**Note:** UTL\_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL\_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

## HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

**See Also:** [HTTP Requests Subprograms](#) on page 224-28

## HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET\_RESPONSE and receive response information from the Web server. When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

**See Also:** [HTTP Responses Subprograms](#) on page 224-30

## HTTP Cookies

The UTL\_HTTP package provides subprograms to manipulate HTTP cookies.

**See Also:** [HTTP Cookies Subprograms](#) on page 224-31

## HTTP Persistent Connections

The UTL\_HTTP package provides subprograms to manipulate persistent connections.

**See Also:** [HTTP Persistent Connections Subprograms](#) on page 224-32

## Error Conditions

The UTL\_HTTP package provides subprograms to retrieve error information.

**See Also:** [Error Conditions Subprograms](#) on page 224-33

## Session Settings

Session settings manipulate the configuration and default behavior of UTL\_HTTP when HTTP requests are executed within a database user session. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect,

body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

**See Also:** [Session Settings Subprograms](#) on page 224-27

## Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

**See Also:** [HTTP Requests Subprograms](#) on page 224-28

## External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

**See Also:** [SET\\_AUTHENTICATION\\_FROM\\_WALLET Procedure](#) on page 224-79

## Exceptions

Table 224–7 lists the exceptions that the UTL\_HTTP package interface can raise. By default, UTL\_HTTP raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excpt_support`, the rest of the exceptions will be raised directly (except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

**Table 224–7 UTL\_HTTP Exceptions**

Exception	Error Code	Reason	Where Raised
BAD_ARGUMENT	29261	The argument passed to the interface is bad	Any HTTP request or response interface when <code>detailed_exception</code> is enabled
BAD_URL	29262	The requested URL is badly formed	BEGIN_REQUEST, when <code>detailed_exception</code> is enabled
END_OF_BODY	29266	The end of HTTP response body is reached	READ_RAW, READ_TEXT, and READ_LINE, when <code>detailed_exception</code> is enabled
HEADER_NOT_FOUND	29265	The header is not found	GET_HEADER, GET_HEADER_BY_NAME, when <code>detailed_exception</code> is enabled
HTTP_CLIENT_ERROR	29268	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when <code>detailed_exception</code> is enabled
HTTP_SERVER_ERROR	29269	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when <code>detailed_exception</code> is enabled
NETWORK_ACCESS_DENIED	24247	Access to the remote network host or credentials in an Oracle wallet is denied	BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when <code>detailed_exception</code> is enabled
ILLEGAL_CALL	29267	The call to UTL_HTTP is illegal at the current state of the HTTP request	SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when <code>detailed_exception</code> is enabled
PARTIAL_MULTIBYTE_EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when <code>detailed_exception</code> is enabled
PROTOCOL_ERROR	29263	An HTTP protocol error occurs when communicating with the Web server	SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when <code>detailed_exception</code> is enabled

**Table 224–7 (Cont.) UTL\_HTTP Exceptions**

Exception	Error Code	Reason	Where Raised
REQUEST_FAILED	29273	The request fails to executes	Any HTTP request or response interface when <code>detailed_exception</code> is disabled
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when <code>detailed_exception</code> is enabled
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when <code>detailed_exception</code> is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when <code>detailed_exception</code> is enabled

---

**NOTE:** The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

---

For `REQUEST` and `REQUEST_PIECES`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

## Examples

The following examples demonstrate how to use UTL\_HTTP.

- [General Usage](#)
- [Retrieving HTTP Response Headers](#)
- [Handling HTTP Authentication](#)
- [Retrieving and Restoring Cookies](#)
- [Making HTTP Request with Private Wallet and Cookie Table](#)

### General Usage

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req    UTL_HTTP.REQ;
    resp   UTL_HTTP.RESP;
    value  VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    LOOP
        UTL_HTTP.READ_LINE(resp, value, TRUE);
        DBMS_OUTPUT.PUT_LINE(value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;
```

### Retrieving HTTP Response Headers

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req    UTL_HTTP.REQ;
    resp   UTL_HTTP.RESP;
    name   VARCHAR2(256);
    value  VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```

## Handling HTTP Authentication

```

SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url          IN VARCHAR2,
                                     username IN VARCHAR2 DEFAULT NULL,
                                     password IN VARCHAR2 DEFAULT NULL,
                                     realm     IN VARCHAR2 DEFAULT NULL) AS

    req          UTL_HTTP.REQ;
    resp         UTL_HTTP.RESP;
    my_scheme    VARCHAR2(256);
    my_realm     VARCHAR2(256);
    my_proxy     BOOLEAN;
BEGIN
    -- Turn off checking of status code. We will check it by ourselves.
    UTL_HTTP.HTTP_RESPONSE_ERROR_CHECK(FALSE);
    req := UTL_HTTP.BEGIN_REQUEST(url);
    IF (username IS NOT NULL) THEN
        UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic
Authen. Scheme
    END IF;
    resp := UTL_HTTP.GET_RESPONSE(req);
    IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, my_proxy);
        IF (my_proxy) THEN
            DBMS_OUTPUT.PUT_LINE('Web proxy server is protected. ');
            DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the proxy
server. ');
        ELSE
            DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected. ');
            DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the Web page. ');
        END IF;
        UTL_HTTP.END_RESPONSE(resp);
        RETURN;
    END IF;
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;

```

## Retrieving and Restoring Cookies

```

CREATE TABLE my_cookies (
    session_id INTEGER,
    name       VARCHAR2(256),
    value      VARCHAR2(1024),
    domain     VARCHAR2(256),
    expire     DATE,
    path       VARCHAR2(1024),
    secure     VARCHAR2(1),
    version    INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE FUNCTION save_cookies RETURN PLS_INTEGER AS

```

```

cookies          UTL_HTTP.COOKIE_TABLE;
my_session_id    PLS_INTEGER;
secure           VARCHAR2(1);
BEGIN
  /* assume that some cookies have been set in previous HTTP requests. */
  UTL_HTTP.GET_COOKIES(cookies);
  SELECT session_id.nextval INTO my_session_id FROM DUAL;
  FOR i in 1..cookies.count LOOP
    IF (cookies(i).secure) THEN
      secure := 'Y';
    ELSE
      secure := 'N';
    END IF;
    INSERT INTO my_cookies
    VALUES (my_session_id, cookies(i).name, cookies(i).value,
            cookies(i).domain,
            cookies(i).expire, cookies(i).path, secure, cookies(i).version);
  END LOOP;
  RETURN my_session_id;
END;
/

REM Retrieve cookies from UTL_HTTP
CREATE OR REPLACE PROCEDURE restore_cookies (this_session_id IN PLS_INTEGER)
AS
  cookies          UTL_HTTP.COOKIE_TABLE;
  cookie           UTL_HTTP.COOKIE;
  i                PLS_INTEGER := 0;
  CURSOR c (c_session_id PLS_INTEGER) IS
    SELECT * FROM my_cookies WHERE session_id = c_session_id;
BEGIN
  FOR r IN c(this_session_id) LOOP
    i := i + 1;
    cookie.name     := r.name;
    cookie.value    := r.value;
    cookie.domain   := r.domain;
    cookie.expire   := r.expire;
    cookie.path     := r.path;
    IF (r.secure = 'Y') THEN
      cookie.secure := TRUE;
    ELSE
      cookie.secure := FALSE;
    END IF;
    cookie.version := r.version;
    cookies(i) := cookie;
  END LOOP;
  UTL_HTTP.CLEAR_COOKIES;
  UTL_HTTP.ADD_COOKIES(cookies);
END;
/

```

## Making HTTP Request with Private Wallet and Cookie Table

```

SET SERVEROUTPUT ON SIZE 40000

CREATE OR REPLACE PROCEDURE DISPLAY_PAGE(url IN VARCHAR2) AS
  request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
  req             UTL_HTTP.REQ;
  resp            UTL_HTTP.RESP;
  data            VARCHAR2(1024);

```

```
BEGIN

-- Create a request context with its wallet and cookie table
request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
    wallet_path      => 'file:/oracle/wallets/test/wallet',
    wallet_password  => '*****',
    enable_cookies   => TRUE,
    max_cookies      => 300,
    max_cookies_per_site => 20);

-- Make a HTTP request using the private wallet and cookie
-- table in the request context
req := UTL_HTTP.BEGIN_REQUEST(
    url              => url,
    request_context => request_context);
resp := UTL_HTTP.GET_RESPONSE(req);

BEGIN
    LOOP
        UTL_HTTP.READ_TEXT(resp, data);
        DBMS_OUTPUT.PUT(data);
    END LOOP;
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;

-- Destroy the request context
UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);

END;

BEGIN
    DISPLAY_PAGE('https://www.example.com/');
END;
/
```

## Subprogram Groups

UTL\_HTTP subprograms are grouped by function:

- [Simple HTTP Fetches in a Single Call Subprograms](#)
- [Session Settings Subprograms](#)
- [HTTP Requests Subprograms](#)
- [HTTP Request Contexts Subprograms](#)
- [HTTP Responses Subprograms](#)
- [HTTP Cookies Subprograms](#)
- [HTTP Persistent Connections Subprograms](#)
- [Error Conditions Subprograms](#)

## Simple HTTP Fetches in a Single Call Subprograms

REQUEST and REQUEST\_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

**Table 224–8** UTL\_HTTP Subprograms—Simple HTTP Fetches in a Single Call

Subprogram	Description
<a href="#">REQUEST Function</a> on page 224-73	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
<a href="#">REQUEST_PIECES Function</a> on page 224-75	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

## Session Settings Subprograms

**Table 224–9 UTL\_HTTP Subprograms—Session Settings**

Subprogram	Description
<a href="#">GET_BODY_CHARSET Procedure</a> on page 224-51	Retrieves the default character set of the body of all future HTTP requests
<a href="#">GET_COOKIE_SUPPORT Procedure</a> on page 224-53	Retrieves the current cookie support settings
<a href="#">GET_DETAILED_EXCP_SUPPORT Procedure</a> on page 224-55	Checks if the UTL_HTTP package will raise a detailed exception or not
<a href="#">GET_FOLLOW_REDIRECT Procedure</a> on page 224-58	Retrieves the follow-redirect setting in the current session
<a href="#">GET_PERSISTENT_CONN_SUPPORT Procedure</a> on page 224-63	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
<a href="#">GET_PROXY Procedure</a> on page 224-65	Retrieves the current proxy settings
<a href="#">GET_RESPONSE_ERROR_CHECK Procedure</a> on page 224-67	Checks if the response error check is set or not
<a href="#">GET_TRANSFER_TIMEOUT Procedure</a> on page 224-68	Retrieves the current network transfer timeout value
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a> on page 224-92	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header
<a href="#">SET_COOKIE_SUPPORT Procedures</a> on page 224-83	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
<a href="#">SET_DETAILED_EXCP_SUPPORT Procedure</a> on page 224-85	Sets the UTL_HTTP package to raise a detailed exception
<a href="#">SET_FOLLOW_REDIRECT Procedures</a> on page 224-86	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the <code>GET_RESPONSE</code> function
<a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a> on page 224-88	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
<a href="#">SET_PROXY Procedure</a> on page 224-90	Sets the proxy to be used for requests of HTTP or other protocols
<a href="#">SET_RESPONSE_ERROR_CHECK Procedure</a> on page 224-91	Sets whether or not <code>GET_RESPONSE</code> raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a> on page 224-92	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server
<a href="#">SET_WALLET Procedure</a> on page 224-93	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

## HTTP Requests Subprograms

**Table 224–10 UTL\_HTTP Subprograms—HTTP Requests**

Subprogram	Description
<a href="#">BEGIN_REQUEST Function</a> on page 224-39	Begins a new HTTP request. <code>UTL_HTTP</code> establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
<a href="#">SET_HEADER Procedure</a> on page 224-87	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.
<a href="#">SET_AUTHENTICATION Procedure</a> on page 224-78	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
<a href="#">SET_AUTHENTICATION_FROM_WALLET Procedure</a> on page 224-79	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.
<a href="#">SET_BODY_CHARSET Procedures</a> on page 224-81	Sets the character set of the request body when the media type is text but the character set is not specified in the <code>Content-Type</code> header
<a href="#">SET_COOKIE_SUPPORT Procedures</a> on page 224-83	Enables or disables support for the HTTP cookies in the request
<a href="#">SET_FOLLOW_REDIRECT Procedures</a> on page 224-86	Sets the maximum number of times <code>UTL_HTTP</code> follows the HTTP redirect instruction in the HTTP response to this request in the <a href="#">GET_RESPONSE Function</a> on page 224-66
<a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a> on page 224-88	Enables or disables support for the HTTP 1.1 persistent-connection in the request
<a href="#">SET_PROXY Procedure</a> on page 224-90	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in <code>UTL_TCP</code> )
<a href="#">WRITE_RAW Procedure</a> on page 224-96	Writes some binary data in the HTTP request body
<a href="#">WRITE_TEXT Procedure</a> on page 224-97	Writes some text data in the HTTP request body

---

## HTTP Request Contexts Subprograms

**Table 224–11** *UTL\_HTTP Subprograms—HTTP Request Contexts*

<b>Subprogram</b>	<b>Description</b>
<a href="#">CREATE_REQUEST_CONTEXT Function</a> on page 224-45	Creates a request context in UTL_HTTP for a wallet and a cookie table
<a href="#">DESTROY_REQUEST_CONTEXT Procedure</a> on page 224-47	Destroys a request context in UTL_HTTP

---

## HTTP Responses Subprograms

**Table 224–12** *UTL\_HTTP Subprograms—HTTP Responses*

Subprogram	Description
<a href="#">END_RESPONSE Procedure</a> on page 224-49	Ends the HTTP response. It completes the HTTP request and response.
<a href="#">GET_AUTHENTICATION Procedure</a> on page 224-50	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
<a href="#">GET_HEADER Procedure</a> on page 224-59	Returns the n <sup>th</sup> HTTP response header name and value returned in the response
<a href="#">GET_HEADER_BY_NAME Procedure</a> on page 224-60	Returns the HTTP response header value returned in the response given the name of the header
<a href="#">GET_HEADER_COUNT Function</a> on page 224-61	Returns the number of HTTP response headers returned in the response
<a href="#">GET_RESPONSE Function</a> on page 224-66	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
<a href="#">READ_LINE Procedure</a> on page 224-69	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
<a href="#">READ_RAW Procedure</a> on page 224-70	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
<a href="#">READ_TEXT Procedure</a> on page 224-71	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
<a href="#">SET_BODY_CHARSET Procedures</a> on page 224-81	Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header

## HTTP Cookies Subprograms

**Table 224–13** *UTL\_HTTP Subprograms—HTTP Cookies*

<b>Subprogram</b>	<b>Description</b>
<a href="#">ADD_COOKIES Procedure</a> on page 224-38	Add the cookies either to a request context or to the UTL_HTTP package's session state
<a href="#">CLEAR_COOKIES Procedure</a> on page 224-41	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state
<a href="#">GET_COOKIE_COUNT Function</a> on page 224-52	Returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session states
<a href="#">GET_COOKIES Function</a> on page 224-54	Returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

## HTTP Persistent Connections Subprograms

**Table 224–14** *UTL\_HTTP Subprograms—HTTP Persistent Connections*

<b>Subprogram</b>	<b>Description</b>
<a href="#">CLOSE_PERSISTENT_CONN Procedure</a> on page 224-42	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session
<a href="#">CLOSE_PERSISTENT_CONNS Procedure</a> on page 224-43	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session
<a href="#">GET_PERSISTENT_CONN_COUNT Function</a> on page 224-62	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers
<a href="#">GET_PERSISTENT_CONNS Procedure</a> on page 224-64	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers

---

## Error Conditions Subprograms

**Table 224–15** *UTL\_HTTP Subprograms—Error Conditions*

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET_DETAILED_SQLCODE Function</a> on page 224-56	Retrieves the detailed SQLCODE of the last exception raised
<a href="#">GET_DETAILED_SQLERRM Function</a> on page 224-57	Retrieves the detailed SQLERRM of the last exception raised

---

## Summary of UTL\_HTTP Subprograms

**Table 224–16 UTL\_HTTP Package Subprograms**

Subprogram	Description	Group
<a href="#">ADD_COOKIES Procedure</a> on page 224-38	Add the cookies either to a request context or to the UTL_HTTP package's session state	<a href="#">HTTP Cookies Subprograms</a> on page 224-31
<a href="#">BEGIN_REQUEST Function</a> on page 224-39	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">CLEAR_COOKIES Procedure</a> on page 224-41	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state	<a href="#">HTTP Cookies Subprograms</a> on page 224-31
<a href="#">CLOSE_PERSISTENT_CONN Procedure</a> on page 224-42	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	<a href="#">HTTP Persistent Connections Subprograms</a> on page 224-32
<a href="#">CLOSE_PERSISTENT_CONNS Procedure</a> on page 224-43	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	<a href="#">HTTP Persistent Connections Subprograms</a> on page 224-32
<a href="#">CREATE_REQUEST_CONTEXT Function</a> on page 224-45	Creates a request context in UTL_HTTP for a wallet and a cookie table	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">DESTROY_REQUEST_CONTEXT Procedure</a> on page 224-47	Destroys a request context in UTL_HTTP for a wallet and a cookie table	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">END_REQUEST Procedure</a> on page 224-48	Ends the HTTP request	<a href="#">HTTP Requests Subprograms</a> on page 224-28

<a href="#">SET_AUTHENTICATION Procedure</a> on page 224-78	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">SET_AUTHENTICATION_FROM_WALLET Procedure</a> on page 224-79	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">SET_BODY_CHARSET Procedures</a> on page 224-81	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header	<a href="#">Session Settings Subprograms</a> on page 224-27
<a href="#">SET_BODY_CHARSET Procedures</a> on page 224-81	Sets the character set of the request body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">SET_BODY_CHARSET Procedures</a> on page 224-81	Sets the character set of the response body when the media type is "text" but the character set is not specified in the <code>Content-Type</code> header	<a href="#">HTTP Responses Subprograms</a> and <a href="#">Session Settings Subprograms</a> on page 224-27
<a href="#">SET_COOKIE_SUPPORT Procedures</a> on page 224-83	Enables or disables support for the HTTP cookies in the request	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">SET_DETAILED_EXCP_SUPPORT Procedure</a> on page 224-85	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	<a href="#">Session Settings Subprograms</a> on page 224-27

**Table 224–16 (Cont.) UTL\_HTTP Package Subprograms**

<b>Subprogram</b>	<b>Description</b>	<b>Group</b>
<a href="#">SET_DETAILED_EXCP_SUPPORT Procedure</a> on page 224-85	Sets the UTL_HTTP package to raise a detailed exception	<a href="#">Session Settings Subprograms</a> on page 224-27
<a href="#">SET_FOLLOW_REDIRECT Procedures</a> on page 224-86	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE function	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">SET_HEADER Procedure</a> on page 224-87	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function	<a href="#">Session Settings Subprograms</a> on page 224-27
<a href="#">SET_HEADER Procedure</a> on page 224-87	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">SET_PERSISTENT_CONN_SUPPORT Procedure</a> on page 224-88	Enables or disables support for the HTTP 1.1 persistent-connection in the request	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">SET_PROXY Procedure</a> on page 224-90	Sets the proxy to be used for requests of HTTP or other protocols	<a href="#">Session Settings</a> on page 224-17 and <a href="#">Session Settings Subprograms</a> on page 224-27
<a href="#">SET_RESPONSE_ERROR_CHECK Procedure</a> on page 224-91	Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	<a href="#">Session Settings Subprograms</a> on page 224-27
<a href="#">SET_TRANSFER_TIMEOUT Procedure</a> on page 224-92	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	<a href="#">Session Settings</a> on page 224-17 and <a href="#">Session Settings Subprograms</a> on page 224-27
<a href="#">SET_WALLET Procedure</a> on page 224-93	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	<a href="#">Session Settings Subprograms</a> on page 224-27
<a href="#">WRITE_LINE Procedure</a> on page 224-95	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">WRITE_RAW Procedure</a> on page 224-96	Writes some binary data in the HTTP request body	<a href="#">HTTP Requests Subprograms</a> on page 224-28
<a href="#">WRITE_TEXT Procedure</a> on page 224-97	Writes some text data in the HTTP request body	<a href="#">HTTP Requests Subprograms</a> on page 224-28

## ADD\_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL\_HTTP package's session state.

**See Also:** [HTTP Cookies](#) on page 224-17 and [HTTP Cookies Subprograms](#) on page 224-31

### Syntax

```
UTL_HTTP.ADD_COOKIES (  
    cookies          IN  cookie_table,  
    request_context IN  request_context_key DEFAULT NULL);
```

### Parameters

**Table 224–17 ADD\_COOKIES Procedure Parameters**

Parameter	Description
cookies	The cookies to be added
request_context	Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.

### Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

## BEGIN\_REQUEST Function

This function begins a new HTTP request. UTL\_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

**See Also:** [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.BEGIN_REQUEST (
    url            IN  VARCHAR2,
    method         IN  VARCHAR2 DEFAULT 'GET',
    http_version   IN  VARCHAR2 DEFAULT NULL,
    request_context IN  request_context_key DEFAULT NULL)
RETURN req;
```

### Parameters

**Table 224–18** *BEGIN\_REQUEST Function Parameters*

Parameter	Description
url	The URL of the HTTP request
method	The method performed on the resource identified by the URL
http_version	The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.
request_context	Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.

### Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL\_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See [Chapter 238, "UTL\\_URL"](#) for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- BEGIN\_REQUEST can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a

subsequent invocation of the [GET\\_RESPONSE Function](#) will raise the `PROTOCOL_ERROR` exception.

A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      => req,
                    name   => 'Content-Type',
                    value  => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      => req,
                    name   => 'Content-Length',
                    value  => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      => req,
                    data   => 'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
      (r      => req);
...
```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the [SET\\_WALLET Procedure](#) on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

## CLEAR\_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the UTL\_HTTP package's session state.

**See Also:** [HTTP Cookies](#) on page 224-17 and [HTTP Cookies Subprograms](#) on page 224-31

### Syntax

```
UTL_HTTP.CLEAR_COOKIES (  
    request_context IN request_context_key DEFAULT NULL);
```

### Parameters

**Table 224–19** CLEAR\_COOKIES Procedure Parameters

Parameter	Description
request_context	Request context to clear the cookies. If NULL, the cookies maintained in the UTL_HTTP package's session state will be cleared instead.

## CLOSE\_PERSISTENT\_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the UTL\_HTTP package in the current database session.

**See Also:** [HTTP Persistent Connections](#) on page 224-17 and [HTTP Persistent Connections Subprograms](#) on page 224-32

### Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (  
    conn IN connection);
```

### Parameters

**Table 224–20** *CLOSE\_PERSISTENT\_CONN Procedure Parameters*

Parameter	Description
conn	The HTTP persistent connection to close

## CLOSE\_PERSISTENT\_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL\_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the proxy www-proxy at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

**See Also:** [HTTP Persistent Connections](#) on page 224-17 and [HTTP Persistent Connections Subprograms](#) on page 224-32

### Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
  host      IN VARCHAR2 DEFAULT NULL,
  port      IN PLS_INTEGER DEFAULT NULL,
  proxy_host IN VARCHAR2 DEFAULT NULL,
  proxy_port IN PLS_INTEGER DEFAULT NULL,
  ssl       IN BOOLEAN DEFAULT NULL);
```

### Parameters

**Table 224–21** *CLOSE\_PERSISTENT\_CONNS Procedure Parameters*

Parameter	Description
host	The host for which persistent connections are to be closed
port	The port number for which persistent connections are to be closed
proxy_host	The proxy host for which persistent connections are to be closed
proxy_port	The proxy port for which persistent connections are to be closed
ssl	Close persistent SSL connection

### Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL

of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a `NULL` value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a `NULL` value in a parameter to match only a `NULL` value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

## CREATE\_REQUEST\_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

**See Also:** [Request Context](#) on page 224-18 and [HTTP Request Contexts Subprograms](#) on page 224-29

### Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (
  wallet_path          IN VARCHAR2 DEFAULT NULL,
  wallet_password     IN VARCHAR2 DEFAULT NULL,
  enable_cookies      IN BOOLEAN  DEFAULT TRUE,
  max_cookies         IN PLS_INTEGER DEFAULT 300,
  max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;
```

### Parameters

**Table 224–22 CREATE\_REQUEST\_CONTEXT Function Parameters**

Parameter	Description
wallet_path	Directory path that contains the Oracle wallet. The format is <code>file:directory-path</code>
wallet_password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See the <i>Oracle Database Advanced Security Administrator's Guide</i> for detailed information about wallets.
enable_cookies	Sets whether HTTP requests using this request context should support HTTP cookies or not: TRUE to enable the support, FALSE to disable it.
max_cookies	Sets the maximum total number of cookies that will be maintained in this request context
max_cookies_per_site	Sets the maximum number of cookies per each Web site that will be maintained in this request context

### Return Values

The request context created.

### Examples

```
DECLARE
  request_context UTL_HTTP.REQUEST_CONTEXT_KEY;
  req            utl_http.req;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
    wallet_path          => 'file:/oracle/wallets/test_wallets',
    wallet_password     => NULL,
    enable_cookies      => TRUE,
    max_cookies         => 300,
    max_cookies_per_site => 20);
  req := UTL_HTTP.BEGIN_REQUEST(
    url                  => 'http://www.example.com/',
```

```
        request_context => request_context);  
END;
```

## DESTROY\_REQUEST\_CONTEXT Procedure

This procedure destroys a request context in UTL\_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

**See Also:** [Request Context](#) on page 224-18 and [HTTP Request Contexts Subprograms](#) on page 224-29

### Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (
    request_context    request_context_key);
```

### Parameters

**Table 224–23 DESTROY\_REQUEST\_CONTEXT Procedure Parameters**

Parameter	Description
request_context	Request context to destroy

### Examples

```
DECLARE
    request_context    UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(...);
    ...
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
```

## END\_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

**See Also:** [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.END_REQUEST (  
    r IN OUT NOCOPY req);
```

### Parameters

**Table 224–24** *END\_REQUEST Procedure Parameters*

Parameter	Description
r	The HTTP request

## END\_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.END_RESPONSE (  
    r IN OUT NOCOPY resp);
```

### Parameters

**Table 224–25** *END\_RESPONSE Procedure Parameters*

Parameter	Description
r	The HTTP response

## GET\_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
  r          IN OUT NOCOPY resp,
  scheme     OUT VARCHAR2,
  realm      OUT VARCHAR2,
  for_proxy  IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 224–26** GET\_AUTHENTICATION Procedure Parameters

Parameter	Description
r	The HTTP response
scheme	The scheme for the required HTTP authentication
realm	The realm for the required HTTP authentication
for_proxy	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE

### Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling GET\_AUTHENTICATION. The Web client makes the second request and supplies the required authentication information with SET\_AUTHORIZATION. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

## GET\_BODY\_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.GET_BODY_CHARSET (  
    charset OUT NOCOPY VARCHAR2);
```

### Parameters

**Table 224–27** *GET\_BODY\_CHARSET Procedure Parameters*

Parameter	Description
charset	The default character set of the body of all future HTTP requests

## GET\_COOKIE\_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL\_HTTP package's session state.

**See Also:** [HTTP Cookies](#) on page 224-17 and [HTTP Cookies Subprograms](#) on page 224-31

### Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (  
    request_context IN request_context_key DEFAULT NULL)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 224–28** GET\_COOKIE\_COUNT Function Parameters

Parameter	Description
request_context	Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.

## GET\_COOKIE\_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
    enable           OUT BOOLEAN,
    max_cookies      OUT PLS_INTEGER,
    max_cookies_per_site OUT PLS_INTEGER);
```

### Parameters

**Table 224–29** *GET\_COOKIE\_SUPPORT Procedure Parameters*

Parameter	Description
enable	Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)
max_cookies	Indicates the maximum total number of cookies maintained in the current session
max_cookies_per_site	Indicates the maximum number of cookies maintained in the current session for each Web site

## GET\_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL\_HTTP package's session state.

**See Also:** [HTTP Cookies](#) on page 224-17 and [HTTP Cookies Subprograms](#) on page 224-31

### Syntax

```
UTL_HTTP.GET_COOKIES (  
    cookies          IN OUT NOCOPY cookie_table,  
    request_context IN          request_context_key DEFAULT NULL);
```

### Parameters

**Table 224–30** GET\_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies returned
request_context	Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.

## GET\_DETAILED\_EXCP\_SUPPORT Procedure

This procedure checks if the UTL\_HTTP package will raise a detailed exception or not.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (  
    enable OUT BOOLEAN);
```

### Parameters

**Table 224–31** GET\_DETAILED\_EXCP\_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

## GET\_DETAILED\_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

**See Also:** [Error Conditions](#) on page 224-17 and [Error Conditions Subprograms](#) on page 224-33

### Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE  
RETURN PLS_INTEGER;
```

## GET\_DETAILED\_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

**See Also:** [Error Conditions](#) on page 224-17 and [Error Conditions Subprograms](#) on page 224-33

### Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM  
RETURN VARCHAR2;
```

## GET\_FOLLOW\_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (  
    max_redirects OUT PLS_INTEGER);
```

### Parameters

**Table 224–32 GET\_FOLLOW\_REDIRECT Procedure Parameters**

Parameter	Description
max_redirects	The maximum number of redirections for all future HTTP requests

## GET\_HEADER Procedure

This procedure returns the  $n^{\text{th}}$  HTTP response header name and value returned in the response.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.GET_HEADER (
  r      IN OUT NOCOPY resp,
  n      IN PLS_INTEGER,
  name   OUT NOCOPY VARCHAR2,
  value  OUT NOCOPY VARCHAR2);
```

### Parameters

**Table 224–33** GET\_HEADER Procedure Parameters

Parameter	Description
r	The HTTP response
n	The $n^{\text{th}}$ header to return
name	The name of the HTTP response header
value	The value of the HTTP response header

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## GET\_HEADER\_BY\_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(  
    r      IN OUT NOCOPY resp,  
    name   IN VARCHAR2,  
    value  OUT NOCOPY VARCHAR2,  
    n      IN PLS_INTEGER DEFAULT 1);
```

### Parameters

**Table 224–34** *GET\_HEADER\_BY\_NAME Procedure Parameters*

Parameter	Description
r	The HTTP response
name	The name of the HTTP response header for which the value is to return
value	The value of the HTTP response header
n	The n <sup>th</sup> occurrence of an HTTP response header by the specified name to return. The default is 1.

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## GET\_HEADER\_COUNT Function

This function returns the number of HTTP response headers returned in the response.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.GET_HEADER_COUNT (  
    r IN OUT NOCOPY resp)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 224–35** *GET\_HEADER\_COUNT Function Parameters*

Parameter	Description
r	The HTTP response

### Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

## GET\_PERSISTENT\_CONN\_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL\_HTTP package to the Web servers.

**See Also:** [HTTP Persistent Connections](#) on page 224-17 and [HTTP Persistent Connections Subprograms](#) on page 224-32

### Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT  
RETURN PLS_INTEGER;
```

### Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

## GET\_PERSISTENT\_CONN\_SUPPORT Procedure

This procedure checks:

- If the persistent connection support is enabled
- Gets the maximum number of persistent connections in the current session

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (  
    enable      OUT BOOLEAN,  
    max_conns  OUT PLS_INTEGER);
```

### Parameters

**Table 224–36** *GET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters*

Parameter	Description
enable	TRUE if persistent connection support is enabled; otherwise FALSE
max_conns	the maximum number of persistent connections maintained in the current session

## GET\_PERSISTENT\_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL\_HTTP package to the Web servers.

**See Also:** [HTTP Persistent Connections](#) on page 224-17 and [HTTP Persistent Connections Subprograms](#) on page 224-32

### Syntax

```
UTL_HTTP.get_persistent_conns (  
    connections IN OUT NOCOPY connection_table);
```

### Parameters

**Table 224–37 GET\_PERSISTENT\_CONNS Procedure Parameters**

Parameter	Description
connections	The network connections kept persistent

### Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

## GET\_PROXY Procedure

This procedure retrieves the current proxy settings.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.GET_PROXY (  
    proxy          OUT NOCOPY VARCHAR2,  
    no_proxy_domains OUT NOCOPY VARCHAR2);
```

### Parameters

**Table 224–38** *GET\_PROXY Procedure Parameters*

Parameter	Description
proxy	The proxy (host and an optional port number) currently used by the UTL_HTTP package
no_proxy_domains	The list of hosts and domains for which no proxy is used for all requests

## GET\_RESPONSE Function

This function reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.GET_RESPONSE (  
    r IN OUT NOCOPY req)  
RETURN resp;
```

### Parameters

**Table 224–39** *GET\_RESPONSE Procedure Parameters*

Parameter	Description
r	The HTTP response

## GET\_RESPONSE\_ERROR\_CHECK Procedure

This procedure checks if the response error check is set or not.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (  
    enable OUT BOOLEAN);
```

### Parameters

**Table 224–40** *GET\_RESPONSE\_ERROR\_CHECK Procedure Parameters*

Parameter	Description
enable	TRUE if the response error check is set; otherwise FALSE

## GET\_TRANSFER\_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (  
    timeout OUT PLS_INTEGER);
```

### Parameters

**Table 224–41 GET\_TRANSFER\_TIMEOUT Procedure Parameters**

Parameter	Description
timeout	The network transfer timeout value in seconds

## READ\_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer. The end of line is as defined in the function `read_line` of `UTL_TCP`. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.READ_LINE(
  r          IN OUT NOCOPY resp,
  data       OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
  remove_crlf IN  BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 224-42 READ\_LINE Procedure Parameters**

Parameter	Description
<code>r</code>	The HTTP response
<code>data</code>	The HTTP response body in text form
<code>remove_crlf</code>	Removes the newline characters if set to TRUE

### Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

## READ\_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.READ_RAW(
  r      IN OUT NOCOPY resp,
  data   OUT NOCOPY RAW,
  len    IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 224–43** READ\_RAW Procedure Parameters

Parameter	Description
r	The HTTP response
data	The HTTP response body in binary form
len	The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL

### Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

## READ\_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

**See Also:** [HTTP Responses](#) on page 224-17 and [HTTP Responses Subprograms](#) on page 224-30

### Syntax

```
UTL_HTTP.READ_TEXT(
  r      IN OUT NOCOPY resp,
  data   OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  len    IN PLS_INTEGER DEFAULT NULL);
```

### Parameters

**Table 224-44** *READ\_TEXT Procedure Parameters*

Parameter	Description
<code>r</code>	The HTTP response
<code>data</code>	The HTTP response body in text form
<code>len</code>	The maximum number of characters of data to read. If <code>len</code> is NULL, this procedure will read as much input as possible to fill the buffer allocated in <code>data</code> . The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL.

### Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If `transfer_timeout` is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482 :

`unsupported character set` exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

## REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL. This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

**See Also:** [Simple HTTP Fetches](#) on page 224-16 and [Simple HTTP Fetches in a Single Call Subprograms](#) on page 224-26

### Syntax

```
UTL_HTTP.REQUEST (
    url          IN VARCHAR2,
    proxy        IN VARCHAR2 DEFAULT NULL,
    wallet_path  IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

### Parameters

**Table 224–45** *REQUEST Function Parameters*

Parameter	Description
url	Uniform resource locator
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets  When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
wallet_password	(Optional) Specifies the password required to open the wallet

### Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

## Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

## Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL\_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function SET\_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

## Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the proxy parameter. For example, from within the Oracle firewall, where there might be a proxy server named www-proxy.my-company.com:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM
DUAL;
```

## REQUEST\_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port] [/]
```

**See Also:** [Simple HTTP Fetches](#) on page 224-16 and [Simple HTTP Fetches in a Single Call Subprograms](#) on page 224-26

### Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
    url            IN VARCHAR2,
    max_pieces    IN NATURAL DEFAULT 32767,
    proxy         IN VARCHAR2 DEFAULT NULL,
    wallet_path   IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

### Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 224–46** *REQUEST\_PIECES Function Parameters*

Parameter	Description
url	Uniform resource locator
max_pieces	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request.  The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.  See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
wallet_password	(Optional) Specifies the password required to open the wallet

## Return Values

REQUEST\_PIECES returns a PL/SQL table of type UTL\_HTTP.HTML\_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST\_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

## Exceptions

INIT\_FAILED  
REQUEST\_FAILED

## Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL\_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET\_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HITPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

## Examples

```
SET SERVEROUTPUT ON

DECLARE
  x  UTL_HTTP.HTML_PIECES;
  len PLS_INTEGER;
BEGIN
  x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
  DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved. ');
  DBMS_OUTPUT.PUT_LINE('with total length ');
  IF x.count < 1 THEN
    DBMS_OUTPUT.PUT_LINE('0');
```

```
ELSE
  len := 0;
  FOR i in 1..x.count LOOP
    len := len + length(x(i));
  END LOOP;
  DBMS_OUTPUT.PUT_LINE(i);
END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
```

## SET\_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

**See Also:** [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.SET_AUTHENTICATION(
    r           IN OUT NOCOPY req,
    username   IN VARCHAR2,
    password   IN VARCHAR2,
    scheme     IN VARCHAR2 DEFAULT 'Basic',
    for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

### Parameters

**Table 224–47** SET\_AUTHENTICATION Procedure Parameters

Parameter	Description
r	HTTP request
username	Username for the HTTP authentication
password	Password for the HTTP authentication
scheme	HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> .
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> .

### Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

## SET\_AUTHENTICATION\_FROM\_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

**See Also:** [External Password Store](#) on page 224-18, and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
  r          IN OUT NOCOPY req,
  alias      IN VARCHAR2,
  scheme     IN VARCHAR2 DEFAULT 'Basic',
  for_proxy  IN BOOLEAN   DEFAULT FALSE);
```

### Parameters

**Table 224–48 SET\_AUTHENTICATION\_FROM\_WALLET Procedure Parameters**

Parameter	Description
r	The HTTP request
alias	Alias to identify and retrieve the username and password credential stored in the Oracle wallet
scheme	HTTP authentication scheme. Either <code>Basic</code> for the HTTP basic or <code>AWS</code> for Amazon S3 authentication scheme. Default is <code>basic</code> .
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is <code>FALSE</code> .

### Usage Notes

- To use the password credentials in a wallet, the `UTL_HTTP` user must have the `use-passwords` privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

### Examples

#### Creating a wallet and entering username and password in the wallet

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: *****
Enter password again: *****
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: *****
```

#### Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
```

```
    acl          => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal    => 'SCOTT',
    is_grant     => TRUE,
    privilege    => 'use-passwords');
DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
    acl          => 'wallet-acl.xml',
    wallet_path  => 'file: /oracle/wallets/test_wallet');
END;
```

### Using username and password from the wallet

```
DECLARE
    req UTL_HTTP.req;
BEGIN
    UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
    req := UTL_HTTP.BEGIN_REQUEST(...);
    UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
    ...
END;
```

## SET\_BODY\_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

- [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to ISO-8859-1. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
    r          IN OUT NOCOPY req,
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
    r          IN OUT NOCOPY resp,
    charset IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 224–49** *SET\_BODY\_CHARSET Procedure Parameters*

<b>Parameter</b>	<b>Description</b>
<code>r</code>	The HTTP response.
<code>charset</code>	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If <code>charset</code> is <code>NULL</code> , the database character set is assumed.

## SET\_COOKIE\_SUPPORT Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

This procedure

### See Also:

- [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28
- [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

## Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
  r          IN OUT NOCOPY REQ,
  enable    IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
  enable      IN BOOLEAN,
  max_cookies IN PLS_INTEGER DEFAULT 300,
  max_cookies_per_site IN PLS_INTEGER DEFAULT 20);
```

## Parameters

**Table 224–50 SET\_COOKIE\_SUPPORT Procedure Parameters**

Parameter	Description
r	The HTTP request
enable	Set enable to TRUE to enable HTTP cookie support; FALSE to disable
max_cookies	Sets the maximum total number of cookies maintained in the current session
max_cookies_per_site	Sets the maximum number of cookies maintained in the current session for each Web site

## Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the Set-Cookie HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See ["Examples"](#) on page 224-21 for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

## SET\_DETAILED\_EXCP\_SUPPORT Procedure

This procedure sets the UTL\_HTTP package to raise a detailed exception. By default, UTL\_HTTP raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLERRM` for more detailed information about the error.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (  
    enable IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 224–51 SET\_DETAILED\_EXCP\_SUPPORT Procedure Parameters**

Parameter	Description
<code>enable</code>	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

## SET\_FOLLOW\_REDIRECT Procedures

This procedure sets the maximum number of times UTL\_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET\_RESPONSE function.

### See Also:

- [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28
- [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

## Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
    r              IN OUT NOCOPY req,
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

## Parameters

**Table 224–52 SET\_FOLLOW\_REDIRECT Procedure Parameters**

Parameter	Description
r	The HTTP request
max_redirects	The maximum number of redirects. Set to zero to disable redirects.

## Usage Notes

If `max_redirects` is set to a positive number, the [GET\\_RESPONSE Function](#) will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the REQ record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function FOLLOW\_REDIRECT and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The SET\_FOLLOW\_REDIRECT procedure must be called before GET\_RESPONSE for any redirection to take effect.

## SET\_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

**See Also:** [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.SET_HEADER (
    r          IN OUT NOCOPY req,
    name      IN VARCHAR2,
    value     IN VARCHAR2);
```

### Parameters

**Table 224–53 SET\_HEADER Procedure Parameters**

Parameter	Description
r	The HTTP request
name	The name of the HTTP request header
value	The value of the HTTP request header

### Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL\_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL\_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the SET\_BODY\_CHARSET procedure.

When you set the Transfer-Encoding header with the value chunked, UTL\_HTTP automatically encodes the request body written by the WRITE\_TEXT, WRITE\_LINE and WRITE\_RAW procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

## SET\_PERSISTENT\_CONN\_SUPPORT Procedure

This procedure enables or disables support for the HTTP 1.1 persistent-connection in the request.

**See Also:** [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    r          IN OUT NOCOPY req,
    enable    IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 224–54 SET\_PERSISTENT\_CONN\_SUPPORT Procedure Parameters**

Parameter	Description
r	The HTTP request
enable	TRUE to keep the network connection persistent. FALSE otherwise.

### Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL\_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in ["Examples"](#) on page 224-89.

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

## Examples

### Using SET\_PERSISTENT\_CONN\_SUPPORT in HTTP Requests

```

DECLARE
    TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
    paths VC2_TABLE;

    UTL_HTTP.fetch_pages(paths IN vc2_table) AS
        url_prefix  VARCHAR2(256) := 'http://www.my-company.com/';
        req         UTL_HTTP.REQ;
        resp        UTL_HTTP.RESP;
        data        VARCHAR2(1024);
    BEGIN
        FOR i IN 1..paths.count LOOP
            req := UTL_HTTP.BEGIN_REQUEST(url_prefix || paths(i));
            -- Use persistent connection except for the last request
            IF (i < paths.count) THEN
                UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
            END IF;
            resp := UTL_HTTP.GET_RESPONSE(req);
            BEGIN
                LOOP
                    UTL_HTTP.READ_TEXT(resp, data);
                    -- do something with the data
                END LOOP;
            EXCEPTION
                WHEN UTL_HTTP.END_OF_BODY THEN
                    NULL;
            END;
            UTL_HTTP.END_RESPONSE(resp);
        END LOOP;
    END;

    BEGIN
        UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);
        paths(1) := '...';
        paths(2) := '...';
        ...
        fetch_pages(paths);
    END;

```

## SET\_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`. `no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.SET_PROXY (
    proxy          IN VARCHAR2,
    no_proxy_domains IN VARCHAR2);
```

### Parameters

**Table 224–55 SET\_PROXY Procedure Parameters**

Parameter	Description
<code>proxy</code>	The proxy (host and an optional port number) to be used by the UTL_HTTP package
<code>no_proxy_domains</code>	The list of hosts and domains for which no proxy should be used for all requests

### Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com`, `eng.my-company.com:80`. When `no_proxy_domains` is NULL and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL\_HTTP sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

## SET\_RESPONSE\_ERROR\_CHECK Procedure

This procedure sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges. For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
    enable IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 224–56** *SET\_RESPONSE\_ERROR\_CHECK Procedure Parameters*

Parameter	Description
<code>enable</code>	TRUE to check for response errors; otherwise FALSE

### Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, `GET_RESPONSE` will raise the `HTTP_CLIENT_ERROR` or `HTTP_SERVER_ERROR` exception. If `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`, `GET_RESPONSE` will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The `GET_RESPONSE` function can raise other exceptions when `SET_RESPONSE_ERROR_CHECK` is set to `FALSE`.

## SET\_TRANSFER\_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL\_HTTP package should attempt while reading the HTTP response from the Web server or proxy server. This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

**See Also:** [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27

### Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (  
    timeout IN PLS_INTEGER DEFAULT 60);
```

### Parameters

**Table 224–57 SET\_TRANSFER\_TIMEOUT Procedure Parameters**

Parameter	Description
timeout	The network transfer timeout value in seconds.

### Usage Notes

The default value of the time out is 60 seconds.

## SET\_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS. When the UTL\_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL\_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL\_HTTP package. An Oracle wallet is required to make an HTTPS request.

### See Also:

- [Session Settings](#) on page 224-17 and [Session Settings Subprograms](#) on page 224-27
- "Managing Fine-Grained Access in PL/SQL Network Utility Packages" in the *Oracle Database Security Guide*

## Syntax

```
UTL_HTTP.SET_WALLET (
    path          IN VARCHAR2,
    password      IN VARCHAR2 DEFAULT NULL);
```

## Parameters

**Table 224–58 SET\_WALLET Procedure Parameters**

Parameter	Description
path	The directory path that contains the Oracle wallet. The format is <code>file:directory-path</code> .  The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code> , and in Unix is, for example, <code>file:/home/username/wallets</code> . When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.
password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See "Using Wallets with Automatic Login Enabled" in the <i>Oracle Database Advanced Security Administrator's Guide</i> for information about using Oracle Wallet Manager and the ORAPKI utility to create an auto-login wallet

## Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

**See Also:** *Oracle Database Advanced Security Administrator's Guide*  
for more information on Wallet Manager

## WRITE\_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`). As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

**See Also:** [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.WRITE_LINE(
  r      IN OUT NOCOPY req,
  data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 224–59** *WRITE\_LINE Procedure Parameters*

Parameter	Description
<code>r</code>	The HTTP request
<code>data</code>	The text line to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The `UTL_HTTP` package performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

## WRITE\_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

**See Also:** [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.WRITE_RAW(
  r      IN OUT NOCOPY REQ,
  data  IN          RAW);
```

### Parameters

**Table 224–60** WRITE\_RAW Procedure Parameters

Parameter	Description
r	The HTTP request
data	The binary data to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

## WRITE\_TEXT Procedure

This procedure writes some text data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

**See Also:** [HTTP Requests](#) on page 224-17 and [HTTP Requests Subprograms](#) on page 224-28

### Syntax

```
UTL_HTTP.WRITE_TEXT(
  r      IN OUT NOCOPY REQ,
  data  IN          VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 224–61** *WRITE\_TEXT Procedure Parameters*

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

### Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

UTL\_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

**See Also:** *Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- [Using UTL\\_I18N](#)
  - Overview
  - Security Model
  - Constants
- [Summary of UTL\\_I18N Subprograms](#)

## Using UTL\_I18N

This section contains topics which relate to using the UTL\_I18N package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)

## Overview

The UTL\_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.

## Security Model

The functions of the `UTL_I18N` package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default

## Constants

The UTL\_I18N package uses the constants shown in [Table 225–1](#).

**Table 225–1 UTL\_I18N Constants**

Constant	Type	Value	Description
GENERIC_CONTEXT	PLS_INTEGER	0	Returns the default character set for general cases.
MAIL_GENERIC	PLS_INTEGER	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
ORACLE_TO_IANA	PLS_INTEGER	0	Map from an Oracle character set name to an IANA character set name.
SHIFT_IN	PLS_INTEGER	0	Used with <code>shift_status</code> . Must be set the first time it is called in piecewise conversion.
IANA_TO_ORACLE	PLS_INTEGER	1	Map from an IANA character set name to an Oracle character set name.
MAIL_CONTEXT	PLS_INTEGER	1	The mapping is between an Oracle character set name and an email safe character set name.
MAIL_WINDOWS	PLS_INTEGER	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
SHIFT_OUT	PLS_INTEGER	1	
FWKATAKANA_HIRAGANA	VARCHAR2 (30)	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
FWKATAKANA_HWKATAKANA	VARCHAR2 (30)	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
HIRAGANA_FWKATAKANA	VARCHAR2 (30)	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAKANA	VARCHAR2 (30)	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKATAKANA	VARCHAR2 (30)	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	VARCHAR2 (30)	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2 (30)	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	VARCHAR2 (30)	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.

**Table 225–1 (Cont.) UTL\_I18N Constants**

<b>Constant</b>	<b>Type</b>	<b>Value</b>	<b>Description</b>
KANA_ HWKATAKANA	VARCHAR2 (30)	'kana_ hwkatakana '	Converts any type of Kana character to a halfwidth Katakana character.

## Summary of UTL\_I18N Subprograms

**Table 225–2 UTL\_I18N Package Subprograms**

Procedure	Description
<a href="#">ESCAPE_REFERENCE Function</a> on page 225-9	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
<a href="#">GET_COMMON_TIME_ZONES Function</a> on page 225-10	Returns the list of common time zone IDs that are independent of the locales.
<a href="#">GET_DEFAULT_CHARSET Function</a> on page 225-11	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
<a href="#">GET_DEFAULT_ISO_CURRENCY Function</a> on page 225-12	Returns the default ISO 4217 currency code for the specified territory.
<a href="#">GET_DEFAULT_LINGUISTIC_SORT Function</a> on page 225-13	Returns the default linguistic sort name for the specified language.
<a href="#">GET_LOCAL_LANGUAGES Function</a> on page 225-14	Returns the local language names for the specified territory.
<a href="#">GET_LOCAL_LINGUISTIC_SORTS Function</a> on page 225-15	Returns the local linguistic sort names for the specified language.
<a href="#">GET_LOCAL_TERRITORIES Function</a> on page 225-16	Returns the local territory names for the specified language.
<a href="#">GET_LOCAL_TIME_ZONES Function</a> on page 225-17	Returns the local time zone IDs for the specified territory.
<a href="#">GET_TRANSLATION Function</a> on page 225-19	Returns the translation of the language and territory name in the specified translation language.
<a href="#">MAP_CHARSET Function</a> on page 225-20	<ul style="list-style-type: none"> <li>■ Maps an Oracle character set name to an IANA character set name.</li> <li>■ Maps an IANA character set name to an Oracle character set name.</li> <li>■ Maps an Oracle character set name to an e-mail safe character set name.</li> </ul>
<a href="#">MAP_FROM_SHORT_LANGUAGE Function</a> on page 225-22	Maps an Oracle short language name to an Oracle language name.
<a href="#">MAP_LANGUAGE_FROM_ISO Function</a> on page 225-23	Returns an Oracle language name from an ISO locale name.
<a href="#">MAP_LOCALE_TO_ISO Function</a> on page 225-24	Returns an ISO locale name from the Oracle language and territory name.
<a href="#">MAP_TERRITORY_FROM_ISO Function</a> on page 225-25	Returns an Oracle territory name from an ISO locale name.
<a href="#">MAP_TO_SHORT_LANGUAGE Function</a> on page 225-26	Maps an Oracle language name to an Oracle short language name.
<a href="#">RAW_TO_CHAR Functions</a> on page 225-27	Converts RAW data that is not encoded in the database character set into a VARCHAR2 string
<a href="#">RAW_TO_NCHAR Functions</a> on page 225-29	Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string
<a href="#">STRING_TO_RAW Function</a> on page 225-31	Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.

**Table 225–2 (Cont.) UTL\_I18N Package Subprograms**

<b>Procedure</b>	<b>Description</b>
<a href="#">TRANSLITERATE Function</a> on page 225-32	Transliterates between Japanese hiragana and katakana.
<a href="#">UNESCAPE_REFERENCE Function</a> on page 225-34	Converts an input string that contains character references to a text string.

## ESCAPE\_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document. Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document.

Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `&#xe5;` is the numeric character reference for the small letter "a" with a ring above, whereas `&aring;` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `&lt;` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

### Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
    str          IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 225-3 ESCAPE\_REFERENCE Function Parameters**

Parameter	Description
<code>str</code>	Specifies the input string
<code>page_cs_name</code>	Specifies the character set of the document. If <code>page_cs_name</code> is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

### Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

### Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns 'hello &lt; &#xe5;'.

## GET\_COMMON\_TIME\_ZONES Function

This function returns a listing of the most commonly used time zones. This list contains a subset of the time zones that are supported in the database.

### Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES  
RETURN STRING_ARRAY;
```

### Examples

Returns the list of the most commonly used time zones.

```
DECLARE  
    retval UTL_I18N.STRING_ARRAY;  
BEGIN  
    retval := UTL_I18N.GET_COMMON_TIME_ZONES;  
END;  
/
```

## GET\_DEFAULT\_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

**See Also:** "[MAP\\_CHARSET Function](#)" on page 225-20 for an explanation of an e-mail safe character set

### Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
    language IN VARCHAR2,
    context  IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

### Parameters

**Table 225-4** GET\_DEFAULT\_CHARSET Function Parameters

Parameter	Description
language	Specifies a valid Oracle language
context	GENERIC_CONTEXT   MAIL_CONTEXT GENERIC_CONTEXT: Returns the default character set for general cases MAIL_CONTEXT: Returns the default e-mail safe character set name
iswindows	If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE.  iswindows has no effect if context is set as GENERIC_CONTEXT.

### Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

### Examples

#### GENERIC\_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

#### MAIL\_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

#### MAIL\_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

## GET\_DEFAULT\_ISO\_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

### Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (  
    territory    IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

### Parameters

**Table 225–5** GET\_DEFAULT\_ISO\_CURRENCY Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

### Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

### Examples

Displays the default ISO currency code for China.

```
DECLARE  
    retval VARCHAR2(50);  
BEGIN  
    retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');  
    DBMS_OUTPUT.PUT_LINE(retval);  
END;  
/
```

## GET\_DEFAULT\_LINGUISTIC\_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

### Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Parameters

**Table 225–6** *GET\_DEFAULT\_LINGUISTIC\_SORT Function Parameters*

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE
    retval VARCHAR2(50);
BEGIN
    SELECT value INTO retval FROM nls_session_parameters
    WHERE parameter = 'NLS_LANGUAGE';
    retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
    DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

## GET\_LOCAL\_LANGUAGES Function

This function returns the local language names for the specified territory.

### Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (
    territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

### Parameters

**Table 225–7 GET\_LOCAL\_LANGUAGES Function Parameters**

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

### Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

### Examples

Returns the list of local languages used in Belgium.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt    INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 2
DUTCH
FRENCH
```

## GET\_LOCAL\_LINGUISTIC\_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A BINARY sort is included for all languages.

### Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

### Parameters

**Table 225–8 GET\_LOCAL\_LINGUISTIC\_SORTS Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Displays the local linguistic sort names for JAPANESE.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.COUNT);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY
```

## GET\_LOCAL\_TERRITORIES Function

This function returns the local territory names for the specified language.

### Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

### Parameters

**Table 225–9 GET\_LOCAL\_TERRITORIES Function Parameters**

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt    INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_TERRITORIES('GERMAN');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

## GET\_LOCAL\_TIME\_ZONES Function

This function returns the local time zone IDs for the specified territory.

### Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
    territory      IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

### Parameters

**Table 225–10 GET\_LOCAL\_TIME\_ZONES Function Parameters**

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

### Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

### Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
    retval  utl_i18n.string_array;
    retval2 utl_i18n.string_array;
    stpos   INTEGER;
BEGIN
    retval := utl_i18n.get_local_time_zones(
        territory);
    retval2 := utl_i18n.get_common_time_zones;
    stpos := retval.LAST + 1;
    retval(stpos) := '-----'; -- a separator
    FOR i IN retval2.FIRST..retval2.LAST LOOP
        stpos := stpos + 1;
        retval(stpos) := retval2(i);
    END LOOP;
    RETURN retval;
END;
```

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt   INTEGER;
BEGIN
    DBMS_OUTPUT.ENABLE(100000);
    retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
    cnt := retval.FIRST;
```

```
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
```

Asia/Baku

-----

```
Pacific/Pago_Pago
Pacific/Honolulu
America/Anchorage
America/Vancouver
America/Los_Angeles
America/Tijuana
America/Edmonton
America/Denver
America/Phoenix
America/Mazatlan
America/Winnipeg
America/Regina
America/Chicago
America/Mexico_City
America/Guatemala
America/El_Salvador
America/Managua
America/Costa_Rica
America/Montreal
...
```

## GET\_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

### Syntax

```
UTL_I18N.GET_TRANSLATION (
    parameter          IN VARCHAR2 CHARACTER SET ANY_CS,
    trans_language     IN VARCHAR2 'AMERICAN',
    flag               IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

### Parameters

**Table 225–11** GET\_TRANSLATION Function Parameters

Parameter	Description
parameter	Specifies a valid language name, territory name, or a combined string in the form of <i>language_territory</i> . It is case-insensitive.
trans_language	Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English.
flag	Specifies the translation type: <ul style="list-style-type: none"> <li>▪ LANGUAGE_TRANS: The function returns the language translation.</li> <li>▪ TERRITORY_TRANS: The function returns the territory translation.</li> <li>▪ LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation.</li> </ul> <p>The default translation type is LANGUAGE_TRANS.</p>

### Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

### Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
    CURSOR c1 IS
        SELECT value FROM V$NLS_VALID_VALUES
        WHERE parameter = 'LANGUAGE'
        ORDER BY value;
    retval NVARCHAR2(100);
BEGIN
    FOR item IN c1 LOOP
        retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
    END LOOP;
END;
```

## MAP\_CHARSET Function

This function maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

### Syntax

```
UTL_I18N.MAP_CHARSET (
    charset    IN VARCHAR2,
    context    IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    flag       IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

### Parameters

**Table 225–12 MAP\_CHARSET Function Parameters**

Parameter	Description
charset	Specifies the character set name to be mapped. The mapping is case-insensitive.
context	GENERIC_CONTEXT   MAIL_CONTEXT GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value. MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.
flag	<ul style="list-style-type: none"> <li>■ ORACLE_TO_IANA   IANA_TO_ORACLE if GENERIC_CONTEXT is set                ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default.                IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name.</li> <li>■ MAIL_GENERIC   MAIL_WINDOWS if MAIL_CONTEXT is set                MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform.                MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.</li> </ul>

### Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP\_CHARSET function with the ORACLE\_TO\_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP\_CHARSET function with the MAIL\_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the `MAP_CHARSET` function with the `MAIL_CONTEXT | MAIL_GENERIC` option with the database character set name, `WE8DEC`. The result is `WE8ISO8859P1`.
2. Convert the contents stored in the database to `WE8ISO8859P1`.
3. Call the `MAP_CHARSET` function with the `ORACLE_TO_IANA | GENERIC_CONTEXT` option with the e-mail safe character set, `WE8ISO8859P1`. The result is `ISO-8859-1`.
4. Specify `ISO-8859-1` in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns `NULL`.

---

---

**Note:** Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

---

---

## Examples

### Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_
ORACLE)
```

This returns 'WE8ISO8859P1'.

### Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

**See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

## MAP\_FROM\_SHORT\_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

### Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
    language          IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

### Parameters

**Table 225–13 MAP\_FROM\_SHORT\_LANGUAGE Function Parameters**

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table `customers` is from the `oe` user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the `GET_DEFAULT_LINGUISTIC_SORT` procedure.

```
DECLARE
    short_n VARCHAR2(10);
    ling_n VARCHAR2(50);
BEGIN
    SELECT nls_language INTO short
    FROM customers WHERE customer_id = 9000;
    ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
        UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
    DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

## MAP\_LANGUAGE\_FROM\_ISO Function

This function returns an Oracle language name from an ISO locale name.

### Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(  
    isolocale IN VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 225–14** MAP\_LANGUAGE\_FROM\_ISO Function Parameters

Parameter	Description
isolocale	Specifies the ISO locale. The mapping is case-insensitive.

### Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the language (for example, en\_ instead of en\_US), then the function returns the default language name for the specified language (for example, American).

### Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

**See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages

## MAP\_LOCALE\_TO\_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name. A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

### Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (  
    ora_language  IN VARCHAR2,  
    ora_territory IN VARCHAR2)  
RETURN VARCHAR2;
```

### Parameters

**Table 225–15** MAP\_LOCALE\_TO\_ISO Function Parameters

Parameter	Description
ora_language	Specifies an Oracle language name. It is case-insensitive.
ora_territory	Specifies an Oracle territory name. It is case-insensitive.

### Usage Notes

If the user specifies an invalid string, then the function returns a NULL string.

### Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en\_US'.

**See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

## MAP\_TERRITORY\_FROM\_ISO Function

This function returns an Oracle territory name from an ISO locale.

### Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (
    isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

### Parameters

**Table 225–16** MAP\_TERRITORY\_FROM\_ISO Function Parameters

Parameter	Description
isolocale	Specifies the ISO locale. The mapping is case-insensitive.

### Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `France`).

### Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en-US')
```

This returns 'America'.

**See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle territories

## MAP\_TO\_SHORT\_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

### Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (  
    language    IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

### Parameters

**Table 225–17** MAP\_TO\_SHORT\_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

### Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

### Examples

Returns the short language name for the language.

```
DECLARE  
    retval VARCHAR2(100);  
BEGIN  
    retval := UTL_I18N.MAP_TO_SHORT_LANGUAGE('american');  
    DBMS_OUTPUT.PUT_LINE(retval);  
END;  
/  
  
US
```

## RAW\_TO\_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

### Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

### Parameters

**Table 225–18 RAW\_TO\_CHAR Function Parameters**

Parameter	Description
data	Specifies the RAW data to be converted to a VARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion.  <b>Note:</b> ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

### Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

### Examples

#### Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('6162636465666C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde' || chr(170)
```

### Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('6162636465666C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde' || chr(170)
```

It also sets shf to SHIFT\_IN and slen to 8.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
    then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
        rtemp := '';
    end if;
    /* do anything you want with nvalue */
    /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
    WHEN utl_tcp.end_of_input THEN
        utl_tcp.close_connection(conn);
END;
```

## RAW\_TO\_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

### Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN NVARCHAR2;
```

### Parameters

**Table 225–19 RAW\_TO\_NCHAR Function Parameters**

Parameter	Description
data	Specifies the RAW data to be converted to an NVARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion.  <b>Note:</b> ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

### Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

### Examples

#### Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('6162636465666C2AA'), 'utf8')
```

This returns the following string in the national character set:

```
'abcde' || chr(170)
```

### Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('6162636465666C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
    then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
        rtemp := '';
    end if;
    /* do anything you want with nvalue */
    /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
    WHEN utl_tcp.end_of_input THEN
        utl_tcp.close_connection(conn);
END;
```

## STRING\_TO\_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

### Syntax

```
UTL_I18N.STRING_TO_RAW(
    data          IN VARCHAR2 CHARACTER SET ANY_CS,
    dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

### Parameters

**Table 225–20** *STRING\_TO\_RAW Function Parameters*

Parameter	Description
data	Specifies the VARCHAR2 or NVARCHAR2 string to convert.
dst_charset	Specifies the destination character set. If <code>dst_charset</code> is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

### Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

### Examples

```
DECLARE
    r raw(50);
    s varchar2(20);
BEGIN
    s:='abcdef' || chr(170);
    r:=utl_i18n.string_to_raw(s, 'utf8');
    dbms_output.put_line(rawtohex(r));
end;
/
```

This returns a hex value of '616263646566C2AA'.

## TRANSLITERATE Function

This function performs script transliteration. In this release, the TRANSLITERATE function only supports Japanese Kana conversion.

### Syntax

```
UTL_I18N.TRANSLITERATE (
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

### Parameters

**Table 225–21 TRANSLITERATE Function Parameters**

Parameter	Description
data	Specifies the data to be converted. Either CHAR or NCHAR data type can be specified.
name	Specifies the transliteration name string. For a list of valid names, see <a href="#">Table 225–22</a> .

### Constants

These options specify Japanese Kana conversions.

**Table 225–22 TRANSLITERATE Function Constants**

Constant Name	Value	Description
KANA_FWKATAKANA	'kana_ fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HWKATAKANA	'kana_ hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.
KANA_HIRAGANA	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
FWKATAKANA_ HWKATAKANA	'fwkatakana_ hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
FWKATAKANA_ HIRAGANA	'fwkatakana_ hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
HWKATAKANA_ FWKATAKANA	'hwkatakana_ fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_ HIRAGANA	'hwkatakana_ hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
HIRAGANA_ FWKATAKANA	'hiragana_ fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_ HWKATAKANA	'hiragana_ hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

### Usage Notes

The function returns the converted string.

## Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

Figure shows how this output might look.

**Figure 225-1 Loading Locale-Specific Data to the Database**

```

タナカ
たなか
タナカ
↓
たなか
たなか
たなか

```

The image `kana_small_arrow.gif` is partially described in the preceding text. It shows how three versions of the word "Tanaka" can be standardized and converted into one form.

\*\*\*\*\*

The following statement normalizes one kana name to hiragana:

```
DECLARE
  Name  japanese_emp.ename%TYPE;
  Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
  SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
  name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
  UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
  WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
    DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

## UNESCAPE\_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

**See Also:** ["ESCAPE\\_REFERENCE Function"](#) on page 225-9 for more information about escape sequences

### Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (  
    str IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

### Parameters

**Table 225–23 UNESCAPE\_REFERENCE Function Parameters**

Parameter	Description
str	Specifies the input string

### Usage Notes

If the user specifies a NULL string or a string whose length is 0, then the function returns a NULL string. If the function fails, then it returns the original string.

### Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')
```

This returns 'hello < | |chr(229).'

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- [Using UTL\\_INADDR](#)
  - Security Model
  - Exceptions
  - Examples
- [Summary of UTL\\_INADDR Subprograms](#)

## Using UTL\_INADDR

- [Security Model](#)
- [Exceptions](#)
- [Examples](#)

## Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the `connect` privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

---

---

**Note:** For more information about managing fine-grained access, see *Oracle Database Security Guide*.

---

---

## Exceptions

**Table 226–1** *Exception - Internet Address Package*

<b>Number</b>	<b>Exception</b>	<b>Description</b>
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

## Examples

Retrieve the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME); -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS); -- get local IP addr
END;
/
```

## Summary of UTL\_INADDR Subprograms

**Table 226–2 UTL\_INADDR Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">GET_HOST_ADDRESS Function</a> on page 226-7	Retrieves the IP address of the local or remote host given its name
<a href="#">GET_HOST_NAME Function</a> on page 226-8	Retrieves the name of the local or remote host given its IP address

## GET\_HOST\_ADDRESS Function

This function retrieves the IP address of the specified host.

### Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (
    host IN VARCHAR2 DEFAULT NULL)
RETURN host_address VARCHAR2;
```

### Parameters

**Table 226–3** *GET\_HOST\_ADDRESS Function Parameters*

Parameter	Description
host	The name of the host to retrieve the IP address.

### Return Values

**Table 226–4** *GET\_HOST\_ADDRESS Function Return Values*

Parameter	Description
host_address	The IP address of the specified host, or that of the local host if host is NULL.

### Exceptions

UNKNOWN\_HOST: The specified IP address is unknown

### Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege on `LOCALHOST`.

## GET\_HOST\_NAME Function

This function retrieves the name of the local or remote host given its IP address.

### Syntax

```
UTL_INADDR.GET_HOST_NAME (  
    ip IN VARCHAR2 DEFAULT NULL)  
RETURN host_name VARCHAR2;
```

### Parameters

**Table 226–5 GET\_HOST\_NAME Function Parameters**

Parameter	Description
ip	The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

### Return Values

**Table 226–6 GET\_HOST\_NAME Function Return Values**

Parameter	Description
host_name	The name of the local or remote host of the specified IP address

### Exceptions

UNKNOWN\_HOST: The specified IP address is unknown

### Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the `resolve` privilege granted through `DBMS_NETWORK_ACL_ADMIN` on `LOCALHOST`.

The UTL\_IDENT package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- [Using UTL\\_IDENT](#)
  - Overview
  - Security Model
  - Constants

## Using UTL\_IDENT

---

This section contains topics which relate to using the UTL\_IDENT package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)

## Overview

The UTL\_IDENT package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

## Security Model

The `UTL_IDENT` package runs as the package owner `SYS`. The public synonym `UTL_IDENT`, and `EXECUTE` permission on this package is granted to `PUBLIC`.

## Constants

The UTL\_IDENT package uses the constants shown in [Table 227-1, "UTL\\_IDENT Constants"](#).

**Table 227-1 UTL\_IDENT Constants**

Constant	Type	Value	Description
IS_ORACLE_SERVER	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Server or not
IS_ORACLE_CLIENT	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Client or not
IS_TIMESTEN	BOOLEAN	TRUE/FALSE	Stipulates if TimesTen or not
IS_ORACLE_FORMS	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Forms or not

UTL\_LMS retrieves and formats error messages in different languages.

**See Also:** *Oracle Database Globalization Support Guide*

This chapter contains the following topics:

- [Using UTL\\_LMS](#)
  - Security Model
- [Summary of UTL\\_LMS Subprograms](#)

## Using UTL\_LMS

This section contains topics which relate to using the UTL\_LMS package.

- [Security Model](#)

## Security Model

This package must be created as the user `SYS`.

## Summary of UTL\_LMS Subprograms

**Table 228–1 UTL\_LMS Package Subprograms**

<b>Function</b>	<b>Description</b>
<a href="#">FORMAT_MESSAGE Function</a> on page 228-5	Formats a retrieved error message
<a href="#">GET_MESSAGE Function</a> on page 228-6	Retrieves an error message based on error number, product, facility, language, and message specified

## FORMAT\_MESSAGE Function

This function formats a message retrieved by the `GET_MESSAGE` function and returns the formatted message. If the function fails, then it returns a `NULL` result.

The following table shows special characters that can be used in the format string.

Special Character	Description
'%s'	Substitute the next string argument
'%d'	Substitute the next integer argument
'%%'	Represents the special character %

### Syntax

```
UTL_LMS.FORMAT_MESSAGE (
  format IN VARCHAR2 CHARACTER SET ANY_CS,
  args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

### Parameters

**Table 228–2** *FORMAT\_MESSAGE Procedure Parameters*

Parameter	Description
format	Specifies the string to format
args	Specifies the list of arguments

### Examples

```
DECLARE
  s varchar2(200);
  i pls_integer;
BEGIN
  i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
  dbms_output.put_line('before format, message is: '||s);
  dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/
```

The following is an unformatted message:

Type %d non pris en charge pour l'expression SQL sur la colonne %s.

The following is the formatted message:

Type 9 non pris en charge pour l'expression SQL sur la colonne my\_column\_name.

## GET\_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns 0 when it is successful. It returns -1 when it fails.

**See Also:** *Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

### Syntax

```
UTL_LMS.GET_MESSAGE (
    errnum    IN PLS_INTEGER,
    product   IN VARCHAR2,
    facility  IN VARCHAR2,
    language  IN VARCHAR2,
    message   OUT NOCOPY VARCHAR2CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

### Parameters

**Table 228–3** GET\_MESSAGE Function Parameters

Parameter	Description
<code>errnum</code>	Specifies the error number. Example: '972' (for ORA-00972)
<code>product</code>	Specifies the product to which the error message applies Example: 'rdbms'
<code>facility</code>	Specifies the error message prefix Example: 'ora'
<code>language</code>	Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes <code>GET_MESSAGE</code> to use the value of the <code>NLS_LANGUAGE</code> session parameter.
<code>message</code>	Specifies the output buffer for the retrieved message

### Usage Notes

If the `language` parameter is set to NULL, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

### Examples

```
DECLARE
    s varchar2(200);
    i pls_integer;
BEGIN
    i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
    dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

The UTL\_MAIL package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- [Using UTL\\_MAIL](#)
  - Security Model
  - Operational Notes
  - Rules and Limits
- [Summary of UTL\\_MAIL Subprograms](#)

## Using UTL\_MAIL

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)

## Security Model

UTL\_MAIL is not installed by default because of the SMTP\_OUT\_SERVER configuration requirement and the security exposure this involves. In installing UTL\_MAIL, you should take steps to prevent the port defined by SMTP\_OUT\_SERVER being swamped by data transmissions .

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

---

---

**Note:** For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

---

---

## Operational Notes

You must both install UTL\_MAIL and define the SMTP\_OUT\_SERVER.

- To install UTL\_MAIL:

```
sqlplus sys/<pwd>  
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql  
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the SMTP\_OUT\_SERVER parameter in the `init.ora` rdbms initialization file. However, if SMTP\_OUT\_SERVER is not defined, this invokes a default of DB\_DOMAIN which is guaranteed to be defined to perform appropriately.

## Rules and Limits

Use `UTL_MAIL` only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

## Summary of UTL\_MAIL Subprograms

**Table 229–1 UTL\_MAIL Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">SEND Procedure</a> on page 229-7	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
<a href="#">SEND_ATTACH_RAW Procedure</a> on page 229-8	Represents the SEND Procedure overloaded for RAW attachments
<a href="#">SEND_ATTACH_VARCHAR2 Procedure</a> on page 229-9	Represents the SEND Procedure overloaded for VARCHAR2 attachments

## SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients. It hides the SMTP API and exposes a one-line email facility for ease of use.

### Syntax

```
UTL_MAIL.SEND (
  sender      IN   VARCHAR2 CHARACTER SET ANY_CS,
  recipients  IN   VARCHAR2 CHARACTER SET ANY_CS,
  cc          IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc         IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject     IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message     IN   VARCHAR2 CHARACTER SET ANY_CS,
  mime_type   IN   VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
  priority    IN   PLS_INTEGER DEFAULT 3,
  replyto     IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

### Parameters

**Table 229–2 SEND Procedure Parameters**

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
replyto	Defines to whom the reply email is to be sent

## SEND\_ATTACH\_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

### Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (
  sender          IN  VARCHAR2 CHARACTER SET ANY_CS,
  recipients      IN  VARCHAR2 CHARACTER SET ANY_CS,
  cc              IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc             IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  mime_type       IN  VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                    DEFAULT 'text/plain; charset=us-ascii',
  priority        IN  PLS_INTEGER DEFAULT 3,
  attachment      IN  RAW,
  att_inline      IN  BOOLEAN DEFAULT TRUE,
  att_mime_type   IN  VARCHAR2 CHARACTER SET ANY_CS
                    DEFAULT 'text/plain; charset=us-ascii',
  att_filename    IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  replyto         IN  VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

### Parameters

**Table 229-3 SEND\_ATTACH\_RAW Procedure Parameters**

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	RAW attachment
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE
att_mime_type	Mime type of the attachment, default is 'application/octet'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

## SEND\_ATTACH\_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

### Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
  sender          IN    VARCHAR2 CHARACTER SET ANY_CS,
  recipients      IN    VARCHAR2 CHARACTER SET ANY_CS,
  cc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc             IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  mime_type       IN    VARCHAR2 CHARACTER SET ANY_CS
                                DEFAULT 'text/plain; charset=us-ascii',
  priority        IN    PLS_INTEGER DEFAULT 3,
  attachment      IN    VARCHAR2 CHARACTER SET ANY_CS, ,
  att_inline      IN    BOOLEAN DEFAULT TRUE,
  att_mime_type   IN    VARCHAR2 CHARACTER SET ANY_CS
                                DEFAULT 'text/plain; charset=us-ascii',
  att_filename    IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  replyto        IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

### Parameters

**Table 229–4 SEND\_ATTACH\_VARCHAR2 Procedure Parameters**

Parameter	Description
sender	Email address of the sender
recipients	Email addresses of the recipient(s), separated by commas
cc	Email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	Email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	String to be included as email subject string, default is NULL
message	Text message body
mime_type	Mime type of the message, default is 'text/plain; charset=us-ascii'
priority	Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.
attachment	Text attachment
att_inline	Specifies whether the attachment is inline, default TRUE
att_mime_type	Mime type of the attachment, default is 'text/plain; charset=us-ascii'
att_filename	String specifying a filename containing the attachment, default is NULL
replyto	Defines to whom the reply email is to be sent

The UTL\_MATCH package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- [Using UTL\\_MATCH](#)
  - Overview
  - Security Model
- [Summary of UTL\\_MATCH Subprograms](#)

## Using UTL\_MATCH

---

- [Overview](#)
- [Security Model](#)

## Overview

"Edit Distance" also known as "Levenshtein Distance" (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of Similarity between two strings, s1 and s2. The distance is the number of insertions, deletions or substitutions required to transform s1 to s2.

The Edit Distance between strings "shackleford" and "shackelford" = 2

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

Table 230–1 shows similarity values returned by Jaro-Winkler and Edit Distance

**Table 230–1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms**

String 1	String 2	Jaro Winkler	Edit Distance
Dunningham	Cunnigham	89	80
Abroms	Abrams	92	83
Lampley	Campley	90	86
Marhta	Martha	96	67
Jonathon	Jonathan	95	88
Jeraldine	Geraldine	92	89

## Security Model

The `UTL_MATCH` package runs with definer's rights. `UTL_MATCH` must be created under `SYS`. Operations provided by this package are performed with `SYS` privileges.

---

## Summary of UTL\_MATCH Subprograms

---

**Table 230–2 DBMS\_ALERT Package Subprograms**

Subprogram	Description
<a href="#">EDIT_DISTANCE Function</a> on page 230-6	Calculates the number of changes required to transform string-1 into string-2
<a href="#">EDIT_DISTANCE_SIMILARITY Function</a> on page 230-7	Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match)
<a href="#">JARO_WINKLER Function</a> on page 230-8	Calculates the measure of agreement between string-1 and string-2
<a href="#">JARO_WINKLER_SIMILARITY Function</a> on page 230-9	Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)

## EDIT\_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

### Syntax

```
UTL_MATCH.EDIT_DISTANCE (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 230–3** *EDIT\_DISTANCE Function Parameters*

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

### Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 2
```

## EDIT\_DISTANCE\_SIMILARITY Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two Strings. The value is typically between 0 (no match) and 100 (perfect match).

### Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (
    s1 IN VARCHAR2,
    s2 IN VARCHAR2)
RETURN PLS_INTEGER;
```

### Parameters

**Table 230–4** *EDIT\_DISTANCE\_SIMILARITY Function Parameters*

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

### Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
-----
returns 82
```

## JARO\_WINKLER Function

This function calculates the measure of agreement between two strings.

### Syntax

```
UTL_MATCH.JARO_WINKLER (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN BINARY_DOUBLE;
```

### Parameters

**Table 230–5 JARO\_WINKLER Function Parameters**

Parameter	Description
s1	Input
s2	input

### Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 9.818E-001
```

## JARO\_WINKLER\_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

### Syntax

```
UTL_MATCH.JARO_WINKLER (  
    s1 IN VARCHAR2,  
    s2 IN VARCHAR2)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 230–6** *JARO\_WINKLER Function Parameters*

Parameter	Description
s1	Input
s2	input

### Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;  
-----  
returns 98
```

The UTL\_NLA package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs.

This chapter contains the following topics:

- [Using UTL\\_NLA](#)
  - Overview
  - Rules and Limits
  - Security Model
- [Subprogram Groups](#)
  - BLAS Level 1 (Vector-Vector Operations) Subprograms
  - BLAS Level 2 (Matrix-Vector Operations) Subprograms
  - BLAS Level 3 (Matrix-Matrix Operations) Subprograms
  - LAPACK Driver Routines (Linear Equations) Subprograms
  - LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
- [Summary of UTL\\_NLA Subprograms](#)

## Using UTL\_NLA

This section contains topics which relate to using the UTL\_NLA package.

- [Overview](#)
- [Rules and Limits](#)
- [Security Model](#)

## Overview

The UTL\_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage )(Version 3.0) operations on vectors and matrices represented as VARRAYS.

### Standards

For more information on the BLAS and LAPACK standards see

<http://www.netlib.org/blas/>

<http://www.netlib.org/lapack/>

### Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

### Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the `BLAS_` prefix (for example, the [BLAS\\_ASUM Functions](#)). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the `LAPACK_` prefix (for example, the [LAPACK\\_GBSV Procedures](#)). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all `/work/` arguments have been removed. The UTL\_NLA package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, `pack`, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

## Rules and Limits

Vectors and matrices are stored in `VARRAYs` with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size  $R \times C \leq 1,000,000$ .

## Security Model

The UTL\_NLA package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

---

## Subprogram Groups

- [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#)
- [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#)
- [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)
- [LAPACK Driver Routines \(Linear Equations\) Subprograms](#)
- [LAPACK Driver Routines \(LLS and Eigenvalue Problems\) Subprograms](#)

## BLAS Level 1 (Vector-Vector Operations) Subprograms

**Table 231-1** *BLAS Level 1 (Vector-Vector Operations) Subprograms*

<b>Subprogram</b>	<b>Description</b>
<a href="#">BLAS_ASUM Functions</a> on page 231-18	Computes the sum of the absolute values of the vector components
<a href="#">BLAS_AXPY Procedures</a> on page 231-19	Copies $\alpha X + Y$ into vector $Y$
<a href="#">BLAS_COPY Procedures</a> on page 231-20	Copies the contents of vector $X$ to vector $Y$
<a href="#">BLAS_DOT Functions</a> on page 231-21	Returns the dot (scalar) product of two vectors $X$ and $Y$
<a href="#">BLAS_IAMAX Functions</a> on page 231-31	Computes the index of the first element of a vector that has the largest absolute value
<a href="#">BLAS_NRM2 Functions</a> on page 231-32	Computes the vector 2-norm (Euclidean norm)
<a href="#">BLAS_ROT Procedures</a> on page 231-33	Returns the plane rotation of points
<a href="#">BLAS_ROTG Procedures</a> on page 231-34	Returns the Givens rotation of points
<a href="#">BLAS_SCAL Procedures</a> on page 231-35	Scales a vector by a constant
<a href="#">BLAS_SWAP Procedures</a> on page 231-44	Swaps the contents of two vectors each of size $n$

## BLAS Level 2 (Matrix-Vector Operations) Subprograms

**Table 231–2** *BLAS Level 2 (Matrix-Vector Operations) Subprograms*

Subprogram	Description
<a href="#">BLAS_GBMV Procedures</a> on page 231-22	Performs the matrix-vector operation $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ band matrix, with $k_l$ sub-diagonals and $k_u$ super-diagonals
<a href="#">BLAS_GEMV Procedures</a> on page 231-27	Performs the matrix-vector operations $y := \alpha A x + \beta y$ or $y := \alpha A' x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ matrix
<a href="#">BLAS_GER Procedures</a> on page 231-29	Performs a rank 1 operation $A := \alpha x y' + A$ where $\alpha$ is a scalar, $x$ is an $m$ element vector, $y$ is an $n$ element vector and $A$ is an $m$ by $n$ matrix
<a href="#">BLAS_SBMV Procedures</a> on page 231-42	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals
<a href="#">BLAS_SPMV Procedures</a> on page 231-36	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form
<a href="#">BLAS_SPR Procedures</a> on page 231-38	Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form
<a href="#">BLAS_SPR2 Procedures</a> on page 231-40	Performs a symmetric rank 2 operation $A := \alpha x y' + \alpha y x' + A$ where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form
<a href="#">BLAS_SBMV Procedures</a> on page 231-42	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals
<a href="#">BLAS_SYMV Procedures</a> on page 231-47	Performs a matrix-vector operation $y := \alpha A x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_SYR Procedures</a> on page 231-49	Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_SYR2 Procedures</a> on page 231-51	Performs a symmetric rank 2 operation $A := \alpha x y' + \alpha y x' + A$ where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix
<a href="#">BLAS_TBMV Procedures</a> on page 231-58	Performs a matrix-vector operation $x := A x$ or $A' x = b$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals
<a href="#">BLAS_TBSV Procedures</a> on page 231-60	Solves one of the systems of equation $A x = b$ or $A' x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals

**Table 231-2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">BLAS_TPMV Procedures</a> on page 231-62	Performs a matrix-vector operation $x := A*x$ or $x := A' *x$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form
<a href="#">BLAS_TPSV Procedures</a> on page 231-64	Solves one of the systems of equation $A*x = b$ or $A' *x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form
<a href="#">BLAS_TRMV Procedures</a> on page 231-69	Performs a matrix-vector operation $x := A*x$ or $x := A' *x$ where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix
<a href="#">BLAS_TRSV Procedures</a> on page 231-74	Solves one of the systems of equation $A*x = b$ or $A' *x = b$ where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix

## BLAS Level 3 (Matrix-Matrix Operations) Subprograms

**Table 231–3** *BLAS Level 3 (Matrix-Matrix Operations) Subprograms*

Subprogram	Description
<a href="#">BLAS_GEMM Procedures</a> on page 231-27	Performs one of the matrix-vector operations $C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$ where $\text{op}(X)$ is one of $\text{op}(X) = X$ or $\text{op}(X) = X'$ where $\alpha$ and $\beta$ are scalars, and $A$ , $B$ and $C$ are matrices, with $\text{op}(A)$ an $m$ by $k$ matrix, $\text{op}(B)$ a $k$ by $n$ matrix and $C$ an $m$ by $n$ matrix
<a href="#">BLAS_SYMM Procedures</a> on page 231-45	Performs one of the matrix-vector operations $C := \alpha * A * B + \beta * C$ or $C := \alpha * B * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $A$ is a symmetric matrix, and $B$ and $C$ are $m$ by $n$ matrices
<a href="#">BLAS_SYR2K Procedures</a> on page 231-53	Performs one of the symmetric rank2 k operations $C := \alpha * A * B' + \alpha * B * A' + \beta * C$ or $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ and $B$ are $n$ by $k$ matrices in the first case and $k$ by $n$ matrices in the second case
<a href="#">BLAS_SYRK Procedures</a> on page 231-56	Performs one of the symmetric rank k operations $C := \alpha * A * A' + \beta * C$ or $C := \alpha * A' * A + \beta * C$ where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ is an $n$ by $k$ matrix in the first case and a $k$ by $n$ matrix in the second case
<a href="#">BLAS_TRMM Procedures</a> on page 231-66	Performs one of the matrix-vector operations $B := \alpha * \text{op}(A) * B$ or $B := \alpha * B * \text{op}(A)$ where $\alpha$ is a scalar, $B$ is an $m$ by $n$ matrix, $A$ is a unit, or non-unit, upper or lower triangular matrix and $\text{op}(A)$ is one of two alternatives
<a href="#">BLAS_TRSM Procedures</a> on page 231-71	Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where $\alpha$ is a scalar, $X$ and $B$ are $m$ by $n$ matrices, $A$ is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix $X$ is overwritten on $B$

## LAPACK Driver Routines (Linear Equations) Subprograms

**Table 231–4** LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
<a href="#">LAPACK_GBSV Procedures</a> on page 231-76	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .
<a href="#">LAPACK_GESV Procedures</a> on page 231-85	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .
<a href="#">LAPACK_GTSV Procedures</a> on page 231-93	This procedure solves the equation $a * x = b$ where $a$ is an $n$ by $n$ tridiagonal matrix, by Gaussian elimination with partial pivoting.
<a href="#">LAPACK_PBSV Procedures</a> on page 231-95	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite band matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_POSV Procedures</a> on page 231-97	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_PPSV Procedures</a> on page 231-99	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix stored in packed format and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .
<a href="#">LAPACK_PTSV Procedures</a> on page 231-101	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite tridiagonal matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices.
<a href="#">LAPACK_SPSV Procedures</a> on page 231-111	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix stored in packed format, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .
<a href="#">LAPACK_SYSV Procedures</a> on page 231-121	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices. The diagonal pivoting method is used to factor $A$ .

## LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

**Table 231–5 LAPACK Driver Routines (LLS and Eigenvalue Problems)**

Subprogram	Description
<a href="#">LAPACK_GEES Procedures</a> on page 231-78	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues, the real Schur form $T$ , and, optionally, the matrix of Schur vectors $Z$ . This gives the Schur factorization $A = Z^*T^*(Z^{**T})$ .
<a href="#">LAPACK_GEEV Procedures</a> on page 231-90	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues and, optionally, the left and/or right eigenvectors.
<a href="#">LAPACK_GELS Procedures</a> on page 231-80	Solves overdetermined or underdetermined real linear systems involving an $m$ by $n$ matrix $A$ , or its transpose, using a QR or LQ factorization of $A$ . It is assumed that $A$ has full rank.
<a href="#">LAPACK_GESDD Procedures</a> on page 231-82	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_GESVD Procedures</a> on page 231-87	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * \text{transpose}(V)$ .
<a href="#">LAPACK_SBEV Procedures</a> on page 231-103	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix $A$
<a href="#">LAPACK_SBEVD Procedures</a> on page 231-105	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_SPEV Procedures</a> on page 231-107	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage
<a href="#">LAPACK_SPEVD Procedures</a> on page 231-109	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_STEV Procedures</a> on page 231-113	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix $A$
<a href="#">LAPACK_STEVD Procedures</a> on page 231-115	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
<a href="#">LAPACK_SYEV Procedures</a> on page 231-117	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$
<a href="#">LAPACK_SYEVD Procedures</a> on page 231-119	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

## Summary of UTL\_NLA Subprograms

**Table 231–6 UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">BLAS_ASUM Functions</a> on page 231-18	Computes the sum of the absolute values of the vector components	BLAS Level 1 (Vector-Vector Operations) Subprograms
<a href="#">BLAS_AXPY Procedures</a> on page 231-19	Copies $\alpha X + Y$ into vector $Y$	BLAS Level 1 (Vector-Vector Operations) Subprograms
<a href="#">BLAS_COPY Procedures</a> on page 231-20	Copies the contents of vector $X$ to vector $Y$	BLAS Level 1 (Vector-Vector Operations) Subprograms
<a href="#">BLAS_DOT Functions</a> on page 231-21	Returns the dot (scalar) product of two vectors $X$ and $Y$	BLAS Level 1 (Vector-Vector Operations) Subprograms
<a href="#">BLAS_GBMV Procedures</a> on page 231-22	Performs the matrix-vector operation $y := \alpha A * x + \beta y$ or $y := \alpha A' * x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ band matrix, with $k_1$ sub-diagonals and $k_u$ super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_GEMM Procedures</a> on page 231-27	Performs one of the matrix-vector operations where $\alpha$ and $\beta$ are scalars, and $A$ , $B$ and $C$ are matrices, with $op(A)$ an $m$ by $k$ matrix, $op(B)$ a $k$ by $n$ matrix and $C$ an $m$ by $n$ matrix	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
<a href="#">BLAS_GEMV Procedures</a> on page 231-27	Performs the matrix-vector operations $y := \alpha A * x + \beta y$ or $y := \alpha A' * x + \beta y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are vectors and $A$ is an $m$ by $n$ matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_GER Procedures</a> on page 231-29	Performs a rank 1 operation $A := \alpha x * y' + A$ where $\alpha$ is a scalar, $x$ is an $m$ element vector, $y$ is an $n$ element vector and $A$ is an $m$ by $n$ matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_IAMAX Functions</a> on page 231-31	Computes the index of the first element of a vector that has the largest absolute value	BLAS Level 1 (Vector-Vector Operations) Subprograms

**Table 231–6 (Cont.) UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">BLAS_SBMV Procedures</a> on page 231-42	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric band matrix, with $k$ super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_SCAL Procedures</a> on page 231-35	Scales a vector by a constant	BLAS Level 1 (Vector-Vector Operations) Subprograms
<a href="#">BLAS_SPMV Procedures</a> on page 231-36	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_SPR Procedures</a> on page 231-38	Performs a symmetric rank 1 operation $A := \alpha * x * x' + A$ where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_SPR2 Procedures</a> on page 231-40	Performs a symmetric rank 2 operation where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_SWAP Procedures</a> on page 231-44	Swaps the contents of two vectors each of size $n$	BLAS Level 1 (Vector-Vector Operations) Subprograms
<a href="#">BLAS_SYMM Procedures</a> on page 231-45	Performs one of the matrix-vector operations where $\alpha$ and $\beta$ are scalars, $A$ is a symmetric matrix, and $B$ and $C$ are $m$ by $n$ matrices	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
<a href="#">BLAS_SYMV Procedures</a> on page 231-47	Performs a matrix-vector operation where $\alpha$ and $\beta$ are scalars, $x$ and $y$ are $n$ element vectors and $A$ is an $n$ by $n$ symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_SYR Procedures</a> on page 231-49	Performs a symmetric rank 1 operation where $\alpha$ is a real scalar, $x$ is an $n$ element vector, and $A$ is an $n$ by $n$ symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_SYR2 Procedures</a> on page 231-51	Performs a symmetric rank 2 operation where $\alpha$ is a scalar, $x$ and $y$ are $n$ element vectors, and $A$ is an $n$ by $n$ symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_SYR2K Procedures</a> on page 231-53	Performs one of the symmetric rank2 $k$ operations where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ and $B$ are $n$ by $k$ matrices in the first case and $k$ by $n$ matrices in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
<a href="#">BLAS_SYRK Procedures</a> on page 231-56	Performs one of the symmetric rank $k$ operations where $\alpha$ and $\beta$ are scalars, $C$ is an $n$ by $n$ symmetric matrix and $A$ is an $n$ by $k$ matrix in the first case and a $k$ by $n$ matrix in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
<a href="#">BLAS_TBMV Procedures</a> on page 231-58	Performs a matrix-vector operation where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms

**Table 231–6 (Cont.) UTL\_NLA Package Subprograms**

<b>Subprogram</b>	<b>Description</b>	<b>Group</b>
<a href="#">BLAS_TBSV Procedures</a> on page 231-60	Solves one of the systems of equation where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_TPMV Procedures</a> on page 231-62	Performs a matrix-vector operation where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_TPSV Procedures</a> on page 231-64	Solves one of the systems of equation where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_TRMM Procedures</a> on page 231-66	Performs one of the matrix-vector operations where $\alpha$ is a scalar, $B$ is an $m$ by $n$ matrix, $A$ is a unit, or non-unit, upper or lower triangular matrix and $op(A)$ is one of two alternatives	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_TRMV Procedures</a> on page 231-69	Performs a matrix-vector operation where $x$ is an $n$ element vector and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">BLAS_TRSM Procedures</a> on page 231-71	Performs one of the matrix-vector operations $op(A) * X = \alpha * B$ or $X * op(A) = \alpha * B$ where $\alpha$ is a scalar, $X$ and $B$ are $m$ by $n$ matrices, $A$ is a unit, or non-unit, upper or lower triangular matrix, $op(A)$ is one of two alternatives. The matrix $X$ is overwritten on $B$	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
<a href="#">BLAS_TRSV Procedures</a> on page 231-74	Solves one of the systems of equation where $b$ and $x$ are $n$ element vectors and $A$ is an $n$ by $n$ unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
<a href="#">LAPACK_GBSV Procedures</a> on page 231-76	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $n$ rhs matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .	LAPACK Driver Routines (Linear Equations) Subprograms
<a href="#">LAPACK_GEES Procedures</a> on page 231-78	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues, the real Schur form $T$ , and, optionally, the matrix of Schur vectors $Z$ . This gives the Schur factorization $A = Z * T * (Z * * T)$ .	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
<a href="#">LAPACK_GEEV Procedures</a> on page 231-90	Computes for an $n$ by $n$ real nonsymmetric matrix $A$ , the eigenvalues and, optionally, the left and/or right eigenvectors.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
<a href="#">LAPACK_GELS Procedures</a> on page 231-80	Solves overdetermined or underdetermined real linear systems involving an $m$ by $n$ matrix $A$ , or its transpose, using a QR or LQ factorization of $A$ . It is assumed that $A$ has full rank.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
<a href="#">LAPACK_GESDD Procedures</a> on page 231-82	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

**Table 231–6 (Cont.) UTL\_NLA Package Subprograms**

Subprogram	Description	Group
<a href="#">LAPACK_GESV Procedures</a> on page 231-85	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor $A$ .	LAPACK Driver Routines (Linear Equations) Subprograms
<a href="#">LAPACK_GESVD Procedures</a> on page 231-87	Computes the singular value decomposition (SVD) of a real $m$ by $n$ matrix $A$ , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * transpose(V)$ .	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
<a href="#">LAPACK_GTSV Procedures</a> on page 231-93	This procedure solves the equation $a * x = b$ where $a$ is an $n$ by $n$ tridiagonal matrix, by Gaussian elimination with partial pivoting.	LAPACK Driver Routines (Linear Equations) Subprograms
<a href="#">LAPACK_PBSV Procedures</a> on page 231-95	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite band matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .	LAPACK Driver Routines (Linear Equations) Subprograms
<a href="#">LAPACK_POSV Procedures</a> on page 231-97	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .	LAPACK Driver Routines (Linear Equations) Subprograms
<a href="#">LAPACK_PPSV Procedures</a> on page 231-99	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite matrix stored in packed format and $x$ and $b$ are $n$ by $nrhs$ matrices. The Cholesky decomposition is used to factor $A$ .	LAPACK Driver Routines (Linear Equations) Subprograms
<a href="#">LAPACK_PTSSV Procedures</a> on page 231-101	This procedure computes the solution to a real system of linear equations $a * x = b$ where $a$ is an $n$ by $n$ symmetric positive definite tridiagonal matrix, and $x$ and $b$ are $n$ by $nrhs$ matrices.	LAPACK Driver Routines (Linear Equations) Subprograms
<a href="#">LAPACK_SBEV Procedures</a> on page 231-103	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix $A$	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
<a href="#">LAPACK_SBEVD Procedures</a> on page 231-105	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
<a href="#">LAPACK_SPEV Procedures</a> on page 231-107	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
<a href="#">LAPACK_SPEVD Procedures</a> on page 231-109	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix $A$ in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

## BLAS\_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_ASUM (
  n      IN      POSITIVEN,
  x      IN      UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_ASUM (
  n      IN      POSITIVEN,
  alpha  IN      SCALAR_DOUBLE,
  x      IN      UTL_NLA_ARRAY_FLT)
RETURN BINARY_FLOAT
```

### Parameters

**Table 231–7** *BLAS\_ASUM Function Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs( incx ) )
incx	Specifies the increment for the elements of x. incx must not be zero.

## BLAS\_AXPY Procedures

This procedure copies  $\alpha X + Y$  into vector  $Y$ .

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_AXPY (
  n      IN      POSITIVEN,
  alpha  IN      SCALAR_DOUBLE,
  x      IN      UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN,
  y      IN OUT  UTL_NLA_ARRAY_DBL,
  incy   IN      POSITIVEN);
```

```
UTL_NLA.BLAS_AXPY (
  n      IN      POSITIVEN,
  alpha  IN      SCALAR_DOUBLE,
  x      IN      UTL_NLA_ARRAY_FLT,
  incx   IN      POSITIVEN,
  y      IN OUT  UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVEN);
```

### Parameters

**Table 231–8** *BLAS\_AXPY Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors $x$ and $y$ . $n$ must be at least zero.
alpha	Specifies the scalar $\alpha$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$
incx	Specifies the increment for the elements of $x$ . $\text{incx}$ must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$
incy	Specifies the increment for the elements of $y$ . $\text{incy}$ must not be zero.

## BLAS\_COPY Procedures

This procedure copies the contents of vector X to vector Y.

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_COPY (
    n      IN      POSITIVEN,
    x      IN      UTL_NLA_ARRAY_DBL,
    incx   IN      POSITIVEN,
    y      IN OUT  UTL_NLA_ARRAY_DBL,
    incy   IN      POSITIVEN);
```

```
UTL_NLA.BLAS_COPY (
    n      IN      POSITIVEN,
    x      IN      UTL_NLA_ARRAY_FLT,
    incx   IN      POSITIVEN,
    y      IN OUT  UTL_NLA_ARRAY_FLT,
    incy   IN      POSITIVEN);
```

### Parameters

**Table 231–9** *BLAS\_COPY Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs( incx ) )
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs( incy ) )
incy	Specifies the increment for the elements of y. incy must not be zero.

## BLAS\_DOT Functions

This function returns the dot (scalar) product of two vectors  $X$  and  $Y$ .

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_DOT (
  n      IN   POSITIVEN,
  x      IN   UTL_NLA_ARRAY_DBL,
  incx   IN   POSITIVEN,
  y      IN   UTL_NLA_ARRAY_DBL,
  incy   IN   POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_DOT (
  n      IN   POSITIVEN,
  x      IN   UTL_NLA_ARRAY_FLT,
  incx   IN   POSITIVEN,
  y      IN   UTL_NLA_ARRAY_FLT,
  incy   IN   POSITIVEN)
RETURN BINARY_FLOAT;
```

### Parameters

**Table 231–10** *BLAS\_DOT Function Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors $x$ and $y$ . $n$ must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs( incx ) )
incx	Specifies the increment for the elements of $x$ . $incx$ must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs( incy ) )
incy	Specifies the increment for the elements of $y$ . $incy$ must not be zero.

## BLAS\_GBMV Procedures

This procedure performs one of the matrix-vector operations

$$y := \alpha * A * x + \beta * y$$

or

$$y := \alpha * A' * x + \beta * y$$

where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are vectors and  $A$  is an  $m$  by  $n$  band matrix, with  $k_l$  sub-diagonals and  $k_u$  super-diagonals.

**See Also:** [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 231-8 for other subprograms in this group

### Syntax

```

    a     IN      UTL_NLA_ARRAY_FLT,
    lda   IN      POSITIVEN,
    x     IN      UTL_NLA_ARRAY_FLT,
    incx  IN      POSITIVEN,
    beta  IN      SCALAR_FLOAT,
    y     IN OUT  UTL_NLA_ARRAY_FLT,
    incy  IN      POSITIVEN,
    pack  IN      flag DEFAULT 'C');

```

## Parameters

**Table 231–11** *BLAS\_GBMV Procedure Parameters*

Parameter	Description
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>■ trans = 'N' or 'n' := <math>\alpha * A * x + \beta * y</math></li> <li>■ trans = 'T' or 't' := <math>\alpha * A^T * x + \beta * y</math></li> <li>■ trans = 'C' or 'c' := <math>\alpha * A^H * x + \beta * y</math></li> </ul>
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
k1	Specifies the number of sub-diagonals of the matrix A. k1 must satisfy $0 \leq k1$ .
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy $0 \leq ku$ .
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). <p>Before entry, the leading <math>(k1 + ku + 1)</math> by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row <math>(ku+1)</math> of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row <math>(ku+2)</math>, and so on.</p> <p>Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.</p>
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $(k1+ku+1)$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(incx))$ when trans = 'N' or 'n' and at least $(1 + (m - 1) * \text{abs}(incx))$ otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(incy))$ when trans = 'N' or 'n' and at least $(1 + (n - 1) * \text{abs}(incy))$ otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.

**Table 231–11 (Cont.) BLAS\_GBMV Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>pack</code>	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"><li>▪ 'C': column-major (default)</li><li>▪ 'R': row-major</li></ul>

## BLAS\_GEMM Procedures

This procedure performs one of the matrix-matrix operations

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$$

where  $\text{op}(X)$  is one of

$\text{op}(X) = X$

or

$\text{op}(X) = X'$

where  $\alpha$  and  $\beta$  are scalars, and  $A$ ,  $B$  and  $C$  are matrices, with  $\text{op}(A)$  an  $m$  by  $k$  matrix,  $\text{op}(B)$  a  $k$  by  $n$  matrix and  $C$  an  $m$  by  $n$  matrix.

**See Also:** [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#)  
on page 231-10 for other subprograms in this group

### Syntax

```

## Parameters

**Table 231–12** *BLAS\_GEMM Procedure Parameters*

Parameter	Description
transa	Specifies the form of $\text{op}(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n': <math>\text{op}(A) = A</math></li> <li>transa = 'T' or 't': <math>\text{op}(A) = A^T</math></li> <li>transa = 'C' or 'c': <math>\text{op}(A) = A^C</math></li> </ul>
transb	Specifies the form of $\text{op}(B)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transb = 'N' or 'n': <math>\text{op}(B) = B</math></li> <li>transb = 'T' or 't': <math>\text{op}(B) = B^T</math></li> <li>transb = 'C' or 'c': <math>\text{op}(B) = B^C</math></li> </ul>
m	Specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix $C$ . $m$ must be at least zero.
n	Specifies the number of columns of the matrix $\text{op}(B)$ and of the matrix $C$ . $n$ must be at least zero.
k	Specifies the rows of the matrix $\text{op}(A)$ and the number of columns of the matrix $\text{op}(B)$ . $k$ must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least $\max(1, k)$ .
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = 'N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the array b must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least $\max(1, n)$ .
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the arrayC is overwritten by the m by n matrix $(\alpha * \text{op}(A) * \text{op}(B) + \beta * C)$ .
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, m)$ .
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>'C': column-major (default)</li> <li>'R': row-major</li> </ul>

## BLAS\_GEMV Procedures

This procedure performs one of the matrix-vector operations

$$y := \alpha * A * x + \beta * y$$

or

$$y := \alpha * A' * x + \beta * y$$

where alpha and beta are scalars, x and y are vectors and A is an m by n matrix.

**See Also:** [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 231-8 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_GEMV (

  y      IN OUT UTL_NLA_ARRAY_FLT,
  incy   IN    POSITIVEN,
  pack   IN    flag DEFAULT 'C');
```

### Parameters

**Table 231–13** *BLAS\_GEMV Procedure Parameters*

Parameter	Description
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>■ trans = 'N' or 'n', <math>y := \alpha * A * x + \beta * y</math></li> <li>■ trans = 'T' or 't', <math>y := \alpha * A' * x + \beta * y</math></li> <li>■ trans = 'C' or 'c', <math>y := \alpha * A * x + \beta * y</math></li> </ul>
m	Specifies the number of rows of the matrix A. m must be at least zero.

**Table 231–13 (Cont.) BLAS\_GEMV Procedure Parameters**

Parameter	Description
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, m).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ when trans = 'N' or 'n' and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ when trans = 'N' or 'n' and at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_GER Procedures

This procedure performs the rank 1 operation

$$A := \alpha * x * y' + A$$

where  $\alpha$  is a scalar,  $x$  is an  $m$  element vector,  $y$  is an  $n$  element vector and  $A$  is an  $m$  by  $n$  matrix.

**See Also:** [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 231-8 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_GER (
  m      IN      POSITIVEN,
  n      IN      POSITIVEN,
  alpha  IN      SCALAR_DBL,
  x      IN OUT  UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN,
  y      IN      UTL_NLA_ARRAY_DBL,

  a      IN OUT  UTL_NLA_ARRAY_FLT,
  lda    IN      POSITIVEN,
  pack   IN      flag DEFAULT 'C');
```

### Parameters

**Table 231–14** *BLAS\_GER Procedure Parameters*

Parameter	Description
$m$	Specifies the number of rows of the matrix $A$ . $m$ must be at least zero.
$n$	Specifies the number of columns of the matrix $A$ . $n$ must be at least zero.
$\alpha$	Specifies the scalar $\alpha$ .
$x$	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( m - 1 ) * \text{abs}( \text{incx} ) )$ Before entry, the incremented array $X$ must contain the $m$ element vector $x$ .
$\text{incx}$	Specifies the increment for the elements of $x$ . $\text{incx}$ must not be zero.

**Table 231–14 (Cont.) BLAS\_GER Procedure Parameters**

Parameter	Description
y	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least  <math>( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )</math></p> <p>Before entry, the incremented array Y must contain the m element vector y.</p>
incy	<p>Specifies the increment for the elements of y. incx must not be zero.</p>
a	<p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n).</p> <p>Before entry, the leading m by n part of the array a must contain the matrix of coefficients. On exit, a is overwritten by the updated matrix.</p>
lda	<p>Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least  <math>\text{max}( 1, m )</math></p>
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_IAMAX (
  n      IN  POSITIVEN,
  x      IN  UTL_NLA_ARRAY_DBL,
  incx   IN  POSITIVEN,
  RETURN POSITIVEN;
```

```
UTL_NLA.BLAS_IAMAX (
  n      IN  POSITIVEN,
  x      IN  UTL_NLA_ARRAY_FLT,
  incx   IN  POSITIVEN,
  RETURN POSITIVEN;
```

### Parameters

**Table 231–15** *BLAS\_IAMAX Function Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least ( 1 + ( n - 1 ) * abs( incx ) )
incx	Specifies the increment for the elements of x. incx must not be zero.

## BLAS\_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_NRM2 (
    n      IN      POSITIVEN,
    x      IN      UTL_NLA_ARRAY_DBL,
    incx   IN      POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_NRM2 (
    n      IN      POSITIVEN,
    x      IN      UTL_NLA_ARRAY_FLT,
    incx   IN      POSITIVEN)
RETURN BINARY_FLOAT;
```

### Parameters

**Table 231–16** *BLAS\_NRM2 Function Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least ( 1 + ( n - 1 ) * abs ( incx ) )
incx	Specifies the increment for the elements of x. incx must not be zero.

## BLAS\_ROT Procedures

This procedure returns the plane rotation of points.

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_ROT (
  n      IN      POSITIVEN,
  x      IN OUT  UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN,
  y      IN OUT  UTL_NLA_ARRAY_DBL,
  incy   IN      POSITIVEN,
  c      IN      SCALAR_DOUBLE,
  s      IN      SCALAR_DOUBLE) ;
```

```
UTL_NLA.BLAS_ROT (
  n      IN      POSITIVEN,
  x      IN OUT  UTL_NLA_ARRAY_FLT,
  incx   IN      POSITIVEN,
  y      IN OUT  UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVEN,
  c      IN      SCALAR_DOUBLE,
  s      IN      SCALAR_DOUBLE) ;
```

### Parameters

**Table 231–17** *BLAS\_ROT Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1+(n-1) * \text{abs}(\text{incx}))$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1+(n-1) * \text{abs}(\text{incy}))$
incy	Specifies the increment for the elements of y. incy must not be zero.
c	SCALAR_FLOAT/DOUBLE.Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE.Specifies the scalar S.

## BLAS\_ROTG Procedures

This procedure returns the Givens rotation of points.

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_ROTG (
  a  IN OUT  SCALAR_DOUBLE,
  b  IN OUT  SCALAR_DOUBLE,
  c  IN OUT  SCALAR_DOUBLE,
  s  IN OUT  SCALAR_DOUBLE);
```

```
UTL_NLA.BLAS_ROTG (
  a  IN OUT  SCALAR_FLOAT,
  b  IN OUT  SCALAR_FLOAT,
  c  IN OUT  SCALAR_FLOAT,
  s  IN OUT  SCALAR_FLOAT);
```

### Parameters

**Table 231–18** *BLAS\_ROT G Procedure Parameters*

Parameter	Description
a	SCALAR_FLOAT/DOUBLE. Specifies the scalar A.
b	SCALAR_FLOAT/DOUBLE. Specifies the scalar B.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

## BLAS\_SCAL Procedures

This procedure scales a vector by a constant.

**See Also:** [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 231-7 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_SCAL (
  n      IN  POSITIVEN,
  alpha  IN  SCALAR_DOUBLE,
  x      IN  OUT UTL_NLA_ARRAY_DBL,
  incx   IN  POSITIVEN);
```

```
UTL_NLA.BLAS_SCAL (
  n      IN  POSITIVEN,
  alpha  IN  SCALAR_FLOAT,
  x      IN  OUT UTL_NLA_ARRAY_FLT,
  incx   IN  POSITIVEN);
```

### Parameters

**Table 231–19** *BLAS\_SCAL Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$
incx	Specifies the increment for the elements of x. incx must not be zero.

## BLAS\_SPMV Procedures

This procedure performs the matrix-vector operation

$$y := \alpha * A * x + \beta * y$$

where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are  $n$  element vectors and  $A$  is an  $n$  by  $n$  symmetric matrix, supplied in packed form.

**See Also:** [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 231-8 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_SPMV (
    uplo    IN        flag,
    n       IN        POSITIVEN,
    alpha   IN        SCALAR_DOUBLE,
    ap      IN        UTL_NLA_ARRAY_DBL,
    x       IN        UTL_NLA_ARRAY_DBL,
    incx    IN        POSITIVEN,
    beta    IN        SCALAR_DOUBLE,
    y       IN OUT    UTL_NLA_ARRAY_DBL,
    incy    IN        POSITIVEN,
    pack    IN        flag DEFAULT 'C');
```

```
UTL_NLA.BLAS_SPMV (
    uplo    IN        flag,
    n       IN        POSITIVEN,
    alpha   IN        SCALAR_FLOAT,
    ap      IN        UTL_NLA_ARRAY_FLT,
    x       IN        UTL_NLA_ARRAY_FLT,
    incx    IN        POSITIVEN,
    beta    IN        SCALAR_FLOAT,
    y       IN OUT    UTL_NLA_ARRAY_FLT,
    incy    IN        POSITIVEN,
    pack    IN        flag DEFAULT 'C');
```

### Parameters

**Table 231–20** *BLAS\_SPMV Procedure Parameters*

Parameter	Description
uplo	Specifies the upper or lower triangular part of the matrix $A$ is supplied in the packed array $AP$ : <ul style="list-style-type: none"> <li>■ uplo = 'U' or 'u'. The upper triangular part of <math>A</math> is supplied in <math>AP</math>.</li> <li>■ uplo = 'L' or 'l'. The lower triangular part of <math>A</math> is supplied in <math>AP</math>.</li> </ul>
n	Specifies the order of the matrix $A$ . $n$ must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar $\alpha$ .

**Table 231–20 (Cont.) BLAS\_SPMV Procedure Parameters**

Parameter	Description
ap	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least <math>((n*(n+1))/2)</math></p> <p>Before entry with <code>uplo = 'U'</code> or <code>'u'</code>, the array <code>ap</code> must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>a(1,1)</code>, <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(1,2)</code> and <code>a(2,2)</code> respectively, and so on.</p> <p>Before entry with <code>uplo = 'L'</code> or <code>'l'</code>, the array <code>ap</code> must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>a(2,1)</code> and <code>ap(3)</code> contain <code>a(3,1)</code> and <code>a(3,2)</code> respectively, and so on.</p>
x	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least <math>(1+(n-1)*abs(incx))</math></p> <p>Before entry, the incremented array <code>X</code> must contain the <code>n</code> element vector <code>x</code>.</p>
incx	Specifies the increment for the elements of <code>x</code> . Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar <code>beta</code> . When <code>beta</code> is supplied as zero then <code>Y</code> need not be set on input.
y	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least <math>(1+(n-1)*abs(incy))</math></p> <p>Before entry, the incremented array <code>Y</code> must contain the <code>n</code> element vector <code>y</code>. On exit, <code>Y</code> is overwritten by the updated vector <code>y</code>.</p>
incy	Specifies the increment for the elements of <code>y</code> . Must not be zero.
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_SPR Procedures

This procedure performs the rank 1 operation

$A := \alpha * x * x' + A$

where  $\alpha$  is a real scalar,  $x$  is an  $n$  element vector, and  $A$  is an  $n$  by  $n$  symmetric matrix, supplied in packed form.

**See Also:** [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 231-8 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_SPR (
    uplo   IN      flag,
    n      IN      POSITIVEN,
    alpha  IN      SCALAR_DBL,
    x      IN OUT  UTL_NLA_ARRAY_DBL,
    incx   IN      POSITIVEN,
    ap     IN OUT  UTL_NLA_ARRAY_DBL,
    pack   IN      flag DEFAULT 'C');
```

```
UTL_NLA.BLAS_SPR (
    uplo   IN      flag,
    n      IN      POSITIVEN,
    alpha  IN      SCALAR_FLT,
    x      IN OUT  UTL_NLA_ARRAY_FLT,
    incx   IN      POSITIVEN,
    ap     IN OUT  UTL_NLA_ARRAY_FLT,
    pack   IN      flag DEFAULT 'C');
```

### Parameters

**Table 231–21** *BLAS\_SPR Procedure Parameters*

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix $A$ is supplied in the packed array $ap$ : <ul style="list-style-type: none"> <li>uplo = 'U' or 'u': The upper triangular part of <math>A</math> is supplied in <math>ap</math>.</li> <li>uplo = 'L' or 'l': The lower triangular part of <math>A</math> is supplied in <math>ap</math>.</li> </ul>
n	Specifies the order of the matrix $A$ . $n$ must be at least zero.
alpha	Specifies the scalar $\alpha$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$ Before entry, the incremented array $X$ must contain the $m$ element vector $x$ .
incx	Specifies the increment for the elements of $x$ . $\text{incx}$ must not be zero.

**Table 231–21 (Cont.) BLAS\_SPR Procedure Parameters**

Parameter	Description
ap	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least <math>((n * (n + 1)) / 2)</math></p> <p>Before entry with <code>uplo = 'U'</code> or <code>'u'</code>, the array <code>ap</code> must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>a(1,1)</code>, <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(1,2)</code> and <code>a(2,2)</code> respectively, and so on. On exit, the array <code>ap</code> is overwritten by the upper triangular part of the updated matrix.</p> <p>Before entry with <code>uplo = 'L'</code> or <code>'l'</code>, the array <code>ap</code> must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>a(1,1)</code>, <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(2,1)</code> and <code>a(3,1)</code> respectively, and so on. On exit, the array <code>ap</code> is overwritten by the lower triangular part of the updated matrix</p>
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_SPR2 Procedures

This procedure performs the rank 2 operation

$$A := \alpha * x * y' + \alpha * y * x' + A$$

where  $\alpha$  is a scalar,  $x$  and  $y$  are  $n$  element vectors, and  $A$  is an  $n$  by  $n$  symmetric matrix, supplied in packed form.

### Parameters

**Table 231–22** *BLAS\_SPR2 Procedure Parameters*

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix $A$ is supplied in the packed array $ap$ : <ul style="list-style-type: none"> <li>■ uplo = 'U' or 'u': The upper triangular part of <math>A</math> is supplied in <math>ap</math>.</li> <li>■ uplo = 'L' or 'l': The lower triangular part of <math>A</math> is supplied in <math>ap</math>.</li> </ul>
n	Specifies the order of the matrix $A$ . $n$ must be at least zero.
alpha	Specifies the scalar $\alpha$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$ Before entry, the incremented array $X$ must contain the $m$ element vector $x$ .

**Table 231–22 (Cont.) BLAS\_SPR2 Procedure Parameters**

Parameter	Description
<code>incx</code>	Specifies the increment for the elements of <code>x</code> . <code>incx</code> must not be zero.
<code>y</code>	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incy}))$ Before entry, the incremented array <code>X</code> must contain the <code>m</code> element vector <code>y</code> .
<code>incy</code>	Specifies the increment for the elements of <code>y</code> . <code>incy</code> must not be zero.
<code>ap</code>	UTL_NLA_ARRAY_FLT/DBL of dimension at least $((n * (n+1)) / 2)$ Before entry with <code>uplo = 'U'</code> or <code>'u'</code> , the array <code>ap</code> must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>ap(1)</code> contains <code>a(1,1)</code> , <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(1,2)</code> and <code>a(2,2)</code> respectively, and so on. On exit, the array <code>ap</code> is overwritten by the upper triangular part of the updated matrix. Before entry with <code>uplo = 'L'</code> or <code>'l'</code> , the array <code>ap</code> must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>a(1,1)</code> , <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(2,1)</code> and <code>a(3,1)</code> respectively, and so on. On exit, the array <code>ap</code> is overwritten by the lower triangular part of the updated matrix
<code>lda</code>	Specifies the first dimension of <code>a</code> as declared in the calling (sub) program. <code>lda</code> must be at least $(k + 1)$ .
<code>pack</code>	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_SBMV Procedures

This procedure performs the matrix-vector operation

$$y := \alpha * A * x + \beta * y$$

where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals.

**See Also:** [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 231-8 for other subprograms in this group

### Syntax

```

    incy    IN        POSITIVEN,
    pack    IN        flag DEFAULT 'C');
```

### Parameters

**Table 231–23** *BLAS\_SBMV Procedure Parameters*

Parameter	Description
<code>uplo</code>	Specifies whether the upper or lower triangular part of the band matrix <code>A</code> is being supplied: <ul style="list-style-type: none"> <li>▪ <code>uplo = 'U'</code> or <code>'u'</code>. The upper triangular part of <code>A</code> is supplied.</li> <li>▪ <code>uplo = 'L'</code> or <code>'l'</code>. The lower triangular part of <code>A</code> is supplied.</li> </ul>
<code>n</code>	Specifies the order of the matrix <code>A</code> . <code>n</code> must be at least zero.
<code>k</code>	Specifies the number of super-diagonals of the matrix <code>A</code> . <code>k</code> must satisfy <code>0 ≤ k</code> .

**Table 231–23 (Cont.) BLAS\_SBMV Procedure Parameters**

Parameter	Description
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	<p>UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n).</p> <p>Before entry with <code>uplo = 'U' or 'u'</code>, the leading (k+1) by n part of the array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.</p> <p>Before entry with <code>uplo = 'L' or 'l'</code>, the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.</p> <p>Unchanged on exit</p>
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
x	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))</p> <p>Before entry, the incremented array X must contain the n element vector x.</p>
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
y	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy))</p> <p>Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.</p>
incy	Specifies the increment for the elements of y. Must not be zero.
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_SWAP Procedures

This procedure swaps the contents of two vectors each of size  $n$ .

### Syntax

```
UTL_NLA.BLAS_SWAP (
  n      IN      POSITIVEN,
  x      IN OUT  UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN,
  y      IN OUT  UTL_NLA_ARRAY_DBL,
  incy   IN      POSITIVEN);
```

```
UTL_NLA.BLAS_SWAP (
  n      IN      POSITIVEN,
  x      IN OUT  UTL_NLA_ARRAY_FLT,
  incx   IN      POSITIVEN,
  y      IN OUT  UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVEN);
```

### Parameters

**Table 231–24** *BLAS\_SWAP Procedure Parameters*

Parameter	Description
$n$	Specifies the number of elements of the vectors $x$ and $y$ . $n$ must be at least zero.
$x$	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$
$\text{incx}$	Specifies the increment for the elements of $x$ . $\text{incx}$ must not be zero.
$y$	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1 + (n-1) * \text{abs}(\text{incy}))$
$\text{incy}$	Specifies the increment for the elements of $y$ . $\text{incy}$ must not be zero.

## BLAS\_SYMM Procedures

This procedure performs one of the matrix-matrix operations

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*B*A + beta*C
```

where alpha and beta are scalars, A is a symmetric matrix, and B and C are m by n matrices.

**See Also:** [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#) on page 231-10 for other subprograms in this group

### Syntax

```
UTL_NLA.BLAS_SYMM (
    side   IN      flag,
    uplo   IN      flag,
    m      IN      POSITIVEN,
    n      IN      POSITIVEN,
    alpha  IN      SCALAR_DOUBLE,
    a      IN      UTL_NLA_ARRAY_DBL,
    lda    IN      POSITIVEN,
    b      IN      UTL_NLA_ARRAY_DBL,
    ldb    IN      POSITIVEN,
    beta   IN      SCALAR_DOUBLE,
    c      IN OUT  UTL_NLA_ARRAY_DBL,
    ldc    IN      POSITIVEN,
    pack   IN      flag DEFAULT 'C');
```

```
UTL_NLA.BLAS_SYMM (
    side   IN      flag,
    uplo   IN      flag,
    m      IN      POSITIVEN,
    n      IN      POSITIVEN,
    alpha  IN      SCALAR_FLOAT,
    a      IN      UTL_NLA_ARRAY_FLT,
    lda    IN      POSITIVEN,
    b      IN      UTL_NLA_ARRAY_FLT,
    ldb    IN      POSITIVEN,
    beta   IN      SCALAR_FLOAT,
    c      IN OUT  UTL_NLA_ARRAY_FLT,
    ldc    IN      POSITIVEN,
    pack   IN      flag DEFAULT 'C');
```

### Parameters

**Table 231–25** *BLAS\_SYMM Procedure Parameters*

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> <li>■ side = 'L' or 'l' : C := alpha*A*B + beta*C</li> <li>■ side = 'R' or 'r' : C := alpha*B*A + beta*C</li> </ul>

**Table 231–25 (Cont.) BLAS\_SYMM Procedure Parameters**

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>■ uplo = 'U' or 'u' : Only the upper triangular part of the symmetric matrix is to be referenced.</li> <li>■ uplo = 'L' or 'l' : Only the lower triangular part of the symmetric matrix is to be referenced.</li> </ul>
m	Specifies the number of rows of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix C. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is m when side = 'L' or 'l', and is n otherwise.  Before entry with side = 'L' or 'l', the leading m by m part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.  Before entry with side = 'R' or 'r', the n by n part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least $\max(1, m)$ , otherwise lda must be at least $\max(1, n)$ .
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n).  Before entry, the leading m by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least $\max(1, m)$ .
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, m)$ .
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_SYMV Procedures

This procedure performs the matrix-vector operation

$$y := \alpha * A * x + \beta * y$$

where  $\alpha$  and  $\beta$  are scalars,  $x$  and  $y$  are  $n$  element vectors and  $A$  is an  $n$  by  $n$  symmetric matrix.

**See Also:** [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 231-8 for other subprograms in this group

### Syntax

### Parameters

**Table 231–28** *BLAS\_SYR2 Procedure Parameters*

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array $A$ is to be referenced: <ul style="list-style-type: none"> <li>■ uplo = 'U' or 'u' : Only the upper triangular part of <math>A</math> is to be referenced.</li> <li>■ uplo = 'L' or 'l' : Only the lower triangular part of <math>A</math> is to be referenced.</li> </ul>
n	Specifies the order of the matrix $A$ . $n$ must be at least zero.
alpha	Specifies the scalar $\alpha$ .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incx} ) )$ Before entry, the incremented array $X$ must contain the $m$ element vector $x$ .

**Table 231–28 (Cont.) BLAS\_SYR2 Procedure Parameters**

Parameter	Description
<code>incx</code>	Specifies the increment for the elements of <code>x</code> . <code>incx</code> must not be zero.
<code>y</code>	UTL_NLA_ARRAY_FLT/DBL of dimension at least $( 1 + ( n - 1 ) * \text{abs}( \text{incy} ) )$ Before entry, the incremented array <code>Y</code> must contain the <code>m</code> element vector <code>y</code> .
<code>incy</code>	Specifies the increment for the elements of <code>y</code> . <code>incy</code> must not be zero.
<code>a</code>	UTL_NLA_ARRAY_FLT/DBL of DIMENSION ( <code>lda</code> , <code>n</code> ) With <code>uplo = 'U'</code> or <code>'u'</code> , the leading <code>n</code> by <code>n</code> upper triangular part of the array <code>A</code> must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of <code>A</code> is not referenced. On exit, the upper triangular part of the array <code>A</code> is overwritten by the upper triangular part of the updated matrix. With <code>uplo = 'L'</code> or <code>'l'</code> , the leading <code>n</code> by <code>n</code> lower triangular part of the array <code>A</code> must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of <code>A</code> is not referenced. On exit, the lower triangular part of the array <code>A</code> is overwritten by the lower triangular part of the updated matrix.
<code>lda</code>	Specifies the first dimension of <code>a</code> as declared in the calling (sub) program. <code>lda</code> must be at least $\text{max}( 1, n )$
<code>pack</code>	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_SYR2K Procedures

This procedure performs one of the symmetric rank2 k operations

$$C := \alpha * A * B' + \alpha * B * A' + \beta * C$$

or

$$C := \alpha * A' * B + \alpha * B' * A + \beta * C$$

where alpha and beta are scalars, C is an n by n symmetric matrix and A and B are n by k matrices in the first case and k by n matrices in the second case.

## Parameters

**Table 231–29** *BLAS\_SYR2K Procedure Parameters*

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array C is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced.</li> <li>uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced.</li> </ul>
trans	Specifies the operations to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n': <math>C := \alpha * A * B' + \alpha * B * A' + \beta * C</math></li> <li>trans = 'T' or 't': <math>C := \alpha * A' * B + \alpha * B' * A + \beta * C</math></li> <li>trans = 'C' or 'c': <math>C := \alpha * A' * B + \alpha * B' * A + \beta * C</math></li> </ul>
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrices A and B. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrices A and B. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where kb is k when trans = 'N' or 'n', and is n otherwise.  Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at least $\max(1, n)$ , otherwise lda must be at least $\max(1, k)$ .
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is k when trans = 'N' or 'n', and is n otherwise.  Before entry with trans = 'N' or 'n', the leading n by k part of the array B must contain the matrix B, otherwise the leading k by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When trans = 'N' or 'n', ldb must be at least $\max(1, n)$ , otherwise ldb must be at least $\max(1, k)$ .
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.

### Parameters

**Table 231–30** *BLAS\_SYRK Procedure Parameters*

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array C is to be referenced: <ul style="list-style-type: none"> <li>■ uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced.</li> <li>■ uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced.</li> </ul>

**Table 231–30 (Cont.) BLAS\_SYRK Procedure Parameters**

Parameter	Description
trans	Specifies the operations to be performed: <ul style="list-style-type: none"> <li>■ trans = 'N' or 'n' : <math>C := \alpha * A * A' + \beta * C</math></li> <li>■ trans = 'T' or 't' : <math>C := \alpha * A' * A + \beta * C</math></li> <li>■ trans = 'C' or 'c' : <math>C := \alpha * A' * A + \beta * C</math></li> </ul>
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrix A. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrix A. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when trans = 'N' or 'n', and is n otherwise.  Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at least $\max(1, n)$ , otherwise lda must be at least $\max(1, k)$ .
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n).  Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix.  Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, n)$ .
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_TBMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where  $x$  is an  $n$  element vector and  $A$  is an  $n$  by  $n$  unit, or non-unit, upper or lower triangular band matrix, with  $(k+1)$  diagonals.

**See Also:** [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 231-8 for other subprograms in this group

### Syntax

```

    pack   IN      flag DEFAULT 'C');
```

### Parameters

**Table 231–31** *BLAS\_TBMV Procedure Parameters*

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>■ uplo = 'U' or 'u'. A is an upper triangular matrix.</li> <li>■ uplo = 'L' or 'l'. A is a lower triangular matrix.</li> </ul>
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>■ trans = 'N' or 'n' <math>x := A*x</math></li> <li>■ trans = 'T' or 't' <math>x := A'*x</math></li> <li>■ trans = 'C' or 'c' <math>x := A'*x</math></li> </ul>

**Table 231–31 (Cont.) BLAS\_TBMV Procedure Parameters**

Parameter	Description
diag	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>■ diag = 'U' or 'u'. A is assumed to be unit triangular.</li> <li>■ diag = 'N' or 'n'. A is not assumed to be unit triangular.</li> </ul>
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>■ with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A.</li> <li>■ with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A.</li> </ul> K must satisfy $0 \leq k$ .
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION ( lda, n ). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## BLAS\_TBSV Procedures

This procedure solves one of the systems of equations

$$A*x = b$$

or

$$A'*x = b$$

where  $b$  and  $x$  are  $n$  element vectors and  $A$  is an  $n$  by  $n$  unit, or non-unit, upper or lower triangular band matrix, with  $(k+1)$  diagonals.

### Parameters

**Table 231–34** *BLAS\_TPSV Procedure Parameters*

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l' : A is a lower triangular matrix.</li> </ul>
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> <li>trans = 'N' or 'n' : <math>A*x = b</math></li> <li>trans = 'T' or 't' : <math>A'*x = b</math></li> <li>trans = 'C' or 'c' : <math>A'*x = b</math></li> </ul>
diag	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u' : A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n' : A is not assumed to be unit triangular.</li> </ul>

**Table 231–34 (Cont.) BLAS\_TPSV Procedure Parameters**

Parameter	Description
n	Specifies the order of the matrix A. n must be at least zero.
ap	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least <math>((n*(n+1))/2)</math></p> <p>Before entry with <code>uplo = 'U' or 'u'</code>, the array ap must contain the upper triangular matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>a(1,1)</code>, <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(1,2)</code> and <code>a(2,2)</code> respectively, and so on.</p> <p>Before entry with <code>uplo = 'L' or 'l'</code>, the array ap must contain the lower triangular matrix packed sequentially, column by column, so that <code>ap(1)</code> contains <code>a(1,1)</code>, <code>ap(2)</code> and <code>ap(3)</code> contain <code>a(2,1)</code> and <code>a(3,1)</code> respectively, and so on.</p> <p>Note that when <code>diag = 'U' or 'u'</code>, the diagonal elements of A are not referenced, but are assumed to be unity.</p>
x	<p>UTL_NLA_ARRAY_FLT/DBL of dimension at least <math>(1 + (n - 1) * \text{abs}(incx))</math></p> <p>Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, x is overwritten with the solution vector x.</p>
incx	Specifies the increment for the elements of x. incx must not be zero.
pack	<p>(Optional) Flags the packing of the matrices:</p> <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

## Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## BLAS\_TRMM Procedures

This procedure performs one of the matrix-matrix operations

```
B := alpha*op( A )*B
```

or

```
B := alpha*B*op( A )
```

where alpha is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

**See Also:** [BLAS Level 3 \(Matrix-Matrix Operations\) Subprograms](#) on page 231-10 for other subprograms in this group

### Syntax

```

    pack   IN      flag DEFAULT 'C');
```

## Parameters

**Table 231–35** *BLAS\_TRMM Procedure Parameters*

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> <li>side = 'L' or 'l' : <math>B := \alpha * op(A) * B</math></li> <li>side = 'R' or 'r' : <math>B := \alpha * B * op(A)</math></li> </ul>
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> <li>uplo = 'U' or 'u' : A is an upper triangular matrix.</li> <li>uplo = 'L' or 'l' : A is a lower triangular matrix.</li> </ul>
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> <li>transa = 'N' or 'n' : <math>op(A) = A</math></li> <li>transa = 'T' or 't' : <math>op(A) = A'</math></li> <li>transa = 'C' or 'c' : <math>op(A) = A'</math></li> </ul>
diag	Specifies whether or not A is unit triangular: <ul style="list-style-type: none"> <li>diag = 'U' or 'u' . A is assumed to be unit triangular.</li> <li>diag = 'N' or 'n' . A is not assumed to be unit triangular.</li> </ul>
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'.  Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced.  Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced.  Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least $\max(1, m)$ , otherwise lda must be at least $\max(1, n)$ .
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n).  Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least $\max(1, m)$ .

**Table 231–35 (Cont.) BLAS\_TRMM Procedure Parameters**

Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of A as declared in the calling (sub) program. lda must be at least max(1, n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>■ 'C': column-major (default)</li> <li>■ 'R': row-major</li> </ul>

### Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

## LAPACK\_GBSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where *a* is a band matrix of order *n* with *k*<sub>l</sub> sub diagonals and *k*<sub>u</sub> superdiagonals, and *x* and *b* are *n* by *nrhs* matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor *A* as

$$a = L * U$$

where *L* is a product of permutation and unit lower triangular matrices with *k*<sub>l</sub> sub diagonals, and *U* is upper triangular with *k*<sub>l</sub>+*k*<sub>u</sub> superdiagonals. The factored form of *a* is then used to solve the system of equations

$$a * x = b$$

**See Also:** [LAPACK Driver Routines \(Linear Equations\) Subprograms](#) on page 231-11 for other subprograms in this group

### Syntax

## LAPACK\_GEES Procedures

This procedure computes for an  $n$  by  $n$  real nonsymmetric matrix  $A$ , the eigenvalues, the real Schur form  $T$ , and, optionally, the matrix of Schur vectors  $Z$ . This gives the Schur factorization  $A = Z^*T^*(Z^*T^*)$ .

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

$$\begin{bmatrix} a & b \\ c & a \end{bmatrix}$$

where  $b*c < 0$ . The eigenvalues of such a block are  $a \pm \sqrt{bc}$ .

## LAPACK\_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an  $m$  by  $n$  matrix  $A$ , or its transpose, using a QR or LQ factorization of  $A$ . It is assumed that  $A$  has full rank.

The following options are provided:

1. If `TRANS = 'N'` and  $m \geq n$ : find the least squares solution of an overdetermined system, that is, solve the least squares problem.  

$$\text{minimize } || B - A * X ||$$
2. If `TRANS = 'N'` and  $m < n$ : find the minimum norm solution of an underdetermined system  $A * X = B$ .
3. If `TRANS = 'T'` and  $m \geq n$ : find the minimum norm solution of an underdetermined system  $A^{**T} * X = B$ .
4. If `TRANS = 'T'` and  $m < n$ : find the least squares solution of an overdetermined system, that is, solve the least squares problem  $\text{minimize } || B - A^{**T} * X ||$ .

## LAPACK\_GESDD Procedures

This procedure computes the singular value decomposition (SVD) of a real  $m$  by  $n$  matrix  $A$ , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

$$A = U * \text{SIGMA} * \text{transpose}(V)$$

where  $\text{SIGMA}$  is an  $m$  by  $n$  matrix which is zero except for its  $\min(m, n)$  diagonal elements,  $U$  is an  $m$  by  $m$  orthogonal matrix, and  $V$  is an  $n$  by  $n$  orthogonal matrix. The diagonal elements of  $\text{SIGMA}$  are the singular values of  $A$ , they are real and non-negative, and are returned in descending order. The first  $\min(m, n)$  columns of  $U$  and  $V$  are the left and right singular vectors of  $A$ .

Note that the routine returns  $V^* * T$ , not  $V$ .

## LAPACK\_GESV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where  $a$  is an  $n$  by  $n$  matrix and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor  $A$  as

$$a = P * L * U$$

where  $P$  is a permutation matrix,  $L$  is unit lower triangular, and  $U$  is upper triangular. The factored form of  $a$  is then used to solve the system of equations

$$a * x = b$$

## LAPACK\_GESVD Procedures

This procedure computes the singular value decomposition (SVD) of a real  $m$  by  $n$  matrix  $A$ , optionally computing the left and/or right singular vectors. The SVD is written

$$A = U * \text{SIGMA} * \text{transpose}(V)$$

where  $\text{SIGMA}$  is an  $m$  by  $n$  matrix which is zero except for its  $\min(m, n)$  diagonal elements,  $U$  is an  $m$  by  $m$  orthogonal matrix, and  $V$  is an  $n$  by  $n$  orthogonal matrix. The diagonal elements of  $\text{SIGMA}$  are the singular values of  $A$ , they are real and non-negative, and are returned in descending order. The first  $\min(m, n)$  columns of  $U$  and  $V$  are the left and right singular vectors of  $A$ .

Note that the routine returns  $V^{*T}$ , not  $V$ .

## LAPACK\_GEEV Procedures

This procedure computes for an  $n$  by  $n$  real nonsymmetric matrix  $A$ , the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector  $v(j)$  of  $A$  satisfies  $A * v(j) = \text{lambda}(j) * v(j)$  where  $\text{lambda}(j)$  is its eigenvalue.
- The left eigenvector  $u(j)$  of  $A$  satisfies  $u(j)**H * A = \text{lambda}(j) * u(j)**H$  where  $u(j)**H$  denotes the conjugate transpose of  $u(j)$ .

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

## LAPACK\_GTSV Procedures

This procedure solves the equation

$$a * x = b$$

where  $a$  is an  $n$  by  $n$  tridiagonal matrix, by Gaussian elimination with partial pivoting.

Note that the equation  $a' * x = b$  may be solved by interchanging the order of the arguments  $du$  and  $d1$ .

## LAPACK\_PBSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where  $a$  is an  $n$  by  $n$  symmetric positive definite band matrix and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The Cholesky decomposition is used to factor  $A$  as

$$A = U^{*T}U \text{ if } UPLO = 'U'$$

or

$$A = L * L^{*T} \text{ if } UPLO = 'L'$$

where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

## LAPACK\_PTSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where  $a$  is an  $n$  by  $n$  symmetric positive definite tridiagonal matrix, and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

$a$  is factored as  $A = L * D * L^{*T}$ , and the factored form of  $a$  is then used to solve the system of equations.

### Parameters

**Table 231–50** LAPACK\_PTSV Procedure Parameters

Parameter	Description
$n$	The order of the matrix $a$ . $N \geq 0$ .
$nrhs$	The number of right-hand sides, which is the number of columns of the matrix $b$ . $nrhs \geq 0$ .
$d$	UTL_NLA_ARRAY_FLT/DBL, DIMENSION ( $n$ ). On entry, the $n$ diagonal elements of the tridiagonal matrix $a$ . On exit, the $n$ diagonal elements of the diagonal matrix $d$ from the factorization $A = L * D * L^{*T}$ .
$e$	UTL_NLA_ARRAY_FLT/DBL, DIMENSION ( $n-1$ ). On entry, the ( $n-1$ ) subdiagonal elements of the tridiagonal matrix $a$ . On exit, the ( $n-1$ ) diagonal elements of the unit bidiagonal factor $L$ from the factorization $A = L * D * L^{*T}$ of $a$ . ( $e$ can also be regarded as the superdiagonal of the unit bidiagonal factor $U$ from the $U^{*T} * D * U$ factorization of $a$ )

**Table 231–50 (Cont.) LAPACK\_PTSV Procedure Parameters**

<b>Parameter</b>	<b>Description</b>
<code>b</code>	UTL_NLA_ARRAY_FLT/DBL, DIMENSION ( <code>ldb</code> , <code>nrhs</code> ). On entry, the <code>n</code> by <code>nrhs</code> matrix of right hand side matrix <code>b</code> . On exit, if <code>info = 0</code> , the <code>n</code> by <code>nrhs</code> solution matrix <code>X</code> .
<code>ldb</code>	The leading dimension of the array <code>b</code> . $ldb \geq \max(1, n)$
<code>info</code>	<ul style="list-style-type: none"> <li>▪ <code>= 0</code> : successful exit</li> <li>▪ <code>&lt; 0</code> : if <code>info = -i</code>, the <code>i</code>-th argument had an illegal value</li> <li>▪ <code>&gt; 0</code> : if <code>info = i</code>, the leading minor of order <code>i</code> of <code>a</code> is not positive definite, so the factorization could not be completed, and the solution has not been computed.</li> </ul>
<code>pack</code>	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> <li>▪ <code>'C'</code>: column-major (default)</li> <li>▪ <code>'R'</code>: row-major</li> </ul>

## LAPACK\_SBEV Procedures

## LAPACK\_SPSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where  $a$  is an  $n$  by  $n$  symmetric matrix stored in packed format, and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The diagonal pivoting method is used to factor  $A$  as

$$A = U * D * U^{*T}, \text{ if } UPLO = 'U'$$

or

$$A = L * D * L^{*T}, \text{ if } UPLO = 'L'$$

where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

## LAPACK\_SYSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where  $a$  is an  $n$  by  $n$  symmetric matrix, and  $x$  and  $b$  are  $n$  by  $nrhs$  matrices.

The diagonal pivoting method is used to factor  $A$  as

$$A = U * D * U^{*T}, \text{ if } UPLO = 'U'$$

or

$$A = L * D * L^{*T}, \text{ if } UPLO = 'L'$$

where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

The UTL\_RAW package provides SQL functions for manipulating RAW datatypes.

This chapter contains the following topics:

- [Using UTL\\_RAW](#)
  - Overview
  - Operational Notes
- [Summary of UTL\\_RAW Subprograms](#)

## Using UTL\_RAW

- [Overview](#)
- [Operational Notes](#)

## Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL\_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL\_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.

## Operational Notes

UTL\_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the `hextoraw` and `rawtohex` functions.

---

---

**Note:** Notes on data types:

- The `PLS_INTEGER` and `BINARY_INTEGER` data types are identical. This document uses `BINARY_INTEGER` to indicate data types in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.
  - The `INTEGER` and `NUMBER(38)` data types are also identical. This document uses `INTEGER` throughout.
- 
-

---

## Summary of UTL\_RAW Subprograms

**Table 232–1 UTL\_RAW Package Subprograms**

Subprogram	Description
<a href="#">BIT_AND Function</a> on page 232-7	Performs bitwise logical "and" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "anded" result RAW
<a href="#">BIT_COMPLEMENT Function</a> on page 232-8	Performs bitwise logical "complement" of the values in RAW <i>r</i> and returns the "complement'ed" result RAW
<a href="#">BIT_OR Function</a> on page 232-9	Performs bitwise logical "or" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "or'd" result RAW
<a href="#">BIT_XOR Function</a> on page 232-10	Performs bitwise logical "exclusive or" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "xor'd" result RAW
<a href="#">CAST_FROM_BINARY_DOUBLE Function</a> on page 232-11	Returns the RAW binary representation of a BINARY_DOUBLE value
<a href="#">CAST_FROM_BINARY_FLOAT Function</a> on page 232-13	Returns the RAW binary representation of a BINARY_FLOAT value
<a href="#">CAST_FROM_BINARY_INTEGER Function</a> on page 232-14	Returns the RAW binary representation of a BINARY_INTEGER value
<a href="#">CAST_FROM_NUMBER Function</a> on page 232-15	Returns the RAW binary representation of a NUMBER value
<a href="#">CAST_TO_BINARY_DOUBLE Function</a> on page 232-16	Casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE
<a href="#">CAST_TO_BINARY_FLOAT Function</a> on page 232-18	Casts the RAW binary representation of a BINARY_FLOAT into a BINARY_FLOAT
<a href="#">CAST_TO_BINARY_INTEGER Function</a> on page 232-20	Casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER
<a href="#">CAST_TO_NUMBER Function</a> on page 232-21	Casts the RAW binary representation of a NUMBER into a NUMBER
<a href="#">CAST_TO_NVARCHAR2 Function</a> on page 232-22	Converts a RAW value into a NVARCHAR2 value
<a href="#">CAST_TO_RAW Function</a> on page 232-23	Converts a RAW value into an NVARCHAR2 value
<a href="#">CAST_TO_VARCHAR2 Function</a> on page 232-24	Converts a VARCHAR2 value into a RAW value
<a href="#">COMPARE Function</a> on page 232-25	Compares RAW <i>r1</i> against RAW <i>r2</i>
<a href="#">CONCAT Function</a> on page 232-26	Concatenates up to 12 RAWs into a single RAW
<a href="#">CONVERT Function</a> on page 232-27	Converts RAW <i>r</i> from character set <i>from_charset</i> to character set <i>to_charset</i> and returns the resulting RAW
<a href="#">COPIES Function</a> on page 232-28	Returns <i>n</i> copies of <i>r</i> concatenated together
<a href="#">LENGTH Function</a> on page 232-29	Returns the length in bytes of a RAW <i>r</i>

**Table 232-1 (Cont.) UTL\_RAW Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">OVERLAY Function</a> on page 232-30	Overlays the specified portion of target RAW with overlay RAW, starting from byte position <code>pos</code> of target and proceeding for <code>len</code> bytes
<a href="#">REVERSE Function</a> on page 232-32	Reverses a byte sequence in RAW <code>r</code> from end to end
<a href="#">SUBSTR Function</a> on page 232-33	Returns <code>len</code> bytes, starting at <code>pos</code> from RAW <code>r</code>
<a href="#">TRANSLATE Function</a> on page 232-35	Translates the bytes in the input RAW <code>r</code> according to the bytes in the translation RAWs <code>from_set</code> and <code>to_set</code>
<a href="#">TRANSLITERATE Function</a> on page 232-37	Converts the bytes in the input RAW <code>r</code> according to the bytes in the transliteration RAWs <code>from_set</code> and <code>to_set</code>
<a href="#">XRANGE Function</a> on page 232-39	Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value <code>start_byte</code> and ending with the value <code>end_byte</code>

## BIT\_AND Function

This function performs bitwise logical "and" of the values in RAW *r1* with RAW *r2* and returns the "anded" result RAW.

### Syntax

```
UTL_RAW.BIT_AND (
    r1 IN RAW,
    r2 IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–2 BIT\_AND Function Parameters**

Parameter	Description
<i>r1</i>	RAW to "and" with <i>r2</i>
<i>r2</i>	RAW to "and" with <i>r1</i>

### Return Values

**Table 232–3 BIT\_AND Function Return Values**

Return	Description
RAW	Containing the "and" of <i>r1</i> and <i>r2</i>
NULL	Either <i>r1</i> or <i>r2</i> input parameter was NULL

### Usage Notes

If *r1* and *r2* differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## BIT\_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW *r* and returns the complement'ed result RAW. The result length equals the input RAW *r* length.

### Syntax

```
UTL_RAW.BIT_COMPLEMENT (  
  r IN RAW)  
  RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–4 BIT\_COMPLEMENT Function Parameters**

Parameter	Description
<i>r</i>	RAW to perform "complement" operation

### Return Values

**Table 232–5 BIT\_COMPLEMENT Function Return Values**

Return	Description
RAW	The "complement" of <i>r1</i>
NULL	If <i>r</i> input parameter was NULL

## BIT\_OR Function

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or'd result RAW.

### Syntax

```
UTL_RAW.BIT_OR (
  r1 IN RAW,
  r2 IN RAW)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–6 BIT\_OR Function Parameters**

Parameters	Description
r1	RAW to "or" with r2
r2	RAW to "or" with r1

### Return Values

**Table 232–7 BIT\_OR Function Return Values**

Return	Description
RAW	Containing the "or" of r1 and r2
NULL	Either r1 or r2 input parameter was NULL

### Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## BIT\_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW *r1* with RAW *r2* and returns the xor'd result RAW.

### Syntax

```
UTL_RAW.BIT_XOR (  
    r1 IN RAW,  
    r2 IN RAW)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–8 BIT\_XOR Function Parameters**

Parameter	Description
<i>r1</i>	RAW to "xor" with <i>r2</i>
<i>r2</i>	RAW to "xor" with <i>r1</i>

### Return Values

**Table 232–9 BIT\_XOR Function Return Values**

Return	Description
RAW	Containing the "xor" of <i>r1</i> and <i>r2</i>
NULL	If either <i>r1</i> or <i>r2</i> input parameter was NULL

### Usage Notes

If *r1* and *r2* differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

## CAST\_FROM\_BINARY\_DOUBLE Function

This function returns the RAW binary representation of a BINARY\_DOUBLE value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
  n          IN BINARY_DOUBLE,
  endianness IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–10 CAST\_FROM\_BINARY\_DOUBLE Function Parameters**

Parameter	Description
n	BINARY_DOUBLE value
endianness	A BINARY_INTEGER value indicating the endianness. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

### Return Values

The binary representation of the BINARY\_DOUBLE value, or NULL if the input is NULL.

### Usage Notes

- An 8-byte `binary_double` value maps to the IEEE 754 double-precision format as follows:
  - byte 0: bit 63 ~ bit 56
  - byte 1: bit 55 ~ bit 48
  - byte 2: bit 47 ~ bit 40
  - byte 3: bit 39 ~ bit 32
  - byte 4: bit 31 ~ bit 24
  - byte 5: bit 23 ~ bit 16
  - byte 6: bit 15 ~ bit 8
  - byte 7: bit 7 ~ bit 0
- The parameter `endianness` describes how the bytes of BINARY\_DOUBLE are mapped to the bytes of RAW. In the following matrix, `rb0 ~ rb7` refer to the bytes in raw and `db0 ~ db7` refer to the bytes in BINARY\_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
<b>big_endian</b>	db0	db1	db2	db3	db4	db5	db6	db7
<b>little_endian</b>	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the BINARY\_DOUBLE argument are copied straight across into the RAW return value. The effect is the same if the user

has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## CAST\_FROM\_BINARY\_FLOAT Function

This function returns the RAW binary representation of a BINARY\_FLOAT value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
  n          IN BINARY_FLOAT,
  endianness IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–11 CAST\_FROM\_BINARY\_FLOAT Function Parameters**

Parameter	Description
n	BINARY_FLOAT value
endianness	A BINARY_INTEGER value indicating the endianness. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

### Return Values

The binary representation (RAW) of the BINARY\_FLOAT value, or NULL if the input is NULL.

### Usage Notes

- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:
  - byte 0: bit 31 ~ bit 24
  - byte 1: bit 23 ~ bit 16
  - byte 2: bit 15 ~ bit 8
  - byte 3: bit 7 ~ bit 0
- The parameter `endianness` describes how the bytes of BINARY\_FLOAT are mapped to the bytes of RAW. In the following matrix, `rb0 ~ rb3` refer to the bytes in RAW and `fb0 ~ fb3` refer to the bytes in BINARY\_FLOAT.

	rb0	rb1	rb2	rb3
big_endian	fb0	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of `machine_endian`, the 4 bytes of the BINARY\_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## CAST\_FROM\_BINARY\_INTEGER Function

This function returns the RAW binary representation of a BINARY\_INTEGER value.

### Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
    n          IN BINARY_INTEGER
    endianness IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–12 CAST\_FROM\_BINARY\_INTEGER Function Parameters**

Parameter	Description
n	BINARY_INTEGER value.
endianness	A BINARY_INTEGER value indicating the endianness. The function recognizes the defined constants <code>big_endian</code> (1), <code>little_endian</code> (2), and <code>machine_endian</code> (3). The default is <code>big_endian</code> . A setting of <code>machine_endian</code> has the same effect as <code>big_endian</code> on a big endian machine, or the same effect as <code>little_endian</code> on a little endian machine.

### Return Values

The binary representation of the BINARY\_INTEGER value.

## CAST\_FROM\_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

### Syntax

```
UTL_RAW.CAST_FROM_NUMBER (  
    n IN NUMBER)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–13** *CAST\_FROM\_NUMBER Function Parameters*

Parameter	Description
n	NUMBER value

### Return Values

The binary representation of the NUMBER value.

## CAST\_TO\_BINARY\_DOUBLE Function

This function casts the RAW binary representation of a BINARY\_DOUBLE into a BINARY\_DOUBLE.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
    r          IN RAW
    endianness IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–14 CAST\_TO\_BINARY\_DOUBLE Function Parameters**

Parameter	Description
r	Binary representation of a BINARY_DOUBLE
endianness	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

### Return Values

The BINARY\_DOUBLE value.

### Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is  $-0$ ,  $+0$  is returned. If the result is NaN, the value BINARY\_DOUBLE\_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE\_ERROR exception is raised.
- An 8-byte binary\_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit 8
byte 7: bit 7 ~ bit 0
```

- The parameter endianness describes how the bytes of BINARY\_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY\_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
<b>big_endian</b>	db0	db1	db2	db3	db4	db5	db6	db7
<b>little_endian</b>	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the RAW argument are copied straight across into the BINARY\_DOUBLE return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## CAST\_TO\_BINARY\_FLOAT Function

This function casts the RAW binary representation of a BINARY\_FLOAT into a BINARY\_FLOAT.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
    r          IN RAW
    endianness IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–15 CAST\_TO\_BINARY\_FLOAT Function Parameters**

Parameter	Description
r	Binary representation of a BINARY_FLOAT
endianness	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

### Return Values

The BINARY\_FLOAT value.

### Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY\_FLOAT\_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE\_ERROR exception is raised.
- A 4-byte binary\_float value maps to the IEEE 754 single-precision format as follows:
  - byte 0: bit 31 ~ bit 24
  - byte 1: bit 23 ~ bit 16
  - byte 2: bit 15 ~ bit 8
  - byte 3: bit 7 ~ bit 0
- The parameter endianness describes how the bytes of BINARY\_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY\_FLOAT.

	rb0	rb1	rb2	rb3
<b>big_endian</b>	fb0	fb1	fb2	fb3
<b>little_endian</b>	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY\_FLOAT return value. The effect is the same if the user has

passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

## CAST\_TO\_BINARY\_INTEGER Function

This function casts the RAW binary representation of a BINARY\_INTEGER into a BINARY\_INTEGER.

### Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (  
    r          IN RAW  
    endianness IN PLS_INTEGER DEFAULT BIG_ENDIAN)  
RETURN BINARY_INTEGER;
```

### Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–16** *CAST\_TO\_BINARY\_INTEGER Function Parameters*

Parameter	Description
r	Binary representation of a BINARY_INTEGER
endianness	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

### Return Values

The BINARY\_INTEGER value

## CAST\_TO\_NUMBER Function

This function casts the RAW binary representation of a NUMBER into a NUMBER.

### Syntax

```
UTL_RAW.CAST_TO_NUMBER (  
    r IN RAW)  
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–17** *CAST\_TO\_NUMBER function Parameters*

Parameter	Description
r	Binary representation of a NUMBER

### Return Values

The NUMBER value.

## CAST\_TO\_NVARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into an NVARCHAR2 value with that number of data bytes.

---

---

**Note:** When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2 value.

---

---

### Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (  
    r IN RAW)  
RETURN NVARCHAR2;
```

### Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–18** *CAST\_TO\_NVARCHAR2 Function Parameters*

Parameter	Description
r	RAW (without leading length field) to be changed to a NVARCHAR2

### Return Values

**Table 232–19** *CAST\_TO\_NVARCHAR2 Function Return Values*

Return	Description
NVARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

## CAST\_TO\_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its data type is recast to a RAW data type.

### Syntax

```
UTL_RAW.CAST_TO_RAW (
    c IN VARCHAR2)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–20 CAST\_TO\_RAW Function Parameters**

Parameter	Description
c	VARCHAR2 to be changed to a RAW

### Return Values

**Table 232–21 CAST\_TO\_RAW Function Return Values**

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field
NULL	If c input parameter was NULL

## CAST\_TO\_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

---

---

**Note:** When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

---

---

### Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (  
    r IN RAW)  
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–22** CAST\_TO\_VARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a VARCHAR2

### Return Values

**Table 232–23** CAST\_TO\_VARCHAR2 Function Return Values

Return	Description
VARCHAR2	Containing having the same data as the input RAW
NULL	If r input parameter was NULL

## COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional pad parameter.

### Syntax

```
UTL_RAW.COMPARE (
  r1  IN RAW,
  r2  IN RAW,
  pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–24 COMPARE Function Parameters**

Parameter	Description
r1	1st RAW to be compared, may be NULL or 0 length
r2	2nd RAW to be compared, may be NULL or 0 length
pad	This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00'

### Return Values

**Table 232–25 COMPARE Function Return Values**

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte

## CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

### Syntax

```
UTL_RAW.CONCAT (  
    r1 IN RAW DEFAULT NULL,  
    r2 IN RAW DEFAULT NULL,  
    r3 IN RAW DEFAULT NULL,  
    r4 IN RAW DEFAULT NULL,  
    r5 IN RAW DEFAULT NULL,  
    r6 IN RAW DEFAULT NULL,  
    r7 IN RAW DEFAULT NULL,  
    r8 IN RAW DEFAULT NULL,  
    r9 IN RAW DEFAULT NULL,  
    r10 IN RAW DEFAULT NULL,  
    r11 IN RAW DEFAULT NULL,  
    r12 IN RAW DEFAULT NULL)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

r1....r12 are the RAW items to concatenate.

### Return Values

**Table 232–26** *CONCAT Function Return Values*

Return	Description
RAW	Containing the items concatenated

### Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

## CONVERT Function

This function converts RAW *r* from character set *from\_charset* to character set *to\_charset* and returns the resulting RAW.

Both *from\_charset* and *to\_charset* must be supported character sets defined to the Oracle server.

### Syntax

```
UTL_RAW.CONVERT (
  r           IN RAW,
  to_charset  IN VARCHAR2,
  from_charset IN VARCHAR2)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–27** *CONVERT Function Parameters*

Parameter	Description
<i>r</i>	RAW byte-string to be converted
<i>to_charset</i>	Name of Globalization Support character set to which <i>r</i> is converted
<i>from_charset</i>	Name of Globalization Support character set in which <i>r</i> is supplied

### Return Values

**Table 232–28** *CONVERT Function Return Values*

Return	Description
RAW	Byte string <i>r</i> converted according to the specified character sets.

### Exceptions

**Table 232–29** *CONVERT Function Optional Parameter*

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none"> <li>- <i>r</i> missing, NULL, or 0 length</li> <li>- <i>from_charset</i> or <i>to_charset</i> missing, NULL, or 0 length</li> <li>- <i>from_charset</i> or <i>to_charset</i> names invalid or unsupported</li> </ul>

## COPIES Function

This function returns *n* copies of *r* concatenated together.

### Syntax

```
UTL_RAW.COPIES (  
  r IN RAW,  
  n IN NUMBER)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–30 COPIES Function Parameters**

Parameters	Description
<i>r</i>	RAW to be copied
<i>n</i>	Number of times to copy the RAW (must be positive)

### Return Values

This returns the RAW copied *n* times.

### Exceptions

**Table 232–31 COPIES Function Exceptions**

Error	Description
VALUE_ERROR	Either: - <i>r</i> is missing, NULL or 0 length - <i>n</i> < 1 - Length of result exceeds maximum length of a RAW

## LENGTH Function

This function returns the length in bytes of a RAW *r*.

### Syntax

```
UTL_RAW.LENGTH (  
    r IN RAW)  
RETURN NUMBER;
```

### Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–32** LENGTH Function Parameters

Parameter	Description
<i>r</i>	RAW byte stream to be measured

### Return Values

**Table 232–33** LENGTH Function Return Values

Return	Description
NUMBER	Current length of the RAW

## OVERLAY Function

This function overlays the specified portion of target RAW with `overlay_str` RAW, starting from byte position `pos` of target and proceeding for `len` bytes.

### Syntax

```
UTL_RAW.OVERLAY (
  overlay_str IN RAW,
  target      IN RAW,
  pos         IN BINARY_INTEGER DEFAULT 1,
  len         IN BINARY_INTEGER DEFAULT NULL,
  pad         IN RAW              DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–34 OVERLAY Function Parameters**

Parameters	Description
<code>overlay_str</code>	Byte-string used to overlay target
<code>target</code>	Byte-string which is to be overlaid
<code>pos</code>	Position in target (numbered from 1) to start overlay
<code>len</code>	The number of target bytes to overlay
<code>pad</code>	Pad byte used when overlay <code>len</code> exceeds <code>overlay_str</code> length or <code>pos</code> exceeds target length

### Defaults and Optional Parameters

**Table 232–35 OVERLAY Function Optional Parameters**

Optional Parameter	Description
<code>pos</code>	1
<code>len</code>	To the length of <code>overlay_str</code>
<code>pad</code>	x'00'

### Return Values

**Table 232–36 OVERLAY Function Return Values**

Return	Description
RAW	The target byte_string overlaid as specified.

### Usage Notes

If `overlay_str` has less than `len` bytes, then it is extended to `len` bytes using the `pad` byte. If `overlay_str` exceeds `len` bytes, then the extra bytes in `overlay_str` are ignored. If `len` bytes beginning at position `pos` of target exceeds the length of target, then target is extended to contain the entire length of `overlay_str`.

If `len` is specified, it must be greater than or equal to 0. If `pos` is specified, it must be greater than or equal to 1. If `pos` exceeds the length of `target`, then `target` is padded with `pad` bytes to position `pos`, and `target` is further extended with `overlay_str` bytes.

## Exceptions

**Table 232-37** *OVERLAY Function Exceptions*

<b>Error</b>	<b>Description</b>
VALUE_ERROR	Either: <ul style="list-style-type: none"><li>- <code>Overlay_str</code> is NULL or has 0 length</li><li>- <code>Target</code> is missing or undefined</li><li>- Length of <code>target</code> exceeds maximum length of a RAW</li><li>- <code>len</code> &lt; 0</li><li>- <code>pos</code> &lt; 1</li></ul>

## REVERSE Function

This function reverses a byte sequence in RAW *r* from end to end. For example, x'0102F3' would be reversed to x'F30201', and 'xyz' would be reversed to 'zyx'. The result length is the same as the input RAW length.

### Syntax

```
UTL_RAW.REVERSE (  
    r IN RAW)  
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–38 REVERSE Function Parameters**

Parameter	Description
<i>r</i>	RAW to reverse

### Return Values

**Table 232–39 REVERSE Function Return Values**

Return	Description
RAW	Containing the "reverse" of <i>r</i>

### Exceptions

**Table 232–40 REVERSE Function Exceptions**

Error	Description
VALUE_ERROR	R is NULL or has 0 length

## SUBSTR Function

This function returns `len` bytes, starting at `pos` from RAW `r`.

### Syntax

```
UTL_RAW.SUBSTR (
  r    IN RAW,
  pos  IN BINARY_INTEGER,
  len  IN BINARY_INTEGER DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–41 SUBSTR Function Parameters**

Parameter	Description
<code>r</code>	The RAW byte-string from which a portion is extracted
<code>pos</code>	The byte position in <code>r</code> at which to begin extraction
<code>len</code>	The number of bytes from <code>pos</code> to extract from <code>r</code> (optional)

### Defaults and Optional Parameters

**Table 232–42 SUBSTR Function Exceptions**

Optional Parameter	Description
<code>len</code>	Position <code>pos</code> through to the end of <code>r</code>

### Return Values

**Table 232–43 SUBSTR Function Return Values**

Return	Description
portion of <code>r</code>	Beginning at <code>pos</code> for <code>len</code> bytes long
NULL	<code>r</code> input parameter was NULL

### Usage Notes

If `pos` is positive, then SUBSTR counts from the beginning of `r` to find the first byte. If `pos` is negative, then SUBSTR counts backward from the end of the `r`. The value `pos` cannot be 0.

If `len` is omitted, then SUBSTR returns all bytes to the end of `r`. The value `len` cannot be less than 1.

## Exceptions

**Table 232-44** *SUBSTR Function Exceptions*

<b>Error</b>	<b>Description</b>
VALUE_ERROR	VALUE_ERROR is returned if: <ul style="list-style-type: none"><li>pos = 0 or &gt; length of r</li><li>len &lt; 1 or &gt; length of r - (pos-1)</li></ul>

## TRANSLATE Function

This function translates the bytes in the input RAW *r* according to the bytes in the translation RAWs *from\_set* and *to\_set*. If a byte in *r* has a matching byte in *from\_set*, then it is replaced by the byte in the corresponding position in *to\_set*, or deleted.

Bytes in *r*, but undefined in *from\_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from\_set* is used. Subsequent duplicates are not scanned and are ignored.

### Syntax

```
UTL_RAW.TRANSLATE (
  r          IN RAW,
  from_set  IN RAW,
  to_set    IN RAW)
RETURN RAW;
```

---

**Note:** Be aware that *to\_set* and *from\_set* are reversed in the calling sequence compared to TRANSLITERATE.

---

### Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–45 TRANSLATE Function Parameters**

Parameter	Description
<i>r</i>	RAW source byte-string to be translated
<i>from_set</i>	RAW byte-codes to be translated, if present in <i>r</i>
<i>to_set</i>	RAW byte-codes to which corresponding <i>from_str</i> bytes are translated

### Return Values

**Table 232–46 TRANSLATE Function Return Values**

Return	Description
RAW	Translated byte-string

### Usage Notes

- If *to\_set* is shorter than *from\_set*, the extra *from\_set* bytes have no corresponding translation bytes. Bytes from the input RAW that match any such *from\_set* bytes are not translated or included in the result. They are effectively translated to NULL.
- If *to\_set* is longer than *from\_set*, the extra *to\_set* bytes are ignored.
- If a byte value is repeated in *from\_set*, the repeated occurrence is ignored.

---

---

**Note:** Differences from the [TRANSLITERATE Function](#):

- The `from_set` parameter comes before the `to_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are not translated or included in the result.
- The resulting RAW value may be shorter than the input RAW value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

---

---

## Exceptions

**Table 232–47** *TRANSLATE Function Exceptions*

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none"><li>- <code>r</code> is NULL or has 0 length</li><li>- <code>from_set</code> is NULL or has 0 length</li><li>- <code>to_set</code> is NULL or has 0 length</li></ul>

## TRANSLITERATE Function

This function converts the bytes in the input RAW *r* according to the bytes in the transliteration RAWs *from\_set* and *to\_set*. Successive bytes in *r* are looked up in the *from\_set*, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the *to\_set*, or the *pad* byte when no correspondence exists.

Bytes in *r*, but undefined in *from\_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from\_set* is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as *r*.

### Syntax

```
UTL_RAW.TRANSLITERATE (
  r          IN RAW,
  to_set     IN RAW DEFAULT NULL,
  from_set   IN RAW DEFAULT NULL,
  pad        IN RAW DEFAULT NULL)
RETURN RAW;
```

---

**Note:** Be aware that *to\_set* and *from\_set* are reversed in the calling sequence compared to TRANSLATE.

---

### Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–48** *TRANSLITERATE Function Parameters*

Parameter	Description
<i>r</i>	RAW input byte-string to be converted
<i>to_set</i>	RAW byte-codes to which corresponding <i>from_set</i> bytes are converted (any length)
<i>from_set</i>	RAW byte-codes to be converted, if presenting <i>r</i> (any length)
<i>pad</i>	1 byte used when <i>to_set</i> is shorter than the <i>from_set</i>

### Defaults and Optional Parameters

**Table 232–49** *TRANSLITERATE Function Optional Parameters*

Optional Parameter	Description
<i>to_set</i>	To the NULL string and effectively extended with <i>pad</i> to the length of <i>from_set</i> as necessary
<i>from_set</i>	x'00' through x'fff'
<i>pad</i>	x'00'

## Return Values

**Table 232–50** *TRANSLITERATE Function Return Values*

Return	Description
RAW	Converted byte-string.

## Usage Notes

- If `to_set` is shorter than `from_set`, the extra `from_set` bytes have no corresponding conversion bytes. Bytes from the input `RAW` that match any such `from_set` bytes are converted in the result to the pad byte instead.
- If `to_set` is longer than `from_set`, the extra `to_set` bytes are ignored.
- If a byte value is repeated in `from_set`, the repeated occurrence is ignored.

---

**Note:** Differences from the [TRANSLATE Function](#):

- The `to_set` parameter comes before the `from_set` parameter in the calling sequence.
- Bytes from `r` that appear in `from_set` but have no corresponding values in `to_set` are replaced by pad in the result.
- The resulting `RAW` value always has the same length as the input `RAW` value.

Note that `TRANSLATE` and `TRANSLITERATE` only differ in functionality when `to_set` has fewer bytes than `from_set`.

---

## Exceptions

**Table 232–51** *TRANSLITERATE Function Exceptions*

Error	Description
VALUE_ERROR	R is NULL or has 0 length

## XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the `start_byte` value is greater than the `end_byte` value, then the succession of resulting bytes begins with `start_byte`, wraps through `x'FF'` back to `x'00'`, then ends at `end_byte`.

### Syntax

```
UTL_RAW.XRANGE (
  start_byte IN RAW DEFAULT NULL,
  end_byte   IN RAW DEFAULT NULL)
RETURN RAW;
```

### Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

### Parameters

**Table 232–52 XRANGE Function Parameters**

Parameters	Description
<code>start_byte</code>	Beginning byte-code value of resulting sequence. The default is <code>x'00'</code> .
<code>end_byte</code>	Ending byte-code value of resulting sequence. The default is <code>x'FF'</code> .

### Return Values

**Table 232–53 XRANGE Function Return Values**

Return	Description
RAW	Containing succession of 1-byte hexadecimal encodings

The UTL\_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- [Using UTL\\_RECOMP](#)
  - Overview
  - Operational Notes
  - Examples
- [Summary of UTL\\_RECOMP Subprograms](#)

## Using UTL\_RECOMP

- [Overview](#)
- [Operational Notes](#)
- [Examples](#)

## Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to [RECOMP\\_PARALLEL Procedure](#).

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

## Operational Notes

- This package uses the job queue for parallel recompilation.
- This package must be run using SQL\*PLUS.
- You must be connected AS SYSDBA to run this script.
- This package expects the following packages to have been created with VALID status:
  - STANDARD (standard.sql)
  - DBMS\_STANDARD (dbmsstdx.sql)
  - DBMS\_JOB (dbmsjob.sql)
  - DBMS\_RANDOM (dbmsrand.sql)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

## Examples

Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

Recompile objects in schema JOE using the number of threads specified in the parameter JOB\_QUEUE\_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

## Summary of UTL\_RECOMP Subprograms

**Table 233–1 UTL\_RECOMP Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">RECOMP_PARALLEL Procedure</a> on page 233-7	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
<a href="#">RECOMP_SERIAL Procedure</a> on page 233-8	Recompiles invalid objects in a given schema or all invalid objects in the database

## RECOMP\_PARALLEL Procedure

This procedure uses the information exposed in the `DBA_Dependencies` view to recompile invalid objects in the database, or in a given schema, in parallel.

### Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(  
  threads IN PLS_INTEGER DEFAULT NULL,  
  schema  IN VARCHAR2     DEFAULT NULL,  
  flags   IN PLS_INTEGER DEFAULT 0);
```

### Parameters

**Table 233–2 RECOMP\_PARALLEL Procedure Parameters**

Parameter	Description
threads	The number of recompile threads to run in parallel. If <code>NULL</code> , use the value of <code>'job_queue_processes'</code> .
schema	The schema in which to recompile invalid objects. If <code>NULL</code> , all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

### Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

## RECOMP\_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

### Syntax

```
UTL_RECOMP.RECOMP_SERIAL(  
  schema IN VARCHAR2 DEFAULT NULL,  
  flags  IN PLS_INTEGER DEFAULT 0);
```

### Parameters

**Table 233–3** *RECOMP\_SERIAL Procedure Parameters*

Parameter	Description
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

The UTL\_REF package provides PL/SQL procedures to support reference-based operations. Unlike SQL, UTL\_REF procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- [Using UTL\\_REF](#)
  - Overview
  - Security Model
  - Types
  - Exceptions
- [Summary of UTL\\_REF Subprograms](#)

## Using UTL\_REF

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)

## Overview

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

## Security Model

The procedural option is needed to use this package. This package must be created under `SYS` (connect/as sysdba). Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

You can use the `UTL_REF` package from stored PL/SQL procedures/packages on the server, as well as from client-side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, `UTL_REF` verifies that the invoker has the appropriate privileges to access the object pointed to by the `REF`.

---

---

**Note:** This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

---

---

Thus, if `UTL_REF` is defined under user `SYS`, and user `A` invokes `UTL_REF.SELECT` to select an object from a reference, then user `A` (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, `UTL_REF` operates with the privileges of the client session under which the PL/SQL execution is being done.

## Types

An object type is a composite datatype defined by the user or supplied as a library type. You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (  
    name    VARCHAR2(20),  
    id      NUMBER,  
  
    member function GET_ID  
        (name VARCHAR2)  
        RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID()`.

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

## Exceptions

Exceptions can be returned during execution of `UTL_REF` functions for various reasons. For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the `UTL_REF` subprogram must have the proper privilege on the object that is being selected or modified.

**Table 234–1** *UTL\_REF Exceptions*

Exceptions	Description
<code>errnum == 942</code>	Insufficient privileges.
<code>errnum == 1031</code>	Insufficient privileges.
<code>errnum == 8177</code>	Unable to serialize, if in a serializable transaction.
<code>errnum == 60</code>	Deadlock detected.
<code>errnum == 1403</code>	No data found (if the REF is NULL, and so on.).

The `UTL_REF` package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

## Summary of UTL\_REF Subprograms

**Table 234–2 UTL\_REF Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">DELETE_OBJECT Procedure</a> on page 234-8	Deletes an object given a reference
<a href="#">LOCK_OBJECT Procedure</a> on page 234-10	Locks an object given a reference
<a href="#">SELECT_OBJECT Procedure</a> on page 234-11	Selects an object given a reference
<a href="#">UPDATE_OBJECT Procedure</a> on page 234-12	Updates an object given a reference

## DELETE\_OBJECT Procedure

This procedure deletes an object given a reference. The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

### Syntax

```
UTL_REF.DELETE_OBJECT (
    reference IN REF "<typename>");
```

### Parameters

**Table 234–3 DELETE\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to delete.

### Exceptions

May be raised.

### Examples

The following example illustrates usage of the UTL\_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address\_t and others...

```
CREATE OR REPLACE TYPE Person_t (
    name    VARCHAR2(64),
    gender  CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    BEGIN
        address := addr;
    END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under Person\_t: Simulate implementation of inheritance using a REF to Person\_t and delegation of setAddress to it.

```
    thePerson REF Person_t,
    empno     NUMBER(5),
    deptREF   Department_t,
    mgrREF    Employee_t,
    reminders StringArray_t,
```

```

MEMBER PROCEDURE setAddress(addr IN Address_t),
MEMBER procedure addReminder(reminder VARCHAR2);
);

```

```

CREATE TYPE BODY Employee_t (
MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    myMgr Employee_t;
    meAsPerson Person_t;
BEGIN

```

Update the address by delegating the responsibility to thePerson. Lock the Person object from the reference, and also select it:

```

    UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
    meAsPerson.setAddress(addr);

```

Delegate to thePerson:

```

    UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
    if mgr is NOT NULL THEN

```

Give the manager a reminder:

```

        UTL_REF.LOCK_OBJECT(mgr);
        UTL_REF.SELECT_OBJECT(mgr, myMgr);
        myMgr.addReminder
        ('Update address in the employee directory for' ||
        thePerson.name || ', new address: ' || addr.asString);
        UTL_REF.UPDATE_OBJECT(mgr, myMgr);
    END IF;
EXCEPTION
    WHEN OTHERS THEN
        errnum := SQLCODE;
        errmsg := SUBSTR(SQLERRM, 1, 200);

```

## LOCK\_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
  INTO object
  FROM object_table t
  WHERE REF(t) = reference
  FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

### Syntax

```
UTL_REF.LOCK_OBJECT (
  reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
  reference IN REF "<typename>",
  object    IN OUT "<typename>");
```

### Parameters

**Table 234–4 LOCK\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to lock.
object	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

### Exceptions

May be raised.

## SELECT\_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

### Syntax

```
UTL_REF.SELECT_OBJECT (
    reference IN REF "<typename>",
    object    IN OUT "<typename>");
```

### Parameters

**Table 234–5** *SELECT\_OBJECT Procedure Parameters*

Parameter	Description
reference	Reference to the object to select or retrieve.
object	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

### Exceptions

May be raised.

## UPDATE\_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

### Syntax

```
UTL_REF.UPDATE_OBJECT (
    reference IN REF "<typename>",
    object    IN    "<typename>");
```

### Parameters

**Table 234–6 UPDATE\_OBJECT Procedure Parameters**

Parameter	Description
reference	Reference of the object to update.
object	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

### Exceptions

May be raised.

The UTL\_SMTP package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

**See Also:** *Oracle Database Advanced Application Developer's Guide*

This chapter contains the following topics:

- [Using UTL\\_SMTP](#)
  - Overview
  - Security Model
  - Constants
  - Types
  - Reply Codes
  - Exceptions
  - Rules and Limits
  - Examples
- [Summary of UTL\\_SMTP Subprograms](#)

## Using UTL\_SMTP

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Reply Codes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)

## Overview

The UTL\_SMTP protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The UTL\_SMTP package provides interfaces to the SMTP commands. For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using UTL\_SMTP, all text data (in other words, those in VARCHAR2) are converted to US7ASCII before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte VARCHAR2 data to RAW and use the WRITE\_RAW\_DATA subprogram to send multibyte data using 8-bit MIME encoding.

UTL\_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL\_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

## Security Model

This package is an invoker's rights package. The invoking user must have the `connect` privilege granted in the access control list assigned to the remote network host to which the user must connect.

---

---

**Note:** For more information, see *Managing Fine-Grained Access in PL/SQL Packages and Types* in *Oracle Database Security Guide*

---

---

## Constants

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

The UTL\_SMTP package uses the constants shown in [Table 235-1, "UTL\\_SMTP Constants"](#).

**Table 235-1 UTL\_SMTP Constants**

Name	Type	Value	Description
ALL_SCHEMES	VARCHAR2 (256)	'CRAM-MD5 PLAIN LOGIN'	List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, PLAIN and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).
NON_CLEARTEXT_PASSWORD_SCHEMES	VARCHAR2 (256)	'CRAM-MD5'	List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.

## Types

- [CONNECTION Record Type](#)
- [REPLY, REPLIES Record Types](#)

### CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

#### Syntax

```
TYPE connection IS RECORD (
    host          VARCHAR2(255),
    port          PLS_INTEGER,
    tx_timeout    PLS_INTEGER,
    private_tcp_con utl_tcp.connection,
    private_state PLS_INTEGER);
```

#### Fields

**Table 235–2 CONNECTION Record Type Fields**

Field	Description
host	Name of the remote host when connection is established. NULL when no connection is established.
port	Port number of the remote SMTP server connected. NULL when no connection is established.
tx_timeout	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
private_tcp_con	Private, for implementation use only. You should not modify this field.
private_state	Private, for implementation use only. You should not modify this field.

#### Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the [OPEN\\_CONNECTION Functions](#). Changing the values of these fields has no effect on the connection. The fields `private_tcp_con` and `private_state` for implementation use only. You should not modify these fields.

### REPLY, REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

## Syntax

```
TYPE reply IS RECORD (  
    code    PLS_INTEGER,  
    text    VARCHAR2(508));
```

```
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
```

## Fields

**Table 235-3** *REPLY, REPLIES Record Type Fields*

Field	Description
code	3-digit reply code
text	Text message of the reply

## Reply Codes

The following is a list of the SMTP reply codes.

**Table 235–4 SMTP Reply Codes**

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; forwards to <forward-path>
252	OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF . CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.

**Table 235-4 (Cont.) SMTP Reply Codes**

<b>Reply Code</b>	<b>Meaning</b>
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

## Exceptions

The table lists the exceptions that can be raised by the interface of the UTL\_SMTP package. The network error is transferred to a reply code of 421- service not available.

**Table 235–5 UTL\_SMTP Exceptions**

---

INVALID_OPERATION	Raised when an invalid operation is made. In other words, calling API other than the <a href="#">WRITE_DATA Procedure</a> , the <a href="#">WRITE_RAW_DATA Procedure</a> or the <a href="#">CLOSE_DATA Function and Procedure</a> after the <a href="#">OPEN_DATA Function and Procedure</a> is called, or calling <code>WRITE_DATA</code> , <code>WRITE_RAW_DATA</code> or <code>CLOSE_DATA</code> without first calling <code>OPEN_DATA</code> .
TRANSIENT_ERROR	Raised when receiving a reply code in 400 range
PERMANENT_ERROR	Raised when receiving a reply code in 500 range

---

## Rules and Limits

No limitation or range-checking is imposed by the API. However, you must be aware of the following size limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

**Table 235–6 SMTP Size Limitation**

<b>Element</b>	<b>Size Limitation</b>
user	Maximum total length of a user name is 64 characters
domain	Maximum total length of a domain name or number is 64 characters
path	Maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators)
command line	Maximum total length of a command line including the command word and the <CRLF> is 512 characters
reply line	Maximum total length of a reply line including the reply code and the <CRLF> is 512 characters
text line	Maximum total length of a text line including the <CRLF> is 1000 characters (but not counting the leading dot duplicated for transparency)
recipients buffer	Maximum total number of recipients that must be buffered is 100 recipients

## Examples

The following example illustrates how UTL\_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```
DECLARE
  c UTL_SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;

BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL_SMTP.HELO(c, 'foo.com');
  UTL_SMTP.MAIL(c, 'sender@foo.com');
  UTL_SMTP.RCPT(c, 'recipient@foo.com');
  UTL_SMTP.OPEN_DATA(c);
  send_header('From',      '"Sender" <sender@foo.com>');
  send_header('To',       '"Recipient" <recipient@foo.com>');
  send_header('Subject',  'Hello');
  UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL_SMTP.CLOSE_DATA(c);
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
  BEGIN
    UTL_SMTP.QUIT(c);
  EXCEPTION
    WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
      NULL; -- When the SMTP server is down or unavailable, we don't have
            -- a connection to the server. The QUIT call raises an
            -- exception that we can ignore.
  END;
  raise_application_error(-20000,
    'Failed to send mail due to the following error: ' || sqlerrm);
END;
```

---

## Summary of UTL\_SMTP Subprograms

**Table 235–7 UTL\_SMTP Package Subprograms**

Subprogram	Description
<a href="#">AUTH Function and Procedure</a> on page 235-14	Sends the AUTH command to authenticate to the SMTP server
<a href="#">CLOSE_CONNECTION Procedure</a> on page 235-16	Closes the SMTP connection, causing the current SMTP operation to terminate
<a href="#">CLOSE_DATA Function and Procedure</a> on page 235-17	Closes the data session
<a href="#">COMMAND Function and Procedure</a> on page 235-18	Performs a generic SMTP command
<a href="#">COMMAND_REPLIES Function</a> on page 235-19	Performs a generic SMTP command and retrieves multiple reply lines
<a href="#">DATA Function and Procedure</a> on page 235-20	Sends the e-mail body
<a href="#">EHLO Function and Procedure</a> on page 235-21	Performs the initial handshake with SMTP server using the EHLO command
<a href="#">HELO Function and Procedure</a> on page 235-22	Performs the initial handshake with SMTP server using the HELO command
<a href="#">HELP Function</a> on page 235-23	Sends HELP command
<a href="#">MAIL Function and Procedure</a> on page 235-24	Initiates an e-mail transaction with the server, the destination is a mailbox
<a href="#">NOOP Function and Procedure</a> on page 235-25	NULL command
<a href="#">OPEN_CONNECTION Functions</a> on page 235-26	Opens a connection to an SMTP server
<a href="#">OPEN_DATA Function and Procedure</a> on page 235-28	Sends the DATA command
<a href="#">QUIT Function and Procedure</a> on page 235-29	Terminates an SMTP session and disconnects from the server
<a href="#">RCPT Function</a> on page 235-30	Specifies the recipient of an e-mail message
<a href="#">RSET Function and Procedure</a> on page 235-31	Terminates the current e-mail transaction
<a href="#">STARTTLS Function and Procedure</a> on page 235-32	Sends STARTTLS command to secure the SMTP connection using SSL/TLS
<a href="#">VRFY Function</a> on page 235-33	Verifies the validity of a destination e-mail address
<a href="#">WRITE_DATA Procedure</a> on page 235-34	Writes a portion of the e-mail message
<a href="#">WRITE_RAW_DATA Procedure</a> on page 235-35	Writes a portion of the e-mail message with RAW data

## AUTH Function and Procedure

This subprogram sends the AUTH command to authenticate to the SMTP server. The UTL\_SMTP package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported. To determine the schemes the SMTP server supports from its EHLO reply, the user must call the [EHLO Function and Procedure](#). Otherwise, UTL\_SMTP uses the first scheme in the list.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```

UTL_SMTP.AUTH (
  c          IN OUT NOCOPY connection,
  username   IN          VARCHAR2,
  password   IN          VARCHAR2,
  schemes    IN          VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES)
RETURN reply;

UTL_SMTP.AUTH (
  c          IN OUT NOCOPY connection,
  username   IN          VARCHAR2,
  password   IN          VARCHAR2,
  schemes    IN          VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES);

```

### Parameters

**Table 235–8 AUTH Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
username	Username
password	Password
schemes	Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTEXT_PASSWORD_SCHEMES constants for suggestions.

### Return Values

**Table 235–9 AUTH Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY</a> , <a href="#">REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL\_SMTP.

- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the `STARTTLS` command (for example, adding `PLAIN` and `LOGIN`), the caller must call the [EHLO Function and Procedure](#) again for UTL\_SMTP to update the list after the [STARTTLS Function and Procedure](#) is called.

## Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE);
  UTL_SMTP.STARTTLS(c);
  UTL_SMTP.AUTH(
    c => c,
    username => 'scott',
    password => 'password'
    schemes => utl_smtp.all_schemes);
END;
```

## CLOSE\_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session. To end the SMTP connection properly, use the [QUIT Function and Procedure](#).

### Syntax

```
UTL_SMTP.CLOSE_CONNECTION (  
    c      IN OUT NOCOPY connection);
```

### Parameters

**Table 235–10** *CLOSE\_CONNECTION Procedure Parameters*

Parameter	Description
c	SMTP connection

## CLOSE\_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF> . <CR><LF> (a single period at the beginning of a line).

### Syntax

```
UTL_SMTP.CLOSE_DATA (
    c      IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
    c      IN OUT NOCOPY connection);
```

### Parameters

**Table 235-11** *CLOSE\_DATA Function and Procedure Parameters*

Parameter	Description
c	SMTP connection

### Return Values

**Table 235-12** *CLOSE\_DATA Function and Procedure Return Values*

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.

`CLOSE_DATA` must be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of `WRITE_DATA` because the SMTP server does not respond until the data-terminator is sent during the call to `CLOSE_DATA`.

## COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

### Syntax

```
UTL_SMTP.COMMAND (
  c      IN OUT NOCOPY  connection,
  cmd    IN              VARCHAR2,
  arg    IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.COMMAND (
  c      IN OUT NOCOPY  connection,
  cmd    IN              VARCHAR2,
  arg    IN              VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 235–13** *COMMAND Function and Procedure Parameters*

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between cmd and arg.

### Return Values

**Table 235–14** *COMMAND Function and Procedure Return Values*

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

## COMMAND\_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

### Syntax

```
UTL_SMTP.COMMAND_REPLIES (
  c      IN OUT NOCOPY  connection,
  cmd   IN              VARCHAR2,
  arg   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

### Parameters

**Table 235–15** *COMMAND\_REPLIES Function Parameters*

Parameter	Description
c	SMTP connection
cmd	SMTP command to send to the server
arg	Optional argument to the SMTP argument. A space is inserted between cmd and arg.

### Return Values

**Table 235–16** *COMMAND\_REPLIES Function Return Values*

Return Value	Description
replies	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> )

### Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

## DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

### Syntax

```
UTL_SMTP.DATA (
  c      IN OUT NOCOPY connection
  body   IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;

UTL_SMTP.DATA (
  c      IN OUT NOCOPY connection
  body   IN  VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 235–17 DATA Function and Procedure Parameters**

Parameter	Description
c	SMTP Connection
body	Text of the message to be sent, including headers, in [RFC822] format

### Return Values

**Table 235–18 DATA Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY</a> , <a href="#">REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a <CR><LF> . <CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of <CR><LF> . <CR><LF> (single period) in body to <CR><LF> . . <CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA subprogram must be called only after OPEN\_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command is not returned to the caller.

## EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the EHLO command.

### Syntax

```
UTL_SMTP.EHLO (
  c          IN OUT NOCOPY connection,
  domain IN)
RETURN replies;
```

```
UTL_SMTP.EHLO (
  c          IN OUT NOCOPY connection,
  domain IN);
```

### Parameters

**Table 235–19 EHLO Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
domain	Domain name of the local (sending) host. Used for identification purposes.

### Return Values

**Table 235–20 EHLO Function and Procedure Return Values**

Return Value	Description
replies	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ).

### Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.

### Related Functions

[HELO Function and Procedure](#)

## HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the HELO command.

### Syntax

```
UTL_SMTP.HELO (
  c          IN OUT NOCOPY  connection,
  domain    IN              VARCHAR2)
RETURN reply;

UTL_SMTP.HELO (
  c          IN OUT NOCOPY  connection,
  domain    IN              VARCHAR2);
```

### Parameters

**Table 235–21 HELO Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
domain	Domain name of the local (sending) host. Used for identification purposes.

### Return Values

**Table 235–22 HELO Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to [OPEN\\_CONNECTION Functions](#) before calling this routine.

The expected response from the server is a message beginning with status code 250.

### Related Functions

[EHLO Function and Procedure](#)

## HELP Function

This function sends the HELP command.

### Syntax

```
UTL_SMTP.HELP (
  c          IN OUT NOCOPY  connection,
  command   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

### Parameters

**Table 235–23 HELP Function Parameters**

Parameter	Description
c	SMTP connection
command	Command to get the help message

### Return Values

**Table 235–24 HELP Function Return Values**

Return Value	Description
replies	Reply of the command (see <a href="#">REPLY</a> , <a href="#">REPLIES</a> Record Types)

## MAIL Function and Procedure

This subprogram initiates a mail transaction with the server. The destination is a mailbox.

### Syntax

```
UTL_SMTP.MAIL (
  c          IN OUT NOCOPY  connection,
  sender     IN             VARCHAR2,
  parameters IN             VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.MAIL (
  c          IN OUT NOCOPY  connection,
  sender     IN             VARCHAR2,
  parameters IN             VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 235–25 MAIL Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
sender	E-mail address of the user sending the message.
parameters	Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ...)".

### Return Values

**Table 235–26 MAIL Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY</a> , <a href="#">REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to `RCPT` and `DATA` to complete the transaction. The connection to the SMTP server must be open and a `HELO` or `EHLO` command must have already been sent.

The expected response from the server is a message beginning with status code 250.

## NOOP Function and Procedure

This subprogram issues the NULL command.

### Syntax

```
UTL_SMTP.NOOP (
  c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.NOOP (
  c IN OUT NOCOPY connection);
```

### Parameter

**Table 235–27 NOOP Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

### Return Values

**Table 235–28 NOOP Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with `OPEN_CONNECTION`. The `NOOP` command can be used to verify that the server is still connected and is listening properly.
- This command replies with a single line beginning with status code 250.

## OPEN\_CONNECTION Functions

These functions open a connection to an SMTP server.

---

**Note:** This functionality associated with `wallet_path`, `wallet_password` and `secure_connection_before_smtp` is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

### Syntax

```

UTL_SMTP.OPEN_CONNECTION (
    host                IN  VARCHAR2,
    port                IN  PLS_INTEGER DEFAULT 25,
    c                   OUT connection,
    tx_timeout          IN  PLS_INTEGER DEFAULT NULL,
    wallet_path         IN  VARCHAR2 DEFAULT NULL,
    wallet_password     IN  VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE)
RETURN reply;

```

```

UTL_SMTP.OPEN_CONNECTION (
    host                IN  VARCHAR2,
    port                IN  PLS_INTEGER DEFAULT 25,
    tx_timeout          IN  PLS_INTEGER DEFAULT NULL,
    wallet_path         IN  VARCHAR2 DEFAULT NULL,
    wallet_password     IN  VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp IN BOOLEAN DEFAULT FALSE)
RETURN reply;

```

### Parameters

**Table 235–29 OPEN\_CONNECTION Functions Parameters**

Parameter	Description
<code>host</code>	Name of the SMTP server host
<code>port</code>	Port number on which SMTP server is listening (usually 25)
<code>c</code>	SMTP connection
<code>tx_timeout</code>	Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
<code>wallet_path</code>	Directory path that contains the Oracle wallet for SSL/TLS. The format is file: <directory-path>
<code>wallet_password</code>	Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.
<code>secure_connection_before_smtp</code>	If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.

## Return Values

**Table 235–30 OPEN\_CONNECTION Functions Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

## Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN\_CONNECTION that returns UTL\_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of OPEN\_CONNECTION that returns REPLY.
- tx\_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx\_timeout from governing write operations in the current release.

## Examples

```

DECLARE
  c utl_smtp.connection;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION(
    host => 'smtp.example.com',
    port => 465,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => TRUE);
END;
```

## OPEN\_DATA Function and Procedure

This subprogram sends the DATA command after which you can use WRITE\_DATA and WRITE\_RAW\_DATA to write a portion of the e-mail message.

### Syntax

```
UTL_SMTP.OPEN_DATA (
    c      IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
    c      IN OUT NOCOPY connection);
```

### Parameters

**Table 235–31 OPEN\_DATA Function and Procedure Parameters**

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in RFC822 format.

### Return Values

**Table 235–32 OPEN\_DATA Function and Procedure Function Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

- The calls to OPEN\_DATA, WRITE\_DATA, WRITE\_RAW\_DATA and CLOSE\_DATA must be made in the right order. A program calls OPEN\_DATA to send the DATA command to the SMTP server. After that, it can call WRITE\_DATA or WRITE\_RAW\_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE\_DATA. After OPEN\_DATA is called, the only subprograms that can be called are WRITE\_DATA, WRITE\_RAW\_DATA, or CLOSE\_DATA. A call to other subprograms results in an INVALID\_OPERATION exception being raised.
- OPEN\_DATA must be called only after OPEN\_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

## QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

### Syntax

```
UTL_SMTP.QUIT (
    c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
    c IN OUT NOCOPY connection);
```

### Parameter

**Table 235–33** *QUIT Function and Procedure Parameters*

Parameter	Description
c	SMTP connection

### Return Values

**Table 235–34** *QUIT Function and Procedure Function Return Values*

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

The `QUIT` command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by `OPEN_CONNECTION` which must have been called before executing this command. If a mail transaction is in progress when `QUIT` is issued, it is canceled in the same manner as `RSET`.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields `REMOTE_HOST` and `REMOTE_PORT` of `c` are reset.

### Related Functions

[RSET Function and Procedure](#)

## RCPT Function

This subprogram specifies the recipient of an e-mail message.

### Syntax

```

UTL_SMTP.RCPT (
  c          IN OUT NOCOPY    connection,
  recipient  IN                VARCHAR2,
  parameters IN                VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
  c          IN OUT NOCOPY    connection,
  recipient  IN                VARCHAR2,
  parameters IN                VARCHAR2 DEFAULT NULL);

```

**Table 235–35** *RCPT Function and Procedure Parameters*

Parameter	Description
c	SMTP connection
recipient	E-mail address of the user to which the message is being sent
parameters	Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of "XXX=XXX (XXX=XXX ...)".

### Return Values

**Table 235–36** *RCPT Function and Procedure Function Return Values*

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

## RSET Function and Procedure

This subprogram terminates the current mail transaction.

### Syntax

```
UTL_SMTP.RSET (
  c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
  c IN OUT NOCOPY connection);
```

### Parameters

**Table 235–37 RSET Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

### Return Values

**Table 235–38 RSET Function and Procedure Return Values**

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

- This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN\_CONNECTION until DATA or OPEN\_DATA is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.
- The server responds to RSET with a message beginning with status code 250.

### Related Functions

[QUIT Function and Procedure](#)

## STARTTLS Function and Procedure

This subprogram sends the `STARTTLS` command to secure the SMTP connection using SSL/TLS. SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN\\_CONNECTION Functions](#).

### Syntax

```
UTL_SMTP.STARTTLS (
  c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.STARTTLS (
  c IN OUT NOCOPY connection);
```

### Parameters

**Table 235–39 STARTTLS Function and Procedure Parameters**

Parameter	Description
c	SMTP connection

### Return Values

**Table 235–40 STARTTLS Function and Procedure Return Values**

Return Value	Description
reply	SMTP reply

### Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

### Examples

```
DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE);
  utl_smtp.starttls(c);
END
```

## VERFY Function

This function verifies the validity of a destination e-mail address.

### Syntax

```
UTL_SMTP.VERFY (
  c          IN OUT NOCOPY connection
  recipient IN VARCHAR2)
RETURN reply;
```

### Parameters

**Table 235–41** *VERFY Function Parameters*

Parameter	Description
c	SMTP connection
recipient	E-mail address to be verified

### Return Values

**Table 235–42** *VERFY Function Return Values*

Return Value	Description
reply	Reply of the command (see <a href="#">REPLY, REPLIES Record Types</a> ). In cases where there are multiple replies, the last reply is returned.

### Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

## WRITE\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_DATA` appends data to the e-mail message.

### Syntax

```
UTL_SMTP.WRITE_DATA (
  c      IN OUT NOCOPY connection,
  data   IN VARCHAR2 CHARACTER SET ANY_CS);
```

### Parameters

**Table 235–43** *WRITE\_DATA Procedure Parameters*

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

### Usage Notes

- The calls to the [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF> . <CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF> . <CR><LF>` (single period) in the body to `<CR><LF> . . <CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be called only after [OPEN\\_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE\\_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE\\_DATA Function and Procedure](#).
- Text (`VARCHAR2`) data sent using `WRITE_DATA` is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension is negotiated with the SMTP server using the `EHLO` subprogram, multibyte `VARCHAR2` data can be sent by first converting the text to RAW using the `UTL_RAW` package, and then sending the RAW data using `WRITE_RAW_DATA`.

## WRITE\_RAW\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to `WRITE_RAW_DATA` appends data to the e-mail message.

### Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
  c      IN OUT NOCOPY connection
  data  IN RAW);
```

### Parameters

**Table 235–44** *WRITE\_RAW\_DATA Procedure Parameters*

Parameter	Description
c	SMTP connection
data	Portion of the text of the message to be sent, including headers, in [RFC822] format

### Usage Notes

- The calls to the [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.
- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF> . <CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF> . <CR><LF>` (single period) in the body to `<CR><LF> . . <CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.
- The [OPEN\\_DATA Function and Procedure](#), [WRITE\\_DATA Procedure](#), [WRITE\\_RAW\\_DATA Procedure](#) and [CLOSE\\_DATA Function and Procedure](#) must be called only after [OPEN\\_CONNECTION Functions](#), [HELO Function and Procedure](#), or [EHLO Function and Procedure](#), [MAIL Function and Procedure](#), and [RCPT Function](#) have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
- Note that there is no function form of the [WRITE\\_DATA Procedure](#) because the SMTP server does not respond until the data-terminator is sent during the call to [CLOSE\\_DATA Function and Procedure](#).

The UTL\_SPADV package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

This chapter contains the following topic:

- [Using UTL\\_SPADV](#)
  - Overview
  - Security Model
  - Operational Notes
- [Summary of UTL\\_SPADV Subprograms](#)

**See Also:** *Oracle Streams Concepts and Administration* for more information about this package and the Oracle Streams Performance Advisor

## Using UTL\_SPADV

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

## Overview

This package enables you to collect and analyze statistics about the performance or Oracle Streams components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Streams performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

**See Also:** *Oracle Streams Concepts and Administration*

## Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE\_CATALOG\_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

**See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

## Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Streams administrator and run the `utlspadv.sql` script in the `rdbms/admin` directory in `ORACLE_HOME`.

The `utlspadv.sql` script creates the following tables:

- [STREAMS\\$\\_PA\\_COMPONENT](#) Table
- [STREAMS\\$\\_PA\\_COMPONENT\\_LINK](#) Table
- [STREAMS\\$\\_PA\\_COMPONENT\\_PROP](#) Table
- [STREAMS\\$\\_PA\\_COMPONENT\\_STAT](#) Table
- [STREAMS\\$\\_PA\\_CONTROL](#) Table
- [STREAMS\\$\\_PA\\_DATABASE](#) Table
- [STREAMS\\$\\_PA\\_DATABASE\\_PROP](#) Table
- [STREAMS\\$\\_PA\\_MONITORING](#) Table
- [STREAMS\\$\\_PA\\_PATH\\_BOTTLENECK](#) Table
- [STREAMS\\$\\_PA\\_PATH\\_STAT](#) Table
- [STREAMS\\$\\_PA\\_SHOW\\_COMP\\_STAT](#) Table
- [STREAMS\\$\\_PA\\_SHOW\\_PATH\\_STAT](#) Table

The Oracle Streams Performance Advisor populates these tables when it is run.

**See Also:** *Oracle Streams Concepts and Administration*

### STREAMS\$\_PA\_COMPONENT Table

The `STREAMS$_PA_COMPONENT` table displays information about the Oracle Streams components at each database.

**Table 236–1** *STREAMS\$\_PA\_COMPONENT Table*

Column	Datatype	NULL	Description
<code>COMPONENT_ID</code>	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Streams Performance Advisor
<code>COMPONENT_NAME</code>	VARCHAR2 (194)		Name of the component
<code>COMPONENT_DB</code>	VARCHAR2 (128)		Name of the database that contains the component

**Table 236–1 (Cont.) STREAMS\$\_PA\_COMPONENT Table**

Column	Datatype	NULL	Description
COMPONENT_TYPE	VARCHAR2 (20)		Type of the component The following types are possible: <ul style="list-style-type: none"> <li>▪ CAPTURE for a capture process</li> <li>▪ PROPAGATION SENDER for a propagation sender</li> <li>▪ PROPAGATION RECEIVER for a propagation receiver</li> <li>▪ APPLY for an apply process</li> <li>▪ QUEUE for a queue</li> </ul>
COMPONENT_CHANGED_TIME	DATE		Time when the component was last changed

**STREAMS\$\_PA\_COMPONENT\_LINK Table**

The STREAMS\$\_PA\_COMPONENT\_LINK table displays information about how information flows between Oracle Streams components.

**Table 236–2 STREAMS\$\_PA\_COMPONENT\_LINK Table**

Column	Datatype	NULL	Description
PATH_ID	NUMBER	NOT NULL	Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2 (4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
SOURCE_COMPONENT_ID	NUMBER	NOT NULL	Source component ID for the path The path starts with this component.
DESTINATION_COMPONENT_ID	NUMBER	NOT NULL	Destination component ID for the path The path ends with this component.
POSITION	NUMBER		Position of the component in the path

**STREAMS\$\_PA\_COMPONENT\_PROP Table**

The STREAMS\$\_PA\_COMPONENT\_PROP table displays information about capture processes and apply processes necessary for analysis by the Streams Performance Advisor.

**Table 236–3** *STREAMS\$\_PA\_COMPONENT\_PROP* Table

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Streams Performance Advisor
PROP_NAME	VARCHAR2 (30)		<p>Property name</p> <p>For a capture process, the component properties include the following:</p> <ul style="list-style-type: none"> <li>▪ SOURCE_DATABASE - The source database for the changes captured by the capture process</li> <li>▪ PARALLELISM - The setting for the parallelism capture process parameter</li> <li>▪ OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0)</li> </ul> <p>For an apply process, the component properties include the following:</p> <ul style="list-style-type: none"> <li>▪ SOURCE_DATABASE - The source database for the messages applied by the apply process</li> <li>▪ PARALLELISM - The setting for the parallelism apply process parameter</li> <li>▪ APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO)</li> <li>▪ MESSAGE_DELIVERY_MODE - Either buffered or persistent</li> </ul>
PROP_VALUE	VARCHAR2 (30)		Property value

**STREAMS\$\_PA\_COMPONENT\_STAT** Table

The *STREAMS\$\_PA\_COMPONENT\_STAT* table displays performance statistics and session statistics about each Oracle Streams component.

**Table 236–4** *STREAMS\$\_PA\_COMPONENT\_STAT* Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run

**Table 236–4 (Cont.) STREAMS\$\_PA\_COMPONENT\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was run for the advisor run ID
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2 (64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2 (64)		Unit of measurement for the statistic
SUB_COMPONENT_TYPE	VARCHAR2 (64)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> <li>■ LOGMINER READER for a builder server of a capture process</li> <li>■ LOGMINER PREPARER for a preparer server of a capture process</li> <li>■ LOGMINER BUILDER for a reader server of a capture process</li> <li>■ CAPTURE SESSION for a capture process session</li> </ul> The following apply process subcomponent types are possible: <ul style="list-style-type: none"> <li>■ PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database</li> <li>■ APPLY READER for a reader server of an apply process</li> <li>■ APPLY COORDINATOR for a coordinator process of an apply process</li> <li>■ APPLY SERVER for a reader server of an apply process</li> </ul>
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V\$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V\$SESSION view for information about the session.

**STREAMS\$\_PA\_CONTROL Table**

The STREAMS\$\_PA\_CONTROL table displays the parameters set for the COLLECT\_STATS procedure in this package. The parameters control the monitoring behavior.

**Table 236–5 STREAMS\$\_PA\_CONTROL Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
PARAM_NAME	VARCHAR2 (30)		The name of the parameter
PARAM_VALUE	VARCHAR2 (4000)		The value set for the parameter
PARAM_UNIT	VARCHAR2 (30)		The unit of the parameter

**STREAMS\$\_PA\_DATABASE Table**

The STREAMS\$\_PA\_DATABASE table displays information about each database that contains Oracle Streams components.

**Table 236–6 STREAMS\$\_PA\_DATABASE Table**

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2 (128)	NOT NULL	Global name of the database analyzed by the Oracle Streams Performance Advisor
LAST_QUERIED	DATE		The time when the Performance Advisor successfully collected information from a database in its last run
ERROR_NUMBER	NUMBER		The error number of the error encountered when the database was last queried
ERROR_MESSAGE	VARCHAR2 (4000)		The error message of the error encountered when the database was last queried

**STREAMS\$\_PA\_DATABASE\_PROP Table**

The STREAMS\$\_PA\_DATABASE\_PROP table displays Oracle Streams database property information necessary for analysis by the Streams Performance Advisor.

**Table 236–7 STREAMS\$\_PA\_DATABASE\_PROP Table**

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2 (128)	NOT NULL	Global name of the database analyzed by the Oracle Streams Performance Advisor

**Table 236–7 (Cont.) STREAMS\$\_PA\_DATABASE\_PROP Table**

Column	Datatype	NULL	Description
PROP_NAME	VARCHAR2 (30)		Property name  The database properties include the following: <ul style="list-style-type: none"> <li>▪ VERSION</li> <li>▪ COMPATIBILITY</li> <li>▪ MANAGEMENT_PACK_ACCESS</li> <li>▪ DB_UNIQUE_NAME</li> </ul>
PROP_VALUE	VARCHAR2 (30)		Property value

**STREAMS\$\_PA\_MONITORING Table**

The STREAMS\$\_PA\_MONITORING table displays information about each monitoring job running in a database.

**Table 236–8 STREAMS\$\_PA\_MONITORING Table**

Column	Datatype	NULL	Description
JOB_NAME	VARCHAR2 (30)	NOT NULL	Name of the monitoring job
CLIENT_NAME	VARCHAR2 (30)		Name of the client that submitted the job  <b>See Also:</b> " <a href="#">Full Monitoring Job Names</a> " on page 236-25
QUERY_USER_NAME	VARCHAR2 (30)		User granted privileges to view the monitoring results
SHOW_STATS_TABLE	VARCHAR2 (30)		Name of the table used by the SHOW_STATS procedure to display statistics
STARTED_TIME	TIMESTAMP		Time the monitoring job started
STOPPED_TIME	TIMESTAMP		Time the monitoring job last stopped
ALTERED_TIME	TIMESTAMP		Time the monitoring job was last altered
STATE	VARCHAR2 (30)		State of the monitoring job, either ENABLED or STOPPED

**STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

The STREAMS\$\_PA\_PATH\_BOTTLENECK table displays information about Oracle Streams components that might be slowing down the flow of messages.

**Table 236–9 STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
ADVISOR_RUN_REASON	VARCHAR2 (4000)		Reason for the bottleneck
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor

**Table 236–9 (Cont.) STREAMS\$\_PA\_PATH\_BOTTLENECK Table**

Column	Datatype	NULL	Description
PATH_KEY	VARCHAR2 (4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
TOP_SESSION_ID	NUMBER		Session ID of the top component. Query the V\$SESSION view for information about the session.
TOP_SESSION_SERIAL#	NUMBER		Session serial number of the top component. Query the V\$SESSION view for information about the session.
ACTION_NAME	VARCHAR2 (32)		Action name for the top session
BOTTLENECK_IDENTIFIED	VARCHAR2 (30)		Whether a bottleneck was identified

**STREAMS\$\_PA\_PATH\_STAT Table**

The STREAMS\$\_PA\_PATH\_STAT table displays performance statistics about each stream path.

**Table 236–10 STREAMS\$\_PA\_PATH\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was run for the advisor run ID
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2 (4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2 (64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2 (64)		Unit of measurement for the statistic

**STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

The STREAMS\$\_PA\_SHOW\_COMP\_STAT table displays statistics for Oracle Streams components.

**Table 236–11 STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run

**Table 236–11 (Cont.) STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

Column	Datatype	NULL	Description
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
POSITION	NUMBER		Position of the component in the path
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
COMPONENT_NAME	VARCHAR2 (194)		Name of the component
COMPONENT_TYPE	VARCHAR2 (30)		Type of the component The following types are possible: <ul style="list-style-type: none"> <li>■ CAPTURE for a capture process</li> <li>■ PROPAGATION SENDER for a propagation sender</li> <li>■ PROPAGATION RECEIVER for a propagation receiver</li> <li>■ APPLY for an apply process</li> <li>■ QUEUE for a queue</li> </ul>
SUB_COMPONENT_TYPE	VARCHAR2 (30)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: <ul style="list-style-type: none"> <li>■ LOGMINER READER for a builder server of a capture process</li> <li>■ LOGMINER PREPARER for a preparer server of a capture process</li> <li>■ LOGMINER BUILDER for a reader server of a capture process</li> <li>■ CAPTURE SESSION for a capture process session</li> </ul> The following apply process subcomponent types are possible: <ul style="list-style-type: none"> <li>■ PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database</li> <li>■ APPLY READER for a reader server of an apply process</li> <li>■ APPLY COORDINATOR for a coordinator process of an apply process</li> <li>■ APPLY SERVER for a reader server of an apply process</li> </ul>

**Table 236–11 (Cont.) STREAMS\$\_PA\_SHOW\_COMP\_STAT Table**

Column	Datatype	NULL	Description
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V\$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V\$SESSION view for information about the session.
STATISTIC_ALIAS	VARCHAR2 (30)		Name of the statistic
STATISTIC_NAME	VARCHAR2 (128)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2 (128)		Unit of measurement for the statistic

**STREAMS\$\_PA\_SHOW\_PATH\_STAT Table**

The STREAMS\$\_PA\_SHOW\_PATH\_STAT table displays statistics for the stream paths in an Oracle Streams configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

**Table 236–12 STREAMS\$\_PA\_SHOW\_PATH\_STAT Table**

Column	Datatype	NULL	Description
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
SETTING	VARCHAR2 (2000)		Setting for the Oracle Streams Performance Advisor Run
STATISTICS	VARCHAR2 (4000)		Component-level statistics
SESSION_STATISTICS	VARCHAR2 (4000)		Session-level statistics
OPTIMIZATION	NUMBER		Whether the path uses the combined capture and apply optimization  0 (zero) means that the path does not use the combined capture and apply optimization.  1 means that the path uses the combined capture and apply optimization.

## Summary of UTL\_SPADV Subprograms

**Table 236–13 DBMS\_STREAMS Package Subprograms**

Subprogram	Description
<a href="#">ALTER_MONITORING Procedure</a> on page 236-15	Alters the monitoring job submitted by the current user.
<a href="#">COLLECT_STATS Procedure</a> on page 236-17	Uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.
<a href="#">IS_MONITORING Function</a> on page 236-19	Checks whether a monitoring job is currently running.
<a href="#">SHOW_STATS Procedure</a> on page 236-20	Generates output that includes the statistics gathered by the COLLECT_STATS procedure.
<a href="#">START_MONITORING Procedure</a> on page 236-23	Starts a monitoring job.
<a href="#">STOP_MONITORING Procedure</a> on page 236-26	Stops a monitoring job.

## ALTER\_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

### Syntax

```
UTL_SPADV.ALTER_MONITORING(
    interval                IN NUMBER DEFAULT NULL,
    top_event_threshold     IN NUMBER DEFAULT NULL,
    bottleneck_idle_threshold IN NUMBER DEFAULT NULL,
    bottleneck_flowctrl_threshold IN NUMBER DEFAULT NULL,
    retention_time          IN NUMBER DEFAULT NULL);
```

### Parameters

**Table 236–14 ALTER\_MONITORING Procedure Parameters**

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.  If NULL, then the current value is not changed.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected.  The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.  If NULL, then the current value is not changed.
bottleneck_idle_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage.  The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.  If NULL, then the current value is not changed.
bottleneck_flowctrl_threshold	A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage.  The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.  If NULL, then the current value is not changed.
retention_time	The number of hours to retain monitoring results.  If NULL, then the current value is not changed.

## Exceptions

**Table 236–15** *ALTER\_MONITORING Procedure Exceptions*

<b>Exception</b>	<b>Description</b>
ORA-20113	no active monitoring job found

## COLLECT\_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

---

---

**Note:** This procedure commits.

---

---

**See Also:** *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

### Syntax

```
UTL_SPADV.COLLECT_STATS (
    interval                IN NUMBER    DEFAULT 60,
    num_runs                IN NUMBER    DEFAULT 10,
    comp_stat_table        IN VARCHAR2   DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
    path_stat_table        IN VARCHAR2   DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
    top_event_threshold    IN NUMBER    DEFAULT 15,
    bottleneck_idle_threshold IN NUMBER  DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50);
```

### Parameters

**Table 236–16 COLLECT\_STATS Procedure Parameters**

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.
num_runs	The number of times that the Oracle Streams Performance Advisor is run by the procedure.
comp_stat_table	The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as <i>[schema_name.]object_name</i> . If the schema is not specified, then the current user is the default.  The procedure creates the specified table if it does not exist.  Oracle recommends that you use the default table STREAMS\$_ADVISOR_COMP_STAT.  See " <a href="#">Usage Notes</a> " on page 236-18 for more information about this parameter.
path_stat_table	The name of the table that stores the statistics collected for stream paths. Specify the table name as <i>[schema_name.]object_name</i> . If the schema is not specified, then the current user is the default.  The procedure creates the specified table if it does not exist.  Oracle recommends that you use the default table STREAMS\$_ADVISOR_PATH_STAT.  See " <a href="#">Usage Notes</a> " on page 236-18 for more information about this parameter.

**Table 236–16 (Cont.) COLLECT\_STATS Procedure Parameters**

Parameter	Description
<code>top_event_threshold</code>	<p>A percentage that determines whether a top wait event statistic is collected.</p> <p>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</p>
<code>bottleneck_idle_threshold</code>	<p>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage.</p> <p>The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p>
<code>bottleneck_flowctrl_threshold</code>	<p>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage.</p> <p>The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p>

## Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

## IS\_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

**See Also:** "[START\\_MONITORING Procedure](#)" on page 236-23

### Syntax

```
UTL_SPADV.IS_MONITORING(  
    job_name      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',  
    client_name   IN VARCHAR2  DEFAULT NULL)  
RETURN BOOLEAN;
```

### Parameters

**Table 236–17** *IS\_MONITORING Function Parameters*

Parameter	Description
<code>job_name</code>	The name of the job for which to check.
<code>client_name</code>	The name of the client that submitted the job.

## SHOW\_STATS Procedure

This procedure generates output that includes the statistics gathered by the `COLLECT_STATS` and `START_MONITORING` procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

---

---

**Note:** This procedure does not commit.

---

---

### See Also:

- ["COLLECT\\_STATS Procedure"](#) on page 236-17
- ["START\\_MONITORING Procedure"](#) on page 236-23
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

## Syntax

```
UTL_SPADV.SHOW_STATS (
  path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
  path_id         IN NUMBER    DEFAULT NULL,
  bgn_run_id      IN NUMBER    DEFAULT -1,
  end_run_id      IN NUMBER    DEFAULT -10,
  show_path_id    IN BOOLEAN   DEFAULT TRUE,
  show_run_id     IN BOOLEAN   DEFAULT TRUE,
  show_run_time   IN BOOLEAN   DEFAULT TRUE,
  show_optimization IN BOOLEAN DEFAULT TRUE,
  show_setting    IN BOOLEAN   DEFAULT FALSE,
  show_stat       IN BOOLEAN   DEFAULT TRUE,
  show_sess       IN BOOLEAN   DEFAULT FALSE,
  show_legend     IN BOOLEAN   DEFAULT TRUE);
```

## Parameters

**Table 236–18** *SHOW\_STATS Procedure Parameters*

Parameter	Description
<code>path_stat_table</code>	<p>The name of the table that contains the stream path statistics. Specify the table name as <code>[schema_name.]object_name</code>. If the schema is not specified, then the current user is the default.</p> <p>When you gather statistics using the <code>COLLECT_STATS</code> procedure, this table is specified in the <code>path_stat_table</code> parameter in the <code>COLLECT_STATS</code> procedure. The default table is <code>STREAMS\$_ADVISOR_PATH_STAT</code>.</p> <p>When you gather statistics using the <code>START_MONITORING</code> procedure, you can determine the name for this table by querying the <code>SHOW_STATS_TABLE</code> column in the <code>STREAMS\$_PA_MONITORING</code> view. The default table for a monitoring job is <code>STREAMS\$_PA_SHOW_PATH_STAT</code>.</p>
<code>path_id</code>	<p>A stream path ID.</p> <p>If non-NULL, then the procedure shows output for the specified stream path only.</p> <p>If NULL, then the procedure shows output for all active stream paths.</p>

**Table 236–18 (Cont.) SHOW\_STATS Procedure Parameters**

Parameter	Description
bgn_run_id	The first Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 236-22 for more information about this parameter.
end_run_id	The last Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 236-22 for more information about this parameter.
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Streams Performance Advisor run ID is included in the output. If FALSE, then the Oracle Streams Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Streams Performance Advisor run time is included in the output. If FALSE, then the Oracle Streams Performance Advisor run time is not included in the output.
show_optimization	If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the <code>top_event_threshold</code> , <code>bottleneck_idle_threshold</code> , and <code>bottleneck_flowctrl_threshold</code> parameters in the <code>COLLECT_STATS</code> procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include <code>IDLE</code> , <code>FLOW CONTROL</code> , and <code>EVENT</code> statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

## Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

**See Also:** *Oracle Streams Concepts and Administration* for information about the combined capture and apply optimization

## START\_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the COLLECT\_STATS procedure to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

---

---

**Note:** This procedure commits.

---

---

### See Also:

- ["COLLECT\\_STATS Procedure"](#) on page 236-17
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

## Syntax

```
UTL_SPADV.START_MONITORING(
  job_name          IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
  client_name       IN VARCHAR2  DEFAULT NULL,
  query_user_name   IN VARCHAR2  DEFAULT NULL,
  interval          IN NUMBER    DEFAULT 60,
  top_event_threshold IN NUMBER   DEFAULT 15,
  bottleneck_idle_threshold IN NUMBER DEFAULT 50,
  bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50,
  retention_time    IN NUMBER    DEFAULT 24);
```

## Parameters

**Table 236–19 START\_MONITORING Procedure Parameters**

Parameter	Description
job_name	The name of the monitoring job to create.
client_name	The name of the client.
query_user_name	The user who will query the result tables. This procedure grants privileges to the specified user to enable the user to query the result tables.
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. The specified interval is used for the interval parameter in the COLLECT_STATS procedure.
top_event_threshold	A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.

**Table 236–19 (Cont.) START\_MONITORING Procedure Parameters**

Parameter	Description
bottleneck_idle_threshold	<p>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage.</p> <p>The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p>
bottleneck_flowctrl_threshold	<p>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage.</p> <p>The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p>
retention_time	The number of hours to retain monitoring results.

## Exceptions

**Table 236–20 START\_MONITORING Procedure Exceptions**

Exception	Description
ORA-20111	<p>cannot start monitoring due to active EM monitoring job</p> <p>Stop the Oracle Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again.</p>
ORA-20112	<p>cannot start monitoring due to active Streams monitoring job</p> <p>Stop the Streams monitoring job, and run the START_MONITORING procedure again.</p>

## Usage Notes

The following are usage notes for the START\_MONITORING procedure:

- [Requirements for the User Running the Procedure](#)
- [Full Monitoring Job Names](#)
- [Restrictions on Monitoring Jobs](#)

### Requirements for the User Running the Procedure

The user who runs the START\_MONITORING procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the DBMS\_STREAMS\_AUTH.GRANT\_ADMIN\_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS\_STREAMS\_AUTH.GRANT\_ADMIN\_PRIVILEGE procedure.

### Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always EM.

The following table show examples of full monitoring job names:

Setting for client_name Parameter	Setting for job_name parameter	Full Monitoring Job Name
NULL	STREAMS\$_MONITORING_JOB	STREAMS\$_MONITORING_JOB
EM	STREAMS\$_MONITORING_JOB	EMSTREAMS\$_MONITORING_JOB
strm	STREAMS\$_MONITORING_JOB	strmSTREAMS\$_MONITORING_JOB
strm	mjob1	strmmjob1

### Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

## STOP\_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

### Syntax

```
UTL_SPADV.STOP_MONITORING(  
    purge IN BOOLEAN DEFAULT FALSE);
```

### Parameters

**Table 236–21 STOP\_MONITORING Procedure Parameters**

Parameter	Description
purge	If TRUE, then the procedure purges information about the monitoring job from the result tables.  If FALSE, then the procedure retains information about the monitoring job in the result tables.

With the UTL\_TCP package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- [Using UTL\\_TCP](#)
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Rules and Limits
  - Examples
- [Summary of UTL\\_TCP Subprograms](#)

## Using UTL\_TCP

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)

## Overview

The `UTL_TCP` package provides TCP/IP client-side access functionality in PL/SQL.

## Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

---

---

**Note:** For more information about managing fine-grained access, see Oracle Database Security Guide

---

---

## Types

- [CONNECTION Type](#)
- [CRLF](#)

### CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

#### Syntax

```
TYPE connection IS RECORD (
  remote_host    VARCHAR2(255) ,
  remote_port    PLS_INTEGER,
  local_host     VARCHAR2(255) ,
  local_port     PLS_INTEGER,
  charset        VARCHAR2(30) ,
  newline        VARCHAR2(2) ,
  tx_timeout     PLS_INTEGER,
  private_sd     PLS_INTEGER);
```

#### Fields

**Table 237–1 Connection Record Type Fields**

Field	Description
remote_host	Name of the remote host when connection is established. NULL when no connection is established.
remote_port	Port number of the remote host connected. NULL when no connection is established.
local_host	Name of the local host used to establish the connection. NULL when no connection is established.
local_port	Port number of the local host used to establish the connection. NULL when no connection is established.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.
tx_timeout	Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

#### Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields

has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields are not set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the `UTL_TCP` package.

## CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

### Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

### Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

## Exceptions

The exceptions raised by the TCP/IP package are listed in [Table 237-2](#).

**Table 237-2 TCP/IP Exceptions**

<b>Exception</b>	<b>Description</b>
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead
END_OF_INPUT	Raised when no more data is available to read from the connection
NETWORK_ERROR	Generic network error
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size)
TRANSFER_TIMEOUT	No data is read and a read time out occurred
PARTIAL_MULTIBYTE_CHAR	No complete character is read and a partial multibyte character is found at the end of the input

## Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

## Examples

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```

DECLARE
  c utl_tcp.connection; -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                              remote_port => 80,
                              charset => 'US7ASCII'); -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0'); -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE)); -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;

```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```

PROCEDURE send_mail (sender IN VARCHAR2,
                    recipient IN VARCHAR2,
                    message IN VARCHAR2)
IS
  mailhost VARCHAR2(30) := 'mailhost.mydomain.com';
  smtp_error EXCEPTION;
  mail_conn utl_tcp.connection;
  PROCEDURE smtp_command(command IN VARCHAR2,
                        ok IN VARCHAR2 DEFAULT '250')
  IS
    response varchar2(3);
    len pls_integer;
  BEGIN
    len := utl_tcp.write_line(mail_conn, command);
    response := substr(utl_tcp.get_line(mail_conn), 1, 3);
    IF (response <> ok) THEN
      RAISE smtp_error;
    END IF;
  END;
END;

BEGIN
  mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                      remote_port => 25,
                                      charset => 'US7ASCII');

  smtp_command('HELO ' || mailhost);
  smtp_command('MAIL FROM: ' || sender);
  smtp_command('RCPT TO: ' || recipient);
  smtp_command('DATA', '354');
  smtp_command(message);

```

```
smtp_command('QUIT', '221');
utl_tcp.close_connection(mail_conn);
EXCEPTION
  WHEN OTHERS THEN
    -- Handle the error
END;
```

---

## Summary of UTL\_TCP Subprograms

**Table 237-3 UTL\_TCP Package Subprograms**

Subprogram	Description
<a href="#">AVAILABLE Function</a> on page 237-12	Determines the number of bytes available for reading from a TCP/IP connection
<a href="#">CLOSE_ALL_CONNECTIONS Procedure</a> on page 237-14	Closes all open TCP/IP connections
<a href="#">CLOSE_CONNECTION Procedure</a> on page 237-15	Closes an open TCP/IP connection
<a href="#">FLUSH Procedure</a> on page 237-16	Transmits immediately to the server all data in the output buffer, if a buffer is used
<a href="#">GET_LINE Function</a> on page 237-17	Returns the line of data read
<a href="#">GET_LINE_NCHAR Function</a> on page 237-18	Returns the line of data read in NCHAR form
<a href="#">GET_RAW Function</a> on page 237-19	Return the data read instead of the amount of data read
<a href="#">GET_TEXT Function</a> on page 237-20	Returns the text data read
<a href="#">GET_TEXT_NCHAR Function</a> on page 237-21	Returns the text data read in NCHAR form
<a href="#">OPEN_CONNECTION Function</a> on page 237-22	Opens a TCP/IP connection to a specified service
<a href="#">READ_LINE Function</a> on page 237-25	Receives a text line from a service on an open connection
<a href="#">READ_RAW Function</a> on page 237-27	Receives binary data from a service on an open connection
<a href="#">READ_TEXT Function</a> on page 237-28	Receives text data from a service on an open connection
<a href="#">SECURE_CONNECTION Procedure</a> on page 237-30	Secures a TCP/IP connection using SSL/TLS
<a href="#">WRITE_LINE Function</a> on page 237-31	Transmits a text line to a service on an open connection
<a href="#">WRITE_RAW Function</a> on page 237-32	Transmits a binary message to a service on an open connection
<a href="#">WRITE_TEXT Function</a> on page 237-33	Transmits a text message to a service on an open connection

---

## AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

### Syntax

```
UTL_TCP.AVAILABLE (
  c          IN OUT NOCOPY connection,
  timeout   IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;
```

### Parameters

**Table 237–4 AVAILABLE Function Parameters**

Parameter	Description
c	TCP connection to determine the amount of data that is available to be read
timeout	Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

### Return Values

The number of bytes available for reading without blocking

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the `END_OF_INPUT` exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
  c    utl_tcp.connection
  data VARCHAR2(256);
  len  PLS_INTEGER;
BEGIN
  c := utl_tcp.open_connection(...);
  LOOP
    IF (utl_tcp.available(c) > 0) THEN
      len := utl_tcp.read_text(c, data, 256);
    ELSE
      ---do some other things
      . . .
    END IF
```

```
    END LOOP;  
END;
```

## **CLOSE\_ALL\_CONNECTIONS Procedure**

This procedure closes all open TCP/IP connections.

### **Syntax**

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

### **Usage Notes**

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

## CLOSE\_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

### Syntax

```
UTL_TCP.CLOSE_CONNECTION (  
    c IN OUT NOCOPY connection);
```

### Parameters

**Table 237-5** *CLOSE\_CONNECTION Procedure Parameters*

Parameter	Description
c	TCP connection to close

### Usage Notes

Connection must have been opened by a previous call to OPEN\_CONNECTION. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

## FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

### Syntax

```
UTL_TCP.FLUSH (  
    c IN OUT NOCOPY connection);
```

### Parameters

**Table 237–6** *FLUSH Procedure Parameters*

Parameter	Description
c	TCP connection to which to send data

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

## GET\_LINE Function

This function returns the line of data read.

### Syntax

```
UTL_TCP.GET_LINE (
  c          IN OUT NOCOPY connection,
  remove_crlf IN          BOOLEAN DEFAULT FALSE,
  peek      IN          BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

### Parameters

**Table 237-7 GET\_LINE Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

### Return Values

The text line read

### Usage Notes

- The connection must have already been opened through a call to OPEN\_CONNECTION.
- See READ\_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

## GET\_LINE\_NCHAR Function

This function returns the line of data read in NCHAR form.

### Syntax

```
UTL_TCP.GET_LINE_NCHAR (
  c          IN OUT NOCOPY connection,
  remove_crlf IN          BOOLEAN DEFAULT FALSE,
  peek      IN          BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

### Parameters

**Table 237–8** GET\_LINE\_NCHAR Function Parameters

Parameter	Description
c	TCP connection from which to receive data
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

### Return Values

The text line read

### Usage Notes

- The connection must have already been opened through a call to OPEN\_CONNECTION.
- See READ\_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

## GET\_RAW Function

This function returns the data read instead of the amount of data read.

### Syntax

```
UTL_TCP.GET_RAW (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN      DEFAULT FALSE)
RETURN RAW;
```

### Parameters

**Table 237–9 GET\_RAW Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.

### Return Values

The binary data read

### Usage Notes

The connection must have already been opened through a call to OPEN\_CONNECTION.

For all the get\_\* APIs described in this section, see the corresponding READ\_\* API for the read time out issue. For GET\_TEXT and GET\_LINE, see the corresponding READ\_\* API for character set conversion, buffer size, and multibyte character issues.

## GET\_TEXT Function

This function returns the text data read.

### Syntax

```
UTL_TCP.GET_TEXT (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN     DEFAULT FALSE)
RETURN VARCHAR2;
```

### Parameters

**Table 237–10** GET\_TEXT Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.

### Return Values

The text data read

### Usage Notes

The connection must have already been opened through a call to OPEN\_CONNECTION.

For all the get\_\* APIs described in this section, see the corresponding read\_\* API for the read time out issue. For GET\_TEXT and GET\_LINE, see the corresponding READ\_\* API for character set conversion, buffer size, and multibyte character issues.

## GET\_TEXT\_NCHAR Function

This function returns the text data read in NCHAR form.

### Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN      DEFAULT FALSE)
RETURN NVARCHAR2;
```

### Parameters

**Table 237-11** GET\_TEXT\_NCHAR Function Parameters

Parameter	Description
c	TCP connection from which to receive data
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.

### Return Values

The text data read

### Usage Notes

The connection must have already been opened through a call to OPEN\_CONNECTION.

For all the get\_\* APIs described in this section, see the corresponding read\_\* API for the read time out issue. For GET\_TEXT and GET\_LINE, see the corresponding READ\_\* API for character set conversion, buffer size, and multibyte character issues.

## OPEN\_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

---

---

**Note:** The functionality associated with `wallet_path` and `wallet_password` is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

### Syntax

```
UTL_TCP.OPEN_CONNECTION (
    remote_host      IN VARCHAR2,
    remote_port      IN PLS_INTEGER,
    local_host       IN VARCHAR2 DEFAULT NULL,
    local_port       IN PLS_INTEGER DEFAULT NULL,
    in_buffer_size   IN PLS_INTEGER DEFAULT NULL,
    out_buffer_size  IN PLS_INTEGER DEFAULT NULL,
    charset          IN VARCHAR2 DEFAULT NULL,
    newline          IN VARCHAR2 DEFAULT CRLF,
    tx_timeout       IN PLS_INTEGER DEFAULT NULL,
    wallet_path      IN VARCHAR2 DEFAULT NULL,
    wallet_password  IN VARCHAR2 DEFAULT NULL,
    RETURN connection;
```

### Parameters

**Table 237–12 OPEN\_CONNECTION Function Parameters**

Parameter	Description
<code>remote_host</code>	Name of the host providing the service. When <code>remote_host</code> is NULL, it connects to the local host.
<code>remote_port</code>	Port number on which the service is listening for connections
<code>local_host</code>	Name of the host providing the service. NULL means does not care.
<code>local_port</code>	Port number on which the service is listening for connections. NULL means don't care.
<code>in_buffer_size</code>	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
<code>out_buffer_size</code>	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.

**Table 237–12 (Cont.) OPEN\_CONNECTION Function Parameters**

Parameter	Description
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using <code>READ_TEXT</code> , <code>READ_LINE</code> , <code>WRITE_TEXT</code> and <code>WRITE_LINE</code> . Set this parameter to <code>NULL</code> when no conversion is needed.
newline	Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.
tx_timeout	Time in seconds that the <code>UTL_TCP</code> package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. <code>NULL</code> indicates to wait forever.
wallet_path	Directory path that contains the Oracle wallet for SSL/TLS. The format is <code>file:directory-path</code>
wallet_password	Password to open the wallet. When the wallet is auto-login enabled, the password may be set to <code>NULL</code> .

## Return Values

A connection to the targeted TCP/IP service

## Usage Notes

- Note that connections opened by this `UTL_TCP` package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
- In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields is not set in the connection record returned by the function.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

## Examples

```
DECLARE
  c UTL_TCP.CONNECTION;
BEGIN
  c := UTL_TCP.OPEN_CONNECTION(
    host      => 'www.example.com',
    port      => 443,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => '*****');
```

```
    UTL_TCP.SECURE_CONNECTION (c => c);  
END;
```

## READ\_LINE Function

This function receives a text line from a service on an open connection. A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

### Syntax

```
UTL_TCP.READ_LINE (
  c          IN OUT NOCOPY connection,
  data      IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  peek      IN          BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

### Parameters

**Table 237–13 READ\_LINE Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
data	Data received.
remove_crlf	If TRUE, then one or more trailing CRLF characters are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

### Return Values

The number of characters of data received

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of

the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

## READ\_RAW Function

This function receives binary data from a service on an open connection.

### Syntax

```
UTL_TCP.READ_RAW (
  c      IN OUT NOCOPY connection,
  data   IN OUT NOCOPY RAW,
  len    IN          PLS_INTEGER DEFAULT 1,
  peek   IN          BOOLEAN      DEFAULT FALSE)
RETURN PLS_INTEGER;
```

### Parameters

**Table 237–14 READ\_RAW Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
data (IN OUT COPY)	Data received
len	Number of bytes of data to receive
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

### Return Values

The number of bytes of data received

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

## READ\_TEXT Function

This function receives text data from a service on an open connection.

### Syntax

```
UTL_TCP.READ_TEXT (
  c      IN OUT NOCOPY connection,
  data   IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  len    IN          PLS_INTEGER DEFAULT 1,
  peek   IN          BOOLEAN      DEFAULT FALSE)
RETURN PLS_INTEGER;
```

### Parameters

**Table 237–15 READ\_TEXT Function Parameters**

Parameter	Description
c	TCP connection from which to receive data
data	Data received
len	Number of characters of data to receive
peek	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

### Return Values

The number of characters of data received

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a `VARCHAR2` buffer is specified in terms of bytes, while the parameter `len` refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the `VARCHAR2` buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

## SECURE\_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS. SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the [OPEN\\_CONNECTION Function](#).

### Syntax

```
UTL_TCP.SECURE_CONNECTION (  
    c      IN OUT NOCOPY connection);
```

### Parameters

**Table 237–16** SECURE\_CONNECTION Procedure Parameters

Parameter	Description
c	TCP connection from which to receive data

## WRITE\_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence is appended to the message before it is transmitted.

### Syntax

```
UTL_TCP.WRITE_LINE (
  c      IN OUT NOCOPY connection,
  data IN          VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

### Parameters

**Table 237–17** *WRITE\_LINE Function Parameters*

Parameter	Description
<code>c</code>	TCP connection to which to send data
<code>data</code>	Buffer containing the data to be sent

### Return Values

The actual number of characters of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

## WRITE\_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

### Syntax

```
UTL_TCP.WRITE_RAW (  
  c      IN OUT NOCOPY connection,  
  data  IN          RAW,  
  len   IN          PLS_INTEGER DEFAULT NULL)  
RETURN PLS_INTEGER;
```

### Parameters

**Table 237–18** WRITE\_RAW Function Parameters

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent
len	The number of bytes of data to transmit. When len is NULL, the whole length of data is written.

### Return Values

The number of bytes of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

## WRITE\_TEXT Function

This function transmits a text message to a service on an open connection.

### Syntax

```
UTL_TCP.WRITE_TEXT (
  c      IN OUT NOCOPY connection,
  data IN          VARCHAR2 CHARACTER SET ANY_CS,
  len IN          PLS_INTEGER DEFAULT NULL)
RETURN num_chars PLS_INTEGER;
```

### Parameters

**Table 237–19** *WRITE\_TEXT Function Parameters*

Parameter	Description
c	TCP connection to which to send data
data	Buffer containing the data to be sent
len	The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition.

### Return Values

The actual number of characters of data transmitted

### Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

The UTL\_URL package has two functions: ESCAPE and UNESCAPE.

**See Also:** [Chapter 224, "UTL\\_HTTP"](#)

This chapter contains the following topics:

- [Using UTL\\_URL](#)
  - Overview
  - Exceptions
  - Examples
- [Summary of UTL\\_URL Subprograms](#)

## Using UTL\_URL

- [Overview](#)
- [Exceptions](#)
- [Examples](#)

## Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP). For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign (\$), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (\_), period (.), exclamation point (!), tilde (~), asterisk (\*), accent ('), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), percentage sign (%), and comma (,)

The UTL\_URL package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used to fetch a Web page by way of the UTL\_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

```
http://www.w3.org/TR/html
```

## Exceptions

[Table 238–1](#) lists the exceptions that can be raised when the `UTL_URL` package API is invoked.

**Table 238–1** *UTL\_URL Exceptions*

<b>Exception</b>	<b>Error Code</b>	<b>Reason</b>
<code>BAD_URL</code>	29262	The URL contains badly formed escape code sequences
<code>BAD_FIXED_WIDTH_CHARSET</code>	29274	Fixed-width multibyte character set is not allowed as a URL character set.

## Examples

You can implement the `x-www-form-urlencoded` encoding using the `UTL_URL.ESCAPE` function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
    data    IN VARCHAR2,
    charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the `form-URL-encode` scheme, the following function implements the decoding scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(
    data    IN VARCHAR2,
    charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.unescape(
        replace(data, '+', ' '),
        charset);
END;
```

## Summary of UTL\_URL Subprograms

---

**Table 238–2 UTL\_URL Package Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">ESCAPE Function</a> on page 238-7	Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format
<a href="#">UNESCAPE Function</a> on page 238-9	Unescapes the escape character sequences to their original forms in a URL. Convert the %xx escape character sequences to the original characters

## ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

### Syntax

```
UTL_URL.ESCAPE (
  url                IN VARCHAR2 CHARACTER SET ANY_CS,
  escape_reserved_chars IN BOOLEAN DEFAULT FALSE,
  url_charset        IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

### Parameters

**Table 238–3 ESCAPE Function Parameters**

Parameter	Description
url	The original URL
escape_reserved_chars	Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.
url_charset	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If url_charset is NULL, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the UTL_HTTP package, whose default value is ISO-8859-1. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

### Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (\_), period (.), exclamation point (!), tilde (~), asterisk (\*), accent ('), left parenthesis ( ( ), right parenthesis ( ) )

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape\_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape\_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair \$logon=scott/tiger into the query string of a URL, escape the \$ and / separately as %24logon=scott%2Ftiger and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

**Returns:**

```
http://foo.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape  
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (?), dollar sign (\$), and space characters in 'Is the use of the "\$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

## UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the %XX escape character sequences to the original characters.

### Syntax

```
UTL_URL.UNESCAPE (
  url          IN VARCHAR2 CHARACTER SET ANY_CS,
  url_charset  IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

### Parameters

**Table 238–4 UNESCAPE Function Parameters**

Parameter	Description
url	The URL to unescape
url_charset	After a character is unescaped, the character is assumed to be in the source_charset character set and it will be converted from the source_charset to the database character set before the URL is returned. If source_charset is NULL, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the UTL_HTTP package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

### Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url\_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using US7ASCII so that %20 is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

## WPG\_DOCLOAD

The WPG\_DOCLOAD package provides an interface to download files, BLOBs and BFILES.

**See Also:** For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod\_plsql*

The chapter contains the following topics:

- [Using WPG\\_DOCLOAD](#)
  - Constants
- [Summary of WPG\\_DOCLOAD Subprograms](#)

## Using WPG\_DOCLOAD

- [Constants](#)

## Constants

- [NAME\\_COL\\_LEN](#)
- [MIMET\\_COL\\_LEN](#)
- [MAX\\_DOCTABLE\\_NAME\\_LEN](#)

### NAME\_COL\_LEN

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

### MIMET\_COL\_LEN

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

### MAX\_DOCTABLE\_NAME\_LEN

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

## Summary of WPG\_DOCLOAD Subprograms

**Table 239–1 WPG\_DOCLOAD Package Subprograms**

Subprogram	Description
<a href="#">DOWNLOAD_FILE Procedures</a> on page 239-5	Downloads files, BLOBS and BFILES

## DOWNLOAD\_FILE Procedures

There are three versions of this procedure:

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

### Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_filename      IN          VARCHAR2,
  p_bcaching      IN          BOOLEAN DEFAULT TRUE);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_blob          IN OUT NOCOPY BLOB);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_bfile         IN OUT          BFILE);
```

### Parameters

**Table 239–2** *DOWNLOAD\_FILE Procedure Parameters*

Parameter	Description
<code>p_filename</code>	The file to download from the document table.
<code>p_blob</code>	The BLOB to download.
<code>p_bfile</code>	The BFILE to download (see <a href="#">Usage Notes</a> ).
<code>p_bcaching</code>	Whether browser caching is enabled (see <a href="#">Usage Notes</a> ).

### Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to `FALSE` to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.
- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

---

---

## ANYDATA TYPE

An `ANYDATA TYPE` contains an instance of a given type, plus a description of the type. In this sense, an `ANYDATA` is self-describing. An `ANYDATA` can be persistently stored in the database.

This chapter contains the following topics:

- [Using ANYDATA TYPE](#)
  - Restrictions
  - Operational Notes
- [Summary of ANYDATA Subprograms](#)

## Using ANYDATA TYPE

- [Restrictions](#)
- [Operational Notes](#)

## Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILES is not currently supported.

## Operational Notes

- [Construction](#)
- [Access](#)

### Construction

There are 2 ways to construct an ANYDATA. The CONVERT\* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```
STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,  
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,  
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,  
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,  
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,  
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,  
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,  
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,  
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,  
STATIC FUNCTION ConvertIntervalYM(inv IN INTERVAL YEAR TO MONTH) return ANYDATA,  
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,  
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,  
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,  
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,  
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,  
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,  
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,  
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,  
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,  
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return  
ANYDATA,  
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,  
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,  
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
```

The second way to construct an ANYDATA is a piece by piece approach. The [BEGINCREATE Static Procedure](#) call begins the construction process and [ENDCREATE Member Procedure](#) call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET\* calls. For piece by piece access of the attributes of objects and elements of collections, the [PIECEWISE Member Procedure](#) should be invoked prior to GET\* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

### Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of

these functions returns the value of a specified datatype inside a SYS . ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
    DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
    DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
    TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
    TIMEZONE,
MEMBER FUNCTION AccessUrowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

## Summary of ANYDATA Subprograms

**Table 240–1** ANYDATA Type Subprograms

Subprogram	Description
<a href="#">BEGINCREATE</a> Static Procedure on page 240-7	Begins creation process on a new ANYDATA
<a href="#">ENDCREATE</a> Member Procedure on page 240-8	Ends creation of an ANYDATA
<a href="#">GET*</a> Member Functions on page 240-9	Gets the current data value (which should be of appropriate type)
<a href="#">GETTYPE</a> Member Function on page 240-12	Gets the Type of the ANYDATA
<a href="#">GETTYPENAME</a> Member Function on page 240-13	Get the fully qualified type name for the ANYDATA
<a href="#">PIECEWISE</a> Member Procedure on page 240-14	Sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT)
<a href="#">SET*</a> Member Procedures on page 240-15	Sets the current data value.

## BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

### Syntax

```
STATIC PROCEDURE BeginCreate(
  dtype          IN OUT NOCOPY AnyType,
  adata          OUT NOCOPY ANYDATA);
```

### Parameters

**Table 240–2 BEGINCREATE Procedure Parameters**

Parameter	Description
dtype	The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)
adata	ANYDATA being constructed.

### Exception

DBMS\_TYPES.INVALID\_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

### Usage Notes

There is no need to call `PIECEWISE` immediately after this call. The construction process begins in a piece-wise manner automatically.

## ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE EndCreate(  
    self          IN OUT NOCOPY ANYDATA);
```

### Parameters

**Table 240–3** *ENDCREATE Procedure Parameter*

Parameter	Description
self	An ANYDATA.

## GET\* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which we are accessing (depending on whether we have invoked the `PIECEWISE` call).

If `PIECEWISE` has NOT been called, we are accessing the `ANYDATA` in its entirety and the type of the data value should match the type of the `ANYDATA`.

If `PIECEWISE` has been called, we are accessing the `ANYDATA` piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

### Syntax

```
MEMBER FUNCTION GetBDouble(
    self      IN ANYDATA,
    dbl       OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
    self      IN ANYDATA,
    b         OUT NOCOPY BFILE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
    self      IN ANYDATA,
    fl       OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
    self      IN ANYDATA,
    b         OUT NOCOPY BLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetChar(
    self      IN ANYDATA,
    c         OUT NOCOPY CHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetClob(
    self      IN ANYDATA,
    c         OUT NOCOPY CLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetCollection(
    self      IN ANYDATA,
    col       OUT NOCOPY "<collection_type>")
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetDate(
    self      IN ANYDATA,
    dat       OUT NOCOPY DATE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetIntervals(
    self      IN ANYDATA,
    inv       OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN      PLS_INTEGER;
```

```
MEMBER FUNCTION GetIntervalYM(  
    self          IN ANYDATA,  
    inv          OUT NOCOPY INTERVAL YEAR TO MONTH)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetNchar(  
    self          IN ANYDATA,  
    nc           OUT NOCOPY NCHAR)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetNClob(  
    self          IN ANYDATA,  
    nc           OUT NOCOPY NCLOB)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetNumber(  
    self          IN ANYDATA,  
    num          OUT NOCOPY NUMBER)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetNvarchar2(  
    self          IN ANYDATA,  
    nc           OUT NOCOPY NVARCHAR2)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetObject(  
    self          IN ANYDATA,  
    obj          OUT NOCOPY "<object_type>")  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetRaw(  
    self          IN ANYDATA,  
    r            OUT NOCOPY RAW)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetRef(  
    self          IN ANYDATA,  
    rf           OUT NOCOPY REF "<object_type>")  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GetTimestamp(  
    self          IN ANYDATA,  
    ts           OUT NOCOPY TIMESTAMP)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GetTimestampTZ(  
    self          IN ANYDATA,  
    ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GetTimestampLTZ(  
    self          IN ANYDATA,  
    ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GetVarchar(  
    self          IN ANYDATA,  
    c            OUT NOCOPY VARCHAR)  
RETURN          PLS_INTEGER;
```

```
MEMBER FUNCTION GetVarchar2(
  self      IN ANYDATA,
  c         OUT NOCOPY VARCHAR2)
RETURN     PLS_INTEGER;
```

## Parameters

**Table 240–4** *GET\* Function Parameter*

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

## Return Values

DBMS\_TYPES.SUCCESS or DBMS\_TYPES.NO\_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

## Exceptions

`DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

`DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.

## GETTYPE Member Function

This function gets the typecode of the ANYDATA.

### Syntax

```
MEMBER FUNCTION GETTYPE (  
    self          IN ANYDATA,  
    typ           OUT NOCOPY AnyType)  
RETURN          PLS_INTEGER;
```

### Parameters

**Table 240–5** *GETTYPE Function Parameter*

Parameter	Description
self	An ANYDATA.
typ	The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.

### Return Values

The typecode corresponding to the type of the ANYDATA.

## GETYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema\_name.type\_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

### Syntax

```
MEMBER FUNCTION GETYPENAME (  
    self          IN ANYDATA)  
RETURN          VARCHAR2;
```

### Parameters

**Table 240–6** GETYPENAME Function Parameter

Parameter	Description
self	An ANYDATA.

### Return Values

Type name of the ANYDATA.

## PIECEWISE Member Procedure

This procedure sets the **MODE** of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the **MODE** of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to `SET*` and `GET*` will sequentially obtain individual attributes or collection elements.

### Syntax

```
MEMBER PROCEDURE PIECEWISE(  
    self          IN OUT NOCOPY ANYDATA);
```

### Parameters

**Table 240–7** *PIECEWISE Procedure Parameters*

Parameter	Description
<code>self</code>	The current data value.

### Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`
- `DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

### Usage Notes

The current data value must be of an `OBJECT` or `COLLECTION` type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

## SET\* Member Procedures

Sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

### Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
    self      IN OUT NOCOPY ANYDATA,
    dbl       IN BINARY_DOUBLE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self      IN OUT NOCOPY ANYDATA,
    b         IN BFILE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self      IN OUT NOCOPY ANYDATA,
    fl       IN          BINARY_FLOAT,
    last_elem IN          boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self      IN OUT NOCOPY ANYDATA,
    b         IN BLOB,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self      IN OUT NOCOPY ANYDATA,
    c         IN CHAR,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self      IN OUT NOCOPY ANYDATA,
    c         IN CLOB,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self      IN OUT NOCOPY ANYDATA,
    col       IN "<collection_type>",
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self      IN OUT NOCOPY ANYDATA,
    dat       IN DATE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self      IN OUT NOCOPY ANYDATA,
    inv       IN INTERVAL DAY TO SECOND,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self      IN OUT NOCOPY ANYDATA,
    inv       IN INTERVAL YEAR TO MONTH,
    last_elem IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETNCHAR(  
    self          IN OUT NOCOPY ANYDATA,  
    nc            IN NCHAR,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNCLOB(  
    self          IN OUT NOCOPY ANYDATA,  
    nc            IN NClob,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNUMBER(  
    self          IN OUT NOCOPY ANYDATA,  
    num          IN NUMBER,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNVARCHAR2(  
    self          IN OUT NOCOPY ANYDATA,  
    nc            IN NVarchar2,  
    last_elem    IN boolean DEFAULT FALSE),  
  
MEMBER PROCEDURE SETOBJECT(  
    self          IN OUT NOCOPY ANYDATA,  
    obj          IN "<object_type>",  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETRAW(  
    self          IN OUT NOCOPY ANYDATA,  
    r            IN RAW,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETREF(  
    self          IN OUT NOCOPY ANYDATA,  
    rf           IN REF "<object_type>",  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETTIMESTAMP(  
    self          IN OUT NOCOPY ANYDATA,  
    ts           IN TIMESTAMP,  
    last_elem    IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETTIMESTAMPPTZ(self IN OUT NOCOPY ANYDATA,  
    ts           IN TIMESTAMP WITH TIME ZONE,  
    last_elem    IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETTIMESTAMPPLTZ(  
    self IN OUT NOCOPY ANYDATA,  
    ts IN TIMESTAMP WITH LOCAL TIME ZONE,  
    last_elem IN boolean DEFAULT FALSE),  
  
MEMBER PROCEDURE SETVARCHAR(  
    self          IN OUT NOCOPY ANYDATA,  
    c            IN VARCHAR,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETVARCHAR2(  
    self          IN OUT NOCOPY ANYDATA,  
    c            IN VARCHAR2,  
    last_elem    IN boolean DEFAULT FALSE);
```

## Parameters

**Table 240–8 SET\* Procedure Parameters**

Parameter	Description
<code>self</code>	An ANYDATA.
<code>num</code>	The number, and associated information, that is to be set.
<code>last_elem</code>	Relevant only if ANYDATA represents a collection. Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise.

## Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

## Usage Notes

When `BEGINCREATE` is called, construction has already begun in a piece-wise fashion. Subsequent calls to `SET*` will set the successive attribute values.

If the ANYDATA is a standalone collection, the `SET*` call will set the successive collection elements.

---

---

## ANYDATASET TYPE

An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- [Construction](#)
- [Summary of ANYDATASET TYPE Subprograms](#)

## Construction

---

The ANYDATASET needs to be constructed value by value, sequentially.

For each data instance (of the type of the ANYDATASET), the ADDINSTANCE function must be invoked. This adds a new data instance to the ANYDATASET. Subsequently, SET\* can be called to set each value in its entirety.

The MODE of construction/access can be changed to attribute/collection element wise by making calls to PIECEWISE.

- If the type of the ANYDATASET is TYPECODE\_OBJECT, individual attributes will be set with subsequent SET\* calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent SET\* calls. Likewise on access. This call is very similar to ANYDATA.PIECEWISE call defined for the type ANYDATA.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

ENDCREATE should be called to finish the construction process (before which no access calls can be made).

---

## Summary of ANYDATASET TYPE Subprograms

**Table 241–1 ANYDATASET Type Subprograms**

Subprogram	Description
<a href="#">ADDINSTANCE Member Procedure</a> on page 241-4	Adds a new data instance to an ANYDATASET.
<a href="#">BEGINCREATE Static Procedure</a> on page 241-5	Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.
<a href="#">ENDCREATE Member Procedure</a> on page 241-6	Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.
<a href="#">GET* Member Functions</a> on page 241-7	Gets the current data value (which should be of appropriate type).
<a href="#">GETCOUNT Member Function</a> on page 241-10	Gets the number of data instances in an ANYDATASET.
<a href="#">GETINSTANCE Member Function</a> on page 241-11	Gets the next instance in an ANYDATASET.
<a href="#">GETTYPE Member Function</a> on page 241-12	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type).
<a href="#">GETTYPENAME Member Function</a> on page 241-13	Gets the AnyType describing the type of the data instances in an ANYDATASET.
<a href="#">PIECEWISE Member Procedure</a> on page 241-14	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
<a href="#">SET* Member Procedures</a> on page 241-15	Sets the current data value.

## ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

### Syntax

```
MEMBER PROCEDURE AddInstance(  
    self          IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 241–2** ADDINSTANCE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

### Exceptions

DBMS\_TYPES.invalid\_parameters: Invalid parameters.  
DBMS\_TYPES.incorrect\_usage: On incorrect usage.

### Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.

## BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE .

### Syntax

```
STATIC PROCEDURE BeginCreate(
  typecode      IN PLS_INTEGER,
  rtype         IN OUT NOCOPY AnyType,
  aset          OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 241–3 BEGINCREATE Procedure Parameter**

Parameter	Description
typecode	The typecode for the type of the ANYDATASET.
dtype	The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.
aset	The ANYDATASET being constructed.

### Exceptions

DBMS\_TYPES.invalid\_parameters: dtype is invalid (not fully constructed, and like errors.)

## ENDCREATE Member Procedure

This procedure ends Creation of a `ANYDATASET`. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE ENDCREATE(  
    self          IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 241–4** *ENDCREATE Procedure Parameter*

Parameter	Description
<code>self</code>	The <code>ANYDATASET</code> being constructed.

## GET\* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the `MODE` with which you are accessing it (depending on how we have invoked the `PIECEWISE` call). If `PIECEWISE` has not been called, we are accessing the instance in its entirety and the type of the data value should match the type of the `ANYDATASET`.

If `PIECEWISE` has been called, we are accessing the instance piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

### Syntax

```
MEMBER FUNCTION GETBDOUBLE(
    self      IN ANYDATASET,
    dbl       OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
    self      IN ANYDATASET,
    fl        OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
    self      IN ANYDATASET,
    b         OUT NOCOPY BFILE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
    self      IN ANYDATASET,
    b         OUT NOCOPY BLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
    self      IN ANYDATASET,
    c         OUT NOCOPY CHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
    self      IN ANYDATASET,
    c         OUT NOCOPY CLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
    self      IN ANYDATASET,
    col       OUT NOCOPY "<collection_type>")
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETDATE(
    self      IN ANYDATASET,
    dat       OUT NOCOPY DATE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
    self      IN ANYDATASET,
    inv       IN OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(  
    self          IN ANYDATASET,  
    inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETNCHAR(  
    self          IN ANYDATASET,  
    nc           OUT NOCOPY NCHAR)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETNCLOB(  
    self          IN ANYDATASET,  
    nc           OUT NOCOPY NCLOB)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETNUMBER(  
    self          IN ANYDATASET,  
    num          OUT NOCOPY NUMBER)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GETNVARCHAR2(  
    self          IN ANYDATASET,  
    nc           OUT NOCOPY NVARCHAR2)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETOBJECT(  
    self          IN ANYDATASET,  
    obj          OUT NOCOPY "<object_type>")  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GETRAW(  
    self          IN ANYDATASET,  
    r            OUT NOCOPY RAW)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GETREF(  
    self          IN ANYDATASET,  
    rf           OUT NOCOPY REF "<object_type>")  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GETTIMESTAMP(  
    self          IN ANYDATASET,  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETTIMESTAMPPLTZ(  
    self          IN ANYDATASET,  
    ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETTIMESTAMPPTZ(  
    self          IN ANYDATASET,  
    ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)  
RETURN PLS_INTEGER,  
  
MEMBER FUNCTION GETUROWID(  
    self          IN ANYDATASET,  
    rid          OUT NOCOPY UROWID)  
RETURN PLS_INTEGER
```

```
MEMBER FUNCTION GETVARCHAR (
  self      IN ANYDATASET,
  c         OUT NOCOPY VARCHAR)
RETURN     PLS_INTEGER;
```

```
MEMBER FUNCTION GETVARCHAR2 (
  self      IN ANYDATASET,
  c         OUT NOCOPY VARCHAR2)
RETURN     PLS_INTEGER;
```

## Parameters

**Table 241–5** *GET\* Function Parameters*

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

## Return Values

DBMS\_TYPES . SUCCESS or DBMS\_TYPES . NO\_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

## Exceptions

DBMS\_TYPES . INVALID\_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS\_TYPES . INCORRECT\_USAGE: Incorrect usage

DBMS\_TYPES . TYPE\_MISMATCH: When the expected type is different from the passed in type.

## GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

### Syntax

```
MEMBER FUNCTION GetCount (  
    self          IN ANYDATASET)  
    RETURN        PLS_INTEGER;
```

### Parameter

**Table 241–6** *GETCOUNT Function Parameter*

Parameter	Description
self	The ANYDATASET being accessed.

### Return Values

The number of data instances.

## GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed. After this function has been called, the GET\* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET\* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

### Syntax

```
MEMBER FUNCTION GETINSTANCE(  
    self          IN OUT NOCOPY ANYDATASET)  
    RETURN        PLS_INTEGER;
```

### Parameters

**Table 241–7** *GETINSTANCE Function Parameter*

Parameter	Description
self	The ANYDATASET being accessed.

### Return Values

DBMS\_TYPES.SUCCESS or DBMS\_TYPES.NO\_DATA

DBMS\_TYPES.NO\_DATA signifies the end of the ANYDATASET (all instances have been accessed).

### Usage Notes

This function should be called even before accessing the first instance.

## GETTYPE Member Function

Gets the AnyType describing the type of the data instances in an ANYDATASET.

### Syntax

```
MEMBER FUNCTION GETTYPE (  
    self          IN ANYDATASET,  
    typ           OUT NOCOPY AnyType)  
RETURN          PLS_INTEGER;
```

### Parameters

**Table 241–8** *GETTYPE Function Parameter*

Parameter	Description
self	The ANYDATASET.
typ	The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.

### Return Values

The typecode corresponding to the type of the ANYDATA.

## GETYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return *schema\_name.type\_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

### Syntax

```
MEMBER FUNCTION GETYPENAME(  
    self          IN ANYDATASET)  
    RETURN        VARCHAR2;
```

### Parameter

**Table 241–9** GETYPENAME Function Parameter

Parameter	Description
self	The ANYDATASET being constructed.

### Return Values

Type name of the ANYDATASET.

## PIECEWISE Member Procedure

This procedure sets the `MODE` of construction, access of the data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the `MODE` of construction, access of the data value to be a collection element at a time (if the data value is of a collection `TYPE`). Once this call has been made, subsequent `SET*` and `GET*` calls will sequentially obtain individual attributes or collection elements.

### Syntax

```
MEMBER PROCEDURE PIECEWISE(  
    self          IN OUT NOCOPY ANYDATASET);
```

### Parameters

**Table 241–10** *PIECEWISE Procedure Parameter*

Parameter	Description
<code>self</code>	The ANYDATASET being constructed.

### Exceptions

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters.

`DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

### Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

## SET\* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the `MODE` with which we are constructing (depending on how we have invoked the `PIECEWISE` call). The type of the current data should be the type of the `ANYDATASET` if `PIECEWISE` has NOT been called. The type should be the type of the attribute at the current position if `PIECEWISE` has been called.

### Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
  self          IN OUT NOCOPY ANYDATASET,
  dbl           IN BINARY_DOUBLE,
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFLOAT(
  self          IN OUT NOCOPY ANYDATASET,
  fl           IN BINARY_FLOAT,
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBFILE(
  self          IN OUT NOCOPY ANYDATASET,
  b            IN BFILE,
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETBLOB(
  self          IN OUT NOCOPY ANYDATASET,
  b            IN BLOB,
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETCHAR(
  self          IN OUT NOCOPY ANYDATASET,
  c            IN CHAR,
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETCLOB(
  self          IN OUT NOCOPY ANYDATASET,
  c            IN CLOB,
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETCOLLECTION(
  self          IN OUT NOCOPY ANYDATASET,
  col          IN "<collection_type>",
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETDATE(
  self          IN OUT NOCOPY ANYDATASET,
  dat          IN DATE,
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETINTERVALDS(
  self          IN OUT NOCOPY ANYDATASET,
  inv          IN INTERVAL DAY TO SECOND,
  last_elem     IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETINTERVALYM(
  self          IN OUT NOCOPY ANYDATASET,
```

```
        inv          IN INTERVAL YEAR TO MONTH,
        last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
    self          IN OUT NOCOPY ANYDATASET,
    nc            IN NCHAR,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(

s
    self          IN OUT NOCOPY ANYDATASET,
    nc            IN NClob,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self          IN OUT NOCOPY ANYDATASET,
    num          IN NUMBER,
    last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
    self          IN OUT NOCOPY ANYDATASET,
    nc            IN NVarchar2,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self          IN OUT NOCOPY ANYDATASET,
    obj          IN "<object_type>",
    last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self          IN OUT NOCOPY ANYDATASET,
    r            IN RAW,
    last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self          IN OUT NOCOPY ANYDATASET,
    rf          IN REF "<object_type>",
    last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self          IN OUT NOCOPY ANYDATASET,
    ts          IN TIMESTAMP,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPLTZ(
    self          IN OUT NOCOPY ANYDATASET,
    ts          IN TIMESTAMP WITH LOCAL TIME ZONE,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPTZ(
    self          IN OUT NOCOPY ANYDATASET,
    ts          IN TIMESTAMP WITH TIME ZONE,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
    self          IN OUT NOCOPY ANYDATASET,
    rid          IN UROWID,
    last_elem    IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETVARCHAR(
  self          IN OUT NOCOPY ANYDATASET,
  c             IN VARCHAR,
  last_elem    BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETVARCHAR2(
  self          IN OUT NOCOPY ANYDATASET,
  c             IN VARCHAR2,
  last_elem    BOOLEAN DEFAULT FALSE);
```

## Parameters

**Table 241–11** *SET\* Procedure Parameters*

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if <code>PIECEWISE</code> has been already called (for a collection). Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise.

## Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

---

---

## ANYTYPE TYPE

An `ANYTYPE TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

This chapter discusses the following:

- [Summary of ANYTYPE Subprograms](#)

---

## Summary of ANYTYPE Subprograms

**Table 242–1 ANYTYPE Type Subprograms**

Subprogram	Description
<a href="#">BEGINCREATE Static Procedure</a> on page 242-3	Creates a new instance of ANYTYPE which can be used to create a transient type description.
<a href="#">SETINFO Member Procedure</a> on page 242-4	Sets any additional information required for constructing a COLLECTION or builtin type.
<a href="#">ADDATTR Member Procedure</a> on page 242-6	Adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).
<a href="#">ENDCREATE Member Procedure</a> on page 242-7	Ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.
<a href="#">GETPERSISTENT Static Function</a> on page 242-8	Returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.
<a href="#">GETINFO Member Function</a> on page 242-9	Gets the type information for the ANYTYPE.
<a href="#">GETATTRELEMINFO Member Function</a> on page 242-10	Gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the <i>self</i> parameter is of a collection type.

## BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

### Syntax

```
STATIC PROCEDURE BEGINCREATE (
  typecode      IN          PLS_INTEGER,
  atype         OUT NOCOPY ANYTYPE);
```

### Parameters

**Table 242–2** *BEGINCREATE Procedure Parameters*

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: <ul style="list-style-type: none"> <li>▪ DBMS_TYPES.TYPECODE_OBJECT</li> <li>▪ DBMS_TYPES.TYPECODE_VARRAY or</li> <li>▪ DBMS_TYPES.TYPECODE_TABLE</li> </ul> Typecodes for builtin types: <ul style="list-style-type: none"> <li>▪ DBMS_TYPES.TYPECODE_NUMBER, and similar types.</li> </ul>
atype	ANYTYPE for a transient type

## SETINFO Member Procedure

This procedure sets any additional information required for constructing a `COLLECTION` or builtin type.

### Syntax

```
MEMBER PROCEDURE SETINFO (
  self          IN OUT NOCOPY ANYTYPE,
  prec          IN PLS_INTEGER,
  scale        IN PLS_INTEGER,
  len          IN PLS_INTEGER,
  csid         IN PLS_INTEGER,
  csfrm        IN PLS_INTEGER,
  atype        IN ANYTYPE DEFAULT NULL,
  elem_tc      IN PLS_INTEGER DEFAULT NULL,
  elem_count   IN PLS_INTEGER DEFAULT 0);
```

### Parameters

**Table 242–3 SETINFO Procedure Parameters**

Parameter	Description
<code>self</code>	The transient <code>ANYTYPE</code> that is being constructed.
<code>prec</code>	Optional. Required if typecode represents a <code>NUMBER</code> . Give precision and scale. Ignored otherwise.
<code>scale</code>	Optional. Required if typecode represents a <code>NUMBER</code> . Give precision and scale. Ignored otherwise.
<code>len</code>	Optional. Required if typecode represents a <code>RAW</code> , <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> type. Gives length.
<code>csid</code>	Required if typecode represents types requiring character information such as <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> .
<code>csfrm</code>	Required if typecode represents types requiring character information such as <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> .
<code>atype</code>	Optional. Required if collection element typecode is a user-defined type such as <code>TYPECODE_OBJECT</code> , and similar others. It is also required for a built-in type that needs user-defined type information such as <code>TYPECODE_REF</code> . This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

**Table 242–4 SETINFO Procedure Parameters - Collection Types**

Parameter	Description
<code>elem_tc</code>	Must be of the collection element's typecode (from <code>DBMS_TYPES</code> package).
<code>elem_count</code>	Pass 0 for <code>elem_count</code> if the <code>self</code> represents a nested table ( <code>TYPECODE_TABLE</code> ). Otherwise pass the collection count if <code>self</code> represents a <code>VARRAY</code> .

### Exceptions

- `DBMS_TYPES.INVALID_PARAMETER`: Invalid Parameters (typecode, typeinfo)

- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage (cannot call after calling `ENDCREATE`, and similar actions.)

### Usage Notes

It is an error to call this function on an `ANYTYPE` that represents a persistent user defined type.

## ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS\_TYPES.TYPECODE\_OBJECT).

### Syntax

```
MEMBER PROCEDURE ADDATTR (
    self          IN OUT NOCOPY ANYTYPE,
    aname         IN VARCHAR2,
    typecode      IN PLS_INTEGER,
    prec          IN PLS_INTEGER,
    scale         IN PLS_INTEGER,
    len           IN PLS_INTEGER,
    csid          IN PLS_INTEGER,
    csfrm         IN PLS_INTEGER,
    attr_type     IN ANYTYPE DEFAULT NULL);
```

### Parameters

**Table 242–5 ADDATTR Procedure Parameters**

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.
aname	Optional. Attribute's name. Could be NULL.
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
csfrm	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

### Exceptions

- DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS\_TYPES.INCORRECT\_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

## ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

### Syntax

```
MEMBER PROCEDURE ENDCREATE(  
    self          IN OUT NOCOPY ANYTYPE);
```

### Parameter

**Table 242–6** *ENDCREATE Procedure Parameter*

Parameter	Description
self	The transient ANYTYPE that is being constructed.

## GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

### Syntax

```
STATIC FUNCTION GETPERSISTENT(  
    schema_name    IN VARCHAR2,  
    type_name      IN VARCHAR2,  
    version        IN VARCHAR2 DEFAULT NULL)  
RETURN            ANYTYPE;
```

### Parameters

**Table 242–7** GETPERSISTENT Function Parameters

Parameter	Description
schema_name	Schema name of the type.
type_name	Type name.
version	Type version.

### Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

## GETINFO Member Function

This function gets the type information for the ANYTYPE.

### Syntax

```
MEMBER FUNCTION GETINFO (
  self      IN ANYTYPE,
  prec      OUT PLS_INTEGER,
  scale     OUT PLS_INTEGER,
  len       OUT PLS_INTEGER,
  csid      OUT PLS_INTEGER,
  csfrm     OUT PLS_INTEGER,
  schema_name OUT VARCHAR2,
  type_name OUT VARCHAR2,
  version   OUT varchar2,
  count     OUT PLS_INTEGER)
RETURN     PLS_INTEGER;
```

### Parameters

**Table 242–8** GETINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
count	If <i>self</i> is a VARRAY, this gives the VARRAY count. If <i>self</i> is of TYPECODE_OBJECT, this gives the number of attributes.

### Return Values

The typecode of *self*.

### Exceptions

- DBMS\_TYPES.INVALID\_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

## GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of `TYPECODE_OBJECT`). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

### Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
    self          IN ANYTYPE,
    pos           IN PLS_INTEGER,
    prec         OUT PLS_INTEGER,
    scale        OUT PLS_INTEGER,
    len          OUT PLS_INTEGER,
    csid         OUT PLS_INTEGER,
    csfrm        OUT PLS_INTEGER,
    attr_elt_type OUT ANYTYPE
    aname        OUT VARRCHAR2)
RETURN         PLS_INTEGER;
```

### Parameters

**Table 242–9** GETATTRELEMINFO Function Parameters

Parameter	Description
<code>self</code>	The <code>ANYTYPE</code> .
<code>pos</code>	If <code>self</code> is of <code>TYPECODE_OBJECT</code> , this gives the attribute position (starting at 1). It is ignored otherwise.
<code>prec</code>	If attribute/collection element typecode represents a <code>NUMBER</code> . Gives precision and scale. Ignored otherwise.
<code>scale</code>	If attribute/collection element typecode represents a <code>NUMBER</code> . Gives precision and scale. Ignored otherwise.
<code>len</code>	If typecode represents a <code>RAW</code> , <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> type. Gives length.
<code>csid</code> , <code>csfrm</code>	If typecode represents a type requiring character information such as: <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> . Gives character set ID, character set form.
<code>attr_elt_type</code>	If attribute/collection element typecode represents a user-defined type, this returns the <code>ANYTYPE</code> corresponding to it. User can subsequently describe the <i>attr_elt_type</i> .
<code>aname</code>	Attribute name (if it is an attribute of an object type, <code>NULL</code> otherwise).

### Return Values

The typecode of the attribute or collection element.

### Exceptions

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (position is beyond bounds or the `ANYTYPE` is not properly constructed).

## Oracle Streams AQ TYPEs

This chapter describes the types used with Oracle Streams Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

**See Also:** *Oracle Streams Advanced Queuing User's Guide* for information about using Oracle Streams AQ.

This chapter contains the following topics:

- [Summary of Types](#)

---

## Summary of Types

- [AQ\\$\\_AGENT](#) Type
- [AQ\\$\\_AGENT\\_LIST\\_T](#) Type
- [AQ\\$\\_DESCRIPTOR](#) Type
- [AQ\\$\\_NTFN\\_DESCRIPTOR](#) Type
- [AQ\\$\\_POST\\_INFO](#) Type
- [AQ\\$\\_POST\\_INFO\\_LIST](#) Type
- [AQ\\$\\_PURGE\\_OPTIONS\\_T](#) Type
- [AQ\\$\\_RECIPIENT\\_LIST\\_T](#) Type
- [AQ\\$\\_REG\\_INFO](#) Type
- [AQ\\$\\_REG\\_INFO\\_LIST](#) Type
- [AQ\\$\\_SUBSCRIBER\\_LIST\\_T](#) Type
- [DEQUEUE\\_OPTIONS\\_T](#) Type
- [ENQUEUE\\_OPTIONS\\_T](#) Type
- [SYS.MSG\\_PROP\\_T](#) Type
- [MESSAGE\\_PROPERTIES\\_T](#) Type
- [MESSAGE\\_PROPERTIES\\_ARRAY\\_T](#) Type
- [MSGID\\_ARRAY\\_T](#) Type

## AQ\$\_AGENT Type

This type identifies a producer or a consumer of a message.

### Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
  name      VARCHAR2(30),
  address   VARCHAR2(1024),
  protocol  NUMBER DEFAULT 0);
```

### Attributes

**Table 243–1 AQ\$\_AGENT Attributes**

Attribute	Description
name	Name of a producer or consumer of a message. The name must follow object name guidelines in the <i>Oracle Database SQL Language Reference</i> with regard to reserved characters.
address	Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.]queue[@dblink]</code> . For example, a queue named <code>emp_messages</code> in the HR queue at the site <code>db1.net</code> has the address: <code>hr.emp_messages@db1.net</code>
protocol	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Streams AQ.

## AQ\$\_AGENT\_LIST\_T Type

This type identifies the list of agents for which DBMS\_AQ.LISTEN listens.

**See Also:** ["AQ\\$\\_AGENT Type"](#) on page 243-3

### Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT  
INDEX BY BINARY_INTEGER;
```

## AQ\$\_DESCRIPTOR Type

This type specifies the Oracle Streams AQ descriptor received by the AQ PL/SQL callbacks upon notification.

**See Also:** ["MESSAGE\\_PROPERTIES\\_T Type"](#) on page 243-24

### Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
  queue_name      VARCHAR2(61),
  consumer_name   VARCHAR2(30),
  msg_id          RAW(16),
  msg_prop        MSG_PROP_T,
  gen_desc        AQ$_NTFN_DESCRIPTOR,
  msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
  ntfnRecdInGrp  NUMBER);
```

### Attributes

**Table 243–2 AQ\$\_DESCRIPTOR Attributes**

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnRecdInGrp	Notifications received in group

## AQ\$\_NTFN\_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

### Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(  
    ntfn_flags NUMBER)
```

### Attributes

**Table 243–3 AQ\$\_NTFN\_DESCRIPTOR Attributes**

Attribute	Description
ntfn_flags	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

## AQ\$\_NTFN\_MSGID\_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value  $2^{30}$  which is the max varray size.

### Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY  
AS VARRAY(1073741824) OF RAW(16);
```

## AQ\$\_POST\_INFO Type

Specifies anonymous subscriptions to which you want to post messages.

### Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (  
    name          VARCHAR2(128),  
    namespace     NUMBER,  
    payload       RAW(2000) DEFAULT NULL);
```

### Attributes

**Table 243–4 AQ\$\_POST\_INFO Attributes**

Attribute	Description
name	Name of the anonymous subscription to which you want to post
namespace	To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code>
payload	The payload to be posted to the anonymous subscription

## AQ\$\_POST\_INFO\_LIST Type

Identifies the list of anonymous subscriptions to which you want to post messages.

**See Also:** [AQ\\$\\_POST\\_INFO Type](#) on page 243-8

### Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

## AQ\$\_PURGE\_OPTIONS\_T Type

This type specifies the options available for purging a queue table.

**See Also:** [PURGE\\_QUEUE\\_TABLE Procedure](#) on page 23-42.

### Syntax

```
TYPE AQ$_PURGE_OPTIONS_T IS RECORD (
    block          BOOLEAN          DEFAULT FALSE
    delivery_mode  PLS_INTEGER     DEFAULT PERSISTENT);
```

**Table 243–5** AQ\$\_PURGE\_OPTIONS\_T Type Attributes

Attribute	Description
block	<p>TRUE/FALSE.</p> <ul style="list-style-type: none"> <li>▪ If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>.</li> <li>▪ The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</li> </ul>
delivery_mode	Kind of messages to purge, either <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT</code>

## AQ\$\_RECIPIENT\_LIST\_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

**See Also:** ["AQ\\$\\_AGENT Type"](#) on page 243-3

### Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT  
INDEX BY BINARY_INTEGER;
```

## AQ\$\_REG\_INFO Type

This type identifies a producer or a consumer of a message.

### Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
    name                VARCHAR2(128),
    namespace           NUMBER,
    callback            VARCHAR2(4000),
    context             RAW(2000) DEFAULT NULL,
    qosflags           NUMBER,
    timeout            NUMBER,
    ntfn_grouping_class NUMBER,
    ntfn_grouping_value NUMBER DEFAULT 600,
    ntfn_grouping_type NUMBER,
    ntfn_grouping_start_time  TIMESTAMP WITH TIME ZONE,
    ntfn_grouping_repeat_count NUMBER);
```

### Attributes

**Table 243–6 AQ\$\_REG\_INFO Type Attributes**

Attribute	Description
name	Specifies the name of the subscription. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queues.
namespace	Specifies the namespace of the subscription. To receive notification from Oracle Streams AQ queues, the namespace must be <code>DBMS_AQ.NAMESPACE_AQ</code> . To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code> .
callback	Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code> . For e-mail notifications, use <code>mailto://xyz@company.com</code> . For raw message payload for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=0</code> . For user-defined type message payload converted to XML for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=1</code> .
context	Specifies the context that is to be passed to the callback function
qosflags	Can be set to one or more of the following values to specify the notification quality of service: <ul style="list-style-type: none"> <li>▪ <code>NTFN_QOS_RELIABLE</code>- This value specifies that reliable notification is required. Reliable notifications persist across instance and database restarts.</li> <li>▪ <code>NTFN_QOS_PAYLOAD</code> - This value specifies that payload delivery is required. It is supported only for client notification and only for RAW queues.</li> <li>▪ <code>NTFN_QOS_PURGE_ON_NTFN</code> - This value specifies that the registration is to be purged automatically when the first notification is delivered to this registration location.</li> </ul>

**Table 243–6 (Cont.) AQ\$\_REG\_INFO Type Attributes**

Attribute	Description
<code>ntfn_grouping_class</code>	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If <code>ntfn_grouping_class</code> is 0, all other notification grouping attributes must be 0. <ul style="list-style-type: none"> <li>NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.</li> </ul>
<code>ntfn_grouping_value</code>	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until <code>ntfn_grouping_repeat_count</code> is exhausted.
<code>ntfn_grouping_type</code>	<ul style="list-style-type: none"> <li>NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default)</li> <li>NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.</li> </ul>
<code>ntfn_grouping_start_time</code>	Notification grouping start time. Notification grouping can start from a user-specified time that should be a valid timestamp with time zone. If <code>ntfn_grouping_start_time</code> is not specified when using grouping, the default is to current timestamp with time zone
<code>ntfn_grouping_repeat_count</code>	Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The <code>ntfn_grouping_repeat_count</code> , if not specified, will default to <ul style="list-style-type: none"> <li>NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.</li> </ul>

## Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

[Table 243–7](#) shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. [Table 243–8](#) shows the actions performed when XML presentation is specified.

**Table 243–7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified**

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
Oracle object type	Not supported	Not supported	Not supported

**Table 243–8 Actions Performed for Nonpersistent Queues When XML Presentation Specified**

<b>Queue Payload Type</b>	<b>OCI Callback</b>	<b>E-mail</b>	<b>PL/SQL Callback</b>
RAW	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
Oracle object type	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

## AQ\$ REG\_INFO\_LIST Type

Identifies the list of registrations to a queue.

**See Also:** ["AQ\\$ REG\\_INFO Type"](#) on page 243-12

### Syntax

```
TYPE SYS.AQ$ REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$ REG_INFO;
```

## AQ\$\_SUBSCRIBER\_LIST\_T Type

Identifies the list of subscribers that subscribe to a queue.

**See Also:** ["AQ\\$\\_AGENT Type"](#) on page 243-3

### Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT  
INDEX BY BINARY_INTEGER;
```

## DEQUEUE\_OPTIONS\_T Type

Specifies the options available for the dequeue operation.

### Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
  consumer_name    VARCHAR2(30)    DEFAULT NULL,
  dequeue_mode     BINARY_INTEGER  DEFAULT REMOVE,
  navigation       BINARY_INTEGER  DEFAULT NEXT_MESSAGE,
  visibility       BINARY_INTEGER  DEFAULT ON_COMMIT,
  wait             BINARY_INTEGER  DEFAULT FOREVER,
  msgid            RAW(16)         DEFAULT NULL,
  correlation      VARCHAR2(128)   DEFAULT NULL,
  deq_condition    VARCHAR2(4000)  DEFAULT NULL,
  signature        aq$_sig_prop    DEFAULT NULL,
  transformation   VARCHAR2(61)   DEFAULT NULL,
  delivery_mode    PLS_INTEGER     DEFAULT PERSISTENT);
```

### Attributes

**Table 243–9 DEQUEUE\_OPTIONS\_T Attributes**

Attribute	Description
consumer_name	Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL.  For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.
dequeue_mode	Specifies the locking behavior associated with the dequeue. Possible settings are:  BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.  LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.  REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.  REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.

**Table 243–9 (Cont.) DEQUEUE\_OPTIONS\_T Attributes**

Attribute	Description
navigation	<p>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:</p> <p><b>NEXT_MESSAGE:</b> Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p><b>NEXT_TRANSACTION:</b> Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.</p> <p><b>FIRST_MESSAGE:</b> Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p><b>FIRST_MESSAGE_MULTI_GROUP:</b> indicates that a call to <code>DBMS_AQ.DEQUEUE_ARRAY</code> will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the <code>ARRAY_SIZE</code> limit. Refer to the <code>TRANSACTION_GROUP</code> attribute for the message to distinguish between transaction groups.</p> <p><b>NEXT_MESSAGE_MULTI_GROUP:</b> indicates that a call to <code>DBMS_AQ.DEQUEUE_ARRAY</code> will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the <code>ARRAY_SIZE</code> limit. Refer to the <code>TRANSACTION_GROUP</code> attribute for the message to distinguish between transaction groups.</p>
visibility	<p>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the <code>BROWSE</code> dequeue mode. Possible settings are:</p> <p><b>ON_COMMIT:</b> The dequeue will be part of the current transaction. This setting is the default.</p> <p><b>IMMEDIATE:</b> The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</p>
wait	<p>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</p> <p><b>FOREVER:</b> Wait forever. This setting is the default.</p> <p><b>NO_WAIT:</b> Do not wait.</p> <p><b>number:</b> Wait time in seconds.</p>
msgid	<p>Specifies the message identifier of the message to be dequeued.</p>
correlation	<p>Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</p>

**Table 243–9 (Cont.) DEQUEUE\_OPTIONS\_T Attributes**

Attribute	Description
deq_condition	<p>A conditional expression based on the message properties, the message data properties, and PL/SQL functions.</p> <p>A <code>deq_condition</code> is specified as a Boolean expression using syntax similar to the <code>WHERE</code> clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the <code>WHERE</code> clause of a SQL query). Message properties include <code>priority</code>, <code>corrid</code> and other columns in the queue table.</p> <p>To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The <code>deq_condition</code> parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</p>
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be <code>BUFFERED</code> or <code>PERSISTENT</code> or <code>PERSISTENT_OR_BUFFERED</code> . The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

## ENQUEUE\_OPTIONS\_T Type

Specifies the options available for the enqueue operation.

### Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
  visibility          BINARY_INTEGER  DEFAULT ON_COMMIT,
  relative_msgid     RAW(16)          DEFAULT NULL,
  sequence_deviation BINARY_INTEGER  DEFAULT NULL,
  transformation     VARCHAR2(61)    DEFAULT NULL,
  delivery_mode      PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

### Attributes

**Table 243–10 ENQUEUE\_OPTIONS\_T Attributes**

Attribute	Description
visibility	Specifies the transactional behavior of the enqueue request. Possible settings are:  ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default.  IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueueing to a non-persistent queue.
relative_msgid	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.
sequence_deviation	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are:  BEFORE: The message is enqueued ahead of the message specified by relative_msgid.  TOP: The message is enqueued ahead of any other messages.
transformation	Specifies a transformation that will be applied before enqueueing the message. The return type of the transformation function must match the type of the queue.
delivery_mode	The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

## SYS.MSG\_PROP\_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

### Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
  priority          NUMBER,
  delay             NUMBER,
  expiration        NUMBER,
  correlation        VARCHAR2(128),
  attempts          NUMBER,
  exception_queue   VARCHAR2(51),
  enqueue_time      DATE,
  state             NUMBER,
  sender_id         aq$_agent,
  original_msgid    RAW(16),
  delivery_mode     NUMBER);
```

### Parameters

**Table 243–11** SYS.MSG\_PROP\_T Type Attributes

Parameter	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message.  The possible settings follow: <code>NO_DELAY</code> : The message is available for immediate dequeuing number: The number of seconds to delay the message
expiration	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.  The possible settings follow: <code>NEVER</code> : The message does not expire number: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.
correlation	Returns the identifier supplied by the producer of the message at enqueue time.
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

**Table 243–11 (Cont.) SYS.MSG\_PROP\_T Type Attributes**

Parameter	Description
exception_queue	<p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> <li>■ <code>RETRY_COUNT</code>, the number of unsuccessful dequeue attempts, has exceeded the specification for the <code>MAX_RETRIES</code> parameter in the <code>DBMS_AQADM.CREATE_QUEUE</code> procedure during queue creation.</li> </ul> <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the <code>MAX_RETRIES</code> parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than <code>MAX_RETRIES</code>. You can view <code>MAX_RETRIES</code> for a queue in the <code>ALL_QUEUES</code> data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</p> <ul style="list-style-type: none"> <li>■ A message was not dequeued before the expiration time elapsed.</li> <li>■ Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> <li>* There were no recipients for the multiconsumer destination queue.</li> <li>* Recipients were specified for a single-consumer destination queue.</li> <li>* Destination queue was an exception queue</li> <li>* There was an error when applying transformation.</li> </ul> </li> </ul> <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a <code>NULL</code> value at dequeue time.</p>
enqueue_time	<p>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> <li>■ <code>DBMS_AQ.READY</code>: The message is ready to be processed.</li> <li>■ <code>DBMS_AQ.WAITING</code>: The message delay has not yet been reached.</li> <li>■ <code>DBMS_AQ.PROCESSED</code>: The message has been processed and is retained.</li> <li>■ <code>DBMSAQ.EXPIRED</code>: The message has been moved to the exception queue.</li> </ul>

**Table 243–11 (Cont.) SYS.MSG\_PROP\_T Type Attributes**

<b>Parameter</b>	<b>Description</b>
sender_id	<p>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent.</p> <p>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified.</p> <p>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]</p>
original_msgid	This parameter is used by Oracle Streams AQ for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

## MESSAGE\_PROPERTIES\_T Type

This type is defined inside the DBMS\_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

**See Also:** [AQ\\$\\_RECIPIENT\\_LIST\\_T Type](#) on page 243-11

### Syntax

```

TYPE message_properties_t IS RECORD (
  priority          BINARY_INTEGER NOT NULL DEFAULT 1,
  delay            BINARY_INTEGER NOT NULL DEFAULT NO_DELAY,
  expiration       BINARY_INTEGER NOT NULL DEFAULT NEVER,
  correlation      VARCHAR2(128)  DEFAULT NULL,
  attempts         BINARY_INTEGER,
  recipient_list   AQ$_RECIPIENT_LIST_T,
  exception_queue  VARCHAR2(61)   DEFAULT NULL,
  enqueue_time     DATE,
  state            BINARY_INTEGER,
  sender_id        SYS.AQ$_AGENT  DEFAULT NULL,
  original_msgid   RAW(16)        DEFAULT NULL,
  signature        aq$_sig_prop   DEFAULT NULL,
  transaction_group VARCHAR2(30)  DEFAULT NULL,
  user_property    SYS.ANYDATA    DEFAULT NULL,
  delivery_mode    PLS_INTEGER    NOT NULL DEFAULT DBMS_AQ.PERSISTENT);

```

### Attributes

**Table 243–12** MESSAGE\_PROPERTIES\_T Attributes

Attribute	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	<p>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with delay set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message.</p> <p>The possible settings follow:</p> <p><code>NO_DELAY</code>: The message is available for immediate dequeuing</p> <p>number: The number of seconds to delay the message</p>

**Table 243–12 (Cont.) MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
expiration	<p>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.</p> <p>The possible settings follow:</p> <p>NEVER: The message does not expire</p> <p>number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.</p>
correlation	Returns the identifier supplied by the producer of the message at enqueue time.
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
recipient_list	<p>This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time.</p> <p>For type definition, see the "<a href="#">AQ\$_AGENT Type</a>" on page 243-3.</p>

**Table 243–12 (Cont.) MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
exception_queue	<p data-bbox="626 260 1330 317">Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p data-bbox="626 327 1330 405">Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul data-bbox="626 422 1330 527" style="list-style-type: none"> <li data-bbox="626 422 1330 527">■ <code>RETRY_COUNT</code>, the number of unsuccessful dequeue attempts, has exceeded the specification for the <code>MAX_RETRIES</code> parameter in the <code>DBMS_AQADM.CREATE_QUEUE</code> procedure during queue creation.</li> </ul> <p data-bbox="675 537 1330 747">For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the <code>MAX_RETRIES</code> parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than <code>MAX_RETRIES</code>. You can view <code>MAX_RETRIES</code> for a queue in the <code>ALL_QUEUES</code> data dictionary view.</p> <p data-bbox="675 758 1330 863">If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</p> <ul data-bbox="626 884 1330 1209" style="list-style-type: none"> <li data-bbox="626 884 1330 940">■ A message was not dequeued before the expiration time elapsed.</li> <li data-bbox="626 951 1330 1209">■ Message propagation to the specified destination queue failed with one of the following errors: <ul data-bbox="675 1014 1330 1209" style="list-style-type: none"> <li data-bbox="675 1014 1330 1071">* There were no recipients for the multiconsumer destination queue.</li> <li data-bbox="675 1081 1330 1138">* Recipients were specified for a single-consumer destination queue.</li> <li data-bbox="675 1148 1330 1176">* Destination queue was an exception queue</li> <li data-bbox="675 1186 1330 1209">* There was an error when applying transformation.</li> </ul> </li> </ul> <p data-bbox="626 1230 1330 1388">The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a <code>NULL</code> value at dequeue time.</p>
enqueue_time	<p data-bbox="626 1409 1330 1486">Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p data-bbox="626 1507 1330 1585">Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul data-bbox="626 1596 1330 1820" style="list-style-type: none"> <li data-bbox="626 1596 1330 1623">■ <code>DBMS_AQ.READY</code>: The message is ready to be processed.</li> <li data-bbox="626 1633 1330 1690">■ <code>DBMS_AQ.WAITING</code>: The message delay has not yet been reached.</li> <li data-bbox="626 1701 1330 1757">■ <code>DBMS_AQ.PROCESSED</code>: The message has been processed and is retained.</li> <li data-bbox="626 1768 1330 1820">■ <code>DBMSAQ.EXPIRED</code>: The message has been moved to the exception queue.</li> </ul>

**Table 243–12 (Cont.) MESSAGE\_PROPERTIES\_T Attributes**

Attribute	Description
sender_id	<p>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent.</p> <p>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified.</p> <p>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]</p>
original_msgid	This parameter is used by Oracle Streams AQ for propagating messages.
signature	Currently not implemented
transaction_group	<p>Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.</p>
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	<p>The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.</p>

## MESSAGE\_PROPERTIES\_ARRAY\_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties. Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T` VARRAY.

**See Also:** ["MESSAGE\\_PROPERTIES\\_T Type"](#) on page 243-24

### Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
  OF MESSAGE_PROPERTIES_T;
```

## MSGID\_ARRAY\_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

### Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

---

---

## DBFS Content Interface Types

This chapter describes public types defined to support the [DBMS\\_DBFS\\_CONTENT](#) interface.

This chapter contains the following topics:

- [Using Content Types](#)
  - Overview
  - Security Model
- [Data Structures](#)

## Using Content Types

- [Overview](#)
- [Security Model](#)

## Overview

The type definitions described in this chapter support the [DBMS\\_DBFS\\_CONTENT](#) interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

## Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) by way of the `DBFS_ROLE`. This role can be granted to users as needed.

## Data Structures

Types that support the [DBMS\\_DBFS\\_CONTENT](#) interface include both Object and Table types.

### Object Types

- [DBMS\\_DBFS\\_CONTENT\\_CONTEXT\\_T](#) Object Type
- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEM\\_T](#) Object Type
- [DBMS\\_DBFS\\_CONTENT\\_PROPERTY\\_T](#) Object Type

### Table Types

- [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEMS\\_T](#) Table Type
- [DBMS\\_DBFS\\_CONTENT\\_PROPERTIES\\_T](#) Table Type
- [DBMS\\_DBFS\\_CONTENT\\_RAW\\_T](#) Table Type

## DBMS\_DBFS\_CONTENT\_CONTEXT\_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
  AUTHID DEFINER
AS OBJECT (
  principal      VARCHAR2(32),
  acl            VARCHAR2(1024),
  owner         VARCHAR2(32),
  asof          TIMESTAMP,
  read_only     INTEGER);
```

### Fields

**Table 244–1** *DBMS\_DBFS\_CONTENT\_CONTEXT\_T Fields*

Field	Description
<code>principal</code>	File system user
<code>acl</code>	Access control list
<code>owner</code>	Path item owner
<code>asof</code>	Timestamp
<code>read_only</code>	Nonzero if the path item is read-only

## DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Object Type

This type describes a type to assist in listing the contents of a directory.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
  AUTHID DEFINER
AS OBJECT (
  path          VARCHAR2(1024),
  item_name     VARCHAR2(256),
  item_type     INTEGER);
```

### Fields

**Table 244–2** DBMS\_DBFS\_CONTENT\_LIST\_ITEM\_T Fields

Field	Description
path	Path to the path item
item_name	Name of the path item
item_type	Type of path item. (See <a href="#">DBMS_DBFS_CONTENT Constants - Path Name Types</a> )

## DBMS\_DBFS\_CONTENT\_PROPERTY\_T Object Type

This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS\_DBFS\_CONTENT interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
  AUTHID DEFINER
AS OBJECT (
  propname      VARCHAR2(32),
  propvalue     VARCHAR2(1024),
  typecode      INTEGER);
```

### Fields

**Table 244–3** DBMS\_DBFS\_CONTENT\_PROPERTY\_T Fields

Field	Description
prop_name	Name of property
prop_value	Value of property
typecode	Property type (See Constants in DBMS_TYPES)

## DBMS\_DBFS\_CONTENT\_LIST\_ITEMS\_T Table Type

This type is a variable-sized array of [DBMS\\_DBFS\\_CONTENT\\_LIST\\_ITEM\\_T Object Type](#). It is used by both the client-facing interfaces and by store providers for the [DBMS\\_DBFS\\_CONTENT](#) interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS  
TABLE OF dbms_dbfs_content_list_item_t;
```

## DBMS\_DBFS\_CONTENT\_PROPERTIES\_T Table Type

This type is a variable-sized array of property tuples of [DBMS\\_DBFS\\_CONTENT\\_PROPERTY\\_T Object Type](#). It is used by both the client-facing interfaces and by store providers for the DBMS\_DBFS\_CONTENT interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS  
TABLE OF dbms_dbfs_content_property_t;
```

## DBMS\_DBFS\_CONTENT\_RAW\_T Table Type

This type is an array of RAW. It is to enable RAW data transport for batch interfaces in the [DBMS\\_DBFS\\_CONTENT](#) interface.

### Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS  
TABLE OF RAW(32767);
```

---

---

## Database URI TYPEs

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- [Summary of URITYPE Supertype Subprograms](#)
- [Summary of HTTPURITYPE Subtype Subprograms](#)
- [Summary of DBURITYPE Subtype Subprograms](#)
- [Summary of XDBURITYPE Subtype Subprograms](#)
- [Summary of URIFACTORY Package Subprograms](#)

**See Also:**

- *Oracle XML DB Developer's Guide*

## Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

**Table 245–1 URITYPE Type Subprograms**

Method	Description
<a href="#">GETBLOB</a> on page 245-3	Returns the BLOB located at the address specified by the URL.
<a href="#">GETCLOB</a> on page 245-4	Returns the CLOB located at the address specified by the URL.
<a href="#">GETCONTENTTYPE</a> on page 245-5	Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.
<a href="#">GETEXTERNALURL</a> on page 245-6	Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.
<a href="#">GETURL</a> on page 245-7	Returns the URL, in non-escaped format, stored inside the <code>UriType</code> instance.
<a href="#">GETXML</a> on page 245-8	Returns the <code>XMLType</code> located at the address specified by the URL.

## GETBLOB

This function returns the BLOB located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getBlob() RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL.
<pre>MEMBER FUNCTION getBlob(     content OUT     VARCHAR2) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL and the content type.
<pre>FUNCTION getBlob(     csid IN NUMBER) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error

## GETCLOB

This function returns the CLOB located at the address specified by the URL. This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

<b>Syntax</b>	<b>Description</b>
<pre>MEMBER FUNCTION getClob()  RETURN clob;</pre>	This function returns the CLOB located at the address specified by the URL.
<pre>MEMBER FUNCTION getClob(     content OUT     VARCHAR2)  RETURN clob;</pre>	This function returns the CLOB located at the address specified by the URL and the content type.

<b>Parameter</b>	<b>IN / OUT</b>	<b>Description</b>
content	(OUT)	Content type of the document to which URI is pointing.

## GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

### Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

## GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

### Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

## GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

### Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

## GETXML

This function returns the `XMLType` located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getXML()  RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL.
<pre>MEMBER FUNCTION getXML(     content OUT     VARCHAR2) RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

---

## Summary of HTTPURITYPE Subtype Subprograms

The HTTPURITYPE is a subtype of the `UriType` that provides support for the HTTP protocol. This uses the `UTL_HTTP` package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

**Table 245–2 HTTPURITYPE Type Subprograms**

Method	Description
<a href="#">CREATEURI</a> on page 245-10	Creates an instance of HTTPURITYPE from the given URI.
<a href="#">GETBLOB</a> on page 245-11	Returns the BLOB located at the address specified by the URL.
<a href="#">GETCLOB</a> on page 245-12	Returns the CLOB located at the address specified by the URL.
<a href="#">GETCONTENTTYPE</a> on page 245-13	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a> on page 245-14	Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.
<a href="#">GETURL</a> on page 245-7	Returns the URL, in non-escaped format, stored inside the <code>UriType</code> instance.
<a href="#">GETXML</a> on page 245-16	Returns the XMLType located at the address specified by the URL
<a href="#">HTTPURITYPE</a> on page 245-17	Creates an instance of HTTPURITYPE from the given URI.

## CREATEURI

This static function constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

### Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN HTTPURITYPE;
```

---

Parameter	IN / OUT	Description
-----------	----------	-------------

---

<code>url</code>	(IN)	The URL string containing a valid HTTP URL; escaped format.
------------------	------	---

---

## GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

Syntax	Description
<pre>MEMBER FUNCTION getBlob() RETURN blob;</pre>	This function returns the BLOB located at the address specified by the HTTP URL.
<pre>MEMBER FUNCTION getBlob(     content OUT     VARCHAR2) RETURN blob;</pre>	This function returns the BLOB located at the address specified by the HTTP URL and the content type.
<pre>FUNCTION getBlob(     csid IN NUMBER) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## GETCLOB

This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

Syntax	Description
MEMBER FUNCTION getClob()  RETURN clob;	Returns the CLOB located at the address specified by the HTTP URL.
MEMBER FUNCTION getClob( content OUT VARCHAR2) RETURN clob;	Returns the CLOB located at the address specified by the HTTP URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

## GETCONTENTTYPE

Returns the content type of the document pointed to by the URI.

### **Syntax**

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

## GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `HTTPURITYPE` instance. The subtype instances override this member function. The `HTTPURITYPE` function does not store the prefix `http://`, but generates it for the external URL.

### Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

## GETURL

This function returns the URL, in non-escaped format, stored inside the `HTTPURITYPE` instance.

### Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

## GETXML

This function returns the `XMLType` located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

Syntax	Description
<pre>MEMBER FUNCTION getXML()  RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL.
<pre>MEMBER FUNCTION getXML(     content OUT     VARCHAR2) RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

## HTTPURITYPE

This constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

### Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE(  
    url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

---

## Summary of DBURITYPE Subtype Subprograms

The `DBURITYPE` is a subtype of the `UriType` that provides support for `DBUri`-refs. A `DBUri`-ref is an intra-database URL that can be used to reference any row or row-column data in the database. The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and view further contain the rows and columns inside them.

**Table 245–3** *DBURITYPE Type Subprograms*

Method	Description
<a href="#">CREATEURI</a> on page 245-19	Constructs a <code>DBURITYPE</code> instance.
<a href="#">DBURITYPE</a> on page 245-20	Creates an instance of <code>DBURITYPE</code> from the given URI.
<a href="#">GETBLOB</a> on page 245-21	Returns the <code>BLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
<a href="#">GETCLOB</a> on page 245-22	Returns the <code>CLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
<a href="#">GETCONTENTTYPE</a> on page 245-23	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a> on page 245-24	Returns the URL, in escaped format, stored inside the <code>DBURITYPE</code> instance.
<a href="#">GETURL</a> on page 245-25	Returns the URL, in non-escaped format, stored inside the <code>DBURITYPE</code> instance.
<a href="#">GETXML</a> on page 245-26	Returns the <code>XMLType</code> located at the address specified by the URL.

## CREATEURI

This static function constructs a `DBURITYPE` instance. Parses the URL given and creates a `DBURITYPE` instance.

### Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN DBURITYPE;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid <code>DBURITYPE</code> .

## DBURITYPE

This constructs a `DBURITYPE` instance.

### Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(  
    url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid <code>DBURITYPE</code> . The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

## GETBLOB

This function returns the BLOB located at the address specified by the URL. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getBlob() RETURN blob;</pre>	This function returns the BLOB located at the address specified by the URL.
<pre>MEMBER FUNCTION getBlob(     content OUT     VARCHAR2) RETURN blob;</pre>	This function returns the BLOB located at the address specified by the URL and the content type.
<pre>FUNCTION getBlob(     csid IN NUMBER) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## GETCLOB

This function returns the CLOB located at the address specified by the `DBURITYPE` instance. If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the `DBUri-ref` identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getClob()  RETURN clob;</pre>	Returns the CLOB located at the address specified by the <code>DBURITYPE</code> instance.
<pre>MEMBER FUNCTION getClob(     content OUT     VARCHAR2) RETURN clob;</pre>	Returns the CLOB located at the address specified by the <code>DBURITYPE</code> instance and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

## GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

### Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

## GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in Web pages.

### Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

## GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

### Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

## GETXML

This function returns the `XMLType` located at the address specified by the URL. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getXML()  RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL.
<pre>MEMBER FUNCTION getXML(     content OUT     VARCHAR2) RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

---

## Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URITYPE. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URITYPE column in a table. The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

**Table 245–4 XDBURITYPE Type Subprograms**

Method	Description
<a href="#">CREATEURI</a> on page 245-28	Returns the <code>UriType</code> corresponding to the specified URL.
<a href="#">GETBLOB</a> on page 245-29	Returns the <code>BLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
<a href="#">GETCLOB</a> on page 245-22	Returns the <code>CLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
<a href="#">GETCONTENTTYPE</a> on page 245-31	Returns the content type of the document pointed to by the URI.
<a href="#">GETEXTERNALURL</a> on page 245-24	Returns the URL, in escaped format, stored inside the <code>XDBURITYPE</code> instance.
<a href="#">GETURL</a> on page 245-25	Returns the URL, in non-escaped format, stored inside the <code>XDBURITYPE</code> instance.
<a href="#">GETXML</a> on page 245-34	Returns the <code>XMLType</code> corresponding to the contents of the document specified by the URL.
<a href="#">XDBURITYPE</a> on page 245-35	Creates an instance of <code>XDBURITYPE</code> from the given URI.

## CREATEURI

This static function constructs a `XDBURITYPE` instance. Parses the URL given and creates a `XDBURITYPE` instance.

### Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid <code>XDBURITYPE</code> .

## GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getBlob() RETURN blob;</pre>	This function returns the BLOB located at the address specified by the URL.
<pre>MEMBER FUNCTION getBlob(     content OUT     VARCHAR2) RETURN blob;</pre>	This function returns the BLOB located at the address specified by the URL and the content type.
<pre>FUNCTION getBlob(     csid IN NUMBER) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

## GETCLOB

This function returns the CLOB located at the address specified by the `XDBURITYPE` instance. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getClob()  RETURN clob;</pre>	Returns the CLOB located at the address specified by the <code>XDBUriType</code> instance.
<pre>MEMBER FUNCTION getClob(     content OUT     VARCHAR2) RETURN clob;</pre>	Returns the CLOB located at the address specified by the <code>XDBUriType</code> instance and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

## GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

### **Syntax**

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

## GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `XDBURITYPE` instance.

### Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

## GETURL

This function returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.

### Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

## GETXML

This function returns the `XMLType` located at the address specified by the URL. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getXML()  RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL.
<pre>MEMBER FUNCTION getXML(     content OUT     VARCHAR2)  RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

## XDBURITYPE

This constructs a XDBURITYPE instance.

### Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
    url      IN  VARCHAR2,
    flags    IN  RAW := NULL)
RETURN self AS RESULT;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid XDBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: <ul style="list-style-type: none"> <li>■ 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised.</li> <li>■ 2 - Indicates that any errors during document retrieval should be suppressed</li> <li>■ 3 - Both flag bits (1, 2) are enabled</li> </ul>

## Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

**Table 245–5 URIFACTORY Type Subprograms**

Method	Description
<a href="#">GETURI</a> on page 245-37	Returns the correct URL handler for the given URL string.
<a href="#">ESCAPEURI</a> on page 245-38	Returns a URL in escaped format.
<a href="#">UNESCAPEURI</a> on page 245-39	Returns a URL in unescaped format.
<a href="#">REGISTERURLHANDLER</a> on page 245-40	Registers a particular type name for handling a particular URL.
<a href="#">UNREGISTERURLHANDLER</a> on page 245-41	Unregisters a URL handler.

## GETURI

This factory method returns the correct URI handler for the given URI string. It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the [REGISTERURLHANDLER](#) function. If the prefix matches, [GETURI](#) would then use that subtype.

### Syntax

```
FUNCTION getUri(  
    url IN Varchar2)  
RETURN UriType;
```

Parameter	IN / OUT	Description
uri	(IN)	The URL string, in escaped format, containing a valid HTTP URL.

## ESCAPEURI

This function returns a URL in escaped format. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the [GETEXTERNALURL](#) function or the [GETURI](#) function to get to the URL value instead of using the attribute present in the `UriType`.

### Syntax

```
MEMBER FUNCTION escapeUri()  
RETURN varchar2;
```

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string to be returned in escaped format.

## UNESCAPEURI

This function returns a URL in unescaped format. This function is the reverse of the [ESCAPEURI](#) function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a `VARCHAR2`, the characters would be converted into the equivalent characters as defined by the database character set.

### Syntax

```
FUNCTION unescapeUri()  
RETURN varchar2;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string to be returned in unescaped format.

## REGISTERURLHANDLER

Registers a particular type name for handling a particular URL. The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUrl` static member function. This function is called by the [GETURI](#) function to generate an instance of the type. The `stripprefix` parameter indicates that the prefix must be stripped off before calling this function.

### Syntax

```
PROCEDURE registerUrlHandler(  
    prefix IN varchar2,  
    schemaName IN varchar2,  
    typename IN varchar2,  
    ignoreCase IN boolean := true,  
    stripprefix IN boolean := true);
```

Parameter	IN / OUT	Description
<code>prefix</code>	(IN)	The prefix to handle; for example, <code>http://</code> .
<code>schemaName</code>	(IN)	Name of the schema where the type resides; case sensitive.
<code>typename</code>	(IN)	The name of the type to handle the URL; case sensitive.
<code>ignoreCase</code>	(IN)	Ignore case when matching prefixes.
<code>stripprefix</code>	(IN)	Strip prefix before generating the instance of the type.

## UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

### Syntax

```
PROCEDURE unregisterUrlHandler(  
    prefix IN varchar2);
```

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to be unregistered.

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues. The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueueing or to interpret a dequeued JMS message.

This chapter contains these topics:

- [Using JMS Types](#)
  - Overview
  - Java Versus PL/SQL Data Types
  - More on Bytes, Stream and Map Messages
  - Upcasting and Downcasting Between General and Specific Messages
  - JMS Types Error Reporting
  - Oracle JMS Type Constants
  - `CONVERT_JMS_SELECTOR`
- [Summary of JMS Types](#)

---

## Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Streams AQ offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Streams AQ offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Streams AQ rules

## Java Versus PL/SQL Data Types

Data types do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

**See Also:** JMS specification 3.11.3, Conversion Provided by `StreamMessage` and `MapMessage`

### New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any data type that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

## More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionalities that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses these common functionalities.

This section contains these topics:

- [Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages](#)
- [Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages](#)
- [Differences Between Bytes and Stream Messages](#)
- [Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes](#)

### Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

### Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

---

**Note:** It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

---

## Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the `Jserv` static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

## Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

## Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the `Jserv` side. This collection is called the message store. Each `map`, `bytes`, or `stream` message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

## Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.  
This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.  
For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

## Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the `Jserv` static variable.

The `prepare` procedure, on the other hand, overwrites the message payload in the `Jserv` static variable with the payload in the PL/SQL ADT.

Oracle provides member function `get_mode` for users to query the mode.

## Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using `Java ObjectOutputStream` and bytes messages are encoded using `Java DataOutputStream`. In stream messages each primitive type is written and read as a `Java Object`, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read `Java` objects, and there are no `Java` objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support `utf-8` encoding.

---

**Note:** All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation [JavaSoft.com](http://JavaSoft.com) for details on how the data is encoded into bytes.

---

## Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either RAW or BLOB in the database. In this release Oracle Streams AQ provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

## Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Streams AQ queue. Oracle Streams AQ supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

## JMS Types Error Reporting

Table 246–1 lists Oracle JMS types related errors.

**Table 246–1 Oracle JMS Types Errors**

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the <code>get_text</code> procedure with a <code>VARCHAR2</code> parameter of <code>aq\$_jms_text_message</code> or <code>get_bytes</code> procedure with a <code>RAW</code> parameter of <code>aq\$_jms_bytes_message</code> .
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example <code>set_byte_property</code> , <code>set_short_property</code> of <code>aq\$_jms_head</code> ADT; <code>set_byte</code> and <code>set_short</code> of <code>aq\$_jms_map_message</code> ADT; <code>write_byte</code> and <code>write_short</code> of <code>aq\$_jms_stream_message</code> and <code>aq\$_jms_bytes_message</code> ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the <code>aq\$_jms_namearray</code> ADT capacity. The current size limit is 1024. You can use the <code>get_names</code> function with <code>offset</code> and <code>length</code> parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the <code>get_exception</code> static procedure of <code>aq\$_jms_map_message</code> , <code>aq\$_jms_bytes_message</code> , and <code>aq\$_jms_stream_message</code> to retrieve the exception information last thrown by the Java stored procedure.  A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT <code>aq\$_jms_exception</code> is created to represent the exception information on the PL/SQL side.
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the <code>clean</code> procedure after using one message. The <code>clean</code> procedure frees the message slot for use by other messages attempting access.

## Oracle JMS Type Constants

This section lists some useful constants when dealing with message type functions.

### DBMS\_AQ Package Constants

DBMS\_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE     CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE  CONSTANT BINARY_INTEGER;
```

### SYS.DBMS\_JMS\_PLSQL Package Constants

SYS.DBMS\_JMS\_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Streams AQ queue. They are useful during the conversion of JMS selectors to Oracle Streams AQ rules:

```
DESTPLOAD_JMSTYPE  CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT  CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA  CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE          CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT         CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER       CONSTANT PLS_INTEGER;
DATA_TYPE_LONG          CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT         CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE        CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN       CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER     CONSTANT PLS_INTEGER;
DATA_TYPE_STRING        CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES         CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW    CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST  CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL   CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE     CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH    CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE    CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE       CONSTANT PLS_INTEGER := -24196;
```

```
ERROR_JAVA_EXCEPTION CONSTANT PLS_INTEGER := -24197;  
ERROR_INVALID_ID      CONSTANT PLS_INTEGER := -24198;  
ERROR_STORE_OVERFLOW  CONSTANT PLS_INTEGER := -24199;
```

## CONVERT\_JMS\_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Streams AQ rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

### Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTPLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

#### Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

#### Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

#### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

### Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

#### Syntax

```
Function convert_jms_selector(
    selector IN VARCHAR2,
    dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

#### Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

#### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

### Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type`

parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

### Syntax

```
Function convert_jms_selector(  
    selector          IN  VARCHAR2,  
    dest_pload_type  IN  PLS_INTEGER,  
    compliant        IN  BOOLEAN )
```

### Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

### Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

## Summary of JMS Types

- [SYS.AQ\\$\\_JMS\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_TEXT\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_BYTES\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_MAP\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_STREAM\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_OBJECT\\_MESSAGE](#) Type
- [SYS.AQ\\$\\_JMS\\_NAMESARRAY](#) Type
- [SYS.AQ\\$\\_JMS\\_VALUE](#) Type
- [SYS.AQ\\$\\_JMS\\_EXCEPTION](#) Type

## SYS.AQ\$\_JMS\_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

MEMBER PROCEDURE get_bytes             (payload OUT BLOB);

```

## CONSTRUCT Static Functions

There are six CONSTRUCT static functions in this type.

### **STATIC FUNCTION construct (mtype IN INT) RETURN aq\$\_jms\_message**

Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (`TextMessage`, `BytesMessage`, `MapMessage`, `StreamMessage` or `ObjectMessage`). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the `construct` method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The `mtype` parameter must be one of the following constants described in "[Oracle JMS Type Constants](#)" on page 246-11:

```

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

```

### **STATIC FUNCTION construct (text\_msg IN aq\$\_jms\_text\_message) RETURN aq\$\_jms\_message**

Creates an `aq$_jms_message` from an `aq$_jms_text_message`.

### **STATIC FUNCTION construct (bytes\_msg IN aq\$\_jms\_bytes\_message) RETURN aq\$\_**

**jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_bytes\_message.

**STATIC FUNCTION construct (stream\_msg IN aq\$\_jms\_stream\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_stream\_message.

**STATIC FUNCTION construct (map\_msg IN aq\$\_jms\_map\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_map\_message.

**STATIC FUNCTION construct (object\_msg IN aq\$\_jms\_object\_message) RETURN aq\$\_jms\_message;**

Creates an aq\$\_jms\_message from an aq\$\_jms\_object\_message.

## Cast Methods

**cast\_to\_bytes\_msg RETURN aq\$\_jms\_bytes\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_bytes\_message. Returns an aq\$\_jms\_bytes\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_BYTES\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_BYTES\_MESSAGE.

**cast\_to\_map\_msg RETURN aq\$\_jms\_map\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_map\_message. Returns an aq\$\_jms\_map\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_MAP\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_MAP\_MESSAGE.

**cast\_to\_object\_msg RETURN aq\$\_jms\_object\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_object\_message. Returns an aq\$\_jms\_object\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_OBJECT\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_OBJECT\_MESSAGE.

**cast\_to\_stream\_msg RETURN aq\$\_jms\_stream\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_stream\_message. Returns an aq\$\_jms\_stream\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_STREAM\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_STREAM\_MESSAGE.

**cast\_to\_text\_msg RETURN aq\$\_jms\_text\_message**

Casts an aq\$\_jms\_message to an aq\$\_jms\_text\_message. Returns an aq\$\_jms\_text\_message or null if the message\_type attribute of the aq\$\_jms\_message is not DBMS\_AQ.JMS\_TEXT\_MESSAGE. This function raises ORA-24198 if the message\_type field of the aq\$\_jms\_message is not DBMS\_AQJMS.JMS\_TEXT\_MESSAGE.

## JMS Header Methods

**set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo.

**get\_replyto RETURN sys.aq\$\_agent**

Returns `replyto`, which corresponds to `JMSReplyTo`.

**set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text and corresponds to `JMSType`.

**get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

**System Properties Methods****set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID`.

**set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID`.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID`.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN VARCHAR**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods****clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception `ORA-24191` if the property name exists, `ORA-24192` if the property name is null, or `ORA-24193` if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

## Payload Methods

**set\_text (payload IN VARCHAR2)**

Sets the payload, a VARCHAR2 value, to an internal representation.

**set\_text (payload IN CLOB),**

Sets the payload, a CLOB value, to an internal representation.

**set\_bytes (payload IN RAW)**

Sets the payload, a RAW value, to an internal representation.

**set\_bytes (payload IN BLOB)**

Sets the payload, a BLOB value, to an internal representation.

**get\_text (payload OUT VARCHAR2)**

Puts the internal representation of the payload into a VARCHAR2 variable payload.

**get\_text (payload OUT CLOB)**

Puts the internal representation of the payload into a CLOB variable payload.

**get\_bytes (payload OUT RAW)**

Puts the internal representation of the payload into a RAW variable payload.

**get\_bytes (payload OUT BLOB)**

Puts the internal representation of the payload into a BLOB variable payload.

## SYS.AQ\$\_JMS\_TEXT\_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Streams AQ queue.

This section contains these topics:

MEMBER PROCEDURE get_text          (payload OUT CLOB);

```

## CONSTRUCT Function

### **STATIC FUNCTION construct RETURN aq\$\_jms\_text\_message**

Creates an empty aq\$\_jms\_text\_message.

## JMS Header Methods

### **set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

### **set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

### **get\_replyto RETURN sys.aq\$\_agent**

Returns replyto, which corresponds to JMSReplyTo.

### **get\_type RETURN VARCHAR**

Returns type, which corresponds to JMSType.

## System Properties Methods

### **set\_userid (userid IN VARCHAR)**

Sets userid, which corresponds to JMSXUserID in JMS.

### **set\_appid (appid IN VARCHAR)**

Sets appid, which corresponds to JMSXAppID in JMS.

### **set\_groupid (groupid IN VARCHAR)**

Sets groupid, which corresponds to JMSXGroupID in JMS.

### **set\_groupseq (groupseq IN INT)**

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

### **get\_userid RETURN VARCHAR**

Returns userid, which corresponds to JMSXUserID.

### **get\_appid RETURN VARCHAR**

Returns appid, which corresponds to JMSXAppID.

### **get\_groupid RETURN VARCHAR**

Returns groupid, which corresponds to JMSXGroupID.

### **get\_groupseq RETURN INT**

Returns groupseq, which corresponds to JMSXGroupSeq.

## User Properties Methods

### **clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the `property_value` exists or ORA-24192 if the `property_name` is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_short\_property property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding `property_name` passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

## Payload Methods

**set\_text (payload IN VARCHAR2)**

Sets the payload, a `VARCHAR2` value, to an internal representation.

**set\_text (payload IN CLOB)**

Sets the payload, a `CLOB` value, to an internal representation.

**get\_text (payload OUT VARCHAR2)**

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

**get\_text (payload OUT CLOB)**

Puts the internal representation of the payload into a `CLOB` variable payload.

## SYS.AQ\$\_JMS\_BYTES\_MESSAGE Type

This type is the ADT used to store a BytesMessage in an Oracle Streams AQ queue.

This section contains these topics:

- [CONSTRUCT Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

### Syntax

```

TYPE AQ$_JMS_BYTES_MESSAGE AS OBJECT(
  header      aq$_jms_header,
  bytes_len   INT,
  bytes_raw   raw(2000),
  bytes_lob   blob,
  STATIC FUNCTION construct RETURN aq$_jms_bytes_message,

MEMBER PROCEDURE write_utf           (id IN PLS_INTEGER, value IN CLOB));

```

## CONSTRUCT Function

### **STATIC FUNCTION construct RETURN aq\$\_jms\_bytes\_message**

Creates an empty aq\$\_jms\_bytes\_message.

## JMS Header Methods

### **set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

### **set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

### **get\_replyto RETURN sys.aq\$\_agent**

Returns replyto, which corresponds to JMSReplyTo.

**get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

**System Properties Methods****set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

**set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods****clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `Long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

## Payload Methods

**set\_bytes (payload in RAW)**

Sets the payload, a `RAW` value, to an internal representation.

**set\_bytes (payload in BLOB)**

Sets the payload, a `BLOB` value, to an internal representation.

**get\_bytes (payload out RAW)**

Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

**get\_bytes (payload out BLOB)**

Puts the internal representation of the payload into a `BLOB` variable payload.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_bytes_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**reset (id IN PLS\_INTEGER)**

Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session

memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

#### **clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

#### **clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

#### **get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Returns the current mode of this message. The return value is either `SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` or `SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

#### **read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN**

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

#### **read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

#### **read\_bytes (id IN PLS\_INTEGER, value OUT NO COPY BLOB, length IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads length of the bytes from bytes message stream into `value` and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_char (id IN PLS\_INTEGER) RETURN CHAR**

Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_double (id IN PLS\_INTEGER) RETURN DOUBLE PRECISION**

Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_float (id IN PLS\_INTEGER) RETURN FLOAT**

Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_int (id IN PLS\_INTEGER) RETURN INT**

Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_long (id IN PLS\_INTEGER) RETURN NUMBER**

Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_unsigned\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_unsigned\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_utf (id IN PLS\_INTEGER, value OUT NOCOPY CLOB)**

Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_boolean (id IN PLS\_INTEGER, value IN BOOLEAN)**

Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_byte (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW)**

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB)**

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW, offset IN PLS\_INTEGER, length IN PLS\_INTEGER)**

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [`offset`, `offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB, offset IN INT, length IN INT)**

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [`offset`, `offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_char (id IN PLS\_INTEGER, value IN CHAR)**

Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_double (id IN PLS\_INTEGER, value IN DOUBLE PRECISION)**

Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_float (id IN PLS\_INTEGER, value IN FLOAT)**

Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_int (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_long (id IN PLS\_INTEGER, value IN NUMBER)**

Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_short (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_utf (id IN PLS\_INTEGER, value IN VARCHAR2)**

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_utf (id IN PLS\_INTEGER, value IN CLOB)**

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

## SYS.AQ\$\_JMS\_MAP\_MESSAGE Type

This type is the ADT used to store a MapMessage in an Oracle Streams AQ queue.

This section contains these topics:

- [CONSTRUCT Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

### Syntax

```

TYPE aq$_jms_map_message AS object(
  header      aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob,
  STATIC FUNCTION construct RETURN aq$_jms_map_message,
  MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),

```

## CONSTRUCT Function

**STATIC FUNCTION construct RETURN aq\$\_jms\_map\_message**

Creates an empty aq\$\_jms\_map\_message object.

## JMS Header Methods

**set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

**set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

**get\_replyto RETURN sys.aq\$\_agent**

Returns replyto, which corresponds to JMSReplyTo.

**get\_type RETURN VARCHAR**

Returns type, which corresponds to JMSType.

## System Properties Methods

**set\_userid (userid IN VARCHAR)**

Sets userid, which corresponds to JMSXUserID in JMS.

**set\_appid (appid IN VARCHAR)**

Sets appid, which corresponds to JMSXAppID in JMS.

**set\_groupid (groupid IN VARCHAR)**

Sets groupid, which corresponds to JMSXGroupID in JMS.

**set\_groupseq (groupseq IN INT)**

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

**get\_userid RETURN VARCHAR**

Returns userid, which corresponds to JMSXUserID.

**get\_appid RETURN VARCHAR**

Returns appid, which corresponds to JMSXAppID.

**get\_groupid RETURN VARCHAR**

Returns groupid, which corresponds to JMSXGroupID.

**get\_groupseq RETURN NUMBER**

Returns groupseq, which corresponds to JMSXGroupSeq.

## User Properties Methods

**clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the `property_value` exists or ORA-24192 if the `property_name` is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding `property_name` passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

## Payload Methods

**set\_bytes (payload IN RAW)**

Sets the internal payload as a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `RAW` variable without interpreting it.

**set\_bytes (payload IN BLOB)**

Sets the internal payload as a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

**get\_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions `ORA-24190` if the length of internal payload is more than 32767.

**get\_bytes (payload OUT BLOB)**

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**set\_boolean (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BOOLEAN)**

Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_byte (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the BYTE value with the specified name in the map. Because there is no BYTE type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN RAW)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT,**

**length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a `Java IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BLOB)**

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)**

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a `Java IndexOutOfBoundsException` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_char (id IN PLS\_INTEGER, name IN VARCHAR2, value IN CHAR)**

Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_double (id IN PLS\_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)**

Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_float (id IN PLS\_INTEGER, name IN VARCHAR2, value IN FLOAT)**

This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_int (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_long (id IN PLS\_INTEGER, name IN VARCHAR2, value IN NUMBER)**

Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_short (id IN PLS\_INTEGER, name IN VARCHAR2, value IN PLS\_INTEGER)**

Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value IN VARCHAR2)**

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value IN CLOB)**

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_boolean (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**

Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_byte (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the BYTE value with the specified name. If there is no item by this name, then null is returned. Because there is no BYTE type in PL/SQL, PLS\_INTEGER is used to represent a byte. Although the PL/SQL users get an PLS\_INTEGER, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a set\_byte function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_bytes (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)**

Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL RAW type, a BLOB is always returned here. The BLOB returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_char (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN CHAR**

Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

**get\_double (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION**

Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

**get\_float (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN FLOAT**

Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_int (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the INT value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type

of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_long (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN NUMBER**

Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_short (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN PLS\_INTEGER**

Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_string (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)**

Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**get\_names (id IN PLS\_INTEGER) RETURN aq\$\_jms\_namearray**

Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

**get\_names (id IN PLS\_INTEGER, names OUT aq\$\_jms\_namearray, offset IN PLS\_INTEGER, length IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval `[offset, offset+length-1]` and interval `[0, size-1]` where `size` is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_object (id IN PLS\_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ\$\_JMS\_VALUE)**

Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned. Users can use the `type` attribute of this ADT to interpret the data. See

the map in the AQ\$\_JMS\_VALUE ADT for the correspondence among `dbms_jms_` `plssql` package constants, Java data type and AQ\$\_JMS\_VALUE attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the data type of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get\_size (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**item\_exists (id IN PLS\_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**

Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

## SYS.AQ\$\_JMS\_STREAM\_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- [CONSTRUCT Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

### Syntax

```

TYPE aq$_jms_stream_message AS object(
  header      aq$_jms_header,
  bytes_len   int,
  bytes_raw   raw(2000),
  bytes_lob   blob,
  STATIC FUNCTION construct RETURN aq$_jms_stream_message,
  MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),
  MEMBER PROCEDURE set_type    (type    IN VARCHAR),
  MEMBER FUNCTION get_replyto  RETURN sys.aq$_agent,

MEMBER PROCEDURE write_string        (id IN PLS_INTEGER, value IN CLOB));

```

## CONSTRUCT Function

### **STATIC FUNCTION construct RETURN aq\$\_jms\_stream\_message**

Creates an empty aq\$\_jms\_stream\_message object.

## JMS Header Methods

### **set\_replyto (replyto IN sys.aq\$\_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

### **set\_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

### **get\_replyto RETURN sys.aq\$\_agent**

Returns replyto, which corresponds to JMSReplyTo.

**get\_type RETURN VARCHAR**

Returns `type`, which corresponds to `JMSType`.

**System Properties Methods****set\_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

**set\_appid (appid IN VARCHAR)**

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

**set\_groupid (groupid IN VARCHAR)**

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

**set\_groupseq (groupseq IN INT)**

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

**get\_userid RETURN VARCHAR**

Returns `userid`, which corresponds to `JMSXUserID`.

**get\_appid RETURN VARCHAR**

Returns `appid`, which corresponds to `JMSXAppID`.

**get\_groupid RETURN VARCHAR**

Returns `groupid`, which corresponds to `JMSXGroupID`.

**get\_groupseq RETURN NUMBER**

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

**User Properties Methods****clear\_properties**

Clears all user properties. This procedure does not affect system properties.

**set\_boolean\_property (property\_name IN VARCHAR, property\_value IN BOOLEAN)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_byte\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

**set\_double\_property (property\_name IN VARCHAR, property\_value IN DOUBLE PRECISION)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_float\_property (property\_name IN VARCHAR, property\_value IN FLOAT)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

**set\_int\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_long\_property (property\_name IN VARCHAR, property\_value IN NUMBER)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set\_short\_property (property\_name IN VARCHAR, property\_value IN INT)**

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set\_string\_property (property\_name IN VARCHAR, property\_value IN VARCHAR)**

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get\_boolean\_property (property\_name IN VARCHAR) RETURN BOOLEAN**

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_byte\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_double\_property (property\_name IN VARCHAR) RETURN DOUBLE PRECISION**

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_float\_property (property\_name IN VARCHAR) RETURN FLOAT**

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_int\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_long\_property (property\_name IN VARCHAR) RETURN NUMBER**

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_short\_property (property\_name IN VARCHAR) RETURN INT**

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

**get\_string\_property (property\_name IN VARCHAR) RETURN VARCHAR**

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

**Payload Methods****get\_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception `ORA-24190` if the length of internal payload is more than 32767.

**get\_bytes (payload OUT BLOB)**

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` variable without interpreting it.

**set\_bytes (payload IN RAW)**

Sets the internal payload as the `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as raw bytes without interpreting it.

**set\_bytes (payload IN BLOB)**

Sets the internal payload as the `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

**prepare (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in `Jserv` session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an `ORA-24196` error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises `ORA-24197` if the Java stored procedure throws an exception during execution, `ORA-24198` if the operation ID is invalid, or `ORA-24199` if the Java stored procedure message store overflows.

**reset (id IN PLS\_INTEGER)**

Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

**flush (id IN PLS\_INTEGER)**

Takes the static variable in `Jserv` and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clear\_body (id IN PLS\_INTEGER)**

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS\_INTEGER)**

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean\_all**

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get\_mode (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or `SYS.dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read\_boolean (id IN PLS\_INTEGER) RETURN BOOLEAN**

Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_byte (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_bytes (id IN PLS\_INTEGER) RETURN BLOB**

Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read\_bytes (id IN PLS\_INTEGER, value OUT NOCOPY BLOB)**

Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_char (id IN PLS\_INTEGER) RETURN CHAR**

Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_double (id IN PLS\_INTEGER) RETURN DOUBLE PRECISION**

Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_float (id IN PLS\_INTEGER) RETURN FLOAT**

Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_int (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_long (id IN PLS\_INTEGER) RETURN NUMBER**

Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_short (id IN PLS\_INTEGER) RETURN PLS\_INTEGER**

Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type

is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_string RETURN CLOB**

Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read\_string (id IN PLS\_INTEGER, value OUT NOCOPY CLOB)**

Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read\_object (id IN PLS\_INTEGER, value OUT NOCOPY AQ\$\_JMS\_VALUE)**

Returns a general value ADT AQ\$\_JMS\_VALUE. Users can use the type attribute of this ADT to interpret the data. See [Table 246–2](#) on page 246-57 for the correspondence among `dbms_jms_plsql` package constants, Java data type and AQ\$\_JMS\_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the data type of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_boolean (id IN PLS\_INTEGER, value IN BOOLEAN)**

Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_byte (id IN PLS\_INTEGER, value IN INT)**

Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW)**

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN RAW, offset IN INT, length IN INT)**

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset`, `offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB)**

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_bytes (id IN PLS\_INTEGER, value IN BLOB, offset IN INT, length IN INT)**

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_char (id IN PLS\_INTEGER, value IN CHAR)**

Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_double (id IN PLS\_INTEGER, value IN DOUBLE PRECISION)**

Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_float (id IN PLS\_INTEGER, value IN FLOAT)**

Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_int (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_long (id IN PLS\_INTEGER, value IN NUMBER)**

Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_short (id IN PLS\_INTEGER, value IN PLS\_INTEGER)**

Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_string (id IN PLS\_INTEGER, value IN VARCHAR2)**

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write\_string (id IN PLS\_INTEGER, value IN CLOB)**

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

## **SYS.AQ\$\_JMS\_OBJECT\_MESSAGE Type**

This type is the ADT used to store an `ObjectMessage` in an Oracle Streams AQ queue.

### **Syntax**

```
TYPE aq$_jms_object_message AS object(  
    header      aq$_jms_header,  
    bytes_len   int,  
    bytes_raw   raw(2000),  
    bytes_lob   blob);
```

## SYS.AQ\$\_JMS\_NAMESARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`. The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMESARRAY AS VARRAY(1024) OF VARCHAR(100);
```

### Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,  
    offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

## SYS.AQ\$\_JMS\_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`. The `type` field in this ADT is used to decide which type of data this object is really holding. [Table 246–2](#) lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object (
  type      number(2),
  num_val   number,
  char_val  char(1),
  text_val  clob,
  bytes_val blob);
```

**Table 246–2** *AQ\$\_JMS\_VALUE Type Fields and Java Fields*

Type	Java Type	aq\$_jms_value Data Field
DBMS_JMS_PLSQL.DATA_TYPE_BYTE	byte	num_val
DBMS_JMS_PLSQL.DATA_TYPE_SHORT	short	num_val
DBMS_JMS_PLSQL.DATA_TYPE_INTEGER	int	num_val
DBMS_JMS_PLSQL.DATA_TYPE_LONG	long	num_val
DBMS_JMS_PLSQL.DATA_TYPE_FLOAT	float	num_val
DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE	double	num_val
DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN	boolean	num_val: 0 FALSE, 1 TRUE
DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER	char	char_val
DBMS_JMS_PLSQL.DATA_TYPE_STRING	java.lang.String	text_val
DBMS_JMS_PLSQL.DATA_TYPE_BYTES	byte[]	bytes_val

## SYS.AQ\$\_JMS\_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side. The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

### Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (  
    id          number, -- Reserved and not used. Right now always return 0.  
    exp_name    varchar(200),  
    err_msg     varchar(500),  
    stack       varchar(4000));
```

---

---

## Expression Filter Types

---

---

**Note:** This functionality is deprecated with Oracle Database Release 11.2 and obsoleted with Release 12.1. For details regarding obsolescence, see My Oracle Support Note ID 1244535.1

---

---

The Expression Filter feature provides a set of predefined types and public synonyms for these types. Most of these types are used for configuring index parameters with the Expression Filter procedural APIs. The `EXF$TABLE_ALIAS` type is used to support expressions defined on one or more database tables.

**See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- [Using Expression Filter Types](#)
- [Summary of Expression Filter Types](#)

---

## Using Expression Filter Types

This section contains topics that relate to using the Expression Filter Types.

- [Security Model](#)

## Security Model

The Oracle Database installation runs the `catexf.sql` script to load the `DBMS_EXPFIL` package and create the required Expression Filter schema objects in the `EXFSYS` schema.

## Summary of Expression Filter Types

Table 247–1 describes the Expression Filter object types.

All the values and names passed to the types defined in this chapter are not case sensitive. To preserve the case, enclose the values with double quotation marks.

**Table 247–1 Expression Filter Object Types**

<b>Object Type Name</b>	<b>Description</b>
<a href="#">EXF\$ATTRIBUTE</a>	Specifies the stored and indexed attributes for the Expression Filter indexes
<a href="#">EXF\$ATTRIBUTE_LIST</a>	Specifies a list of stored and indexed attributes when configuring index parameters
<a href="#">EXF\$INDEXOPER</a>	Specifies a list of common operators in predicates with a stored or an indexed attribute
<a href="#">EXF\$TABLE_ALIAS</a>	Indicates a special form of elementary attribute used to manage expressions defined on one or more database tables
<a href="#">EXF\$TEXT</a>	Associates preferences to a text attribute in an attribute set or an event structure
<a href="#">EXF\$XPATH_TAG</a>	Configures an XML element or an XML attribute for indexing a set of XPath predicates
<a href="#">EXF\$XPATH_TAGS</a>	Specifies a list of XML tags when configuring the Expression Filter index parameters

## EXF\$ATTRIBUTE

The EXF\$ATTRIBUTE type is used to handle stored and indexed attributes for the Expression Filter indexes.

### Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE AS OBJECT attr_name    VARCHAR2(350),
                                                attr_oper    EXF$INDEXOPER,
                                                attr_indexed VARCHAR2(5);
```

### Attributes

**Table 247–2 EXF\$ATTRIBUTE Attributes**

Attribute	Description
attr_name	The arithmetic expression that constitutes the stored or indexed attribute
attr_oper	The list of common operators in the predicates with the attribute. Default value: EXF\$INDEXOPER('all')
attr_indexed	TRUE if the attribute is indexed, else FALSE. Default value: FALSE.

### Usage Notes

- The EXF\$ATTRIBUTE type is used to specify the stored and indexed attributes for an Expression Filter index using the DBMS\_EXPFIL.DEFAULT\_INDEX\_PARAMETERS procedure. When values for attr\_oper and attr\_indexed fields are omitted during EXF\$ATTRIBUTE instantiation, it is considered a stored attribute with a default value for common operators (EXF\$INDEXOPER('all')).

### Examples

A stored attribute with no preference on the list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)')
```

An indexed attribute is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
              attr_indexed => 'TRUE')
```

An indexed attribute with a list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
              attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
              attr_indexed => 'TRUE')
```

## EXF\$ATTRIBUTE\_LIST

The EXF\$ATTRIBUTE\_LIST type specifies a list of stored and indexed attributes while configuring the index parameters.

### Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE_LIST as VARRAY(490) of exf$attribute;
```

### Attributes

None.

### Usage Notes

- Also see the [DEFAULT\\_INDEX\\_PARAMETERS Procedure](#) for more information

### Examples

A list of stored and indexed attributes can be represented as follows:

```
exf$attribute_list (  
    exf$attribute (attr_name => 'Model',  
                  attr_oper => exf$indexoper('='),  
                  attr_indexed => 'TRUE'),  
    exf$attribute (attr_name => 'Price',  
                  attr_oper => exf$indexoper('all'),  
                  attr_indexed => 'TRUE'),  
    exf$attribute (attr_name => 'HorsePower(Model, Year)',  
                  attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),  
                  attr_indexed => 'FALSE')  
)
```

## EXF\$INDEXOPER

The EXF\$INDEXOPER type specifies the list of common operators in predicates with a stored or an indexed attribute.

### Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$INDEXOPER as VARRAY(20) of VARCHAR2(15);
```

The values for the EXF\$INDEXOPER array are expected to be from the list in the following table:

Value	Predicate Description
=	Equality predicates
>	Greater than predicates
<	Less than predicates
>=	Greater than or equal to predicates
<=	Less than or equal to predicates
!= or <> or ^=	Not equal to predicates
IS NULL	IS NULL predicates
IS NOT NULL	IS NOT NULL predicates
ALL	All the operators listed in this table starting with the equality predicate through the IS NOT NULL predicate
NVL	Predicates with NVL (equality) operator
LIKE	Predicates with LIKE operator
BETWEEN	BETWEEN predicates

### Attributes

None.

### Usage Notes

- A value of ALL for one of the EXF\$INDEXOPER items implies that all the simple operators (=,>,<,>=,<=,!=, IS NULL, IS NOT NULL) are common in the predicates with an attribute. This value can be used along with one or more complex operators (NVL, LIKE and BETWEEN).
- A predicate with a BETWEEN operator is treated as two predicates with binary operators, one with '>=' operator and another with '<=' operator. By default, only one of these operators is indexed, and the other operator is evaluated by value substitution. However, if predicates with the BETWEEN operator are common for an attribute (stored or indexed), both the binary operators resulting from the BETWEEN operator can be indexed by specifying BETWEEN in the EXF\$INDEXOPER VARRAY. However, because this uses additional space in the predicate table, this operator should be used only when majority of predicates with an attribute use the BETWEEN operator.
- When the LIKE operator is chosen as one of the common operators for an attribute, LIKE predicates on that attributes are indexed. Indexing a LIKE operator is beneficial only if the VARCHAR2 constant on the right-hand side of the

predicate does not lead with a wild-card character. For example, indexing a LIKE operator will filter the following predicates efficiently:

```
company LIKE 'General%'  
company LIKE 'Proctor%'
```

But, the following predicates are evaluated as sparse predicates in the last stage:

```
company LIKE '%Electric'  
company LIKE "%Gamble'
```

## Examples

An attribute with a list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',  
              attr_oper => exf$indexoper('=', '<', '>', '>=', '<=', 'between'),  
              attr_indexed => 'TRUE')
```

## EXF\$TABLE\_ALIAS

A EXF\$TABLE\_ALIAS type is a special form of elementary attribute that can be included in the attribute set. These attributes manage expressions defined on one or more database tables.

### Syntax

```
CREATE or REPLACE TYPE EXF$TABLE_ALIAS AS OBJECT table_name VARCHAR2(70);
```

### Attributes

**Table 247–3 EXF\$TABLE\_ALIAS Attribute**

Attribute	Description
table_name	Name of the table with a possible schema extension

### Usage Notes

- The concept of a table alias attribute is captured in the Expression Filter dictionary and the corresponding attribute in the attribute set's object type is created with a VARCHAR2 data type. (Also see Oracle Database Rules Manager and Expression Filter Developer's Guide and [ADD\\_ELEMENTARY\\_ATTRIBUTE Procedures](#).)

### Examples

For a set of expressions defined on database tables, the corresponding table alias attributes are configured as follows:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set => 'HRAttrSet',
    attr_name => 'EMP',
    tab_alias => exf$table_alias('SCOTT.EMP'));
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set => 'HRAttrSet',
    attr_name => 'DEPT',
    tab_alias => exf$table_alias('DEPT'));
END;
/
```

The Expression column using the previous attribute set can store expressions of form EMP.JOB = 'Clerk' and EMP.NAME = 'Joe', where JOB and NAME are the names of the columns in the SCOTT.EMP table.

## EXF\$TEXT

A `EXF$TEXT` type associates preferences to a text attribute in an attribute set or an event structure.

### Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$TEXT AS OBJECT(preferences VARCHAR2(1000));
```

### Attributes

**Table 247–4** *EXF\$TEXT Attribute*

Attribute	Description
preferences	Text preference specification, such as LEXER, CLASSIFIER, and WORDLIST

### Usage Notes

- The `EXF$TEXT` attribute is used to specify the preferences for a text attribute at the time of creation. The preferences specified through the instance of `EXF$TEXT` type are used in creation of the `CTXRULE` index for the text predicates. The syntax for the text preference specification is similar to the `PARAMETERS` clause specified for a `CTXRULE` `Indextype`. [See `CREATE INDEX` syntax for `CTXRULE` `Indextype` in *Oracle Text Reference*, Release 10g Release 2.]

### Examples

A text predicate with a `LEXER` and `WORDLIST` preferences can be created using the following instance of `EXF$TEXT` object as follows:

```
EXF$TEXT ('LEXER insrpt_lexer WORDLIST insrpt_wordlist');
```

## EXF\$XPATH\_TAG

The EXF\$XPATH\_TAG type configures an XML element or an XML attribute for indexing a set of XPath predicates.

### Syntax

```
CREATE or REPLACE TYPE EXF$XPATH_TAG AS OBJECT tag_name    VARCHAR2(350),
                                              tag_indexed  VARCHAR2(5),
                                              tag_type     VARCHAR2(30);
```

### Attributes

**Table 247–5 EXF\$XPATH\_TAG Attributes**

Attribute	Description
tag_name	Name of the XML element or attribute. The name for an XML attribute is formatted as: <ElementName>@<AttributeName>. Optionally, the element name can be prefixed with its namespace URL as in <Namespace URL>:<ElementName>@<AttributeName>.
tag_indexed	TRUE if XML tag is indexed; otherwise FALSE. Default: TRUE if the tag is a positional filter. FALSE if the tag is a value filter.
tag_type	Datatype for the value in the case of value filter. NULL for positional filters.

### Usage Notes

- EXF\$XPATH\_TAG type configures an XML element or an attribute as a positional or a value filter for an Expression Filter index (see the section on index tuning for XPath predicates in *Oracle Database Rules Manager and Expression Filter Developer's Guide*). An instance of the EXF\$XPATH\_TAG type with NULL value for tag\_type configures the XML tag as a positional filter. In the current release, the only other possible values for the tag\_type attribute are strings (CHAR or VARCHAR) and such tags are configured as value filters. By default, all positional filters are indexed and the value filters are not indexed. This behavior can be overridden by setting a TRUE or FALSE value for the tag\_indexed attribute accordingly.

### Examples

An XML element can be configured as a positional filter and be indexed using the following instance of the EXF\$XPATH\_TAG type.

```
exf$xpath_tag(tag_name    => 'stereo',      --- XML element
              tag_indexed => 'TRUE',      --- indexed predicate group
              tag_type     => null)      --- positional filter
```

An XML attribute can be configured as a value filter and be indexed using the following type instance.

```
exf$xpath_tag(tag_name    => 'stereo@make', --- XML attribute
              tag_indexed => 'TRUE',      --- indexed predicate group
              tag_type     => 'VARCHAR(15)') --- value filter
```

The following commands configure the two filters shown previously using the namespace URL for the corresponding elements.

```
exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo',
```

```
        tag_indexed => 'TRUE', --- indexed predicate group
        tag_type => null)      --- positional filter

exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo@make'
        tag_indexed => 'TRUE', --- indexed predicate group
        tag_type => 'VARCHAR(15)') --- value filter
```

## EXF\$XPATH\_TAGS

The EXF\$XPATH\_TAGS type specifies a list of XML tags while configuring the Expression Filter index parameters.

### Syntax

```
CREATE or REPLACE TYPE EXF$XPATH_TAGS as VARRAY(490) of EXF$XPATH_TAG;
```

### Attributes

None.

### Usage Notes

- EXF\$XPATH\_TAGS type specifies a list of XML tags while configuring the Expression Filter index parameters. (See [DEFAULT\\_INDEX\\_PARAMETERS Procedure](#).)

### Examples

A list of XML tags configured as positional and value filters can be represented as follows:

```
exf$xpath_tags(
  exf$xpath_tag(tag_name    => 'stereo@make', --- XML attribute
                tag_indexed => 'TRUE',
                tag_type    => 'VARCHAR(15)'), --- value filter
  exf$xpath_tag(tag_name    => 'stereo',      --- XML element
                tag_indexed => 'FALSE',
                tag_type    => null),         --- positional filter
  exf$xpath_tag(tag_name    => 'memory',      --- XML element
                tag_indexed => 'TRUE',
                tag_type    => 'VARCHAR(10)') --- value filter
)
```

---

---

## Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

- [Using Logical Change Record Types](#)
  - Overview
  - Security Model
- [Summary of Logical Change Record Types](#)
- [Common Subprograms for LCR\\$\\_DDL\\_RECORD and LCR\\$\\_ROW\\_RECORD](#)

---

## Using Logical Change Record Types

This section contains topics that relate to using the logical change record (LCR) types.

- [Overview](#)
- [Security Model](#)

## Overview

In Oracle Streams, logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueueing, and dequeuing LCRs manually.

**See Also:** *Oracle Streams Concepts and Administration* for more information about LCRs

## Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

---

## Summary of Logical Change Record Types

**Table 248–1 Logical Change Record (LCR) Types**

Type	Description
<a href="#">LCR\$_DDL_RECORD</a> Type on page 248-6	Represents a data definition language (DDL) change to a database object
<a href="#">LCR\$_ROW_RECORD</a> Type on page 248-15	Represents a data manipulation language (DML) change to a database object
<a href="#">LCR\$_ROW_LIST</a> Type on page 248-47	Identifies a list of column values for a row in a table
<a href="#">LCR\$_ROW_UNIT</a> Type on page 248-48	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS\_APPLY\_ADM
- DBMS\_AQ
- DBMS\_AQADM
- DBMS\_CAPTURE\_ADM
- DBMS\_PROPAGATION\_ADM
- DBMS\_RULE
- DBMS\_RULE\_ADM
- DBMS\_STREAMS
- DBMS\_STREAMS\_ADM
- DBMS\_TRANSFORM

## LCR\$\_DDL\_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- [LCR\\$\\_DDL\\_RECORD Constructor](#)
- [Summary of LCR\\$\\_DDL\\_RECORD Subprograms](#), which also include the subprograms described in "Common Subprograms for LCR\$\_DDL\_RECORD and LCR\$\_ROW\_RECORD" on page 248-36

---

---

### Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
  - The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.
- 
- 

### LCR\$\_DDL\_RECORD Constructor

Creates a `SYS.LCR$_DDL_RECORD` object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
    source_database_name IN VARCHAR2,
    command_type         IN VARCHAR2,
    object_owner         IN VARCHAR2,
    object_name          IN VARCHAR2,
    object_type          IN VARCHAR2,
    ddl_text             IN CLOB,
    logon_user           IN VARCHAR2,
    current_schema       IN VARCHAR2,
    base_table_owner     IN VARCHAR2,
    base_table_name      IN VARCHAR2,
    tag                  IN RAW          DEFAULT NULL,
    transaction_id       IN VARCHAR2   DEFAULT NULL,
    scn                  IN NUMBER     DEFAULT NULL,
    position             IN RAW          DEFAULT NULL,
    edition_name         IN VARCHAR2   DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```

## LCR\$\_DDL\_RECORD Constructor Function Parameters

**Table 248–2 Constructor Function Parameters for LCR\$\_DDL\_RECORD**

Parameter	Description
source_database_name	<p>The database where the DDL statement occurred</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</p>
command_type	<p>The type of command executed in the DDL statement</p> <p>Set this parameter to a non-NULL value.</p> <p><b>See Also:</b> The "SQL Command Codes" table in the <i>Oracle Call Interface Programmer's Guide</i> for a complete list of command types</p> <p>The following command types <i>are not supported</i> in DDL LCRs:</p> <pre>ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME</pre> <p>The snapshot equivalents of the materialized view command types are also not supported.</p>
object_owner	The user who owns the object on which the DDL statement was executed
object_name	The database object on which the DDL statement was executed
object_type	<p>The type of object on which the DDL statement was executed</p> <p>The following are valid object types:</p> <pre>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</pre> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>

**Table 248–2 (Cont.) Constructor Function Parameters for LCR\$\_DDL\_RECORD**

Parameter	Description
ddl_text	The text of the DDL statement Set this parameter to a non-NULL value.
logon_user	The user whose session executed the DDL statement
current_schema	The schema that is used if no schema is specified explicitly for the modified database objects in <code>ddl_text</code> If a schema is specified in <code>ddl_text</code> that differs from the one specified for <code>current_schema</code> , then the function uses the schema specified in <code>ddl_text</code> . Set this parameter to a non-NULL value.
base_table_owner	If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code> ), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_owner</code> specifies the owner of the table involved. Otherwise, <code>base_table_owner</code> is NULL.
base_table_name	If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code> ), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_name</code> specifies the name of the table involved. Otherwise, <code>base_table_name</code> is NULL.
tag	A binary tag that enables tracking of the LCR For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used. <b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i>
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record for a captured LCR was written to the redo log The SCN value is meaningless for a user-created LCR.
position	The position of the LCR LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product. <b>See Also:</b> <i>Oracle Database XStream Guide</i>
edition_name	The name of the edition in which the DDL statement was executed

## Summary of LCR\$\_DDL\_RECORD Subprograms

**Table 248–3 LCR\$\_DDL\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">EXECUTE Member Procedure</a> on page 248-9	Executes the LCR under the security domain of the current user
<a href="#">GET_BASE_TABLE_NAME Member Function</a> on page 248-9	Gets the base (dependent) table name
<a href="#">GET_BASE_TABLE_OWNER Member Function</a> on page 248-10	Gets the base (dependent) table owner
<a href="#">GET_CURRENT_SCHEMA Member Function</a> on page 248-10	Gets the default schema (user) name

**Table 248-3 (Cont.) LCR\$\_DDL\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">GET_DDL_TEXT Member Procedure</a> on page 248-10	Gets the DDL text in a CLOB
<a href="#">GET_EDITION_NAME Member Function</a> on page 248-11	Gets the name of the edition in which the DDL statement was executed
<a href="#">GET_LOGON_USER Member Function</a> on page 248-11	Gets the logon user name
<a href="#">GET_OBJECT_TYPE Member Function</a> on page 248-11	Gets the type of the object involved for the DDL
<a href="#">SET_BASE_TABLE_NAME Member Procedure</a> on page 248-11	Sets the base (dependent) table name
<a href="#">SET_BASE_TABLE_OWNER Member Procedure</a> on page 248-11	Sets the base (dependent) table owner
<a href="#">SET_CURRENT_SCHEMA Member Procedure</a> on page 248-12	Sets the default schema (user) name
<a href="#">SET_DDL_TEXT Member Procedure</a> on page 248-12	Sets the DDL text
<a href="#">SET_EDITION_NAME Member Procedure</a> on page 248-12	Sets the name of the edition in which the DDL statement was executed
<a href="#">SET_LOGON_USER Member Procedure</a> on page 248-13	Sets the logon user name
<a href="#">SET_OBJECT_TYPE Member Procedure</a> on page 248-13	Sets the object type
Common Subprograms	See " <a href="#">Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD</a> " on page 248-36 for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

## EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

---

---

**Note:** The EXECUTE member procedure can be invoked only in an apply handler for an Oracle Streams apply process.

---

---

## Syntax

```
MEMBER PROCEDURE EXECUTE;
```

## GET\_BASE\_TABLE\_NAME Member Function

Gets the base (dependent) table name.

## Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```

### GET\_BASE\_TABLE\_OWNER Member Function

Gets the base (dependent) table owner.

#### Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER()  
RETURN VARCHAR2;
```

### GET\_CURRENT\_SCHEMA Member Function

Gets the current schema name.

#### Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()  
RETURN VARCHAR2;
```

### GET\_DDL\_TEXT Member Procedure

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)  
IS  
    ddl_text    CLOB;  
BEGIN  
    DBMS_OUTPUT.PUT_LINE( ' -----' );  
    DBMS_OUTPUT.PUT_LINE( '  Displaying DDL text in a DDL LCR: ' );  
    DBMS_OUTPUT.PUT_LINE( ' -----' );  
    DBMS_LOB.CREATETEMPORARY(ddl_text, true);  
    ddl_lcr.GET_DDL_TEXT(ddl_text);  
    DBMS_OUTPUT.PUT_LINE('DDL text: ' || ddl_text);  
    DBMS_LOB.FREETEMPORARY(ddl_text);  
END;  
/
```

---

---

**Note:** GET\_DDL\_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

---

---

#### Syntax

```
MEMBER FUNCTION GET_DDL_TEXT(  
    ddl_text IN/OUT CLOB);
```

#### Parameter

**Table 248–4** GET\_DDL\_TEXT Procedure Parameter

Parameter	Description
ddl_text	The DDL text in the DDL LCR

**GET\_EDITION\_NAME Member Function**

Gets the name of the edition in which the DDL statement was executed.

**See Also:** *Oracle Database Advanced Application Developer's Guide*

**Syntax**

```
MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;
```

**GET\_LOGON\_USER Member Function**

Gets the logon user name.

**Syntax**

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

**GET\_OBJECT\_TYPE Member Function**

Gets the type of the object involved for the DDL.

**Syntax**

```
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```

**SET\_BASE\_TABLE\_NAME Member Procedure**

Sets the base (dependent) table name.

**Syntax**

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
    base_table_name IN VARCHAR2);
```

**Parameter**

**Table 248–5 SET\_BASE\_TABLE\_NAME Procedure Parameter**

Parameter	Description
base_table_name	The name of the base table

**SET\_BASE\_TABLE\_OWNER Member Procedure**

Sets the base (dependent) table owner.

**Syntax**

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
    base_table_owner IN VARCHAR2);
```

## Parameter

**Table 248–6 SET\_BASE\_TABLE\_OWNER Procedure Parameter**

Parameter	Description
base_table_owner	The name of the base owner

## SET\_CURRENT\_SCHEMA Member Procedure

Sets the default schema (user) name.

## Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(  
    current_schema IN VARCHAR2);
```

## Parameter

**Table 248–7 SET\_CURRENT\_SCHEMA Procedure Parameter**

Parameter	Description
current_schema	The name of the schema to set as the current schema Set this parameter to a non-NULL value.

## SET\_DDL\_TEXT Member Procedure

Sets the DDL text.

## Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(  
    ddl_text IN CLOB);
```

## Parameter

**Table 248–8 SET\_DDL\_TEXT Procedure Parameter**

Parameter	Description
ddl_text	The DDL text Set this parameter to a non-NULL value.

## SET\_EDITION\_NAME Member Procedure

Sets the name of the edition in which the DDL statement was executed.

**See Also:** *Oracle Database Advanced Application Developer's Guide*

## Syntax

```
MEMBER PROCEDURE SET_EDITION_NAME(  
    edition_name IN VARCHAR2);
```

**Parameter****Table 248–9** *SET\_EDITION\_NAME Procedure Parameter*

Parameter	Description
edition_name	Name of the edition

**SET\_LOGON\_USER Member Procedure**

Sets the logon user name.

**Syntax**

```
MEMBER PROCEDURE SET_LOGON_USER(
    logon_user IN VARCHAR2);
```

**Parameter****Table 248–10** *SET\_LOGON\_USER Procedure Parameter*

Parameter	Description
logon_user	The name of the schema to set as the logon user

**SET\_OBJECT\_TYPE Member Procedure**

Sets the object type.

**Syntax**

```
MEMBER PROCEDURE SET_OBJECT_TYPE(
    object_type IN VARCHAR2);
```

## Parameter

**Table 248–11** *SET\_OBJECT\_TYPE Procedure Parameter*

<b>Parameter</b>	<b>Description</b>
<code>object_type</code>	<p>The object type</p> <p>The following are valid object types:</p> <ul style="list-style-type: none"><li>CLUSTER</li><li>FUNCTION</li><li>INDEX</li><li>LINK</li><li>OUTLINE</li><li>PACKAGE</li><li>PACKAGE BODY</li><li>PROCEDURE</li><li>SEQUENCE</li><li>SYNONYM</li><li>TABLE</li><li>TRIGGER</li><li>TYPE</li><li>USER</li><li>VIEW</li></ul> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The <code>GET_OBJECT_TYPE</code> member procedure returns NULL for object types not listed.</p>

## LCR\$\_ROW\_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR\$\_ROW\_LIST type.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- [LCR\\$\\_ROW\\_RECORD Constructor](#)
- [Summary of LCR\\$\\_ROW\\_RECORD Subprograms](#), which also include the subprograms described in [Common Subprograms for LCR\\$\\_DDL\\_RECORD and LCR\\$\\_ROW\\_RECORD](#) on page 248-36

---

---

### Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
  - The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.
- 
- 

**See Also:** [LCR\\$\\_ROW\\_LIST Type](#) on page 248-47

## LCR\$\_ROW\_RECORD Constructor

Creates a SYS.LCR\$\_ROW\_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
  source_database_name IN VARCHAR2,
  command_type         IN VARCHAR2,
  object_owner         IN VARCHAR2,
  object_name          IN VARCHAR2,
  tag                  IN RAW          DEFAULT NULL,
  transaction_id       IN VARCHAR2    DEFAULT NULL,
  scn                  IN NUMBER      DEFAULT NULL,
  old_values           IN SYS.LCR$_ROW_LIST DEFAULT NULL,
  new_values           IN SYS.LCR$_ROW_LIST DEFAULT NULL,
  position             IN RAW          DEFAULT NULL,
  statement            IN VARCHAR2    DEFAULT NULL,
  bind_variables       IN SYS.LCR$_ROW_LIST DEFAULT NULL,
  bind_by_position     IN VARCHAR2    DEFAULT 'N')
RETURN SYS.LCR$_ROW_RECORD;
```

## LCR\$\_ROW\_RECORD Constructor Function Parameters

**Table 248–12 Constructor Function Parameters for LCR\$\_ROW\_RECORD**

Parameter	Description
source_database_name	<p>The database where the row change occurred</p> <p>If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.</p>
command_type	<p>The type of command executed in the DML statement</p> <p>Set this parameter to a non-NULL value.</p> <p>Valid values are the following:</p> <p>INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM</p> <p>If INSERT, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.</p> <p>If UPDATE, then ensure that the LCR has a new_values collection that is not empty and an old_values collection that is not empty.</p> <p>If DELETE, then ensure that the LCR has a NULL or empty new_values collection and an old_values collection that is not empty.</p> <p>If LOB ERASE, LOB WRITE, or LOB TRIM, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.</p>
object_owner	<p>The user who owns the table on which the row change occurred</p> <p>Set this parameter to a non-NULL value.</p>
object_name	<p>The table on which the DML statement was executed</p> <p>Set this parameter to a non-NULL value.</p>
tag	<p>A binary tag that enables tracking of the LCR</p> <p>For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.</p> <p><b>See Also:</b> <i>Oracle Streams Replication Administrator's Guide</i></p>
transaction_id	The identifier of the transaction
scn	<p>The SCN at the time when the change record was written to the redo log</p> <p>The SCN value is meaningless for a user-created LCR.</p>
old_values	<p>The column values for the row before the DML change</p> <p>If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.</p>

**Table 248–12 (Cont.) Constructor Function Parameters for LCR\$\_ROW\_RECORD**

Parameter	Description
new_values	The column values for the row after the DML change  If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values.  If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.
position	The position of the LCR  LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product.  <b>See Also:</b> <i>Oracle Database XStream Guide</i>
statement	This parameter is reserved for internal use only.
bind_variables	This parameter is reserved for internal use only.
bind_by_position	This parameter is reserved for internal use only.

---

**Note:** Starting with Oracle Database 11g Release 2 (11.2.0.2), this constructor function includes the following new parameters: `statement`, `bind_variables`, and `bind_by_position`.

---

## Summary of LCR\$\_ROW\_RECORD Subprograms

**Table 248–13 LCR\$\_ROW\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">ADD_COLUMN Member Procedure</a> on page 248-18	Adds the value as old or new, depending on the value type specified, for the column
<a href="#">CONVERT_LONG_TO_LOB_CHUNK Member Procedure</a> on page 248-20	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
<a href="#">DELETE_COLUMN Member Procedure</a> on page 248-20	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
<a href="#">EXECUTE Member Procedure</a> on page 248-20	Executes the LCR under the security domain of the current user
<a href="#">GET_LOB_INFORMATION Member Function</a> on page 248-22	Gets the LOB information for the column
<a href="#">GET_LOB_OFFSET Member Function</a> on page 248-22	Gets the LOB offset for the specified column
<a href="#">GET_LOB_OPERATION_SIZE Member Function</a> on page 248-23	Gets the operation size for the LOB column
<a href="#">GET_LONG_INFORMATION Member Function</a> on page 248-23	Gets the LONG information for the column
<a href="#">GET_ROW_TEXT Member Procedure</a> on page 248-24	Gets the SQL statement for the change that is encapsulated in the LCR

**Table 248–13 (Cont.) LCR\$\_ROW\_RECORD Type Subprograms**

Subprogram	Description
<a href="#">GET_VALUE Member Function</a> on page 248-25	Gets the old or new value for the specified column, depending on the value type specified
<a href="#">GET_VALUES Member Function</a> on page 248-26	Gets a list of old or new values, depending on the value type specified
<a href="#">GET_WHERE_CLAUSE Member Procedure</a> on page 248-26	Gets a WHERE clause for the change that is encapsulated in the row LCR
<a href="#">GET_XML_INFORMATION Member Function</a> on page 248-28	Gets the XML information for the specified column
<a href="#">IS_STATEMENT_LCR Member Function</a> on page 248-28	Reserved for internal use only
<a href="#">KEEP_COLUMNS Member Procedure</a> on page 248-28	Keeps a list of columns a row LCR
<a href="#">RENAME_COLUMN Member Procedure</a> on page 248-29	Renames a column in an LCR
<a href="#">SET_LOB_INFORMATION Member Procedure</a> on page 248-29	Sets LOB information for the column
<a href="#">SET_LOB_OFFSET Member Procedure</a> on page 248-30	Sets the LOB offset for the specified column
<a href="#">SET_LOB_OPERATION_SIZE Member Procedure</a> on page 248-31	Sets the operation size for the LOB column
<a href="#">SET_ROW_TEXT Member Procedure</a> on page 248-31	Reserved for internal use only
<a href="#">SET_VALUE Member Procedure</a> on page 248-31	Overwrites the value of the specified column
<a href="#">SET_VALUES Member Procedure</a> on page 248-33	Replaces the existing old or new values for the LCR, depending on the value type specified
<a href="#">SET_XML_INFORMATION Member Procedure</a> on page 248-35	Sets the XML information for the column
Common Subprograms	See <a href="#">Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD</a> on page 248-36 for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

### ADD\_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

---

**Note:** To set a column value that already exists, run [SET\\_VALUE](#).

---

**See Also:** [SET\\_VALUE Member Procedure](#) on page 248-31

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lob` is set to `FALSE` for

the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

---

---

**Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
  - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
  - When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.
- 
- 

## Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
    value_type    IN VARCHAR2,
    column_name   IN VARCHAR2,
    column_value  IN ANYDATA);
```

## Parameters

**Table 248–14** *ADD\_COLUMN Procedure Parameters*

Parameter	Description
<code>value_type</code>	The type of value to add for the column Specify <code>old</code> to add the old value of the column. Specify <code>new</code> to add the new value of the column.
<code>column_name</code>	The column name This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.
<code>column_value</code>	The value of the column If <code>NULL</code> , then this procedure raises an error. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified. A <code>NULL</code> column value can be specified by encapsulating the <code>NULL</code> value in an <code>ANYDATA</code> wrapper.

## CONVERT\_LONG\_TO\_LOB\_CHUNK Member Procedure

Converts LONG data in a row LCR into a CLOB, or converts LONG RAW data in a row LCR into a BLOB.

This procedure can change the operation code from LONG WRITE to LOB WRITE for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- LONG data can be sent as a part of a row LCR with one of the following operation codes: INSERT, UPDATE, or LONG\_WRITE. Because LONG data can be sent in multiple pieces, make sure that this method is invoked on either none or all LONG pieces.
- LOB to LONG conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

**See Also:** *Oracle Streams Replication Administrator's Guide*

### Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;
```

## DELETE\_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

### Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
    column_name IN VARCHAR2,
    value_type  IN VARCHAR2 DEFAULT '*');
```

### Parameters

**Table 248–15** *DELETE\_COLUMN Procedure Parameters*

Parameter	Description
column_name	The column name An error is raised if the column does not exist in the LCR.
value_type	The type of value to delete for the column Specify old to delete the old value of the column. Specify new to delete the new value of the column. If * is specified, then the procedure deletes both the old and new values.

## EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR is in a queue and was last enqueued by a mechanism other than an Oracle Streams capture process, such as an Oracle Streams apply process or an application.
- The LCR has been constructed using the `LCR$_ROW_RECORD` constructor function but has not been enqueued.
- The LCR is in the error queue.

---

**Note:** Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

---

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lob` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lob` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.
- A DML or error handler configured with `assemble_lob` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

## Syntax

```
MEMBER PROCEDURE EXECUTE(
    conflict_resolution IN BOOLEAN);
```

## Parameters

**Table 248–16 EXECUTE Procedure Parameters**

Parameter	Description
<code>conflict_resolution</code>	<p>If <code>TRUE</code>, then any conflict resolution defined for the table using the <code>SET_UPDATE_CONFLICT_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package is used to resolve conflicts resulting from the execution of the LCR.</p> <p>If <code>FALSE</code>, then conflict resolution is not used.</p> <p>An error is raised if this parameter is not specified or is set to <code>NULL</code>.</p>

## GET\_LOB\_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB          CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the `use_old` parameter is a convenient way to get the value of the columns.

### Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
  value_type  IN VARCHAR2,
  column_name IN VARCHAR2,
  use_old     IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

### Parameters

**Table 248–17 GET\_LOB\_INFORMATION Function Parameters**

Parameter	Description
<code>value_type</code>	The type of value to return for the column, either <code>old</code> or <code>new</code>
<code>column_name</code>	The name of the column
<code>use_old</code>	<p>If Y and <code>value_type</code> is <code>new</code>, and no new value exists, then the function returns the corresponding old value. If N and <code>value_type</code> is <code>new</code>, then the function does not return the old value if no new value exists.</p> <p>If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not UPDATE, then the function ignores the value of the <code>use_old</code> parameter.</p> <p>NULL is not a valid specification for the <code>use_old</code> parameter.</p>

## GET\_LOB\_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is `DBMS_LCR.LAST_LOB_CHUNK` or `DBMS_LCR.LOB_CHUNK`
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

### Syntax

```
GET_LOB_OFFSET(
  value_type  IN VARCHAR2,
```

```

column_name IN VARCHAR2)
RETURN NUMBER;

```

## Parameters

**Table 248–18** *GET\_LOB\_OFFSET Procedure Parameters*

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

## GET\_LOB\_OPERATION\_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS\_LCR.LAST\_LOB\_CHUNK

Otherwise, returns NULL.

## Syntax

```

MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
  value_type IN VARCHAR2,
  column_name IN VARCHAR2)
RETURN NUMBER,

```

## Parameters

**Table 248–19** *GET\_LOB\_OPERATION\_SIZE Function Parameters*

Parameter	Description
value_type	The type of value to return for the column Currently, only new can be specified.
column_name	The name of the LOB column

## GET\_LONG\_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

```

DBMS_LCR.NOT_A_LONG          CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG          CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG        CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK         CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK    CONSTANT NUMBER := 5;

```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the `use_old` parameter is a convenient way to get the value of the columns.

## Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

## Parameters

**Table 248–20 GET\_LONG\_INFORMATION Function Parameters**

Parameter	Description
<code>value_type</code>	The type of value to return for the column, either <code>old</code> or <code>new</code>
<code>column_name</code>	The name of the column
<code>use_old</code>	<p>If Y and <code>value_type</code> is new, and no new value exists, then the function returns the corresponding old value. If N and <code>value_type</code> is new, then the function does not return the old value if no new value exists.</p> <p>If <code>value_type</code> is old or if the <code>command_type</code> of the row LCR is not UPDATE, then the function ignores the value of the <code>use_old</code> parameter.</p> <p>NULL is not a valid specification for the <code>use_old</code> parameter.</p>

## GET\_ROW\_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

## Syntax

The following procedure returns the SQL statement in a CLOB data type.

```
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text IN/OUT CLOB);
```

The following procedure returns the SQL statement with bind variables in a CLOB data type.

```
MEMBER PROCEDURE GET_ROW_TEXT(
    row_text IN/OUT CLOB,
    variable_list IN/OUT LCR$_ROW_LIST,
    bind_var_syntax IN VARCHAR2 DEFAULT ':');
```

**See Also:** ["LCR\\$\\_ROW\\_LIST Type"](#) on page 248-47

## Parameters

**Table 248–21 GET\_ROW\_TEXT Procedure Parameters**

Parameter	Description
row_text	The SQL statement for the change that is encapsulated in the LCR
variable_list	The values for the bind variables in the order of the bind variables
bind_var_syntax	The syntax for the bind variables One of the following values is valid: <ul style="list-style-type: none"> <li>■ Specify :, the default, for bind values to be in the form :1, :2, and so on.</li> <li>■ Specify ? for bind values to be in the form ?.</li> </ul>

## GET\_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use\_old parameter is a convenient way to get the value of a column.

## Syntax

```
MEMBER FUNCTION GET_VALUE(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN ANYDATA;
```

## Parameters

**Table 248–22 GET\_VALUE Function Parameters**

Parameter	Description
value_type	The type of value to return for the column Specify old to get the old value for the column. Specify new to get the new value for the column.
column_name	The column name If the column is present and has a NULL value, then the function returns an ANYDATA instance containing a NULL value. If the column value is absent, then the function returns a NULL.
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function returns NULL if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

## GET\_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the `use_old` parameter is a convenient way to get the values of all columns.

### Syntax

```
MEMBER FUNCTION GET_VALUES (
    value_type IN VARCHAR2,
    use_old    IN VARCHAR2 DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

### Parameters

**Table 248–23 GET\_VALUES Function Parameters**

Parameter	Description
<code>value_type</code>	The type of values to return  Specify <code>old</code> to return a list of old values. Specify <code>new</code> to return a list of new values.
<code>use_old</code>	If Y and <code>value_type</code> is <code>new</code> , then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and the old values where there are no new values.  If N and <code>value_type</code> is <code>new</code> , then the function returns a list of all new values in the LCR without returning any old values.  If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not UPDATE, then the function ignores the value of the <code>use_old</code> parameter.  NULL is not a valid specification for the <code>use_old</code> parameter.

## GET\_WHERE\_CLAUSE Member Procedure

Gets a WHERE clause for the change that is encapsulated in the row LCR.

Use the WHERE clause returned by `GET_WHERE_CLAUSE` instead of using the ROWID, because the ROWID is not ANSI compatible. The generated WHERE clause might not match the WHERE clause in the original DML operation.

The ROWID of an INSERT statement is the ROWID of the new row created by the INSERT. The WHERE clause generated for an INSERT operation identifies the new row. Therefore, the generated WHERE clause includes all of the new values inserted.

For example, consider the following insert into the `hr.departments` table:

```
INSERT INTO hr.departments (
    department_id, department_name, manager_id, location_id)
VALUES (10, 'HR', 20, 40);
```

The generated WHERE clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated WHERE clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
      "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The ROWID of an UPDATE statement is the ROWID of the row that was updated. The WHERE clause generated for an UPDATE operation identifies the row after the UPDATE

executes. The generated WHERE clause is based on the old and new values of the UPDATE.

For example, consider the following update to the `hr.departments` table:

```
UPDATE hr.departments SET department_name='Management'
WHERE department_name='Administration' AND location_id = 20 AND
      manager_id = 30 AND department_id = 10;
```

The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the generated WHERE clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
      "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT\_NAME", because the new value is the value of the column after the UPDATE. For the rest of the columns, the old values are used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The generated WHERE clause consists of all the old column values present in the DELETE operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

## Syntax

The following procedure returns the WHERE clause of a SQL statement in a CLOB data type.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
  where_clause IN/OUT CLOB);
```

The following procedure returns the WHERE clause of a SQL statement with bind variables in a CLOB data type.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
  where_clause IN/OUT CLOB,
  variable_list IN/OUT LCR$_ROW_LIST,
  bind_var_syntax IN VARCHAR2 DEFAULT ':');
```

### See Also:

- [LCR\\$\\_ROW\\_LIST Type](#) on page 248-47
- *Oracle Streams Concepts and Administration*

## Parameters

**Table 248–24 GET\_WHERE\_CLAUSE Procedure Parameters**

Parameter	Description
<code>where_clause</code>	The WHERE clause of the SQL statement for the change that is encapsulated in the LCR
<code>variable_list</code>	The values for the bind variables in the order of the bind variables

**Table 248–24 (Cont.) GET\_WHERE\_CLAUSE Procedure Parameters**

Parameter	Description
bind_var_syntax	<p>The syntax for the bind variables</p> <p>One of the following values is valid:</p> <ul style="list-style-type: none"> <li>■ Specify :, the default, for bind values to be in the form :1, :2, and so on.</li> <li>■ Specify ? for bind values to be in the form ?.</li> </ul>

## GET\_XML\_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML    CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC   CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF  CONSTANT NUMBER := 3;
```

DBMS\_LCR.NOT\_XML indicates that the column is not an XMLType column. DBMS\_LCR.XML\_DOC indicates that the column contains an XML document. DBMS\_LCR.XML\_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

## Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
    column_name IN VARCHAR2)
RETURN NUMBER;
```

## Parameter

**Table 248–25 GET\_XML\_INFORMATION Function Parameter**

Parameter	Description
column_name	The column name

## IS\_STATEMENT\_LCR Member Function

This function is reserved for internal use only.

---

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

---

## KEEP\_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.

## Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(
    column_list IN VARCHAR2,
    value_type  IN VARCHAR2 DEFAULT '*');
```

## Parameters

**Table 248–26** *KEEP\_COLUMNS Procedure Parameters*

Parameter	Description
column_list	The names of the columns kept for the row LCR Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.
value_type	The type of value for which to keep the columns Specify <code>old</code> to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify <code>new</code> to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If <code>*</code> is specified, then the procedure keeps both the old and the new columns.

## RENAME\_COLUMN Member Procedure

Renames a column in a row LCR.

## Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
    from_column_name IN VARCHAR2,
    to_column_name   IN VARCHAR2,
    value_type       IN VARCHAR2 DEFAULT '*');
```

## Parameters

**Table 248–27** *RENAME\_COLUMN Procedure Parameters*

Parameter	Description
from_column_name	The existing column name
to_column_name	The new column name An error is raised if a column with the specified name already exists.
value_type	The type of value for which to rename the column Specify <code>old</code> to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify <code>new</code> to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If <code>*</code> is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.

## SET\_LOB\_INFORMATION Member Procedure

Sets LOB information for the column.

---

**Note:** When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

---

## Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
  value_type      IN  VARCHAR2,
  column_name     IN  VARCHAR2,
  lob_information IN  NUMBER);
```

## Parameters

**Table 248–28** *SET\_LOB\_INFORMATION Procedure Parameters*

Parameter	Description												
value_type	The type of value to set for the column, either old or new Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.												
column_name	The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.												
lob_information	Specify one of the following values: <table border="0" style="margin-left: 20px;"> <tr> <td>DBMS_LCR.NOT_A_LOB</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.NULL_LOB</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.INLINE_LOB</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td> <td>CONSTANT NUMBER := 5;</td> </tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td> <td>CONSTANT NUMBER := 6;</td> </tr> </table>	DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;	DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;	DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;	DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;	DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;	DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;
DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;												
DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;												
DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;												
DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;												
DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;												
DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;												

## SET\_LOB\_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

---

---

**Note:** When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

---

---

## Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
  value_type      IN  VARCHAR2,
  column_name     IN  VARCHAR2,
  lob_offset      IN  NUMBER);
```

## Parameters

**Table 248–29** *SET\_LOB\_OFFSET Procedure Parameters*

Parameter	Description
value_type	The type of value to set for the column Currently, only new can be specified.
column_name	The column name An error is raised if the column value does not exist in the LCR.

**Table 248–29 (Cont.) SET\_LOB\_OFFSET Procedure Parameters**

Parameter	Description
lob_offset	The LOB offset number  Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.

**SET\_LOB\_OPERATION\_SIZE Member Procedure**

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

---

**Note:** When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

---

**Syntax**

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
  value_type      IN  VARCHAR2,
  column_name     IN  VARCHAR2,
  lob_operation_size IN NUMBER);
```

**Parameters****Table 248–30 SET\_LOB\_OPERATION\_SIZE Procedure Parameters**

Parameter	Description
value_type	The type of value to set for the column  Currently, only new can be specified.
column_name	The name of the LOB column  An exception is raised if the column value does not exist in the LCR.
lob_operation_size	If lob_information for the LOB is or will be DBMS_LOB.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE.  Otherwise, set to NULL.

**SET\_ROW\_TEXT Member Procedure**

This procedure is reserved for internal use only.

---

**Note:** This functionality is available starting with Oracle Database 11g Release 2 (11.2.0.2).

---

**SET\_VALUE Member Procedure**

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

---

---

**Note:** To add a column to a row LCR, run `ADD_COLUMN`.

---

---

**See Also:** [ADD\\_COLUMN Member Procedure](#) on page 248-18

### Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

---

---

**Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
  - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
  - When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a `LONG` or `LONG RAW` column.
- 
- 

### Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value an `XMLType` column, specify the `XMLType` for the `column_value` parameter. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` column is represented by the original (nonassembled) row LCRs.

---

---

**Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with `XMLType` columns.
  - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.
- 
- 

## Syntax

```
MEMBER PROCEDURE SET_VALUE(
  value_type  IN  VARCHAR2,
  column_name IN  VARCHAR2,
  column_value IN ANYDATA);
```

## Parameters

**Table 248–31** *SET\_VALUE Procedure Parameters*

Parameter	Description
<code>value_type</code>	The type of value to set  Specify <code>old</code> to set the old value of the column. Specify <code>new</code> to set the new value of the column.
<code>column_name</code>	The column name  An error is raised if the specified <code>column_value</code> does not exist in the LCR for the specified <code>column_type</code> .
<code>column_value</code>	The new value of the column  If <code>NULL</code> is specified, then this procedure raises an error. To set the value to <code>NULL</code> , encapsulate the <code>NULL</code> in an <code>ANYDATA</code> instance.  If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

## SET\_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

### Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), then you can use this member procedure in the handler procedure. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated LOB locator

is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

---

---

**Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
  - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
  - When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on `LONG` or `LONG RAW` columns.
- 
- 

**Considerations for XMLType Columns**

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value of one or more `XMLType` columns in a row LCR, specify an `XMLType` for each `XMLType` column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` columns are represented by the original (nonassembled) row LCRs.

---

---

**Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with `XMLType` columns.
  - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.
- 
- 

**Syntax**

```
MEMBER PROCEDURE SET_VALUES(
```

```
value_type IN VARCHAR2,
value_list IN SYS.LCR$_ROW_LIST);
```

## Parameters

**Table 248–32 SET\_VALUES Procedure Parameters**

Parameter	Description
value_type	The type of values to replace Specify old to replace the old values. Specify new to replace the new values.
value_list	List of values to replace the existing list Use a NULL or an empty list to remove all values. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

## SET\_XML\_INFORMATION Member Procedure

Sets the XML information for the column.

## Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
    column_name IN VARCHAR2,
    xml_information IN NUMBER);
```

## Parameters

**Table 248–33 SET\_XML\_INFORMATION Procedure Parameters**

Parameter	Description
column_name	The name of the column An exception is raised if the column value does not exist in the LCR.
xml_information	Specify one of the following values: <pre>DBMS_LCR.NOT_XML    CONSTANT NUMBER := 1; DBMS_LCR.XML_DOC    CONSTANT NUMBER := 2; DBMS_LCR.XML_DIFF   CONSTANT NUMBER := 3;</pre> DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

## Common Subprograms for LCR\$\_DDL\_RECORD and LCR\$\_ROW\_RECORD

The following functions and procedures are common to both the LCR\$\_DDL\_RECORD and LCR\$\_ROW\_RECORD type.

**See Also:** For descriptions of the subprograms for these types that are exclusive to each type:

- ["Summary of LCR\\$\\_DDL\\_RECORD Subprograms"](#) on page 248-8
- ["Summary of LCR\\$\\_ROW\\_RECORD Subprograms"](#) on page 248-17

**Table 248–34 Summary of Common Subprograms for DDL and Row LCR Types**

Subprogram	Description
<a href="#">GET_COMMAND_TYPE Member Function</a> on page 248-37	Gets the command type of the logical change record (LCR)
<a href="#">GET_COMMIT_SCN Member Function</a> on page 248-37	Gets the commit system change number (SCN) of the transaction to which the current LCR belongs
<a href="#">GET_COMMIT_SCN_FROM_POSITION Static Function</a> on page 248-37	Gets the commit SCN of a transaction from the input position, which is generated by an XStream outbound server
<a href="#">GET_COMMIT_TIME</a> on page 248-38	Gets the commit time of the transaction to which the current LCR belongs
<a href="#">GET_COMPATIBLE Member Function</a> on page 248-38	Gets the minimal database compatibility required to support the LCR
<a href="#">GET_EXTRA_ATTRIBUTE Member Function</a> on page 248-39	Gets the value for the specified extra attribute in the LCR
<a href="#">GET_OBJECT_NAME Member Function</a> on page 248-40	Gets the name of the object that is changed by the LCR
<a href="#">GET_OBJECT_OWNER Member Function</a> on page 248-40	Gets the owner of the object that is changed by the LCR
<a href="#">GET_POSITION Member Function</a> on page 248-41	Gets the position of the current LCR
<a href="#">GET_SCN Member Function</a> on page 248-41	Gets the SCN of the LCR
<a href="#">GET_SCN_FROM_POSITION Static Function</a> on page 248-41	Gets the SCN from the input position, which is generated by an XStream outbound server
<a href="#">GET_SOURCE_DATABASE_NAME Member Function</a> on page 248-41	Gets the source database name.
<a href="#">GET_SOURCE_TIME Member Function</a> on page 248-42	Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created
<a href="#">GET_TAG Member Function</a> on page 248-42	Gets the tag for the LCR
<a href="#">GET_THREAD_NUMBER Member Function</a> on page 248-42	Gets the thread number of the database instance that made the change that is encapsulated in the LCR

**Table 248–34 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types**

Subprogram	Description
<a href="#">GET_TRANSACTION_ID Member Function</a> on page 248-42	Gets the transaction identifier of the LCR
<a href="#">IS_NULL_TAG Member Function</a> on page 248-42	Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL
<a href="#">SET_COMMAND_TYPE Member Procedure</a> on page 248-43	Sets the command type in the LCR
<a href="#">SET_EXTRA_ATTRIBUTE Member Procedure</a> on page 248-43	Sets the value for the specified extra attribute in the LCR
<a href="#">SET_OBJECT_NAME Member Procedure</a> on page 248-44	Sets the name of the object that is changed by the LCR
<a href="#">SET_OBJECT_OWNER Member Procedure</a> on page 248-45	Sets the owner of the object that is changed by the LCR
<a href="#">SET_SOURCE_DATABASE_NAME Member Procedure</a> on page 248-45	Sets the source database name of the object that is changed by the LCR
<a href="#">SET_TAG Member Procedure</a> on page 248-45	Sets the tag for the LCR

### GET\_COMMAND\_TYPE Member Function

Gets the command type of the LCR.

**See Also:** The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

#### Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE ()
RETURN VARCHAR2;
```

### GET\_COMMIT\_SCN Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns NULL.

#### Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

### GET\_COMMIT\_SCN\_FROM\_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

#### Syntax

```
STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
```

```

    position IN RAW)
RETURN NUMBER;

```

## Parameters

**Table 248–35** *GET\_COMMIT\_SCN\_FROM\_POSITION* Function Parameter

Parameter	Description
position	The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

## GET\_COMMIT\_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns NULL.

## Syntax

```

MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;

```

## GET\_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_9_2	9.2.0
DBMS_STREAMS.COMPATIBLE_10_1	10.1.0
DBMS_STREAMS.COMPATIBLE_10_2	10.2.0
DBMS_STREAMS.COMPATIBLE_11_1	11.1.0
DBMS_STREAMS.COMPATIBLE_11_2	11.2.0

DDL LCRs always return DBMS\_STREAMS.COMPATIBLE\_9\_2.

You can use the following functions in the DBMS\_STREAMS package for constant compatibility return values:

- The COMPATIBLE\_9\_2 function returns the DBMS\_STREAMS.COMPATIBLE\_9\_2 constant.

- The COMPATIBLE\_10\_1 function returns DBMS\_STREAMS.COMPATIBLE\_10\_1 constant.
- The COMPATIBLE\_10\_2 function returns DBMS\_STREAMS.COMPATIBLE\_10\_2 constant.
- The COMPATIBLE\_11\_1 function returns DBMS\_STREAMS.COMPATIBLE\_11\_1 constant.
- The COMPATIBLE\_11\_2 function returns DBMS\_STREAMS.COMPATIBLE\_11\_2 constant.
- The MAX\_COMPATIBLE function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the GET\_COMPATIBLE member function for an LCR in rule conditions and apply handlers.

---

**Note:** You can determine which database objects in a database are not supported by Oracle Streams by querying the DBA\_STREAMS\_UNSUPPORTED data dictionary view.

---

**See Also:**

- *Oracle Streams Concepts and Administration* for examples of rules that discard changes that are not supported by Oracle Streams
- [Chapter 143, "DBMS\\_STREAMS"](#) and [Chapter 144, "DBMS\\_STREAMS\\_ADM"](#)
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

## Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

## GET\_EXTRA\_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an ANYDATA instance. You can use the INCLUDE\_EXTRA\_ATTRIBUTE procedure in the DBMS\_CAPTURE\_ADM package to instruct a capture process to capture one or more extra attributes.

**See Also:** [INCLUDE\\_EXTRA\\_ATTRIBUTE Procedure](#) on page 32-33

## Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
    attribute_name IN VARCHAR2)
RETURN ANYDATA;
```

## Parameters

**Table 248–36** *GET\_EXTRA\_ATTRIBUTE Function Parameter*

Parameter	Description
<code>attribute_name</code>	<p>The name of the extra attribute to return</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <li>■ <code>row_id</code> The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is <code>UROWID</code>.</li> <li>■ <code>serial#</code> The serial number of the session that performed the change captured in the LCR. The type is <code>NUMBER</code>.</li> <li>■ <code>session#</code> The identifier of the session that performed the change captured in the LCR. The type is <code>NUMBER</code>.</li> <li>■ <code>thread#</code> The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is <code>NUMBER</code>.</li> <li>■ <code>tx_name</code> The name of the transaction that includes the LCR. The type is <code>VARCHAR2</code>.</li> <li>■ <code>username</code> The name of the current user who performed the change captured in the LCR. The type is <code>VARCHAR2</code>.</li> </ul> <p>An error is raised if the specified <code>attribute_name</code> is not valid.</p> <p>If no value exists for the specified extra attribute, then the function returns a <code>NULL</code>.</p> <p><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>

### GET\_OBJECT\_NAME Member Function

Gets the name of the object that is changed by the LCR.

#### Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;
```

### GET\_OBJECT\_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

#### Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;
```

## GET\_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

### Syntax

```
MEMBER FUNCTION GET_POSITION()
RETURN RAW;
```

---

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

---

## GET\_SCN Member Function

Gets the system change number (SCN) of the LCR.

### Syntax

```
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

## GET\_SCN\_FROM\_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.

### Syntax

```
STATIC FUNCTION GET_SCN_FROM_POSITION(
    position IN RAW)
RETURN NUMBER;
```

### Parameters

**Table 248–37** GET\_SCN\_FROM\_POSITION Function Parameter

Parameter	Description
position	The position  You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.

---

---

**Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

---

---

## GET\_SOURCE\_DATABASE\_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

### Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;
```

### GET\_SOURCE\_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

#### Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()  
RETURN DATE;
```

### GET\_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

#### Syntax

```
MEMBER FUNCTION GET_TAG()  
RETURN RAW;
```

### GET\_THREAD\_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

**See Also:** *Oracle Real Application Clusters Administration and Deployment Guide*

#### Syntax

```
MEMBER FUNCTION GET_THREAD_NUMBER()  
RETURN NUMBER;
```

### GET\_TRANSACTION\_ID Member Function

Gets the transaction identifier of the LCR.

#### Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()  
RETURN VARCHAR2;
```

### IS\_NULL\_TAG Member Function

Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

#### Syntax

```
MEMBER FUNCTION IS_NULL_TAG()  
RETURN VARCHAR2;
```

## SET\_COMMAND\_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing `INSERT` to `GRANT` would raise an error.

### See Also:

- The description of the `command_type` parameter in [LCR\\$\\_DDL\\_RECORD Constructor Function Parameters](#) on page 248-7
- The description of the `command_type` parameter in [LCR\\$\\_ROW\\_RECORD Type](#) on page 248-15
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

## Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
    command_type IN VARCHAR2);
```

## Parameter

**Table 248–38 SET\_COMMAND\_TYPE Procedure Parameter**

Parameter	Description
<code>command_type</code>	The command type Set this parameter to a non-NULL value.

## SET\_EXTRA\_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

**See Also:** [INCLUDE\\_EXTRA\\_ATTRIBUTE Procedure](#) on page 32-33

## Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
    attribute_name IN VARCHAR2,
    attribute_value IN ANYDATA);
```

## Parameters

**Table 248–39 SET\_EXTRA\_ATTRIBUTE Procedure Parameter**

Parameter	Description
attribute_name	<p>The name of the extra attribute to set</p> <p>Valid names are:</p> <ul style="list-style-type: none"> <li>▪ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2.</li> <li>▪ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>▪ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</li> <li>▪ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</li> <li>▪ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2.</li> <li>▪ username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.</li> </ul> <p>An error is raised if the specified attribute_name is not valid.</p> <p><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>
attribute_value	<p>The value to which the specified extra attribute is set</p> <p>If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.</p>

## SET\_OBJECT\_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

## Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME (
    object_name IN VARCHAR2);
```

## Parameter

**Table 248–40 SET\_OBJECT\_NAME Procedure Parameter**

Parameter	Description
object_name	The name of the object

**SET\_OBJECT\_OWNER Member Procedure**

Sets the owner of the object that is changed by the LCR.

**Syntax**

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
    object_owner IN VARCHAR2);
```

**Parameter****Table 248–41 SET\_OBJECT\_OWNER Procedure Parameter**

Parameter	Description
object_owner	The schema that contains the object

**SET\_SOURCE\_DATABASE\_NAME Member Procedure**

Sets the source database name of the object that is changed by the LCR.

**Syntax**

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
    source_database_name IN VARCHAR2);
```

**Parameter****Table 248–42 SET\_SOURCE\_DATABASE\_NAME Procedure Parameter**

Parameter	Description
source_database_name	The source database of the change  If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value.

**SET\_TAG Member Procedure**

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

**See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

**Syntax**

```
MEMBER PROCEDURE SET_TAG(
    tag IN RAW);
```

**Parameter****Table 248-43** *SET\_TAG Procedure Parameter*

<b>Parameter</b>	<b>Description</b>
tag	The binary tag for the LCR The size limit for a tag value is two kilobytes.

## LCR\$\_ROW\_LIST Type

Identifies a list of column values for a row in a table.

This type uses the LCR\$\_ROW\_UNIT type and is used in the LCR\$\_ROW\_RECORD type.

**See Also:**

- [LCR\\$\\_ROW\\_UNIT Type](#) on page 248-48
- [LCR\\$\\_ROW\\_RECORD Type](#) on page 248-15

### Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT  
/
```

## LCR\$\_ROW\_UNIT Type

Identifies the value for a column in a row.

This type is used in the LCR\$\_ROW\_LIST type.

**See Also:** [LCR\\$\\_ROW\\_LIST Type](#) on page 248-47

### Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name      VARCHAR2(4000),
  data             ANYDATA,
  lob_information  NUMBER,
  lob_offset       NUMBER,
  lob_operation_size NUMBER,
  long_information NUMBER);
/
```

### Attributes

**Table 248-44** LCR\$\_ROW\_UNIT Attributes

Attribute	Description												
column_name	The name of the column												
data	The data contained in the column												
lob_information	Contains the LOB information for the column and contains one of the following values: <table border="0" style="margin-left: 20px;"> <tr> <td>DBMS_LCR.NOT_A_LOB</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.NULL_LOB</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.INLINE_LOB</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td> <td>CONSTANT NUMBER := 5;</td> </tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td> <td>CONSTANT NUMBER := 6;</td> </tr> </table>	DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;	DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;	DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;	DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;	DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;	DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;
DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;												
DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;												
DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;												
DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;												
DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;												
DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;												
lob_offset	The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns  Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.												
lob_operation_size	If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE.  If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.												
long_information	Contains the LONG information for the column and contains one of the following values: <table border="0" style="margin-left: 20px;"> <tr> <td>DBMS_LCR.not_a_long</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.null_long</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.inline_long</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.long_chunk</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.last_long_chunk</td> <td>CONSTANT NUMBER := 5;</td> </tr> </table>	DBMS_LCR.not_a_long	CONSTANT NUMBER := 1;	DBMS_LCR.null_long	CONSTANT NUMBER := 2;	DBMS_LCR.inline_long	CONSTANT NUMBER := 3;	DBMS_LCR.long_chunk	CONSTANT NUMBER := 4;	DBMS_LCR.last_long_chunk	CONSTANT NUMBER := 5;		
DBMS_LCR.not_a_long	CONSTANT NUMBER := 1;												
DBMS_LCR.null_long	CONSTANT NUMBER := 2;												
DBMS_LCR.inline_long	CONSTANT NUMBER := 3;												
DBMS_LCR.long_chunk	CONSTANT NUMBER := 4;												
DBMS_LCR.last_long_chunk	CONSTANT NUMBER := 5;												

---

---

## Oracle Multimedia ORDAudio TYPE

The Oracle Multimedia ORDAudio object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. Oracle Multimedia ORDAudio can store and retrieve audio data of any data format. Oracle Multimedia ORDAudio can extract metadata from audio data of a variety of popular audio formats. Oracle Multimedia ORDAudio can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- [Documentation of ORDAudio](#)

---

## Documentation of ORDAudio

For a complete description of this type within the context of Oracle Multimedia, see `ORDAudio` in the *Oracle Multimedia Reference*.

---

---

## Oracle Multimedia ORDDicom TYPE

The Oracle Multimedia ORDDicom object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

Oracle Multimedia ORDDicom provides methods to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. Oracle Multimedia ORDDicom also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- [Documentation of ORDDicom](#)

---

## Documentation of ORDDicom

For a complete description of this type within the context of Oracle Multimedia, see ORDDicom in the *Oracle Multimedia DICOM Developer's Guide*.

---

---

## Oracle Multimedia ORDDoc TYPE

The Oracle Multimedia ORDDoc object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. Oracle Multimedia can store and retrieve media data of any data format. Oracle Multimedia ORDDoc data type can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. However, you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

- [Documentation of ORDDoc](#)

---

## Documentation of ORDDoc

For a complete description of this type within the context of Oracle Multimedia, see ORDDoc in the *Oracle Multimedia Reference*.

---

---

## Oracle Multimedia ORDIImage TYPE

The Oracle Multimedia ORDIImage object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. Oracle Multimedia ORDIImage can store and retrieve image data of any data format. Oracle Multimedia ORDIImage can process (cut, scale, and generate thumbnails) of images, convert the format of images, extract properties of images of a variety of popular data formats, and extract and embed application metadata in images.

- [Documentation of ORDIImage](#)

---

## Documentation of ORDImage

For a complete description of this type within the context of Oracle Multimedia, see ORDImage in the *Oracle Multimedia Reference*.

---

## Oracle Multimedia SQL/MM Still Image TYPES

Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

The following object relational types for images and image characteristics are included in this support:

SI\_StillImage  
SI\_AverageColor  
SI\_Color  
SI\_ColorHistogram  
SI\_FeatureList  
SI\_PositionalColor  
SI\_Texture

- [Documentation of SQL/MM Still Image](#)

---

## Documentation of SQL/MM Still Image

For a complete description of this type within the context of Oracle Multimedia, see `SQL/MM Still Image` in the *Oracle Multimedia Reference*.

---

---

## Oracle Multimedia ORDVideO TYPE

The Oracle Multimedia ORDVideO object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so on, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. Oracle Multimedia ORDVideO can store and retrieve video data of any data format. Oracle Multimedia ORDVideO can extract metadata from video data of a variety of popular video formats. Oracle Multimedia ORDVideO can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- [Documentation of ORDVideO](#)

---

## Documentation of ORDVide

For a complete description of this type within the context of Oracle Multimedia, see ORDVide in the *Oracle Multimedia Reference*.

---

---

## MGD\_ID Package Types

The MGD\_ID package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The MGD\_ID Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification). The MGD\_ID package contains several predefined types.

**See Also:** *Oracle Database Advanced Application Developer's Guide* for more information.

This chapter contains the following topics:

- [Using MGD\\_ID Package Object Types](#)
- [Summary of Types](#)
- [Summary of MGD\\_ID Subprograms](#)

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

## Using MGD\_ID Package Object Types

This section contains topics that relate to using the MGD\_ID package object types.

- [Security Model](#)

## Security Model

You must run the `catmgd.sql` script to load the `DBMS_MGD_ID_UTL` package and create the required Identity Code Package schema objects in the `MGDSYS` schema.

`MGD_ID` is a `MGDSYS`-owned object type. Any `MGD_ID` subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the `MGD_ID` object type and its subprograms.

`EXECUTE` privilege is granted to `PUBLIC` for this ADT: `MGD_ID`.

A public synonym, by the same name, is created for this ADT: `MGD_ID`.

## Summary of Types

---

Table 255–1 describes the MGD\_ID Package object types.

**Table 255–1 MGD\_ID Package Object Types**

<b>Object Type Name</b>	<b>Description</b>
<a href="#">MGD_ID_COMPONENT Object Type</a>	Datatype that specifies the name and value pair attributes that define a component
<a href="#">MGD_ID_COMPONENT_VARRAY Object Type</a>	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
<a href="#">MGD_ID Object Type</a>	Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components

---

## MGD\_ID\_COMPONENT Object Type

The `MGD_ID_COMPONENT` type is a datatype that specifies the name and value pair attributes that define a component.

### Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT as object (name VARCHAR2(256),  
                                                    value VARCHAR2(1024));
```

### Attributes

**Table 255–2** *MGD\_ID\_COMPONENT Attributes*

Attribute	Description
<code>name</code>	Name of component
<code>value</code>	Value of the component as a character

### Usage Notes

None.

### Examples

See the [MGD\\_ID Constructor Function](#) for an example.

## MGD\_ID\_COMPONENT\_VARRAY Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

### Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_
COMPONENT;
```

### Attributes

None.

### Usage Notes

None.

### Examples

See the [MGD\\_ID Constructor Function](#) for an example.

## MGD\_ID Object Type

The MGD\_ID type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

### Syntax

```
CREATE OR REPLACE TYPE MGD_ID as object (category_id VARCHAR2(256),
                                         components MGD_ID_COMPONENT_VARRAY);
```

### Attributes

**Table 255–3 MGD\_ID Object Type Attributes**

Attribute	Description
category_id	Category identifier for the code category of this code
components	List of components as name-value attributes

### Methods

[Table 255–5](#) describes the methods of the MGD\_ID object type.

**Table 255–4 MGD\_ID Methods**

Method	Description
MGD_ID constructor function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT function	Returns the string representation of the MGD_ID in the specified format
GET_COMPONENT function	Returns the string value of the specified MGD_ID component
TO_STRING function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE function	Returns the result of the conversion of the identifier from one format to the specified format

### Usage Notes

None.

### Examples

See the [Summary of MGD\\_ID Subprograms](#) section and the section about using the Identity Code package in *Oracle Database Advanced Application Developer's Guide* for examples.

## Summary of MGD\_ID Subprograms

Table 255–5 describes the subprograms in the MGD\_ID object type.

All the values and names passed to the procedures defined in the MGD\_ID object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

**Table 255–5 MGD\_ID Object Type Subprograms**

<b>Subprogram</b>	<b>Description</b>
<a href="#">MGD_ID Constructor Function</a>	Creates an MGD_ID object based on the parameters passed in and returns self as a result
<a href="#">FORMAT Function</a>	Returns the string representation of the MGD_ID object in the specified format
<a href="#">GET_COMPONENT Function</a>	Returns the string value of the specified MGD_ID component
<a href="#">TO_STRING Function</a>	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
<a href="#">TRANSLATE Function</a>	Returns the result of the conversion of the identifier from one format to the specified format

## MGD\_ID Constructor Function

This constructor function constructs an identity code type object, `MGD_ID`. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Constructs an `MGD_ID` object type based on the category ID and a list of components.

```
constructor function MGD_ID (
    category_id      IN VARCHAR2,
    components       IN MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
constructor function MGD_ID (
    category_id      VARCHAR2,
    identifier       VARCHAR2,
    parameter_list   VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category name, category version, and a list of components.

```
constructor function MGD_ID (
    category_name    VARCHAR2,
    category_version VARCHAR2,
    components       MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an `MGD_ID` object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
constructor function MGD_ID (
    category_name    VARCHAR2,
    category_version VARCHAR2,
    identifier       VARCHAR2,
    parameter_list   VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

### Parameters

**Table 255–6 MGD\_ID Constructor Function Parameters**

Parameter	Description
<code>category_id</code>	Category identifier
<code>components</code>	List of component name value pairs
<code>category_name</code>	Category name, such as EPC
<code>category_version</code>	Category version. If NULL, the latest version for the specified category name will be used.

**Table 255–6 (Cont.) MGD\_ID Constructor Function Parameters**

Parameter	Description
identifier	<p>Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY.</p> <p>Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.</p>
parameter_list	<p>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:</p> <p><code>filter=3;companyprefixlength=7;taglength=96</code></p>

## Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is NULL, the `bit_length` is 8\* the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

## Examples

The following examples construct identity code type objects.

Construct an `MGD_ID` object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
            MGD_ID_COMPONENT_VARRAY (
                MGD_ID_COMPONENT('companyprefix','0037000'),
                MGD_ID_COMPONENT('itemref','030241'),
                MGD_ID_COMPONENT('serial','1041970'),
                MGD_ID_COMPONENT('schemes','SGTIN-64')
            )
        ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('itemref', '030241'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
```

.  
.  
.

Constructs an MGD\_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
            'urn:epc:id:sgtin:0037000.030241.1041970',
            'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor22.sql
```

.  
.  
.

```
MGD_ID('1', MGD_ID_COMPONENT_VARRAY (MGD_ID_COMPONENT('filter', '3'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('companyprefixlength', '7'),
                                     MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('itemref', '030241')))
```

.  
.  
.

Construct an MGD\_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
            MGD_ID_COMPONENT_VARRAY (
                MGD_ID_COMPONENT('companyprefix', '0037000'),
                MGD_ID_COMPONENT('itemref', '030241'),
                MGD_ID_COMPONENT('serial', '1041970'),
                MGD_ID_COMPONENT('schemes', 'SGTIN-64')
            )
        ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor33.sql
```

.  
.  
.

```
MGD_ID('1', MGD_ID_COMPONENT_VARRAY (MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('itemref', '030241'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
```

.  
.  
.

Constructs an MGD\_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor4.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
             'urn:epc:id:sgtin:0037000.030241.1041970',
             'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor4.sql
```

```
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('companyprefixlength', '7'),
                                     MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

## FORMAT Function

This function returns the string representation of the MGD\_ID object in the specified format.

### Syntax

```
function FORMAT (parameter_list IN VARCHAR2,
                 output_format  IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

### Parameters

**Table 255–7** *FORMAT Function Parameters*

Parameter	Description
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:  filter=3;companyprefixlength=7;taglength=96
output_format	One of the supported output formats into which an MGD_ID component is formatted: <ul style="list-style-type: none"> <li>■ BINARY</li> <li>■ LEGACY</li> <li>■ TAG_ENCODING</li> <li>■ PURE_IDENTITY</li> <li>■ ONS_HOSTNAME</li> </ul>

### Usage Notes

None.

### Examples

See the example for the [GET\\_COMPONENT Function](#).

## GET\_COMPONENT Function

This function returns the value of the specified MGD\_ID component.

### Syntax

```
function GET_COMPONENT (
            component_name IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

### Parameters

**Table 255–8 GET\_COMPONENT Function Parameter**

Parameter	Description
component_name	Name of component

### Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

### Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  -----
  --PURE_IDENTIT
  -----
  dbms_output.put_line('..Testing constructor with pure identity');
  -----
  -- PURE_IDENTITY representation can be translated to BINARY and
  -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
  -----
  id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970',
'scheme=SGTIN-64;filter=3');
  dbms_output.put_line(id.to_string);
  dbms_output.put_line('filter          = ' || id.get_component('filter'));
  dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
  dbms_output.put_line('itemref       = ' || id.get_component('itemref'));
  dbms_output.put_line('serial        = ' || id.get_component('serial'));
  dbms_output.put_line('BINARY format = ' || id.format(NULL, 'BINARY'));
  dbms_output.put_line('PURE_IDENTITY format = ' || id.format(NULL, 'PURE_IDENTITY'));
  dbms_output.put_line('TAG_ENCODING format = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @get_component.sql
.
.
.
..Testing constructor with pure identity
category_id =1;filter = 3;schemes = SGTIN-64;companyprefixlength =
7;companyprefix = 0037000;scheme = SGTIN-64;serial = 1041970;itemref = 030241
filter          = 3
company prefix = 0037000
itemref         = 030241
serial          = 1041970
BINARY format  =1001100000000000001000001110110001000010000011111110011000110010
PURE_IDENTITY format = urn:epc:id:sgtin:0037000.030241.1041970
TAG_ENCODING format = urn:epc:tag:sgtin-64:3.0037000.030241.1041970
PL/SQL procedure successfully completed.
.
.
.
```

## TO\_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD\_ID object.

### Syntax

```
function TO_STRING  
    RETURN VARCHAR2;
```

### Parameters

None.

### Usage Notes

None.

### Examples

The following example converts the MGD\_ID object into a string value:

```
-- Contents of tostring3.sql file  
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');  
DECLARE  
id          MGD_ID;  
BEGIN  
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));  
    dbms_output.put_line('..Testing to_string');  
    id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');  
    DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');  
    DBMS_OUTPUT.PUT_LINE(id.to_string);  
END;  
/  
SHOW ERRORS;  
call DBMS_MGD_ID_UTL.remove_proxy();  
connect / as sysdba;  
drop user mgduser cascade;  
  
SQL> @tostring3.sql  
. .

mgd_id object as a string  
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =  
0037000;scheme = GID-96;1 = 1;serial = 1041970  
PL/SQL procedure successfully completed.  
. .
```

## TRANSLATE Function

This static function translates between different representations directly without first constructing an MGD\_ID object. This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

### Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
function TRANSLATE (
    category_name    IN VARCHAR2,
    identifier       IN VARCHAR2,
    parameter_list   IN VARCHAR2,
    output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
function TRANSLATE (
    category_name    IN VARCHAR2,
    category_version IN VARCHAR2,
    identifier       IN VARCHAR2,
    parameter_list   IN VARCHAR2,
    output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

### Parameters

**Table 255–9 TRANSLATE Function Parameters**

Parameter	Description
category_name	Name of category
category_version	Category version. If NULL, the latest version of the specified category name will be used.
identifier	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

**Table 255–9 (Cont.) TRANSLATE Function Parameters**

Parameter	Description
output_format	One of the supported output formats into which an MGD_ID component shall be converted: <ul style="list-style-type: none"> <li>▪ BINARY</li> <li>▪ LEGACY</li> <li>▪ TAG_ENCODING</li> <li>▪ PURE_IDENTITY</li> <li>▪ ONS_HOSTNAME</li> </ul>

## Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

## Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL, '00110101000000000000100100001000100000000000011101100010000100000000000000011111110011000110
010'
, NULL, 'BINARY'));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
  dbms_output.put_line(

This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

- [Using Rule Types](#)
  - Overview
  - Security Model
- [Summary of Rule Types](#)

## Using Rule Types

This section contains topics that relate to using the types used with rules, rule sets, and evaluation contexts.

- [Overview](#)
- [Security Model](#)

## Overview

This types in this chapter are used in rules and enable clients to evaluate rules with the rules engine.

**See Also:**

- [Chapter 126, "DBMS\\_RULE"](#)
- [Chapter 127, "DBMS\\_RULE\\_ADM"](#)
- *Oracle Streams Extended Examples* for examples that use rule types

## Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

**See Also:** *Oracle Database Security Guide* for more information about user group PUBLIC

---

## Summary of Rule Types

**Table 256–1 Rule Types**

Type	Description
<a href="#">RE\$ATTRIBUTE_VALUE Type</a> on page 256-7	Specifies the value of a variable attribute
<a href="#">RE\$ATTRIBUTE_VALUE_LIST Type</a> on page 256-8	Identifies a list of attribute values
<a href="#">RE\$COLUMN_VALUE Type</a> on page 256-9	Specifies the value of a table column
<a href="#">RE\$COLUMN_VALUE_LIST Type</a> on page 256-10	Identifies a list of column values
<a href="#">RE\$NAME_ARRAY Type</a> on page 256-11	Identifies a list of names
<a href="#">RE\$NAME_ARRAY Type</a> on page 256-11	Identifies a list of name-value pairs
<a href="#">RE\$NV_LIST Type</a> on page 256-13	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
<a href="#">RE\$NV_NODE Type</a> on page 256-15	Identifies a name-value pair
<a href="#">RE\$RULE_HIT Type</a> on page 256-16	Specifies a rule found because of evaluation
<a href="#">RE\$RULE_HIT_LIST Type</a> on page 256-17	Identifies a list of rules found because of evaluation
<a href="#">RE\$TABLE_ALIAS Type</a> on page 256-18	Provides the table corresponding to an alias used in a rule evaluation context
<a href="#">RE\$TABLE_ALIAS_LIST Type</a> on page 256-19	Identifies a list of table aliases used in a rule evaluation context
<a href="#">RE\$TABLE_VALUE Type</a> on page 256-20	Specifies the value of a table row using a ROWID
<a href="#">RE\$TABLE_VALUE_LIST Type</a> on page 256-21	Identifies a list of table values
<a href="#">RE\$VARIABLE_TYPE Type</a> on page 256-22	Provides the type of a variable used in a rule evaluation context
<a href="#">RE\$VARIABLE_TYPE_LIST Type</a> on page 256-24	Identifies a list of variables and their types used in a rule evaluation context
<a href="#">RE\$VARIABLE_VALUE Type</a> on page 256-25	Specifies the value of a variable
<a href="#">RE\$VARIABLE_VALUE_LIST Type</a> on page 256-26	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- DBMS\_RULE
- DBMS\_RULE\_ADM

You can use the DBMS\_RULE\_ADM package to create and administer rules, rule sets, and evaluation contexts, and you can use the DBMS\_RULE package to evaluate rules.

When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- DBMS\_APPLY\_ADM
- DBMS\_CAPTURE\_ADM
- DBMS\_PROPAGATION\_ADM
- DBMS\_STREAMS
- DBMS\_STREAMS\_ADM
- DBMS\_STREAMS\_AUTH

**See Also:** *Oracle Streams Concepts and Administration*

## RE\$ATTRIBUTE\_VALUE Type

Specifies the value of a variable attribute.

---

---

**Note:** Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

---

---

### Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
  variable_name  VARCHAR2(32),
  attribute_name VARCHAR2(4000),
  attribute_value ANYDATA);
```

### Attributes

**Table 256–2 RE\$ATTRIBUTE\_VALUE Attributes**

Attribute	Description
variable_name	Specifies the variable used in a rule
attribute_name	Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3.
attribute_value	Specifies the attribute value

## RE\$ATTRIBUTE\_VALUE\_LIST Type

Identifies a list of attribute values.

### Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

## RE\$COLUMN\_VALUE Type

Specifies the value of a table column.

---

---

**Note:** Enclose the column name in double quotation marks (") if the name contains special characters.

---

---

### Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
  table_alias  VARCHAR2(32),
  column_name  VARCHAR2(4000),
  column_value ANYDATA);
```

### Attributes

**Table 256-3 RE\$COLUMN\_VALUE Attributes**

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
column_name	Specifies the column name
column_value	Specifies the column value

## RE\$COLUMN\_VALUE\_LIST Type

Identifies a list of column values.

### Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

## RE\$NAME\_ARRAY Type

Identifies a list of names.

### Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

## RE\$NV\_ARRAY Type

Identifies a list of name-value pairs.

### Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

## RE\$NV\_LIST Type

Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context for rule set evaluation and the action context for a rule.

### Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
  actx_list SYS.RE$NV_ARRAY);
```

### Attributes

**Table 256–4 RE\$NV\_LIST Attributes**

Attribute	Description
actx_list	The list of name-value pairs

### RE\$NV\_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE\$NV\_LIST type:

- [ADD\\_PAIR Member Procedure](#)
- [GET\\_ALL\\_NAMES Member Function](#)
- [GET\\_VALUE Member Function](#)
- [REMOVE\\_PAIR Member Procedure](#)

### ADD\_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

---

---

**Note:** Enclose the name in double quotation marks (") if the name contains special characters.

---

---

#### Syntax

```
MEMBER PROCEDURE ADD_PAIR(
  name IN VARCHAR2,
  value IN ANYDATA);
```

#### Parameters

**Table 256–5 ADD\_PAIR Procedure Parameters**

Parameter	Description
name	The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

### GET\_ALL\_NAMES Member Function

Returns a list of all the names in the name-value pair list.

**Syntax**

```
MEMBER FUNCTION GET_ALL_NAMES()  
RETURN SYS.RE$NAME_ARRAY;
```

**GET\_VALUE Member Function**

Returns the value for the specified name in a name-value pair list.

---

---

**Note:** Enclose the name in double quotation marks (") if the name contains special characters.

---

---

**Syntax**

```
MEMBER FUNCTION GET_VALUE(  
    name IN VARCHAR2)  
RETURN ANYDATA;
```

**Parameters**

**Table 256–6** GET\_VALUE Procedure Parameters

Parameter	Description
name	The name whose value to return

**REMOVE\_PAIR Member Procedure**

Removes the name-value pair with the specified name from the name-value pair list.

---

---

**Note:** Enclose the name in double quotation marks (") if the name contains special characters.

---

---

**Syntax**

```
MEMBER PROCEDURE REMOVE_PAIR(  
    name IN VARCHAR2);
```

**Parameters**

**Table 256–7** REMOVE\_PAIR Procedure Parameters

Parameter	Description
name	The name of the pair to remove

## RE\$NV\_NODE Type

Identifies a name-value pair.

---

---

**Note:** Enclose the name in double quotation marks (") if the name contains special characters.

---

---

### Syntax

```
TYPE SYS.RE$NV_NODE (  
    nvn_name    VARCHAR2(30),  
    nvn_value   ANYDATA);
```

### Attributes

**Table 256–8** RE\$NV\_NODE Attributes

Attribute	Description
nvn_name	Specifies the name in the name-value pair
nvn_value	Specifies the value in the name-value pair

## RE\$RULE\_HIT Type

Specifies a rule found because of an evaluation.

**See Also:**

- [CREATE\\_RULE Procedure](#) on page 127-15
- [ALTER\\_RULE Procedure](#) on page 127-11

### Syntax

```
TYPE SYS.RE$RULE_HIT (  
    rule_name          VARCHAR2(65),  
    rule_action_context RE$NV_LIST);
```

### Attributes

**Table 256–9 RE\$RULE\_HIT Attributes**

Attribute	Description
rule_name	The rule name in the form <i>schema_name.rule_name</i> . For example, a rule named <code>employee_rule</code> in the <code>hr</code> schema is returned in the form <code>"hr"."employee_rule"</code> .
rule_action_context	The rule action context as specified in the <code>CREATE_RULE</code> or <code>ALTER_RULE</code> procedure of the <code>DBMS_RULE_ADM</code> package

## RE\$RULE\_HIT\_LIST Type

Identifies a list of rules found because of an evaluation.

### Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

## RE\$TABLE\_ALIAS Type

Provides the table corresponding to an alias used in a rule evaluation context. A specified table name must satisfy the schema object naming rules.

---

---

**Note:** Enclose the table name in double quotation marks (") if the name contains special characters.

---

---

**See Also:** *Oracle Database SQL Language Reference* for information about schema object naming rules

### Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(  
    table_alias VARCHAR2(32),  
    table_name  VARCHAR2(194));
```

### Attributes

**Table 256–10 RE\$TABLE\_ALIAS Attributes**

Attribute	Description
table_alias	The alias used for the table in a rule
table_name	The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema.  The format is one of the following:  <i>schema_name.table_name</i>  <i>table_name</i>  For example, if the <i>schema_name</i> is <i>hr</i> and the <i>table_name</i> is <i>employees</i> , then enter the following:  <i>hr.employees</i>

## RE\$TABLE\_ALIAS\_LIST Type

Identifies a list of table aliases used in a rule evaluation context.

### Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

## RE\$TABLE\_VALUE Type

Specifies the value of a table row using a ROWID.

### Syntax

```
TYPE SYS.RE$TABLE_VALUE(  
    table_alias VARCHAR2(32),  
    table_rowid VARCHAR2(18));
```

### Attributes

**Table 256–11 RE\$TABLE\_VALUE Attributes**

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
table_rowid	Specifies the rowid for the table row

## RE\$TABLE\_VALUE\_LIST Type

Identifies a list of table values.

---

---

**Note:** Each table alias in the list in the list must be unique.

---

---

### Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

## RE\$VARIABLE\_TYPE Type

Provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

---

**Note:** Enclose the variable name in double quotation marks (") if the name contains special characters.

---

**See Also:** *Oracle Database SQL Language Reference* for information about schema object naming rules

### Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
    variable_name          VARCHAR2 (32) ,
    variable_type          VARCHAR2 (4000) ,
    variable_value_function VARCHAR2 (228) ,
    variable_method_function VARCHAR2 (228) );
```

### Attributes

**Table 256–12 RE\$VARIABLE\_TYPE Attributes**

Attribute	Description
variable_name	The variable name used in a rule
variable_type	The type that is resolved in the evaluation context schema. Any valid Oracle built-in data type, user-defined type, or Oracle-supplied type can be specified. See the <i>Oracle Database SQL Language Reference</i> for more information about these types.
variable_value_function	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context.  See the "Usage Notes" for more information.
variable_method_function	Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function.  The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context.  See the "Usage Notes" for more information.

### Usage Notes

The functions for both the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format can be omitted: *schema\_name*, *package\_name*, and *@dblink*.

For example, if the *schema\_name* is *hr*, the *package\_name* is *var\_pac*, the *function\_name* is *func\_value*, and the *dblink* is *dbs1.net*, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

### Signature for *variable\_value\_function*

The function must have the following signature:

```
FUNCTION variable_value_function_name(
  evaluation_context_schema IN VARCHAR2,
  evaluation_context_name   IN VARCHAR2,
  variable_name             IN VARCHAR2,
  event_context             IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

### Signature for *variable\_method\_function*

This function must have the following signature:

```
FUNCTION variable_method_function_name(
  evaluation_context_schema IN VARCHAR2,
  evaluation_context_name   IN VARCHAR2,
  variable_value            IN SYS.RE$VARIABLE_VALUE,
  method_name              IN VARCHAR2,
  event_context            IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

## RE\$VARIABLE\_TYPE\_LIST Type

Identifies a list of variables and their types used in a rule evaluation context.

### Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

## RE\$VARIABLE\_VALUE Type

Specifies the value of a variable.

---

---

**Note:** Enclose the variable name in double quotation marks (") if the name contains special characters.

---

---

### Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (  
    variable_name VARCHAR2(32),  
    variable_data ANYDATA);
```

### Attributes

**Table 256–13** RE\$VARIABLE\_VALUE Attributes

Attribute	Description
variable_name	Specifies the variable name used in a rule
variable_data	Specifies the data for the variable value

## RE\$VARIABLE\_VALUE\_LIST Type

Identifies a list of variable values.

### Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

---

---

## Rules Manager Types

---

---

**Note:** This functionality is deprecated with Oracle Database Release 11.2 and obsoleted with Release 12.1. For details regarding obsolescence, see My Oracle Support Note ID 1244535.1

---

---

Rules Manager contains one predefined type and a public synonym for this type.

**See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- [Using Rules Manager Types](#)
- [Summary of Rule Manager Types](#)

## Using Rules Manager Types

This section contains topics that relate to using the Rules Manager Types.

- [Security Model](#)

## Security Model

The Oracle Database installation runs the `catrul.sql` script to load the `DBMS_RLMGR` package and create the required Rules Manager schema objects in the `EXFSYS` schema.

## Summary of Rule Manager Types

[Table 257-1](#) describes the Rules Manager object type.

**Table 257-1 Rules Manager Object Types**

Object Type Name	Description
<a href="#">RLM\$EVENTIDS Object Type</a>	Specifies a list of event identifiers to the CONSUME_PRIM_EVENTS procedure

## RLM\$EVENTIDS Object Type

The RLM\$EVENTIDS defines a table of VARCHAR2 values.

### Syntax

```
CREATE OR REPLACE TYPE RLM$EVENTIDS is table of VARCHAR2(38);
```

### Attributes

None.

### Usage Notes

- RLM\$EVENTIDS type passes a list of event identifiers to the CONSUME\_PRIM\_EVENTS procedure. These event identifiers are ROWIDS for the corresponding events in the database and their values are available through the arguments of the action callback procedure and rule class results view columns, when the rule class is configured for RULE consumption policy

### Examples

The following commands show the body of the action callback procedure for a rule class configured for RULE consumption policy. This demonstrates the use of RLM\$EVENTDIDS type to consume the events before executing the action for the matched rules.

```
CREATE OR REPLACE PROCEDURE PromoAction (
    Flt          AddFlight,
    Flt_EvtId ROWID,    --- rowid for the fligt primitive event
    Car          AddRentalCar,
    Car_EvtId ROWID,
    rlm$rule     TravelPromotions%ROWTYPE) is
    evtcnsmd NUMBER;
BEGIN
    evtcnsmd := dbms_rlmgr.consume_prim_events(
        rule_class => 'TravelPromotions',
        event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));

    IF (evtcnsmd = 1) THEN
        -- consume operation was successful; perform the action ---
        OfferPromotion (Flt.CustID, rlm$rule.PromoType, rlm$rule.OfferedBy);
    END IF;
END;
/
```

---

---

## UTL Streams Types

UTL Streams Types describes abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

**See Also:** For more information, see A.

This chapter contains the following topics:

- [Summary of UTL Binary Streams Types](#)

## Summary of UTL Binary Streams Types

**Table 258–1 UTL Binary Streams Types**

Type	Description
<a href="#">UTL_BINARYINPUTSTREAM</a> Type on page 258-3	Reads bytes and closes a stream.
<a href="#">UTL_BINARYOUTPUTSTREAM</a> Type on page 258-4	Writes bytes and closes a stream.
<a href="#">UTL_CHARACTERINPUTSTREAM</a> Type on page 258-5	Reads chars and closes a stream.
<a href="#">UTL_CHARACTEROUTPUTSTREAM</a> Type on page 258-6	Writes chars and closes a stream.

## UTL\_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

### Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (

    MEMBER FUNCTION available (
        self      IN OUT NOCOPY Utl_BinaryInputStream)
        RETURN INTEGER,

    MEMBER FUNCTION read (
        self      IN OUT NOCOPY Utl_BinaryInputStream,
        numBytes IN              INTEGER DEFAULT 1)
        RETURN RAW,

    MEMBER PROCEDURE read (
        self      IN OUT NOCOPY Utl_BinaryInputStream,
        bytes     IN OUT NOCOPY RAW,
        numBytes  IN OUT        INTEGER),

    MEMBER PROCEDURE read (
        self      IN OUT NOCOPY Utl_BinaryInputStream,
        bytes     IN OUT NOCOPY RAW,
        offset    IN INTEGER,
        numBytes  IN OUT        INTEGER),

    member function close (
        self      In Out Nocopy Utl_BinaryInputStream)

) NOT FINAL;
```

### Attributes

**Table 258–2 UTL\_BINARYINPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> <li>■ #1 - Reads the number of bytes specified by <code>numBytes</code> (default is 1) and returns the bytes as a <code>RAW</code>. If there are no remaining bytes a value of <code>NULL</code> is returned.</li> <li>■ #2 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>. Additionally, the actual number of bytes read is returned in parameter <code>numBytes</code>. If this parameter is set to 0 then there are no more bytes to be read.</li> <li>■ #3 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>, beginning at the <code>offset</code> specified by parameter <code>offset</code>. The actual number of bytes read is returned in parameter <code>numBytes</code>. If this value is 0, then there are no additional bytes to be read.</li> </ul>
CLOSE	Releases all resources held on the node to support the stream

## UTL\_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

### Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

    MEMBER FUNCTION write (                                     -- #1
        self          IN OUT NOCOPY sys.utl_BinaryOutputStream,
        bytes         IN           RAW,
        numBytes      IN           INTEGER DEFAULT 1)
    RETURN INTEGER,

    MEMBER PROCEDURE write (                                  -- #2
        self          IN OUT NOCOPY sys.utl_BinaryOutputStream,
        bytes         IN NOCOPY   RAW,
        numBytes      IN OUT      INTEGER),

    MEMBER PROCEDURE write (                                  -- #3
        self          IN OUT NOCOPY utl_BinaryOutputStream,
        bytes         IN NOCOPY   RAW,
        offset        IN           INTEGER,
        numBytes      IN OUT      INTEGER),

    MEMBER PROCEDURE flush (
        self          IN OUT NOCOPY utl_BinaryOutputStream),

    MEMBER PROCEDURE close (
        self          IN OUT NOCOPY utl_BinaryOutputStream)

) NOT FINAL;
```

### Attributes

**Table 258–3 UTL\_BINARYOUTPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> <li>■ #1 - Writes the number of bytes specified by <code>numBytes</code> (default is 1) from RAW into the stream. The actual number of bytes written is returned.</li> <li>■ #2 - Writes the number of bytes specified in parameter <code>numBytes</code> from parameter bytes to the stream. The actual number of bytes written is returned in parameter <code>numBytes</code>.</li> <li>■ #3 - Writes the number of bytes specified by <code>numBytes</code> to the stream, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes written is returned in parameter <code>numBytes</code>.</li> </ul>
FLUSH	Insures that any buffered bytes are copied to the node destination
CLOSE	Frees all resources associated with the stream

## UTL\_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

### Syntax

```
CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

    MEMBER FUNCTION available (
        self          IN OUT NOCOPY  utl_CharacterInputStream)
    RETURN INTEGER,

    MEMBER FUNCTION read (
        self          IN OUT NOCOPY  utl_CharacterInputStream,
        numChars     IN              INTEGER DEFAULT 1,
        lineFeed     IN              BOOLEAN DEFAULT FALSE)
    RETURN VARCHAR2,

    MEMBER PROCEDURE read (
        self          IN OUT NOCOPY  utl_CharacterInputStream,
        chars        IN OUT NOCOPY  VARCHAR2,
        numChars     IN OUT         INTEGER,
        lineFeed     IN BOOLEAN DEFAULT FALSE),

    MEMBER PROCEDURE read (
        self          IN OUT NOCOPY  utl_CharacterInputStream,
        chars        IN OUT NOCOPY  VARCHAR2,
        offset       IN              INTEGER,
        numChars     IN OUT         INTEGER,
        lineFeed     IN              BOOLEAN DEFAULT FALSE),

    MEMBER PROCEDURE close (
        self          IN OUT NOCOPY  utl_CharacterInputStream)

) NOT FINAL;
```

### Attributes

**Table 258–4 UTL\_CHARACTERINPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> <li>■ #1 - Returns the number of characters remaining to be read</li> <li>■ #2 - Reads the number of characters specified by <code>numChars</code> (default value is 1) and returns the characters as a <code>VARCHAR2</code>. If the value of <code>lineFeed</code> is true (default value is <code>FALSE</code>) then the reading stops if a linefeed character is found. If there are no remaining characters a value of <code>NULL</code> is returned.</li> <li>■ #3 - Reads reads the number of characters specified by parameter <code>numChars</code> into the parameter <code>chars</code>. Additionally, the actual number of characters read is returned in parameter <code>numChars</code>. If this value is 0, then there are no more characters to be read. If the value of <code>lineFeed</code> is <code>TRUE</code> (default is <code>FALSE</code>), then reading stops if a linefeed character is encountered.</li> </ul>
CLOSE	Releases all resources held by the stream

## UTL\_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (`chars`) and close a stream.

### Syntax

```
CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT (

  MEMBER FUNCTION write (                                     -- #1
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN             VARCHAR2,
    numChars  IN             INTEGER DEFAULT 1,
    lineFeed  IN             BOOLEAN DEFAULT FALSE)
  RETURN INTEGER,

  MEMBER PROCEDURE write (                                   -- #2
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN OUT NOCOPY VARCHAR2,
    numChars  IN OUT        INTEGER,
    lineFeed  IN             BOOLEAN DEFAULT FALSE),

  member procedure write (                                   -- #3
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN NOCOPY     varchar2,
    offset    IN            integer,
    numChars  IN OUT        integer,
    lineFeed  IN            boolean default false),

  MEMBER PROCEDURE flush (
    self      IN OUT NOCOPY utl_CharacterOutputStream),

  MEMBER PROCEDURE close (
    self      IN OUT NOCOPY utl_CharacterOutputStream)

) NOT FINAL;
```

### Attributes

**Table 258–5 UTL\_CHARACTEROUTPUTSTREAM Type Member Subprograms**

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> <li>■ #1 - Writes the number of characters specified by <code>numChars</code> (default is 1) from parameter <code>chars</code> into the stream and returns the actual number of characters written. If the value of <code>lineFeed</code> is <code>TRUE</code> (default is <code>FALSE</code>) a <code>lineFeed</code> character is inserted after the last character.</li> <li>■ #2 - writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code> into the stream. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is <code>true</code> (default is <code>FALSE</code>) a <code>lineFeed</code> character is inserted after the last character.</li> <li>■ #3 - Writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code>, beginning at <code>offset</code> specified by parameter <code>offset</code>. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is <code>true</code> (default is <code>FALSE</code>) a <code>lineFeed</code> character is inserted after the last character .</li> </ul>
FLUSH	Copies all characters that may be contained within buffers to the node value

**Table 258-5 (Cont.) UTL\_CHARACTEROUTPUTSTREAM Type Member Subprograms**

<b>Member Subprogram</b>	<b>Description</b>
CLOSE	Releases all resources held by the stream

`XMLType` is a system-defined opaque type for handling XML data. It has predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLGEN` and `SYS_XMLAGG` SQL functions.

This chapter contains the following topics:

## Summary of XMLType Subprograms

Table 259–1 summarizes functions and procedures of the XMLType.

**Table 259–1 XMLTYPE Subprograms**

Method	Description
<a href="#">CREATENONSCHEMABASEDXML</a> on page 259-4	Creates a non schema based XML from the input schema based instance.
<a href="#">CREATESCHEMABASEDXML</a> on page 259-5	Creates a schema based XMLType instance from the non-schema based instance using the input schema URL.
<a href="#">CREATEXML</a> on page 6	Static function for creating and returning an XMLType instance.
<a href="#">EXISTSNODE</a> on page 259-8	Takes a XMLType instance and a XPath and returns 1 or 0 indicating if applying the XPath returns a non-empty set of nodes.
<a href="#">EXTRACT</a> on page 259-9	Takes a XMLType instance and an XPath, applies the XPath expression and returns the results as an XMLType.
<a href="#">GETBLOBVAL</a> on page 259-10	Returns the value of the XMLType instance as a BLOB
<a href="#">GETCLOBVAL</a> on page 259-11	Returns the value of the XMLType instance as a CLOB.
<a href="#">GETNAMESPACE</a> on page 259-12	Returns the namespace for the top level element in a schema based document.
<a href="#">GETNUMBERVAL</a> on page 259-13	Returns the value of the XMLType instance as a NUMBER. This is only valid if the input XMLType instance contains a simple text node and is convertible to a number.
<a href="#">GETROOTELEMENT</a> on page 259-14	Returns the root element of the input instance. Returns NULL if the instance is a fragment
<a href="#">GETSCHEMAURL</a> on page 259-15	Returns the XML schema URL if the input is an XML Schema based.
<a href="#">GETSTRINGVAL</a> on page 259-16	Returns the value of the XMLType instance as a string.
<a href="#">ISFRAGMENT</a> on page 259-17	Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
<a href="#">ISSCHEMABASED</a> on page 259-18	Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.
<a href="#">ISSCHEMAVALID</a> on page 259-19	Checks if the input instance is schema valid according to the given schema URL.
<a href="#">ISSCHEMAVALIDATED</a> on page 259-20	Checks if the instance has been validated against the schema.
<a href="#">SCHEMAVALIDATE</a> on page 259-21	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
<a href="#">SETSCHEMAVALIDATED</a> on page 259-22	Sets the schema valid flag to avoid costly schema validation.
<a href="#">TOOBJECT</a> on page 259-23	Converts the XMLType instance to an object type.
<a href="#">TRANSFORM</a> on page 259-24	Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML.

**Table 259-1 (Cont.) XMLTYPE Subprograms**

<b>Method</b>	<b>Description</b>
<a href="#">XMLTYPE</a> on page 259-25	Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.

## CREATENONSCHEMABASEDXML

Member function. Creates a non-schema based XML document from a schema based instance.

### **Syntax**

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML  
return XMLType deterministic;
```

---

## CREATESCHEMABASEDXML

Member function. Creates a schema based XMLType instance from a non-schema based XMLType value. It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

### Syntax

```
MEMBER FUNCTION createSchemaBasedXML(  
schema IN varchar2 := NULL)  
return XMLType deterministic;
```

---

Parameter	Description
schema	Optional XMLSchema URL used to convert the value to the specified schema..

---

## CREATEXML

Static function for creating and returning an `XMLType` instance. The string and clob parameters used to pass in the data must contain well-formed and valid XML documents. The options are described in the following table.

Syntax	Description
<pre> STATIC FUNCTION createXML(     xmlData IN varchar2) RETURN XMLType deterministic; </pre>	Creates the <code>XMLType</code> instance from a string.
<pre> STATIC FUNCTION createXML(     xmlData IN clob) RETURN XMLType deterministic; </pre>	Creates the <code>XMLType</code> instance from a CLOB.
<pre> STATIC FUNCTION createXML (     xmlData IN clob,     schema IN varchar2,     validated IN number := 0,     wellformed IN number := 0 ) RETURN XMLType deterministic; </pre>	This static function creates a schema-based <code>XMLType</code> instance using the specified schema and xml data parameters.
<pre> STATIC FUNCTION createXML (     xmlData IN varchar2,     schema IN varchar2,     validated IN number := 0,     wellformed IN number := 0) RETURN XMLType deterministic; </pre>	This static function creates a schema-based <code>XMLType</code> instance using the specified schema and xml data parameters.
<pre> STATIC FUNCTION createXML (     xmlData IN "&lt;ADT_1&gt;",     schema IN varchar2 := NULL,     element IN varchar2 := NULL,     validated IN NUMBER := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from an instance of an user-defined type.
<pre> STATIC FUNCTION createXML (     xmlData IN SYS_REFCURSOR,     schema in varchar2 := NULL,     element in varchar2 := NULL,     validated in number := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.

Syntax	Description
<pre> STATIC FUNCTION createXML (     xmlData IN AnyData,     schema IN varchar2 := NULL,     element IN varchar2 := NULL,     validated IN number := 0) RETURN sys.XMLType deterministic     parallel_enable </pre>	<p>Creates an XML instance from ANYDATA.</p> <p>If the ANYDATAinstance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATAcontains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p>
<pre> STATIC FUNCTION createXML (     xmlData IN blob,     csid IN number,     schema IN varchar2,     validated IN number := 0,     wellformed IN number := 0) return sys.XMLType deterministic </pre>	<p>Creates an XML instance from a BLOB.</p>
<pre> STATIC FUNCTION createXML (     xmlData IN bfile,     csid IN number,     Schema IN varchar2,     validated IN number := 0,     wellformed IN number := 0) return sys.XMLType deterministic </pre>	<p>Creates an XML instance from a BFILE.</p>

Parameter	Description
xmlData	The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema.
validated	Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)
wellformed	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)
CSID	The character set id of input XML data.

## EXISTSNODE

Member function. Checks if the node exists. If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION existsNode(     xpath IN varchar2) RETURN number deterministic;</pre>	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.
<pre>MEMBER FUNCTION existsNode(     xpath in varchar2,     nsmap in varchar2) RETURN number deterministic;</pre>	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

Parameter	Description
xpath	The XPath expression to test.
nsmap	Optional namespace mapping.

## EXTRACT

Member function. Extracts an XMLType fragment and returns an XMLType instance containing the result node(s). If the XPath does not result in any nodes, then returns NULL. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION extract(     xpath IN varchar2) RETURN XMLType deterministic;</pre>	Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.
<pre>MEMBER FUNCTION extract(     xpath IN varchar2,     nsmmap IN varchar2) RETURN XMLType deterministic;</pre>	This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.

Parameter	Description
xpath	The XPath expression to apply.
nsmmap	Optional prefix to namespace mapping information.

## GETBLOBVAL

Member function. Returns a BLOB containing the serialized XML representation; if the BLOB returned is temporary, it must be freed after use.

### Syntax

```
MEMBER FUNCTION getBlobVal()  
RETURN Blob deterministic;
```

## GETCLOBVAL

Member function. Returns a CLOB containing the serialized XML representation; if the CLOB returned is temporary, it must be freed after use.

### Syntax

```
MEMBER FUNCTION getClobVal()  
RETURN clob deterministic;
```

## GETNAMESPACE

Member function. Returns the namespace of the top level element in the instance. Returns `NULL` if the input is a fragment or is a non-schema based instance.

### Syntax

```
MEMBER FUNCTION getNamespace  
return varchar2 deterministic;
```

## GETNUMBERVAL

Member function. Returns a numeric value, formatted from the text value pointed to by the `XMLType` instance. The `XMLType` must point to a valid text node that contains a numerical value. The options are described in the following table.

### Syntax

```
MEMBER FUNCTION getNumberVal()  
RETURN number deterministic;
```

## GETROOTELEMENT

Member function. Gets the root element of the `XMLType` instance. Returns `NULL` if the instance is a fragment.

### Syntax

```
MEMBER FUNCTION getRootElement  
return varchar2 deterministic;
```

## GETSCHEMAURL

Member function. Returns the XML Schema URL corresponding to the `XMLType` instance, if the `XMLType` instance is a schema-based document. Otherwise returns `NULL`.

### Syntax

```
MEMBER FUNCTION getSchemaURL  
return varchar2 deterministic;
```

## GETSTRINGVAL

Member function. Returns the document as a string. Returns a string containing the serialized XML representation, or in case of text nodes, the text itself. If the XML document is bigger than the maximum size of the `VARCHAR2`, which is 4000, then an error is raised at run time.

### Syntax

```
MEMBER FUNCTION getStringVal()  
RETURN varchar2 deterministic;
```

## ISFRAGMENT

Determines if the `XMLType` instance corresponds to a well-formed document, or a fragment. Returns 1 or 0 indicating if the `XMLType` instance contains a fragment or a well-formed document.

### Syntax

```
MEMBER FUNCTION isFragment()  
RETURN number deterministic;
```

## ISSCHEMABASED

Member function. Determines whether the `XMLType` instance is schema-based or not. Returns 1 or 0 depending on whether the `XMLType` instance is schema-based.

### Syntax

```
MEMBER FUNCTION isSchemaBased  
return number deterministic;
```

## ISSCHEMAVALID

Member function. Checks if the input instance is conformant to a specified schema. Does not change the validation status of the XML instance. If a XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

### Syntax

```
member function isSchemaValid(  
schurl IN VARCHAR2 := NULL,  
elem IN VARCHAR2 := NULL)  
return NUMBER deterministic;
```

Parameter	IN / OUT	Description
schurl	(IN)	The URL of the XML Schema against which to check conformance.
elem	(IN)	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

## ISSCHEMAVALIDATED

Member function. Returns the validation status of the `XMLType` instance -- tells if a schema based instance has been actually validated against its schema. Returns 1 if the instance has been validated against the schema, 0 otherwise.

### Syntax

```
MEMBER FUNCTION isSchemaValidated  
return NUMBER deterministic;
```

## SCHEMAVALIDATE

Member procedure. Validates the XML instance against its schema if it hasn't already been done. For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

### Syntax

```
MEMBER PROCEDURE schemaValidate(  
    self IF OUT NOCOPY XMLType);
```

Parameter	IN / OUT	Description
self	(OUT)	XML instance being validated against the schema.

## SETSCHEMAVALIDATED

Member function. Sets the `VALIDATION` state of the input XML instance.

### Syntax

```
MEMBER PROCEDURE setSchemaValidated(  
self IF OUT NOCOPY XMLType,  
    flag IN BINARY_INTEGER := 1);
```

Parameter	IN / OUT	Description
<code>self</code>	(OUT)	XML instance.
<code>flag</code>	(IN)	0 - NOT VALIDATED; 1 - VALIDATED (Default)

## TOOBJECT

Member procedure. Converts the XML value to an object type using the `XMLSCHEMA` mapping, if available. If a `SCHEMA` is not supplied or the input is a non-schema based XML, the procedure uses canonical mapping between elements and object type attributes.

### See Also:

- An in-depth discussion of this topic inside *Oracle XML DB Developer's Guide*

### Syntax

```
MEMBER PROCEDURE toObject(
  SELF in XMLType,
  object OUT "<ADT_1>",
  schema in varchar2 := NULL,
  element in varchar2 := NULL);
```

Parameter	IN / OUT	Description
<code>SELF</code>	(IN)	Instance to be converted. Implicit if used as a member procedure.
<code>object</code>	(IN)	Converted object. An object instance of the required type may be passed in to this function
<code>schema</code>	(IN)	Schema URL. The mapping of the <code>XMLType</code> instance to the converted object instance may be specified using a schema.
<code>element</code>	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter.

## TRANSFORM

Member function. This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs. If any of the arguments other than the parammap is NULL, then a NULL is returned.

### Syntax

```
MEMBER FUNCTION transform(  
xsl IN XMLType,  
parammap in varchar2 := NULL)  
RETURN XMLType deterministic;
```

Parameter	IN / OUT	Description
xsl	(IN)	The XSL stylesheet describing the transformation
parammap	(IN)	Top level parameters to the XSL - string of name=value pairs

## XMLTYPE

XMLType constructor. The options are described in the following table.

Syntax	Description
<pre> constructor function XMLType(   xmlData IN clob,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN Number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType(   xmlData IN varchar2,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType (   xmlData IN "w&lt;ADT_1&gt;",   schema IN varchar2 := NULL,   element IN varchar2 := NULL,   validated IN number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.</p>
<pre> constructor function XMLType(   xmlData IN SYS_REFCURSOR,   schema in varchar2 := NULL,   element in varchar2 := NULL,   validated in number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.</p>
<pre> constructor function XMLType(   xmlData IN AnyData,   schema IN varchar2 := NULL,   element IN varchar2 := NULL,   validated IN number := 0) return self as result deterministic parallel_enable </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter.</p> <p>If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p>

Syntax	Description
<pre> constructor function XMLType(   xmlData IN blob, csid IN number,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.</p>
<pre> constructor function XMLType(   xmlData IN bfile,   csid IN number,   schema IN varchar2 := NULL,   validated IN number := 0,   wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.</p>

Parameter	Description
xmlData	The data in the form of a BFILE, BLOB, CLOB, REFS, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema.
validated	Indicates that the instance is valid to the given XML Schema.
wellformed	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)
CSID	The character set id of input XML data.

- DYNAMIC, 124-10
- SHARED\_CONTEXT\_SENSITIVE, 124-10
- SHARED\_STATIC, 124-10
- STATIC, 124-10

DBMS\_RLS.ADD\_POLICY\_CONTEXT parameters

- attribute, 124-13
- namespace, 124-13
- object\_name, 124-13
- object\_schema, 124-13

DBMS\_RLS.CREATE\_POLICY\_GROUP parameters

- object\_name, 124-14
- object\_schema, 124-14
- policy\_group, 124-14

DBMS\_RLS.DELETE\_POLICY\_GROUP parameters

- object\_name, 124-15
- object\_schema, 124-15
- policy\_group, 124-15

DBMS\_RLS.DISABLE\_GROUPED\_POLICY parameters

- group\_name, 124-16
- object\_name, 124-16
- object\_schema, 124-16
- policy\_name, 124-16

DBMS\_RLS.DROP\_GROUPED\_POLICY parameters

- object\_name, 124-17, 124-18
- object\_schema, 124-17, 124-18
- policy\_group, 124-17
- policy\_name, 124-17, 124-18

---

DBMS\_RLS.DROP\_POLICY\_CONTEXT parameters  
  attribute, 124-19  
  namespace, 124-19  
  object\_name, 124-19  
  object\_schema, 124-19

DBMS\_RLS.ENABLE\_GROUPED\_POLICY parameters  
  enable, 124-20  
  group\_name, 124-20  
  object\_name, 124-20  
  object\_schema, 124-20  
  policy\_name, 124-20

DBMS\_RLS.ENABLE\_POLICY parameters  
  enable, 124-21  
  object\_name, 124-21  
  object\_schema, 124-21  
  policy\_name, 124-21

DBMS\_RLS.REFRESH\_GROUPED\_POLICY parameters  
  group\_name, 124-22  
  object\_name, 124-22  
  object\_schema, 124-22  
  policy\_name, 124-22
