREATE ANY JOB system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the queue\_spec parameter, or use a file watcher schedule for the event\_schedule\_name parameter.

**See Also:** ["DEFINE\\_CHAIN\\_STEP Procedure"](#) on page 128-80

## DEFINE\_CHAIN\_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form `SCHED_RULE${N}`.

### Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
  chain_name          IN VARCHAR2,
  condition           IN VARCHAR2,
  action             IN VARCHAR2,
  rule_name          IN VARCHAR2 DEFAULT NULL,
  comments           IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–36** *DEFINE\_CHAIN\_RULE Procedure Parameters*

Parameter	Description
chain_name	The name of the chain to alter
condition	<p>A boolean expression which must evaluate to TRUE for the action to be performed. Every chain must have a rule that evaluates to TRUE to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</p> <ul style="list-style-type: none"> <li>■ Scheduler Chain Condition Syntax           <p>See "<a href="#">Scheduler Chain Condition Syntax</a>" on page 128-78 for details</p> </li> <li>■ SQL WHERE Clause Syntax           <p>Conditions expressed with SQL must use the syntax of a SELECT statement WHERE clause.</p> <p>You can refer to chain step attributes by using the chain step name as a bind variable.</p> <p>The bind variable syntax is <code>:step_name.attribute</code>. (<code>step_name</code> refers to a typed object.) Possible attributes are: <code>completed</code>, <code>state</code>, <code>start_date</code>, <code>end_date</code>, <code>error_code</code>, and <code>duration</code>.</p> <p>Possible values for the state attribute include: 'NOT_STARTED', 'SCHEDULED', 'RUNNING', 'PAUSED', 'STALLED', 'SUCCEEDED', 'FAILED', and 'STOPPED'. If a step is in the state 'SUCCEEDED', 'FAILED', or 'STOPPED', its <code>completed</code> attribute is set to 'TRUE', otherwise <code>completed</code> is 'FALSE'.</p> </li> </ul>

**Table 128–36 (Cont.) DEFINE\_CHAIN\_RULE Procedure Parameters**

Parameter	Description
<code>action</code>	<p>The action to be performed when the rule evaluates to TRUE. The action must consist of at least one keyword with an optional value and an optional delay clause.</p> <p>Possible actions include:</p> <ul style="list-style-type: none"> <li>▪ <code>[AFTER <i>delay_interval</i>] START <i>step_1</i> [, <i>step_2</i> ...]</code></li> <li>▪ <code>STOP <i>step_1</i> [, <i>step_2</i> ...]</code></li> <li>▪ <code>END [{<i>end_value</i>   <i>step_name.error_code</i>}]</code></li> </ul> <p>At the beginning of the START action, a delay clause can specify a delay interval before performing the action. <i>delay_interval</i> is a formatted datetime interval of the form HH:MM:SS.</p> <p>The END action ends the chain with an error code equal to either the supplied <i>end_value</i> or the error code that <i>step_name</i> completes with. The default error code is 0, indicating a successful chain run.</p>
<code>rule_name</code>	<p>The name of the rule being created. If no <code>rule_name</code> is given, one is generated in the form <code>SCHED_RULE\$_{N}</code>.</p>
<code>comments</code>	<p>An optional comment describing the rule. This is stored in the rule object created.</p>

### Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain. The following are the available constructs, which are all boolean expressions:

```
TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer
```

These boolean operators are available to create more complex conditions:

```
expression AND expression
expression OR expression
NOT (expression)
```

*integer* can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the NOT operator.

PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

## Usage Notes

Defining a chain rule requires ALTER privileges on the chain (either as the owner, or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

## Examples

The following are examples of using rule conditions and rule actions.

### Rule Conditions Using Scheduler Chain Condition Syntax

```
'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7) '
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7
```

### Rule Conditions Using SQL Syntax

```
':step1.completed = ''TRUE'' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

':step1.duration > interval '5' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to
complete
```

### Rule Actions

```
'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has
not completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
```

## DEFINE\_CHAIN\_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have EXECUTE privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the ALTER\_CHAIN procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

### Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
    chain_name          IN VARCHAR2,
    step_name          IN VARCHAR2,
    program_name       IN VARCHAR2);
```

### Parameters

**Table 128-37** DEFINE\_CHAIN\_STEP Procedure Parameters

Parameter	Description
<code>chain_name</code>	The name of the chain to alter.
<code>step_name</code>	The name of the step being defined. If a step already exists with this name, the new step replaces the old one.
<code>program_name</code>	The name of a program or chain to run during this step. The chain owner must have EXECUTE privileges on this program or chain.

### Usage Notes

Defining a chain step requires ALTER privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

**See Also:**

- ["ALTER\\_CHAIN Procedure"](#) on page 128-40
- ["DEFINE\\_CHAIN\\_EVENT\\_STEP Procedure"](#) on page 128-76

## DEFINE\_METADATA\_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

### Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
  program_name          IN VARCHAR2,
  metadata_attribute   IN VARCHAR2,
  argument_position    IN PLS_INTEGER,
  argument_name        IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–38** DEFINE\_METADATA\_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered
metadata_attribute	The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. <a href="#">Table 128–39</a> describes these attributes in detail.
argument_position	The position of the argument as it is passed to the executable. The position cannot be greater than the number_of_arguments specified for the program. It must be unique, so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.

**Table 128–39** Metadata Attributes

Metadata Attribute	Data Type	Description
job_name	VARCHAR2	Name of the currently running job
job_subname	VARCHAR2	Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.
job_owner	VARCHAR2	Owner of the currently running job
job_scheduled_start	TIMESTAMP WITH TIME ZONE	When the currently running job was scheduled to start
job_start	TIMESTAMP WITH TIME ZONE	When the currently running job started

**Table 128–39 (Cont.) Metadata Attributes**

Metadata Attribute	Data Type	Description
window_start	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window opened
window_end	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window is scheduled to close
event_message	(See Description)	For an event-based job, the message content of the event that started the job. The data type of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See <a href="#">"SCHEDULER_FILEWATCHER_RESULT Object Type"</a> on page 15.

### Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event\_message can be used in PL/SQL blocks that you enter into the job\_action or program\_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

## DEFINE\_PROGRAM\_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

### Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–40** *DEFINE\_PROGRAM\_ARGUMENT Procedure Parameters*

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique so it replaces any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the <a href="#">SET_JOB_ARGUMENT_VALUE Procedure</a> .
argument_type	The data type of the argument being defined. This is not verified or used by the Scheduler. The program user uses <code>argument_type</code> when deciding what value to assign to the argument. Any valid SQL data type is allowed.
default_value	The default value to be assigned to the argument if none is specified by the job.
out_argument	This parameter is reserved for future use. It must be set to <code>FALSE</code> .

### Usage Notes

All program arguments from 1 to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

DEFINE\_PROGRAM\_ARGUMENT only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

**See Also:**

- ["DEFINE\\_ANYDATA\\_ARGUMENT Procedure"](#) on page 128-75
- ["SET\\_JOB\\_ARGUMENT\\_VALUE Procedure"](#) on page 128-147

## DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its `enabled` attribute is set to `FALSE`.

### Syntax

```
DBMS_SCHEDULER.DISABLE (
    name           IN VARCHAR2,
    force          IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 128–41** *DISABLE Procedure Parameters*

Parameter	Description
<code>name</code>	<p>The name of the object being disabled. Can be a comma-delimited list.</p> <p>If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled.</p> <p>If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected.</p>
<code>force</code>	<p>If <code>TRUE</code>, objects are disabled even if other objects depend on them. See the usage notes for more information.</p>
<code>commit_semantics</code>	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> <li> <p>■ <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and the previous disable operations that were successful are committed to disk.</p> <p>This is the default.</p> </li> <li> <p>■ <code>TRANSACTIONAL</code>: The procedure returns on the first error and everything that happened before that error is rolled back.</p> <p>This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when <code>force</code> is set to <code>TRUE</code>.</p> </li> <li> <p>■ <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.</p> <p>This type is only supported when disabling a job or a list of jobs.</p> </li> </ul>

### Usage Notes

Windows must be preceded by `SYS`.

Disabling an object that is already disabled does not generate an error.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or a group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege.

You can use `DISABLE` with any schema except the `SYS` schema.

### Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

### Programs

When a program is disabled, the status is changed to `disabled`. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call and are allowed to continue.

No arguments that pertain to the program are affected when the program is disabled.

### File Watchers

If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

### Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error occurs.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

### Window Groups

When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

### **Job Chains**

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run.

If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime.

Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

### **Database Destinations**

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

### **External Destinations**

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

### **Groups**

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

## DROP\_AGENT\_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination—using the `schagent` utility to unregister a Scheduler agent with a database—is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE SCHEDULER` privilege.

---

**Note:** External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable `CREATE_AGENT_DESTINATION` procedure.

---

### Syntax

```
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (
    destination_name          IN VARCHAR2);
```

### Parameters

**Table 128–42 DROP\_AGENT\_DESTINATION Procedure Parameters**

Parameter	Description
<code>destination_name</code>	<p>A comma-separated list of external destinations to drop. Because user <code>SYS</code> owns all external destinations, do not prefix them with a schema name.</p> <p>The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped.</p> <p>Cannot be <code>NULL</code>.</p>

### Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to `NULL`.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

## DROP\_CHAIN Procedure

This procedure drops an existing chain.

### Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
    chain_name          IN VARCHAR2,
    force               IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–43** *DROP\_CHAIN Procedure Parameters*

Parameter	Description
chain_name	The name of the chain to drop. Can also be a comma-delimited list of chains.
force	<p>If <i>force</i> is set to <code>FALSE</code>, the chain must not be referenced by any job, otherwise an error will occur.</p> <p>If <i>force</i> is set to <code>TRUE</code>, all jobs pointing to the chain are disabled before the chain is dropped.</p> <p>Running jobs that point to this chain are stopped before the chain is dropped.</p>

### Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with `ALTER` privileges on the chain or the `CREATE ANY JOB` system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the `DBMS_RULE_ADM.DROP_RULE_SET` and `DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT` procedures for more information.

If *force* is `FALSE`, no jobs may be using this chain. If *force* is `TRUE`, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).

## DROP\_CHAIN\_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

### Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (  
    chain_name          IN VARCHAR2,  
    rule_name           IN VARCHAR2,  
    force               IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–44** DROP\_CHAIN\_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
rule_name	The name of the rule to drop
force	If <i>force</i> is set to TRUE, the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If <i>force</i> is set to FALSE and the chain is running, an error is generated.

### Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS\_RULE\_ADM.DROP\_RULE procedure for more information.

## DROP\_CHAIN\_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

### Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  force               IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–45** *DROP\_CHAIN\_STEP Procedure Parameters*

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step being dropped. Can be a comma-separated list.
force	If <i>force</i> is set to <b>TRUE</b> , this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted.  If <i>force</i> is set to <b>FALSE</b> and this chain is currently running, an error is thrown.

### Usage Notes

Dropping a chain step requires **ALTER** privileges on the chain (either as the owner or as a user with **ALTER** privileges on the chain or the **CREATE ANY JOB** system privilege).

## DROP\_CREDENTIAL Procedure

This procedure drops a credential.

### Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (  
    credential_name      IN VARCHAR2,  
    force                 IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–46** *DROP\_CREDENTIAL Procedure Parameters*

Parameter	Description
credential_name	The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to NULL.
force	If set to <code>FALSE</code> , the credential must not be referenced by any job, or an error will occur. If set to <code>TRUE</code> , the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.

### Usage Notes

Only the owner of a credential or a user with the `CREATE ANY JOB` system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

**See Also:** "[CREATE\\_CREDENTIAL Procedure](#)" on page 128-49

## DROP\_DATABASE\_DESTINATION Procedure

This procedure drops one or more database destinations.

### Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (
    destination_name      IN VARCHAR2);
```

### Parameters

**Table 128–47** *DROP\_DATABASE\_DESTINATION Procedure Parameters*

Parameter	Description
destination_name	<p>The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name.</p> <p>The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped.</p> <p>Cannot be NULL.</p>

### Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop the database destination.

When a database destination is dropped:

- All job instances that refer to the destination in the `*_SCHEDULER_JOB_DESTS` views are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

**See Also:** [CREATE\\_DATABASE\\_DESTINATION Procedure](#) on page 128-50

## DROP\_FILE\_WATCHER Procedure

This procedure drops one or more file watchers.

### Syntax

```
DBMS_SCHEDULER.DROP_FILE_WATCHER (  
    file_watcher_name      IN VARCHAR2,  
    force                  IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–48** *DROP\_FILE\_WATCHER Procedure Parameters*

Parameter	Description
file_watcher_name	The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name.  Cannot be NULL.
force	If set to <code>FALSE</code> , the file watcher must not be referenced by any job, or an error occurs. If set to <code>TRUE</code> , the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled.

### Usage Notes

Only the owner of a file watcher or a user with the `CREATE ANY JOB` system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

**See Also:** ["CREATE\\_FILE\\_WATCHER Procedure"](#) on page 128-53

## DROP\_GROUP Procedure

This procedure drops one or more groups.

### Syntax

```
DBMS_SCHEDULER.DROP_GROUP (
  group_name      IN VARCHAR2,
  force           IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–49** *DROP\_GROUP Procedure Parameters*

Parameter	Description
group_name	A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name.  The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped.  Cannot be NULL.
force	If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views.

### Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop a group. You must have the MANAGE SCHEDULER privilege to drop a group of type WINDOW.

**See Also:** ["CREATE\\_FILE\\_WATCHER Procedure"](#) on page 128-53

## DROP\_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

### Syntax

```
DBMS_SCHEDULER.DROP_JOB (
  job_name          IN VARCHAR2,
  force             IN BOOLEAN DEFAULT FALSE,
  defer            IN BOOLEAN DEFAULT FALSE,
  commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 128–50 DROP\_JOB Procedure Parameters**

Parameter	Description
job_name	The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified.  If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.
force	If force is set to TRUE, the Scheduler first attempts to stop the running job instances (by issuing the STOP_JOB call with the force flag set to false), and then drops the jobs.
defer	If defer is set to TRUE, the Scheduler allows the running jobs to complete and then drops the jobs.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> <li>■ STOP_ON_FIRST_ERROR returns on the first error and previous successful drop operations are committed to disk. This is the default.</li> <li>■ TRANSACTIONAL returns on the first error. Everything that happened before that error is rolled back. This type is not supported when force is set to TRUE.</li> <li>■ ABSORB_ERRORS tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.</li> </ul> <p>Only STOP_ON_FIRST_ERROR is permitted when job classes are included in the job_name list.</p>

### Usage Notes

If both force and defer are set to FALSE and a job is running at the time of the call, the attempt to drop that job fails. The entire call to DROP\_JOB may then fail, depending on the setting of commit\_semantics.

Setting both force and defer to TRUE results in an error.

Dropping a job requires ALTER privileges on the job either as the owner of the job or as a user with the ALTER object privilege on the job or the CREATE ANY JOB system privilege.

## DROP\_JOB\_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

### Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
  job_class_name      IN VARCHAR2,
  force               IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–51** *DROP\_JOB\_CLASS Procedure Parameters*

Parameter	Description
job_class_name	The name of the job class. Can be a comma-delimited list.
force	<p>If <i>force</i> is set to <code>FALSE</code>, a class being dropped must not be referenced by any jobs, otherwise an error occurs.</p> <p>If <i>force</i> is set to <code>TRUE</code>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped.</p> <p>Running jobs that belong to the job class are not affected.</p>

### Usage Notes

Dropping a job class requires the `MANAGE SCHEDULER` system privilege.

## DROP\_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

### Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (  
    program_name          IN VARCHAR2,  
    force                 IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–52** *DROP\_PROGRAM Procedure Parameters*

Parameter	Description
program_name	The name of the program to be dropped. Can be a comma-delimited list.
force	If <i>force</i> is set to <i>FALSE</i> , the program must not be referenced by any job, otherwise an error occurs.  If <i>force</i> is set to <i>TRUE</i> , all jobs referencing the program are disabled before the program is dropped.  Running jobs that point to the program are not affected by the <i>DROP_PROGRAM</i> call and are allowed to continue.

### Usage Notes

Dropping a program requires that you be the owner of the program or have *ALTER* privileges on that program. You can also drop a program if you have the *CREATE ANY JOB* privilege.

## DROP\_PROGRAM\_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

### Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_name         IN VARCHAR2);
```

### Parameters

**Table 128–53** *DROP\_PROGRAM\_ARGUMENT Procedure Parameters*

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_name	The name of the argument being dropped
argument_position	The position of the argument to be dropped

### Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program argument if you have the CREATE ANY JOB privilege.

## DROP\_SCHEDULE Procedure

This procedure drops a schedule.

### Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (  
    schedule_name    IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–54** *DROP\_SCHEDULE Procedure Parameters*

Parameter	Description
schedule_name	The name of the schedule. Can be a comma-delimited list.
force	If <i>force</i> is set to <code>FALSE</code> , the schedule must not be referenced by any job or window, otherwise an error will occur.  If <i>force</i> is set to <code>TRUE</code> , any jobs or windows that use this schedule are disabled before the schedule is dropped  Running jobs and open windows that point to the schedule are not affected.

### Usage Notes

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.

## DROP\_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

### Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (
    window_name          IN VARCHAR2,
    force                 IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–55** *DROP\_WINDOW Procedure Parameters*

Parameter	Description
window_name	The name of the window. Can be a comma-delimited list.
force	<p>If <code>force</code> is set to <code>FALSE</code>, the window must be not be open or referenced by any job, otherwise an error occurs.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply.</p> <p>Running jobs that have the window as their schedule is allowed to continue, unless the <code>stop_on_window_close</code> flag is set to <code>TRUE</code> for the job. If this is the case, the job is stopped when the window is dropped.</p>

### Usage Notes

Dropping a window requires the `MANAGE SCHEDULER` privilege.

## DROP\_WINDOW\_GROUP Procedure

\*\*\* **Deprecated in Oracle Database 11g Release 2 (11.2). Use DROP\_GROUP instead.**

This procedure drops a window group but not the windows that are members of this window group.

### Syntax

```
DBMS_SCHEDULER.DROP_WINDOW_GROUP (  
    group_name          IN VARCHAR2  
    force               IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–56** *DROP\_WINDOW\_GROUP Procedure Parameters*

Parameter	Description
group_name	The name of the window group
force	<p>If <code>force</code> is set to <code>FALSE</code>, the window group must not be referenced by any job otherwise an error will occur.</p> <p>If <code>force</code> is set to <code>TRUE</code>, the window group is dropped and those jobs that have the window group as their schedule are disabled. Running jobs that have the window group as their schedule are allowed to continue, even if the <code>stop_on_window_close</code> flag was set to <code>TRUE</code> when for the job.</p> <p>If a member of the window group that is being dropped is open, the window group can still be dropped.</p>

### Usage Notes

If you want to drop all the windows that are members of this group but not the window group itself, you can use the `DROP_WINDOW` procedure and provide the name of the window group to the call.

To drop a window group, you must have the `MANAGE SCHEDULER` privilege.

## ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is enabled, its `enabled` attribute is set to `TRUE`. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the `JOB_RUN_COUNT`, `FAILURE_COUNT` and `RETRY_COUNT` columns in the `*_SCHEDULER_JOBS` data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

### Syntax

```
DBMS_SCHEDULER.ENABLE (
    name           IN VARCHAR2,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 128–57** *ENABLE Procedure Parameters*

Parameter	Description
<code>name</code>	<p>The name of the Scheduler object being enabled. Can be a comma-delimited list of names.</p> <p>If a job class name is specified, then all the jobs in the job class are enabled.</p> <p>If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.</p>
<code>commit_semantics</code>	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> <li>▪ <code>STOP_ON_FIRST_ERROR</code> - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default.</li> <li>▪ <code>TRANSACTIONAL</code> - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs.</li> <li>▪ <code>ABSORB_ERRORS</code> - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details. This type is only supported when enabling a job or a list of jobs.</li> </ul>

### Usage Notes

Window names must be preceded by `SYS`.

To run `ENABLE` for a window or group of type `WINDOW`, you must have the `MANAGE_SCHEDULER` privilege. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE_EXTERNAL_JOB` system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the `EXECUTE` privilege on the designated credential.

You can use `ENABLE` with any schema except the `SYS` schema.

## END\_DETACHED\_JOB\_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the `detached` attribute set to `TRUE`. A detached job run does not end until this procedure or the [STOP\\_JOB Procedure](#) is called.

### Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
  job_name          IN VARCHAR2,
  error_number      IN PLS_INTEGER DEFAULT 0,
  additional_info   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–58** *END\_DETACHED\_JOB\_RUN Procedure Parameters*

Parameter	Description
<code>job_name</code>	The name of the job to end. Must be a detached job that is running.
<code>error_number</code>	If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If non-zero, then the job run is logged as failed with this error number.
<code>additional_info</code>	This text is stored in the <code>additional_info</code> column of the <code>*_scheduler_job_run_details</code> views for this job run.

### Usage Notes

This procedure requires that you either own the job or have `ALTER` privileges on it. You can also end any detached job run if you have the `CREATE ANY JOB` privilege.

**See Also:** *Oracle Database Administrator's Guide* for information about detached jobs.

## EVALUATE\_CALENDAR\_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the `next_run_date` returned by one invocation as the `return_date_after` argument of the next invocation.

See the calendaring syntax described in ["Operational Notes"](#) on page 128-20.

### Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
  calendar_string      IN  VARCHAR2,
  start_date           IN  TIMESTAMP WITH TIME ZONE,
  return_date_after    IN  TIMESTAMP WITH TIME ZONE,
  next_run_date        OUT TIMESTAMP WITH TIME ZONE);
```

### Parameters

**Table 128–59** *EVALUATE\_CALENDAR\_STRING Procedure Parameters*

Parameter	Description
<code>calendar_string</code>	The calendar expression to be evaluated. The string must be in the calendaring syntax described in <a href="#">"Operational Notes"</a> on page 128-20.
<code>start_date</code>	The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.
<code>return_date_after</code>	The <code>return_date_after</code> argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the <code>start_date</code> and the calendar string.  When a NULL value is passed for this argument, the Scheduler automatically fills in <code>sys_timestamp</code> as its value.
<code>next_run_date</code>	The first timestamp that matches the calendar string and start date that occur after the value passed in for the <code>return_date_after</code> argument.

### Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
  start_date          TIMESTAMP;
  return_date_after  TIMESTAMP;
  next_run_date       TIMESTAMP;
BEGIN
  start_date :=
    to_timestamp_tz('01-JAN-2003 10:00:00', 'DD-MON-YYYY HH24:MI:SS');
  return_date_after := start_date;
  FOR i IN 1..5 LOOP
```

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(  
    'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',  
    start_date, return_date_after, next_run_date);  
DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);  
return_date_after := next_run_date;  
END LOOP;  
END;  
/  
  
next_run_date: 02-JAN-03 09.30.00.000000 AM  
next_run_date: 03-JAN-03 09.30.00.000000 AM  
next_run_date: 06-JAN-03 09.30.00.000000 AM  
next_run_date: 07-JAN-03 09.30.00.000000 AM  
next_run_date: 08-JAN-03 09.30.00.000000 AM  
  
PL/SQL procedure successfully completed.
```

## Usage Notes

No specific Scheduler privileges are required.

## EVALUATE\_RUNNING\_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (RUN\_JOB can be used to start the job.)

If any of the steps of the chain are themselves running chains, another EVALUATE\_RUNNING\_CHAIN is performed on each of the nested running chains.

### Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
    job_name          IN VARCHAR2);
```

### Parameters

**Table 128–60** EVALUATE\_RUNNING\_CHAIN Procedure Parameter

Parameter	Description
job_name	The name of the running job (pointing to a chain) to reevaluate the rules for

### Usage Notes

Running EVALUATE\_RUNNING\_CHAIN on a job requires alter privileges on the job (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

---

**Note:** The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. EVALUATE\_RUNNING\_CHAIN should be used only under the following circumstances:

- After manual intervention of a running chain with the ALTER\_RUNNING\_CHAIN procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, EVALUATE\_RUNNING\_CHAIN may not be needed if you set the evaluation\_interval attribute when you created the chain.

---

## GENERATE\_JOB\_NAME Function

This function returns a unique name for a job. The name will be of the form {prefix}N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOB\$\_1, JOB\$\_2, JOB\$\_3, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.

### Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
    prefix          IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

### Parameters

**Table 128–61** *GENERATE\_JOB\_NAME Function Parameter*

Parameter	Description
prefix	The prefix to use when generating the job name

### Usage Notes

If the prefix is explicitly set to NULL, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the DBMS\_SCHEDULER calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the GENERATE\_JOB\_NAME function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

## GET\_AGENT\_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

### Syntax

```
DBMS_SCHEDULER.GET_AGENT_INFO (
  agent_name      IN VARCHAR2,
  attribute       IN VARCHAR2) RETURN VARCHAR2;
```

### Parameters

**Table 128–62** GET\_AGENT\_INFO Function Parameter

Parameter	Description
agent_name	The name of an external destination where the agent is running
attribute	Possible Attributes values <ul style="list-style-type: none"> <li>■ <b>VERSION:</b> Returns the agent version number. Requires the <code>CREATE JOB</code> system privilege.</li> <li>■ <b>UPTIME:</b> Returns the time the agent has been up and running. Requires the <code>CREATE JOB</code> system privilege.</li> <li>■ <b>NUMBER_OF_RUNNING_JOBS:</b> Returns the number of jobs that the agent is currently running. Requires the <code>CREATE JOB</code> system privilege.</li> <li>■ <b>TOTAL_JOBS_RUN:</b> Returns the number of jobs run by the agent since it was started. Requires the <code>CREATE JOB</code> system privilege.</li> <li>■ <b>RUNNING_JOBS:</b> Returns a comma-separated list of the names of the jobs running currently. Requires the <code>MANAGE SCHEDULER</code> system privilege.</li> <li>■ <b>ALL:</b> Returns all the information the previous options return. It requires the <code>MANAGE SCHEDULER</code> system privilege.</li> </ul>

### Usage Notes

This function returns the same information as the `schagent` utility status option.

## GET\_AGENT\_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. `GET_AGENT_VERSION` throws an error if the agent is not registered with the database or if the agent is not currently running.

### Syntax

```
DBMS_SCHEDULER.GET_AGENT_VERSION (
  agent_host      IN VARCHAR2) RETURN VARCHAR2;
```

### Parameters

**Table 128–63** *GET\_AGENT\_VERSION Function Parameter*

Parameter	Description
agent_host	Either the hostname and port on which the agent is running in the form <code>hostname:port</code> or the name of the agent as shown in the <code>destination_name</code> column of the <code>ALL_SCHEDULER_EXTERNAL_DESTS</code> view which lists all Scheduler agents registered with the database.

### Usage Notes

This function requires the `CREATE EXTERNAL JOB` system privilege.

## GET\_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

### Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
  name          IN VARCHAR2,
  attribute     IN VARCHAR2,
  value        OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                  TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                  INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
  name          IN VARCHAR2,
  attribute     IN VARCHAR2,
  value        OUT VARCHAR2,
  value2       OUT VARCHAR2);
```

### Parameters

**Table 128–64** GET\_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being retrieved. See the <a href="#">SET_ATTRIBUTE Procedure</a> on page 128-130 for tables of attribute values.
value	The existing value of the attribute
value2	The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

### Usage Notes

To run GET\_ATTRIBUTE for a job class, you must have the MANAGE\_SCHEDULER privilege or have EXECUTE privileges on the class. For a schedule, window, or group, no privileges are necessary. Otherwise, you must be the owner of the object or have ALTER or EXECUTE privileges on that object or have the CREATE ANY JOB privilege.

See the [SET\\_ATTRIBUTE Procedure](#) on page 128-130 for tables of attribute values that you can retrieve for the various Scheduler object types.

## GET\_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

This procedure differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

### Syntax

```
DBMS_SCHEDULER.GET_FILE (
    source_file           IN VARCHAR2,
    source_host          IN VARCHAR2,
    credential_name      IN VARCHAR2,
    file_contents        IN OUT NOCOPY {BLOB|CLOB});

DBMS_SCHEDULER.GET_FILE (
    source_file           IN VARCHAR2,
    source_host          IN VARCHAR2,
    credential_name      IN VARCHAR2,
    destination_file_name IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–65** *GET\_FILE Procedure Parameters*

Parameter	Description
<code>source_file</code>	<p>Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host.</p> <p>If the format of this parameter is <code>external_log_id_stdout</code>, then the stdout from the designated external job run is returned.</p> <p>If the format of this parameter is <code>external_log_id_stderr</code>, the error text from the designated external job run is returned.</p> <p>You obtain the value of <code>external_log_id</code> from the <code>ADDITIONAL_INFO</code> column of the <code>*_SCHEDULER_JOB_RUN_DETAILS</code> views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the <code>external_log_id</code> name/value pair, and then append either <code>"_stdout"</code> or <code>"_stderr"</code> to its value.</p> <p>The external job must have an associated credential. The <code>credential_name</code> parameter of <code>GET_FILE</code> must name the same credential that is used by the job, and the <code>source_host</code> parameter must be the same as the <code>destination</code> attribute of the job.</p>

**Table 128–65 (Cont.) GET\_FILE Procedure Parameters**

Parameter	Description
source_host	<p>If the file is to be retrieved from a remote host, then this parameter must be a valid an external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)</p> <p>If source_host is NULL or set to 'localhost', then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the schagent.conf file, which is located in the Scheduler agent home directory on the remote host.</p>
credential_name	The name of the credential to use for accessing the file system.
file_contents	The variable from which the file contents is read.
destination_file_name	The file to which the file contents is written.
destination_directory_object	The directory object that specifies the path to the destination file, when destination_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

## Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

## GET\_SCHEDULER\_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

### Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
  attribute    IN VARCHAR2,
  value       OUT VARCHAR2);
```

### Parameters

**Table 128–66** GET\_SCHEDULER\_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	The name of the attribute
value	The existing value of the attribute

### Usage Notes

To run GET\_SCHEDULER\_ATTRIBUTE, you must have the MANAGE\_SCHEDULER privilege.

[Table 128–67](#) lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see [Table 128–97](#) on page 128-151 and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

**Table 128–67** Scheduler Attributes Retrievable with GET\_SCHEDULER\_ATTRIBUTE

Scheduler Attribute	Description
current_open_window	Name of the currently open window
default_timezone	Default time zone used by the Scheduler for repeat intervals and windows
email_sender	The default e-mail address of the sender for job state e-mail notifications
email_server	The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.
event_expiry_time	Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.
log_history	Retention period in days for job and window logs. The range of valid values is 0 through 1000000.
max_job_slave_processes	This Scheduler attribute is not used.

## OPEN\_WINDOW Procedure

This procedure opens a window independent of its schedule. This window opens and the resource plan associated with it takes effect immediately for the duration specified or for the normal duration of the window if no duration is given. Only an enabled window can be manually opened.

### Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
    window_name          IN VARCHAR2,
    duration              IN INTERVAL DAY TO SECOND,
    force                 IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 128–68 OPEN\_WINDOW Procedure Parameters**

Parameter	Description
<code>window_name</code>	The name of the window
<code>duration</code>	The duration of the window. It is of type interval day to second. If it is <code>NULL</code> , then the window opens for the regular duration as specified in the window metadata.
<code>force</code>	<p>If <code>force</code> is set to <code>FALSE</code>, then opening an already open window generates an error.</p> <p>If <code>force</code> is set to <code>TRUE</code>:</p> <p>You can open a window that is already open. The window stays open for the duration specified in the call, from the time the <code>OPEN_WINDOW</code> command was issued.</p> <p>For example: <code>window1</code> was created with a duration of four hours. It has now been open for two hours. If, at this point, you reopen <code>window1</code> using the <code>OPEN_WINDOW</code> call and do not specify a duration, then <code>window1</code> stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.</p> <p>The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</p>

### Usage Notes

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the `ALTER SYSTEM` statement with the `force` option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the `MANAGE SCHEDULER` privilege.

## PURGE\_LOG Procedure

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure is used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

### Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
    log_history          IN PLS_INTEGER  DEFAULT 0,
    which_log           IN VARCHAR2     DEFAULT 'JOB_AND_WINDOW_LOG',
    job_name            IN VARCHAR2     DEFAULT NULL);
```

### Parameters

**Table 128–69** *PURGE\_LOG Procedure Parameters*

Parameter	Description
<code>log_history</code>	This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept.
<code>which_log</code>	This specifies the log type. Valid values are: <code>job_log</code> , <code>window_log</code> , and <code>job_and_window_log</code> .
<code>job_name</code>	This specifies which job-specific entries must be purged from the job log. This can be a comma-delimited list of job names and job classes. Whenever <code>job_name</code> has a value other than <code>NULL</code> , the <code>which_log</code> argument implicitly includes the job log.

### Usage Notes

This procedure requires the `MANAGE SCHEDULER` privilege.

### Examples

The following completely purges all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following purges all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in `jobclass1` and older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

## PUT\_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer. It differs from the equivalent UTL\_FILE procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

### Syntax

```
DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,
  credential_name       IN VARCHAR2,
  file_contents         IN {BLOB|CLOB},
  destination_permissions IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_SCHEDULER.PUT_FILE (
  destination_file      IN VARCHAR2,
  destination_host      IN VARCHAR2,
  credential_name       IN VARCHAR2,
  source_file_name      IN VARCHAR2,
  source_directory_object IN VARCHAR2,
  destination_permissions IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–70 PUT\_FILE Procedure Parameters**

Parameter	Description
destination_file	Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.
destination_host	If NULL or set to 'localhost', the file is saved to the file system of the local computer.  To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)
credential_name	The name of the credential to use for accessing the destination file system.
file_contents	The variable from which the file contents is read.
source_file_name	The file from which the file contents is written
source_directory_object	The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

### Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

## REMOVE\_EVENT\_QUEUE\_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER\$\_EVENT\_QUEUE.

### Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (  
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–71 REMOVE\_EVENT\_QUEUE\_SUBSCRIBER Procedure Parameters**

Parameter	Description
subscriber_name	Name of the Oracle Streams Advanced Queuing (AQ) agent to remove the subscription from. If NULL, the user name of the calling user is used.

### Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

## REMOVE\_GROUP\_MEMBER Procedure

This procedure removes one or more members from an existing group.

### Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (
  group_name      IN VARCHAR2,
  member         IN VARCHAR2);
```

### Parameters

**Table 128-72 REMOVE\_GROUP\_MEMBER Procedure Parameters**

Parameter	Description
group_name	The name of the group.
member_name	<p>The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group.</p> <p>A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members.</p> <p>If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views.</p>

### Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

**See Also:** ["CREATE\\_GROUP Procedure"](#) on page 128-55

## REMOVE\_JOB\_EMAIL\_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

### Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (
    job_name          IN VARCHAR2,
    recipients        IN VARCHAR2 DEFAULT NULL,
    events            IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128-73** ADD\_JOB\_EMAIL\_NOTIFICATION Procedure Parameters

Parameter	Description
job_name	Name of the job to remove e-mail notifications for. Cannot be NULL.
recipients	E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses.
events	Job state event to remove e-mail notification for. Comma-separated list of job state events.

### Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If `recipients` is NULL, e-mail notifications for the specified events are removed for all existing recipients. If `events` is NULL, notifications for all events are removed for the specified recipients. If both `recipients` and `events` are NULL, all e-mail notifications are removed for the job.

For example, if `recipients` is 'jsmith@example.com,rjones@example.com' and `events` is 'JOB\_FAILED,JOB\_BROKEN', then notifications for both the JOB\_FAILED and JOB\_BROKEN events are removed for both jsmith and rjones. If `recipients` is NULL, then notifications for both the JOB\_FAILED and JOB\_BROKEN events are removed for jsmith, rjones, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the CREATE ANY JOB system privilege or ALTER object privilege on the job.

**See Also:** ["ADD\\_JOB\\_EMAIL\\_NOTIFICATION Procedure"](#) on page 128-36

## REMOVE\_WINDOW\_GROUP\_MEMBER Procedure

**\*\*\* Deprecated in Oracle Database 11g Release 2 (11.2). Use REMOVE\_GROUP\_MEMBER instead.**

This procedure removes one or more windows from an existing window group.

### Syntax

```
DBMS_SCHEDULER.REMOVE_WINDOW_GROUP_MEMBER (
    group_name          IN VARCHAR2,
    window_list        IN VARCHAR2);
```

### Parameters

**Table 128–74 REMOVE\_WINDOW\_GROUP\_MEMBER Procedure Parameters**

Parameter	Description
group_name	The name of the window group.
window_list	The name of the window or windows.

### Usage Notes

If any of the windows specified is invalid, does not exist, or is not a member of the given group, the call fails. Removing a window from a group requires the `MANAGE SCHEDULER` privilege.

Dropping an open window from a window group has no impact on any running jobs that has the window as its schedule because the jobs only stop when a window closes.

## RESET\_JOB\_ARGUMENT\_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

RESET\_JOB\_ARGUMENT\_VALUE is overloaded.

### Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name          IN VARCHAR2,
  argument_position IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name          IN VARCHAR2,
  argument_name     IN VARCHAR2);
```

### Parameters

**Table 128–75** RESET\_JOB\_ARGUMENT\_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job being altered
argument_position	The position of the program argument being reset
argument_name	The name of the program argument being reset

### Usage Notes

If the corresponding program argument has no default value, the job is disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET\_JOB\_ARGUMENT\_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RESET\_JOB\_ARGUMENT\_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

## RUN\_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given. If no `job_name` is given, one is generated of the form `RUN_CHAIN$_chainnameN`, where `chainname` is the first 8 characters of the chain name and `N` is an integer.

If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run). If `start_steps` is `NULL`, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

### Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    start_steps         IN VARCHAR2,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    step_state_list    IN SYS.SCHEDULER$_STEP_TYPE_LIST,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–76** *RUN\_CHAIN Procedure Parameters*

Parameter	Description				
<code>chain_name</code>	The name of the chain to run				
<code>job_name</code>	The name of the job to create to run the chain				
<code>start_steps</code>	Comma-separated list of the steps to start when the chain starts running				
<code>step_state_list</code>	List of chain steps with an initial state ( <code>SUCCEEDED</code> or <code>FAILED</code> ) to set for each.  Set the attributes of <code>sys.scheduler\$_step_type</code> as follows: <table border="0" style="margin-left: 20px;"> <tr> <td><code>step_name</code></td> <td>The name of the step</td> </tr> <tr> <td><code>step_type</code></td> <td>'SUCCEEDED' or 'FAILED <i>error_number</i>'</td> </tr> </table> where <i>error_number</i> is a positive or negative integer.	<code>step_name</code>	The name of the step	<code>step_type</code>	'SUCCEEDED' or 'FAILED <i>error_number</i> '
<code>step_name</code>	The name of the step				
<code>step_type</code>	'SUCCEEDED' or 'FAILED <i>error_number</i> '				

### Usage Notes

Running a chain requires `CREATE JOB` if the job is being created in the user's schema, or `CREATE ANY JOB` otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the `EXECUTE` privilege on the chain or the `EXECUTE ANY PROGRAM` system privilege).

## Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```
declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/
```

## RUN\_JOB Procedure

This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call RUN\_JOB to run a job according to its schedule. Use RUN\_JOB to run a job outside of its normal schedule.

### Syntax

```
DBMS_SCHEDULER.RUN_JOB (
    job_name          IN VARCHAR2,
    use_current_session IN BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 128–77** RUN\_JOB Procedure Parameters

Parameter	Description
job_name	<p>A job name or a comma-separated list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator.</p> <p>If you specify a multiple-destination job, the job runs on all destinations. In this case, the use_current_session argument must be FALSE.</p>
use_current_session	<p>This specifies whether or not the job run should occur in the same session that the procedure was invoked from.</p> <p>When use_current_session is set to TRUE:</p> <ul style="list-style-type: none"> <li>■ The job runs as the user who called RUN_JOB, or in the case of a local external job with a credential, the user named in the credential.</li> <li>■ You can test a job and see any possible errors on the command line.</li> <li>■ run_count, last_start_date, last_run_duration, and failure_count are not updated.</li> <li>■ RUN_JOB can be run in parallel with a regularly scheduled job run.</li> </ul> <p>When use_current_session is set to FALSE:</p> <ul style="list-style-type: none"> <li>■ The job runs as the user who is the job owner.</li> <li>■ You need to check the job log to find error information.</li> <li>■ run_count, last_start_date, last_run_duration, and failure_count are updated.</li> <li>■ RUN_JOB fails if a regularly scheduled job is running.</li> </ul> <p>For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to TRUE, use_current_session must be FALSE</p>

### Usage Notes

The job does not have to be enabled. If the job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.

- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the `CREATE EXTERNAL JOB` privilege if this is an external job.

A `TRUE` value for `use_current_session` is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the `destination_name` attribute
- Jobs that point to chains (chain jobs)
- Jobs that make use of detached programs (detached jobs).

When `use_current_session` is `TRUE`, the call to `RUN_JOB` blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the `RUN_JOB` procedure. When `use_current_session` is `FALSE`, `RUN_JOB` returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use `RUN_JOB` in their sessions simultaneously when `use_current_session` is set to `TRUE`.

`RUN_JOB` requires that you own the job or have `ALTER` privileges on that job. You can also run a job if you have the `CREATE ANY JOB` privilege.

## Example

The following is an example of using `RUN_JOB`.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB (
    JOB_NAME          => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```

## SET\_AGENT\_REGISTRATION\_PASS Procedure

This procedure sets the agent registration password for a database. A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

### Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
  registration_password  IN VARCHAR2,
  expiration_date       IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  max_uses              IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 128–78 SET\_AGENT\_REGISTRATION\_PASS Procedure Parameters**

Parameter	Description
registration_password	This is the password that remote agents must specify in order to successfully register with the database. If this is NULL, then no agents will be able to register with the database.
expiration_date	If this is set to a non-NULL value, then the registration_password is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past.
max_uses	This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.

### Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the `MANAGE_SCHEDULER` system privilege.

By default, `max_uses` is set to NULL, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to NULL if no new agents are being registered.

## SET\_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types. To set an attribute to NULL, use the `SET_ATTRIBUTE_NULL` procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

### Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        IN {BOOLEAN|DATE|TIMESTAMP|
                    TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                    INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        IN VARCHAR2,
    value2       IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 128–79 SET\_ATTRIBUTE Procedure Parameters**

Parameter	Description
name	The name of the object
attribute	See <a href="#">Table 128–81</a> through <a href="#">Table 128–91</a> .
value	The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the <code>SET_ATTRIBUTE_NULL</code> procedure.
value2	The <code>value2</code> argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.

[Table 128–80](#) is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in *Oracle Database Administrator's Guide*.

**Table 128–80 Attribute Tables for Scheduler Object Types**

Scheduler Object Type	Table of Attributes
Job	<a href="#">Table 128–81</a> on page 128-132
Program	<a href="#">Table 128–83</a> on page 128-139
Schedule	<a href="#">Table 128–84</a> on page 128-139
File Watcher	<a href="#">Table 128–85</a> on page 128-139
Job Class	<a href="#">Table 128–86</a> on page 128-140
Window	<a href="#">Table 128–87</a> on page 128-141
Chain	<a href="#">Table 128–88</a> on page 128-141
Database Destination	<a href="#">Table 128–89</a> on page 128-142

**Table 128–80 (Cont.) Attribute Tables for Scheduler Object Types**

Scheduler Object Type	Table of Attributes
External Destination	<a href="#">Table 128–90</a> on page 128-143
Group	<a href="#">Table 128–91</a> on page 128-143
Credential	<a href="#">Table 128–92</a> on page 128-143

## Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run `SET_ATTRIBUTE` for a window, a group of type `WINDOW`, or job class, you must have the `MANAGE_SCHEDULER` privilege. Otherwise, you must be the owner of the object being altered or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

### Job

If there is a running instance of the job when the `SET_ATTRIBUTE` call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the `ALTER` privilege on a job lets a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

### Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

### Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.

**File Watcher**

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

**Job Class**

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE_SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

**Window**

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan.

**Job Attribute Values**

Table 128–81 lists attribute values for jobs.

**Note:** See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table.

**Table 128–81 Job Attribute Values**

Name	Description
<code>allow_runs_in_restricted_mode</code>	If <code>TRUE</code> , the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. <code>FALSE</code> by default.
<code>auto_drop</code>	This attribute, if <code>TRUE</code> , causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if: <ul style="list-style-type: none"> <li>■ Its end date (or the end date of the schedule) has passed.</li> <li>■ It has run <code>max_runs</code> number of times. <code>max_runs</code> must be set with <code>SET_ATTRIBUTE</code>.</li> <li>■ It is not a repeating job and has run once.</li> </ul> A job is automatically disabled when it has failed <code>max_failures</code> times. <code>max_failures</code> is also set with <code>SET_ATTRIBUTE</code> . If this attribute is set to <code>FALSE</code> , the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the <code>DROP_JOB</code> procedure. By default, jobs are created with <code>auto_drop</code> set to <code>TRUE</code> .
<code>comments</code>	An optional comment.

**Table 128–81 (Cont.) Job Attribute Values**

Name	Description
credential_ name	<p>This attribute specifies the name of the Scheduler credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.</p>
database_role	<p>This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby.</p>
destination	<p>Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.</p> <p><b>*** Deprecated in Oracle Database 11g Release 2 (11.2). Use <code>destination_name</code> instead.</b></p> <p>This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format:</p> <p><i>hostname:port</i></p> <p>This attribute is set to NULL by default.</p>
destination_ name	<p>The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL.</p> <p>See <a href="#">Table 128–27</a> on page 128-59 for details about this attribute.</p>
end_date	<p>Specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If it is not, an error is generated when the job is enabled.</p>
event_spec	<p>This attribute takes two values: the value argument specifies the event condition and the value2 argument specifies the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments in the <a href="#">"CREATE_JOB Procedure"</a> on page 128-57.</p>

**Table 128–81 (Cont.) Job Attribute Values**

Name	Description
follow_ default_ timezone	<p>If TRUE and if the job <code>start_date</code> is null, then when the <code>default_timezone</code> scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.</p> <p>For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone.</p> <p>If the job <code>start_date</code> is not null, then the time zone for the run date and time for the job is always specified by the time zone of the <code>start_date</code>.</p> <p>If FALSE, the next start date and time for the job is not recomputed when the <code>default_timezone</code> scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone.</p> <p>Summer and winter transitions do not change the default time zone name.</p>
instance_id	Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.
instance_ stickiness	<p>This attribute should only be used for a database running in an Oracle Real Application Clusters (Oracle RAC) environment. By default, it is set to TRUE. If you set <code>instance_stickiness</code> to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it does not start new jobs for a significant period of time, another instance runs the job. If the interval between runs is large, <code>instance_stickiness</code> is ignored and the job is handled as if it were a non-sticky job.</p> <p>If <code>instance_stickiness</code> is set to FALSE, each instance of the job runs on the first instance available.</p> <p>For environments other than Oracle RAC, this attribute is not useful because there is only one instance.</p>
job_action	The action that the job performs, depending on the <code>job_type</code> attribute. For example, if <code>job_type</code> is 'STORED_PROCEDURE', <code>job_action</code> contains the name of the stored procedure.
job_class	The class this job is associated with.
job_priority	<p>This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution.</p> <p>If no job priority is specified when creating a job, the default priority of 3 is assigned to it.</p>
job_type	<p>The type of this job. Valid values are: 'PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', and 'CHAIN'.</p> <p>If this is set, <code>program_name</code> must be NULL.</p>
job_weight	<p>*** Deprecated in Oracle Database 11g Release 2 (11.2). Do not change the value of this attribute from the default, which is 1.</p> <p>Weight of the job for parallel execution.</p>

**Table 128–81 (Cont.) Job Attribute Values**

Name	Description
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <p>DBMS_SCHEDULER.LOGGING_OFF</p> <p>(The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.</p> <p>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</p> <p>The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p>DBMS_SCHEDULER.LOGGING_RUNS</p> <p>The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p>DBMS_SCHEDULER.LOGGING_FULL</p> <p>In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with SET_ATTRIBUTE), stop, and so on.</p>
max_failures	<p>This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views.</p> <p>max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job are started regardless of how many previous instances have failed.</p>
max_run_duration	<p>This attribute specifies the maximum amount of time that the job should be allowed to run. Its data type is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.</p>
max_runs	<p>This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED.</p> <p>max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it repeats forever or until end_date or max_failures is reached.</p>
number_of_arguments	<p>The number of arguments if the program is inlined. If this is set, program_name should be NULL.</p>

**Table 128–81 (Cont.) Job Attribute Values**

Name	Description
parallel_instances	<p>This is a boolean attribute that can be set only for event-based jobs.</p> <p>If FALSE (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored.</p> <p>If TRUE, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its <i>parent job</i>). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources.</p> <p>The lightweight jobs are not visible in any of the *_SCHEDULER_JOBS views. However, they are visible in the *_SCHEDULER_RUNNING_JOBS views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.</p>
program_name	<p>The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.</p>
raise_events	<p>This attribute tells the Scheduler at what stages of the job execution to raise events. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it.</p> <ul style="list-style-type: none"> <li>▪ job_started CONSTANT PLS_INTEGER := 1</li> <li>▪ job_succeeded CONSTANT PLS_INTEGER := 2</li> <li>▪ job_failed CONSTANT PLS_INTEGER :=4</li> <li>▪ job_broken CONSTANT PLS_INTEGER :=8</li> <li>▪ job_completed CONSTANT PLS_INTEGER :=16</li> <li>▪ job_stopped CONSTANT PLS_INTEGER :=32</li> <li>▪ job_sch_lim_reached CONSTANT PLS_INTEGER :=64</li> <li>▪ job_disabled CONSTANT PLS_INTEGER :=128</li> <li>▪ job_chain_stalled CONSTANT PLS_INTEGER :=256</li> <li>▪ job_all_events CONSTANT PLS_INTEGER := 511</li> <li>▪ job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped</li> </ul> <p><a href="#">Table 128–82</a> describes these event types in detail.</p>
repeat_interval	<p>Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "<a href="#">Calendaring Syntax</a>" on page 128-20 for more information.</p>

**Table 128–81 (Cont.) Job Attribute Values**

Name	Description
restartable	<p>This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to <code>FALSE</code>. Setting this to <code>TRUE</code> means that if a job fails while running, it is restarted from the beginning point of the job.</p> <p>In the case of a chain job, if this attribute is <code>TRUE</code>, the chain is restarted from the beginning after an application failure. If this attribute is <code>FALSE</code>, or if there has been a database failure, the chain is restarted at the last running step. The <code>restart_on_recovery</code> attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.)</p> <p>Note that setting this attribute to <code>TRUE</code> might lead to data inconsistencies in some situations, for example, if data is committed within a job.</p> <p>Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.</p> <p>The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter.</p> <p>Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.</p> <p>The Scheduler stops retrying a job when:</p> <ul style="list-style-type: none"> <li>■ One of the retries succeeds.</li> <li>■ All of its six retries have failed.</li> <li>■ The next retry would occur after the next regularly scheduled run of the job.</li> </ul> <p>The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.</p>
schedule_limit	<p>In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m.</p> <p>If <code>schedule_limit</code> is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.</p>
schedule_name	<p>The name of a schedule, window, or group of type <code>WINDOW</code> to use as the schedule for this job. If this is set, <code>end_date</code>, <code>start_date</code> and <code>repeat_interval</code> should all be <code>NULL</code>.</p>
start_date	<p>The original date and time on which this job started or is scheduled to start. If this is set, <code>schedule_name</code> should be <code>NULL</code>.</p>

**Table 128–81 (Cont.) Job Attribute Values**

Name	Description
stop_on_window_close	<p>This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to TRUE implies that the job should stop once the associated window is closed. The job is stopped using the stop_job procedure with force set to FALSE.</p> <p>By default, stop_on_window_close is set to FALSE. Therefore, if you do not set this attribute, the job continues after the window closes.</p> <p>Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.</p>

The following event types are valid values for the raise\_events attribute in [Table 128–81, "Job Attribute Values"](#).

**Table 128–82 Event Types Raised by the Scheduler**

Event Type	Description
job_all_events	Not an event, but a constant that provides an easy way for you to enable all events
job_broken	The job has been disabled and has changed to the BROKEN state because it exceeded the number of failures defined by the max_failures job attribute
job_chain_stalled	A job running a chain is in the CHAIN_STALLED state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain evaluation_interval is set to NULL. No progress is made in the chain unless there is manual intervention.
job_completed	The job completed because it reached its max_runs or end_date
job_disabled	The job was disabled by the Scheduler or by a call to SET_ATTRIBUTE
job_failed	The job failed, either due to an error or an abnormal termination.
job_over_max_dur	The job exceeded the maximum run duration specified by its max_run_duration attribute. (Note: you do not need to enable this event with the raise_events job attribute; it is always enabled.)
job_run_completed	A job run either failed, succeeded, or was stopped
job_sch_lim_reached	The schedule limit of the job was reached. The job was not started because the delay in starting the job exceeded the value of the schedule_limit job attribute.
job_started	The job started
job_stopped	The job was stopped by a call to STOP_JOB
job_succeeded	The job completed successfully

### Program Attribute Values

[Table 128–83](#) lists program attribute values.

**Note:** See the CREATE\_PROGRAM procedure for more complete descriptions of the attributes in this table.

**Table 128–83 Program Attribute Values**

Name	Description
comments	An optional comment. This can describe what the program does or give usage details.
detached	If TRUE, the program is a detached program. See <i>Oracle Database Administrator's Guide</i> for information about detached jobs and detached programs.
number_of_arguments	The number of arguments required by the stored procedure or other executable that the program invokes
program_action	The action that the program performs, indicated by the program_type attribute. For example, if program_type is 'STORED_PROCEDURE', program_action contains the name of the stored procedure.
program_type	The type of program. This must be one of these supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.

### Schedule Attribute Values

[Table 128–84](#) lists schedule attribute values.

**Note:** See the CREATE\_SCHEDULE and CREATE\_CALENDAR\_SCHEDULE procedures for more complete descriptions of the attributes in this table.

**Table 128–84 Schedule Attribute Values**

Name	Description
comments	An optional comment.
end_date	The cutoff date and time after which the schedule does not specify any dates.
event_spec	This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments to the <a href="#">"CREATE_JOB Procedure"</a> on page 128-57.
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. See <a href="#">"Calendaring Syntax"</a> on page 128-20 for more information.
start_date	The start or reference date and time used by the calendaring syntax.

### File Watcher Attribute Values

[Table 128–85](#) lists file watcher attribute values.

**Table 128–85 File Watcher Attribute Values**

Parameter	Description
destination	Remote host name or IP address where the file is expected to arrive. If NULL, destination is the local host.
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.

**Table 128–85 (Cont.) File Watcher Attribute Values**

Parameter	Description
file_name	Name of the file being looked for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid Scheduler credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have the EXECUTE privilege on the credential. Cannot be NULL.
min_file_size	Minimum file size in bytes before the file watcher considers the file found. Default is 0.
steady_state_duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If NULL, an internal value is used.
comments	Optional comment.

**Job Class Attribute Values**

Table 128–86 lists job class attribute values.

**Note:** See the CREATE\_JOB\_CLASS procedure for more complete descriptions of the attributes in this table.

**Table 128–86 Job Class Attribute Values**

Name	Description
comments	An optional comment about the class.
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately.  The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
logging_level	This attribute specifies how much information is logged. The valid values are: <ul style="list-style-type: none"> <li>■ DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class.</li> <li>■ DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs in the class that failed, with the reason for failure.</li> <li>■ DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default.</li> <li>■ DBMS_SCHEDULER.LOGGING_FULL The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.</li> </ul>
resource_consumer_group	The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See <i>Oracle Database Administrator's Guide</i> for a description of resource consumer groups and the Database Resource Manager.

**Table 128–86 (Cont.) Job Class Attribute Values**

Name	Description
service	The database service that the jobs in the job class have affinity to. If both the <code>resource_consumer_group</code> and <code>service</code> attributes are set for a job class, and if the service is mapped to a resource consumer group, the <code>resource_consumer_group</code> attribute takes precedence.

**Window Attribute Values**

[Table 128–87](#) lists window attribute values.

**Note:** See the `CREATE_WINDOW` procedure for more complete descriptions of the attributes in this table.

**Table 128–87 Window Attribute Values**

Name	Description
comments	An optional comment about the window.
duration	The duration of the window.
end_date	The date after which the window no longer opens. If this is set, <code>schedule_name</code> must be NULL.
repeat_interval	An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, <code>schedule_name</code> must be NULL. See " <a href="#">Calendaring Syntax</a> " on page 128-20 for more information.
resource_plan	The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the <code>force</code> option, no resource plan switch occurs.  Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.
schedule_name	The name of a schedule to use with this window. If this is set, <code>start_date</code> , <code>end_date</code> , and <code>repeat_interval</code> must all be NULL.
start_date	The next date and time on which this window is scheduled to open. If this is set, <code>schedule_name</code> must be NULL.
window_priority	The priority of the window. Must be either 'LOW' (default) or 'HIGH'.

**Chain Attribute Values**

[Table 128–88](#) lists chain attribute values.

**Note:** See the `CREATE_CHAIN` procedure for more complete descriptions of the attributes in this table.

**Table 128–88 Chain Attribute Values**

Name	Description
comments	An optional comment describing the purpose of the chain.

**Table 128–88 (Cont.) Chain Attribute Values**

Name	Description
evaluation_interval	<p>If not NULL, provides an additional evaluation of the chain at this interval, as well as at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives)</p> <p>This attribute should only to be used when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler, because the extra interval is CPU intensive. For most chains, the normal evaluation times are sufficient.</p>
rule_set_name	<p>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use DEFINE_CHAIN_RULE to add rules and DROP_CHAIN_RULE to remove them.</p> <p>Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form SCHED_RULESET\$ {N} and the evaluation context created is of the form SCHED_EVCTX\$ {N}</p> <p>See <i>Oracle Streams Concepts and Administration</i> for information on rules and rule sets.</p>

### Database Destination Attribute Values

Table 128–89 lists database destination attribute values.

**Note:** See the CREATE\_DATABASE\_DESTINATION procedure for more complete descriptions of the attributes in this table.

**Table 128–89 Database Destination Attribute Values**

Name	Description
agent	<p>The name of the external destination (also known as agent destination) that is used to connect to the remote database.</p> <p>You can obtain valid external destination names from the view ALL_SCHEDULER_EXTERNAL_DESTS.</p>
connect_info	<p>The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in tnsnames.ora that resolves to the connect descriptor.</p> <p>Note: This corresponds to the tns_name argument of CREATE_DATABASE_DESTINATION.</p>
enabled	If TRUE, the database destination is enabled.
comments	An optional comment about the database destination.

### External Destination Attribute Values

Table 128–90 lists external destination attribute values.

**Note:** External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

**Table 128–90 External Destination Attribute Values**

Name	Description
hostname	(GET_ATTRIBUTE only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides.
port	(GET_ATTRIBUTE only) The TCP port number on which the agent listens.
ip_address	(GET_ATTRIBUTE only) The IP address of the host on which the agent resides.
enabled	If TRUE, the external destination is enabled.
comments	An optional comment about the external destination.

**Group Attribute Values**

[Table 128–91](#) lists group attribute values.

---

---

**Note:** See the CREATE\_GROUP procedure for more complete descriptions of the attributes in this table.

---

---

**Table 128–91 Group Attribute Values**

Name	Description
group_type	(GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST).
member_name	Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER.  Note: this attribute corresponds to the member argument of CREATE_GROUP.
enabled	If TRUE, the group is enabled.
comments	An optional comment about the group.
number_of_members	(GET_ATTRIBUTE only) The number of members in the group.

**Credential Attribute Values**

[Table 128–92](#) lists credential attribute values.

---

---

**Note:** See the CREATE\_CREDENTIAL procedure for more complete descriptions of the attributes in this table.

---

---

**Table 128–92 Credential Attribute Values**

Name	Description
username	The user name for logging into to the host operating system or remote Oracle database. Maximum length is 64.
password	The password for the user name. Maximum length is 128.
comments	A description of the credential. Maximum length is 240.
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64.

**Table 128–92 (Cont.) Credential Attribute Values**

Name	Description
database_role	The value of the database_role attribute is used as the system privilege for logging into a remote database to run a remote database job.  Valid values are: SYSDBA and SYSOPER.

## SET\_ATTRIBUTE\_NULL Procedure

This procedure sets an attribute of an object to NULL. The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

### Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2);
```

### Parameters

**Table 128–93** SET\_ATTRIBUTE\_NULL Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being changed

### Usage Notes

To run SET\_ATTRIBUTE\_NULL for a window, group of type WINDOW, or job class, you must have the MANAGE\_SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

## SET\_JOB\_ANYDATA\_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an `AnyData` object. It overrides any default value set for the program argument. `NULL` is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE\\_ANYDATA\\_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

`SET_JOB_ANYDATA_VALUE` is overloaded.

### Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name           IN VARCHAR2,
    argument_position  IN PLS_INTEGER,
    argument_value     IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name           IN VARCHAR2,
    argument_name      IN VARCHAR2,
    argument_value     IN SYS.ANYDATA);
```

### Parameters

**Table 128–94** SET\_JOB\_ANYDATA\_VALUE Procedure Parameters

Parameter	Description
<code>job_name</code>	The name of the job to be altered
<code>argument_name</code>	The name of the program argument being set
<code>argument_position</code>	The position of the program argument being set
<code>argument_value</code>	The new value to be assigned to the program argument, encapsulated in an <code>AnyData</code> object

### Usage Notes

`SET_JOB_ANYDATA_VALUE` requires that you own the job or have `ALTER` privileges on that job. You can also set a job argument value if you have the `CREATE ANY JOB` privilege.

`SET_JOB_ANYDATA_VALUE` does not apply to lightweight jobs because lightweight jobs cannot take `AnyData` arguments.

#### See Also:

- ["SET\\_JOB\\_ARGUMENT\\_VALUE Procedure"](#) on page 128-147
- ["DEFINE\\_ANYDATA\\_ARGUMENT Procedure"](#) on page 128-75

## SET\_JOB\_ARGUMENT\_VALUE Procedure

This procedure sets the value of an argument in a program associated with a job. It overrides any default value set for the program argument. NULL is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE\\_PROGRAM\\_ARGUMENT Procedure](#) or the [DEFINE\\_METADATA\\_ARGUMENT Procedure](#)

Scheduler does no type checking of the argument at any time.

SET\_JOB\_ARGUMENT\_VALUE is overloaded.

### Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER,
  argument_value     IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2,
  argument_value     IN VARCHAR2);
```

### Parameters

**Table 128–95 SET\_JOB\_ARGUMENT\_VALUE Procedure Parameters**

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure.

### Usage Notes

SET\_JOB\_ARGUMENT\_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET\_JOB\_ARGUMENT\_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET\_JOB\_ARGUMENT\_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

**See Also:**

- ["SET\\_JOB\\_ANYDATA\\_VALUE Procedure"](#) on page 128-146
- ["DEFINE\\_PROGRAM\\_ARGUMENT Procedure"](#) on page 128-83

## SET\_JOB\_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

### Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
  jobattr_array      IN JOBATTR_ARRAY,
  commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 128–96** SET\_JOB\_ATTRIBUTES Procedure Parameters

Parameter	Description
jobattr_array	The array of job attribute changes.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> <li>▪ STOP_ON_FIRST_ERROR returns on the first error and commits previous successful attribute changes to disk. This is the default.</li> <li>▪ TRANSACTIONAL returns on the first error and rolls back everything that happened before that error.</li> <li>▪ ABSORB_ERRORS tries to absorb any errors and complete the rest of the job attribute changes on the list. It commits all the successful changes. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.</li> </ul>

### Usage Notes

Calling SET\_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and reenables the job. SET\_JOB\_ATTRIBUTES changes the attribute values in the context of a single transaction.

## SET\_SCHEDULER\_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately.

[Table 128–97](#) provides short attribute descriptions for the SET\_SCHEDULER\_ATTRIBUTE procedure. For complete descriptions, see section "Setting Scheduler Preferences" in *Oracle Database Administrator's Guide*.

### Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (  
    attribute      IN VARCHAR2,  
    value          IN VARCHAR2);
```

## Parameters

**Table 128–97 SET\_SCHEDULER\_ATTRIBUTE Procedure Parameters**

Parameter	Description
attribute	<p>The name of the Scheduler attribute. Possible values are:</p> <ul style="list-style-type: none"> <li>▪ 'default_timezone': Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when start_date is not specified. See "Calendaring Syntax" on page 128-20 for more information.</li> <li>▪ 'email_server': The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.</li> <li>▪ 'email_sender': The default e-mail address of the sender of job state e-mail notifications.</li> <li>▪ 'email_server_credential': The schema and name of an existing credential object that SYS has execute object privileges on. Default is NULL. The username and password stored in this credential are used to authenticate with the e-mail server when sending e-mail notifications.</li> </ul> <p>This functionality is available with Oracle Database 11g Release 2 (11.2.0.2).</p> <ul style="list-style-type: none"> <li>▪ 'email_server_encryption': This attribute indicates whether or not encryption is enabled for this email server connection, and if so, at what point encryption starts, and with which protocol. Values are: <ul style="list-style-type: none"> <li>– NONE: the default, indicating no encryption used</li> <li>– SSL_TLS: indicating that either SSL or TLS are used, from the beginning of the connection</li> <li>– STARTTLS: indicating that the connection starts unencrypted, but the command STARTTLS is sent to the e-mail server and starts encryption</li> </ul> <p>This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).</p> </li> <li>▪ 'event_expiry_time': The time, in seconds, before a job state event generated by the Scheduler expires from the Scheduler event queue. If NULL, job state events expire after 24 hours.</li> <li>▪ 'log_history': The number of days that log entries for both the job log and the window log are retained. Default is 30 and the range of valid values is 0 through 1000000.</li> <li>▪ 'max_job_slave_processes': This Scheduler attribute is not used.</li> </ul>
value	The new value of the attribute

## Usage Notes

To run SET\_SCHEDULER\_ATTRIBUTE, you must have the MANAGE SCHEDULER privilege.

**See Also:** *Oracle Database Administrator's Guide* for more detailed descriptions of Scheduler attributes

## STOP\_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class. After stopping the job, the state of a one-time job is set to STOPPED, whereas the state of a repeating job is set to SCHEDULED or COMPLETED, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, STOP\_JOB stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

### Syntax

```
DBMS_SCHEDULER.STOP_JOB (
  job_name          IN VARCHAR2
  force             IN BOOLEAN DEFAULT FALSE
  commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

### Parameters

**Table 128–98 STOP\_JOB Procedure Parameters**

Parameter	Description
job_name	<p>Name of a job to stop. Can be a comma-separated list of jobs, where each entry can be one of the following:</p> <ul style="list-style-type: none"> <li>▪ Job name: the name of an existing job, optionally preceded by a schema name and dot separator.</li> <li>▪ Job destination ID: a number, obtained from the JOB_DEST_ID column of the *_SCHEDULER_JOB_DESTS views, that represents the unique combination of a job, a credential, and a destination.</li> <li>▪ Job class: the name of a job class. Must be preceded by the SYS schema name and a dot separator.</li> </ul> <p>If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination group as its destination_name attribute, all job instances on all destinations are stopped.</p>
force	<p>If force is set to FALSE, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned.</p> <p>If force is set to TRUE, the Scheduler immediately terminates the job slave. Oracle recommends that STOP_JOB with force set to TRUE be used only after a STOP_JOB with force set to FALSE has failed.</p> <p>Use of the force option requires the MANAGE_SCHEDULER system privilege.</p>

**Table 128–98 (Cont.) STOP\_JOB Procedure Parameters**

Parameter	Description
<code>commit_semantics</code>	<p>The commit semantics. The following two types are supported:</p> <ul style="list-style-type: none"> <li>▪ <code>STOP_ON_FIRST_ERROR</code>: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default.</li> <li>▪ <code>ABSORB_ERRORS</code>: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the <code>job_name</code> list. If errors occur, you can query the view <code>SCHEDULER_BATCH_ERRORS</code> for details.</li> </ul>

## Usage Notes

`STOP_JOB` without the `force` option requires that you be the owner of the job or have `ALTER` privileges on that job. You can also stop a job if you have the `CREATE ANY JOB` or `MANAGE SCHEDULER` privilege.

`STOP_JOB` with the `force` option requires that you have the `MANAGE SCHEDULER` privilege.

## Example

The following is an example of using `STOP_JOB`.

```
BEGIN
  DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB', 984, 1223, SYS.ETL_JOBCLASS');
END;
```

---

## DBMS\_SERVER\_ALERT

The `DBMS_SERVER_ALERT` package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- [Using DBMS\\_SERVER\\_ALERT](#)
  - Security Model
  - Object Types
  - Relational Operators
  - Supported Metrics
- [Summary of DBMS\\_SERVER\\_ALERT Subprograms](#)

---

## Using DBMS\_SERVER\_ALERT

This section contains topics which relate to using the DBMS\_SERVER\_ALERT package. The following topics define constants used in package procedures.

- [Security Model](#)
- [Object Types](#)
- [Relational Operators](#)
- [Supported Metrics](#)

## Security Model

The user needs DBA or IMP\_FULL\_DATABASE roles to use the DBMS\_SERVER\_ALERT package.

## Object Types

You qualify the metric by an individual object for the following object types.

**Table 129–1 Object Types Defined as Constants**

Constant	Description
OBJECT_TYPE_SYSTEM	Metrics collected on the system level for each instance.
OBJECT_TYPE_FILE	Metrics collected on the file level. These are used for AVG_FILE_READ_TIME and AVG_FILE_WRITE_TIME metrics.
OBJECT_TYPE_SERVICE	Metrics collected on the service level. Currently ELAPSED_TIME_PER_CALL and CPU_TIME_PER_CALL are collected.
OBJECT_TYPE_TABLESPACE	Metrics collected on the tablespace level. <b>Note:</b> Dictionary managed tablespaces are not supported.
OBJECT_TYPE_EVENT_CLASS	Metrics collected on wait event class level. Currently supported metrics are AVG_USERS_WAITING and DB_TIME_WAITING.
OBJECT_TYPE_SESSION	Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.

## Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

**Table 129–2 Relational Operators Defined as Constants**

Constant	Description
OPERATOR_CONTAINS	A metric value matching an entry in a list of threshold values is considered a violation.
OPERATOR_DO_NOT_CHECK	The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.
OPERATOR_EQ	A metric value equal to the threshold value is considered a violation.
OPERATOR_GE	A metric value greater than or equal to the threshold value is considered a violation.
OPERATOR_GT	A metric value greater than the threshold value is considered a violation.
OPERATOR_LE	A metric value less than or equal to the threshold value is considered a violation.
OPERATOR_LT	A metric value less than the threshold value is considered a violation.
OPERATOR_NE	A metric value not equal to the threshold value is considered a violation.

## Supported Metrics

The following metrics are supported. All internal metric names are supplied as package constants.

**Table 129–3 List of Supported Metrics**

<b>Metric Name (Internal)</b>	<b>Metric Name (External)</b>	<b>Units</b>
AVG_FILE_READ_TIME	Average File Read Time	Microseconds
AVG_FILE_WRITE_TIME	Average File Write Time	Microseconds
AVG_USERS_WAITING	Average Number of Users Waiting on a Class of Wait Events	Count of sessions
BLOCKED_USERS	Number of Users blocked by some Session	Number of Users
BRANCH_NODE_SPLITS_SEC	Branch Node Splits (for each second)	Splits for each Second
BRANCH_NODE_SPLITS_TXN	Branch Node Splits (for each transaction)	Splits for each Transaction
BUFFER_CACHE_HIT	Buffer Cache Hit (%)	% of cache accesses
CLUSTER_MSG_WAIT_SCT	Cluster Messaging Wait (by session count)	Count of sessions
CLUSTER_MSG_WAIT_TIME	Cluster Messaging Wait (by time)	Microseconds
CONSISTENT_CHANGES_SEC	Consistent Changes (for each second)	Changes for each Second
CONSISTENT_CHANGES_TXN	Consistent Changes (for each transaction)	Changes for each Transaction
CONSISTENT_GETS_SEC	Consistent Gets (for each second)	Gets for each Second
CONSISTENT_GETS_TXN	Consistent Gets (for each transaction)	Gets for each Transaction
CONTENTION_WAIT_SCT	Internal Contention Wait (by session count)	Count of sessions
CONTENTION_WAIT_TIME	Internal Contention Wait (by time)	Microseconds
CPU_TIME_PER_CALL	CPU time for each user call for each service	Microseconds for each call
CR_BLOCKS_CREATED_SEC	CR Blocks Created (for each second)	Blocks for each Second
CR_BLOCKS_CREATED_TXN	CR Blocks Created (for each transaction)	Blocks for each Transaction
CR_RECORDS_APPLIED_SEC	CR Undo Records Applied (for each second)	Records for each Second
CR_RECORDS_APPLIED_TXN	CR Undo Records Applied (for each transaction)	Records for each Transaction
CURSOR_CACHE_HIT	Cursor Cache Hit (%)	% of soft parses
DATABASE_WAIT_TIME	Database Wait Time (%)	% of all database time
DATABASE_CPU_TIME	Database CPU Time (%)	% of all database time
DATA_DICT_HIT	Data Dictionary Hit (%)	% of dictionary accesses
DATA_DICT_MISS	Data Dictionary Miss (%)	% of dictionary accesses

**Table 129-3 (Cont.) List of Supported Metrics**

<b>Metric Name (Internal)</b>	<b>Metric Name (External)</b>	<b>Units</b>
DB_BLKGETS_SEC	DB Block Gets (for each second)	Gets for each Second
DB_BLKGETS_TXN	DB Block Gets (for each transaction)	Gets for each Transaction
DB_TIME_WAITING	Percent of Database Time Spent Waiting on a Class of Wait Events	% of Database Time
DBR_IO_LIMIT_WAIT_SCT	Resource Mgr I/O Limit Wait (by session count)	Count of sessions
DBR_IO_LIMIT_WAIT_TIME	Resource Mgr I/O Limit Wait (by time)	Microseconds
DBR_CPU_LIMIT_WAIT_SCT	Resource Mgr CPU Limit Wait (by session count)	Count of sessions
DBR_CPU_LIMIT_WAIT_TIME	Resource Mgr CPU Limit Wait (by time)	Microseconds
DBR_USR_LIMIT_WAIT_SCT	Resource Mgr User Limit Wait (by session count)	Count of sessions
DBR_USR_LIMIT_WAIT_TIME	Resource Mgr User Limit Wait (by time)	Microseconds
DBWR_CKPT_SEC	DBWR Checkpoints (for each second)	Checkpoints for each Second
DISK_IO	Disk I/O	Milliseconds
DISK_IO_WAIT_SCT	Disk I/O Wait (by session count)	Count of sessions
DISK_SORT_SEC	Sorts to Disk (for each second)	Sorts for each Second
DISK_SORT_TXN	Sorts to Disk (for each transaction)	Sorts for each Transaction
ELAPSED_TIME_PER_CALL	Elapsed time for each user call for each service	Microseconds for each call
ENQUEUE_DEADLOCKS_SEC	Enqueue Deadlocks (for each second)	Deadlocks for each Second
ENQUEUE_DEADLOCKS_TXN	Enqueue Deadlocks (for each transaction)	Deadlocks for each Transaction
ENQUEUE_REQUESTS_SEC	Enqueue Requests (for each second)	Requests for each Second
ENQUEUE_REQUESTS_TXN	Enqueue Requests (for each transaction)	Requests for each Transaction
ENQUEUE_TIMEOUTS_SEC	Enqueue Timeouts (for each second)	Timeouts for each Second
ENQUEUE_TIMEOUTS_TXN	Enqueue Timeouts (for each transaction)	Timeouts for each Transaction
ENQUEUE_WAITS_SEC	Enqueue Waits (for each second)	Waits for each Second
ENQUEUE_WAITS_TXN	Enqueue Waits (for each transaction)	Waits for each Transaction
EXECUTE_WITHOUT_PARSE	Executes Performed Without Parsing	% of all executes
FULL_INDEX_SCANS_SEC	Fast Full Index Scans (for each second)	Scans for each Second
FULL_INDEX_SCANS_TXN	Fast Full Index Scans (for each transaction)	Scans for each Transaction

**Table 129–3 (Cont.) List of Supported Metrics**

<b>Metric Name (Internal)</b>	<b>Metric Name (External)</b>	<b>Units</b>
GC_AVG_CR_GET_TIME	Global Cache CR Request	Milliseconds
GC_AVG_CUR_GET_TIME	Global Cache Current Request	Milliseconds
GC_BLOCKS_CORRUPT	Global Cache Blocks Corrupt	Blocks
GC_BLOCKS_LOST	Global Cache Blocks Lost	Blocks
HARD_PARSSES_SEC	Hard Parses (for each second)	Parses for each Second
HARD_PARSSES_TXN	Hard Parses (for each transaction)	Parses for each Transaction
LEAF_NODE_SPLITS_SEC	Leaf Node Splits (for each second)	Splits for each Second
LEAF_NODE_SPLITS_TXN	Leaf Node Splits (for each transaction)	Splits for each Transaction
LIBRARY_CACHE_HIT	Library Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_MISS	Library Cache Miss (%)	% of cache accesses
LOG_SWITCH_SEC	Background Checkpoints (for each second)	Checkpoints for each Second
LOGONS_CURRENT	Current Number of Logons	Number of Logons
LOGONS_SEC	Cumulative Logons (for each second)	Logons for each Second
LOGONS_TXN	Cumulative Logons (for each transaction)	Logons for each Transaction
LONG_TABLE_SCANS_SEC	Scans on Long Tables (for each second)	Scans for each Second
LONG_TABLE_SCANS_TXN	Scans on Long Tables (for each transaction)	Scans for each Transaction
OPEN_CURSORS_SEC	Cumulative Open Cursors (for each second)	Cursors for each Second
MEMORY_SORTS_PCT	Sorts in Memory (%)	% of sorts
NETWORK_BYTES_SEC	Network Bytes, for each second	Bytes for each Second
NETWORK_MSG_WAIT_SCT	Network Message Wait (by session count)	Count of sessions
NETWORK_MSG_WAIT_TIME	Network Message Wait (by time)	Microseconds
OPEN_CURSORS_CURRENT	Current Number of Cursors	Number of Cursors
OPEN_CURSORS_TXN	Cumulative Open Cursors (for each transaction)	Cursors for each Transaction
OS_SCHED_CPU_WAIT_SCT	Operating System Scheduler CPU Wait (by session count)	Count of sessions
OS_SCHED_CPU__WAIT_TIME	Operating System Scheduler CPU Wait (by time)	Microseconds
OS_SERVICE_WAIT_SCT	Operating System Service Wait (by session count)	Count of sessions
OS_SERVICE_WAIT_TIME	Operating System Service Wait (by time)	Microseconds
OTHER_WAIT_SCT	Other Waits (by session count)	Count of sessions
OTHER_WAIT_TIME	Other Waits (by time)	Microseconds

**Table 129-3 (Cont.) List of Supported Metrics**

<b>Metric Name (Internal)</b>	<b>Metric Name (External)</b>	<b>Units</b>
PARSE_FAILURES_SEC	Parse Failures (for each second)	Parses for each Second
PARSE_FAILURES_TXN	Parse Failures (for each transaction)	Parses for each Transaction
PGA_CACHE_HIT	PGA Cache Hit (%)	% bytes processed in PGA
PHYS_DESGN_WAIT_SCT	Physical Design Wait (by session count)	Count of sessions
PHYS_DESGN_WAIT_TIME	Physical Design Wait (by time)	Microseconds
PHYSICAL_READS_SEC	Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_TXN	Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_SEC	Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_TXN	Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_DIR_SEC	Direct Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_DIR_TXN	Direct Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_DIR_SEC	Direct Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_DIR_TXN	Direct Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_LOB_SEC	Direct LOB Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_LOB_TXN	Direct LOB Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_LOB_SEC	Direct LOB Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_LOB_TXN	Direct LOB Physical Writes (for each transaction)	Writes for each Transaction
PROCESS_LIMIT_PCT	Process Limit Usage (%)	% of maximum value
PSERVICE_WAIT_SCT	Process Service Wait (by session count)	Count of sessions
PSERVICE_WAIT_TIME	Process Service Wait (by time)	Microseconds
PX_DOWNGRADED_SEC	Downgraded Parallel Operations (for each second)	Operations for each Second
PX_DOWNGRADED_25_SEC	Downgraded to 25% and more (for each second)	Operations for each Second
PX_DOWNGRADED_50_SEC	Downgraded to 50% and more (for each second)	Operations for each Second
PX_DOWNGRADED_75_SEC	Downgraded to 75% and more (for each second)	Operations for each Second
PX_DOWNGRADED_SER_SEC	Downgraded to serial (for each second)	Operations for each Second
RB_RECORDS_APPLIED_SEC	Rollback Undo Records Applied (for each second)	Records for each Second

**Table 129–3 (Cont.) List of Supported Metrics**

<b>Metric Name (Internal)</b>	<b>Metric Name (External)</b>	<b>Units</b>
RB_RECORDS_APPLIED_TXN	Rollback Undo Records Applied (for each transaction)	Records for each Transaction
REDO_ALLOCATION_HIT	Redo Log Allocation Hit	% of redo allocations
REDO_GENERATED_SEC	Redo Generated (for each second)	Redo Bytes for each Second
REDO_GENERATED_TXN	Redo Generated (for each transaction)	Redo Bytes for each Transaction
REDO_WRITES_SEC	Redo Writes (for each second)	Writes for each Second
REDO_WRITES_TXN	Redo Writes (for each transaction)	Writes for each Transaction
RECURSIVE_CALLS_SEC	Recursive Calls (for each second)	Calls for each Second
RECURSIVE_CALLS_TXN	Recursive Calls (for each transaction)	Calls for each Transaction
RESPONSE_TXN	Response (for each transaction)	Seconds for each Transaction
ROWS_PER_SORT	Rows Processed for each Sort	Rows for each Sort
SESS_LOGICAL_READS_SEC	Session Logical Reads (for each second)	Reads for each Second
SESS_LOGICAL_READS_TXN	Session Logical Reads (for each transaction)	Reads for each Transaction
SESSION_CPU_SEC	Database CPU (for each second)	Microseconds for each Second
SESSION_CPU_TXN	Database CPU (for each transaction)	Microseconds for each Transaction
SESSION_LIMIT_PCT	Session Limit Usage (%)	% of maximum value
SHARED_POOL_FREE_PCT	Shared Pool Free(%)	% of shared pool
SOFT_PARSE_PCT	Soft Parse (%)	% of all parses
SQL_SRV_RESPONSE_TIME	Service Response (for each execution)	Seconds
TABLESPACE_PCT_FULL	Tablespace space usage	% full
TABLESPACE_BYT_FREE	Tablespace bytes space usage	Kilobytes free
TOTAL_TABLE_SCANS_SEC	Total Table Scans (for each second)	Scans for each Second
TOTAL_TABLE_SCANS_TXN	Total Table Scans (for each transaction)	Scans for each Transaction
TOTAL_INDEX_SCANS_SEC	Total Index Scans (for each second)	Scans for each Second
TOTAL_INDEX_SCANS_TXN	Total Index Scans (for each transaction)	Scans for each Transaction
TOTAL_PARSSES_SEC	Total Parses (for each second)	Parses for each Second
TOTAL_PARSSES_TXN	Total Parses (for each transaction)	Parses for each Transaction
TRANSACTION_RATE	Number of Transactions (for each second)	Transactions for each Second
TXN_COMMITTED_PCT	Transactions Committed (%)	% of all transactions
USER_COMMITS_SEC	User Commits (for each second)	Commits for each Second
USER_COMMITS_TXN	User Commits (for each transaction)	Commits for each Transaction
USER_ROLLBACKS_SEC	User Rollbacks (for each second)	Rollbacks for each Second

**Table 129-3 (Cont.) List of Supported Metrics**

<b>Metric Name (Internal)</b>	<b>Metric Name (External)</b>	<b>Units</b>
USER_ROLLBACKS_TXN	User Rollbacks (for each transaction)	Rollbacks for each Transaction
USER_CALLS_SEC	User Calls (for each second)	Calls for each Second
USER_CALLS_TXN	User Calls (for each transaction)	Calls for each Transaction
USER_CALLS_PCT	User Calls (%)	% of all calls
USER_LIMIT_PCT	User Limit Usage (%)	% of maximum value
WCR_AVG_IO_LAT	Average IO response time (for a WRC client)	Milliseconds
WCR_PCPU	Percentage of replay threads on CPU (for a WRC client)	% of total replay threads
WCR_PIO	Percentage of replay threads doing IOs (for a WRC client)	% of total replay threads

## Summary of DBMS\_SERVER\_ALERT Subprograms

**Table 129–4 DBMS\_SERVER\_ALERT Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">EXPAND_MESSAGE</a> Function on page 129-13	Expands alert messages
<a href="#">GET_THRESHOLD</a> Procedure on page 129-14	Gets the current threshold settings for a specified metric
<a href="#">SET_THRESHOLD</a> Procedure on page 129-15	Sets the warning and critical thresholds for a specified metric

## EXPAND\_MESSAGE Function

This function expands alert messages.

### Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE (
  user_language      IN  VARCHAR2,
  message_id        IN  NUMBER,
  argument_1        IN  VARCHAR2,
  argument_2        IN  VARCHAR2,
  argument_3        IN  VARCHAR2,
  argument_4        IN  VARCHAR2,
  argument_5        IN  VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 129–5** *EXPAND\_MESSAGE Function Parameters*

Parameter	Description
user_language	The language of the current session.
message_id	Id of the alert message
argument_1	The first argument in the alert message.
argument_2	The second argument in the alert message.
argument_3	The third argument in the alert message.
argument_4	The fourth argument in the alert message.
argument_5	The fifth argument in the alert message.

## GET\_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

### Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD (
  metrics_id           IN  BINARY_INTEGER,
  warning_operator     OUT BINARY_INTEGER,
  warning_value        OUT VARCHAR2,
  critical_operator    OUT BINARY_INTEGER,
  critical_value       OUT VARCHAR2,
  observation_period   OUT BINARY_INTEGER,
  consecutive_occurrences OUT BINARY_INTEGER,
  instance_name        IN  VARCHAR2,
  object_type          IN  BINARY_INTEGER,
  object_name          IN  VARCHAR2);
```

### Parameters

**Table 129–6** GET\_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See <a href="#">"Supported Metrics"</a> on page 129-6.
warning_operator	The operator for the comparing the actual value with the warning threshold.
warning_value	The warning threshold value.
critical_operator	The operator for the comparing the actual value with the critical threshold.
critical_value	The critical threshold value.
observation_period	The period at which the metric values are computed and verified against the threshold setting.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV\$INSTANCE View.
object_type	Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.
object_name	The name of the object.

### Usage Notes

Note that this subprogram does not check if the value of the instance\_name parameter is meaningful or valid.

## SET\_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

### Syntax

```
DBMS_SERVER_ALERT.SET_THRESHOLD (
    metrics_id           IN   BINARY_INTEGER,
    warning_operator     IN   BINARY_INTEGER,
    warning_value        IN   VARCHAR2,
    critical_operator     IN   BINARY_INTEGER,
    critical_value        IN   VARCHAR2,
    observation_period   IN   BINARY_INTEGER,
    consecutive_occurrences IN BINARY_INTEGER,
    instance_name        IN   VARCHAR2,
    object_type          IN   BINARY_INTEGER,
    object_name          IN   VARCHAR2);
```

### Parameters

**Table 129-7 SET\_THRESHOLD Procedure Parameters**

Parameter	Description
metrics_id	The internal name of the metric. See <a href="#">"Supported Metrics"</a> on page 129-6.
warning_operator	The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See <a href="#">"Relational Operators"</a> on page 129-5.
warning_value	The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.
critical_operator	The operator for the comparing the actual value with the critical threshold. See <a href="#">"Relational Operators"</a> on page 129-5.
critical_value	The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.
observation_period	The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts.
object_type	See <a href="#">"Object Types"</a> on page 129-4.
object_name	The name of the object. This is NULL for SYSTEM.

### Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the `DBA_THRESHOLDS` view. The exception is the lower-case string 'database\_wide' which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.

The `DBMS_SERVICE` package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- [Using DBMS\\_SERVICE](#)
  - Overview
  - Security Model
  - Constants
  - Exceptions
- [Summary of DBMS\\_SERVICE Subprograms](#)

**See Also:** *Oracle Real Application Clusters Administration and Deployment Guide* for administering services in Oracle Real Application Clusters.

---

## Using DBMS\_SERVICE

This section contains topics which relate to using the DBMS\_SERVICE package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)

## Overview

DBMS\_SERVICE supports the management of services in the RDBMS for the purposes of workload measurement, management, prioritization, and XA/and distributed transaction management.

Oracle Real Application Clusters (Oracle RAC) has a functionality to manage service names across instances. This package allows the creation, deletion, starting and stopping of services in both Oracle RAC and a single instance. Additionally, it provides the ability to disconnect all sessions which connect to the instance with a service name when Oracle RAC removes that service name from the instance.

**See Also:** For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

## Security Model

### Privileges

The client using this package must have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

### Schemas

This package must be installed under `SYS` schema.

### Roles

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

## Deprecated Subprograms

For Oracle Real Applications Clusters (Oracle RAC) databases, the following DBMS\_SERVICE procedures are deprecated in 11.2, and `srvctl` used instead:

- [CREATE\\_SERVICE Procedure](#)
- [MODIFY\\_SERVICE Procedure](#)
- [START\\_SERVICE Procedure](#)
- [STOP\\_SERVICE Procedure](#)

The same is true for single-instance databases managed by Oracle Restart or Oracle Clusterware.

This is because the service attributes are stored in CRS and those attributes overwrite those specified by DBMS\_SERVICE. The DBMS\_SERVICE procedures do not update the CRS attributes.

## Constants

The `DBMS_SERVICE` package uses the constants shown in following tables

- Constants used in calling arguments are described in [Table 130–1, "Constants used in Calling Arguments"](#)
- Constants used in connection balancing goal arguments are described in [Table 130–2, "Constants used in Connection Balancing Goal Arguments"](#)
- Constants used TAF failover attribute arguments are described in [Table 130–3, "Constants used in TAF Failover Attribute Arguments"](#)

**Table 130–1 Constants used in Calling Arguments**

Name	Type	Value	Description
GOAL_NONE	NUMBER	0	Disables Load Balancing Advisory
GOAL_SERVICE_TIME	NUMBER	1	Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service
GOAL_THROUGHPUT	NUMBER	2	Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service

**Table 130–2 Constants used in Connection Balancing Goal Arguments**

Name	Type	Value	Description
CLB_GOAL_SHORT	NUMBER	1	Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either <code>goal_service_time</code> or <code>goal_throughput</code> ). When <code>GOAL=NONE</code> (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.
CLB_GOAL_LONG	NUMBER	2	Balances the number of connections per instance using session count per service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.

**Table 130–3 Constants used in TAF Failover Attribute Arguments**

Name	Type	Value	Description
FAILOVER_METHOD_NONE	VARCHAR2	0	Server side TAF is not enabled for this service
FAILOVER_METHOD_BASIC	VARCHAR2	1	Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time. It is not possible to pre-establish a backup connection. (which is to say, <code>PRECONNECT</code> is not supported)

**Table 130–3 (Cont.) Constants used in TAF Failover Attribute Arguments**

Name	Type	Value	Description
FAILOVER_TYPE_ NONE	NUMBER		Server side TAF type is NONE
FAILOVER_TYPE_ SESSION	NUMBER		Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF will re-connect to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.
FAILOVER_TYPE_ SELECT	NUMBER		Server side TAF failover type is SELECT
FAILOVER_RETRIES	NUMBER		Number of retries to use during a failover. Specifies the number of times for TAF to attempt the re-connect and re-authenticate pair. The value must be integral and greater than 0. The maximum value is UB4MAXVAL
FAILOVER_DELAY	NUMBER		Number of seconds delay before trying to fail over. Specifies the delay (in seconds) that TAF will incur if the re-connect / re-authentication fails. The value must be integral and greater than 0. The maximum value is UB4MAXVAL.

## Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF will continue to re-attempt the connect and authentication as long as the callback returns a value of OCI\_FO\_RETRY. Any delay must be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method will default to BASIC. Delay and retries are optional and may be specified independently.

## Exceptions

The following table lists the exceptions raised by `DBMS_SERVICE` package.

**Table 130–4** *DBMS\_SERVICE Exceptions*

Exception	Error Code	Description
<code>NULL_SERVICE_NAME</code>	44301	The service name argument was found to be <code>NULL</code>
<code>NULL_NETWORK_NAME</code>	44302	The network name argument was found to be <code>NULL</code>
<code>SERVICE_EXISTS</code>	44303	This service name was already in existence
<code>SERVICE_DOES_NOT_EXIST</code>	44304	The specified service was not in existence
<code>SERVICE_IN_USE</code>	44305	The specified service was running
<code>SERVICE_NAME_TOO_LONG</code>	44306	The service name was too long
<code>NETWORK_PREFIX_TOO_LONG</code>	44307	The network name, excluding the domain, was too long
<code>NOT_INITIALIZED</code>	44308	The services layer was not yet initialized
<code>GENERAL_FAILURE</code>	44309	There was an unknown failure
<code>MAX_SERVICES_EXCEEDED</code>	44310	The maximum number of services has been reached
<code>SERVICE_NOT_RUNNING</code>	44311	The specified service was not running
<code>DATABASE_CLOSED</code>	44312	The database was closed
<code>INVALID_INSTANCE</code>	44313	The instance name argument was not valid
<code>NETWORK_EXISTS</code>	44314	The network name was already in existence
<code>NULL_ATTRIBUTES</code>	44315	All attributes specified were <code>NULL</code>
<code>INVALID_ARGUMENT</code>	44316	Invalid argument supplied
<code>DATABASE_READONLY</code>	44317	The database is open read-only
<code>MAX_SN_LENGTH</code>	44318	The total length of all running service network names exceeded the maximum allowable length

---

## Summary of DBMS\_SERVICE Subprograms

**Table 130-5 DBMS\_SERVICE Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CREATE_SERVICE Procedure</a> on page 130-10	Creates service
<a href="#">DELETE_SERVICE Procedure</a> on page 130-12	Deletes service
<a href="#">DISCONNECT_SESSION Procedure</a> on page 130-13	Disconnects service
<a href="#">MODIFY_SERVICE Procedure</a> on page 130-14	Modifies service
<a href="#">START_SERVICE Procedure</a> on page 130-16	Activates service
<a href="#">STOP_SERVICE Procedure</a> on page 130-17	Stops service

## CREATE\_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

---

**Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services. This is because the service attributes are stored in CRS by `srvctl`, and overwrite those specified by `DBMS_SERVICE`. The `DBMS_SERVICE` procedures do not update the CRS attributes.

---

---

**Note:** The functionality associated with the `edition` argument is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

### Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
  service_name      IN VARCHAR2,
  network_name     IN VARCHAR2,
  goal              IN NUMBER DEFAULT NULL,
  dtp              IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications IN BOOLEAN DEFAULT NULL,
  failover_method  IN VARCHAR2 DEFAULT NULL,
  failover_type    IN VARCHAR2 DEFAULT NULL,
  failover_retries IN NUMBER DEFAULT NULL,
  failover_delay   IN NUMBER DEFAULT NULL,
  clb_goal         IN NUMBER DEFAULT NULL,
  edition          IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 130–6 CREATE\_SERVICE Procedure Parameters**

Parameter	Description
<code>service_name</code>	Name of the service limited to 64 characters in the Data Dictionary
<code>network_name</code>	The network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET <code>service_names</code> character set (see <i>Oracle Database Net Services Reference</i> ).
<code>goal</code>	The workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> <li>■ <code>DBMS_SERVICE.GOAL_SERVICE_TIME</code></li> <li>■ <code>DBMS_SERVICE.GOAL_THROUGHPUT</code></li> <li>■ <code>DBMS_SERVICE.GOAL_NONE</code></li> </ul>
<code>dtp</code>	Declares the service to be for DTP or distributed transactions including XA transactions

**Table 130–6 (Cont.) CREATE\_SERVICE Procedure Parameters**

Parameter	Description
aq_ha_notifications	Determines whether HA events are sent through AQ for this service
failover_method	The TAF failover method for the service
failover_type	The TAF failover type for the service
failover_retries	The TAF failover retries for the service
failover_delay	The TAF failover delay for the service
clb_goal	Method used for Connection Load Balancing (see <a href="#">Table 130–2, "Constants used in Connection Balancing Goal Arguments"</a> )
edition	<p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument will have no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).</p>

## Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.us.oracle.com', 'ernie.us.oracle.com');
```

## DELETE\_SERVICE Procedure

This procedure deletes a service from the data dictionary.

---

---

**Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services. This is because the service attributes are stored in CRS by `srvctl`, and overwrite those specified by `DBMS_SERVICE`. Unless the service is also deleted with `srvctl`, it will be re-created in the database when CRS next starts the service.

---

---

### Syntax

```
DBMS_SERVICE.DELETE_SERVICE(  
    service_name    IN VARCHAR2);
```

### Parameters

**Table 130–7** *DELETE\_SERVICE Procedure Parameters*

Parameter	Description
<code>service_name</code>	Name of the service limited to 64 characters in the Data Dictionary

### Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.us.oracle.com');
```

## DISCONNECT\_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

### Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(
  service_name      IN VARCHAR2,
  disconnect_option IN NUMBER DEFAULT POST_TRANSACTION);
```

### Parameters

**Table 130–8** DISCONNECT\_SESSION Procedure Parameters

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary
disconnect_option	There are two options, package constants expressed as NUMBER: <ul style="list-style-type: none"> <li>■ POST_TRANSACTION = 0 : the session will disconnect after the current transaction commits or rolls back</li> <li>■ IMMEDIATE = 1 : sessions will be disconnected immediately</li> </ul> <p><b>Note:</b> IMMEDIATE or POST_TRANSACTION will be automatically translated as 1 and 0 respectively. However, passing-in a string literal (quoted using either the ' or " characters, such as "IMMEDIATE" or 'POST_TRANSACTION') will raise an error.</p>

### Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the DBMS\_JOB package or put the SQL session in background if the caller does not want to wait for all corresponding sessions to be disconnected.

### Examples

This disconnects sessions with service\_name 'ernie.us.oracle.com'.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.us.oracle.com');
```

## MODIFY\_SERVICE Procedure

This procedure modifies an existing service.

---

**Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services. This is because the service attributes are stored in CRS by `srvctl`, and overwrite those specified by `DBMS_SERVICE`. The `DBMS_SERVICE` procedures do not update the CRS attributes and therefore are not persistent, though they do take effect immediately, until the service is next started with `srvctl`.

---

---

**Note:** The functionality associated with the `edition` and `modify_edition` arguments is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

### Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(
  service_name      IN VARCHAR2,
  goal              IN NUMBER DEFAULT NULL,
  dtp              IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications IN BOOLEAN DEFAULT NULL,
  failover_method  IN VARCHAR2 DEFAULT NULL,
  failover_type    IN VARCHAR2 DEFAULT NULL,
  failover_retries IN NUMBER DEFAULT NULL,
  failover_delay   IN NUMBER DEFAULT NULL,
  clb_goal         IN NUMBER DEFAULT NULL,
  edition          IN VARCHAR2 DEFAULT NULL,
  modify_edition   IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 130–9 MODIFY\_SERVICE Procedure Parameters**

Parameter	Description
<code>service_name</code>	Name of the service limited to 64 characters in the Data Dictionary
<code>goal</code>	The workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> <li>▪ <code>DBMS_SERVICE.GOAL_SERVICE_TIME</code></li> <li>▪ <code>DBMS_SERVICE.GOAL_THROUGHPUT</code></li> <li>▪ <code>DBMS_SERVICE.GOAL_NONE</code></li> </ul>
<code>dtp</code>	Declares the service to be for DTP or distributed transactions including XA transactions
<code>aq_ha_notifications</code>	Determines whether HA events are sent through AQ for this service
<code>failover_method</code>	The TAF failover method for the service
<code>failover_type</code>	The TAF failover type for the service

**Table 130–9 (Cont.) MODIFY\_SERVICE Procedure Parameters**

Parameter	Description
failover_retries	The TAF failover retries for the service
failover_delay	The TAF failover delay for the service
clb_goal	Method used for Connection Load Balancing (see <a href="#">Table 130–2, "Constants used in Connection Balancing Goal Arguments"</a> )
edition	<p>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument will have no effect.</p> <p>During service creation or modification, no validation is performed on this parameter.</p> <p>At connection time, if the connecting user does not have <code>USE</code> privilege on the edition, or the edition does not exist, this raises the error <code>ORA-38802</code> (edition does not exist).</p>
modify_edition	If <code>TRUE</code> , the edition service attribute is updated to use the edition argument value. If <code>FALSE</code> or <code>NULL</code> , the edition attribute will not be updated.

## Usage Notes

- If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you must modify services using the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service will be modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` will be lost unless they are also made with the corresponding `srvctl` command. Service attribute modifications take effect immediately starting with 11.2.0.2 when the service is started or modified by `srvctl`.
- Although the edition attribute can be modified while the service is up and running, it may not be safe to do so. Users must proceed with caution since this will cause new connections to be connected at the new edition, while existing connection will not be affected. This can in turn cause mid-tier operations to connect to the wrong edition.

## START\_SERVICE Procedure

This procedure starts a service. This procedure alters the `service_name` IOP to contain this `service_name`. In Oracle RAC, implementing this option will act on the instance specified.

---

---

**Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services.

---

---

### Syntax

```
DBMS_SERVICE.START_SERVICE(
    service_name IN VARCHAR2,
    instance_name IN VARCHAR2);
```

### Parameters

**Table 130–10** *START\_SERVICE Procedure Parameters*

Parameter	Description
<code>service_name</code>	Name of the service limited to 64 characters in the Data Dictionary
<code>instance_name</code>	Name of the instance where the service must be activated (optional). The instance on which to start the service. <code>NULL</code> results in starting of the service on the local instance. In single instance this can only be the current instance or <code>NULL</code> . Specify <code>DBMS_SERVICE.ALL_INSTANCES</code> to start the service on all configured instances.

### Examples

```
DBMS_SERVICE.START_SERVICE('ernie.us.oracle.com');
```

## STOP\_SERVICE Procedure

This procedure stops a service, altering the `service_name` IOP to remove this `service_name`.

---

---

**Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services.

---

---

### Syntax

```
DBMS_SERVICE.STOP_SERVICE(
  service_name  IN VARCHAR2,
  instance_name IN VARCHAR2);
```

### Parameters

**Table 130–11 STOP\_SERVICE Procedure Parameters**

Parameter	Description
<code>service_name</code>	Name of the service limited to 64 characters in the Data Dictionary
<code>instance_name</code>	Name of the instance where the service must be stopped (optional). The instance on which to stop the service. <code>NULL</code> results in stopping of the service locally. In single instance this can only be the current instance or <code>NULL</code> . The default in Oracle RAC and exclusive case is <code>NULL</code> . Specify <code>DBMS_SERVICE.ALL_INSTANCES</code> to stop the service on all configured instances.

### Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.us.oracle.com');
```

This package provides access to SQL `ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- [Using DBMS\\_SESSION](#)
  - Security Model
  - Operational Notes
- [Data Structures](#)
- [Summary of DBMS\\_SESSION Subprograms](#)

---

## Using DBMS\_SESSION

- [Security Model](#)
- [Operational Notes](#)

## Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

## Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

## Data Structures

---

The DBMS\_SESSION package defines TABLE types.

### Table Types

- [INTEGER\\_ARRAY Table Type](#)
- [LNAME\\_ARRAY Table Type](#)

## INTEGER\_ARRAY Table Type

A table type of `BINARY_INTEGER`.

### Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

## LNAME\_ARRAY Table Type

A table type of VARCHAR2.

### Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

---

## Summary of DBMS\_SESSION Subprograms

**Table 131–1 DBMS\_SESSION Package Subprograms**

Subprogram	Description
<a href="#">CLEAR_ALL_CONTEXT Procedure</a> on page 131-9	Clears all context information
<a href="#">CLEAR_CONTEXT Procedure</a> on page 131-10	Clears the context
<a href="#">CLEAR_IDENTIFIER Procedure</a> on page 131-11	Clears the identifier
<a href="#">CLOSE_DATABASE_LINK Procedure</a> on page 131-12	Closes database link
<a href="#">FREE_UNUSED_USER_MEMORY Procedure</a> on page 131-13	Lets you reclaim unused memory after performing operations requiring large amounts of memory
<a href="#">GET_PACKAGE_MEMORY_UTILIZATION Procedure</a> on page 131-15	Describes static package memory usage
<a href="#">IS_ROLE_ENABLED Function</a> on page 131-16	Determines if the named role is enabled for the session.
<a href="#">IS_SESSION_ALIVE Function</a> on page 131-17	Determines if the specified session is active
<a href="#">LIST_CONTEXT Procedures</a> on page 131-18	Returns a list of active namespace and context for the current session
<a href="#">MODIFY_PACKAGE_STATE Procedure</a> on page 131-19	Used to perform various actions (as specified by the <code>action_flags</code> parameter) on the session state of all PL/SQL program units active in the session
<a href="#">SESSION_TRACE_DISABLE Procedure</a> on page 131-23	Resets the session-level SQL trace for the session from which it was called.
<a href="#">SESSION_TRACE_ENABLE Procedure</a> on page 131-24	Enables session-level SQL trace for the invoking session
<a href="#">RESET_PACKAGE Procedure</a> on page 131-25	De-instantiates all packages in the session
<a href="#">SET_CONTEXT Procedure</a> on page 131-27	Sets or resets the value of a context attribute
<a href="#">SET_EDITION_DEFERRED Procedure</a> on page 131-29	Requests a switch to the specified edition
<a href="#">SET_IDENTIFIER Procedure</a> on page 131-30	Sets the identifier
<a href="#">SET-NLS Procedure</a> on page 131-31	Sets Globalization Support (NLS)
<a href="#">SET_ROLE Procedure</a> on page 131-32	Sets role
<a href="#">SET_SQL_TRACE Procedure</a> on page 131-33	Turns tracing on or off
<a href="#">SWITCH_CURRENT_CONSUMER_GROUP Procedure</a> on page 131-34	Facilitates changing the current resource consumer group of a user's current session
<a href="#">UNIQUE_SESSION_ID Function</a> on page 131-36	Returns an identifier that is unique for all sessions currently connected to this database

## CLEAR\_ALL\_CONTEXT Procedure

### Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT  
namespace          VARCHAR2);
```

### Parameters

**Table 131–2 CLEAR\_ALL\_CONTEXT Procedure Parameters**

Parameter	Description
namespace	The namespace where the application context information is to be cleared. Required.

### Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

## CLEAR\_CONTEXT Procedure

### Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
  namespace      VARCHAR2,
  client_identifier VARCHAR2
  attribute      VARCHAR2);
```

### Parameters

**Table 131–3 CLEAR\_CONTEXT Procedure Parameters**

Parameter	Description
namespace	<p>Namespace in which the application context is to be cleared. Required.</p> <p>For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context.</p> <p>For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT.</p>
client_identifier	Applies to a global context and is optional for other types of contexts; 64-byte maximum
attribute	Specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_identifier arguments is cleared.

### Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS\_CONTEXT return the most recent value.

## **CLEAR\_IDENTIFIER Procedure**

This procedure removes the `set_client_id` in the session.

### **Syntax**

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

### **Usage Notes**

This procedure is executable by public.

## CLOSE\_DATABASE\_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:

```
ALTER SESSION CLOSE DATABASE LINK <name>
```

### Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (  
    dblink VARCHAR2);
```

### Parameters

**Table 131–4** *CLOSE\_DATABASE\_LINK Procedure Parameters*

Parameter	Description
dblink	Name of the database link to close

## FREE\_UNUSED\_USER\_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

---

---

**Note:** This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

---

---

### Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

### Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server:** This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server:** This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

### Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA

memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

## Examples

The following PL/SQL illustrates the method and the use of procedure `FREE_UNUSED_USER_MEMORY`.

```
CREATE PACKAGE foobar
  type number_idx_tbl is table of number indexed by binary_integer;

  store1_table number_idx_tbl;    -- PL/SQL indexed table
  store2_table number_idx_tbl;    -- PL/SQL indexed table
  store3_table number_idx_tbl;    -- PL/SQL indexed table
  ...
END;                                -- end of foobar

DECLARE
  ...
  empty_table number_idx_tbl;    -- uninitialized ("empty") version
BEGIN
  FOR i in 1..1000000 loop
    store1_table(i) := i;        -- load data
  END LOOP;
  ...
  store1_table := empty_table;    -- "truncate" the indexed table
  ...
  -
  dbms_session.free_unused_user_memory; -- give memory back to system

  store1_table(1) := 100;        -- index tables still declared;
  store2_table(2) := 200;        -- but truncated.
  ...
END;
```

## GET\_PACKAGE\_MEMORY\_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the [FREE\\_UNUSED\\_USER\\_MEMORY Procedure](#) is invoked.

### Syntax

```
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
    owner_names      OUT NOCOPY LNAME_ARRAY,
    unit_names       OUT NOCOPY LNAME_ARRAY,
    unit_types       OUT NOCOPY INTEGER_ARRAY,
    used_amounts     OUT NOCOPY INTEGER_ARRAY,
    free_amounts     OUT NOCOPY INTEGER_ARRAY);
```

### Parameters

**Table 131-5** GET\_PACKAGE\_MEMORY\_UTILIZATION Function Parameters

Parameter	Description
owner_name	Owner of package
unit_name	Name of package
unit_types	Value of the type# columns of the dictionary table obj\$
used_amounts	Amount of allocated memory specified in bytes
free_amounts	Amount of available memory specified in bytes

## IS\_ROLE\_ENABLED Function

This function determines if the named role is enabled for this session.

### Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (  
    rolename    VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 131-6 IS\_ROLE\_ENABLED Function Parameters**

Parameter	Description
rolename	Name of the role.\

### Return Values

**Table 131-7 IS\_ROLE\_ENABLED Function Return Values**

Return	Description
is_role_enabled	TRUE or FALSE, depending on whether the role is enabled

## IS\_SESSION\_ALIVE Function

This function determines if the specified session is active.

### Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (  
    uniqueid VARCHAR2)  
RETURN BOOLEAN;
```

### Parameters

**Table 131–8 IS\_SESSION\_ALIVE Function Parameters**

Parameter	Description
uniqueid	Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.

### Return Values

**Table 131–9 IS\_SESSION\_ALIVE Function Return Values**

Return	Description
is_session_alive	TRUE or FALSE, depending on whether the session is active

## LIST\_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

### Syntax

```
TYPE AppCtxRecTyp IS RECORD (
    namespace VARCHAR2(30),
    attribute VARCHAR2(30),
    value      VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
    list OUT AppCtxTabTyp,
    size OUT NUMBER);
```

### Parameters

**Table 131–10 LIST\_CONTEXT Procedure Parameters**

Parameter	Description
list	Buffer to store a list of application context set in the current session

### Return Values

**Table 131–11 LIST\_CONTEXT Procedure Return Values**

Return	Description
list	A list of (namespace, attribute, values) set in current session
size	Returns the number of entries in the buffer returned

### Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because list is a table type variable, its size is dynamically adjusted to the size of returned list.

## MODIFY\_PACKAGE\_STATE Procedure

This procedure is used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running. The procedure uses the DBMS\_SESSION constants listed in [Table 131–13](#).

### Syntax

```
DBMS_SESSION.MODIFY_PACKAGE_STATE (
    action_flags IN PLS_INTEGER);
```

### Parameters

**Table 131–12** *MODIFY\_PACKAGE\_STATE Procedure Parameters*

Parameter	Description
<code>action_flags</code>	<p>Bit flags that determine the action taken on PL/SQL program units:</p> <p><code>DBMS_SESSION.FREE_ALL_RESOURCES</code> (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstated and package globals are reinitialized. Invoking <code>MODIFY_PACKAGE_STATE</code> with the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> parameter provides functionality identical to the <code>DBMS_SESSION.RESET_PACKAGE()</code> interface.</p> <p><code>DBMS_SESSION.REINITIALIZE</code> (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the <code>DBMS_SESSION.REINITIALIZE</code> flag is similar to the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> flag in that both have the effect of reinitializing all packages.</p> <p>However, <code>DBMS_SESSION.REINITIALIZE</code> should exhibit better performance than the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> option because:</p> <ul style="list-style-type: none"> <li>■ Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused.</li> <li>■ Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use.</li> <li>■ The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated.</li> </ul>

## Usage Notes

See the parameter descriptions in [Table 131–14](#) for the differences between the flags and why `DBMS_SESSION.REINITIALIZE` exhibits better performance than `DBMS_SESSION.FREE_ALL_RESOURCES`.

**Table 131–13 Action\_flags Constants for MODIFY\_PACKAGE\_STATE**

Constant	Description
<code>FREE_ALL_RESOURCES</code>	<code>PLS_INTEGER:= 1</code>
<code>REINITIALIZE</code>	<code>PLS_INTEGER:= 2</code>

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```

package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ...
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/

```

For the package P, reinitialization involves:

- Setting `P.n` to `NULL`
- Invoking function `P2.foo` and setting `P.m` to the value returned from `P2.foo`
- Setting `P.d` to the return value of `SYSDATE` built-in
- Closing cursor `P.c` if it was previously opened
- Setting `P.v` to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.

- When using `FREE_ALL_RESOURCES` or `REINITIALIZE`, make sure that resetting package variable values does not affect the application.
- Because `DBMS_SESSION.REINITIALIZE` does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the `FREE_ALL_RESOURCES` flag or the `RESET_PACKAGE` procedure had been used. For instance, after performing `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)`, if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until `DBMS_SESSION.RESET_PACKAGE` is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)` does not compile on the client because it uses the constant `DBMS_SESSION.REINITIALIZE`.

Instead, use `DBMS_SESSION.MODIFY_PACKAGE_STATE(2)` on the client, because the argument is explicitly provided.

## Examples

This example illustrates the use of `DBMS_SESSION.MODIFY_PACKAGE_STATE`. Consider a package `P` with some global state (a cursor `c` and a number `cnt`). When the package is first initialized, the package variable `cnt` is 0 and the cursor `c` is `CLOSED`. Then, in the session, change the value of `cnt` to 111 and also execute an `OPEN` operation on the cursor. If you call `print_status` to display the state of the package, you see that `cnt` is 111 and that the cursor is `OPEN`. Next, call `DBMS_SESSION.MODIFY_PACKAGE_STATE`. If you print the status of the package `P` again using `print_status`, you see that `cnt` is 0 again and the cursor is `CLOSED`. If the call to `DBMS_SESSION.MODIFY_PACKAGE_STATE` had not been made, then the second `print_status` would have printed 111 and `OPEN`.

```

create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2  P.cnt := 111;
  3  open p.c;

```

```
4 P.print_status;
5 end;
6 /
P.cnt = 111
P.c is OPEN
```

PL/SQL procedure successfully completed.

```
SQL> begin
2 dbms_session.modify_package_state(dbms_session.reinitialize);
3 end;
4 /
```

PL/SQL procedure successfully completed.

```
SQL> set serveroutput on;
```

```
SQL>
```

```
SQL> begin
2 P.print_status;
3 end;
4 /
```

```
P.cnt = 0
```

```
P.c is CLOSED
```

PL/SQL procedure successfully completed.

## **SESSION\_TRACE\_DISABLE Procedure**

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

### **Syntax**

```
DBMS_SESSION.SESSION_TRACE_DISABLE;
```

## SESSION\_TRACE\_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

### Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(  
    waits      IN   BOOLEAN DEFAULT TRUE,  
    binds      IN   BOOLEAN DEFAULT FALSE,  
    plan_stat  IN   VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 131–14** SESSION\_TRACE\_ENABLE Procedure Parameters

Parameter	Description
waits	Specifies if wait information is to be traced
binds	Specifies if bind information is to be traced
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

## RESET\_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

---

**Note:** See "[SESSION\\_TRACE\\_ENABLE Procedure](#)" on page 131-24. The `MODIFY_PACKAGE_STATE` interface, introduced in Oracle9i, provides an equivalent of the `RESET_PACKAGE` capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

---

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

### Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

### Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

---

**Note:** `RESET_PACKAGE` only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

---

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls `RESET_PACKAGE`. The `RESET_PACKAGE` effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

### Examples

This SQL\*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

## SET\_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

### Syntax

```
DBMS_SESSION.SET_CONTEXT (
    namespace VARCHAR2,
    attribute  VARCHAR2,
    value      VARCHAR2,
    username   VARCHAR2,
    client_id  VARCHAR2 );
```

### Parameters

**Table 131–15 SET\_CONTEXT Procedure Parameters**

Parameter	Description
namespace	Namespace of the application context to be set, limited to 30 bytes
attribute	Attribute of the application context to be set, limited to 30 bytes
value	Value of the application context to be set, limited to 4 kilobytes.
username	Database username attribute of the application context. Default: NULL
client_id	Application-specific client_id attribute of the application context (64-byte maximum). Default: NULL

### Usage Notes

- The first three parameters are required for all types of context.
- The username parameter must be a valid SQL identifier.
- The client\_id parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for set\_identifier.
- If the namespace parameter is a global context namespace, then the username parameter is matched against the current database user name in the session, and the client\_id parameter is matched against the current client\_id in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of SET\_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.

- If the value of the parameter in the namespace has been set, `SET_CONTEXT` overwrites this value.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

**See Also:** *Oracle Database Security Guide* for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

## SET\_EDITION\_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

### Syntax

```
DBMS_SESSION.SET_EDITION_DEFERRED (  
    edition    IN    VARCHAR2);
```

### Parameters

**Table 131–16** *SET\_EDITION\_DEFERRED Procedure Parameters*

Parameter	Description
edition	Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double-quotes must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name and, if double-quotes are not used, the contents are set in uppercase. The caller must have USE privilege on the named edition.

## SET\_IDENTIFIER Procedure

This procedure sets the client ID in the session.

### Syntax

```
DBMS_SESSION.SET_IDENTIFIER (  
    client_id VARCHAR2);
```

### Parameters

**Table 131–17 SET\_IDENTIFIER Procedure Parameters**

Parameter	Description
<code>client_id</code>	The application-specific identifier of the current database session

### Usage Notes

Note the following:

- `SET_IDENTIFIER` initializes the current session with a client identifier to identify the associated global application context
- `client_id` is case sensitive; it must match the `client_id` parameter in the `set_context`
- This procedure is executable by public

## SET\_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the following SQL statement:

```
ALTER SESSION SET <nls_parameter> = <value>
```

### Syntax

```
DBMS_SESSION.SET_NLS (  
    param VARCHAR2,  
    value VARCHAR2);
```

### Parameters

**Table 131–18 SET\_NLS Procedure Parameters**

Parameter	Description
param	Globalization Support parameter. The parameter name must begin with 'NLS'.
value	Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, "set_nls ('nls_date_format','DD-MON-YY')".

## SET\_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the SET ROLE SQL statement.

### Syntax

```
DBMS_SESSION.SET_ROLE (  
    role_cmd VARCHAR2);
```

### Parameters

**Table 131–19 SET\_ROLE Procedure Parameters**

Parameter	Description
role_cmd	Text is appended to "set role" and then run as SQL

### Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

## SET\_SQL\_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the following SQL statement:

```
ALTER SESSION SET SQL_TRACE ...
```

### Syntax

```
DBMS_SESSION.SET_SQL_TRACE (  
    sql_trace boolean);
```

### Parameters

**Table 131–20** *SET\_SQL\_TRACE Procedure Parameters*

Parameter	Description
sql_trace	TRUE turns tracing on, FALSE turns tracing off

## SWITCH\_CURRENT\_CONSUMER\_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

### Syntax

```
DBMS_SESSION.switch_current_consumer_group (
    new_consumer_group    IN  VARCHAR2,
    old_consumer_group    OUT VARCHAR2,
    initial_group_on_error IN  BOOLEAN);
```

### Parameters

**Table 131–21 SWITCH\_CURRENT\_CONSUMER\_GROUP Procedure Parameters**

Parameter	Description
<code>new_consumer_group</code>	Name of consumer group to which you want to switch
<code>old_consumer_group</code>	Name of the consumer group from which you just switched out
<code>initial_group_on_error</code>	If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error

### Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

---

**Note:** You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

---

### Exceptions

**Table 131–22 SWITCH\_CURRENT\_CONSUMER\_GROUP Procedure Exceptions**

Exception	Description
29368	Non-existent consumer group
1031	Insufficient privileges
29396	Cannot switch to OTHER_GROUPS consumer group

### Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to TRUE, SWITCH\_CURRENT\_CONSUMER\_GROUP puts the current session into the default group, if it can't put it into the group designated by `new_consumer_group`. The error associated with the attempt to move

a session into `new_consumer_group` is raised, even though the current consumer group has been changed to the initial consumer group.

## Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
  old_group varchar2(30);
  prev_group varchar2(30);
  curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error is thrown, but the consumer group does not change
  -- because 'initial_group_on_error' is set to FALSE

  dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)

  BEGIN
    -- perform some operations while under privileged group

  EXCEPTION
    WHEN OTHERS THEN
      -- It is possible that the procedure owner does not have privileges
      -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
      -- that the user is moved out of the privileged group in such a
      -- situation

      dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
      RAISE;
    END;

  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/
```

## UNIQUE\_SESSION\_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

### Syntax

```
DBMS_SESSION.UNIQUE_SESSION_ID  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

### Return Values

**Table 131–23** *UNIQUE\_SESSION\_ID Function Return Values*

Return	Description
unique_session_id	Returns up to 24 bytes

---

---

## DBMS\_SHARED\_POOL

The `DBMS_SHARED_POOL` package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. `DBMS_SHARED_POOL` enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- [Using DBMS\\_SHARED\\_POOL](#)
  - Overview
  - Operational Notes
- [Summary of DBMS\\_SHARED\\_POOL Subprograms](#)

---

## Using DBMS\_SHARED\_POOL

- [Overview](#)
- [Operational Notes](#)

## Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

DBMS\_SHARED\_POOL is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, DBMS\_SHARED\_POOL supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. DBMS\_SHARED\_POOL is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

## Operational Notes

To create `DBMS_SHARED_POOL`, run the `DBMSPOOL.SQL` script. The `PRVTPPOOL.PLB` script is automatically executed after `DBMSPOOL.SQL` runs. These scripts are *not* run by as part of standard database creation.

---

## Summary of DBMS\_SHARED\_POOL Subprograms

**Table 132-1 DBMS\_SHARED\_POOL Package Subprograms**

Subprogram	Description
<a href="#">ABORTED_REQUEST_THRESHOLD Procedure</a> on page 132-6	Sets the aborted request threshold for the shared pool
<a href="#">KEEP Procedure</a> on page 132-7	Keeps an object in the shared pool
<a href="#">MARKHOT Procedure</a> on page 132-9	Marks a library cache object as a hot object
<a href="#">PURGE Procedure</a> on page 132-10	Purges the named object or specified heap(s) of the object
<a href="#">SIZES Procedure</a> on page 132-12	Shows objects in the shared pool that are larger than the specified size
<a href="#">UNKEEP Procedure</a> on page 132-13	Unkeeps the named object
<a href="#">UNMARKHOT Procedure</a> on page 132-14	Unmarks a library cache object as a hot object

## ABORTED\_REQUEST\_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

### Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (  
    threshold_size NUMBER);
```

### Parameters

**Table 132–2 ABORTED\_REQUEST\_THRESHOLD Procedure Parameters**

Parameter	Description
threshold_size	Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive.

### Exceptions

An exception is raised if the threshold is not in the valid range.

### Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED\_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than threshold\_size. This user gets the 'out of memory' error without attempting to search the LRU list.

## KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

### Syntax

```
DBMS_SHARED_POOL.KEEP (
    name VARCHAR2,
    flag CHAR          DEFAULT 'P');
```

### Parameters

**Table 132–3 KEEP Procedure Parameters**

Parameter	Description
name	Name of the object to keep.  The value for this identifier is the concatenation of the address and hash_value columns from the v\$sqlarea view. This is displayed by the SIZES procedure.  Currently, TABLE and VIEW objects may not be kept.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name.  Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function.  Set to 'T' or 't' to specify that the input is the name of a type.  Set to 'R' or 'r' to specify that the input is the name of a trigger.  Set to 'Q' or 'q' to specify that the input is the name of a sequence.  In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.

### Exceptions

An exception is raised if the named object cannot be found.

### Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, and types which are specified by name
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte

names are allowed). A cursor can be kept by `DBMS_SHARED_POOL.KEEP('0034CDFF, 20348871', 'C')`, `0034CDFF` being the `ADDRESS` and `20348871` the `HASH_VALUE`. Note that the complete hexadecimal address must be in the first 8 characters.

## MARKHOT Procedure

This procedure marks a library cache object as a hot object.

### Syntax

```
DBMS_SHARED_POOL.MARKHOT (
  schema      VARCHAR2,
  objname     VARCHAR2,
  namespace   NUMBER DEFAULT 1,
  global      BOOLEAN DEFAULT TRUE);
```

```
DBMS_SHARED_POOL.MARKHOT (
  hash        VARCHAR2,
  namespace   NUMBER DEFAULT 1,
  global      BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 132–4 MARKHOT Procedure Parameters**

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object
namespace	Number indicating the library cache namespace in which the object is to be searched
global	If TRUE (default), mark the object hot on all OracleRAC instances
hash	16-byte hash value for the object

### Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)

## PURGE Procedure

This procedure purges the named object or specified heap(s) of the object.

### Syntax

```
DBMS_SHARED_POOL.PURGE (
  name          VARCHAR2,
  flag          CHAR DEFAULT 'P',
  heaps         NUMBER DEFAULT 1);
```

```
DBMS_SHARED_POOL.PURGE (
  schema        VARCHAR2,
  objname       VARCHAR2,
  namespace     NUMBER,
  heaps         NUMBER);
```

```
DBMS_SHARED_POOL.PURGE (
  hash          VARCHAR2,
  namespace     NUMBER,
  heaps         NUMBER);
```

### Parameters

**Table 132–5 PURGE Procedure Parameters**

Parameter	Description
name	Name of the object to purge.  The value for this identifier is the concatenation of the address and hash_value columns from the v\$sqlarea view. This is displayed by the SIZES procedure.  Currently, TABLE and VIEW objects may not be purged.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name.  Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function.  Set to 'T' or 't' to specify that the input is the name of a type.  Set to 'R' or 'r' to specify that the input is the name of a trigger.  Set to 'Q' or 'q' to specify that the input is the name of a sequence.  In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.
heaps	Heaps to be purged. For example, if heap 0 and heap 6 are to be purged:  1<<0   1<<6 => hex 0x41 => decimal 65, so specify heaps =>65.  Default is 1, that is, heap 0 which means the whole object would be purged
schema	User name or the schema to which the object belongs
objname	Name of the object to purge
namespace	Parameter is a number indicating the library cache namespace in which the object is to be searched

**Table 132-5 (Cont.) PURGE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
hash	16-byte hash value for the object

**Exceptions**

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

**Usage Notes**

All objects supported by the [KEEP Procedure](#) are supported for PURGE.

## SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

### Syntax

```
DBMS_SHARED_POOL.SIZES (  
    minsize NUMBER);
```

### Parameters

**Table 132–6 SIZES Procedure Parameters**

Parameter	Description
<code>minsize</code>	Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.

### Usage Notes

Issue the `SQLDBA` or `SQLPLUS` `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

## UNKEEP Procedure

This procedure unkeeps the named object.

### Syntax

```
DBMS_SHARED_POOL.UNKEEP (  
    name VARCHAR2,  
    flag CHAR      DEFAULT 'P');
```

---

---

**Caution:** This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

---

---

### Parameters

**Table 132–7 UNKEEP Procedure Parameters**

Parameter	Description
name	Name of the object to unkeep. See description of the name object for the KEEP procedure.
flag	See description of the flag parameter for the KEEP procedure.

### Exceptions

An exception is raised if the named object cannot be found.

## UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

### Syntax

```
DBMS_SHARED_POOL.UNMARKHOT (  
    schema          VARCHAR2,  
    objname         VARCHAR2,  
    namespace       NUMBER DEFAULT 1,  
    global          BOOLEAN DEFAULT TRUE);
```

```
DBMS_SHARED_POOL.UNMARKHOT (  
    hash           VARCHAR2,  
    namespace       NUMBER DEFAULT 1,  
    global          BOOLEAN DEFAULT TRUE);
```

### Parameters

**Table 132–8 UNMARKHOT Procedure Parameters**

Parameter	Description
schema	User name or the schema to which the object belongs
objname	Name of the object
namespace	Number indicating the library cache namespace in which the object is to be searched
global	If TRUE (default), unmark the object hot on all Oracle RAC instances
hash	16-byte hash value for the object

### Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

The DBMS\_SPACE package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- [Using DBMS\\_SPACE](#)
  - Security Model
- [Data Structures](#)
- [Summary of DBMS\\_SPACE Subprograms](#)

## Using DBMS\_SPACE

- [Security Model](#)
-

## Security Model

This package runs with `SYS` privileges. The execution privilege is granted to `PUBLIC`. Subprograms in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

## Data Structures

The DBMS\_SPACE package defines an OBJECT type, a RECORD type, and a TABLE type.

### OBJECT Types

[CREATE\\_TABLE\\_COST\\_COLINFO](#) Object Type

### RECORD Types

[ASA\\_RECO\\_ROW](#) Record Type

### TABLE Types

[ASA\\_RECO\\_ROW\\_TB](#) Table Type

---

## CREATE\_TABLE\_COST\_COLINFO Object Type

This type describes the data type and size of a column in the table.

### Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(  
  col_type    VARCHAR(200),  
  col_size    NUMBER)
```

### Attributes

**Table 133-1** CQ\_NOTIFICATION\$\_DESCRIPTOR Object Type

Attribute	Description
col_type	Column type
col_size	Column size

## ASA\_RECO\_ROW Record Type

This type contains the column type of individual columns returned by the [ASA\\_RECOMMENDATIONS Function](#).

### Syntax

```
TYPE asa_reco_row IS RECORD (
    tablespace_name    VARCHAR2 (30) ,
    segment_owner     VARCHAR2 (30) ,
    segment_name      VARCHAR2 (30) ,
    segment_type      VARCHAR2 (18) ,
    partition_name    VARCHAR2 (30) ,
    allocated_space    NUMBER,
    used_space        NUMBER,
    reclaimable_space NUMBER,
    chain_rowexcess   NUMBER,
    recommendations   VARCHAR2 (1000) ,
    c1                VARCHAR2 (1000) ,
    c2                VARCHAR2 (1000) ,
    c3                VARCHAR2 (1000) ,
    task_id           NUMBER,
    mesg_id           NUMBER) ;
```

### Attributes

**Table 133–2 ASA\_RECO\_ROW Attributes**

Field	Description
tablespace_name	Name of the tablespace containing the object
segment_owner	Name of the schema
segment_name	Name of the object
segment_type	Type of the segment 'TABLE','INDEX' and so on
partition_name	Name of the partition
allocated_space	Space allocated to the segment
used_space	Space actually used by the segment
reclaimable_space	Reclaimable free space in the segment
chain_rowexcess	Percentage of excess chain row pieces that can be eliminated
recommendations	Recommendation or finding for this segment
c1	Command associated with the recommendation
c2	Command associated with the recommendation
c3	Command associated with the recommendation
task_id	Advisor Task that processed this segment
mesg_id	Message ID corresponding to the recommendation

## ASA\_RECO\_ROW\_TB Table Type

### Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

---

## Summary of DBMS\_SPACE Subprograms

**Table 133-3 DBMS\_SPACE Package Subprograms**

Subprogram	Description
<a href="#">ASA_RECOMMENDATIONS Function</a> on page 133-9	Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user
<a href="#">CREATE_INDEX_COST Procedure</a> on page 133-10	Determines the cost of creating an index on an existing table
<a href="#">CREATE_TABLE_COST Procedures</a> on page 133-11	Determines the size of the table given various attributes
<a href="#">FREE_BLOCKS Procedure</a> on page 133-13	Returns information about free blocks in an object (table, index, or cluster)
<a href="#">ISDATAFILEDROPPABLE_NAME Procedure</a> on page 133-15	Checks whether a datafile is droppable
<a href="#">OBJECT_DEPENDENT_SEGMENTS Function</a> on page 133-16	Returns the list of segments that are associated with the object
<a href="#">OBJECT_GROWTH_TREND Function</a> on page 133-18	A table function where each row describes the space usage of the object at a specific point in time
<a href="#">SPACE_USAGE Procedures</a> on page 133-20	Returns information about free blocks in an auto segment space managed segment
<a href="#">UNUSED_SPACE Procedure</a> on page 133-23	Returns information about unused space in an object (table, index, or cluster)

## ASA\_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

### Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (
    all_runs          IN    VARCHAR2 DEFAULT := TRUE,
    show_manual      IN    VARCHAR2 DEFAULT := TRUE,
    show_findings    IN    VARCHAR2 DEFAULT := FALSE)
RETURN ASA_RECO_ROW_TB PIPELINED;
```

### Parameters

**Table 133–4** *ASA\_RECOMMENDATIONS Procedure Parameters*

Parameter	Description
all_runs	If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.
show_manual	If TRUE, we show the results of manual invocations only. The auto advisor results are excluded. If FALSE, results of manual invocation of segment advisor are not returned.
show_findings	Show only the findings instead of the recommendations

## CREATE\_INDEX\_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

### Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
  ddl          IN   VARCHAR2,
  used_bytes   OUT  NUMBER,
  alloc_bytes  OUT  NUMBER,
  plan_table   IN   VARCHAR2 DEFAULT NULL);
```

### Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

### Parameters

**Table 133–5 CREATE\_INDEX\_COST Procedure Parameters**

Parameter	Description
ddl	The create index DDL statement
used_bytes	The number of bytes representing the actual index data
alloc_bytes	Size of the index when created in the tablespace
plan_table	Which plan table to use, default NULL

### Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

## CREATE\_TABLE\_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

### Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
  tablespace_name  IN VARCHAR2,
  avg_row_size     IN NUMBER,
  row_count        IN NUMBER,
  pct_free         IN NUMBER,
  used_bytes       OUT NUMBER,
  alloc_bytes      OUT NUMBER);
```

```
DBMS_SPACE.CREATE_TABLE_COST (
  tablespace_name  IN VARCHAR2,
  colinfos         IN CREATE_TABLE_COST_COLUMNS,
  row_count        IN NUMBER,
  pct_free         IN NUMBER,
  used_bytes       OUT NUMBER,
  alloc_bytes      OUT NUMBER);
```

```
CREATE TYPE create_table_cost_colinfo IS OBJECT (
  COL_TYPE  VARCHAR(200),
  COL_SIZE  NUMBER);
```

### Parameters

**Table 133–6 CREATE\_TABLE\_COST Procedure Parameters**

Parameter	Description
tablespace_name	The tablespace in which the object will be created. The default is SYSTEM tablespace.
avg_row_size	The anticipated average row size in the table
colinfos	The description of the columns
row_count	The anticipated number of rows in the table
pct_free	The percentage of free space in each block for future expansion of existing rows due to updates
used_bytes	The space used by user data
alloc_bytes	The size of the object taking into account the tablespace extent characteristics

## Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, `pctfree` etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

## Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  c1 sys.create_table_cost_columns;
BEGIN
  c1 := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',c1,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```

## FREE\_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster). See [SPACE\\_USAGE Procedures](#) for returning free block information in an auto segment space managed segment.

### Syntax

```
DBMS_SPACE.FREE_BLOCKS (
  segment_owner   IN VARCHAR2,
  segment_name    IN VARCHAR2,
  segment_type    IN VARCHAR2,
  freelist_group_id IN NUMBER,
  free_blks       OUT NUMBER,
  scan_limit      IN NUMBER DEFAULT NULL,
  partition_name  IN VARCHAR2 DEFAULT NULL);
```

### Pragmas

```
pragma restrict_references (free_blocks,WNDS);
```

### Parameters

**Table 133–7 FREE\_BLOCKS Procedure Parameters**

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> <li>■ TABLE</li> <li>■ TABLE PARTITION</li> <li>■ TABLE SUBPARTITION</li> <li>■ INDEX</li> <li>■ INDEX PARTITION</li> <li>■ INDEX SUBPARTITION</li> <li>■ CLUSTER</li> <li>■ LOB</li> <li>■ LOB PARTITION</li> <li>■ LOB SUBPARTITION</li> </ul>
freelist_group_id	Freelist group (instance) whose free list size is to be computed
free_blks	Returns count of free blocks for the specified group
scan_limit	Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.

**Examples**

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

---

---

**Note:** An error is raised if `scan_limit` is not a positive number.

---

---

## ISDATAFILEDROPPABLE\_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

### Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (
  filename      IN      VARCHAR2,
  retval        OUT     NUMBER);
```

### Pragmas

```
pragma restrict_references (free_blocks,WNDS);
```

### Parameters

**Table 133–8 ISDATAFILEDROPPABLE\_NAME Procedure Parameters**

Parameter	Description
filename	Name of the file
retval	Values: 0 if the file is not droppable, 1 if the file is droppable.

### Examples

```
DECLARE
  fname      VARCHAR2(100);
  retval     NUMBER;
BEGIN
  SELECT file_name
  INTO fname
  FROM dba_data_files
  WHERE file_name like '%empty%';

  DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname, retval);
  DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

## OBJECT\_DEPENDENT\_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

### Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS (
  objowner   IN   VARCHAR2,
  objname    IN   VARCHAR2,
  partname   IN   VARCHAR2,
  objtype    IN   NUMBER)
RETURN dependent_segments_table PIPELINED;
```

### Parameters

**Table 133–9** *OBJECT\_DEPENDENT\_SEGMENTS Function Parameters*

Parameter	Description
objowner	The schema containing the object
objname	The name of the object
partname	The name of the partition
objtype	Type of the object: <ul style="list-style-type: none"> <li>▪ OBJECT_TYPE_TABLE constant positive := 1;</li> <li>▪ OBJECT_TYPE_NESTED_TABLE constant positive := 2;</li> <li>▪ OBJECT_TYPE_INDEX constant positive := 3;</li> <li>▪ OBJECT_TYPE_CLUSTER constant positive := 4;</li> <li>▪ OBJECT_TYPE_TABLE_PARTITION constant positive := 7;</li> <li>▪ OBJECT_TYPE_INDEX_PARTITION constant positive := 8;</li> <li>▪ OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9;</li> <li>▪ OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10;</li> <li>▪ OBJECT_TYPE_MV constant positive := 13;</li> <li>▪ OBJECT_TYPE_MVLOG constant positive := 14;</li> </ul>

### Return Values

The content of one row of a `dependent_segments_table`:

```
TYPE object_dependent_segment IS RECORD (
  segment_owner   VARCHAR2(100),
  segment_name    VARCHAR2(100),
  segment_type    VARCHAR2(100),
  tablespace_name VARCHAR2(100),
  partition_name  VARCHAR2(100),
```

---

```
lob_column_name    VARCHAR2(100);
```

**Table 133–10** *OBJECT\_DEPENDENT\_SEGMENT Type Parameters*

<b>Parameter</b>	<b>Description</b>
segment_owner	The schema containing the segment
segment_name	The name of the segment
segment_type	The type of the segment, such as table, index or LOB
tablespace_name	The name of the tablespace
partition_name	The name of the partition, if any
lob_column_name	The name of the LOB column, if any

## OBJECT\_GROWTH\_TREND Function

This is a table function. The output will be in the form of one or more rows where each row describes the space usage of the object at a specific point in time. Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

### Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
  object_owner      IN   VARCHAR2,
  object_name       IN   VARCHAR2,
  object_type       IN   VARCHAR2,
  partition_name    IN   VARCHAR2 DEFAULT NULL,
  start_time        IN   TIMESTAMP DEFAULT NULL,
  end_time          IN   TIMESTAMP DEFAULT NULL,
  interval          IN   DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
  skip_interpolated IN   VARCHAR2 DEFAULT 'FALSE',
  timeout_seconds   IN   NUMBER DEFAULT NULL,
  single_datapoint_flag IN VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

### Parameters

**Table 133–11** OBJECT\_GROWTH\_TREND Function Parameters

Parameter	Description
object_owner	The schema containing the object
object_name	The name of the object
object_type	The type of the object
partition_name	The name of the partition
start_time	Statistics generated after this time will be used in generating the growth trend
end_time	Statistics generated until this time will be used in generating the growth trend
interval	The interval at which to sample
skip_interpolated	Whether interpolation of missing values should be skipped
timeout_seconds	The time-out value for the function in seconds
single_data_point_flag	Whether in the absence of statistics the segment should be sampled

### Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
  timepoint      TIMESTAMP,
  space_usage    NUMBER,
  space_alloc    NUMBER,
  quality        VARCHAR(20));
```

**Table 133-12** *OBJECT\_GROWTH\_TREND\_ROW* Type Parameters

<b>Parameter</b>	<b>Description</b>
timepoint	The time at which the statistic was recorded
space_usage	The space used by data
space_alloc	The size of the segment including overhead and unused space
quality	The quality of result: "GOOD", "INTERPOLATED", "PROJECTION"

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

## SPACE\_USAGE Procedures

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBs, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBs.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBs in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBs.

### Syntax

```
DBMS_SPACE.SPACE_USAGE(
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    unformatted_blocks OUT NUMBER,
    unformatted_bytes  OUT NUMBER,
    fs1_blocks         OUT NUMBER,
    fs1_bytes          OUT NUMBER,
    fs2_blocks         OUT NUMBER,
    fs2_bytes          OUT NUMBER,
    fs3_blocks         OUT NUMBER,
    fs3_bytes          OUT NUMBER,
    fs4_blocks         OUT NUMBER,
    fs4_bytes          OUT NUMBER,
    full_blocks        OUT NUMBER,
    full_bytes         OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SPACE.SPACE_USAGE(
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    segment_size_blocks OUT NUMBER,
    segment_size_bytes OUT NUMBER,
    used_blocks        OUT NUMBER,
    used_bytes         OUT NUMBER,
    expired_blocks     OUT NUMBER,
    expired_bytes      OUT NUMBER,
    unexpired_blocks   OUT NUMBER,
    unexpired_bytes    OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 133–13** SPACE\_USAGE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Name of the segment to be analyzed
partition_name	Partition name of the segment to be analyzed

**Table 133–13 (Cont.) SPACE\_USAGE Procedure Parameters**

Parameter	Description
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> <li>▪ TABLE</li> <li>▪ TABLE PARTITION</li> <li>▪ TABLE SUBPARTITION</li> <li>▪ INDEX</li> <li>▪ INDEX PARTITION</li> <li>▪ INDEX SUBPARTITION</li> <li>▪ CLUSTER</li> <li>▪ LOB</li> <li>▪ LOB PARTITION</li> <li>▪ LOB SUBPARTITION</li> </ul>
unformatted_blocks	Total number of blocks unformatted
unformatted_bytes	Total number of bytes unformatted
fs1_blocks	Number of blocks having at least 0 to 25% free space
fs1_bytes	Number of bytes having at least 0 to 25% free space
fs2_blocks	Number of blocks having at least 25 to 50% free space
fs2_bytes	Number of bytes having at least 25 to 50% free space
fs3_blocks	Number of blocks having at least 50 to 75% free space
fs3_bytes	Number of bytes having at least 50 to 75% free space
fs4_blocks	Number of blocks having at least 75 to 100% free space
fs4_bytes	Number of bytes having at least 75 to 100% free space
full_blocks	Total number of blocks full in the segment
full_bytes	Total number of bytes full in the segment
segment_size_blocks	Number of blocks allocated to the segment
segment_size_bytes	Number of bytes allocated to the segment
used_blocks	Number blocks allocated to the LOB that contains active data
used_bytes	Number bytes allocated to the LOB that contains active data
expired_blocks	Number of expired blocks used by the LOB to keep version data
expired_bytes	Number of expired bytes used by the LOB to keep version data
unexpired_blocks	Number of unexpired blocks used by the LOB to keep version data
unexpired_bytes	Number of unexpired bytes used by the LOB to keep version data
partition_name	Name of the partition (NULL if not a partition)

**Examples**

```
variable unf number;
variable unfb number;
variable fs1 number;
```

```
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                       'TABLE',
                       :unf, :unfb,
                       :fs1, :fs1b,
                       :fs2, :fs2b,
                       :fs3, :fs3b,
                       :fs4, :fs4b,
                       :full, :fullb);

end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
```

## UNUSED\_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

### Syntax

```
DBMS_SPACE.UNUSED_SPACE (
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    total_blocks       OUT NUMBER,
    total_bytes        OUT NUMBER,
    unused_blocks      OUT NUMBER,
    unused_bytes       OUT NUMBER,
    last_used_extent_file_id OUT NUMBER,
    last_used_extent_block_id OUT NUMBER,
    last_used_block    OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 133–14** *UNUSED\_SPACE Procedure Parameters*

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> <li>■ TABLE</li> <li>■ TABLE PARTITION</li> <li>■ TABLE SUBPARTITION</li> <li>■ INDEX</li> <li>■ INDEX PARTITION</li> <li>■ INDEX SUBPARTITION</li> <li>■ CLUSTER</li> <li>■ LOB</li> <li>■ LOB PARTITION</li> <li>■ LOB SUBPARTITION</li> </ul>
total_blocks	Returns total number of blocks in the segment
total_bytes	Returns total number of blocks in the segment, in bytes
unused_blocks	Returns number of blocks which are not used
unused_bytes	Returns, in bytes, number of blocks which are not used
last_used_extent_file_id	Returns the file ID of the last extent which contains data
last_used_extent_block_id	Returns the starting block ID of the last extent which contains data
last_used_block	Returns the last block within this extent which contains data

**Table 133–14 (Cont.) UNUSED\_SPACE Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>partition_name</code>	Partition name of the segment to be analyzed.  This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.

## Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,  
:total_bytes, :unused_blocks, :unused_bytes, :lastextf,  
:last_extb, :lastusedblock);
```

---

---

## DBMS\_SPACE\_ADMIN

The DBMS\_SPACE\_ADMIN package provides functionality for locally managed tablespaces.

**See Also:** *Oracle Database Administrator's Guide* for an example and description of using DBMS\_SPACE\_ADMIN.

This chapter contains the following topics:

- [Using DBMS\\_SPACE\\_ADMIN](#)
  - Security Model
  - Constants
  - Operational Notes
- [Summary of DBMS\\_SPACE\\_ADMIN Subprograms](#)

---

## Using DBMS\_SPACE\_ADMIN

This section contains topics which relate to using the DBMS\_SPACE\_ADMIN package.

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)

## Security Model

This package runs with *SYS* privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

## Constants

**Table 134–1 DBMS\_SPACE\_ADMIN Constants**

Constant	Type	Value	Description
SEGMENT_VERIFY_EXTENTS	POSITIVE	1	Verifies that the space owned by segment is appropriately reflected in the bitmap as used
SEGMENT_VERIFY_EXTENTS_GLOBAL	POSITIVE	2	Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it
SEGMENT_MARK_CORRUPT	POSITIVE	3	Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)
SEGMENT_MARK_VALID	POSITIVE	4	Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.
SEGMENT_DUMP_EXTENT_MAP	POSITIVE	5	Dumps the extent map for a given segment
TABLESPACE_VERIFY_BITMAP	POSITIVE	6	Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent
TABLESPACE_EXTENT_MAKE_FREE	POSITIVE	7	Marks the block range (extent) as free in the bitmaps
TABLESPACE_EXTENT_MAKE_USED	POSITIVE	8	Marks the block range (extent) as used in the bitmaps
SEGMENT_VERIFY_BASIC	POSITIVE	9	Performs the basic metadata checks
SEGMENT_VERIFY_DEEP	POSITIVE	10	Performs deep verification
SEGMENT_VERIFY_SPECIFIC	POSITIVE	11	Performs a specific check for the segment
HWM_CHECK	POSITIVE	12	Checks high water mark (HWM)
BMB_CHECK	POSITIVE	13	Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks)
SEG_DICT_CHECK	POSITIVE	14	Checks consistency of segment header with corresponding SEG entry
EXTENT_TS_BITMAP_CHECK	POSITIVE	15	Checks whether the tablespace bitmaps corresponding to the extent map are marked used
DB_BACKPOINTER_CHECK	POSITIVE	16	Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment
EXTENT_SEGMENT_BITMAP_CHECK	POSITIVE	17	Checks whether the bitmap blocks are consistent with the extent map

**Table 134-1 (Cont.) DBMS\_SPACE\_ADMIN Constants**

<b>Constant</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
BITMAPS_CHECK	POSITIVE	18	Checks from the datablocks that the bitmap states representing the blocks are consistent
TS_VERIFY_BITMAPS	POSITIVE	19	Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace
TS_VERIFY_DEEP	POSITIVE	20	Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option
TS_VERIFY_SEGMENTS	POSITIVE	21	Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace, taking either the BASIC or the DEEP option
SEGMENTS_DUMP_BITMAP_SUMMARY	POSITIVE	27	Dumps only bitmap block summaries

## Operational Notes

Before migrating the `SYSTEM` tablespace, the following conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not `SYSTEM`.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

---

## Summary of DBMS\_SPACE\_ADMIN Subprograms

**Table 134–2 DBMS\_SPACE\_ADMIN Package Subprograms**

Subprogram	Description
<a href="#">ASSM_SEGMENT_VERIFY Procedure</a> on page 134-8	Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces
<a href="#">ASSM_TABLESPACE_VERIFY Procedure</a> on page 134-10	Verifies ASSM tablespaces
<a href="#">DROP_EMPTY_SEGMENTS Procedure</a> on page 134-11	Drops segments from empty tables or table fragments and dependent objects
<a href="#">MATERIALIZER_DEFERRED_SEGMENTS Procedure</a> on page 134-12	Materializes segments for tables and table fragments with deferred segment creation and their dependent objects
<a href="#">SEGMENT_CORRUPT Procedure</a> on page 134-13	Marks the segment corrupt or valid so that appropriate error recovery can be done
<a href="#">SEGMENT_DROP_CORRUPT Procedure</a> on page 134-14	Drops a segment currently marked corrupt (without reclaiming space)
<a href="#">SEGMENT_DUMP Procedure</a> on page 134-15	Dumps the segment header and extent maps of a given segment
<a href="#">SEGMENT_VERIFY Procedure</a> on page 134-16	Verifies the consistency of the extent map of the segment
<a href="#">TABLESPACE_FIX_BITMAPS Procedure</a> on page 134-17	Marks the appropriate block range (extent) as free or used in bitmap
<a href="#">TABLESPACE_FIX_SEGMENT_STATES Procedure</a> on page 134-18	Fixes the state of the segments in a tablespace in which migration was aborted
<a href="#">TABLESPACE_MIGRATE_FROM_LOCAL Procedure</a> on page 134-19	Migrates a locally managed tablespace to dictionary-managed tablespace
<a href="#">TABLESPACE_MIGRATE_TO_LOCAL Procedure</a> on page 134-20	Migrates a tablespace from dictionary-managed format to locally managed format
<a href="#">TABLESPACE_REBUILD_BITMAPS Procedure</a> on page 134-21	Rebuilds the appropriate bitmaps
<a href="#">TABLESPACE_REBUILD_QUOTAS Procedure</a> on page 134-22	Rebuilds quotas for given tablespace
<a href="#">TABLESPACE_RELOCATE_BITMAPS Procedure</a> on page 134-23	Relocates the bitmaps to the destination specified
<a href="#">TABLESPACE_VERIFY Procedure</a> on page 134-24	Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized

## ASSM\_SEGMENT\_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

### Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
  segment_owner  IN VARCHAR2,
  segment_name   IN VARCHAR2,
  segment_type   IN VARCHAR2,
  partition_name IN VARCHAR2,
  verify_option  IN POSITIVE  DEFAULT SEGMENT_VERIFY_BASIC,
  attrib         IN POSITIVE  DEFAULT NULL);
```

### Parameters

**Table 134–3 ASSM\_SEGMENT\_VERIFY Procedure Parameters**

Parameter	Description
segment_owner	Schema that owns the segment
segment_name	Name of the segment to be verified
segment_type	Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER
partition_name	Name of the partition or subpartition
verify_option	One of the following options: <ul style="list-style-type: none"> <li>■ SEGMENT_VERIFY_BASIC := 9. Performs deep verification</li> <li>■ SEGMENT_VERIFY_DEEP := 10. Performs the basic metadata checks (Default)</li> <li>■ SEGMENT_VERIFY_SPECIFIC := 11. Performs a specific check for the segment</li> </ul>

**Table 134-3 (Cont.) ASSM\_SEGMENT\_VERIFY Procedure Parameters**

Parameter	Description
attrib	<p>When option <code>SEGMENT_VERIFY_SPECIFIC</code> is specified as option, <code>attrib</code> can be one of the following:</p> <ul style="list-style-type: none"> <li>■ <code>HWM_CHECK := 12</code>. Checks whether high water mark information is accurate</li> <li>■ <code>BMB_CHECK := 13</code>. Checks whether space bitmap blocks have correct backpointers to the segment header</li> <li>■ <code>SEG_DICT_CHECK := 14</code>. Checks whether dictionary information for segment is accurate</li> <li>■ <code>EXTENT_TS_BITMAP_CHECK := 15</code>. Checks whether extent maps are consistent with file level bitmaps</li> <li>■ <code>DB_BACKPOINTER_CHECK := 16</code>. Checks whether datablocks have correct backpointers to the space metadata blocks</li> <li>■ <code>EXTENT_SEGMENT_BITMAP_CHECK := 17</code>. Checks whether extent map in the segment matches the bitmaps in the segment</li> <li>■ <code>BITMAPS_CHECK := 18</code>. Checks whether space bitmap blocks are accurate</li> </ul>

### Usage Notes

- Using this procedure requires `SYSDBA` privileges.
- You can determine the relative file # and header block # (`header_relative_file` and `header_block` parameters) by querying `DBA_SEGMENTS`.
- This procedure outputs a dump file named `sid_ora_process_ID.trc` to the location specified in the `USER_DUMP_DEST` initialization parameter.

## ASSM\_TABLESPACE\_VERIFY Procedure

This procedure verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

### Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
  tablespace_name  IN VARCHAR2,
  ts_option        IN POSITIVE,
  segment_option   IN POSITIVE DEFAULT NULL);
```

### Parameters

**Table 134–4 ASSM\_TABLESPACE\_VERIFY Procedure Parameters**

Parameter	Description
tablespace_name	Name of the tablespace to verify. The tablespace must be an ASSM tablespace.
ts_option	<ul style="list-style-type: none"> <li>■ TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file\$ and control file.</li> <li>■ TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments .</li> <li>■ TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY.</li> </ul>
segment_option	<p>When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:</p> <ul style="list-style-type: none"> <li>■ SEGMENT_VERIFY_BASIC := 9</li> <li>■ SEGMENT_VERIFY_DEEP := 10</li> </ul> <p>The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified.</p>

### Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named `sid_ora_process_ID.trc` to the location specified in the USER\_DUMP\_DEST initialization parameter.

## DROP\_EMPTY\_SEGMENTS Procedure

This procedure drops segments from empty tables or table fragments and dependent objects.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (
  schema_name      IN      VARCHAR2  DEFAULT NULL,
  table_name       IN      VARCHAR2  DEFAULT NULL,
  partition_name   IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 134–5** *DROP\_EMPTY\_SEGMENTS Procedure Parameters*

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

### Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in "Restrictions on Deferred Segment Creation"), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No schema\_name is specified, in which case tables belonging to all schemas are scanned
- Both schema\_name and table\_name are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

## MATERIALIZED\_DEFERRED\_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
DBMS_SPACE_ADMIN.MATERIALIZED_DEFERRED_SEGMENTS (
  schema_name      IN      VARCHAR2  DEFAULT NULL,
  table_name       IN      VARCHAR2  DEFAULT NULL,
  partition_name   IN      VARCHAR2  DEFAULT NULL);
```

### Parameters

**Table 134–6** *MATERIALIZED\_DEFERRED\_SEGMENTS Procedure Parameters*

Parameter	Description
schema_name	Name of schema
table_name	Name of table
partition_name	Name of partition

### Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- No schema\_name is specified, in which case tables belonging to all schemas are scanned
- Both schema\_name and table\_name are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

## SEGMENT\_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be done. It cannot be used on the SYSTEM tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
  tablespace_name      IN   VARCHAR2,
  header_relative_file IN   POSITIVE,
  header_block        IN   POSITIVE,
  corrupt_option       IN   POSITIVE DEFAULT SEGMENT_MARK_CORRUPT);
```

### Parameters

**Table 134–7** SEGMENT\_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
corrupt_option	SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID

### Usage Notes

You can determine the relative file number and block number (header\_relative\_file and header\_block parameter) of the segment header block by querying DBA\_SEGMENTS.

### Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);
```

## SEGMENT\_DROP\_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space). For this to work, the segment must be marked *temporary*. To mark a corrupt segment as temporary, issue a DROP command on the segment.

### Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (  
  tablespace_name      IN    VARCHAR2,  
  header_relative_file IN    POSITIVE,  
  header_block         IN    POSITIVE);
```

### Parameters

**Table 134–8** SEGMENT\_DROP\_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header

### Usage Notes

- The space for the segment is not released, and it must be fixed by using the [TABLESPACE\\_FIX\\_BITMAPS Procedure](#) or the [TABLESPACE\\_REBUILD\\_BITMAPS Procedure](#).
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header\_relative\_file and header\_block parameter) of the segment header block by querying DBA\_SEGMENTS.

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

## SEGMENT\_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the `USER_DUMP_DEST` initialization parameter.

### Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
  tablespace_name      IN   VARCHAR2,
  header_relative_file IN   POSITIVE,
  header_block         IN   POSITIVE,
  dump_option          IN   POSITIVE DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

### Parameters

**Table 134–9** *SEGMENT\_DUMP Procedure Parameters*

Parameter	Description
<code>tablespace_name</code>	Name of tablespace in which segment resides
<code>header_relative_file</code>	Relative file number of segment header
<code>header_block</code>	Block number of segment header
<code>dump_option</code>	One of the following options: <ul style="list-style-type: none"> <li>■ <code>SEGMENT_DUMP_EXTENT_MAP</code></li> <li>■ <code>SEGMENT_DUMP_BITMAP_SUMMARY</code></li> </ul>

### Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass `SEGMENT_DUMP_BITMAP_SUMMARY` as the `dump_option` parameter.
- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

## SEGMENT\_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

### Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
  tablespace_name      IN    VARCHAR2,
  header_relative_file IN    POSITIVE,
  header_block         IN    POSITIVE,
  verify_option        IN    POSITIVE DEFAULT SEGMENT_VERIFY_EXTENTS);
```

### Parameters

**Table 134–10** SEGMENT\_VERIFY Procedure Parameters

Parameters	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
verify_option	What kind of check to do: SEGMENT_VERIFY_EXTENTS or SEGMENT_VERIFY_EXTENTS_GLOBAL

### Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.
- You can determine the relative file number and block number (header\_relative\_file and header\_block parameter) of the segment header block by querying DBA\_SEGMENTS.

### Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);
```

## TABLESPACE\_FIX\_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the `SYSTEM` tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
  tablespace_name      IN   VARCHAR2,
  dbarange_relative_file IN  POSITIVE,
  dbarange_begin_block IN  POSITIVE,
  dbarange_end_block   IN  POSITIVE,
  fix_option           IN  POSITIVE);
```

### Parameters

**Table 134–11** TABLESPACE\_FIX\_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
dbarange_relative_file	Relative file number of block range (extent)
dbarange_begin_block	Block number of beginning of extent
dbarange_end_block	Block number (inclusive) of end of extent
fix_option	One of the following options: <ul style="list-style-type: none"> <li>■ TABLESPACE_EXTENT_MAKE_FREE</li> <li>■ TABLESPACE_EXTENT_MAKE_USED</li> </ul>

### Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as `USED` in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83, DBMS_SPACE_
ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of `TABLESPACE_EXTENT_MAKE_FREE` marks the bits free in bitmaps. The `BEGIN` and `END` blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.

## TABLESPACE\_FIX\_SEGMENT\_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted. During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by SMON when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (  
    tablespace_name    IN    VARCHAR);
```

### Parameters

**Table 134–12** TABLESPACE\_FIX\_SEGMENT\_STATES Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace whose segments must be fixed

### Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES ('TS1');
```

## TABLESPACE\_MIGRATE\_FROM\_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (  
    tablespace_name      IN      VARCHAR2);
```

### Parameter

**Table 134–13** TABLESPACE\_MIGRATE\_FROM\_LOCAL Procedure Parameter

Parameter	Description
tablespace_name	Name of tablespace

### Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

## TABLESPACE\_MIGRATE\_TO\_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
    tablespace_name    IN    VARCHAR2,
    unit_size          IN    POSITIVE DEFAULT NULL,
    rfno                IN    POSITIVE DEFAULT NULL);
```

### Parameters

**Table 134–14 TABLESPACE\_MIGRATE\_TO\_LOCAL Procedure Parameters**

Parameter Name	Description
tablespace_name	Name of the tablespace to be migrated
unit_size	Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks
rfno	Relative File Number of the file where the bitmap blocks are placed

### Usage Notes

- Before you migrate the `SYSTEM` tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the `SYSTEM` tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

**See Also:** *Oracle Database Administrator's Guide*

- The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.
- Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the `MINIMUM EXTENT` for the tablespace (5 if `MINIMUM EXTENT` is not specified). Thus, the calculated value will not be larger than the `MINIMUM EXTENT` for the tablespace. The last free extent in every file is ignored for GCD calculation. If you specify the unit size, then it must be a factor of the `unit_size` calculated by the system; otherwise an error message is returned.
- The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, then an error is issued. The data file specified must be part of the tablespace being migrated. If the dataflow is not specified, then the system chooses a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, then an error is raised.

### Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps are placed in file with relative file number 2.

## TABLESPACE\_REBUILD\_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
  tablespace_name      IN   VARCHAR2,
  bitmap_relative_file IN   POSITIVE  DEFAULT NULL,
  bitmap_block        IN   POSITIVE  DEFAULT NULL);
```

### Parameters

**Table 134–15 TABLESPACE\_REBUILD\_BITMAPS Procedure Parameters**

Parameter	Description
tablespace_name	Name of tablespace
bitmap_relative_file	Relative file number of bitmap block to rebuild
bitmap_block	Block number of bitmap block to rebuild

### Usage Notes

Only full rebuild is supported.

### Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

## TABLESPACE\_REBUILD\_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (  
    tablespace_name          IN    VARCHAR2);
```

### Parameters

**Table 134–16** *TABLESPACE\_REBUILD\_QUOTAS Procedure Parameters*

Parameter	Description
tablespace_name	Name of tablespace

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS ('USERS');
```

## TABLESPACE\_RELOCATE\_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (
    tablespace_name    IN      VARCHAR2,
    filno              IN      POSITIVE,
    blkno              IN      POSITIVE);
```

### Parameters

**Table 134–17 TABLESPACE\_RELOCATE\_BITMAPS Procedure Parameters**

Parameter Name	Description
tablespace_name	Name of tablespace
filno	Relative File Number of the destination file
blkno	Block Number of the destination range

### Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of SPACE HEADER segment that contains the bitmap blocks. The SPACE HEADER segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the TABLESPACE\_RELOCATE\_BITMAPS command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the SYSTEM tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

---

**Note:** The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.

---

## TABLESPACE\_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

### Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (  
    tablespace_name      IN    VARCHAR2,  
    verify_option        IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

### Parameters

**Table 134–18** TABLESPACE\_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
verify_option	One option is supported: TABLESPACE_VERIFY_BITMAP

### Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY ('USERS');
```

The DBMS\_SPM package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

**See Also:** For more information about "Using SQL Plan Management" in the *Oracle Database Performance Tuning Guide*

This chapter contains the following topics:

- [Using DBMS\\_SPM](#)
  - Overview
  - Security Model
  - Constants
  - Examples

- [Summary of DBMS\\_SPM Subprograms](#)

## Using DBMS\_SPM

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Examples](#)

## Overview

The DBMS\_SPM package allows the user to manage SQL execution plans using SQL plan management. SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

## Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS\_SPM package.

## Constants

The DBMS\_SPM package uses the constants shown in [Table 135-1](#), "DBMS\_SPM Constants". These constants are defined as standard input for the `time_limit` parameter of the [EVOLVE\\_SQL\\_PLAN\\_BASELINE](#) Function.

**Table 135-1 DBMS\_SPM Constants**

Constant	Type	Value	Description
AUTO_LIMIT	INTEGER	2147483647	Oracle determines the appropriate time spent by the <a href="#">EVOLVE_SQL_PLAN_BASELINE</a> Function.
NO_LIMIT	INTEGER	2147483647 -1	There is no limit to the time spent by the <a href="#">EVOLVE_SQL_PLAN_BASELINE</a> Function.

## Examples

Detailed examples are located under the following topics:

- [Migrating Stored Outlines to SQL Plan Baselines](#)
- [Migrating Outlines to Utilize SQL Plan Management Features](#)
- [Migrating Outlines to Preserve Stored Outline Behavior](#)
- [Performing Follow-Up Tasks After Stored Outline Migration](#)

## Data Structures

---

The DBMS\_SPM package defines a TABLE type.

### Table Types

- [NAMELIST Table Type](#)

## NAMELIST Table Type

This type allows for a list of names as an input parameter.

### Syntax

```
TYPE name_list IS TABLE OF VARCHAR2(30);
```

---

## Summary of DBMS\_SPM Subprograms

This table lists the package subprograms in alphabetical order.

**Table 135–2 DBMS\_SPM Package Subprograms**

Subprogram	Description
<a href="#">ALTER_SQL_PLAN_BASELINE Function</a> on page 135-10	Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format
<a href="#">CONFIGURE Procedure</a> on page 135-12	Sets configuration options for SQL management base, in parameter/value format
<a href="#">CREATE_STGTAB_BASELINE Procedure</a> on page 135-13	Creates a staging table that used for transporting SQL plan baselines from one system to another
<a href="#">DROP_SQL_PLAN_BASELINE Function</a> on page 135-14	drops a single plan, or all plans associated with a SQL statement
<a href="#">EVOLVE_SQL_PLAN_BASELINE Function</a> on page 135-15	Evolves SQL plan baselines associated with one or more SQL statements
<a href="#">LOAD_PLANS_FROM_CURSOR_CACHE Functions</a> on page 135-17	Loads one or more plans present in the cursor cache for a SQL statement
<a href="#">LOAD_PLANS_FROM_SQLSET Function</a> on page 135-19	Loads plans stored in a SQL tuning set (STS) into SQL plan baselines
<a href="#">MIGRATE_STORED_OUTLINE Functions</a> on page 135-20	Migrates existing stored outlines to SQL plan baselines
<a href="#">PACK_STGTAB_BASELINE Function</a> on page 135-22	Packs (exports) SQL plan baselines from SQL management base into a staging table
<a href="#">UNPACK_STGTAB_BASELINE Function</a> on page 135-23	Unpacks (imports) SQL plan baselines from a staging table into SQL management base

## ALTER\_SQL\_PLAN\_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

### Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  attribute_name  IN VARCHAR2,
  attribute_value IN VARCHAR2)
RETURN PLS_INTEGER;
```

### Parameters

**Table 135–3 ALTER\_SQL\_PLAN\_BASELINE Function Parameters**

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.
attribute_name	Name of plan attribute to set (see table below).
attribute_value	Value of plan attribute to use (see table below)

**Table 135–4 Names & Values for ALTER\_SQL\_PLAN\_BASELINE Function Parameters**

Name	Description	Possible Values
enabled	'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.	'YES' or 'NO'
fixed	'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.	'YES' or 'NO'
autopurge	'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.	'YES' or 'NO'
plan_name	Name of the plan	String of up to 30-characters
description	Plan description.	String of up to 500-characters

### Return Values

The number of plans altered.

**Usage Notes**

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

## CONFIGURE Procedure

This procedure sets configuration options for SQL management base, in parameter/value format. This function can be called numerous times, each time setting a different configuration option.

### Syntax

```
DBMS_SPM.CONFIGURE (
  parameter_name  IN VARCHAR2,
  parameter_value IN NUMBER);
```

### Parameters

**Table 135–5 CONFIGURE Procedure Parameters**

Parameter	Description
parameter_name	Name of parameter to set (see table below)
parameter_value	Value of parameter to use (see table below)

**Table 135–6 Names & Values for CONFIGURE Procedure Parameters**

Name	Description	Possible Values	Default Value
space_budget_percent	Maximum percent of SYSAUX space that can be used for SQL management base	1, 2, ..., 50	10
plan_retention_weeks	Number of weeks to retain unused plans before they are purged	5, 6, ..., 523	53

### Usage Notes

- The default space budget for SQL management base is no more than ten percent of the size of SYSAUX tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

## CREATE\_STGTAB\_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

### Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := NULL,
  tablespace_name IN VARCHAR2 := NULL);
```

### Parameters

**Table 135–7 CREATE\_STGTAB\_BASELINE Procedure Parameters**

Parameter	Description
table_name	Name of staging table to create for the purpose of packing and unpacking SQL plan baselines
table_owner	Name of owner of the staging table. Default NULL means current schema is the table owner.
tablespace_name	Name of tablespace. Default NULL means create staging table in the default tablespace.

### Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

## DROP\_SQL\_PLAN\_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

### Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (  
    sql_handle      IN VARCHAR2 := NULL,  
    plan_name      IN VARCHAR2 := NULL)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 135–8** DROP\_SQL\_PLAN\_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.

### Return Values

The number of plans dropped

## EVOLVE\_SQL\_PLAN\_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans. If interrogated by the user (parameter `verify = 'YES'`), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit = 'YES'`).

The second form of the function employs a plan list format.

### Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  sql_handle   IN VARCHAR2 := NULL,
  plan_name    IN VARCHAR2 := NULL,
  time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
  plan_list    IN DBMS_SPM.NAME_LIST,
  time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
  verify       IN VARCHAR2 := 'YES',
  commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

### Parameters

**Table 135–9** *EVOLVE\_SQL\_PLAN\_BASELINE Function Parameters*

Parameter	Description
<code>sql_handle</code>	SQL statement identifier. Unless <code>plan_name</code> is specified, <code>NULL</code> means to consider all statements with non-accepted plans in their SQL plan baselines.
<code>plan_name</code>	Plan identifier. Default <code>NULL</code> means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if <code>sql_handle</code> is <code>NULL</code> .
<code>plan_list</code>	A list of plan names. Each plan in the list can belong to same or different SQL statement.
<code>time_limit</code>	Time limit in number of minutes. This applies only if <code>verify = 'YES'</code> . The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. <ul style="list-style-type: none"> <li>■ <code>DBMS_SPM.AUTO_LIMIT</code> (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done.</li> <li>■ <code>DBMS_SPM.NO_LIMIT</code> means there is no time limit.</li> <li>■ A positive integer value represents a user specified time limit.</li> </ul>

**Table 135–9 (Cont.) EVOLVE\_SQL\_PLAN\_BASELINE Function Parameters**

Parameter	Description
<code>verify</code>	<p>Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan.</p> <ul style="list-style-type: none"> <li>▪ 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan</li> <li>▪ 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans</li> </ul>
<code>commit</code>	<p>Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'.</p> <ul style="list-style-type: none"> <li>▪ 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when <code>verify = 'YES'</code>.</li> <li>▪ 'NO' - generate a report without any updates. Note that <code>commit = 'NO'</code> together with <code>verify = 'NO'</code> represents a no-op.</li> </ul>

## Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if `verify = 'YES'` the result of their performance verification.

## Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

## LOAD\_PLANS\_FROM\_CURSOR\_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute\_name and attribute\_value pair.

### Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  sql_text       IN CLOB,
  fixed         IN VARCHAR2  := 'NO',
  enabled       IN VARCHAR2  := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  sql_handle     IN VARCHAR2,
  fixed         IN VARCHAR2  := 'NO',
  enabled       IN VARCHAR2  := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  fixed         IN VARCHAR2  := 'NO',
  enabled       IN VARCHAR2  := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  attribute_name IN VARCHAR2,
  attribute_value IN VARCHAR2,
  fixed         IN VARCHAR2  := 'NO',
  enabled       IN VARCHAR2  := 'YES')
RETURN PLS_INTEGER;
```

### Parameters

**Table 135–10** LOAD\_PLANS\_FROM\_CURSOR\_CACHE Function Parameters

Parameter	Description
sql_id	SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.
plan_hash_value	Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.
sql_text	SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.

**Table 135–10 (Cont.) LOAD\_PLANS\_FROM\_CURSOR\_CACHE Function Parameters**

Parameter	Description
<code>sql_handle</code>	SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The <code>sql_handle</code> must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
<code>fixed</code>	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
<code>attribute_name</code>	One of possible attribute names: <ul style="list-style-type: none"> <li>▪ <code>SQL_TEXT</code></li> <li>▪ <code>PARSING_SCHEMA_NAME</code></li> <li>▪ <code>MODULE</code></li> <li>▪ <code>ACTION</code></li> </ul>
<code>attribute_value</code>	Attribute value is used as a search pattern of LIKE predicate if attribute name is <code>SQL_TEXT</code> . Otherwise, it is used as an equality search value. (for example, for specifying <code>attribute_name =&gt; 'SQL_TEXT'</code> , and <code>attribute_value =&gt; '% HR-123 %'</code> means applying <code>SQL_TEXT LIKE '% HR-123 %'</code> as a selection filter. Similarly, specifying <code>attribute_name =&gt; 'MODULE'</code> , and <code>attribute_value =&gt; 'HR'</code> means applying <code>'MODULE = 'HR'</code> as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is <code>SQL_TEXT</code> .
<code>enabled</code>	Default 'YES' means the loaded plans are enabled for use by the optimizer

**Return Values**

Number of plans loaded

**Usage Notes**

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

## LOAD\_PLANS\_FROM\_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

### Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sqlset_owner     IN  VARCHAR2 := NULL,
  basic_filter     IN  VARCHAR2 := NULL,
  fixed            IN  VARCHAR2 := 'NO',
  enabled          IN  VARCHAR2 := 'YES'
  commit_rows     IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

### Parameters

**Table 135–11** *LOAD\_PLANS\_FROM\_SQLSET Function Parameters*

Parameter	Description
sqlset_name	Name of the STS from where the plans are loaded into SQL plan baselines
sqlset_owner	Owner of STS. NULL means current schema is the owner.
basic_filter	A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can specified against the view DBA_SQLSET_STATEMENTS. For example <code>basic_filter =&gt; 'sql_text like 'select /*LOAD_STS*/%'</code> or <code>basic_filter =&gt; 'sql_id="b62q7nc33gzwx"'</code> .
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.

### Return Values

The number of plans loaded

### Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

## MIGRATE\_STORED\_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

### Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
    attribute_name    IN  VARCHAR2,
    attribute_value   IN  CLOB,
    fixed            IN  VARCHAR2 := 'NO')
RETURN CLOB;

DBMS_SPM.MIGRATE_STORED_OUTLINE (
    outln_list       IN  DBMS_SPM.NAME_LIST,
    fixed            IN  VARCHAR2 := 'NO')
RETURN CLOB;
```

### Parameters

**Table 135–12** *MIGRATE\_STORED\_OUTLINE Function Parameters*

Parameter	Description
<code>attribute_name</code>	Specifies the type of parameter used in <code>attribute_value</code> to identify the migrated stored outlines. It is case insensitive. Possible values: <ul style="list-style-type: none"> <li>▪ <code>outline_name</code></li> <li>▪ <code>sql_text</code></li> <li>▪ <code>category</code></li> <li>▪ <code>all</code></li> </ul>
<code>attribute_value</code>	Based on <code>attribute_name</code> , this can be: <ul style="list-style-type: none"> <li>▪ Name of stored outline to be migrated</li> <li>▪ SQL text of stored outlines to be migrated</li> <li>▪ Category of stored outlines to be migrated</li> <li>▪ NULL if <code>attribute_name</code> is <code>all</code></li> </ul>
<code>fixed</code>	NO (default) or YES. Specifies the "fixed" status of the plans generated during migration. By default, plans are generated as "non-fixed" plans.
<code>outln_list</code>	List of outline names to be migrated

### Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated

- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

### Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to `DEFAULT`. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate `all`, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.

## PACK\_STGTAB\_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

### Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := NULL,
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    sql_text        IN CLOB      := NULL,
    creator         IN VARCHAR2 := NULL,
    origin          IN VARCHAR2 := NULL,
    enabled         IN VARCHAR2 := NULL,
    accepted        IN VARCHAR2 := NULL,
    fixed           IN VARCHAR2 := NULL,
    module          IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

### Parameters

**Table 135–13** *PACK\_STGTAB\_BASELINE Function Parameters*

Parameter	Description
table_name	Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-QLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

### Return Values

Number of SQL plan baselines packed

## UNPACK\_STGTAB\_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

### Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner     IN VARCHAR2 := NULL,
    sql_handle      IN VARCHAR2 := NULL,
    plan_name       IN VARCHAR2 := NULL,
    sql_text        IN CLOB      := NULL,
    creator         IN VARCHAR2 := NULL,
    origin          IN VARCHAR2 := NULL,
    enabled         IN VARCHAR2 := NULL,
    accepted        IN VARCHAR2 := NULL,
    fixed           IN VARCHAR2 := NULL,
    module          IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

### Parameters

**Table 135–14 UNPACK\_STGTAB\_BASELINE Function Parameters**

Parameter	Description
table_name	Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

### Return Values

Number of plans unpacked

The `DBMS_SQL` package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL. For example, you can enter a `DROP TABLE` statement from within a stored procedure by using the `PARSE` procedure supplied with the `DBMS_SQL` package.

**See Also:** For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference*.

This chapter contains the following topics:

## Using DBMS\_SQL

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

## Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to DBMS\_SQL that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than DBMS\_SQL. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)

Also, there are some tasks that can only be performed using DBMS\_SQL.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

**See Also:** *Oracle Call Interface Programmer's Guide*

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the DBMS\_SQL package. These differences include the following:

- The OCI uses bind by address, while the DBMS\_SQL package uses bind by value.
- With DBMS\_SQL you must call VARIABLE\_VALUE to retrieve the value of an OUT parameter for an anonymous block, and you must call COLUMN\_VALUE after fetching rows to actually retrieve the values of the columns in the rows into your program.
- The current release of the DBMS\_SQL package does not provide CANCEL cursor procedures.
- Indicator variables are not required, because NULLs are fully supported as values of a PL/SQL variable.

A sample usage of the DBMS\_SQL package follows. For users of the Oracle Call Interface, this code should seem fairly straightforward.

## Security Model

DBMS\_SQL is a SYS-owned package compiled with AUTHID CURRENT\_USER. Any DBMS\_SQL subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

**See Also:** *Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

In Oracle Database 11g, Release 1 (11.1), Oracle introduces a number of enhancements to DBMS\_SQL to improve the security of the package.

### Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, ORA-29471, is raised when any DBMS\_SQL subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and DBMS\_SQL becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the [IS\\_OPEN Function](#) denotes a cursor currently open in the session, the return value is TRUE. If the actual value is NULL, then the return value is FALSE. Otherwise, this raises an ORA-29471 error.

Note that the [OPEN\\_CURSOR Function](#) is the only DBMS\_SQL subprogram that has no formal parameter for the cursor number; rather, it returns a cursor number. Therefore it is not within the scope of these rules.

### Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single DBMS\_SQL subprogram call. The check is:

- The `current_user` is the same on calling the subprogram as it was on calling the most recent parse.
- The enabled roles on calling the subprogram must be a superset of the enabled roles on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, and ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the `OPEN_CURSOR` subprogram which takes a formal parameter, `security_level`, with allowed values NULL, 1 and 2.

- When `security_level = 1` (or is NULL), the checks are made only when binding and executing.
- When `security_level = 2`, the checks are always made.

### Upgrade Considerations

This security regime is stricter than those in Oracle Database 10g, Release 2 (10.2) and previous releases. As a consequence, users of DBMS\_SQL may encounter runtime errors on upgrade. While these security enhancements make for more secure applications, users may wish to relax the security checks temporarily as they migrate to Oracle Database 11g, Release 1 (11.1). If so, please consult with Oracle Support on steps to relax the above security restrictions.

## Constants

The constants described in [Table 136-1](#) are used with the `language_flag` parameter of the [PARSE Procedures](#).

**Table 136-1** *DBMS\_SQL Constants*

<b>Name</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
V6	INTEGER	0	Specifies Oracle database version 6 behavior
NATIVE	INTEGER	1	Specifies normal behavior for the database to which the program is connected
V7	INTEGER	2	Specifies Oracle database version 7 behavior

## Exceptions

```
inconsistent_type EXCEPTION;  
  pragma exception_init(inconsistent_type, -6562);
```

This exception is raised by the [COLUMN\\_VALUE Procedure](#) or the [VARIABLE\\_VALUE Procedures](#) when the type of the given OUT parameter (for where to put the requested value) is different from the type of the value.

## Operational Notes

- [Execution Flow](#)
- [Processing Queries](#)
- [Processing Updates, Inserts, and Deletes](#)
- [Locating Errors](#)

### Execution Flow

1. [OPEN\\_CURSOR](#)
2. [PARSE](#)
3. [BIND\\_VARIABLE](#) or [BIND\\_ARRAY](#)
4. [DEFINE\\_COLUMN](#), [DEFINE\\_COLUMN\\_LONG](#), or [DEFINE\\_ARRAY](#)
5. [EXECUTE](#)
6. [FETCH\\_ROWS](#) or [EXECUTE\\_AND\\_FETCH](#)
7. [VARIABLE\\_VALUE](#), [COLUMN\\_VALUE](#), or [COLUMN\\_VALUE\\_LONG](#)
8. [CLOSE\\_CURSOR](#)

#### **OPEN\_CURSOR**

To process a SQL statement, you must have an open cursor. When you call the [OPEN\\_CURSOR Function](#), you receive a cursor ID number for the data structure representing a valid cursor maintained by Oracle. These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the DBMS\_SQL package.

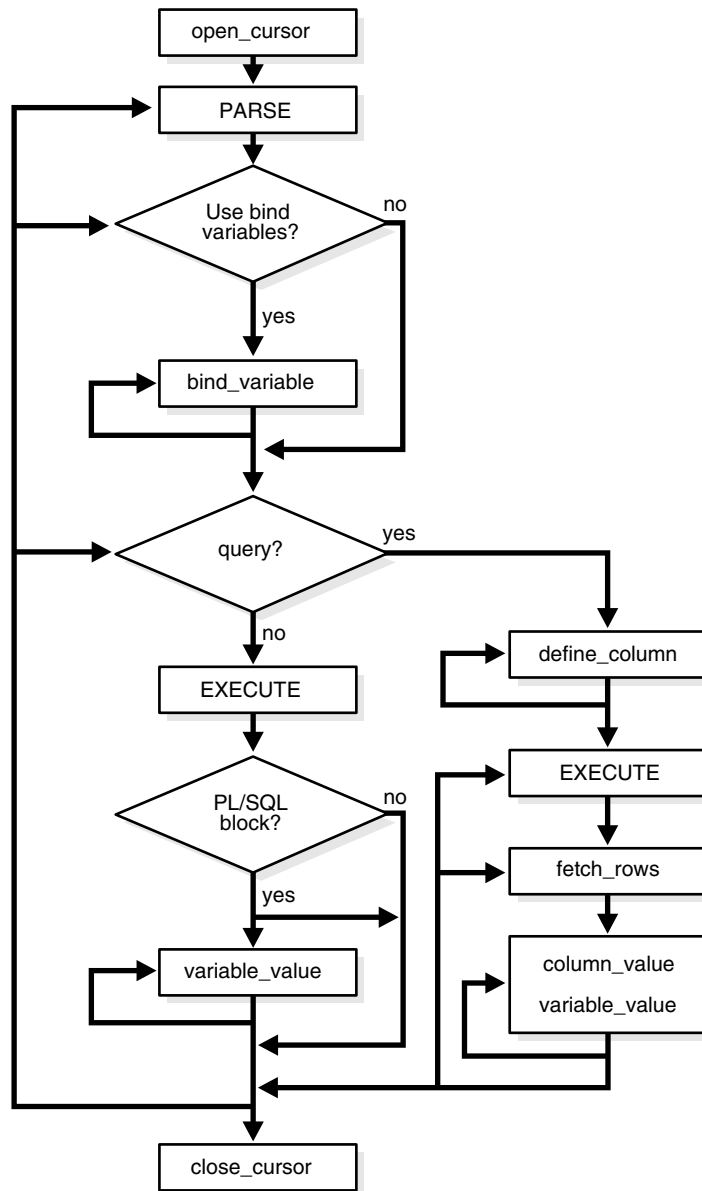

#### **PARSE**

Every SQL statement must be parsed by calling the [PARSE Procedures](#). Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of DBMS\_SQL is shown in [Figure 136-1](#).

Figure 136-1 DBMS\_SQL Execution Flow

This illustration describes execution flow in DBMS\_SQL that begins with "open\_cursor" and ends with "close\_cursor". Key to the symbols used:

- ... -> denotes "continue to next step", for example "open cursor" -> "PARSE"
- ... material enclosed in double quotation marks denotes an action, for example "PARSE"
- ... material enclosed in single quotation marks denotes a choice point, for example 'Use bind variables': Yes/No

"open\_cursor" -> "PARSE" -> Choice point: 'Use bind variables': Yes/No

'Use bind variables': Yes/No ...Yes -> "bind variable" (option to repeat) -> Choice point: 'query' ->

'Use bind variables': Yes/No ...No -> Choice point: 'query' ->

Choice point: 'query': Yes/No

- Choice point: 'query': Yes/No ...Yes -> "DEFINE\_COLUMN" (option to repeat) -> "EXECUTE" -> "FETCH\_ROWS" -> "column\_value, variable\_value" (option to repeat) -> option to loop back to "EXECUTE", option to loop back to "fetch\_rows", option to loop back to "PARSE", option to loop back to 'Use bind variables', option to loop back to 'query' -> "close\_cursor"
- Choice point: query Yes/No ...No -> "EXECUTE" -> Choice point: pl/sql block(s): Yes/No
  - Choice point: pl/sql block(s): Yes/No ...Yes -> Choice point: 'Use variable values': Yes/No
    - \* Choice point: 'Use variable values': Yes/No ... Yes -> "variable\_value" (option to repeat) -> option to loop back to "PARSE", option to loop back to 'Use bind variables', option to loop back to 'query' -> close\_cursor
    - \* Choice point: 'Use variable values': Yes/No ... No -> option to loop back to "PARSE", option to loop back to 'Use bind variables', option to loop back to 'query' -> close\_cursor
  - Choice point: pl/sql block(s): Yes/No ...No -> option to loop back to "PARSE", option to loop back to 'Use bind variables', option to loop back to 'query' -> close\_cursor

\*\*\*\*\*

#### **BIND\_VARIABLE or BIND\_ARRAY**

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the bind procedures, the [BIND\\_ARRAY Procedures](#) on page 136-52 or the [BIND\\_VARIABLE Procedures](#) on page 136-55, to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind, variables.

DBMS\_SQL can run a DML statement multiple times — each time with a different bind variable. The [BIND\\_ARRAY](#) procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each EXECUTE. This is similar to the array interface supported by the OCI.

#### **DEFINE\_COLUMN, DEFINE\_COLUMN\_LONG, or DEFINE\_ARRAY**

The columns of the row being selected in a SELECT statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures ([DEFINE\\_COLUMN](#), [DEFINE\\_COLUMN\\_LONG](#), or [DEFINE\\_ARRAY](#)) to specify the variables that are to receive the SELECT values, much the way an INTO clause does for a static query.

Use the [DEFINE\\_COLUMN\\_LONG](#) procedure to define LONG columns, in the same way that [DEFINE\\_COLUMN](#) is used to define non-LONG columns. You must call [DEFINE\\_COLUMN\\_LONG](#) before using the [COLUMN\\_VALUE\\_LONG](#) procedure to fetch from the LONG column.

Use the [DEFINE\\_ARRAY](#) procedure to define a PL/SQL collection into which you want to fetch rows in a single SELECT statement. [DEFINE\\_ARRAY](#) provides an interface to fetch multiple rows at one fetch. You must call [DEFINE\\_ARRAY](#) before using the [COLUMN\\_VALUE](#) procedure to fetch the rows.

**EXECUTE**

Call the `EXECUTE` function to run your SQL statement.

**FETCH\_ROWS or EXECUTE\_AND\_FETCH**

The `FETCH_ROWS` function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve anymore rows. Instead of calling `EXECUTE` and then `FETCH_ROWS`, you may find it more efficient to call `EXECUTE_AND_FETCH` if you are calling `EXECUTE` for a single execution.

**VARIABLE\_VALUE, COLUMN\_VALUE, or COLUMN\_VALUE\_LONG**

For queries, call `COLUMN_VALUE` to determine the value of a column retrieved by the `FETCH_ROWS` call. For anonymous blocks containing calls to PL/SQL procedures or DML statements with `returning` clause, call `VARIABLE_VALUE` to retrieve the values assigned to the output variables when statements were run.

To fetch just part of a `LONG` database column (which can be up to two gigabytes in size), use the `COLUMN_VALUE_LONG` procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

**CLOSE\_CURSOR**

When you no longer need a cursor for a session, close the cursor by calling `CLOSE_CURSOR`. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

If you neglect to close a cursor, then the memory used by that cursor remains allocated even though it is no longer needed.

**Processing Queries**

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the [DEFINE\\_COLUMN Procedures](#), the [DEFINE\\_COLUMN\\_LONG Procedure](#), or the [DEFINE\\_ARRAY Procedure](#).
2. Run your `SELECT` statement by calling the [EXECUTE Function](#).
3. Call the [FETCH\\_ROWS Function](#) (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call [COLUMN\\_VALUE Procedure](#) or [COLUMN\\_VALUE\\_LONG Procedure](#) to determine the value of a column retrieved by the [FETCH\\_ROWS Function](#) for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the [VARIABLE\\_VALUE Procedures](#) to retrieve the values assigned to the output variables of these procedures.

**Processing Updates, Inserts, and Deletes**

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. You must first run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the [EXECUTE Function](#).
2. If statements have the `returning` clause, then you must call the [VARIABLE\\_VALUE Procedures](#) to retrieve the values assigned to the output variables.

## Locating Errors

There are additional functions in the DBMS\_SQL package for obtaining information about the last referenced cursor in the session. The values returned by these functions are only meaningful immediately after a SQL statement is run. In addition, some error-locating functions are only meaningful after certain DBMS\_SQL calls. For example, you call the [LAST\\_ERROR\\_POSITION Function](#) immediately after a PARSE.

## Examples

This section provides example procedures that make use of the DBMS\_SQL package.

### Example 1

This example does not require the use of dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The DEMO procedure deletes all of the employees from the EMP table whose salaries are greater than the salary that you specify when you run DEMO.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
    cursor_name INTEGER;
    rows_processed INTEGER;
BEGIN
    cursor_name := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
        DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

### Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(string IN varchar2) AS
    cursor_name INTEGER;
    ret INTEGER;
BEGIN
    cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
    DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
    ret := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@hq.com('CREATE TABLE acct(c1 INTEGER)');
```

**Example 3**

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id          of type NUMBER
name       of type VARCHAR2(30)
birthdate of type DATE
```

This procedure does not specifically require the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
    source      IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var      NUMBER;
    name_var    VARCHAR2(30);
    birthdate_var DATE;
    source_cursor INTEGER;
    destination_cursor INTEGER;
    ignore      INTEGER;
BEGIN

    -- Prepare a cursor to select from the source table:
    source_cursor := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(source_cursor,
        'SELECT id, name, birthdate FROM ' || source,
        DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
    ignore := DBMS_SQL.EXECUTE(source_cursor);

    -- Prepare a cursor to insert into the destination table:
    destination_cursor := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(destination_cursor,
        'INSERT INTO ' || destination ||
        ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
        DBMS_SQL.NATIVE);

    -- Fetch a row from the source table and insert it into the destination table:
    LOOP
        IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
            -- get column values of the row
            DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
            DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
            DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

            -- Bind the row into the cursor that inserts into the destination table. You
            -- could alter this example to require the use of dynamic SQL by inserting an
            -- if condition before the bind.
            DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
            DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
            DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
            birthdate_var);
            ignore := DBMS_SQL.EXECUTE(destination_cursor);
        ELSE

            -- No more rows to copy:

```

```

        EXIT;
    END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
    WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(source_cursor) THEN
            DBMS_SQL.CLOSE_CURSOR(source_cursor);
        END IF;
        IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
            DBMS_SQL.CLOSE_CURSOR(destination_cursor);
        END IF;
        RAISE;
END;
/

```

### Examples 3, 4, and 5: Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

```

DECLARE
    stmt VARCHAR2(200);
    empno_array      DBMS_SQL.NUMBER_TABLE;
    empname_array    DBMS_SQL.VARCHAR2_TABLE;
    jobs_array       DBMS_SQL.VARCHAR2_TABLE;
    mgr_array        DBMS_SQL.NUMBER_TABLE;
    hiredate_array   DBMS_SQL.VARCHAR2_TABLE;
    sal_array        DBMS_SQL.NUMBER_TABLE;
    comm_array       DBMS_SQL.NUMBER_TABLE;
    deptno_array     DBMS_SQL.NUMBER_TABLE;
    c                NUMBER;
    dummy           NUMBER;
BEGIN
    empno_array(1) := 9001;
    empno_array(2) := 9002;
    empno_array(3) := 9003;
    empno_array(4) := 9004;
    empno_array(5) := 9005;
    empno_array(6) := 9006;
    empno_array(7) := 9007;

    empname_array(1) := 'Dopey';
    empname_array(2) := 'Grumpy';
    empname_array(3) := 'Doc';
    empname_array(4) := 'Happy';
    empname_array(5) := 'Bashful';
    empname_array(6) := 'Sneezy';
    empname_array(7) := 'Sleepy';

    jobs_array(1) := 'Miner';
    jobs_array(2) := 'Miner';
    jobs_array(3) := 'Miner';
    jobs_array(4) := 'Miner';

```

```
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1) := 1000;
sal_array(2) := 1000;
sal_array(3) := 1000;
sal_array(4) := 1000;
sal_array(5) := 1000;
sal_array(6) := 1000;
sal_array(7) := 1000;

comm_array(1) := 0;
comm_array(2) := 0;
comm_array(3) := 0;
comm_array(4) := 0;
comm_array(5) := 0;
comm_array(6) := 0;
comm_array(7) := 0;

deptno_array(1) := 11;
deptno_array(2) := 11;
deptno_array(3) := 11;
deptno_array(4) := 11;
deptno_array(5) := 11;
deptno_array(6) := 11;
deptno_array(7) := 11;

stmt := 'INSERT INTO emp VALUES(
      :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
      :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
```

```

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;

```

Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

```

DECLARE
    stmt VARCHAR2(200);
    empno_array    DBMS_SQL.NUMBER_TABLE;
    salary_array   DBMS_SQL.NUMBER_TABLE;
    c              NUMBER;
    dummy         NUMBER;
BEGIN

    empno_array(1) := 7369;
    empno_array(2) := 7876;
    empno_array(3) := 7900;
    empno_array(4) := 7934;

    salary_array(1) := 10000;
    salary_array(2) := 10000;
    salary_array(3) := 10000;
    salary_array(4) := 10000;

    stmt := 'update emp set sal = :salary_array
            WHERE empno = :num_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
    DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);

    EXCEPTION WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;
/

```

In a DELETE statement, for example, you could bind in an array in the WHERE clause and have the statement be run for each element in the array:

```

DECLARE
    stmt VARCHAR2(200);
    dept_no_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
begin
    dept_no_array(1) := 10; dept_no_array(2) := 20;
    dept_no_array(3) := 30; dept_no_array(4) := 40;
    dept_no_array(5) := 30; dept_no_array(6) := 40;
    stmt := 'delete from emp where deptno = :dept_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);

```

```

DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);

EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
END;
/

```

In the preceding example, only elements 1 through 4 are used as specified by the `BIND_ARRAY` call. Each element of the array potentially deletes a large number of employees from the database.

### Examples 6 and 7: Defining an Array

The following examples show how to use the `DEFINE_ARRAY` procedure:

```

declare
  c      NUMBER;
  d      NUMBER;
  n_tab  DBMS_SQL.NUMBER_TABLE;
  indx   NUMBER := -10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  dbms_sql.parse(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

    EXIT WHEN d != 10;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

Each time the preceding example does a [FETCH\\_ROWS Function](#) call, it fetches 10 rows that are kept in `DBMS_SQL` buffers. When the [COLUMN\\_VALUE Procedure](#) call is run, those rows move into the PL/SQL table specified (in this case `n_tab`), at positions -10 to -1, as specified in the `DEFINE` statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at `EXECUTE` and keeps getting updated every time a `COLUMN_VALUE` call is made. If you re-execute at any point, then the current index for each `DEFINE` is re-initialized to "indx".

In this way the entire result of the query is fetched into the table. When `FETCH_ROWS` cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the `DEFINE_ARRAY` procedure:

Consider a table `MULTI_TAB` defined as:

```
CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```
declare
  c          NUMBER;
  d          NUMBER;
  n_tab     DBMS_SQL.NUMBER_TABLE;
  d_tab1    DBMS_SQL.DATE_TABLE;
  v_tab     DBMS_SQL.VARCHAR2_TABLE;
  d_tab2    DBMS_SQL.DATE_TABLE;
  indx     NUMBER := 10;
BEGIN

  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

  d := DBMS_SQL.EXECUTE(c);

  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);

    EXIT WHEN d != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  /*

  The four tables can be used for anything. One usage might be to use BIND_ARRAY to
  move the rows to another table by using a statement such as 'INSERT into SOME_T
  values (:a, :b, :c, :d);

  */

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
```

```
END;
/
```

### Example 8: Describe Columns

This can be used as a substitute to the SQL\*Plus DESCRIBE call by using a SELECT \* query on the table that you want to describe.

```
DECLARE
  c          NUMBER;
  d          NUMBER;
  col_cnt    INTEGER;
  f          BOOLEAN;
  rec_tab    DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
BEGIN
  DBMS_OUTPUT.NEW_LINE;
  DBMS_OUTPUT.PUT_LINE('col_type          = '
    || rec.col_type);
  DBMS_OUTPUT.PUT_LINE('col_maxlen       = '
    || rec.col_max_len);
  DBMS_OUTPUT.PUT_LINE('col_name        = '
    || rec.col_name);
  DBMS_OUTPUT.PUT_LINE('col_name_len    = '
    || rec.col_name_len);
  DBMS_OUTPUT.PUT_LINE('col_schema_name = '
    || rec.col_schema_name);
  DBMS_OUTPUT.PUT_LINE('col_schema_name_len = '
    || rec.col_schema_name_len);
  DBMS_OUTPUT.PUT_LINE('col_precision   = '
    || rec.col_precision);
  DBMS_OUTPUT.PUT_LINE('col_scale       = '
    || rec.col_scale);
  DBMS_OUTPUT.PUT('col_null_ok          = ');
  IF (rec.col_null_ok) THEN
    DBMS_OUTPUT.PUT_LINE('true');
  ELSE
    DBMS_OUTPUT.PUT_LINE('false');
  END IF;
END;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;

  DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

  d := DBMS_SQL.EXECUTE(c);

  DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
 * Following loop could simply be for j in 1..col_cnt loop.
 * Here we are simply illustrating some of the PL/SQL table
 * features.
 */
  col_num := rec_tab.first;
  IF (col_num IS NOT NULL) THEN
    LOOP
      print_rec(rec_tab(col_num));
      col_num := rec_tab.next(col_num);
      EXIT WHEN (col_num IS NULL);
    END LOOP;
  END IF;
END;
```

```

        END LOOP;
    END IF;

    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

### Example 9: RETURNING clause

The RETURNING clause was added to DML statements in an earlier Oracle database release. With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions. These values are returned in bind variables.

DBMS\_SQL.BIND\_VARIABLE is used to bind these outbinds if a single row is inserted, updated, or deleted. If multiple rows are inserted, updated, or deleted, then DBMS\_SQL.BIND\_ARRAY is used. DBMS\_SQL.VARIABLE\_VALUE must be called to get the values in these bind variables.

---

---

**Note:** This is similar to DBMS\_SQL.VARIABLE\_VALUE, which must be called after running a PL/SQL block with an out-bind inside DBMS\_SQL.

---

---

#### i) Single row insert

```

CREATE OR REPLACE PROCEDURE single_Row_insert
    (c1 NUMBER, c2 NUMBER, r OUT NUMBER) IS
    c NUMBER;
    n NUMBER;
begin
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

#### ii) Single row update

```

CREATE OR REPLACE PROCEDURE single_Row_update
    (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
    c NUMBER;
    n NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
        'WHERE rownum < 2 ' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;

```

/

## iii) Single row delete

```

CREATE OR REPLACE PROCEDURE single_Row_Delete
  (c1 NUMBER, r OUT NUMBER) IS
c NUMBER;
n number;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

## iv) Multiple row insert

```

CREATE OR REPLACE PROCEDURE multi_Row_insert
  (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
  r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

## v) Multiple row Update.

```

CREATE OR REPLACE PROCEDURE multi_Row_update
  (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

---

---

**Note:** bnd1 and bnd2 can be arrays as well. The value of the expression for all the rows updated will be in bnd3. There is no way of differentiating which rows were updated of each value of bnd1 and bnd2.

---

---

#### vi) Multiple row delete

```
CREATE OR REPLACE PROCEDURE multi_row_delete
  (c1 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

#### vii) Out-bind in bulk PL/SQL

```
CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
  (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/
```

---

---

**Note:** DBMS\_SQL.BIND\_ARRAY of number\_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

---

---

#### Example 10: Binds and Defines of User-defined Types in DBMS\_SQL

```
CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/

INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
```

```

/
INSERT INTO depts
    VALUES ('Asia', dnames_var('Finance', 'Payroll', 'Shipping', 'Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
    some_dnames dnames_var;
    c          NUMBER;
    r          NUMBER;
    sql_stmt   VARCHAR2(32767) :=
        'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
        INTO :b3';

BEGIN

    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
    DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
    DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

    r := DBMS_SQL.EXECUTE(c);

    -- Get value of outbind variable
    DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

    DBMS_SQL.CLOSE_CURSOR(c);

    -- select dept_names
    sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
    DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

    r := DBMS_SQL.EXECUTE_AND_FETCH(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through some_dnames collections
    FOR i IN some_dnames.FIRST .. some_dnames.LAST LOOP
        DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
    END LOOP;

END;
/

DECLARE
    new_dnames dnames_var;
BEGIN
    new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                             'Executive', 'Marketing');
    update_depts(new_dnames, 'Asia');
END;

```

/

---

## Data Structures

The DBMS\_SQL package defines the following RECORD types and TABLE types.

### RECORD Types

- DESC\_REC Record Type
- DESC\_REC2 Record Type
- DESC\_REC3 Record Type

### TABLE Types

- BFILE\_TABLE Table Type
- BINARY\_DOUBLE\_TABLE Table Type
- BINARY\_FLOAT\_TABLE Table Type
- BLOB\_TABLE Table Type
- CLOB\_TABLE Table Type
- DATE\_TABLE Table Type
- DESC\_TAB Table Type
- DESC\_TAB2 Table Type
- DESC\_TAB3 Table Type
- INTERVAL\_DAY\_TO\_SECOND\_TABLE Table Type
- INTERVAL\_YEAR\_TO\_MONTH\_TABLE Table Type
- NUMBER\_TABLE Table Type
- TIME\_TABLE Table Type
- TIME\_WITH\_TIME\_ZONE\_TABLE Table Type
- TIMESTAMP\_TABLE Table Type
- TIMESTAMP\_WITH\_LTZ\_TABLE Table Type
- TIMESTAMP\_WITH\_TIME\_ZONE\_TABLE Table Type
- UROWID\_TABLE Table Type
- VARCHAR2\_TABLE Table Type
- VARCHAR2A Table Type
- VARCHAR2S Table Type

## DESC\_REC Record Type

---

**Note:** This type has been deprecated in favor of the [DESC\\_REC2 Record Type](#).

---

This record type holds the describe information for a single column in a dynamic query. It is the element type of the DESC\_TAB table type and the [DESCRIBE\\_COLUMNS Procedure](#).

### Syntax

```
TYPE desc_rec IS RECORD (
    col_type          BINARY_INTEGER := 0,
    col_max_len       BINARY_INTEGER := 0,
    col_name          VARCHAR2(32)   := '',
    col_name_len      BINARY_INTEGER := 0,
    col_schema_name   VARCHAR2(32)   := '',
    col_schema_name_len BINARY_INTEGER := 0,
    col_precision     BINARY_INTEGER := 0,
    col_scale         BINARY_INTEGER := 0,
    col_charsetid     BINARY_INTEGER := 0,
    col_charsetform   BINARY_INTEGER := 0,
    col_null_ok       BOOLEAN        := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

### Fields

**Table 136–2** DESC\_REC Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

## DESC\_REC2 Record Type

DESC\_REC2 is the element type of the DESC\_TAB2 table type and the [DESCRIBE\\_COLUMNS2 Procedure](#).

This record type is identical to DESC\_REC except for the col\_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC\_REC because column name values can be greater than 32 characters. DESC\_REC is deprecated as a result.

### Syntax

```
TYPE desc_rec2 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   varchar2(32)   := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,
  col_scale         binary_integer := 0,
  col_charsetid     binary_integer := 0,
  col_charsetform   binary_integer := 0,
  col_null_ok       boolean        := TRUE);
```

### Fields

**Table 136–3** DESC\_REC2 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

## DESC\_REC3 Record Type

DESC\_REC3 is the element type of the DESC\_TAB3 table type and the [DESCRIBE\\_COLUMNS3 Procedure](#).

DESC\_REC3 is identical to DESC\_REC2 except for two additional fields to hold the type name (`type_name`) and type name len (`type_name_len`) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The `col_type_name` and `col_type_name_len` fields are only populated when the `col_type` field's value is 109, the Oracle type number for user-defined types.

### Syntax

```
TYPE desc_rec3 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   varchar2(32) := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,
  col_scale         binary_integer := 0,
  col_charsetid     binary_integer := 0,
  col_charsetform   binary_integer := 0,
  col_null_ok       boolean := TRUE,
  col_type_name     varchar2(32767) := '',
  col_type_name_len binary_integer := 0);
```

### Fields

**Table 136–4** DESC\_REC3 Fields

Field	Description
<code>col_type</code>	Type of column
<code>col_max_len</code>	Maximum column length
<code>col_name</code>	Name of column
<code>col_name_len</code>	Length of column name
<code>col_schema_name</code>	Column schema name
<code>col_schema_name_len</code>	Length of column schema name
<code>col_precision</code>	Precision of column
<code>col_scale</code>	Scale of column
<code>col_charsetid</code>	Column character set ID
<code>col_charsetform</code>	Column character set form
<code>col_null_ok</code>	NULL column flag; TRUE, if NULL possible
<code>col_type_name</code>	User-define type column type name, this field is valid when <code>col_type</code> is 109
<code>col_type_name_len</code>	Length of user-define type column type name, this field is valid when <code>col_type</code> is 109

## **BFILE\_TABLE Table Type**

This is a table of BFILE.

### **Syntax**

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

## **BINARY\_DOUBLE\_TABLE Table Type**

This is a table of BINARY\_DOUBLE.

### **Syntax**

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

## **BINARY\_FLOAT\_TABLE Table Type**

This is a table of `BINARY_FLOAT`.

### **Syntax**

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

## **BLOB\_TABLE Table Type**

This is a table of BLOB.

### **Syntax**

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

## **CLOB\_TABLE Table Type**

This is a table of CLOB.

### **Syntax**

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

## DATE\_TABLE Table Type

This is a table of DATE.

### Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

## DESC\_TAB Table Type

This is a table of [DESC\\_REC Record Type](#).

### Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

## DESC\_TAB2 Table Type

This is a table of [DESC\\_REC2 Record Type](#).

### Syntax

```
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```

## DESC\_TAB3 Table Type

This is a table of [DESC\\_REC3 Record Type](#).

### Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```

## INTERVAL\_DAY\_TO\_SECOND\_TABLE Table Type

This is a table of DSINTERVAL\_UNCONSTRAINED.

### Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF  
    DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

## INTERVAL\_YEAR\_TO\_MONTH\_TABLE Table Type

This is a table of YMINTERVAL\_UNCONSTRAINED.

### Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;
```

## NUMBER\_TABLE Table Type

This is a table of NUMBER.

### Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

## TIME\_TABLE Table Type

This is a table of `TIME_UNCONSTRAINED`.

### Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

## TIME\_WITH\_TIME\_ZONE\_TABLE Table Type

This is a table of `TIME_TZ_UNCONSTRAINED`.

### Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;;
```

## **TIMESTAMP\_TABLE Table Type**

This is a table of `TIMESTAMP_UNCONSTRAINED`.

### **Syntax**

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

## TIMESTAMP\_WITH\_LTZ\_TABLE Table Type

This is a table of `TIMESTAMP_LTZ_UNCONSTRAINED`

### Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF  
    TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

## TIMESTAMP\_WITH\_TIME\_ZONE\_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

### Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF  
    TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

## UROWID\_TABLE Table Type

This is a table of UROWID.

### Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

## **VARCHAR2\_TABLE Table Type**

This is table of VARCHAR2 (2000).

### **Syntax**

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

## VARCHAR2A Table Type

This is table of VARCHAR2 (32767).

### Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

## VARCHAR2S Table Type

This is table of VARCHAR2 (256) .

---

---

**Note:** This type has been superseded by the [VARCHAR2A Table Type](#). Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

---

---

### Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

---

## Summary of DBMS\_SQL Subprograms

**Table 136–5 DBMS\_SQL Package Subprograms**

Subprogram	Description
<a href="#">BIND_ARRAY Procedures</a> on page 136-52	Binds a given value to a given collection
<a href="#">BIND_VARIABLE Procedures</a> on page 136-55	Binds a given value to a given variable
<a href="#">CLOSE_CURSOR Procedure</a> on page 136-57	Closes given cursor and frees memory
<a href="#">COLUMN_VALUE Procedure</a> on page 136-58	Returns value of the cursor element for a given position in a cursor
<a href="#">COLUMN_VALUE_LONG Procedure</a> on page 136-61	Returns a selected part of a LONG column, that has been defined using <code>DEFINE_COLUMN_LONG</code>
<a href="#">DEFINE_ARRAY Procedure</a> on page 136-62	Defines a collection to be selected from the given cursor, used only with <code>SELECT</code> statements
<a href="#">DEFINE_COLUMN Procedures</a> on page 136-65	Defines a column to be selected from the given cursor, used only with <code>SELECT</code> statements
<a href="#">DEFINE_COLUMN_CHAR Procedure</a> on page 136-67	Defines a column of type <code>CHAR</code> to be selected from the given cursor, used only with <code>SELECT</code> statements
<a href="#">DEFINE_COLUMN_LONG Procedure</a> on page 136-68	Defines a LONG column to be selected from the given cursor, used only with <code>SELECT</code> statements
<a href="#">DEFINE_COLUMN_RAW Procedure</a> on page 136-69	Defines a column of type <code>RAW</code> to be selected from the given cursor, used only with <code>SELECT</code> statements
<a href="#">DEFINE_COLUMN_ROWID Procedure</a> on page 136-70	Defines a column of type <code>ROWID</code> to be selected from the given cursor, used only with <code>SELECT</code> statements
<a href="#">DESCRIBE_COLUMNS Procedure</a> on page 136-71	Describes the columns for a cursor opened and parsed through <code>DBMS_SQL</code>
<a href="#">DESCRIBE_COLUMNS2 Procedure</a> on page 136-72	Describes describes the specified column, an alternative to <a href="#">DESCRIBE_COLUMNS Procedure</a>
<a href="#">DESCRIBE_COLUMNS3 Procedure</a> on page 136-73	Describes describes the specified column, an alternative to <a href="#">DESCRIBE_COLUMNS Procedure</a>
<a href="#">EXECUTE Function</a> on page 136-75	Executes a given cursor
<a href="#">EXECUTE_AND_FETCH Function</a> on page 136-76	Executes a given cursor and fetch rows
<a href="#">FETCH_ROWS Function</a> on page 136-77	Fetches a row from a given cursor
<a href="#">IS_OPEN Function</a> on page 136-78	Returns <code>TRUE</code> if given cursor is open
<a href="#">LAST_ERROR_POSITION Function</a> on page 136-79	Returns byte offset in the SQL statement text where the error occurred
<a href="#">LAST_ROW_COUNT Function</a> on page 136-80	Returns cumulative count of the number of rows fetched
<a href="#">LAST_ROW_ID Function</a> on page 136-81	Returns <code>ROWID</code> of last row processed
<a href="#">LAST_SQL_FUNCTION_CODE Function</a> on page 136-82	Returns SQL function code for statement

**Table 136-5 (Cont.) DBMS\_SQL Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">OPEN_CURSOR Function</a> on page 136-83	Returns cursor ID number of new cursor
<a href="#">PARSE Procedures</a> on page 136-84	Parses given statement
<a href="#">TO_CURSOR_NUMBER Function</a> on page 136-84	Takes an OPENED strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number
<a href="#">TO_REFCURSOR Function</a> on page 136-89	Takes an OPENED, PARSED, and EXECUTED cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL
<a href="#">VARIABLE_VALUE Procedures</a> on page 136-91	Returns value of named variable for given cursor

## BIND\_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

### Syntax

```
DBMS_SQL.BIND_ARRAY (
  c           IN INTEGER,
  name        IN VARCHAR2,
  <table_variable> IN <datatype>
  [, index1   IN INTEGER,
  index2      IN INTEGER] );
```

Where the <table\_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>      Clob_Table
<bflt_tab>      Binary_Float_Table
<bdbl_tab>      Binary_Double_Table
<blob_tab>     Blob_Table
<bfile_tab>     Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
<tm_tab>       Time_Table
<ttz_tab>      Time_With_Time_Zone_Table
<tms_tab>      Timestamp_Table
<tstz_tab>     Timestamp_With_ltz_Table;
<tstz_tab>     Timestamp_With_Time_Zone_Table
<ids_tab>     Interval_Day_To_Second_Table
<iym_tab>     Interval_Year_To_Month_Table
```

Notice that the BIND\_ARRAY procedure is overloaded to accept different datatypes.

### Parameters

**Table 136–6 BIND\_ARRAY Procedure Parameters**

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the collection in the statement.
table_variable	Local variable that has been declared as <datatype>.
index1	Index for the table element that marks the lower bound of the range.
index2	Index for the table element that marks the upper bound of the range.

### Usage Notes

The length of the bind variable name should be <=30 bytes.

For binding a range, the table must contain the elements that specify the range — tab(index1) and tab(index2) — but the range does not have to be dense. Index1 must be less than or equal to index2. All elements between tab(index1) and tab(index2) are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

**See Also:** "Examples 3, 4, and 5: Bulk DML" on page 136-14 for examples of how to bind collections.

### Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The DBMS\_SQL package lets you work on collections of data using the PL/SQL table type.

*Table items* are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local DBMS\_SQL buffers (the same as for all scalar types) and then the table is manipulated from the local DBMS\_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

### Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS\_SQL.

```

TYPE binary_double_table
           IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
           IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table
           IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table
           IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table
           IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table
           IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
           IS TABLE OF dsinterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
           IS TABLE OF yminterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE number_table
           IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table
           IS TABLE OF time_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table

```

```

                IS TABLE OF time_tz_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE timestamp_table
                IS TABLE OF timestamp_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
                IS TABLE OF timestamp_ltz_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                IS TABLE OF timestamp_tz_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID          INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

## BIND\_VARIABLE Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

### Syntax

```
DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

Notice that BIND\_VARIABLE is overloaded to accept different datatypes.

The following syntax is also supported for BIND\_VARIABLE. The square brackets [] indicate an optional parameter for the BIND\_VARIABLE function.

```
DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_RAW (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN RAW [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_ROWID (
    c           IN INTEGER,
```

```
name          IN VARCHAR2,
value         IN ROWID);
```

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

## Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

## Parameters

**Table 136–7 BIND\_VARIABLE Procedure Parameters**

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the variable in the statement.
value	Value that you want to bind to the variable in the cursor. For IN and IN/OUT variables, the value has the same type as the type of the value being passed in for this parameter.
out_value_size	Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable.  If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.

## Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

The length of the bind variable name should be <=30 bytes.

**See Also:** ["Examples 3, 4, and 5: Bulk DML"](#) on page 136-14 for examples of how to bind collections.

## CLOSE\_CURSOR Procedure

This procedure closes a given cursor.

### Syntax

```
DBMS_SQL.CLOSE_CURSOR (  
    c      IN OUT INTEGER);
```

### Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

### Parameters

**Table 136–8** *CLOSE\_CURSOR Procedure Parameters*

Parameter	Mode	Description
c	IN	ID number of the cursor that you want to close.
c	OUT	Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.

## COLUMN\_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

### Syntax

```
DBMS_SQL.COLUMN_VALUE (
    c                IN  INTEGER,
    position         IN  INTEGER,
    value            OUT <datatype>
    [,column_error   OUT NUMBER]
    [,actual_length  OUT INTEGER]);
```

Where square brackets [ ] indicate optional parameters and <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
    c                IN  INTEGER,
    position         IN  INTEGER,
    value            OUT CHAR CHARACTER SET ANY_CS
    [,column_error   OUT NUMBER]
    [,actual_length  OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_RAW (
    c                IN  INTEGER,
    position         IN  INTEGER,
    value            OUT RAW
    [,column_error   OUT NUMBER]
    [,actual_length  OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_ROWID (
    c                IN  INTEGER,
    position         IN  INTEGER,
    value            OUT ROWID
    [,column_error   OUT NUMBER]
```

```
[,actual_length OUT INTEGER]);
```

The following syntax enables the `COLUMN_VALUE` procedure to accommodate bulk operations:

```
DBMS_SQL.COLUMN_VALUE(
  c                IN                INTEGER,
  position         IN                INTEGER,
  <param_name>    IN OUT NOCOPY    <table_type>);
```

Where the `<param_name>` and its corresponding `<table_type>` can be any one of these matching pairs:

```
bdbl_tab    Binary_Double_Table
bflt_tab    Binary_Float_Table
bf_tab      Bfile_Table
bl_tab      Blob_Table
cl_tab      Clob_Table
d_tab       Date_Table
ids_tab     Interval_Day_To_Second_Table
iym_tab     Interval_Year_To_Month_Table
n_tab       Number_Table
tm_tab      Time_Table
ttz_tab     Time_With_Time_Zone_Table
tms_tab     Timestamp_Table
tstz_tab    Timestamp_With_ltz_Table;
tstz_tab    Timestamp_With_Time_Zone_Table
ur_tab      Urowid_Table
c_tab       Varchar2_Table
```

## Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

## Parameters

**Table 136–9** *COLUMN\_VALUE Procedure Parameters (Single Row)*

Parameter	Description
<code>c</code>	ID number of the cursor from which you are fetching the values.
<code>position</code>	Relative position of the column in the cursor. The first column in a statement has position 1.
<code>value</code>	Returns the value at the specified column. Oracle raises exception <code>ORA-06562, inconsistent_type</code> , if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>DEFINE_COLUMN</code> .
<code>column_error</code>	Returns any error code for the specified column value.
<code>actual_length</code>	The actual length, before any truncation, of the value in the specified column.

**Table 136–10** *COLUMN\_VALUE Procedure Parameters (Bulk)*

Parameter	Description
<code>c</code>	ID number of the cursor from which you are fetching the values.
<code>position</code>	Relative position of the column in the cursor. The first column in a statement has position 1.
<code>&lt;param_name&gt;</code>	Local variable that has been declared <code>&lt;table_type&gt;</code> . <code>&lt;param_name&gt;</code> is an IN OUT NOCOPY parameter for bulk operations.  For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the <a href="#">DEFINE_ARRAY Procedure</a> a batch size (the <code>cnt</code> parameter) of 10 rows was specified and a start index ( <code>lower_bound</code> ) of 1 was specified, then the first call to this subprogram after calling the <a href="#">FETCH_ROWS Function</a> will populate elements at index 1..10, and the next call will populate elements 11..20, and so on.

## Exceptions

INCONSISTENT\_TYPE (ORA-06562) is raised if the type of the given OUT parameter `value` is different from the actual type of the value. This type was the given type when the column was defined by calling procedure `DEFINE_COLUMN`.

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

## COLUMN\_VALUE\_LONG Procedure

This procedure gets part of the value of a long column.

### Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (
  c           IN  INTEGER,
  position    IN  INTEGER,
  length      IN  INTEGER,
  offset      IN  INTEGER,
  value       OUT VARCHAR2,
  value_length OUT INTEGER);
```

### Pragmas

```
pragma restrict_references (column_value_long, RNDS, WNDS);
```

### Parameters

**Table 136–11** COLUMN\_VALUE\_LONG Procedure Parameters

Parameter	Description
c	Cursor ID number of the cursor from which to get the value.
position	Position of the column of which to get the value.
length	Number of bytes of the long value to fetch.
offset	Offset into the long field for start of fetch.
value	Value of the column as a VARCHAR2.
value_length	Number of bytes actually returned in value.

## DEFINE\_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a `FETCH_ROWS` call). This procedure lets you do batch fetching of rows from a single `SELECT` statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into `DBMS_SQL` buffers until you run a `COLUMN_VALUE` call, at which time the rows are copied into the table that was passed as an argument to the `COLUMN_VALUE` call.

### Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using `DBMS_SQL`. (These are the same types as you can specify for the `BIND_ARRAY` procedure.)

```

TYPE binary_double_table
           IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
           IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
           IS TABLE OF dsinterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
           IS TABLE OF yminterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
           IS TABLE OF time_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_table
           IS TABLE OF timestamp_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
           IS TABLE OF timestamp_ltz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
           IS TABLE OF timestamp_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

```

### Syntax

```

DBMS_SQL.DEFINE_ARRAY (
  c           IN INTEGER,
  position    IN INTEGER,
  <table_variable> IN <datatype>
  cnt        IN INTEGER,
  lower_bnd  IN INTEGER);

```

Where `<table_variable>` and its corresponding `<datatype>` can be any one of the following matching pairs, `DEFINE_ARRAY` being overloaded to accept different datatypes:

<code>&lt;clob_tab&gt;</code>	<code>Clob_Table</code>
<code>&lt;bflt_tab&gt;</code>	<code>Binary_Float_Table</code>
<code>&lt;bdbl_tab&gt;</code>	<code>Binary_Double_Table</code>
<code>&lt;blob_tab&gt;</code>	<code>Blob_Table</code>
<code>&lt;bfile_tab&gt;</code>	<code>Bfile_Table</code>
<code>&lt;date_tab&gt;</code>	<code>Date_Table</code>
<code>&lt;num_tab&gt;</code>	<code>Number_Table</code>
<code>&lt;urowid_tab&gt;</code>	<code>Urowid_Table</code>
<code>&lt;vchr2_tab&gt;</code>	<code>Varchar2_Table</code>
<code>&lt;tm_tab&gt;</code>	<code>Time_Table</code>
<code>&lt;ttz_tab&gt;</code>	<code>Time_With_Time_Zone_Table</code>
<code>&lt;tms_tab&gt;</code>	<code>Timestamp_Table</code>
<code>&lt;tstz_tab&gt;</code>	<code>Timestamp_With_ltz_Table;</code>
<code>&lt;tstz_tab&gt;</code>	<code>Timestamp_With_Time_Zone_Table</code>
<code>&lt;ids_tab&gt;</code>	<code>Interval_Day_To_Second_Table</code>
<code>&lt;iym_tab&gt;</code>	<code>Interval_Year_To_Month_Table</code>

## Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent `FETCH_ROWS` call fetch "count" rows. When the `COLUMN_VALUE` call is made, these rows are placed in positions `lower_bnd`, `lower_bnd+1`, `lower_bnd+2`, and so on. While there are still rows coming, the user keeps issuing `FETCH_ROWS/COLUMN_VALUE` calls. The rows keep accumulating in the table specified as an argument in the `COLUMN_VALUE` call.

## Parameters

**Table 136–12** *DEFINE\_ARRAY Procedure Parameters*

Parameter	Description
<code>c</code>	ID number of the cursor to which you want to bind an array.
<code>position</code>	Relative position of the column in the array being defined. The first column in a statement has position 1.
<code>table_variable</code>	Local variable that has been declared as <code>&lt;datatype&gt;</code> .
<code>cnt</code>	Number of rows that must be fetched.
<code>lower_bnd</code>	Results are copied into the collection, starting at this lower bound index.

## Usage Notes

The count (`cnt`) must be an integer greater than zero; otherwise an exception is raised. The `lower_bnd` can be positive, negative, or zero. A query on which a `DEFINE_ARRAY` call was issued cannot contain array binds.

## Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
  TYPE namelist IS TABLE OF employees.last_name%TYPE;
  TYPE sallist IS TABLE OF employees.salary%TYPE;
  names      namelist;
  sals       sallist;
```

```

c          NUMBER;
r          NUMBER;
sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

  DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

  DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
  DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

  r := DBMS_SQL.EXECUTE(c);

  LOOP
    r := DBMS_SQL.FETCH_ROWS(c);
    DBMS_SQL.COLUMN_VALUE(c, 1, names);
    DBMS_SQL.COLUMN_VALUE(c, 2, sals);
    EXIT WHEN r != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  -- loop through the names and sals collections
  FOR i IN names.FIRST .. names.LAST LOOP
    DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
  END LOOP;
END;
/

```

**See Also:** ["Examples 6 and 7: Defining an Array"](#) on page 136-17 for examples of how to define collections.

## DEFINE\_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN\\_CHAR Procedure](#), [DEFINE\\_COLUMN\\_LONG Procedure](#), [DEFINE\\_COLUMN\\_RAW Procedure](#) and [DEFINE\\_COLUMN\\_ROWID Procedure](#).

### Syntax

```
DBMS_SQL.DEFINE_COLUMN (
  c           IN INTEGER,
  position   IN INTEGER,
  column     IN <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

Note that `DEFINE_COLUMN` is overloaded to accept different datatypes.

The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```
DBMS_SQL.DEFINE_COLUMN (
  c           IN INTEGER,
  position   IN INTEGER,
  column     IN VARCHAR2 CHARACTER SET ANY_CS,
  column_size IN INTEGER);
```

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

### Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

## Parameters

**Table 136–13** *DEFINE\_COLUMN Procedure Parameters*

Parameter	Description
<code>c</code>	ID number of the cursor for the row being defined to be selected
<code>position</code>	Relative position of the column in the row being defined. The first column in a statement has position 1.
<code>column</code>	Value of the column being defined. The type of this value determines the type for the column being defined.
<code>column_size</code>	Maximum expected size of the column value in bytes for columns of type <code>VARCHAR2</code> , and <code>RAW</code> .

## Usage Notes

When using character length semantics the maximum number of bytes that can be returned for a column value of type `VARCHAR2` is calculated as: `column_size * maximum character byte size for the current character set`. For example, specifying the `column_size` as 10 means that a maximum of 30 (10\*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

## DEFINE\_COLUMN\_CHAR Procedure

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_LONG Procedure](#), [DEFINE\\_COLUMN\\_RAW Procedure](#) and [DEFINE\\_COLUMN\\_ROWID Procedure](#).

### Syntax

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
  c           IN INTEGER,
  position   IN INTEGER,
  column     IN CHAR CHARACTER SET ANY_CS,
  column_size IN INTEGER);
```

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

### Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

### Parameters

**Table 136–14** DEFINE\_COLUMN\_CHAR Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in characters for columns of type CHAR.

## DEFINE\_COLUMN\_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_CHAR Procedure](#), [DEFINE\\_COLUMN\\_RAW Procedure](#) and [DEFINE\\_COLUMN\\_ROWID Procedure](#).

### Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (  
    c           IN INTEGER,  
    position    IN INTEGER);
```

### Parameters

**Table 136–15** DEFINE\_COLUMN\_LONG Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

## DEFINE\_COLUMN\_RAW Procedure

This procedure defines a column of type RAW to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_CHAR Procedure](#), [DEFINE\\_COLUMN\\_LONG Procedure](#) and [DEFINE\\_COLUMN\\_ROWID Procedure](#).

### Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (
  c           IN INTEGER,
  position   IN INTEGER,
  column     IN RAW,
  column_size IN INTEGER);
```

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

### Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

### Parameters

**Table 136–16** *DEFINE\_COLUMN Procedure Parameters*

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of and RAW

## DEFINE\_COLUMN\_ROWID Procedure

This procedure defines a column of type ROWID to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the [DEFINE\\_COLUMN Procedures](#), [DEFINE\\_COLUMN\\_CHAR Procedure](#), [DEFINE\\_COLUMN\\_LONG Procedure](#) and [DEFINE\\_COLUMN\\_RAW Procedure](#).

### Syntax

```
DBMS_SQL.DEFINE_COLUMN_ROWID (
  c           IN INTEGER,
  position   IN INTEGER,
  column     IN ROWID);
```

**See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

### Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

### Parameters

**Table 136–17** DEFINE\_COLUMN Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.

## DESCRIBE\_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS\_SQL.

### Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (  
    c           IN  INTEGER,  
    col_cnt    OUT INTEGER,  
    desc_t     OUT DESC_TAB);
```

### Parameters

**Table 136-18** *DESCRIBE\_COLUMNS Procedure Parameters*

Parameter	Description
c	ID number of the cursor for the columns being described
col_cnt	Number of columns in the select list of the query
desc_t	Describe table to fill in with the description of each of the columns of the query

**See Also:** ["Example 8: Describe Columns"](#) on page 136-19 illustrates how to use DESCRIBE\_COLUMNS.

## DESCRIBE\_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to [DESCRIBE\\_COLUMNS Procedure](#).

### Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS2 (  
  c           IN  INTEGER,  
  col_cnt    OUT INTEGER,  
  desc_t     OUT DESC_TAB2);
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);
```

### Parameters

**Table 136–19** DESCRIBE\_COLUMNS2 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

## DESCRIBE\_COLUMNS3 Procedure

This procedure describes the specified column. This is an alternative to [DESCRIBE\\_COLUMNS Procedure](#).

### Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
  c          IN  INTEGER,
  col_cnt   OUT INTEGER,
  desc_t    OUT DESC_TAB3);
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

### Parameters

**Table 136–20 DESCRIBE\_COLUMNS3 Procedure Parameters**

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

### Usage Notes

The cursor passed in by the cursor ID has to be OPENED and PARSED, otherwise an "invalid cursor id" error is raised.

### Examples

```
CREATE TYPE PROJECT_T AS OBJECT
  ( projname      VARCHAR2(20),
    mgr           VARCHAR2(20))
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
  curid      NUMBER;
  desctab   DBMS_SQL.DESC_TAB3;
  colcnt    NUMBER;
  sql_stmt  VARCHAR2(200) := 'select * from projecttab';
BEGIN

  curid := DBMS_SQL.OPEN_CURSOR;

  DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

  DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 109 THEN
```

```
        DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
        DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                               desctab(i).col_type_name);
    END IF;
END LOOP;

DBMS_SQL.CLOSE_CURSOR(curid);
END;
/
```

Output:

```
PROJECT is user-defined type: HR.PROJECT_T
```

## EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed. The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and should be ignored.

### Syntax

```
DBMS_SQL.EXECUTE (  
    c    IN INTEGER)  
RETURN INTEGER;
```

### Parameters

**Table 136–21 EXECUTE Function Parameters**

Parameter	Description
c	Cursor ID number of the cursor to execute.

### Return Values

Returns number of rows processed

### Usage Notes

The DBMS\_SQL cursor that is returned by the [TO\\_CURSOR\\_NUMBER Function](#) performs in the same way as a DBMS\_SQL cursor that has already been executed. Consequently, calling EXECUTE for this cursor will cause an error.

## EXECUTE\_AND\_FETCH Function

This function executes the given cursor and fetches rows. This function provides the same functionality as calling `EXECUTE` and then calling `FETCH_ROWS`. Calling `EXECUTE_AND_FETCH` instead, however, may reduce the number of network round-trips when used against a remote database.

The `EXECUTE_AND_FETCH` function returns the number of rows actually fetched.

### Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (  
    c          IN INTEGER,  
    exact      IN BOOLEAN DEFAULT FALSE)  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references (execute_and_fetch, WNDS);
```

### Parameters

**Table 136–22 EXECUTE\_AND\_FETCH Function Parameters**

Parameter	Description
<code>c</code>	ID number of the cursor to execute and fetch.
<code>exact</code>	Set to <code>TRUE</code> to raise an exception if the number of rows actually matching the query differs from one.  Note: Oracle does not support the exact fetch <code>TRUE</code> option with <code>LONG</code> columns.  Even if an exception is raised, the rows are still fetched and available.

### Return Values

Returns designated rows

## FETCH\_ROWS Function

This function fetches a row from a given cursor. You can call `FETCH_ROWS` repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling `COLUMN_VALUE`, for each column, after each call to `FETCH_ROWS`.

The `FETCH_ROWS` function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

### Syntax

```
DBMS_SQL.FETCH_ROWS (  
    c          IN INTEGER)  
    RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

### Parameters

**Table 136–23** *FETCH\_ROWS Function Parameters*

Parameter	Description
c	ID number.

### Return Values

Returns a row from a given cursor

## IS\_OPEN Function

This function checks to see if the given cursor is currently open.

### Syntax

```
DBMS_SQL.IS_OPEN (  
    c          IN INTEGER)  
    RETURN BOOLEAN;
```

### Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

### Parameters

**Table 136–24 IS\_OPEN Function Parameters**

Parameter	Description
c	Cursor ID number of the cursor to check.

### Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the [CLOSE\\_CURSOR Procedure](#) Procedure `NULLs` out the cursor variable passed to it.

### Exceptions

`ORA-29471 DBMS_SQL access denied`: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent `DBMS_SQL` call in the same session will raise this error, meaning that `DBMS_SQL` is non-operational for this session.

## LAST\_ERROR\_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

### Syntax

```
DBMS_SQL.LAST_ERROR_POSITION  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references (last_error_position, RNDS, WNDS);
```

### Return Values

Returns the byte offset in the SQL statement text where the error occurred

### Usage Notes

Call this function after a `PARSE` call, before any other `DBMS_SQL` procedures or functions are called.

## LAST\_ROW\_COUNT Function

This function returns the cumulative count of the number of rows fetched.

### Syntax

```
DBMS_SQL.LAST_ROW_COUNT  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references (last_row_count, RNDS, WNDS);
```

### Return Values

Returns the cumulative count of the number of rows fetched

### Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call. If called after an `EXECUTE` call, then the value returned is zero.

## LAST\_ROW\_ID Function

This function returns the ROWID of the last row processed.

### Syntax

```
DBMS_SQL.LAST_ROW_ID  
RETURN ROWID;
```

### Pragmas

```
pragma restrict_references (last_row_id, RNDS, WNDS);
```

### Return Values

Returns the ROWID of the last row processed

### Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call.

## LAST\_SQL\_FUNCTION\_CODE Function

This function returns the SQL function code for the statement. These codes are listed in the *Oracle Call Interface Programmer's Guide*.

### Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE  
RETURN INTEGER;
```

### Pragmas

```
pragma restrict_references (last_sql_function_code, RNDS, WNDS);
```

### Return Values

Returns the SQL function code for the statement

### Usage Notes

You should call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

## OPEN\_CURSOR Function

This procedure opens a new cursor. The second overload takes a `security_level` parameter to apply fine-grained control to the security of the opened cursor.

When you no longer need this cursor, you must close it explicitly by calling the [CLOSE\\_CURSOR Procedure](#).

### Syntax

```
DBMS_SQL.OPEN_CURSOR
RETURN INTEGER;

DBMS_SQL.OPEN_CURSOR (
    security_level IN INTEGER)
RETURN INTEGER;
```

### Parameters

**Table 136–25 OPEN\_CURSOR Function Parameters**

Parameter	Description
<code>security_level</code>	<p>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of <code>open_cursor</code> without the <code>security_level</code> parameter, the default security level value 1 will be enforced on the opened cursor.</p> <ul style="list-style-type: none"> <li>▪ Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default.</li> <li>▪ Level 1 - requires that the effective userid and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.</li> <li>▪ Level 2 - requires that the effective userid and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.</li> </ul>

### Pragmas

```
pragma restrict_references (open_cursor, RNDS, WNDS);
```

### Return Values

Returns the cursor ID number of the new cursor

### Usage Notes

You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

## PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are three versions of the PARSE procedure:

- Taking a VARCHAR2 statement as an argument
- Taking VARCHAR2a, table of VARCHAR2(32767), as an argument. The VARCHAR2A overload version of the procedure concatenates elements of a PL/SQL table statement and parses the resulting string. You can use this procedure to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.
- Taking a CLOB statement as an argument. You can use the CLOB overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

### Syntax

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2,
    language_flag    IN    INTEGER,
    edition          IN    VARCHAR2 DEFAULT NULL,
    apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    CLOB,
    language_flag    IN    INTEGER,
    edition          IN    VARCHAR2 DEFAULT NULL,
    apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE);
```

```
DBMS_SQL.PARSE (
    c                IN    INTEGER,
    statement        IN    VARCHAR2A,
    lb              IN    INTEGER,
    ub              IN    INTEGER,
    lfflg          IN    BOOLEAN,
    language_flag    IN    INTEGER,
    edition          IN    VARCHAR2 DEFAULT NULL,
    apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,
    fire_apply_trigger IN    BOOLEAN DEFAULT TRUE);
```

## Parameters

**Table 136–26 PARSE Procedure Parameters**

Parameter	Description
c	ID number of the cursor in which to parse the statement.
statement	<p>SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs.</p> <p>Unlike PL/SQL statements, your SQL statement should not include a final semicolon. For example:</p> <pre>DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2); DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);</pre>
lb	Lower bound for elements in the statement
ub	Upper bound for elements in the statement
lfflg	If TRUE, then insert a linefeed after each element on concatenation.
language_flag	<p>Determines how Oracle handles the SQL statement. The following options are recognized:</p> <ul style="list-style-type: none"> <li>▪ V6 (or 0) specifies version 6 behavior.</li> <li>▪ NATIVE (or 1) specifies normal behavior for the database to which the program is connected.</li> <li>▪ V7 (or 2) specifies Oracle database version 7 behavior.</li> </ul>
edition	<p>Specifies the edition to run the statement in. Passing NULL indicates the statement should to run in the caller's current edition. The contents of the string are processed as a SQL identifier; double-quotes must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name, and if double-quotes are not used the contents will be uppercased. If the edition is specified with a non-NULL value, the user with which the statement is to be executed must have USE privilege on the named edition.</p>
apply_crossedition_trigger	<p>Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement.</p> <p>If a non-NULL value is specified, the specified crossedition trigger will be executed assuming fire_apply_trigger is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's dml_event_clause, any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the "crossedition trigger DML rules" applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed.</p> <p>The contents of the string are processed as a SQL identifier; double-quotes must surround the remainder of the string if special characters or lower case characters are present in the trigger's actual name, and if double-quotes are not used, the contents will be uppercased.</p>

**Table 136–26 (Cont.) PARSE Procedure Parameters**

Parameter	Description
fire_apply_trigger	Indicates whether the specified <code>apply_crossedition_trigger</code> is itself to be executed, or should only be a guide used in selecting other triggers. This is typically set <code>FALSE</code> when the statement is a replacement for the actions the <code>apply_crossedition_trigger</code> would itself perform. If <code>FALSE</code> , the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The <code>apply_crossedition_trigger</code> and <code>fire_apply_trigger</code> parameters are ignored if the statement is not a DML.

## Usage Notes

- Using `DBMS_SQL` to dynamically run DDL statements can result in the program hanging. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, results in a hang.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
```

- The `VARCHAR2S` type is currently supported for backward compatibility of legacy code. However, you are advised to use `VARCHAR2A` both for its superior capability and because `VARCHAR2S` will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new `CLOB` overload version of the `PARSE` procedure can be used instead of the `VARCHAR2A` overload

## Exceptions

If you create a type/procedure/function/package using `DBMS_SQL` that has compilation warnings, an `ORA-24344` exception is raised, and the procedure is still created.

## TO\_CURSOR\_NUMBER Function

This function takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS\_SQL cursor number.

### Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER(
  rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;
```

### Parameters

**Table 136–27 TO\_CURSOR\_NUMBER Function Parameters**

Parameter	Description
rc	REF CURSOR to be transformed into a cursor number

### Return Values

Returns a DBMS\_SQL manageable cursor number transformed from a REF CURSOR

### Usage Notes

- The REF CURSOR passed in has to be OPENed, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS\_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS\_SQL cursor that is returned by this subprogram performs in the same way as a DBMS\_SQL cursor that has already been executed.

### Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur      CurType;
  curid        NUMBER;
  desctab      DBMS_SQL.DESCTAB;
  colcnt       NUMBER;
  namevar      VARCHAR2(50);
  numvar       NUMBER;
  datevar      DATE;
  empno        NUMBER := 100;
BEGIN

  -- sql_stmt := 'select ..... from employees where employee_id = :b1';
  OPEN src_cur FOR sql_stmt USING empno;

  -- Switch from native dynamic SQL to DBMS_SQL
  curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);

  DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

  -- Define columns
  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 2 THEN
      DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
```

```
        ELSIF desctab(i).col_type = 12 THEN
            DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
        .....
        ELSE
            DBMS_SQL.DEFINE_COLUMN(curid, i, namevar, 25);
        END IF;
    END LOOP;

-- Fetch Rows
    WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
        FOR i IN 1 .. colcnt LOOP
            IF (desctab(i).col_type = 1) THEN
                DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
            ELSIF (desctab(i).col_type = 2) THEN
                DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
            ELSIF (desctab(i).col_type = 12) THEN
                DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
        .....
            END IF;
        END LOOP;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/
```

## TO\_REFCURSOR Function

This function takes an OPENed, PARSEd, and EXECUTEd cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL. This subprogram is only used with SELECT cursors.

### Syntax

```
DBMS_SQL.TO_REFCURSOR (
    cursor_number IN OUT INTEGER)
RETURN SYS_REFCURSOR;
```

### Parameters

**Table 136–28 TO\_REFCURSOR Function Parameters**

Parameter	Description
cursor_number	Cursor number of the cursor to be transformed into REF CURSOR

### Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS\_SQL cursor number

### Usage Notes

- The cursor passed in by the cursor\_number has to be OPENed, PARSEd, and EXECUTEd; otherwise an error is raised.
- Once the cursor\_number is transformed into a REF CURSOR, the cursor\_number is no longer accessible by any DBMS\_SQL operations.
- After a cursor\_number is transformed into a REF CURSOR, using DBMS\_SQL.IS\_OPEN to check to see if the cursor\_number is still open results in an error.

### Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
    TYPE CurType IS REF CURSOR;
    src_cur          CurType;
    curid            NUMBER;
    sql_stmt         VARCHAR2(200);
    ret              INTEGER;
    empnos           DBMS_SQL.Number_Table;
    depts            DBMS_SQL.Number_Table;
BEGIN

    -- DBMS_SQL.OPEN_CURSOR
    curid := DBMS_SQL.OPEN_CURSOR;

    sql_stmt :=
        'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID = :b1';

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
    ret := DBMS_SQL.EXECUTE(curid);

    -- Switch from DBMS_SQL to native dynamic SQL
```

```
src_cur := DBMS_SQL.TO_REFCURSOR(curid);

-- Fetch with native dynamic SQL
FETCH src_cur BULK COLLECT INTO empnos, depts;

IF empnos.COUNT > 0 THEN
  DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
  DBMS_OUTPUT.PUT_LINE('-----');
  -- Loop through the empnos and depts collections
  FOR i IN 1 .. empnos.COUNT LOOP
    DBMS_OUTPUT.PUT_LINE(empnos(i) || ' ' || depts(i));
  END LOOP;
END IF;

-- Close cursor
CLOSE src_cur;
END;
/
```

## VARIABLE\_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause.

### Syntax

```
DBMS_SQL.VARIABLE_VALUE (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT NOCOPY <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.VARIABLE_VALUE_CHAR (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT CHAR CHARACTER SET ANY_CS);
```

```
DBMS_SQL.VARIABLE_VALUE_RAW (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT RAW);
```

```
DBMS_SQL.VARIABLE_VALUE_ROWID (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT ROWID);
```

The following syntax enables the VARIABLE\_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.VARIABLE_VALUE (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
```

```
value          OUT NOCOPY <table_type>;
```

For bulk operations, <table\_type> can be:

```
Binary_Double_Table
Binary_Float_Table
Bfile_Table
Blob_Table
Clob_Table
Date_Table
Interval_Day_To_Second_Table
Interval_Year_To_Month_Table
Number_Table
Time_Table
Time_With_Time_Zone_Table
Timestamp_Table
Timestamp_With_ltz_Table;
Timestamp_With_Time_Zone_Table
Urowid_Table
Varchar2_Table
```

## Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

## Parameters

**Table 136–29 VARIABLE\_VALUE Procedure Parameters**

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	<ul style="list-style-type: none"> <li>▪ Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE</code>.</li> <li>▪ Array option: Local variable that has been declared &lt;table_type&gt;. For bulk operations, value is an <code>OUT NOCOPY</code> parameter.</li> </ul>

The DBMS\_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

## Using DBMS\_SQLDIAG

- [Overview](#)
- [Constants](#)
- [Examples](#)

## Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement.

This section covers the following topics:

- [About the SQL Repair Advisor](#)
- [Running the SQL Repair Advisor](#)
- [Removing a SQL Patch](#)

### About the SQL Repair Advisor

You run the SQL Repair Advisor after a SQL statement fails with a critical error. The advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

### Running the SQL Repair Advisor

You run the SQL Repair Advisor by creating and executing a diagnostic task using the `CREATE_DIAGNOSIS_TASK` and `EXECUTE_DIAGNOSIS_TASK` respectively. The SQL Repair Advisor first reproduces the critical error and then tries to produce a workaround in the form of SQL patch.

#### 1. Identify the problem SQL statement

Consider the SQL statement that gives a critical error:

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT MAX(ROWID) FROM t t2
WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)
```

You use the SQL Repair advisor to repair this critical error.

#### 2. Create a diagnosis task

Invoke `DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK`. You can specify an optional task name, an optional time limit for the advisor task, and problem type. In the example below, we specify the SQL text, the task name as 'error\_task' and a problem type as 'DBMS\_SQLDIAG.PROBLEM\_TYPE\_COMPILATION\_ERROR'.

```
DECLARE
    rep_out          CLOB;
    t_id             VARCHAR2(50);
BEGIN
    t_id := DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK(
        sql_text => 'DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT
MAX(ROWID) FROM t t2 WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)',
        task_name => 'error_task',
        problem_type =>DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR);
```

#### 3. Execute the diagnosis task

To execute the workaround generation and analysis phase of the SQL Repair Advisor, you call `DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK` with the task ID returned by the `CREATE_DIAGNOSIS_TASK`. After a short delay, the SQL Repair Advisor returns. As part of its execution, the SQL Repair Advisor keeps a record of its findings which can be accessed through the reporting facilities of SQL Repair Advisor.

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (t_id);
```

#### 4. Report the diagnosis task

The analysis of the diagnosis task is accessed through `dbms_sqldiag.report_diagnosis_task`. If the SQL Repair Advisor was able to find a workaround, it recommends a SQL Patch. A SQL Patch is similar to a SQL profile but unlike the SQL Profile, it is used to workaround compilation or execution errors.

```
rep_out := DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (t_id, DBMS_SQLDIAG.TYPE_TEXT);

DBMS_OUTPUT.PUT_LINE ('Report : ' || rep_out);

END;
/
```

#### 5. Applying the patch

If a patch recommendation is present in the report, you can run the `ACCEPT_SQL_PATCH` command to accept the patch by invoking `DBMS_SQLDIAG.ACCEPT_SQL_PATCH`. This procedure takes the `task_name` as an argument.

```
EXECUTE DBMS_SQLDIAG.ACCEPT_SQL_PATCH(task_name => 'error_task', task_owner =>
'SYS', replace => TRUE);
```

#### 6. Test the patch

Now that you have accepted the patch, you can rerun the SQL statement. This time, it will not give you the critical error. If you run 'explain plan' for this statement, you will see that a SQL patch was used to generate the plan.

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (select max(rowid) FROM t t2
WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d);
```

#### Removing a SQL Patch

In a situation where you obtained an official patch from Oracle to fix an error, or upgraded to the next patchset or release of Oracle which included the fix for the error, you call `DBMS_SQLDIAG.DROP_SQL_PATCH` with the patch name to drop the SQL patch. The patch name can be obtained from the explain plan section or by querying the view `DBA_SQL_PATCHES`.

## Constants

The DBMS\_SQLDIAG package uses the constants shown in the following tables:

- [Table 137-1, "DBMS\\_SQLDIAG Constants - SQLDIAG Advisor Name"](#) describes the name of SQL repair advisor as seen by the advisor framework
- [Table 137-2, "DBMS\\_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values"](#) describes SQLDIAG advisor task scope parameter values
- [Table 137-3, "DBMS\\_SQLDIAG Constants - SQLDIAG Advisor time\\_limit Constants"](#) describes SQLDIAG advisor time\_limit constants
- [Table 137-4, "DBMS\\_SQLDIAG Constants - Report Type \(possible values\) Constants"](#) describes possible formats for a report
- [Table 137-5, "DBMS\\_SQLDIAG Constants - Report Level \(possible values\) Constants"](#) describes possible levels of detail in the report
- [Table 137-6, "DBMS\\_SQLDIAG Constants - Report Section \(possible values\) Constants"](#) describes possible report sections (comma delimited)
- [Table 137-7, "DBMS\\_SQLDIAG Constants - Problem Type Constants"](#) describes possible values for the problem\_type parameter of the [CREATE\\_DIAGNOSIS\\_TASK Functions](#)
- [Table 137-8, "DBMS\\_SQLDIAG Constants - Findings Filter Constants"](#) describes possible values for the \_sql\_findings\_mode parameter

**Table 137-1 DBMS\_SQLDIAG Constants - SQLDIAG Advisor Name**

Constant	Type	Value	Description
ADV_SQL_DIAG_NAME	VARCHAR2(18)	'SQL Repair Advisor'	Name of SQL repair advisor as seen by the advisor framework

**Table 137-2 DBMS\_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values**

Constant	Type	Value	Description
SCOPE_COMPREHENSIVE	VARCHAR2(13)	'COMPREHENSIVE'	Detailed analysis of the problem which may take more time to execute
SCOPE_LIMITED	VARCHAR2(7)	'LIMITED'	Brief analysis of the problem

**Table 137-3 DBMS\_SQLDIAG Constants - SQLDIAG Advisor time\_limit Constants**

Constant	Type	Value	Description
TIME_LIMIT_DEFAULT	NUMBER	1800	Default time limit for analysis of the problem

**Table 137–4 DBMS\_SQLDIAG Constants - Report Type (possible values) Constants**

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Report from the <a href="#">REPORT_DIAGNOSIS_TASK</a> Function in HTML form
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Report from the <a href="#">REPORT_DIAGNOSIS_TASK</a> Function in text form
TYPE_XML	VARCHAR2(3)	'XML'	Report from the <a href="#">REPORT_DIAGNOSIS_TASK</a> Function in XML form

**Table 137–5 DBMS\_SQLDIAG Constants - Report Level (possible values) Constants**

Constant	Type	Value	Description
LEVEL_ALL	VARCHAR2(3)	'ALL'	Complete report including annotations about statements skipped over
LEVEL_BASIC	VARCHAR2(5)	'BASIC'	Shows information about every statement analyzed, including recommendations not implemented
LEVEL_TYPICAL	VARCHAR2(7)	'TYPICAL'	Simple report shows only information about the actions taken by the advisor.

**Table 137–6 DBMS\_SQLDIAG Constants - Report Section (possible values) Constants**

Constant	Type	Value	Description
SECTION_ALL	VARCHAR2(3)	'ALL'	All statements
SECTION_ERRORS	VARCHAR2(6)	'ERRORS'	Statements with errors
SECTION_FINDINGS	VARCHAR2(8)	'FINDINGS'	Tuning findings
SECTION_INFORMATION	VARCHAR2(11)	'INFORMATION'	General information
SECTION_PLANS	VARCHAR2(5)	'PLANS'	Explain plans
SECTION_SUMMARY	VARCHAR2(7)	'SUMMARY'	Summary information

**Table 137–7 DBMS\_SQLDIAG Constants - Problem Type Constants**

Constant	Type	Value	Description
PROBLEM_TYPE_PERFORMANCE	NUMBER	1	User suspects this is a performance problem

**Table 137-7 (Cont.) DBMS\_SQLDIAG Constants - Problem Type Constants**

Constant	Type	Value	Description
PROBLEM_TYPE_WRONG_RESULTS	NUMBER	2	User suspects the query is giving inconsistent results
PROBLEM_TYPE_COMPILATION_ERROR	NUMBER	3	User sees a crash in compilation
PROBLEM_TYPE_EXECUTION_ERROR	NUMBER	4	User sees a crash in execution
PROBLEM_TYPE_ALT_PLAN_GEN	NUMBER	5	User to explore all alternative plans

**Table 137-8 DBMS\_SQLDIAG Constants - Findings Filter Constants**

Constant	Type	Value	Description
SQLDIAG_FINDINGS_ALL	NUMBER	1	Show all possible findings
SQLDIAG_FINDINGS_VALIDATION	NUMBER	2	Show status of validation rules over structures
SQLDIAG_FINDINGS_FEATURES	NUMBER	3	Show only features used by the query
SQLDIAG_FINDINGS_FILTER_PLANS	NUMBER	4	Show the alternative plans generated by the advisor
SQLDIAG_FINDINGS_CR_DIFF	NUMBER	5	Show difference between two plans
SQLDIAG_FINDINGS_MASK_VARIANT	NUMBER	6	Mask info for testing
SQLDIAG_FINDINGS_OBJ_FEATURES	NUMBER	7	Show features usage history
SQLDIAG_FINDINGS_BASIC_INFO	NUMBER	8	Show the alternative plans generated by the advisor

## Examples

### Patch Pack / Unpack

Patches can be exported out of one system and imported into another by means of a staging table, provided by subprograms in this package. Like with SQL diagnosis sets, the operation of inserting into the staging table is called a "pack", and the operation of creating patches from staging table data is termed the "unpack".

DBAs should perform a pack/unpack as follows:

1. Create a staging table owned by user 'SH' through a call to `CREATE_STGTAB_SQLPATCH`:

```
EXEC DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH(
    table_name      => 'STAGING_TABLE',
    schema_name     => 'SH');
```

2. Call `PACK_STGTAB_SQLPATCH` one or more times to write SQL patch data into the staging table. In this case, copy data for all SQL patches in the `DEFAULT` category into a staging table owned by the current schema owner:

```
EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
    staging_table_name => 'STAGING_TABLE');
```

3. In this case, only a single SQL patch `SP_FIND_EMPLOYEE` is copied into a staging table owned by the current schema owner:

```
EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
    patch_name       => 'SP_FIND_EMPLOYEE',
    staging_table_name => 'STAGING_TABLE');
```

The staging table can then be moved to another system using either `datapump`, `import/export` commands or through a `databaselink`.

4. Call `UNPACK_STGTAB_SQLPATCH` to create SQL patches on the new system from the patch data in the staging table. In this case, change the name in the data for the `SP_FIND_EMPLOYEE` patch stored in the staging table to `'SP_FIND_EMP_PROD'`:

```
exec dbms_sqldiag.remap_stgtab_sqlpatch(
    old_patch_name   => 'SP_FIND_EMPLOYEE',
    new_patch_name   => 'SP_FIND_EMP_PROD');
```

## Summary of DBMS\_SQLDIAG Subprograms

**Table 137-9 DBMS\_SQLDIAG Package Subprograms**

Subprogram	Description
<a href="#">ACCEPT_SQL_PATCH Function &amp; Procedure</a> on page 137-11	Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task
<a href="#">ALTER_SQL_PATCH Procedure</a> on page 137-13	Alters specific attributes of an existing SQL patch object
<a href="#">CANCEL_DIAGNOSIS_TASK Procedure</a> on page 137-14	Cancel a diagnostic task
<a href="#">CREATE_DIAGNOSIS_TASK Functions</a> on page 137-15	Creates a diagnostic task in order to diagnose a single SQL statement
<a href="#">CREATE_STGTAB_SQLPATCH Procedure</a> on page 137-17	Creates the staging table used for transporting SQL patches from one system to another
<a href="#">DROP_DIAGNOSIS_TASK Procedure</a> on page 137-18	Drops a diagnostic task
<a href="#">DROP_SQL_PATCH Procedure</a> on page 137-19	Drops the named SQL patch from the database
<a href="#">EXECUTE_DIAGNOSIS_TASK Procedure</a> on page 137-20	Executes a diagnostic task
<a href="#">EXPLAIN_SQL_TESTCASE Function</a> on page 137-21	Explains a SQL test case
<a href="#">EXPORT_SQL_TESTCASE Procedures</a> on page 137-22	Exports a SQL test case to a directory
<a href="#">EXPORT_SQL_TESTCASE_DIR_BY_INC Function</a> on page 137-25	Generates a SQL Test Case corresponding to the incident ID passed as an argument.
<a href="#">EXPORT_SQL_TESTCASE_DIR_BY_TXT Function</a> on page 137-26	Generates a SQL Test Case corresponding to the SQL passed as an argument
<a href="#">GET_FIX_CONTROL Function</a> on page 137-27	Returns the value of fix control for a given bug number
<a href="#">GET_SQL Function</a> on page 137-28	Imports a SQL test case
<a href="#">IMPORT_SQL_TESTCASE Procedures</a> on page 137-29	Imports a SQL test case into a schema
<a href="#">INCIDENTID_2_SQL Procedure</a> on page 137-31	Initializes a <code>sql_setrow</code> from an incident ID
<a href="#">INTERRUPT_DIAGNOSIS_TASK Procedure</a> on page 137-32	Interrupts a diagnostic task
<a href="#">LOAD_SQLSET_FROM_TCB Function</a> on page 137-33	Loads a <code>SQLSET</code> from Test Case Builder (TCB) file
<a href="#">PACK_STGTAB_SQLPATCH Procedure</a> on page 137-34	SQL patches into the staging table created by the <a href="#">CREATE_STGTAB_SQLPATCH Procedure</a>

**Table 137-9 (Cont.) DBMS\_SQLDIAG Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">REPORT_DIAGNOSIS_TASK</a> Function on page 137-35	Reports on a diagnostic task
<a href="#">RESET_DIAGNOSIS_TASK</a> Procedure on page 137-36	Resets a diagnostic task
<a href="#">RESUME_DIAGNOSIS_TASK</a> Procedure on page 137-37	Resumes a diagnostic task
<a href="#">SET_DIAGNOSIS_TASK_PARAMETER</a> Procedure on page 137-38	Sets a diagnosis task parameter
<a href="#">UNPACK_STGTAB_SQLPATCH</a> Procedure on page 137-39	Unpacks from the staging table populated by a call to the <a href="#">PACK_STGTAB_SQLPATCH</a> Procedure, using the patch data stored in the staging table to create patches on this system

---

## ACCEPT\_SQL\_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

### Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER := NULL,
  name           IN  VARCHAR2 := NULL,
  description    IN  VARCHAR2 := NULL,
  category       IN  VARCHAR2 := NULL,
  task_owner    IN  VARCHAR2 := NULL,
  replace       IN  BOOLEAN := FALSE,
  force_match    IN  BOOLEAN := FALSE)
RETURN VARCHAR2;

DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER := NULL,
  name           IN  VARCHAR2 := NULL,
  description    IN  VARCHAR2 := NULL,
  category       IN  VARCHAR2 := NULL,
  task_owner    IN  VARCHAR2 := NULL,
  replace       IN  BOOLEAN := FALSE,
  force_match    IN  BOOLEAN := FALSE);
```

### Parameters

**Table 137–10** ACCEPT\_SQL\_PATCH Function & Procedure Parameters

Parameter	Description
taskname	Name of the SQL diagnosis task
object_id	Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task
name	Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.
description	User specified string describing the purpose of this SQL patch. Maximum size of description is 500.
category	Category name which must match the value of the SQLDIAGNOSE_CATEGORY parameter in a session for the session to use this patch. It defaults to the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.
task_owner	Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.

**Table 137–10 (Cont.) ACCEPT\_SQL\_PATCH Function & Procedure Parameters**

Parameter	Description
<code>replace</code>	If the patch already exists, it will be replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .
<code>force_match</code>	If <code>TRUE</code> this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>CURSOR_SHARING</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>CURSOR_SHARING</code> parameter.

**Return Values**

Name of the SQL patch

**Usage Notes**

Requires `CREATE ANY SQL PROFILE` privilege

## ALTER\_SQL\_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

### Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
  name           IN VARCHAR2,
  attribute_name IN VARCHAR2,
  value          IN VARCHAR2);
```

### Parameters

**Table 137–11 ALTER\_SQL\_PATCH Procedure Parameters**

Parameter	Description
name	Name of SQL patch to alter.
attribute_name	Name of SQL patch to alter. Possible values: <ul style="list-style-type: none"> <li>■ STATUS -&gt; can be set to ENABLED or DISABLED</li> <li>■ NAME -&gt; can be reset to a valid name (must be a valid Oracle identifier and must be unique).</li> <li>■ DESCRIPTION -&gt; can be set to any string of size no more than 500</li> <li>■ CATEGORY -&gt; can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text)</li> </ul> This parameter is mandatory and is case sensitive.
value	New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.

### Usage Notes

Requires ALTER ANY SQL PATCH privilege

## CANCEL\_DIAGNOSIS\_TASK Procedure

This procedure cancels a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

### Parameters

**Table 137–12** CANCEL\_DIAGNOSIS\_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

## CREATE\_DIAGNOSIS\_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

### Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text          IN   CLOB,
    bind_list         IN   sql_binds := NULL,
    user_name         IN   VARCHAR2 := NULL,
    scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,
    task_name         IN   VARCHAR2 := NULL,
    description       IN   VARCHAR2 := NULL,
    problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id            IN   VARCHAR2,
    plan_hash_value   IN   NUMBER    := NULL,
    scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,
    task_name         IN   VARCHAR2 := NULL,
    description       IN   VARCHAR2 := NULL,
    problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sqlset_name       IN   VARCHAR2,
    basic_filter      IN   VARCHAR2 := NULL,
    object_filter     IN   VARCHAR2 := NULL,
    rank1             IN   VARCHAR2 := NULL,
    rank2             IN   VARCHAR2 := NULL,
    rank3             IN   VARCHAR2 := NULL,
    result_percentage IN   NUMBER    := NULL,
    result_limit      IN   NUMBER    := NULL,
    scope             IN   VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN   NUMBER    := TIME_LIMIT_DEFAULT,
    task_name         IN   VARCHAR2 := NULL,
    description       IN   VARCHAR2 := NULL,
    plan_filter       IN   VARCHAR2 := 'MAX_ELAPSED_TIME',
    sqlset_owner      IN   VARCHAR2 := NULL,
    problem_type      IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

### Parameters

**Table 137–13 CREATE\_DIAGNOSIS\_TASK Function Parameters**

Parameter	Description
sql_text	Text of a SQL statement
bind_list	Set of bind values

**Table 137-13 (Cont.) CREATE\_DIAGNOSIS\_TASK Function Parameters**

<b>Parameter</b>	<b>Description</b>
user_name	Username for who the statement/sqlset will be diagnosed
scope	Diagnosis scope (limited/comprehensive)
time_limit	Maximum duration in seconds for the diagnosis session
task_name	Optional diagnosis task name
description	Maximum of 256 SQL diagnosis session description
problem_type	Determines the goal of the task. Possible values are: <ul style="list-style-type: none"> <li>■ PROBLEM_TYPE_WRONG_RESULTS</li> <li>■ PROBLEM_TYPE_COMPILATION_ERROR</li> <li>■ PROBLEM_TYPE_EXECUTION_ERROR</li> </ul>
sql_id	Identifier of the statement
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	Sqlset name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set (STS)
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from (filtered/ranked) SQL
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: <ul style="list-style-type: none"> <li>■ LAST_GENERATED: plan with most recent timestamp</li> <li>■ FIRST_GENERATED: opposite to LAST_GENERATED</li> <li>■ LAST_LOADED: plan with most recent first_load_time stat info</li> <li>■ FIRST_LOADED: opposite to LAST_LOADED</li> <li>■ MAX_ELAPSED_TIME: plan with maximum elapsed time</li> <li>■ MAX_BUFFER_GETS: plan with maximum buffer gets</li> <li>■ MAX_DISK_READS: plan with maximum disk reads</li> <li>■ MAX_DIRECT_WRITES: plan with maximum direct writes</li> <li>■ MAX_OPTIMIZER_COST: plan with maximum optimum cost</li> </ul>
sqlset_owner	Owner of the sqlset, or null for current schema owner

## CREATE\_STGTAB\_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

### Syntax

```
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (  
    table_name      IN  VARCHAR2 ,  
    schema_name     IN  VARCHAR2 := NULL ,  
    tablespace_name IN  VARCHAR2 := NULL ) ;
```

### Parameters

**Table 137-14** CREATE\_STGTAB\_SQLPATCH Procedure Parameters

Parameter	Description
table_name	(Mandatory) Name of the table to create (case-sensitive)
schema_name	Schema to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)

## DROP\_DIAGNOSIS\_TASK Procedure

This procedure drops a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

### Parameters

**Table 137–15** *DROP\_DIAGNOSIS\_TASK Procedure Parameters*

Parameter	Description
taskname	Name of task

## DROP\_SQL\_PATCH Procedure

This procedure drops the named SQL patch from the database.

### Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (  
    name      IN  VARCHAR2,  
    ignore    IN  BOOLEAN := FALSE);
```

### Parameters

**Table 137–16** *DROP\_SQL\_PATCH Function & Procedure Parameters*

Parameter	Description
name	Name of patch to be dropped. The name is case sensitive.
ignore	Ignore errors due to object not existing.

### Usage Notes

Requires DROP ANY SQL PATCH privilege

## EXECUTE\_DIAGNOSIS\_TASK Procedure

This procedure executes a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

### Parameters

**Table 137–17 EXECUTE\_DIAGNOSIS\_TASK Procedure Parameters**

Parameter	Description
taskname	Name of task

## EXPLAIN\_SQL\_TESTCASE Function

This procedure explains a SQL test case.

### Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (  
    sqlTestCase      IN  CLOB)  
RETURN CLOB;
```

### Parameters

**Table 137-18** *EXPLAIN\_SQL\_TESTCASE Function Parameters*

Parameter	Description
sqlTestCase	XML document describing the SQL test case

## EXPORT\_SQL\_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

### Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    sql_text           IN          CLOB,
    user_name          IN          VARCHAR2 := NULL,
    bind_list          IN          sql_binds := NULL,
    exportEnvironment IN          BOOLEAN := TRUE,
    exportMetadata     IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody      IN          BOOLEAN := FALSE,
    samplingPercent    IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit          IN          NUMBER := 0,
    testcase_name      IN          VARCHAR2 := NULL,
    testcase           IN OUT NOCOPY CLOB,
    preserveSchemaMapping IN      BOOLEAN := FALSE);
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    incident_id        IN          VARCHAR2,
    exportEnvironment IN          BOOLEAN := TRUE,
    exportMetadata     IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := FALSE,
    exportPkgbody      IN          BOOLEAN := FALSE,
    samplingPercent    IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit          IN          NUMBER :=
        DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name      IN          VARCHAR2 := NULL,
    testcase           IN OUT NOCOPY CLOB,
    preserveSchemaMapping IN      BOOLEAN := FALSE);
```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V\$SQL to get the SQL identifier and the SQL hash value.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory          IN          VARCHAR2,
    sql_id             IN          VARCHAR2,
    plan_hash_value    IN          NUMBER := NULL,
    exportEnvironment IN          BOOLEAN := TRUE,
    exportMetadata     IN          BOOLEAN := TRUE,
    exportData         IN          BOOLEAN := TRUE,
    exportPkgbody      IN          BOOLEAN := FALSE,
    samplingPercent    IN          NUMBER := 100,
    ctrlOptions        IN          VARCHAR2 := NULL,
    timeLimit          IN          NUMBER :=
        DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name      IN          VARCHAR2 := NULL,
    testcase           IN OUT NOCOPY CLOB,
    preserveSchemaMapping IN      BOOLEAN := FALSE);
```

## Parameters

**Table 137–19 EXPORT\_SQL\_TESTCASE Procedure Parameters**

Parameter	Description
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to export
incident_id	Incident ID containing the offending SQL
sql_id	Identifier of the statement in the cursor cache
username	Name of the user schema to use to parse the SQL, defaults to SYS
bind_list	List of bind values associated to the statement
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
exportPkgbody	TRUE if the body of the packages referenced in the SQL are exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters
timeLimit	How much time should we spend exporting the SQL test case
testcaseName	An optional name for the SQL test case. This is used to prefix all the generated scripts
testcase	Resulting testcase
preservesSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment

## Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata.(xxxxxmain.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA role.
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT\_SQL\_TESTCASE with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT\\_SQL\\_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.

## EXPORT\_SQL\_TESTCASE\_DIR\_BY\_INC Function

This function generates a SQL Test Case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

### Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
  incident_id      IN  NUMBER,
  directory        IN  VARCHAR2,
  exportEnvironment IN  VARCHAR2 := 'TRUE',
  exportMetadata  IN  VARCHAR2 := 'TRUE',
  exportData      IN  VARCHAR2 := 'FALSE',
  samplingPercent IN  VARCHAR2 := '100',
  ctrlOptions     IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 137–20 EXPORT\_SQL\_TESTCASE\_DIR\_BY\_INC Function Parameters**

Parameter	Description
incident_id	Incident ID containing the offending SQL. For more information about Incidents, see <i>Oracle Database Performance Tuning Guide</i> .
directory	Directory to store the various generated files
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters

## EXPORT\_SQL\_TESTCASE\_DIR\_BY\_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

### Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
    incident_id      IN    NUMBER,
    directory        IN    VARCHAR2,
    sql_text         IN    CLOB,
    user_name        IN    VARCHAR2 := 'SYS',
    exportEnvironment IN  VARCHAR2 := 'TRUE',
    exportMetadata   IN  VARCHAR2 := 'TRUE',
    exportData       IN  VARCHAR2 := 'FALSE',
    samplingPercent  IN  VARCHAR2 := '100',
    ctrlOptions      IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

### Parameters

**Table 137–21 EXPORT\_SQL\_TESTCASE\_DIR\_BY\_TXT Function Parameters**

Parameter	Description
incident_id	Incident ID containing the offending SQL
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to explain
username	Name of the user schema to use to parse the SQL, defaults to SYS
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters

## GET\_FIX\_CONTROL Function

This function returns the value of fix control for a given bug number.

### Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (  
    bug_number IN NUMBER)  
RETURN NUMBER;
```

### Parameters

**Table 137-22** *GET\_FIX\_CONTROL Function Parameters*

Parameter	Description
bug_number	Bug number

## GET\_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

### Syntax

```
DBMS_SQLDIAG.GET_SQL (  
    incident_id IN    VARCHAR2)  
    RETURN SQLSET_ROW;
```

### Parameters

**Table 137–23** *GET\_SQL Function Parameters*

Parameter	Description
<code>incident_id</code>	Identifier of the incident

## IMPORT\_SQL\_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

### Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
  directory          IN  VARCHAR2,
  sqlTestCase        IN  CLOB,
  importEnvironment  IN  BOOLEAN := TRUE,
  importMetadata     IN  BOOLEAN := TRUE,
  importData         IN  BOOLEAN := TRUE,
  importPkgbody      IN  BOOLEAN := FALSE,
  importDiagnosis    IN  BOOLEAN := TRUE,
  ignoreStorage      IN  BOOLEAN := TRUE,
  ctrlOptions        IN  VARCHAR2 := NULL,
  preserveSchemaMapping IN BOOLEAN := FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
  directory          IN  VARCHAR2,
  filename           IN  VARCHAR2,
  importEnvironment  IN  BOOLEAN := TRUE,
  importMetadata     IN  BOOLEAN := TRUE,
  importData         IN  BOOLEAN := TRUE,
  importPkgbody      IN  BOOLEAN := FALSE,
  importDiagnosis    IN  BOOLEAN := TRUE,
  ignoreStorage      IN  BOOLEAN := TRUE,
  ctrlOptions        IN  VARCHAR2 := NULL,
  preserveSchemaMapping IN BOOLEAN := FALSE);
```

### Parameters

**Table 137–24** *IMPORT\_SQL\_TESTCASE Procedure Parameters*

Parameter	Description
directory	Directory containing test case files
filename	Name of a file containing an XML document describing the SQL test case
importEnvironment	TRUE if the compilation environment should be imported
importMetadata	TRUE if the definition of the objects referenced in the SQL should be imported
importData	TRUE if the data of the objects referenced in the SQL should be imported
importPkgbody	TRUE if the body of the packages referenced in the SQL are imported
importDiagnosis	TRUE if the diagnostic information associated to the task should be imported
ignoreStorage	TRUE if the storage attributes should be ignored
ctrlOptions	Opaque control parameters

**Table 137-24 (Cont.) IMPORT\_SQL\_TESTCASE Procedure Parameters**

Parameter	Description
<code>preservesSchemaMapping</code>	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment

## Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (xxxxmain.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the SYSDBA privilege
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call [EXPORT\\_SQL\\_TESTCASE Procedures](#) with `exportData=>TRUE` and the data will be imported by default, unless turned OFF by `importData=>FALSE`.
- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call [EXPORT\\_SQL\\_TESTCASE Procedures](#) with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call [IMPORT\\_SQL\\_TESTCASE Procedures](#) with `importPkgbody=>TRUE`.

## INCIDENTID\_2\_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

### Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
  incident_id  IN   VARCHAR2,
  sql_stmt    OUT  SQLSET_ROW,
  problem_type OUT  NUMBER,
  err_code    OUT  BINARY_INTEGER,
  err_mesg    OUT  VARCHAR2);
```

### Parameters

**Table 137–25** *INCIDENTID\_2\_SQL Procedure Parameters*

Parameter	Description
<code>incident_id</code>	Identifier of the incident
<code>sql_stmt</code>	Resulting SQL
<code>problem_type</code>	Tentative type of SQL problem (currently among <code>PROBLEM_TYPE_COMPILATION_ERROR</code> and <code>PROBLEM_TYPE_EXECUTION_ERROR</code> )
<code>err_code</code>	Error code if any otherwise it is set to <code>NULL</code>
<code>err_msg</code>	Error message if any otherwise it is set to <code>NULL</code>

## INTERRUPT\_DIAGNOSIS\_TASK Procedure

This procedure interrupts a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

### Parameters

**Table 137–26** *INTERRUPT\_DIAGNOSIS\_TASK Procedure Parameters*

Parameter	Description
taskname	Name of task

## LOAD\_SQLSET\_FROM\_TCB Function

This function loads a SQLSET from a Test Case Builder file.

### Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (  
    directory      IN      VARCHAR2,  
    filename       IN      VARCHAR2,  
    sqlset_name    IN      VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```

### Parameters

**Table 137-27** *LOAD\_SQLSET\_FROM\_TCB Function Parameters*

Parameter	Description
directory	Name of directory
filename	Name of file
sqlset_name	Name of SQLSET

## PACK\_STGTAB\_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the [CREATE\\_STGTAB\\_SQLPATCH Procedure](#).

### Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
  patch_name          IN  VARCHAR2 := '%',
  patch_category      IN  VARCHAR2 := 'DEFAULT',
  staging_table_name  IN  VARCHAR2,
  staging_schema_owner IN  VARCHAR2 := NULL);
```

### Parameters

**Table 137–28 UPPACK\_STGTAB\_SQLPATCH Procedure Parameters**

Parameter	Description
patch_name	Name of patch to pack (% wildcards acceptable, case-sensitive)
patch_category	Category to which to pack patches (% wildcards acceptable, case-insensitive)
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

### Usage Notes

- Requires: ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. See the [Examples](#) on page 137-8 for details. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

## REPORT\_DIAGNOSIS\_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

### Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
  taskname          IN  VARCHAR2,
  type              IN  VARCHAR2 := TYPE_TEXT,
  level             IN  VARCHAR2 := LEVEL_TYPICAL,
  section          IN  VARCHAR2 := SECTION_ALL,
  object_id        IN  NUMBER   := NULL,
  result_limit     IN  NUMBER   := NULL,
  owner_name       IN  VARCHAR2 := NULL)
RETURN CLOB;
```

### Parameters

**Table 137–29** *REPORT\_DIAGNOSIS\_TASK Function Parameters*

Parameter	Description
taskname	Name of task to report
type	Type of the report. Possible values are: TEXT, HTML, XML (see <a href="#">Table 137–4, "DBMS_SQLDIAG Constants - Report Type (possible values) Constants"</a> ).
level	Format of the recommendations. Possible values are TYPICAL, BASIC, ALL ( <a href="#">Table 137–5, "DBMS_SQLDIAG Constants - Report Level (possible values) Constants"</a> ).
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL ( <a href="#">Table 137–6, "DBMS_SQLDIAG Constants - Report Section (possible values) Constants"</a> ).
object_id	Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).
result_limit	Number of statements in a STS for which the report is generated
owner_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

## RESET\_DIAGNOSIS\_TASK Procedure

This procedure resets a diagnostic task.

### Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

### Parameters

**Table 137–30** RESET\_DIAGNOSIS\_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

## RESUME\_DIAGNOSIS\_TASK Procedure

This procedure resumes a diagnostic path.

### Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

### Parameters

**Table 137-31 RESUME\_DIAGNOSIS\_TASK Procedure Parameters**

Parameter	Description
taskname	Name of task

## SET\_DIAGNOSIS\_TASK\_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2. The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- MODE: diag scope (comprehensive, limited)
- \_SQLDIAG\_FINDING\_MODE: findings in the report (see "[DBMS\\_SQLDIAG Constants - Findings Filter Constants](#)" on page 137-7 for possible values)

### Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (  
    taskname          IN  VARCHAR2,  
    parameter         IN  VARCHAR2,  
    value             IN  NUMBER);
```

### Parameters

**Table 137-32 SET\_DIAGNOSIS\_TASK\_PARAMETER Procedure Parameters**

Parameter	Description
taskname	Identifier of the task to execute
parameter	Name of the parameter to set
value	New value of the specified parameter

## UNPACK\_STGTAB\_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the [PACK\\_STGTAB\\_SQLPATCH Procedure](#). It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the [ACCEPT\\_SQL\\_PATCH Function & Procedure](#)).

### Syntax

```
DBMS_SQLDIAG.UNPACK_STGTAB_SQLPATCH (
  patch_name          IN  VARCHAR2 := '%',
  patch_category     IN  VARCHAR2 := '%',
  replace            IN  BOOLEAN,
  staging_table_name IN  VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

### Parameters

**Table 137–33 UPPACK\_STGTAB\_SQLPATCH Procedure Parameters**

Parameter	Description
patch_name	Name of patch to unpack (% wildcards acceptable, case-sensitive)
patch_category	Category from which to unpack patches (% wildcards acceptable, case-insensitive)
replace	Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

### Usage Notes

- Requires: ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

The DBMS\_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

- [Using DBMS\\_SQLPA](#)
  - Overview
  - Security Model
- [Summary of DBMS\\_SQLPA Subprograms](#)

## Using DBMS\_SQLPA

- [Overview](#)
- [Security Model](#)

## Overview

The DBMS\_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the [CREATE\\_ANALYSIS\\_TASK Functions](#) to create an analysis task for a single statement or a group of SQL statements.s
2. The [EXECUTE\\_ANALYSIS\\_TASK Function & Procedure](#) executes a previously created analysis task.
3. The [REPORT\\_ANALYSIS\\_TASK Function](#) displays the results of an analysis task.

## Security Model

This package is available to `PUBLIC` and performs its own security checking. All analysis task interfaces (`XXX_ANALYSIS_TASK`) require privilege `ADVISOR`.

---

## Summary of DBMS\_SQLPA Subprograms

**Table 138–1 DBMS\_SQLPA Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">CANCEL_ANALYSIS_TASK Procedure</a> on page 138-6	Cancels the currently executing task analysis of one or more SQL statements
<a href="#">CREATE_ANALYSIS_TASK Functions</a> on page 138-7	Creates an advisor task to process and analyze one or more SQL statements
<a href="#">DROP_ANALYSIS_TASK Procedure</a> on page 138-10	Drops a SQL analysis task
<a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a> on page 138-11	Executes a previously created analysis task
<a href="#">INTERRUPT_ANALYSIS_TASK Procedure</a> on page 138-14	Interrupts the currently executing analysis task
<a href="#">REPORT_ANALYSIS_TASK Function</a> on page 138-15	Displays the results of an analysis task
<a href="#">RESET_ANALYSIS_TASK Procedure</a> on page 138-17	Resets the currently executing analysis task to its initial state
<a href="#">RESUME_ANALYSIS_TASK Procedure</a> on page 138-18	Resumes a previously interrupted analysis task that was created to process a SQL tuning set.
<a href="#">SET_ANALYSIS_TASK_PARAMETER Procedures</a> on page 138-19	Sets the SQL analysis task parameter value
<a href="#">SET_ANALYSIS_DEFAULT_PARAMETER Procedures</a> on page 138-21	Sets the SQL analysis task parameter default value

---

## CANCEL\_ANALYSIS\_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

### Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 138–2 CANCEL\_ANALYSIS\_TASK Procedure Parameters**

Parameter	Description
task_name	Name of the task to cancel

### Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

## CREATE\_ANALYSIS\_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements. You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

### Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  parsing_schema    IN VARCHAR2  := NULL,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER     := NULL,
  task_name        IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  begin_snap       IN NUMBER,
  end_snap         IN NUMBER,
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER     := NULL,
  task_name        IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2  := NULL,
  order_by         IN VARCHAR2  := NULL,
  top_sql          IN VARCHAR2  := NULL,
  task_name        IN VARCHAR2  := NULL,
```

```

description      IN VARCHAR2 := NULL
sqlset_owner     IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

## Parameters

**Table 138–3 CREATE\_ANALYSIS\_TASK Function Parameters**

Parameter	Description
sql_text	Text of a SQL statement
bind_list	A set of bind values
parsing_schema	Name of the schema where the statement can be compiled
task_name	Optional analysis task name
description	Description of the SQL analysis task to a maximum of 256 characters
sql_id	Identifier of a SQL statement
plan_hash_value	Hash value of the SQL execution plan
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
order_by	Order-by clause on the selected SQL
top_sql	Top N SQL after filtering and ranking
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

## Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

## Examples

```

variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id    => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap => 1,
    end_snap   => 2,
    sql_id     => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)

```

```
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -  
    sqlset_name    => 'my_workload', -  
    order_by       => 'BUFFER_GETS', -  
    description    => 'process workload ordered by buffer gets');
```

## DROP\_ANALYSIS\_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

### Syntax

```
DBMS_SQLPA.DROP_ANALYSIS_TASK(  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 138–4** *DROP\_ANALYSIS\_TASK Procedure Parameters*

Parameter	Description
task_name	The name of the analysis task to drop

## EXECUTE\_ANALYSIS\_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

### Syntax

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK (
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := 'test execute',
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK (
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := 'test execute',
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL);
```

### Parameters

**Table 138–5 EXECUTE\_ANALYSIS\_TASK Function & Procedure Parameters**

Parameter	Description
task_name	Identifier of the task to execute
execution_type	Type of the action to perform by the function. If NULL it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter. Possible values are: <ul style="list-style-type: none"> <li>▪ <code>[TEST] EXECUTE</code> - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default.</li> <li>▪ <code>EXPLAIN PLAN</code> - generate explain plan for every statement in the SQL workload. This is similar to the <code>EXPLAIN PLAN</code> command. The resulting plans will be stored in the advisor framework in association with the task.</li> <li>▪ <code>COMPARE [PERFORMANCE]</code> - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type <code>EXPLAIN_PLAN</code> or <code>TEST_EXECUTE</code> already exist in the task</li> <li>▪ <code>CONVERT SQLSET</code> - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.</li> </ul>
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the <a href="#">SET_ANALYSIS_DEFAULT_PARAMETER Procedures</a> ).

**Table 138–5 (Cont.) EXECUTE\_ANALYSIS\_TASK Function & Procedure Parameters**

Parameter	Description
execution_desc	A 256-length string describing the execution

## Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

## Examples

### 1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK (
    sqlset_name => 'my_sts');
```

### 2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK (
    task_name      => :tname,
    execution_type => 'compare performance',
    execution_name => 'before_change');
```

### 3. Make change

...

### 4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK (
    task_name      => :tname, -
    execution_type => 'test execute ',
    execution_name => 'after_change');
```

### 5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER (
    :tname, 'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK (
    task_name      => :tname, -
    execution_type => 'compare performance', -
    execution_name => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK (
    task_name      => :tname, -
    execution_type => 'compare performance',
    execution_params => dbms_advisor.arglist(
```

```
'execution_name1',  
'before_change',  
'execution_name2',  
'after_change',  
'comparion_metric',  
'buffer_gets'));
```

## INTERRUPT\_ANALYSIS\_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

### Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 138–6** *INTERRUPT\_ANALYSIS\_TASK Procedure Parameters*

Parameter	Description
task_name	Identifier of the analysis task to interrupt

### Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

## REPORT\_ANALYSIS\_TASK Function

This procedure displays the results of an analysis task.

### Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
  task_name      IN  VARCHAR2,
  type           IN  VARCHAR2  := 'TEXT',
  level         IN  VARCHAR2  := 'TYPICAL',
  section       IN  VARCHAR2  := 'SUMMARY',
  object_id     IN  NUMBER     := NULL,
  top_sql       IN  NUMBER     := 100,
  execution_name IN  VARCHAR2  := NULL,
  task_owner    IN  VARCHAR2  := NULL,
  order_by     IN  VARCHAR2  := NULL)
RETURN CLOB;
```

### Parameters

**Table 138–7** REPORT\_ANALYSIS\_TASK Function Parameters

Parameter	Description
task_name	Name of the task to report
type	Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).
level	Level of detail in the report: <ul style="list-style-type: none"> <li>▪ ALL - details of all SQL</li> <li>▪ BASIC - currently the same as typical</li> <li>▪ CHANGED - only SQL with changed performance</li> <li>▪ CHANGED_PLANS - only SQL with plan changes</li> <li>▪ ERRORS - SQL with errors only</li> <li>▪ IMPROVED - only improved SQL</li> <li>▪ REGRESSED - only regressed SQL</li> <li>▪ TIMEOUT - only SQL which timed-out during execution</li> <li>▪ TYPICAL (default) - show information about every statement analyzed, including changing and errors</li> <li>▪ UNCHANGED - only SQL with unchanged performance</li> <li>▪ UNCHANGED_PLANS - only SQL with unchanged plans</li> <li>▪ UNSUPPORTED - only SQL not supported by SPAs</li> </ul>
section	Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> <li>▪ SUMMARY (default) - workload summary only</li> <li>▪ ALL - summary and details on SQL</li> </ul>
object_id	Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)
top_sql	Number of SQL statements in a STS for which the report is generated
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

**Table 138–7 (Cont.) REPORT\_ANALYSIS\_TASK Function Parameters**

Parameter	Description
task_owner	Owner of the relevant analysis task. Defaults to the current schema owner.
order_by	How to sort SQL statements in the report (summary and body). Possible values: <ul style="list-style-type: none"> <li>■ CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric</li> <li>■ NULL (default) - order SQL statement by impact on workload</li> <li>■ SQL_IMPACT - order SQL statement by change impact on SQL</li> <li>■ WORKLOAD_IMPACT - same as NULL</li> <li>■ METRIC_DELTA - same as CHANGE_DIFF</li> </ul>

## Return Values

A CLOB containing the desired report.

## Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

## Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5)
from dual;
```

## RESET\_ANALYSIS\_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution. All intermediate result data will be deleted.

### Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(  
    task_name          IN VARCHAR2);
```

### Parameters

**Table 138–8** *RESET\_ANALYSIS\_TASK Procedure Parameters*

Parameter	Description
task_name	Identifier of the analysis task to reset

### Examples

```
-- reset and re-execute a task  
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);  
  
-- re-execute the task  
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

## RESUME\_ANALYSIS\_TASK Procedure

This procedure resumes a previously interrupted or FAILED (with a fatal error) task execution.

### Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

### Parameters

**Table 138–9 RESUME\_ANALYSIS\_TASK Procedure Parameters**

Parameter	Description
task_name	Identifier of the analysis task to resume
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter <code>basic_filter</code> ) that was specified when calling the <a href="#">CREATE_ANALYSIS_TASK Functions</a> .

### Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

### Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

## SET\_ANALYSIS\_TASK\_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

### Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name      IN VARCHAR2,
  parameter      IN VARCHAR2,
  value          IN VARCHAR2);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name      IN VARCHAR2,
  parameter      IN VARCHAR2,
  value          IN NUMBER);
```

### Parameters

**Table 138–10 SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

Parameter	Description
task_name	Identifier of the task to execute
parameter	Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: <ul style="list-style-type: none"> <li>▪ APPLY_CAPTURED_COMPILEENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</li> <li>▪ BASIC_FILTER: basic filter for SQL tuning set</li> <li>▪ CELL_SIMULATION_ENABLED: Set it to 'TRUE' to simulate Exadata Cell effect on SQL tuning set. For more details, see the helper script tcellsim.sql in the ADMIN directory.</li> <li>▪ COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10)</li> <li>▪ DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</li> <li>▪ DAYS_TO_EXPIRE: number of days until the task is deleted</li> <li>▪ DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the <a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a>.</li> </ul>

**Table 138–10 (Cont.) SET\_ANALYSIS\_TASK\_PARAMETER Procedure Parameters**

Parameter	Description
parameter (contd.)	<ul style="list-style-type: none"> <li data-bbox="667 260 1333 390">■ <code>DISABLE_MULTI_EXEC</code>: SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to 'TRUE' to disable this capability. In this case, each SQL in the SQL tuning set is executed only once.</li> <li data-bbox="667 407 1333 485">■ <code>EXECUTION_DAYS_TO_EXPIRE</code>: number of days until the task's executions will be deleted (without deleting the task)</li> <li data-bbox="667 501 1333 657">■ <code>EXECUTE_FULLDML</code>: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</li> <li data-bbox="667 674 1333 722">■ <code>EXECUTION_NAME1</code>: name of the first task execution to analyze</li> <li data-bbox="667 739 1333 787">■ <code>EXECUTION_NAME2</code>: name of the second task execution to analyze</li> <li data-bbox="667 804 1333 829">■ <code>LOCAL_TIME_LIMIT</code>: per-statement time out (seconds)</li> <li data-bbox="667 846 1333 921">■ <code>METRIC_DELTA_THRESHOLD</code>: threshold of the difference between the SQL performance metric before and after the change. The default value is zero.</li> <li data-bbox="667 938 1333 987">■ <code>PLAN_FILTER</code>: plan filter for SQL tuning set (see <code>SELECT_SQLSET</code> for possible values)</li> <li data-bbox="667 1003 1333 1052">■ <code>RANK_MEASURE1</code>: first ranking measure for SQL tuning set</li> <li data-bbox="667 1068 1333 1117">■ <code>RANK_MEASURE2</code>: second possible ranking measure for SQL tuning set</li> <li data-bbox="667 1134 1333 1182">■ <code>RANK_MEASURE3</code>: third possible ranking measure for SQL tuning set</li> <li data-bbox="667 1199 1333 1247">■ <code>RESUME_FILTER</code>: a extra filter for SQL tuning sets besides <code>BASIC_FILTER</code></li> <li data-bbox="667 1264 1333 1339">■ <code>SQL_IMPACT_THRESHOLD</code>: threshold of a change impact on a SQL statement. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.</li> </ul>
value	New value of the specified parameter

## SET\_ANALYSIS\_DEFAULT\_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

### Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER (  
    parameter    IN  VARCHAR2,  
    value        IN  VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER (  
    parameter    IN  VARCHAR2,  
    value        IN  NUMBER);
```

## Parameters

**Table 138–11 SET\_ANALYSIS\_DEFAULT\_PARAMETER Procedure Parameters**

Parameter	Description
parameter	<p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"> <li>■ <code>APPLY_CAPTURED_COMPILEENV</code>: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</li> <li>■ <code>BASIC_FILTER</code>: basic filter for SQL tuning set</li> <li>■ <code>COMPARISON_METRIC</code>: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>)</li> <li>■ <code>DATABASE_LINK</code>: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</li> <li>■ <code>DAYS_TO_EXPIRE</code>: number of days until the task is deleted</li> <li>■ <code>DEFAULT_EXECUTION_TYPE</code>: the task will default to this type of execution when none is specified by the <a href="#">EXECUTE_ANALYSIS_TASK Function &amp; Procedure</a>.</li> <li>■ <code>EXECUTE_FULLDML</code>: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</li> <li>■ <code>EXECUTION_DAYS_TO_EXPIRE</code>: number of days until the tasks's executions will be deleted (without deleting the task)</li> <li>■ <code>EXECUTION_NAME1</code>: name of the first task execution to analyze</li> <li>■ <code>EXECUTION_NAME2</code>: name of the second task execution to analyze</li> <li>■ <code>LOCAL_TIME_LIMIT</code>: per-statement time out (seconds)</li> </ul>

**Table 138–11 (Cont.) SET\_ANALYSIS\_DEFAULT\_PARAMETER Procedure Parameters**

Parameter	Description
parameter (contd.)	<ul style="list-style-type: none"> <li data-bbox="748 264 1317 317">■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</li> <li data-bbox="748 327 1382 380">■ RANK_MEASURE1: first ranking measure for SQL tuning set</li> <li data-bbox="748 390 1382 443">■ RANK_MEASURE2: second possible ranking measure for SQL tuning set</li> <li data-bbox="748 453 1414 506">■ RANK_MEASURE3: third possible ranking measure for SQL tuning set</li> <li data-bbox="748 516 1414 569">■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</li> <li data-bbox="748 579 1398 674">■ SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement.</li> <li data-bbox="748 684 1357 737">■ SQL_LIMIT: maximum number of SQL statements to process</li> <li data-bbox="748 747 1373 800">■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements</li> <li data-bbox="748 810 1211 842">■ TIME_LIMIT: global time out (seconds)</li> <li data-bbox="748 852 1382 989">■ WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. The DBMS\_SQLTUNE package is the interface for tuning SQL on demand. The related package DBMS\_AUTO\_SQLTUNE package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- [Using DBMS\\_SQLTUNE](#)
  - Overview
  - Security Model
- [Data Structures](#)
- [Subprogram Groups](#)
  - SQL Tuning Advisor Subprograms
  - SQL Profile Subprograms
  - SQL Tuning Set Subprograms
  - Real-time SQL Monitoring Subprograms
  - SQL Performance Reporting Subprograms
- [Summary of DBMS\\_SQLTUNE Subprograms](#)

---

## Using DBMS\_SQLTUNE

- [Overview](#)
- [Security Model](#)

## Overview

The DBMS\_SQLTUNE package provides a number interrelated areas of functionality:

- [SQL Tuning Advisor Subprograms](#)
- [SQL Profile Subprograms](#)
- [SQL Tuning Set Subprograms](#)
- [Real-time SQL Monitoring Subprograms](#)

### SQL Tuning Advisor

The SQL Tuning Advisor is one of a suite of Advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, the SQL Tuning Advisor automates the tuning process of problematic SQL statements. That is, it takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advice is provided in the form of precise SQL actions for tuning the SQL along with their expected performance benefit.

The group of [SQL Tuning Advisor Subprograms](#) provide a task-oriented interface that lets you access the Advisor. You can call the following subprograms in the order given to use some of the SQL Tuning Advisor's features:

1. You use the [CREATE\\_TUNING\\_TASK Functions](#) to create a tuning task for tuning a single statement or a group of SQL statements.
2. The [EXECUTE\\_TUNING\\_TASK Function & Procedure](#) executes a previously created tuning task.
3. The [REPORT\\_TUNING\\_TASK Function](#) displays the results of a tuning task.
4. You use the [SCRIPT\\_TUNING\\_TASK Function](#) to create a SQL\*PLUS script which can then be executed to implement a set of Advisor recommendations

### SQL Profile Subprograms

The SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of [SQL Profile Subprograms](#) provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the [ACCEPT\\_SQL\\_PROFILE Procedure and Function](#) to accept a SQL profile recommended by the SQL Tuning Advisor.
- You can alter the STATUS, NAME, DESCRIPTION, and CATEGORY attributes of an existing SQL profile with the [ALTER\\_SQL\\_PROFILE Procedure](#).
- You can drop a SQL profile with the [DROP\\_SQL\\_PROFILE Procedure](#).

### SQL Tuning Sets

The SQL Tuning Advisor input can be a single SQL statement or a set of statements. When tuning multiple statements in one advisor task, you give the input in the form of a SQL tuning set (STS). A SQL tuning set is a database object that stores SQL

statements along with their execution context in a system-provided schema. SQL tuning sets provide an infrastructure for dealing with SQL workloads and simplify tuning of a large number of SQL statements.

SQL tuning sets store SQL statements along with

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans - which are the sequence of operations Oracle performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

SQL tuning sets can be created by filtering or ranking SQL statements from several sources:

- The cursor cache using the [SELECT\\_CURSOR\\_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT\\_WORKLOAD\\_REPOSITORY Functions](#)
- Other SQL tuning sets using the [SELECT\\_SQLSET Function](#)
- SQL Performance Analyzer task comparison results using the [SELECT\\_SQLPA\\_TASK Function](#)
- SQL Trace files using the [SELECT\\_SQL\\_TRACE Function](#)
- A user-defined workload

The complete group of [SQL Tuning Set Subprograms](#) facilitates this functionality. As examples:

- You use the [CREATE\\_SQLSET Procedure and Function](#) to create a SQL tuning set object in the database
- The [LOAD\\_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL
- The [CAPTURE\\_CURSOR\\_CACHE\\_SQLSET Procedure](#) collects SQL statements from the cursor cache over a specified time interval, attempting to build a realistic picture of system workload.

### **Import/Export SQL Tuning Sets and SQL Profiles**

You use DBMS\_SQLTUNE subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source system and populate that staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as datapump, import/export, or database link), where it is used to reconstitute the objects in their original form. These steps are implemented by means of subprograms included in this package:

1. Call the [CREATE\\_STGTAB\\_SQLPROF Procedure](#) or the [CREATE\\_STGTAB\\_SQLSET Procedure](#) to create the staging table on the source system.
2. Call the [PACK\\_STGTAB\\_SQLPROF Procedure](#) or [PACK\\_STGTAB\\_SQLSET Procedure](#) to populate the staging table with information from the source system.

3. Once you have moved the staging table to the destination system, you call the [UNPACK\\_STGTAB\\_SQLPROF Procedure](#) or the [UNPACK\\_STGTAB\\_SQLSET Procedure](#) to recreate the object on the new system.

**See Also:** *Oracle Database Performance Tuning Guide* for more information about programmatic flow

### Automatic Tuning Task Functions

The automated system task `SYS_AUTO_SQL_TUNING_TASK` is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK` API. See the `DBMS_AUTO_SQLTUNE` package for the list of subprograms that you can use to manage the automated SQL tuning task.

**See Also:** [Using DBMS\\_AUTO\\_SQLTUNE](#)

### Real-time SQL Monitoring

Real-time SQL Monitoring allows DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated close to real-time during statement execution. These statistics are exposed by the `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR` views. In addition, `DBMS_SQLTUNE` provides a subprogram `REPORT_SQL_MONITOR` to report on monitoring information.

## Security Model

This package is available to PUBLIC and performs its own security checking:

- As the SQL Tuning advisor relies on the advisor framework, all tuning task interfaces (XXX\_TUNING\_TASK) require privilege ADVISOR.
- SQL tuning set subprograms (XXX\_SQLSET) require either the ADMINISTER SQL TUNING SET or the ADMINISTER ANY SQL TUNING SET privilege. Users having the ADMINISTER SQL TUNING SET privilege can only create and modify a SQL tuning set they own, while the ADMINISTER ANY SQL TUNING SET privilege allows them to operate upon all SQL tuning sets, even those owned by other users. For example, using the [CREATE\\_SQLSET Procedure and Function](#) you can create a SQL tuning set to be owned by another user. In this case, the user need not necessarily have the ADMINISTER SQL TUNING SET privilege to operate upon her tuning set.
- Previously, three different privileges were needed to invoke subprograms concerned with SQL profiles:
  - CREATE ANY SQL PROFILE
  - ALTER ANY SQL PROFILE
  - DROP ANY SQL PROFILE

These have now been deprecated in favor of ADMINISTER SQL MANAGEMENT OBJECT

## Data Structures

The DBMS\_SQLTUNE package defines the following OBJECT type

### Object Types

- [SQLSET\\_ROW Object Type](#)

## SQLSET\_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL tuning set for the user. Logically, a SQL tuning set is a collection of `SQLSET_ROWS` where each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds, and plan. The `SELECT_XXX` subprograms each model a data source as a collection of `SQLSET_ROWS`, unique by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms in the `DBMS_SQLTUNE` package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

### Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                VARCHAR(13),
  force_matching_signature NUMBER,
  sql_text              CLOB,
  object_list           sql_objects,
  bind_data             RAW(2000),
  parsing_schema_name  VARCHAR2(30),
  module                VARCHAR2(48),
  action                VARCHAR2(32),
  elapsed_time          NUMBER,
  cpu_time              NUMBER,
  buffer_gets           NUMBER,
  disk_reads            NUMBER,
  direct_writes         NUMBER,
  rows_processed        NUMBER,
  fetches               NUMBER,
  executions            NUMBER,
  end_of_fetch_count    NUMBER,
  optimizer_cost        NUMBER,
  optimizer_env         RAW(2000),
  priority              NUMBER,
  command_type          NUMBER,
  first_load_time       VARCHAR2(19),
  stat_period           NUMBER,
  active_stat_period    NUMBER,
  other                 CLOB,
  plan_hash_value       NUMBER,
  sql_plan              sql_plan_table_type,
  bind_list             sql_binds)
```

### Attributes

**Table 139–1** *SQLSET\_ROW Attributes*

Attribute	Description
<code>sql_id</code>	Unique SQL ID
<code>forcing_matching_signature</code>	Signature with literals, case, and whitespace removed
<code>sql_text</code>	Full text for the statement
<code>object_list</code>	Currently not implemented

**Table 139-1 (Cont.) SQLSET\_ROW Attributes**

<b>Attribute</b>	<b>Description</b>
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive.
parsing_schema_name	Schema where the SQL is parsed
module	Last application module for the SQL
action	Last application action for the SQL
elapsed_time	Sum total elapsed time for this SQL statement
cpu_time	Sum total CPU time for this SQL statement
buffer_gets	Sum total number of buffer gets
disk_reads	Sum total number of disk reads
direct_writes	Sum total number of direct writes
rows_processed	Sum total number of rows processed by this SQL
fetches	Sum total number of fetches
executions	Total executions of this SQL
end_of_fetch_count	Number of times the statement was fully executed with all of its rows fetched
optimizer_cost	Optimizer cost for this SQL
optimizer_env	Optimizer environment for this SQL statement
priority	User-defined priority (1,2,3)
command_type	Statement type, such as INSERT or SELECT.
first_load_time	Load time of parent cursor
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active
other	Other column for user defined attributes
plan_hash_value	Plan hash value of the plan
sql_plan	Explain plan
bind_list	List of user specified binds for SQL This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data - they are mutually exclusive.

---

## Subprogram Groups

DBMS\_SQLTUNE subprograms are grouped by function:

- [SQL Tuning Advisor Subprograms](#)
- [SQL Profile Subprograms](#)
- [SQL Tuning Set Subprograms](#)
- [Real-time SQL Monitoring Subprograms](#)
- [SQL Performance Reporting Subprograms](#)

## SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

**Table 139–2 SQL Tuning Task Subprograms**

Subprogram	Description
<a href="#">CANCEL_TUNING_TASK Procedure</a> on page 139-25	Cancels the currently executing tuning task
<a href="#">CREATE_SQL_PLAN_BASELINE Procedure</a> on page 139-28	Creates a SQL plan baseline for an existing plan
<a href="#">CREATE_TUNING_TASK Functions</a> on page 139-33	Creates a tuning of a single statement or SQL tuning set for either the SQL Tuning Advisor
<a href="#">DROP_TUNING_TASK Procedure</a> on page 139-40	Drops a SQL tuning task
<a href="#">EXECUTE_TUNING_TASK Function &amp; Procedure</a> on page 139-41	Executes a previously created tuning task
<a href="#">IMPLEMENT_TUNING_TASK Function</a> on page 139-42	Implements a set of SQL profile recommendations made by the SQL Tuning Advisor
<a href="#">INTERRUPT_TUNING_TASK Procedure</a> on page 139-43	Interrupts the currently executing tuning task
<a href="#">REPORT_AUTO_TUNING_TASK Function</a> on page 139-54	Displays a report from the automatic tuning task, reporting on a range of executions
<a href="#">REPORT_TUNING_TASK Function</a> on page 139-66	Displays the results of a tuning task
<a href="#">RESET_TUNING_TASK Procedure</a> on page 139-68	Resets the currently executing tuning task to its initial state
<a href="#">RESUME_TUNING_TASK Procedure</a> on page 139-69	Resumes a previously interrupted task that was created to process a SQL tuning set
<a href="#">SCRIPT_TUNING_TASK Function</a> on page 139-70	Creates a SQL*PLUS script which can then be executed to implement a set of SQL Tuning Advisor recommendations
<a href="#">SET_TUNING_TASK_PARAMETER Procedures</a> on page 139-84	Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER

The [Summary of DBMS\\_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

## SQL Profile Subprograms

This subprogram group provides an interface to manage SQL profiles.

**Table 139–3 SQL Profile Subprograms**

Subprogram	Description
<a href="#">ACCEPT_SQL_PROFILE Procedure and Function</a> on page 139-19	Creates a SQL profile for the specified tuning task
<a href="#">ALTER_SQL_PROFILE Procedure</a> on page 139-23	Alters specific attributes of an existing SQL profile object
<a href="#">CREATE_STGTAB_SQLPROF Procedure</a> on page 139-30	Creates the staging table used for copying SQL profiles from one system to another
<a href="#">DROP_SQL_PROFILE Procedure</a> on page 139-38	Drops the named SQL profile from the database
<a href="#">PACK_STGTAB_SQLPROF Procedure</a> on page 139-48	Moves profile data out of the <code>SYS</code> schema into the staging table
<a href="#">REMAP_STGTAB_SQLPROF Procedure</a> on page 139-51	Changes the profile data values kept in the staging table prior to performing an unpack operation
<a href="#">SQLTEXT_TO_SIGNATURE Function</a> on page 139-86	Returns a SQL text's signature
<a href="#">UNPACK_STGTAB_SQLPROF Procedure</a> on page 139-87	Uses the profile data stored in the staging table to create profiles on this system

The [Summary of DBMS\\_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

## SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

**Table 139–4 SQL Tuning Set Subprograms**

Subprogram	Description
<a href="#">ADD_SQLSET_REFERENCE Function</a> on page 139-22	Adds a new reference to an existing SQL tuning set to indicate its use by a client
<a href="#">CAPTURE_CURSOR_CACHE_SQLSET Procedure</a> on page 139-26	Over a specified time interval incrementally captures a workload from the cursor cache into a SQL tuning set
<a href="#">CREATE_SQLSET Procedure and Function</a> on page 139-29	Creates a SQL tuning set object in the database
<a href="#">CREATE_STGTAB_SQLSET Procedure</a> on page 139-31	Creates a staging table through which SQL Tuning Sets are imported and exported
<a href="#">DELETE_SQLSET Procedure</a> on page 139-37	Deletes a set of SQL statements from a SQL tuning set
<a href="#">DROP_SQLSET Procedure</a> on page 139-39	Drops a SQL tuning set if it is not active
<a href="#">LOAD_SQLSET Procedure</a> on page 139-44	Populates the SQL tuning set with a set of selected SQL
<a href="#">PACK_STGTAB_SQLSET Procedure</a> on page 139-49	Copies tuning sets out of the <code>SYS</code> schema into the staging table
<a href="#">REMOVE_SQLSET_REFERENCE Procedure</a> on page 139-53	Deactivates a SQL tuning set to indicate it is no longer used by the client
<a href="#">SELECT_CURSOR_CACHE Function</a> on page 139-72	Collects SQL statements from the cursor cache
<a href="#">SELECT_SQL_TRACE Function</a> on page 139-76	Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>
<a href="#">SELECT_SQLPA_TASK Function</a> on page 139-78	Collects SQL statements from a SQL performance analyzer comparison task
<a href="#">SELECT_SQLSET Function</a> on page 139-80	Collects SQL statements from an existing SQL tuning set
<a href="#">SELECT_WORKLOAD_REPOSITORY Functions</a> on page 139-82	Collects SQL statements from the workload repository
<a href="#">UNPACK_STGTAB_SQLSET Procedure</a> on page 139-88	Copies one or more SQL tuning sets from the staging table
<a href="#">UPDATE_SQLSET Procedures</a> on page 139-90	Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set

The [Summary of DBMS\\_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

## Real-time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in V\$SQL\_MONITOR and V\$SQL\_PLAN\_MONITOR.

**Table 139–5 SQL Tuning Set Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">REPORT_SQL_MONITOR Function</a> on page 139-59	Reports on real-time SQL Monitoring
<a href="#">REPORT_SQL_MONITOR_LIST Function</a> on page 139-64	Builds a report for all or a sub-set of statements monitored by Oracle

---

## SQL Performance Reporting Subprograms

This subprogram group provides detailed reports on SQL performance using statistics from the cursor cache and automatic workload repository (AWR).

**Table 139–6 SQL Performance Reporting Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">REPORT_SQL_DETAIL Function</a> on page 139-56	Reports on a specific SQLID

## Summary of DBMS\_SQLTUNE Subprograms

**Table 139–7 DBMS\_SQLTUNE Package Subprograms**

Subprogram	Description	Group
<a href="#">ACCEPT_SQL_PROFILE Procedure and Function</a> on page 139-19	Create a SQL profile for the specified tuning task	<a href="#">SQL Profile Subprograms</a> on page 139-12
<a href="#">ADD_SQLSET_REFERENCE Function</a> on page 139-22	Adds a new reference to an existing SQL tuning set to indicate its use by a client	<a href="#">SQL Tuning Set Subprograms</a> on page 139-13
<a href="#">ALTER_SQL_PROFILE Procedure</a> on page 139-23	Alters specific attributes of an existing SQL profile object	<a href="#">SQL Profile Subprograms</a> on page 139-12
<a href="#">CANCEL_TUNING_TASK Procedure</a> on page 139-25	Cancels the currently executing tuning task	<a href="#">SQL Tuning Advisor Subprograms</a> on page 139-11
<a href="#">CAPTURE_CURSOR_CACHE_SQLSET Procedure</a> on page 139-26	Over a specified time interval incrementally captures a workload from the cursor cache into a SQL tuning set	<a href="#">SQL Tuning Set Subprograms</a> on page 139-13
<a href="#">CREATE_SQL_PLAN_BASELINE Procedure</a> on page 139-28	Creates a SQL plan baseline for an existing plan	<a href="#">SQL Tuning Advisor Subprograms</a> on page 139-11
<a href="#">CREATE_SQLSET Procedure and Function</a> on page 139-29	Creates a SQL tuning set object in the database	<a href="#">SQL Tuning Set Subprograms</a> on page 139-13
<a href="#">CREATE_STGTAB_SQLPROF Procedure</a> on page 139-30	Creates the staging table used for copying SQL profiles from one system to another	<a href="#">SQL Profile Subprograms</a> on page 139-12
<a href="#">CREATE_STGTAB_SQLSET Procedure</a> on page 139-31	Creates a staging table through which SQL tuning sets are imported and exported	<a href="#">SQL Tuning Set Subprograms</a> on page 139-13
